SHSBC TAPES 001-100
a) Table of Contents, in Checksheet order:

1. 61-05-07 E-METER TALK AND DEMO.................................................................1
2. 61-05-12 ASSESSMENT..................................................................................23
3. 61-05-19 E-METER..........................................................................................45
4. 61-05-26 ON AUDITING..................................................................................69
5. 61-06-01 FLATTENING A PROCESS AND THE E-METER..........................92
6. 61-06-02 FLOWS, PREHAV SCALE, PRIMARY SCALE..............................104
7. 61-06-05 ROUTINE 1, 2 AND 3......................................................................118
8. 61-06-06 SECURITY CHECKS*......................................................................132
9. 61-06-07 POINTS IN ASsessING.................................................................144
10. 61-06-08 QUESTION AND ANSWER PERIOD: ENDING AN INTENSIVE....158
11. 61-06-09 READING E-METER REACTIONS............................................172
12. 61-06-12 E-METER ACTIONS, ERRORS IN AUDITING.........................192
13. 61-06-13 SEMINAR, QUESTION AND ANSWER PERIOD..........................209
14. 61-06-14 SEMINAR: WITHHOLDS...............................................................221
15. 61-06-15 NOT-KNOW..................................................................................237
16. 61-06-16 CONFRONT AND HAVINGNESS ROUTINES 1, 2 AND 3...........255
17. 61-06-19 QUESTION AND ANSWER PERIOD: AUDITING SLOWDOWNS...273
18. 61-06-20 SEC CHECK QUESTIONS, MUTUAL RUDIMENTS....................293
19. 61-06-21 SEMINAR: AUDITING SPEED......................................................315
20. 61-06-22 RUNNING CCHS..........................................................................331
21. 61-06-23 QUESTION AND ANSWER PERIOD: CCHS, AUDITING...........351
22. 61-06-26 DEALING WITH ATTACKS ON SCIENTOLOGY.........................371
23. 61-06-27 CCHS – CIRCUITS.........................................................................388
24. 61-06-28 RAW MEAT TROUBLE-SHOOTING CASES...............................410
25. 61-06-29 WRONG TARGET, SEC CHECK................................................430
26. 61-06-30 TRAINING ON TRS, TALK ON AUDITING.................................448
27. 61-07-03 ROUTINE 1A-PROBLEMS..........................................................464
28. 61-07-04 ROUTINE 1A – PROBLEMS AND SOLUTIONS...........................486
29. 61-07-05 QUESTION AND ANSWER PERIOD: PROCEDURE IN AUDITING..508
30. 61-07-06 ROUTINE 1A – PROBLEMS AND CONFRONT..........................532
31. 61-07-11 ROUTINE 1A – PROBLEMS AND SECURITY CHECKS...............556
32. 61-07-12 QUESTION AND ANSWER PERIOD: ANATOMY OF MAYBE, SOLUTIONS......578
33. 61-07-14 CHECKING RUDS AND WITHHOLDS........................................600
34. 61-07-18 CAN'T HAVE, CREATE, FUNDAMENTALS OF ALL PROBLEMS.....622
35. 61-07-19 QUESTION AND ANSWER PERIOD: AUDITOR EFFECT ON METER...642
36. 61-07-20 GAMES CONDITIONS...............................................................666
37. 61-08-03 CREATION AND GOALS............................................................686
38. 61-08-04 METHODOLOGY OF AUDITING NOT-DOINGNESS AND OCCLUSION..708
39. 61-08-08 FORGETTINGNESS......................................................................730

</table>
Okay. This is a talk on an E-Meter, 7 May, 1961, to HASI London technical staff.

Now, this instrument is probably the simplest instrument on Earth and is the least known. There's tremendous mysteries connected with this instrument, and nearly everybody using it has developed a whole bunch of technology of his own on it and a lot of that technology is actually in total avoidance of the purpose of the meter.

There's tremendous numbers of things that you could say are this, that or the other way about this meter and none of them are right. It is a very simple machine. That's the first thing I've got to tell you.

Now, any time you put a simple machine, a simple piece of data, in people's hands, what happens? You enter a simple datum, you blow off the confusion, right? Well, after all these years we're still blowing confusion off of E-Meters.

Now, the whole fact of clearing today depends on this meter. If you can read this meter well, you can clear people, and if you can't read this meter well, you certainly can't. That's just the long and the short of it. I've seen a veteran auditor do a bad read on a meter, audit somebody for a couple of hundred hours – factually, audit somebody for a couple of hundred hours – and wonder why they weren't getting Clear. It's just the meter. In SOP Goals a bad assessment – the – it looks so good but it's just not quite right – extends auditing time to ten thousand hours. I mean, simple! You just won't make it, that's all. It's an Aristotelian proposition: it's black or white.

And the funny part about SOP Goals is, it can be run on anybody; there's very little preparation actually necessary for it. If you get the right goal by Assessment by Elimination – once more, there's no judgment here involved: You just shake this meter down for every goal the person has. And when they no longer have any goals which they're withholding – secret goals, childhood goals, antisocial goals, goals: "What would you have to have happen to know Scientology worked?" You see, all those goals shaken down until they no longer produce a fall on this meter, when you got that complete list, whether it's 70 or 250, this meter goes numb. It goes completely null; it no longer registers, when you've got the list.

All right. Now, having that list, you go down until you washed out all goals but one. Just by going over the list and over the list and over the list and over the list and over the list, you'll find out, oddly enough – and this is almost an accident, and it just plays into our hands just madly – there's only one goal left that will register on the meter. I don't care if it takes you twenty-five hours to get the assessment right; if the assessment is right, you have saved all the hours of auditing the fellow will now invest without result. You see, it isn't that – it isn't that you waste time by taking a long time to do an assessment; it's you waste time by
getting a bad assessment. You get a wrong assessment, you've had it. I mean, the fellow just isn't going to go anyplace.

Now, you get a list of all the terminals, and when you finally run this meter completely null on a terminal list for the goal you've now got – you've the goal, now you run the thing completely null. You go right down the line: Terminal, another terminal, "What other terminal would represent that goal? Ah, good. What other terminal would represent that goal? What other terminal would represent that goal? What's another one now?"

Finally the needle goes null. It no longer registers. You – in other words, you get the list of terminals so long as the idea of a terminal for that goal is producing a reaction on the meter. Meter goes null, you got the terminal list, that's it.

Now, you go over this list and over this list and over this list and over this list, and mysteriously and wonderfully, if you go over it enough times, only one terminal – and boy, can you be fooled on this; I've seen an expert fooled on this. Enough times, only one terminal produces a drop. There isn't any single other reaction on the meter except one terminal.

Oh, for a while he'll look juicy. There's one that's going to fall and "Oh, boy!" you say, "That's it." And then all of a sudden that doesn't do it anymore. But another terminal falls like mad and then that's gone. And then – ah, what the hell.

You just go over them enough, and all of a sudden one terminal starts to fall. And it falls and it falls, and it doesn't matter how many times you say so, and it doesn't matter whether you kick the pc or drug him or dope him, it still falls. You get the idea? That's the terminal. Hh-sssss!

I don't care how many hours you take to do that. That's well-invested time, because the number of hours it takes to do a good assessment is compared to the infinity of hours in auditing you're going to spend if the assessment is wrong. You got the idea? Because the fellow is never going to go Clear, so you've consigned him to an infinity of auditing hours. Because he'll never go Clear on a wrong assessment. He won't even get better. How do you like that?

Now, we have lots of processes we can make him better on, which have no assessment, like "Put your finger in your ear. Thank you." And the fellow has finally got his earache over with and that sort of thing. We can do things with other processes, but not SOP Goals. It's infinity, or a finite. An infinity of hours in auditing is the result of a wrong assessment, and a finite number of hours is a result of a right assessment. It's just that bing-bang, you see? It's just black and white. It's either that or it isn't.

You're just about to get a new Prehav Scale, by the way, and it is a very – took me quite a while to figure out how I could deliver the thing properly, and exactly what it was. Well, we've got this in the works; actually it's in the typist's hands. But this is the point: What do you know? It does Assessment by Elimination. If you went over the key points of the scale enough times, only one point falls. Doesn't matter how many other points fall, only one point falls. So you do it Assessment by Elimination every time on the Prehav Scale – every time you do this Assessment by Elimination.
As long as you've got three levels falling, you are wrong to stop. If you've got three levels ticking, you're wrong to stop. You go over that until you've got one level falling. And that is the level. The rest will blow off; they'll not-is.

Well, heck, it may take you a couple of hours then to get the right assessment for the next level to run. Every time you flatten a level, why, it might take you another... I don't care if it does, you see? Because every moment that you run without the right assessment is totally lost in auditing.

So how do you waste auditing time? You waste auditing time -- well, various ways. One of the first ways is you run rudiments on somebody who is incapable of running a rudiment. That's a good way to waste auditing time. Let's spend fifteen hours on rudiments on somebody who cannot produce any reaction on the body by thinking. The reason he can't is he alter-is every command. So you say, "What part of that somatic could you be responsible for?" or some command. That'd be a bad process. "What part of a leg could you be responsible for?" You're going to cure up his PT problem: he's got a pain in his leg or something like that. And you could go on and on and on and on and on and on. Why? Because the fellow is running "What leg has responsibility?"

Look, auditing doesn't work if they don't do the auditing command. So that alter-isness has to be knocked out -- obsessive alter-isness has to be knocked out. And all of this is preparatory to SOP Goals. It's just preparatory.

Now, what processes do you run to prepare him? Actually the best known process is Attention. But Attention, or Change, or an assessed Change Scale or, actually, the new Prehav Scale, which you haven't got in your hands yet, simply run without a terminal. In other words, you can start assessing on the Prehav Scale with no terminal and run anything you can get your hands on, and then you loosen up the tone arm. And then you can come back and do an SOP Goals Assessment on the person if you've got him set up that way.

We have had some remarkable recoveries on just running on the Prehav Scale, by the way -- no terminal, no assessment, no nothing. Quite interesting. But it sets a person up to run -- the new Prehav Scale will, because it's got all varieties of change and alteration in it. So it'd take out all the obsessive change off of the case, all the alter-is of the auditing command.

But that's beside the point. This is actually not a lecture on how to set a case up, because that will be too easy. I could say: The best way I know of to do it is to take the new Prehav Scale and do an assessment directly without a terminal on the pc and you only do that when his tone arm won't move -- he's got a stuck tone arm. And you run the levels that do make it fall in spite of the fact that it's stuck, because those are the automaticity levels. Get the automaticities off the surface of the case and you immediately have somebody who can be assessed and who will follow an auditing command. And SOP Goals grips them so with interest, with the right goal, that they don't alter-is auditing commands. They are too interested. They're sitting right in the middle of it. You got it?

So we've got this thing made. And it's essentially a very simple regimen. It fortunately, perhaps, for us is one which requires technical perfection. That's fortunately for us! Because it means no screwball outfit -- but imagine some outfit like the Grand Temple of Ishtar or the Brothers of the Snake, or something, suddenly being able to pick up our technology, if it were
terribly, terribly simple, and use it to plow everybody in on Earth. This was one of the points that maybe you weren't looking at, but I was. If it came out at the other end too simple — all you had to do was say "bligablog" and the guy was — had a terrific mental effect, you see; or if you said "subba-hubba-hubba-hubbaboo" or something, and some terrific mental effect occurred in the individual, it was susceptible to being used as Black Dianetics — if it was too simple.

But we've come out the other end of the horn, and we get an actual look at what it really is, and it's simply this: perfect adherence to the Auditor's Code. Oh yeah, but your black operations can't follow the Auditor's Code.

Look, Freudian psychoanalysis is exactly reverse to the Auditor's Code the whole way. Everything we say in the Auditor's Code "plus," psychoanalysis says "minus." If you don't believe it, look it over some time. They do exact reverse to everything that's in the Auditor's Code. Well, therefore the Auditor's Code is not something they'd have any sympathy with, so therefore they'd never follow it, would they? So all right, that puts a barrier across their track.

Perfect TRs. It takes a person in pretty good shape to do a perfect TR. Why perfect TR? Well, the funny part of it is, if it isn't a perfect TR, your pc, as he comes up through SOP Goals, gets new PT problems and new ARC breaks with the greatest of ease. And if you're not administering it with perfect TRs, the individual is thrown off line and you're wasting auditing time like mad. And if your TRs were bad enough he never would get Clear. That's another barrier across the track, isn't it?

A total understanding of this meter and a perfect use of Model Session. Now, a black operation would only use this meter to blackmail; that's the total use they'd put the meter to. Once more it'd be booby-trapped: They'd never really learn how to run the meter. And Model Session: They couldn't learn Model Session because they can't duplicate. Those are the things that it actually takes to clear somebody, plus a perfect assessment.

And we have a new book, *E-Meter Essentials*, which is quite comprehensive. However, what I'm giving you today are — well, most of it is covered in *E-Meter Essentials*; but I'm going to give you, right now, a breakdown of the material on an E-Meter, which is probably even a little more simple than the take-off point of *E-Meter Essentials*. I've thought of a new point of take-off.

It's a very funny thing. I get better at explaining things, and I've got a better explanation today on E-Meters than I had when I wrote the book just two or three weeks ago.

Now, here's this explanation.

The reason I've given you, by the way, all of this rundown here on the subject of what it takes to clear somebody is just to try to tell you, "Look, guys, that's all it is." You know? I mean, there isn't anything else but those factors. There are no other factors. There are no sneak factors out someplace than those I have exactly mentioned. So if you say "Well, there's something more that Ron hasn't told us," or something like this, look around to find out what fact Ron has told you that you're dispersing on. Will you? Because I'm actually now giving you all the dope. It's taken eleven years to condense it, to find out all about it, to develop it, to
get it into every case line, to require no vast mental gymnastics for each particular different case.

I'll tell you how wide and varied Dianetics was. On several occasions I dreamed up a complete regimen that fitted a case, and the case started to run on it, and then went out and invented a whole new Dianetics that applied only to that regimen which was invented for that particular case. Fellow by the name of Altman in New York City, remember that? What did they eventually call that – Gestalt therapy or something? It was something real weird.

But it was something that was invented for Altman's case and it only applied to Altman. And he went out and he started a whole school of Dianetics. He might – he'd might better have called it "Altman's case."

To get something that embraced all cases and which you could use and which wouldn't betray you in your hands and which you didn't have to suddenly develop an enormous bleuh for this particular case because this case was all different, has been quite a trick, and it's taken eleven years. And that's probably a very long time.

But as Dick said the other day, in view of the fact nobody had done anything for the fifty thousand years preceding, that eleven years doesn't look very much. So don't feel betrayed that I didn't tell you all this yesterday as a favor, huh? It's taken me quite a little while to find out the words to fit the music.

Things like this. Now, I'm going to tell you about an E-Meter. Things like this. This is just a communication expression. And the moment I tell you this, I'm sure you're going to say "Well, what do you know?" This is a tension machine. That's all. That's all it measures. If you want to be idiotic and leave the electronics alone, it is a tension machine – not an attention machine, a tension machine. The more tense is the individual, the more offbeat is the read.

From the meter standpoint, the only thing you're trying to do is take the tension measurements out of this machine. That's the goal of clearing as viewed from an E-Meter.

Now, there's, oddly enough, the lowest zone of tension, which is, there is so much tension in the world that there is no sense in doing anything about anything anywhere, and you've got an ambulant, catatonic schiz. You got a dead thetan who is totally incapable – he thinks of himself as dead, you see – and he's totally incapable of influencing the machine. That's your first stage. But the machine even on that first stage, although it reads the way a Clear should read (it's the lower harmonic mockery of the Clear), still detects perfectly. Because he's Clear here, male, 3 on the tone arm dial and/or she still detects here, female, 2 on the tone arm dial, the needle is tense. You've got your sensitivity up to read him.

So the machine still detects this case. And as a cross-detection, the machine does not react favorably at all, and the individual cannot answer positively, to his own satisfaction or yours, any questions about help. That one he can't embrace.

If you just ask him, "Well, how could you help me?" – although he's sitting here at 3 and you say, "Well, he's sitting here at 3; when I ask him things, there's no action on the needle; so therefore, he must be a natural Clear!" You see?
Well, look at this needle, and you're going to find out something about Mr. Needle. The needle is going to be in some kind of a state of dishabille, and it will be almost as stiff, as you see that needle floating there, with the cans unplugged. The needle isn't going to move off of that.

Now, a severe test of it would be to kick him in the shins. The needle is still not going to move off of that. This does not look like a Clear. It doesn't even vaguely look like a Clear. The difference is the needle and the sensitivity knob.

Your sensitivity knob will have to be up to get a third-of-a-dial drop – sometimes way up. Otherwise the individual is at a Clear mockery. Do you follow me? That's a mockery. And that's the thetan who thinks of himself as dead, dead, dead, and actually "There isn't any use to have any tension anyhow because it's all so tense that if I just stay here nicely dead – ." And although he's walking and talking on the subject of machinery – you know, he's all machine motivated – you'll find in his normal course of endeavor if you ask him any questions, that he has all kinds of bad luck, that he doesn't quite groove in, but basically this: He doesn't believe anything can be done.

I had the perfect case of this tell me one day – he was actually working here on press – and he told me, "Well, you can't possibly produce a story about 'Tomatoes Feel Pain' every six weeks." He knew a lot about press – that was what he knew: "You can't possibly!"

See, there's no doingness. So there's no help, there's no doingness, there's no possibility – these are immediately detectable in the individual. They're not a deep, searching detection you have to take. You just say, "Well, let's get busy and sort out these papers," and you'll get the answer, "You can't do. There isn't any sense in sorting out the papers because ..." You got the idea? He says a "can't do."

Well now, doingness is the common denominator of the Prehavingness Scale. And an individual who can't do isn't even on the scale. See, everything is "can't do."

Now, don't be fooled by this case because the meter detects it at once. Sensitivity knob down here – look at your sensitivity knob. There is your best case detector – not your tone arm, not your needle, but the sensitivity knob, right down here in the lower left-hand corner of the meter. Now, that right there is your case detector. And don't forget it. That's a honey. And if you don't know anything else about the tone arm or the needle as case detection, know the sensitivity knob.

On these modern meters, if the sensitivity knob has to come up to 2 to get a read, the case is in bad condition. It's just as simple as that. Much less 3, 4, 8, 16. If you have to wind up this sensitivity knob at all, your case is in bad condition. You got that? That's di-ag-nosis, if you want to call it that.

Put the fellow on the machine. If you don't pay any attention whatsoever to the tone arm, if you don't pay any attention over here to the needle at all, you can tell on this sensitivity knob. If you have to crank the sensitivity knob up to get the case to get a one-third-of-a-dial drop on the needle for a test, case in bad shape. Otherwise it should sit down here, way down, way down.
Now, your first test of course, then, is when you hook up the meter, you balance the thing, you say, "Well now, it's sitting here at two", snap in your cable; fellow has got the cans, and you say "Squeeze the cans. Squeeze the cans." And he gets a sixteenth-of-a-dial drop. Bring the sensitivity knob up and you say, "Squeeze the cans." And you get an eighth-of-a-dial drop and you bring the sensitivity up and you say, "Squeeze the cans." And you finally get exactly one third-of-a-dial drop and his sensitivity is at 4 – don't pay any attention to your tone arm, that's it. The case is in lousy condition. That's all you have to know.

You don't even have to go psychiatric and say he's a catatonic ambiguousa. He's just in lousy shape.

Meaning this: That we'll have to do some preparatory work before we can do an assessment. And that's everything that means to you. We've got to do preparatory work before we do an assessment. Let's find out a little bit more about this case.

Now, you actually don't have to bring this sensitivity knob down here to its zero – you don't have to bring it down there for a third-of-a-dial drop to do an assessment. You can still assess these people long before they have recovered on their sensitivity. That's interesting, isn't it? But the probability is, you're going to have to do something with this case.

Now, if this is in real bad shape, you're probably have to – going to have to do something adventurous just to get him to sit in the chair.

All right. Now, let's look this over. Your diagnosis, we have said in the past, is tone arm and needle and sensitivity knob. Your first and foremost diagnosis – and most everything you want to know about the case – is told to you by the sensitivity knob. Now, we can progress with our diagnosis. Now, this individual, to get a third-of-a-dial drop when he squeezes the cans, which is the cans held in his hands relaxedly with his fingers not off of them but just touching them normally as he would in auditing, you say, "Squeeze the cans."

Now, sometimes they go like this, you know? It's very jerky and so forth, and they keep squeezing, squeezing, squeezing. To me, that's diagnosis. The guy can't follow a simple order. You say, "Give the cans a squeeze." I don't know what he's doing with them. But you have to then educate him in how to squeeze the cans. That's not very diagnostic, but he squeezes the cans properly just one squash and then back to relaxation, and you get a one-third-of-a-dial drop with the thing low. All right, that would be all right. But you get a third-of-a-dial drop with the sensitivity needle at 4 – ah-ah-ah-ah-ah-ah-ah-ah, oh-oh-oh-oh-oh! Individual is not going to have a lie reaction. He's going to be very hard to security check. He – all of these other things follow out. Why?

Because the guy is very, very, very surrounded by tensions of all kinds, sorts and descriptions. I'm using this word tension as just sort of an embracive thing of he's got all kinds of things going on, and he's got all kinds of tightnesses and tautnesses.

Now, this coordinates this way: If you were to reach over and squeeze this cord which comes out of his neck – a fellow who is up here at about 2 or 3 on the sensitivity knob will sometimes scream like a hog with his throat cut. That's painful! But if it is just exactly like a cable – you know, it's as though he had galvanized iron cable, not an upper muscle here on the upper part of his shoulder from his neck over to his shoulder pit and doesn't feel any pain
at all, you can expect this thing to have to ride at 16 for a third-of-a-dial drop. You got it? He's very tense and doesn't even know it.

Now, how tense is tense? Well, actually, the fellow that can be nervous about being tense, or the fellow that can be jittery about being tense, or the fellow that can jiggle his foot or scratch his head or fumble his chin is not in very bad shape. You go down scale and this fellow is getting into the rigidity of rigor mortis. Now, that's in bad shape. Can't move anything at all ever. That's your sensitivity knob telling you the story of your case.

And you do a Security Check, get your third-of-a-dial drop, and if this thing is up high, you know what you could really do? You could say to the fellow, "Well, why don't you get some auditing? Then we'll security check you later." Because frankly, any Security Check that you get on this individual is going to be very suspect. He will, however, fall on things where he has crimes. But to clear them – oh, my God!

Well, we just had one; we just did seven hours, or so, on a case to run a Joburg Security Check. Case isn't as bad off as cases go by an awful long ways.

So that forecasts that somebody reading at about sixteen, to clear every level you could get a tick on – what does that mean? That means a twenty-five-hour intensive for one Joburg Security Check. Well, oddly enough it would do him a lot of good; he'd get off a lot of withholds and you'd see that the needle was loosening up and this tone arm falling. And, you'd – more importantly for diagnosis, you'd see that the sensitivity knob didn't have to be so high. Okay?

Now, always run a meter with a third-of-a-dial drop. These meters are set, I check them over, and they do respond to that mechanical action. Another type of meter or another model or something like that, they might not respond that way, but this type of meter that I've checked out does respond that way. But you will get a proper fall if you have a third-of-a-dial drop on a squeeze of the cans on the needle.

Don't run one jacked way up with its sensitivity very high and with the needle flying around, because you don't get any significant read. A third-of-a-dial drop at any given time during a session will give you a significant read and it'll leave out all the heartbeats and so forth.

Now, in E-Meter Essentials it gives you a drill. Let's go a little bit further now. In E-Meter Essentials it gives you a drill, and the drill is a body movement-detection drill. And every auditor should do that drill. Just have somebody sit back and breathe and wheeze and cough and tell him to do these various things and watch the reactions on this needle. And this will teach you, after you've done it – with your meter set up properly – after you've done it, this will teach you that they are erratic, they are very fast, and that they don't in the least look like reads. And you will learn rapidly to differentiate between a read from the bank and a body reaction. The fellow who shifts his thumb on the can sporadically – keeps shifting his thumb or something like this: it doesn't even vaguely look like a read. You'll see that very soon. You'll see that after a while you don't even have to look up to see if he's doing something odd.
Now, you get into a rock slam, as one of the needle characteristics, and you'll find that you usually have to check the pc: "What are you doing?" All of a sudden you've got a wham-wham of the needle. Well, kind of check the pc: "What are you doing?" That's the only one that looks like a body movement. But then that keeps up. And he couldn't possibly be doing this rhythmic body movement this well. So even that is detectable. Now, it's the body movement that makes the erratic moves, and which the phrenologist – that is taught in most universities today – or is it Chaldeosis, or they read stars – horoscopy or something like that. These birds are so unaccustomed to a galvanometer that they never learned how to read one, and they think the falls are mostly attributable to body motions. They have been defeated by the body motion, so they say you never can tell on a lie detector, or this and that, because it's a body motion. And this is the first invalidative factor they give the meter.

Remember that the basis of this meter is one hundred years old. This is not a new meter. A century this thing has been around. And for nobody to have learned how to use it in a whole century was something weird.

Now, of course, we had to set it up so that it would read for our purposes. We had to redesign circuits. We brought it into a very compact package. The shelf life of this British – of the batteries in this British meter and the consumption rate are the same. Now, that's quite remarkable, isn't it? Did you know that you could take one of these modern Mark IV British meters and – don't do this – but you could leave it on in the case for weeks without running it down? Could just leave it on for weeks and weeks, because its consumption rate is the same as shelf life for the battery. Pretty interesting, huh?

Well, we've refined the living daylights out of the meter and we've made it read, and we've found out what these various components that can vary the meter mean, and we're not teaching you a new electronic instrument. All we're doing is teaching you a refined electronic instrument that nobody ever learned how to read.

So don't feel that you're dense or stupid, particularly, because you don't instantly and immediately pick up how to read an E-Meter. Because remember, it's been around for a century without anybody in the halls of learning even finding out anything about it.

You know that this thing is part and parcel of every lie detector in the United States. Men are actually sent to the electric chair on the evidence of one of these things, and the guys operating them don't know how to read them. They don't know anything about the mind. They don't know anything about the track. They tell you, "It reads only sweat. If the individual sweats suddenly, you get a drop. And then when he unsweats..." It gets silly, doesn't it? Actually, the fellow with soaking wet palms and the fellow with perfectly dry palms can read more or less the same, as far as that's concerned. It has no bearing on it, but that's what they tell you, and it's very amusing.

All right. State of case – sensitivity knob. Don't be fooled by it. If it's a high knob – it's just open-and-shut. If it's a high reading on the sensitivity knob, look out, because you're dealing with somebody who's going to alter-is commands. That's all. There's the possibility of his alter-is commands. Well, you're probably have to going to do something with this, straight on the Prehav Scale, to get the alter-is of [off?] the commands before you get anything run. You got it? Simple.
Let's put it this way; let's make another remark on this: He is not a Release. Now, the best person to run SOP Goals on is a Release. And if you were being terribly careful the whole way, you would make a Release before you started SOP Goals. The odd part of it is, if you're very good on SOP Goals, you can do an assessment on a person who isn't a Release and you will make faster auditing progress if you do it.

Normally, if you have a high sensitivity knob reading, it will assess only to a present time problem. Your whole SOP Goals will assess to a present time problem. That goal which is the present time problem for the case will be the goal you will usually get. Something to expect, huh? Something to sort of know about the thing.

But if you've released the person first, or got him up in that general direction one way or the other – . Well, after all, look at the technology we've had over the last many, many years, I mean, you can do all kinds of things with cases. You can soften up this meter; you can make this meter read differently with auditing. Practically everything we've ever found out is now valuable to us, one way or the other. I'm not saying you have this enormous span of things, but if you know something that's made cases well for you – you know, it – just this: If you know something that has made cases well for you – something like 8-C or something like this; you've made cases well with this sort of thing, you know; you've changed meter reads on them and so forth – why, that's a better reality, make them a Release with it. And you'll find the sensitivity is reading lower. If you've done something that makes the case better, you've produced a Release. Now go ahead with SOP Goals.

Now, that fits into your reality, doesn't it? I'm not giving you a whole new package and saying all of Scientology is discarded, but I'm telling you where it stops. It stops at SOP Goals. SOP Goals is itself, and it is very precise.

How you produce this Release: that's a matter that is pretty well up to you. I can give you numerous ways that will be highly functional on numerous cases. But by doing four or five of them, you will always have a case in shape to be run on SOP Goals.

All right. Let's look at the next factor on this. This has to do with the tone arm. This tone arm – this thing over here on the upper – upper-left side of the meter. All right. Now, this thing reads at 5,000 ohms female; 12,500 ohms male for the body. And its read is monitored for the body. It reads the body.

When a person is Clear you're not reading him; the E-Meter ceases to read. It's hit its zenith. When he's a total stable MEST Clear, it has hit its zenith. The meter is no good from there on up. It will always have to be used lower than that, however.

So what do you – what have you got left here? You've got his body. And apparently a female body is 5,000 ohms and a male body is 12,500 ohms, and that's represented by F with a circle around it and 2 for a female, and the M with a circle around it and the 3 for a male.

Now, that tells you at once why the lower-harmonic case – the dead thetan – why he reads at 2 and 3. See, that tells you why he reads at 2 and 3, because he's a dead body. You go down to the morgue and put the meter on a corpse down there, and you'll get these same reads. It's very fascinating, isn't it?
So you've either got the thetan not mauling the body around and changing its density every three seconds, or a dead thetan which couldn't, and you have these two extremes. And the worst-off case that you will run into is, of course, the lower, mockery harmonic of the Clear. Only he's really dead in his head. He's so dead in his head he thinks he's elsewhere while he's there.

You ask this person where he is – you just ask this person where he is; he's always someplace else.

In between that band, you have innumerable variations of this tone arm – innumerable variations of the tone arm. But most important – and this is the most recent discovery – did you know there were – you know these are divisions, and when you hear divisions of the tone arm dial it's 1 to 2. Look on your dial there. Look on your dial and just move it now from 1 to 2, 1 to 2. That is called one division of the tone arm dial. One tone arm division – 1 to 2.

Similarly, 2 to 3. Move it from 2 to 3. From 2 to 3 – that is one division of the tone arm dial.

Now, back it down from 3 to 2. All right. Back it down now from 3 to 2. That again is the movement of one division of the tone arm dial. Doesn't matter which way it moves; that is a movement of one division.

Now, move it from 3 to 3.5 and then back to 3. Do that again. Move it from 3 to 3.5 and back to 3. That is not one division of movement – not one division of movement. That is a half a division of movement, even though it moved up a half and back a half.

The way we're running this thing now, our movements are so explicit that when we say it has to have one division of movement for the tone arm dial, or an eighth of the division of movement of the tone arm dial, we mean in one direction up or one direction down, not four times with a quarter.

Now let's look at four times with a quarter. Move it from 3 to 3.25 to 3, to 3.25, to 3, to 3.25. That is not one motion – one division of the tone arm dial. Have you got that? That's not one division of the tone arm dial.

No, one division motion of the tone arm dial – the way we're – this is a refined look at the situation – is from 3 to 4, or 4 to 3. Now, this may contradict some of your earlier data. But we've had to codify this thing, so we're expressing exactly what we're expressing. A quarter of a division of movement could be this: In five minutes – now move it from 3 to 3.25, to 3, to 3.25, to 3, to 3.25, to 3 to 3.25. Got that? That all took place in five minutes of auditing. That's a quarter of a division of motion of the tone arm dial. Didn't matter how many times it happened; that's a quarter of a division of the tone arm dial. Got that subtle difference? That's just so we don't make any mistakes about this.

All right. Now, this tone arm is what we audit with, and you are being technically incorrect if you make a report like this: "The tone arm dial was pretty motionless while I was running the process, but the needle was moving." Any mention of a needle during the running of a process is a faux pas. It has nothing to do with the running of the process.
Now, curiosa – that it occasionally rock slams on you is just curiosa. It's not factual. It doesn't immediately lead you into making any new decision or solution. It's interesting that there is something flying around. But let me give you a caution: Because this needle flies around ... it is moving, isn't it? And your attention – it's moving rapidly, let us say – your attention is liable to be drawn to the needle and you're liable to start trying to interpret the needle as you audit a process. And it has nothing to do with the auditing of a process. We couldn't care less what the needle is doing.

While we're running the process, we might as well take the needle and snap it off and throw it away. The only thing we're going to pay any attention to at all is this tone arm dial. If that is moving, the process is biting, and if that isn't moving, the process is not biting.

And here we get a black-and-white Aristotelian fact: No motion on the tone arm dial, no action in the bank.

I'm not going to bother to go into the details here today of why this bank action occurs and so forth, but the bank is moving, and the movement of the bank is registered over here on a broad, wide basis on the tone arm dial.

Now, we're running processes today which do move the tone arm dial, and which are sufficiently good that they cannot help but move the tone arm dial. If you're running the right process, the tone arm dial is moving; if you're running the wrong process, it is not.

If the process is flat – regardless of what this needle is doing over here – if the process is flat, the tone arm dial is not moving. If the case is progressing, the tone arm dial is moving; if the case is not progressing, the tone arm dial is not moving. Simple, very straightforward. In other words, process on the tone arm.

Now, we take a look at this needle. What is the needle for then? That is for assessment. That is what you use that needle for, it is for assessment. There are several things the needle can do, and only one of those things has any real significance to you. What you are looking for is falls. They are called falls, drops, dips – there are numerous words used, but fall is actually the proper word only because it says "fall" on the needle – on the needle dial. It says "fall". And that means the fall is in the direction from set to where it is marked "fall." In other words, a fall inevitably drops to the right and recovers.

But it can go this way: It can fall, recover slightly, fall, recover slightly, fall, recover – it's still a fall. All right, we'll take a fall here, and it fell and then it recovered slightly and fell and recovered slightly and fell and recovered slightly and fell ... By the way, I don't pay any attention to this – tone arm numbers here – these numbers don't mean anything over here on the needle dial. They mean something on the tone arm dial, but they don't mean anything here.

I just noticed the other day somebody has marked this thing up for two divisions as one number. That will be changed. A division is simply the distance between two black marks on this thing.

All right, with that repetitive and continual fall, the actual fall was one, two, three, four, five, six, seven, eight. In what space of time? Well, I would say in the matter of two or three seconds. You know, it kind of pumps itself down. Well, that is the number of divisions
of fall. Now, this thing is marked off with little black marks and you have these and you call them divisions. Don't pay any attention to the numbers on the thing. And that is divisions of fall.

Now, diagnostically, the fall is the primary needle manifestation. Now let's talk in these needle manifestations. Fall – that's primary. A stronger manifestation than fall is the rock slam. That's just all over the… I don't know whether I – yeah, yeah, I can. I can make one of these things rock slam. There – there – there's a rock slam. Just agitate – go ahead, do it – agitate your tone arm here and watch that needle. Just move that back and forth rapidly; that's a rock slam. See that? Crazy. That's a crazy thing! That means you're right on the rock chain to the first time the – ever guy – the guy ever decided to be another valence. That's right straight on the line. You get that thing, take it. That's your strongest read.

Theta bop is a diagnostic read, but when you're really on the button your theta bop turns into a fall. But if you're reading a bunch of questions and you get a theta bop and you keep getting a theta bop every third question – theta bop – there's one of those questions someplace in the assessment list that is a theta bop question, and it has to do with leaving and death. And it's really kind of the yo-yo. The thetan is backing out of his head and coming back in slightly. Whether he's doing it inside his head, or on the next planet, it doesn't matter, but he's going in and out. And he actually is moving in and out. He's moving – tck-tck-tck-tck-tck-tck-tck-tck-tck-tck-tck-tck – he's going. Call it – like a yo-yo – the old child's toy that bounced down and came back up and bounced down and came back up. And that's represented by a little tick-tick-tick, that is almost exactly the same path.

That's too fast a one. Now, if you just move this thing about an eighth of a division move your tone arm back and forth smoothly about an eighth of a division – move it back and forth smoothly an eighth of a division – you'll notice that needle rocking back and forth there over the same pattern. That is a theta bop. It does not matter a continental how wide the theta bop is. It can be a whole dial wide – .

Now, basically, I've always referred to a theta bop as something that did it repetitively, and most theta bops which are going to be anything at all do it repetitively. Now, if you refined this down to the ne plus ultra, you'd find out that one dip and one recovery at the exact same speed over the exact same area would be a one-motion theta bop. You're now sort of nagging at the facts. It's true. That's perfectly true, but it's not very useful. That's perfectly true, but it's not very useful. You get what I'm talking about now?

Now, a theta bop has the equal halt at both ends. You see, you might as well call it a fall as far as diagnostics are concerned, if it fell once and recovered, you might as well call it a fall. But technically speaking you could say well, that was a one – a one-jump theta bop, but of course it's diagnostic the way a fall is. See? You could differentiate between these two things. It would mean that the speed of recovery was the same exactly as the speed of drop.

But it's still diagnostic and it means the same thing ordinarily that a fall would get.

If you saw that manifestation, sooner or later you're going to turn on what caused it. And then it's going to go rock-rock-rock-rock-rock. It'll do the same thing many times now. It'd mean that you just ticked the edge of a theta bop.
So fall, rock slam, theta bop – all right? All of them are useful diagnostically. All of them. The fall is ordinarily what you use – you ordinarily use the fall. That's the usual action. The theta bop can be used as an indicator. But never put it down as "the needle reacted." Put it down as a theta bop. Make the Greek letter \( \theta \) and write "bop" after it.

That simply means the guy wants to get out of there. He wants to die. He is stuck in a past death. And oddly enough, he wants to leave the assessment, or he's got leavingness on his mind. It doesn't matter which of these things is true, you would merely know that some of them are true if he's consistently theta bopping. Theta bop and death are synonymous. Theta bop and leaving are synonymous because death is leaving. A guy blows out of his head when he dies so when he gets the idea of leaving, he also theta bops. It's very simple. Returning will also give you a theta bop.

Now, what do you use for assessment, then? Actually it's broadly covered by a change of needle pattern. The needle is sitting there quietly; you read question, question, question, question, and nothing is happening at all. And then you read a question and it goes jiggle-jaggle. Well, we don't care what it did. Read the question again; it goes jiggle-jaggle. We really don't care what it did, you understand? It did something. The needle responded because we read the question, and that is the fundamental; whatever the significance of the response are, that is the fundamental. And there's only one exception to this: It rose.

I can hear far too much about needles rising. I can hear too much about this; I can easily be bored with the subject of rising needles. In fact, you hardly have to do anything to bore me with it, because it means just one thing. It means the pc isn't confronting. And, of course, that's why he's being audited.

So, I'll show you what a rising needle looks like. Now, take this thing and set it at 2.5 – set your meter at 2.5 – and now move it slowly and evenly to 2. You got that? If your meter is turned on here – it's turned on and balanced and is in the vicinity of 2, you ought to have a read on the needle – the needle ought to be up in the middle of the dial. All right, take it from – again, take it from 2.25. Now, very slowly, over this period of time, inch it, inch it, inch it smoothly, smoothly – sometimes even with little jerks – inch it smoothly up to 2 and you will get it. That is a rising needle.

Now, naturally needles have to rise for tone arms to recover, don't they? Just the mechanics of the meter tell you that. They have to rise. It's absolutely vital. Otherwise you would never get another read anywhere on the tone arm, would you?

And if you become too fascinated with a rising needle, you're becoming too fascinated with something which doesn't mean anything. It just doesn't, that's all. Beyond this just one thing: The pc has struck something he isn't confronting.

Now, we used to use this rising needle this way: Anything that will stop a needle from rising is something the pc can confront, or is usually why the needle is rising. You can find out why the needle is rising by finding out what stops it from rising. Whatever stops a needle from rising is why it's rising.

I studied ASW under a British instructor. I was running British corvettes during the war and I was studying ASW and they have to do with meters too, you know? They have
chemical recorders and pings and bops and dials and Lord knows what. And I sat down in the classroom, and he gave me a lecture on the speed of sound, which went down to the particle motion of particles influenced by sound. We were about a hundred fathoms under any information we had to have to run a chemical recorder, you understand? I was struck by the tremendous thoroughness of this and that this particular instructor got through – after a long course of this and that on these things – I was very indebted to him for having given me all this stuff. I really knew about it, you understand? But I'll be a son of a monkey if it – if it had much application to hunting submarines, you know – the physics of speed of sound and that sort of thing. And I got the idea of the thoroughness of this thing. And the thoroughness of this thing was fabulous.

Well, I'm only mentioning this particular incident for this reason: Yeah, it'd be a good thing to teach you all about this E-Meter on the standpoint of making you learn the circuit. You know, the resistors and capacitors and everything in the circuit and exactly how the balance wheels go on in back of this thing and so forth. That would be a good idea. And probably you couldn't be called a total expert on E-Meters unless you could build one out of some old baling wire, you understand? But there is a point – there is a point where that information ceases to be of any value to you, because you are not building E-Meters.

Now, there was some sense in his teaching me all about the speed of sound, and so forth, because I could do a calculation. But how sound existed as sound: I didn't need to know this, you understand? I remember that course because on the one hand I resented the living daylights out of it – I had already been using these things in action, and on the other hand I appreciated it because it seemed so thorough.

I'm only bringing this up to tell you, don't think that there aren't things about this meter you could study. You could study its circuit; you could study its manufacture; you could under-study its costing; you could study methods of improvement of it. Well, needle manifestations become an esoteric subject like the construction of the meter. Am I making my point?

Now – now, you can really start getting esoteric. I'll give you an example. There's a stage four needle. And that stage four needle can't be duplicated over here by this tone arm, but if you'll take it up to 2.25, now swing it fairly rapidly in a rise by bringing the tone arm to 2, and then pretend the needle stuck, and then drop it back rapidly to 2.25, and then bring it up to 2, and then to 2.25, and then bring it up to 2 and pretend it stuck, and then bring it back to 2.25. Got that? You see that motion? Well, you can't get the exact motion by moving the tone arm because it's a distinct stick at the top. Up it goes, up, up, and sticks, and then it falls; and then it goes up, up, and sticks, and then it falls. There is a stage four case. You could hit the guy with a belaying pin, you could put him in boiling oil, and I think you'd still get a stage four needle. It is just a total no-effect sort of needle.

Now, a stage four can be very tiny. I've seen them a half a division wide. It's not a theta bop because a theta bop is back and forth, equal speed. Actually there's kind of a little flip on the end of it. If your needle was very sensitive, you'd see your flip on both ends of the theta bop. It goes over and flips and goes back and flips and goes back – and by a flip I mean it kind of goes tzit, tzit, tzit, back and forth, tick-tick-tick-tick-tick-tick-tick. On these meters it simply looks like a little swing.
But a stage four now: that's up, *tsk* stick, fall. Now, it's very relaxed at the bottom of it – up, stick, fall. It simply means a lousy case. You're going to have it already adjudicated down here with the sensitivity knob. You see? Nothing is having any effect on the case at all – nothing – as long as you've got a stage four needle. To that degree it's useful to know. You won't see them often. So when you do see them, nothing is having any effect on the case. But it's almost impossible for modern auditing not to have any effect on a case, so it would be very brief that you would see one. We can blow up stage four needles now very nicely.

I remember two famous cases that had stage four needles, though, that lasted through all of the early processes of Dianetics and Scientology, still with stage four needles. It's a no-effect sort of a manifestation. All right, the Prehav Scale will blow up that needle in no time at all, so why should we go into the particulars of it?

All right, there's another one; there's a *jiggle-jiggle*. A vibration – the needle simply vibrates like mad. Well, you've got somebody with an alternating current ridge. Very important. So he's got an alternating current ridge!

There's other stuff about meters – 4.5 means a crowd. If the guy is stuck at 4.5 on the tone arm he's afraid of people, or he's stuck in people.

You ever see travel pictures of the famous monastery in Greece where they haul people up in a basket that's their elevator? And it survived down through the centuries because no invader can even get near it – he can't climb it. Have you ever heard of this one? Well, I actually did an E-Meter assessment on its – on the head of that monastery, a few months ago. And where was he? He was at 4.5. Naturally, in – living in a protected area up in the sky – you almost might say – that nobody could get near or something, he had done such a tremendous avoidance of people that he finally got himself stuck there.

Incidentally, the only goal you could get out of this old man is he wanted to go to heaven. He believed his own propaganda. He said he wanted to have something happen with his eyes. He was going blind. That's what he said, but that meter didn't say so. He just wanted to die. He wanted to go to heaven. I tried to find a terminal to heaven. And I'm afraid there were too many people around for me to do a very good job of the assessment, because I could only spend about a half an hour on it, or something like this.

I got him straightened out enough so something could be done about his eyes. And after that I turned it over to a local auditor, and it would do something for his eyes.

Trying to find a terminal for somebody who wants to go to heaven, who answers you nothing but in total doctrine, you see – total doctrine. I mean, all your answers are doctrine answers, have nothing to do with anything. He had no – he had not – he didn't even have a goal to be a priest. I gave a Presession 38 to run the engram of his heartbreak when he was a young man at the age of eighteen in the United States when he decided to become a priest. That was the point where his whole life had broken down and he decided to become a priest, and actually, he'd been trying to go to heaven since he was eighteen, in other words. But going to heaven – what is this? It's just a manifestation of a fellow trying to die. So of course he was going blind. He was making nothing out of his own mock-up so fast that – what could you do?
Well, what could you do? Well, you could find the incident where he decided to become a priest – that's what you could do – and run it. The old man wasn't in bad shape, by the way, and I mentioned people enough to him in the assessment that I kicked him off his 4.5 read on the tone arm.

An obsessively stuck at 2.5 means a machine, a robot, a doll – that sort of thing.

Now, these are just samples of bric-a-brac. Oh yes, as time goes on, these things are very nice to know, and they're – they mark you as "the expert." Now, after I'd taken a course on ASDIC from a British instructor I was after that certified as a total, total expert, don't you see? I could probably build the machines. Now, I can't even buy one out of war surplus. I've been trying to get one for a yacht, and they won't even sell me one. Probably an expert like that – he's at least entitled to his machinery, isn't he?

Now, these you might assign to esoterics, so get your levels of importance up here – levels of importance. Terribly important that a read on the needle produces – most ordinarily and usually and significantly and which you always make record of – a fall; next to that, a theta bop; more rarely, a rock slam. Most positive read is a rock slam.

Somebody starts rock slamming, and then you get him so he does nothing but rock slam on that question, that is the question that is producing the rock slam. And man you'd better run it because that is right on the rock chain. That is hotter than a pistol.

Every time you come by "boy scout" – he used to have an ambition to be a boy scout. Ambition to be a boy scout – rock slam. And then later on he wanted to be a minister – no rock slam. And then later on, why, he wanted to become a choir boy – no rock slam; no action at all, and so on. You go over this list of assessment again, you get it up to "boy scout" – rock slam. And all of a sudden, no rock slam on "boy scout." That has dropped out.

But later on in the questions he wanted to be a frontiersman. That rock slams, see? In other words, "boy scout" was borrowing its rock slam from "frontiersman." And we keep on asking him about "frontiersman," and the more we ask him about "frontiersman," the more rock slam we get – that's only valid if this other phenomenon takes place: no other goal on the list produces any fall, any theta bop, or any action on the needle. But "frontiersman" produces rock slam.

Well, then, you're saying the same thing as frontiersman produces fall, aren't you? So a rock slam you can classify for diagnosis as a very positive fall, that's all.

Fall is what you look for. And don't go talking to me about rises and don't start worrying me about how this pc consistently read at 3 7/8, and what did that mean? I don't know what it means. Who's kidding who? Got it? So what? That's interesting, and those of us that are fooling around with meters will eventually get this thing read down to a point of where you could put any man or beast on the face of Earth on an E-Meter and we can probably tell what his name, rank and serial number is for each life back – you know? That's way beyond what is needed to make SOP Goals work or make auditing work.

You produce a reaction on this needle that is different than the reaction you had on this needle, and you've got a reaction. But that's not true of fall, because you might have
leered at the moment you asked the question, and he couldn't confront a leer so now he's rising. Rise means nothing.

Now there's another read I'll have to tell you about on this meter. And that is 7 on the tone arm dial. The limitations of manufacture of the meter prevent us from having a 7 on the tone arm dial.

I was very bright a few months ago in South Africa and made this horrendous discovery that there is a 7 on the tone arm dial but it can't be reached by the tone arm.

Put this thing at 2. Got your meter set there at 2. All right. Now, let's say he's a dead-body 2; he's a dead-thetan 2, see? Sticky needle, this, that, the other thing; high sensitivity down here, and so on. It doesn't read in these gradients, by the way, because the bank goes *click* and *thud* and shifts here and there. But an actual, totally slow read of this thing, of his recovery, will bring him down – this is the dead-thetan case – bring him down to 1.5. Now, if you keep him hanging at 1.5, of course you're not making any progress with the case.

This is not a suppression of the case because it's gone down. Actually, the way it reads is: Move it down now to 1.5. Now move it down to where it won't go any further. Now twist it all the way up around here to above 6. Now, you see, between that 1 and between that 6 on the bottom of the dial there should be a 7 through which this tone arm should move. This is a limitation of the meter.

You see, 1.5 is more responsibility than he had at 2. You got that? So to have more responsibility than he had at 1.5, it'd have to go down to 1, right? To take more responsibility for life than he had at 1, he's got to go over here to 6. And that's more responsibility than 1. And then there's more responsibility at 5, you see? And then there's more responsibility at 4, and then when he consistently again is reading here at his 3, for Clear, why he, when he is cleared he will just hang there. And it means he's totally responsible. Now, there's the cycle of responsibility on that action. And as you audit, that is the one factor that you can check a pc back against. Is he more responsible?

Well, the dead thetan is more responsible at 1.5 than he was at 2. See, but there is no 7 on your tone arm dial. The limitations of manufacture of the meter prevent this thing from just twisting all the way through and coming back again. Otherwise, actually, it's a full circle.

So don't think that the case that goes down to 1.5 is a special case. It is not. He's not a special case. He's more responsible than he just was. Only start worrying about this case if he sooner or later doesn't become 6.5. Got it? That means he's hung up. He's not making progress. But that's the way the case goes.

Now, on ACCs we've had this oddity of an auditor trying to read ... Ordinarily he would run one tone-arm-dial division, you see, between 1 and 6 – or he'd – he's really running two, see?

But here's the way he goes. He goes from 1, 6, 1, 6, 1, 6, 1, 6, 1, 6, 1 – got the idea? And actually the auditor is having to twist his tone arm dial. Now, there's a point there, because 7 exists, where the meter doesn't read. There's a point where the meter doesn't read. And at some time or another, very, very rarely, you – very rarely – while processing somebody ordi-
narily, you will find somebody who is sitting at 7. And you can't get him on the top of the meter, and you can't get him on the bottom of the meter.

And no meter ever manufactured will be able to compensate this because of the tone arm limitations of just having the tone arm on a pot. You got the idea? This is modern electronics. They'll have to change modern electronics before we can get a 7. You got it?

You probably could design one that would run this way, but don't be too amazed if you go for instance from 6 to 1, 6 to 1, or if all of a sudden the pc doesn't read anywhere. You start going this way. He doesn't read anywhere on the dial; he's not up, he's not down, sensitivity doesn't do anything. Well, two things could happen: Either your meter's out, at which time it is just necessary for you to reach over and take the cans and put yourself on the meter, see, and pull the tone arm down – "Oh, the meter is reading" – give them back to the pc. Ah, that tells you it all. Ha-ha! He's at 7. The pc is at 7. Just go on and process him on something you figure will work, or go on processing whatever you were processing that got him onto 7.

If you picked him up originally off the street and he was on 7 – very rare this is; this is extremely rare, but it could happen to you, what's your final answer? Well, you'll just have to run him on something that will improve the case, and he will read on the E-Meter. This is a bug in the construction of the meter. Okay?

All right. Now, change of characteristic means that the meter, on a certain question, has its needle shift into a different action than it was in. It resumes its old action when you no longer ask the question – when you ask the question, it takes on any different reaction. You got the idea? A change of characteristic – that's all that means. For instance, it was theta-bopping and you asked him about donuts and you started to get a fall. But you ask him about anything else and he theta-bops again. That's a change of characteristic.

Now reversewise, you were getting a fall, a fall, a fall, everything you say to the pc, you see? You say, "Well, did you eat breakfast this morning? Do you like Egyptian cotton? What color is a piece of tin?" You ask him anything and you get a fall. Well, that is the needle pattern of that pc. It's a fall, it's a fall, it's a fall, it's a fall, it's a fall. It'd be maybe a one-two division fall every time you say anything. Ordinarily you'd get this if your sensitivity was just a little high. One of the ways to do it is just back your sensitivity off a little bit. But nevertheless you can read through that. That is the pattern of the meter.

You usually read from a still needle. Try to read from a still needle. But the pattern of the meter for this pc is a fall – "Do you like Egyptian cotton?" "Have you seen a jeweler recently?" "Have you ever shot grapes?" And it's just a fall, it's a fall, it's a fall, it's a fall. The fall is always the same fall. And then you say, "Well, are you pleased with your marriage now?" – you get a theta bop. Ah-ha! Ah-ha! And you say, "Do you like the Union Jack?" and you get a fall and you get a fall. And you say, "Are you pleased with your marriage?" and you get a theta bop. That means that that question is charged. But which question is charged? It's the one that produces the change of pattern. You got the idea?

Now, more loosely, more loosely, you can say that any time the pc has a charged question within his level of reality, you get a change of pattern. You could say a fall is a change of pattern, a theta bop is a change of pattern, a rock slam is a change of pattern, don't you see? So basically you're trying to change the pattern of this meter.
Now let's get back to tension. This meter has to be set up higher and higher, and its reads are tighter and tighter, the more tension there is on a case, and your goal of processing is to take that tension off, and the meter, of course, registers this – you get a low sensitivity knob. This starts to come in toward Clear, and eventually tension isn't even registered on the needle.

Sort of falls out in this order: The tension, as the case gets better, will fall out of the sensitivity knob. Then the tension starts – you see, at 6.5 on the tone arm dial, that's not untense. Actually, you go ding like this and the fellow hits high C, you know?

All right, there it comes out of the tone arm dial, down, and he gets down toward Clear read. And it pumps down over the hours and hours of processing, you see, gradually pumps down closer and closer in, and eventually the tension totally disappears out of the needle. And the needle then is a free needle.

We have been careless in use of terms. A free needle means the needle is free. A null needle means it doesn't get a change of pattern or react on the question. But a free needle just floats. When you've seen a free needle – it'd become unmistakable. It just floats around. Actually it looks like your sensitivity knob – you can actually approximate a free needle by turning your sensitivity up maybe to about 16 on an average case, and then not let him breathe. And you'll get a float. And this needle just floats around. And of course, that's no tension, isn't it?

Now, when you've cleaned up everything in life that he could possibly have any tension on, which is called stabilizing a Clear, you just go over more goals and more Prehav Scale – just – and do all the steps of SOP Goals on and on and on. He starts blowing them by inspection, and it gets easier and easier for him to blow them, there's less and less tension on this needle, and eventually you can't get any reaction on the needle, and that's it. You've got a Clear. You got that?

So just – I've taken you now from total tension, which is dead-thetan reading at Clear, then you get a read on up the line – more and different positions of the tone arm, different characteristics of the needle – eventually up to... At no particular stage of the game does it read a certain combo, beyond saying, well, the fellow does not now have to have his sensitivity jacked up. All right, he used to have! So therefore he's getting better. The fellow is not now reading at 6 on the tone arm, he reads down around 3.5, 4. Well, he's getting better. Don't you see? And his needle doesn't get sticky and unstick and do jerky things, and so forth, and – he's getting better, don't you see? And eventually when the needle, the tone arm and the sensitivity knob no longer produce – no matter what you do with them – any reaction on the thetan that you're auditing...

Oh, of course, you can still – on a floating needle you can pinch the guy madly and so forth, and rough him up enough and go like this in front of his face and kick him around. And if he did get annoyed with you, which is not probable, but if you did, you could probably get another reaction on the thing. If you hit him with a truck – something.

But now we're getting up to Theta Clear. Now, this requires an entirely different meter. I'll talk to you in just a moment about the future of meters. This meter will always be nec-
ecessary just as it is, because it tells us everything we need to know in order to clear a person. Okay? We needn't know any more than this.

We could know all about its design, and how many pounds of weight the thing has. You could probably be flunked on an E-Meter examination. "What is the exact weight in grams of a..." We could get pedantic, you know "... of a Mark IV British meter? Oh, you don't know? Well, you don't know how to run an E-Meter?" You get the idea? We could go goofy like this.

As a matter of fact, they do in the army. The private trying to make a lance corporal: Why, they ask him how many pounds does whatever the current-issue rifle weigh and all of this kind of thing. And what is the exact muzzle velocity of a Stokes mortar and ah... He isn't supposed to know the exact muzzle velocity; he's supposed to be able to fire them accurately.

The next meter above this is not a meter you would care to use on a person up to clearing, because it's an oscilloscope meter. And for you to stand there with a green line dancing madly in front of your face during all of the auditing where this needle is, you wouldn't like it. You wouldn't like it.

It's interesting, and if a case was real sticky, you might take one of these O-Meters, or theta meters, and you might put a low-tone case on it and you might be able to get him unstuck on his flows because it registers flows, but you wouldn't like to audit him on it.

I've already discovered this. I've been researching, by the way, for this next level meter for several years, and I finally got it boxed into, I know exactly what we're looking for and exactly what we've got to have. Now, that's as far as it's gone. Well, I've got some people building one, as far as that goes. But for you to audit with a bzzzzzzzzzzzzzzzzzzzz going on here... Furthermore, they're about two feet deep, minimum, and they're about a foot and a half high, and about a foot and a half wide, and you'd have to have the janitor come up and move it in your auditing room, because they're heavy. Now, a big one (which it may eventually have to be) is so big that it took Peter and myself – and we were very happy when we set it down– to carry in the last experimental model into this office. It took the two of us, staggering. So it's not practical from that standpoint.

But it is practical from the point that if you're going to audit somebody up from Clear, you have to have something that reads in micro-microvolts. You have to have something which is so sensitive that... There's the body and there's the thetan. Now, if the thetan is still in connection with his body in any way, shape or form, it'll read on the meter. You see? So you'd be able to tell what he's thinking and what he can't confront – electrically, you see? And you'd be able to sort him out, even though he was off the top of this meter, with this new theta meter, you see? He'd think, "I hate cops," you know? He's Clear as far as Earth body is concerned and that sort of thing but he's still got bugs.

Because look, I'll point something out to you. He cannot... Well, he builds houses. That's kind of remarkable when you come to think about it. He builds houses. He builds them. You know, he puts planks together, and puts up windows, and... Why doesn't he say "House" – pshew! There's a house. So there must be something wrong with him. Obvious, isn't it?
This actually doesn't read any higher than about 20 on the Tone Scale. This goes up to about 20 on the Tone Scale. From 20 to 40 on the Tone Scale you need another piece of equipment. Why? Because this measures games conditions called physical universe, and you need something that shades the tiniest, tiniest things to read the next level up. But this will take you to Clear.

Well the funny part of it is that everything you need to know about this meter I have given you in this talk. Isn't anything else you need to know about this meter.

Assess on the needle, process on the tone arm, diagnose on the sensitivity knob. The thing represents tensions. The higher these things have to be set up, the more tension is in the pc, and as you run it, you are simply taking the tension out of the pc, and the needle and the tone arm and the sensitivity knob read more and more comfortably.

And eventually when they don't read at all, you've got a stable MEST Clear. When I say they don't read at all, it's just frankly that.

I have a piece of news for you – just – I might as well put onto this last few inches of tape here that's running, that you will be interested in. We have theoretically transcended MEST universe weapons. It may not mean much to you as a sudden statement. But as you go off the top of this meter – in other words, the meter is no longer active on the individual – it means his tolerance of motion, his tolerance of change, is so great that if you hit him with a bullet you wouldn't hurt him. You probably wouldn't even be able to hit him with a bullet. And the big boys walking up and down and mocking up space flights with their – from their arsenals of atom bombs… Here they are, with their nice, polished atom bombs that can wipe out the world, and so forth. Well, nobody developed a defense against the atom bomb, and for a number of years I actually worked on MEST defenses against an atom bomb and I know they could be developed, but it would cost billions.

And we all of a sudden have a defense against the atom bomb. A person who is super-cleared, probably up around the level of Theta Clear, is not affected by them. He could probably stand right in the middle of an atom bomb blast, but his tolerance of change would be so great…
ASSESSMENT

A lecture given on
12 May 1961

Thank you.

Looks like an ACC. This is May the 12th, 1961.

Somebody hand me an E-Meter, would you? ... That's all right.

Now, I don't want you to get the idea that this course consists basically of formal lectures. Of course, in most ACCs, I back up the Instructors and I give them all the information I can, but I actually seldom go over individual cases. In this particular course I'm going over individual cases with a fine-toothed Ron. I see your auditor's reports every day and try to keep it on the wheels.

But what can happen here is that you go around in a fog of some kind or another and you got some kind of a burning question or a big withhold or a dissatisfaction or something like that, and I don't hear about it. All right, if that takes place, why, the obvious thing to do is to write me a despatch or grab ahold of me when you see me – I try to get down here every afternoon. A despatch will get to me very easily. It has hardly any distance to go at all because you're in the middle of HCO's worldwide communications, and we really keep them whirring around here. We don't know how well they do in London, but here we do fine. All right. Matter of fact they're doing all right in London now.

Now, I've got to talk to you about assessment, and that's what this is all about: assessment. Boy, I tell you, there seems to be an awful lot to know about assessment that I considered was a lead-pipe cinch.

Don't get the idea that what you're doing is experimental. It is not experimental. But I'll tell you that trying to find out what you do wrong with it and how to communicate how to do it right is a complex drill all of itself. And if there's anything that's being worked with, it is that. But that is always worked with. That always has to be worked with. How do you communicate this information so that people can do it without additives or alter-is?

I'll give you some simple rundown: I say, "Well, you look at the pc fixedly and sneeze and that fixes it all up, you see?" That's all dandy. And then what do I hear? "Well, do you sneeze in E-flat minor?" [laughter] "What is the violence and duration of the sneeze?" [laughter] "Is this done in an auditing session? Do you use Model Session form to put this sneeze in? Or is it a special form?" "Now, this, of course, isn't bounded by the Auditor's Code is it?" [laughter] And particularly, "This changes, of course, everything we have been doing before."

Those things are pretty inevitable. Now, I don't mean to be sarcastic. I'm just showing you what happens – I'm not being sarcastic because this is too true; it is too painfully true.
And it works like this: You, in trying to equate a relatively simple fundamental in Scientology at this time, are, of course, picking up a fundamental which sits right in the middle of anybody's case. And you tend to blow off a little bit of a confusion, you know, in trying to grab hold of it. And it isn't as if I were teaching you how to run a diesel engine. What little oddball ideas you had about diesel engines would blow off in a hurry. I could teach you how to run a diesel engine – very complicated – to even you girls, you see? Just bang. It'd be hardly anything to it. I'd show you: Well, there's this and there's that and there's the other thing. I'd have to read a book and find out how myself first. But that would be very easy. But that isn't what we're teaching. And the data that we're teaching goes straight into the middle of a reactive computation.

SOP Goals, right here at this minute, is doing this exact thing and nothing else: It is exactly reversing how the mind got aberrated and it reverses that exact process. Now, I'm not trying to hand out any stink cabbages to myself about this having been a hot piece of mental prestidigitation to get this job done. The best evidence of that is the fact that it had not been done before.

All I'm trying to do here is show you that the most hidden factors of the mind were, of course, the things that aberrated the mind, because nobody has ever freed a mind before. So therefore, they must have been the most concealed or they would have gotten as-ised. Just as simple as that, see? Almost anybody could have come along and as-ised them if they hadn't been very hidden.

So although SOP Goals, at first glance, looks very simple, it is actually undoing all of the factors which made a mind plow in, made a person's ability run downhill, and it consists of all the solutions that a person adopted to fix up oddball circumstances that haven't anything to do with anything anymore ever, and probably had nothing to do with it then.

Here is this little fellow, he's playing out here on the hill, and he's just having a marvelous time. And he goes around and listens to panpipes and dances with the goats. And he's free as the breeze, and everything is wonderful. And the next thing we hear of him, he's a general of armies [laughter], and he's miserable, and he's upset, and he's eventually assassinated. What happened?

Who wouldn't want to have the kind of mind that could be happy doing something simple? Who wouldn't want to have this kind of a mind? Well, I don't know anybody who wouldn't want to have it, in the long run, because basically what you're afraid of is getting bored. Well, how come you get bored? It must be what you're doing is somehow or another insufficient or inadequate to the demands of the environment.

Well, this little boy dancing on the hill amongst the goats – boy, he must have been invalidated within an inch of his life. It must have been proven to him conclusively that the game of playing with goats was no game to be played, and he's lost a very simple game in the favor of a very complicated game which he never did enjoy. What happened to him?

Well, something had to happen to him. First, he himself had to get somebody involved in that kind of a situation on the backtrack. He himself had to take a little boy playing and dancing with the goats and push him into a position where he assumed enormous responsibility for him to have the Achilles' heel, eventually, of falling for the same trap. Well, you'd cer-
tainly never look for that because we're totally educated to believe that everybody became a victim.

Now, I'll show you how far we've gone: Dick was commenting the other day on the old tapes of the Philadelphia lectures. And he says, "You're talking about – there's comments in there about being trapped in the MEST universe, and so forth. Well, we all kind of thought that at that time, and it was sort of obvious," and so forth. Well, you couldn't have been trapped in the physical universe unless you trapped somebody in it. Well, who would have looked for this oddball factor?

The psychologist knew the stimulus-response. He knew that if you kicked Bill, Bill was kicked. That was a stimuli of some kind or another. But if the kick was a stimuli, then Bill was restimestimulated into doing something. But he didn't say what.

He totally didn't look at the other end of the line at all. What was the consequences of kicking Bill? It isn't a stimulus-response factor at all; it's an overt-motivator sequence. To get kicked in the butt it is necessary to kick somebody in the butt. You get the idea? I mean, it's this idiot simplicity. You had to open yourself up on this postulate: "Being kicked in the butt is bad. And people don't want to be kicked. I am a people, therefore I don't want to be kicked in the butt, therefore I must resist being kicked in the butt, therefore I am certainly going to be kicked in the butt." And there's your overt-motivator sequence at work in the most inelegant, stupid form.

Who would have looked for these factors? Well, over a course of about eleven years, we've got them rounded up. The proof of the pudding, now, is the fact that we can go ahead and do things with cases that have never been done before, with an accuracy – or if it is done with an accuracy. We can do it with an accuracy if it is done with an accuracy. In other words, we can advance a case accurately – almost as if we set it up and say "It'll be here. It'll be there. It'll be there. And this'll happen, and this'll happen, and this'll happen" as a total predict – as long as everything done with the case is done with complete accuracy.

Now, we know all the things that have to be done with a case. Now, there are only two reasons why people don't clear. I'll expand that, because you are studying these other things – there's three reasons why people don't clear.

Inadequate knowledge of technical application: That would be your first largest heading. Person doesn't know the TRs, doesn't know how to read an E-Meter, doesn't know Model Session, and doesn't stay inside the Auditor's Code, you see? Now, actually I'm not giving you "There are a whole large number of these things to know. There are literally thousands..." No, that's not so, see? I stated them all when I just made that statement. Technical application just includes those things.

Next is the accuracy of assessment: The assessment must be done with total accuracy. There is not such a thing as a slightly correct assessment. In spite of the Dianetic Axiom that absolutes are unobtainable, there is such a thing as a perfect assessment. It is an absolute – a perfect assessment.

Now, it is very strange and very peculiar that there could be such a thing as a perfect assessment, because there isn't any such thing as a perfect mind. Here's an artificial perfection
which you are trying to attain on a case. And it is highly artificial – extremely so. And it has to be done exactly right. And we're learning more and more how to do it exactly right by finding out the things you're doing wrong. That's a good way to learn though, isn't it? Don't make blunders, though, to teach other people. We don't need those; we got enough blunders at the present time. I have no insufficiency of havingness of blunders.

All right. What do people have to know? Well, evidently you have to invent certain things...

And just to conclude this three: The third one is an incomplete Prehav Scale. You don't have the full Prehav Scale at this moment, and there could be the possibility that cases could hang up for a missing link in the Prehav Scale. But that is not very serious, because if you have a perfect assessment and the case hung up in clearing, when you did get the big, full-dress Prehav Scale, all that would be necessary to do is level those levels on the Prehav Scale that have not been flattened, because they weren't there, and the case will blow through to Clear. I mean, it's as easy as that. All you've done is put a little bit of a wait on the line. Well, man has been waiting, on this planet alone, for several thousand years, so I think we can stand a few days.

I got two stenographers typing themselves ragged right now trying to get that scale for you, just as though man hasn't been waiting for it for that long.

Well, how do you do a right assessment? If that is the most single important thing to do, how do you do it? Well, apparently there's at the present time as many ways to do an assessment, almost, as there are people – apparently. There are lots of ways to do assessments.

Well, the more I look at it, the more it narrows down to the solemn fact that there's only one way to do an assessment to achieve a perfect assessment. I haven't really found any question about it. It isn't "Well, you could do this or you could do that." That isn't the case. Every time you look over two things you could do with an assessment, one inevitably emerges as infinitely superior to the other. It sorts itself out. We might not know, at this instant, everything there is to know that we have to tell you so that you will never make a mistake on an assessment. See, you might still be able to invent one. [laughter] See, there might be something there that never quite gets through. I'm [not] being sarcastic; there's a distinct possibility this is the case. Therefore, we have to take every precaution that this doesn't happen.

Now, the first thing, then, you must know is that in SOP Goals there is no such thing as a nearly correct assessment. There is only one correct assessment. It is an absolute. Now, we said absolutes were unobtainable, but remember, we're only attaining an absolute upon an aberration. And that's very easy to do.

There is one assessment for one case and that is it. Now, what's odd is, in the first few days of running of a case – I'd say in the first few hours of run; anything up to thirty, forty hours of run – do you know that you can reassess at any time and get the same assessment? You know that you can always reassess. The auditing of an incorrect assessment does not wipe out the correct assessment. That's another lead-pipe fact. You can just wrap around that and hug it to your bosom because it's a very fortunate fact for you. It is extremely fortunate.
It means that you can make a mistake with a case and audit it for some little time – 25, 30, 40, 50, 60, 180 hours, and still do a right assessment on the case afterwards. Isn't that fascination?

Of course, you're going to have trouble with the case the whole distance. He's going to be ARC breaky and blow-out-the-window, and he's going to be this and he's going to be that. And he may be upset or not progressing. The whole Prehav Scale may be getting kind of live and hotted up, and we can't quite figure out why the whole scale is getting hotter and hotter. It's just incorrect assessment.

So there might be difficulties in trying to hold somebody still and audit them on an improper assessment that only technical skill could overcome. And it isn't true that an absolutely perfect assessment always audits with perfect ease. See, that has its bumps too, because you may make a technical blunder, or something of this sort, as you run, that you'll have to patch up like mad, and the case is pretty trembly.

Now, let's take a good look at this. If you can always do a right assessment, even if a wrong one has been done, then the answer to vast difficulties which you're having with a case (or auditing a case for 30, 40, 50 hours without marked and distinct improvement) has as its answer – Those are the difficulties: auditing a case, and the case is just having one awful, horrible time, and you just practically can't hold the case in session, and the case is all ARC broke, and all of this stuff is going on. Answer? Reassess, perfectly.

All right. A wrong assessment: It was one of these almost-right assessments. If you'd just asked one more question or just two more goals it would have been right. But you missed that. No criticism here of having missed it. Only, if you get out of here and start missing assessments and I start hearing about it back over the lines again, I'll write the postmaster and have him turn in your thetan [laughter].

But if you did an almost-correct assessment and the case apparently ran but just seemed to go on running. That would be the symptom: The case just seems to go on running forever and seems about to put in the next 280 hours going the same way. No marked change is occurring for every given 12.5 to 15, 20 hours of auditing, see? No marked change on SOP Goals. Answer: Reassess.

Difficulties with SOP Goals would come about through your inability to apply things right technically. Let's say your TRs are all out. And you sit there, and you look at your E-Meter, and it's all sort of cross-eyed. And this thing keeps falling madly. The E-Meter keeps falling, and it keeps falling. And you say, "Peanuts?" You see? It's – you say, "Peanuts?" And there it goes. You say "Peanuts?" There it goes. And you say, "Well, peanuts are sure null." [laughter] You can make a technical blunder of this character, you see, and get all wound up in a ball if your confront is bad. Your pc may ARC break consistently and continually through just horribly bad technology, I mean a terribly poor administration of the TRs, Model Session and E-Metering. You're missing the living daylights out of the rudiments. You know, the man drops off the pin on a PT problem, and you say, "Well, that's flat." "Do you have a PT problem?" bang! "Well, that's flat. I'm glad we haven't got to handle a PT problem today." And
then your pc starts blowing out of session and getting snarly, and so forth. Oh, you can make those blunders.

But the symptom of an imperfect assessment is you, with nearly perfect handling of Model Session, TRs and E-Meter, have one hell of a time keeping him in-session and he's always ARC broke with you. That's the result of an imperfect assessment. It's not a correct assessment, that's all. The thing to do is reassess.

Now, let's answer this question: Do we care how much time you spend doing an assessment? No. We do not care. There are ways to do assessments more rapidly, but there is no such thing as doing an assessment more accurately. You can be very slippy doing an assessment. You can be quite rapid. You can be quite positive and very easy and very sure of yourself and come out with the exact answer at the other end. Or you can go at it slowly and ploddingly and chopping it all up and chewing everything up and spitting it all out and grinding, and so forth. If your Model Session's any good, you can keep the pc in-session, no matter how grim he thinks this is. But I don't care if you took 25 to 50 hours doing an assessment; I would much rather you did a perfect assessment than a fast, imperfect one.

For instance, I wouldn't care in an HGC if they took a whole intensive of 25 hours just to do one assessment. I wouldn't care. Or if this situation took place, I would consider this perfectly all right: A fellow does an assessment; it takes him 8 or 9 hours, or 10 or 12 hours, or something like this. And he did an assessment on this pc; he runs the pc for 5 or 6 hours and there's no change and there's no gain on the pc. I wouldn't take it amiss at all if he just scrapped that original assessment and neither should even a paying pc – scrapped that original assessment and did another assessment from scratch.

Doing assessment saves time, because the accuracy of the assessment, if perfect, prevents an infinity of auditing hours without clearing. So you have – well look, you'd have a thousand hours of an assessment would at least be a finite number of hours of processing. And if an assessment took a thousand hours to do a perfect assessment – that's utterly ridiculous, but if it did, it would still be better than doing a sloppy, fast one. A thousand-hour assessment would probably clear the fellow in a hundred or two, you see? So you'd have the totality of time in auditing: a finite period of twelve hundred hours. But an imperfect assessment would give you an infinity of auditing hours, and that would be that. And this is the arithmetic that has to do with an assessment. He just never would get Clear. So there's no finite auditing period to an imperfect assessment. It will go on forever. And that is that! And it'll be very rough auditing too. And it'll just go on forever. Now, there is the advantage, then, of a perfect assessment.

How long should an assessment take? Well, when you're learning how, it's going to take a lot longer than when you don't have so many doubts and questions in your mind, naturally. I wouldn't even criticize you for a moment if it took you 15 hours to assess somebody. I wouldn't criticize you. It wouldn't even occur to me to criticize you.

But if you took 25 hours to assess somebody and then got the improper assessment, and it was way off the gun and off the beam, and then you say, "Well, I want to get on with auditing him so..." I would not be critical; I would again write the postmaster, and I would say "Please deliver one..." [laughter]
There's your situation. Do you see the order of magnitude and how this thing sets up? Do you see how this is? Hm? Well please, if you don't learn anything else, learn that, because it's your foremost datum – the foremost datum which you have, and which I know now is absolutely true. This is one of those weird, big truths. It's only true as far as auditing is concerned; it's only true as far as clearing is concerned; but, within that framework, it is one gargantuan truth!

A perfect assessment is the only assessment that you can afford to do on the pc, regardless of time, effort, difficulty, money or anything else. It's the only one that you can afford to do. It is the only one he can afford. If you were charging five hundred pounds for an intensive, and it took you 3 intensives to assess the pc, and it cost him fifteen hundred pounds to get a perfect assessment, do you realize that would be cheap? Hm? But that – regardless of what you got for an intensive, if he charged you a hundred pounds for 25 hours and did the assessment in 3 hours and did a wrong one, he's a thief. That is a complete waste of money. An imperfect assessment would be a complete waste of money. That's all there is to it.

Any auditing done now on SOP Goals – not preparing a case, not getting a fellow over his mother-in-law trouble, or any of the old-type of auditing that we have done; we're now talking about clearing people directly and overtly – any effort put onto clearing somebody, from the level of first assessment, SOP Goals on, that does not result in a perfect assessment is wasted, and will continue to be wasted from there on out. The answer is assess perfectly, assess 100 percent.

Now, is there a way to assess? Is there an actual routine which is so precise that somebody could sit and look at you for 10 minutes and tell whether or not you were doing a correct assessment or not? Yes, such a system exists. It's not down on paper. There's a high probability that it can be stated on paper, that it actually could be followed stated on paper. But that gives you a high probability that it'll probably never be followed. [laughter] Because we're dealing with the basic stuff of which the reactive mind is composed. And that on this subject more than any other subject, you are going to find more confusion, more silly questions – well, don't get mad at them. You realize that you're trying to lay into somebody a datum which restimulates the whole confounded reactive bank, boom! Just like that. I mean, you know, it's – you're right there in the middle of it.

Now, he went down the track this way. I will tell you now how to do one. The pc went down the track. So he was out there one day walking down a road, and he saw a little boy playing with the goats, and the little boy appeared to be very happy. And he was very grumpy that day, or just for the hell of it, he zapped the little boy. And he went on for a few centuries, and one day he was out there playing on the hill with the goats, and the king's men came along and wiped out all the goats and beat him and threw him amongst the dead. And he came to himself and decided that the thing to do was to rule king's men. Or maybe he decided the thing to do was to be a very rich merchant so that you could buy all the goats and the soldiers could just slaughter the goats ad nauseam and you still wouldn't run out of goats.

But you've altered his beingness because he has had to solve a problem, and the basic solution to the problem was a new beingness which gave him a new game. And a game con-
sisted of beingness, doingness and havingness. Those are the components of the game. But he is now not being himself; he is being a solution to the problem of living.

And then one day (he became a merchant, let us say) pirates jumped upon all his cargoes as they were on the high seas and wiped him out, and pauperized him utterly and completely so that he went around whining, starving; children were sold into slavery, or anything else happened to him. And he decides then that he knows how to be a merchant: The way you should be a merchant is to be a naval captain.

Now, what an oddball situation this is! You have a fellow who wanted to be a merchant who actually is being a naval captain. Well, actually, most military lines, or naval lines, get into it in more or less this groove. And you'll find them then getting very close to commercial lines, but then they began to despise and have enormous contempt for commercial lines, and they won't have anything at all to do with commercial lines, don't you see?

So what do we see? We see a fellow who is now in a tertiary condition with regard to his game, which was playing with goats on a hill. There he is stomping up and down his quarterdeck saying "Flog 'em!" [laughter]

And then one day, he is overcome by storms, battles, winds, everything else after long periods of time with this beingness and this game, and he decides the thing to be is a weatherman so that you can foretell storms. Now what game is he in? Now you're in the fourth position.

Now, it just literally took thousands of years don't think this happens fast it took thousands of years for him to make these shifts.

What beingness is real to this pc? What does he now consider a game? What does he think he has to do to have a good, safe, secure game? Well, as the result of all these beingnesses, it's the game somebody will permit him to play. Therefore, when you clear him without clearing up his beingness-havingness-doingness games condition – "be-do-have," "games condition": these things are synonyms – all right, you clear him up but you don't clear up any of these problems of the games condition. No, he's going to maybe go Clear, and then he's going to realize he has no game because he knows what he has to do in order to have a game: he's got to be able to foretell weather. [laughter] And although you've got him very clear on the subject of foretelling weather, he actually kind of moved out of foretelling weather, and he knows you have to be pretty aberrated and worried to really be interested in foretelling weather, and he knows it's dangerous not to be able to foretell weather and not to foretell it. So he starts putting the thumbscrews on himself; which is to say, a naval captain gets overwhelmed by storms, see, so he brings up this engram and forces himself again to tell weather. And even though you got him up to Clear read, he will now be bored or upset. But he's really not bored, he's worried. He's got to get back there and foretell weather, and the thing to do to foretell weather is put the thumbscrews on himself of realizing what would happen to a naval captain. See? It's very simple. And he goes un-clear. He just dives overboard, just like that, boom.

And again, he comes in, he's reading stickily on the meter. Well, what has he done? To state it very simply because it can be stated mechanically, too, he knew that the only game
that you could play would be that game of foretelling weather, and he knows you have to be aberrated to do it.

So it's less dangerous, he thinks – the jerk! – to be aberrated than to fail to play the game of foretelling weather. That's what it amounts to. It's less dangerous to be aberrated, to have no friends, to get every kind of a of a domestic or business scene messed up anything that you could think of, see that is less dangerous than not to be in the game of foretelling weather. That's the way his thinkingness goes. So he goes un-clear.

So therefore, you could use just plain processes on and on and on and on, and you'd eventually get this fellow up so he's reading on a free needle. And then he stays Clear for a little while and then he walks out, and then he's all of a sudden *clank* reading something else. And you say, "This is the most mysterious thing I ever saw in my life."

And we explained it one time by saying you could postulate himself – now he could postulate, and he can postulate himself un-clear. And that was perfectly true and is exactly how he does it. But *why? Why* did he do it? Well, that's the games condition.

Unless you have cleared up his games conditions clear across the boards, he will continue to restore himself into an aberrated condition.

Now, here's the funny thing: He really can't foretell weather [laughter] that's always the hooker on this – because he's too aberrated to foretell weather. See, he's got to play the game, and so you have nearly every human being on Earth today is in this condition of he's got to be *something*, but he can't be it. There's something wrong with being what he's being, and so he can't be it and so he really dare not be it and yet he must be it. And this emerges whenever you're auditing somebody on SOP Goals.

Very shortly along the line someplace he will tell you, "Oooohhh," he will say, "If I go on with just a few more commands of this, the situation which I found myself in in life so far will become intolerable because now this goal I have is about to be cleared away, and I won't be able to do this anymore." And he comes to these fabulous conclusions which all the whole – (quote) ha! "science" of psychology came to in the States – psychoanalysis came to the conclusion; psychiatry, in general, came to the conclusion long ago – that artists only "art" because they're crazy, that people only do the things they do because they're crazy. Well, that is not at all true. That is not at all true.

People who are in a very good state of beingness, given the educational data, are not going to *not* do it anymore. They will actually be able to do it and have some fun, and do it well.

I'll give you an idea. I had – used to have grave qualms about docking ships. I can handle practically anything in the way of ships, but I started getting them around docks or around shallow ground ... It's quite visible what this is: A ship isn't supposed to touch anything; it is not supposed to run aground, you know? It's not supposed to ram things. It's not supposed to go into cliffs, you see? So most of the time you're skippering a ship, you're preventing it from running into things. In other words, you're preventing a ship from communicating. That's about all it amounts to, you see?
And I thought, "Well, this is a very necessary thing, obviously." And I was thinking about ships and monkeying around with yachts, and so forth, and I was thinking about ships. I got a little – a few cognitions on this thing. It became very obvious to me, and I started to laugh at myself, you see, because "Well, you have to be very worried about ships in order to run ships." And I'd actually stopped running ships because I was worried about them – because I liked ships, because I wanted to run ships. You get the idea? [laughter]

And this little thought came to me as I was sort of thinking this through and getting it straightened out – this little thought occurred to me: "Well now, if I became totally unworried about ships I would become totally incapable about them." Puh! What balderdash! The very fact you're worried about them will eventually cause you to ram docks with them. So therefore, you've got to withhold yourself from ships because you know you're going to damage them. So therefore, you've got to run ships because you can't run ships. See? So here's a whole zone of now-I'm-supposed-to's which wouldn't work out at all. Got the idea?

Well, I got this cleaned up and all of a sudden I realized that, oh, I don't know, I can dock ships and handle ships and do things with ships and run ships and navigate ships. And all of a sudden it looked very weird to me: "Why have I been worrying about ships?" And I'm getting one. [laughter] Of course, it's an old hooker, but it's all right, see? That doesn't matter either. So the bottom falls out of it, so you take to the lifeboats. [laughter]

Now, here's the essence of all these beingnesses and now-I'm-supposed-to's (which is doingness) in order to have something: They get into a can't-have, must-have, jammed-up situation, and a fellow has to abandon them because they've been invalidated too many times, and he's gotten invalidated in too many ways.

And there's this whole parade of these things: Here's a game, the fellow is fairly happy with the game, and something invalidated it. So he now goes into this new valence and plays this new game in order to keep the old game, which now he can't have. And now he's got this new game and he's got all the beingness, doingness and havingness of this new game, but something invalidates that. So he takes over on the winning valence of a new game, and he goes into this new game and the beingness, doingness and havingness of this new game and then – so forth. And he's becoming unhappy in life by this time, you see? But that invalidates the old game. Now something comes along and invalidates this new game and now he's – for some reason or other, he isn't himself anymore. You see, he's just departed from it. His communication with the world has become very poor.

Now, in assessment, you're backtracking that exact "put on the new valence with the new doingness and havingness," you see – "put on the new valence with the doingness and havingness." Only, people express these things as goals. That's what – they express them. And you've got to have a game that is real to the pc. And what falls or reacts on the meter is what is real to the pc. So that is the first game you audit. And there's only one of them that is attainable or reachable.

Now, that's the oddity. If there's anything peculiar about this, that's the oddity. How come there's only one? Because obviously there are thousands of these things lying behind him. Well, there's only one at a time – one at a time. And as these valences go up, the pc goes...
down. And here he is in the nowhere of the minus Tone Scale and the valence may be clear up to serenity.

And therefore, he operates in a totally psychotic way, while being totally serene. We know this case: The theetie-weetie case. Totally serene, totally batty.

What's this all about? Well, the valence is all the way up at Tone 40, and the pc is all the way down below minus 8. Now, as you audit, the valence that you're auditing out comes down and the pc starts taking over the control of that environment and that game, and he'll find out that he can play it, with this reservation: that he doesn't have to if he doesn't want to. But before that he had to play this game; he had no choice.

So you're restoring the power of choice of the pc over games. And as the pc gets out of these fixed games, he can now look around the environment and find out that he can not only play that game but that he can play other games. Now he's got more games. And if he's got more games, he'll stay Clear. And if he's got less games, that he really can play, he will go aberrated on you again. So the total stability of clearing works out to be "how much horizon you lift for the pc in these given zones of beingness, doingsness and havingsness." And if you lift them all so that he's no longer aberrated along these lines, you have a stable MEST Clear. And he'll stay that way.

The very act of finishing off clearing stabilizes the Clear, because it's just more SOP Goals. More SOP Goals and more SOP Goals and more SOP Goals and more SOP Goals. You see? More goals, more beingness, doingsnesses and havingsnesses that are plowed in. And they start running out faster and faster and faster and faster and faster.

And the plight of this poor girl in the 3rd South African who made the first Clear down there was terrible toward the end. The auditor was in this terrible state. And she became very, very worried and finally went and saw the Instructors. For two days she had found a goal – she had done a complete assessment on the case and had found a goal, and it was the right goal, and she'd found the right terminal, and she'd got it all set, and she'd ask the pc and it had disappeared off the meter. [laughter]

What was happening? They were blowing by inspection. And they'd gotten to a state of blowing by inspection and that was all there was to it.

What do you suppose starts happening to life about that time? What do you suppose starts happening when somebody comes in – your wife comes in or your husband comes in, or somebody says to you, "And the house has just burned down, and it's all bad, and the government's been overturned, and they're shooting all your business partners," and so forth? If that much bad luck would happen to you, which is doubtful. It wouldn't become an engram. You would probably do something effective about it and none of it would become an engram. And that would be an interesting thing to have happen, wouldn't it?

Supposing you got up even a little higher than a stable MEST Clear and an automobile ran into you. If it did – it'd almost have to be by your intention – but if it did run into you, what do you suppose would happen?

You know, it's obvious that the only thing that keeps an injury there is the engram you make of it. We've got a lot of interesting things here to find out. When you throw a body off
of the wall or drop it off of a cliff, what does it do, bounce? And then what do you do, pick it up and dust it off? Or will dust stick to it? [laughter] Can it retain an injury? Ah, but all injuries are retained by mental image pictures; this has been demonstrated time and time again in the last eleven years. Interesting.

But do you have to have a game to be injured? Well, if you don't have to have a game to be an injured invalid, the high probability is you can pick up your body, throw it against the wall, it bounces off – it just would have gone splat! in a pale pink mist, you see, previously – pick it up, dust it off and walk on down the street. Is this the kind of thing that happens?

Well, these things we don't know. But we're right there finding them out.

I was rather interested to get a letter from a Clear the other day (I didn't receive it, but it was written to somebody in the organization) and instead of saying how wonderful it all was (beyond the thing that she's getting along fine, which was a social statement), the whole thing was devoted to getting the show on the road in that particular area, and the various problems they were dealing with and how they were settling them, and how we could help out settling these various problems and straightening up the particular area. Darnedest letter you ever wanted to read, see? It's just all – "Well, we're being effective. We want to be effective. Now, here we go. And we're doing this and that, and you can do so-and-so and so-and-so." And there wasn't a single mention of her case beyond this social line, "How are you? I am fine," see? That was interesting too, wasn't it?

How would it feel to go around getting things done and never be worried about your case? How would that feel? Would that feel odd? Never worried about your own reaction, never worried about your consequences, never be even vaguely upset by your – whether you were going to get tired or confused or not.

Well, this is obviously from a person who if you'd said, "Are you tired?" she would have probably laughed at you.

"Who me? Tired? No, no, not tired."

"Well, you've been working for forty-eight hours. I thought you might be tired."

"Oh, have I? Oh yes. Yeah well, there's a lot of things to do. Now, I'll tell you…"

So a Clear, apparently, doesn't go up and sit on cloud nine. Having to play the game is what prevents one from playing the game, and evidently one can play the game as long as one doesn't have to play the game. So that's the status which is reached, which is a very interesting thing.

The perfect assessment is the first step in for a case. If you've done a perfect assessment, the case all of a sudden feels much better. If you've done an imperfect assessment, the case feels not so good. There's that indicator too. It starts in with a perfect assessment. That's the first foot on the pathway. And the first thing you run into as a possibility that the fellow is not going to make the grade is an imperfect assessment, and then that will haunt it all the way through. After that, you're in trouble from there on out.

So it's a good thing to know how to do an assessment. Be able to read an E-Meter; do an assessment; carry it on. I don't care how long it takes you to learn one. That is immaterial. I
couldn't care less. But what do you know? I can show you how to do a rather rapid assessment. You've been doing assessments which bid fair to be going on for fifteen or twenty hours. Well, you can do them faster than that and still have them that accurate.

But if I show you how to do such an assessment, I don't want you to get the idea that I am trying to speed you up in doing assessments, because I don't care how long it takes you to do an assessment. But I can show you how to make it a little easier on the pc and how to make it a little faster for you, and so forth. And there are exact ways to go about this in order to do this.

Now, I'll give you an example of that: In reading repeater technique, which you use on goals and terminals assessing but not on Prehav Scale assessing – you don't use repeater technique to find out the level of a Prehav Scale. I think I'd better put that on practically every tape we release and all the information. Bulletins – maybe I should carry it as a footnote on all bulletins, because it seems so natural after you've done repeater technique, you see, on goals, to do repeater technique on terminals, then – well, Prehav Scale? "Obviously, you should do repeater technique on the Prehav Scale. Everybody knows that!" That's just one of these additives.

Now, obviously, as you go down the Prehav Scale you'd hit all of these levels. If you repeated each level over and over and over and over and over, you'd really grind the fellow in, because you're auditing him on hot buttons. But that's not true of the goals and it's not true of the terminals.

So what's the best way to do a Terminals – I mean, a Goals Assessment? Well, it's to get all of the goals. That's the first one. And then when you're sure you've got all of the goals and you've been through the list one time, get all of the goals. And after you've been through the list a second time, well, you get all of the goals. What do you mean "all of the goals"? Well, you always ask him if there aren't some more goals. Every time you go through a list of anything in the way of goals or terminals, you always add at the end of the list, as the last kickup of the heels, "What additional goals do you have?" And you run it against the meter. And if the question produces the slightest change of characteristic on your E-Meter, you say "What goal is that?" until you get it. And you flatten the meter every time you read a goals list. And you flatten the meter for new terminals every time you read a terminals list.

You always add the new goals, because he's always got new goals, until you get the right one. And after that your meter is null on new goals, and it'll stay pretty null on it. But after you've run him for a while on – you've got the goals; you've got the terminal; you've got everything; and you then – now get the Prehav, and you audit him for a while – when you come back to do a new terminal, you'd better do a new Terminal Assessment and get the new terminals, because they – are now tremendous numbers of terminals which add themselves to this goal you're trying to flatten. And when you're finally finished up with terminals for that goal, that goal is going to be flat.

Now, for your new goal: add goals, find all of the goals. In other words, it is quantitative. Find all of the goals. Every opportunity you get, find more goals. On terminals: every opportunity you get, find more terminals. Quantity, quantity, quantity. I don't care if you have
a list of 1295 goals and 15,000 terminals. I just couldn't care less. You won't achieve that. You'll probably cool off at the absolute top of about 350. That's probably the extreme.

The most I've seen right now is about 280, or something like that. But I did hear of a case just this morning that had some vast number of goals. And it was all assessed out and finally was assessed out wrong, and the question "Do you have some more goals?" produced the goal of the pc. Coo!

So quantity hasn't a single thing to do with it – that is to say, how many you get. It's **quantitative.** It – you just go *on.* You get more. You see? It doesn't matter how many. It doesn't matter how long it takes and it doesn't matter how many you get. Just make sure that you get it all. And just make sure that when you do it, you do it so that you come out with a perfect result.

And what is a perfect result? One goal falls and one terminal falls; and you can't even *get* another goal, and you can't *get* another terminal, and that is *it.*

Actually, the assessment has to be as perfect as it mechanically works out to be. It's quite mysterious that it works out so wonderfully and so mechanically to be just that. It'll turn out to be "one goal that won't go flat unless you audit it." And, of course, if you've got this one goal and then you go over the list again and *it* disappears, you didn't have all the goals. That's all that means. And if you had your list of terminals, and you finally had one terminal, and there it was, and that's that one terminal, and you've really got it all done, and you say, "Well" – just as an afterthought – "Well, how do you feel about janitors?" and it goes null – what did that mean? It means you didn't have all the terminals, that's all. You've got to now make a new, additional terminals list and find the terminal. You have – all you – all you've got are null. Well, then you haven't got the right one, that's all.

Now, in addition to that, you have to find the terminal at both ends of the goal. Now, what do I mean by that? The terminal at both *ends* of the goal? The fellow has a goal "to shoot sparrows," and this turns out to be the idiotic goal that he comes up with. We don't care how sensible it is or how insensible. That's what he comes up with. His ambition and the thing to do is "to shoot sparrows." That is it. Well, it defies your reality that anybody wants to dedicate his entire existence to shooting sparrows, but as a matter of fact you probably are not aware of the fact that for centuries, for actually thousands of years, every time he marries a beautiful wife, or something of that sort, sparrows turn up in some peculiar way and ruin his marriage, and we never can figure out how this is, see? [laughter] Well, that's his aberration. Don't you try to make it reasonable; that's why he's crazy. [laughter] Got the idea?

All right. So that's the way it is. So you got this goal "to shoot sparrows." Now, when I say you get both ends of the goal, I mean you have to get a terminals list for the beginning and a terminals list for the end, because there's two understood terminals here. "I want to shoot sparrows." Well, the first question is "Who are you?" "*Who* would want to shoot sparrows?" You understand? You get the terminals list for the "*I.*" "*Who* would want to shoot sparrows?"

Now, it's better if you can get *that* than to get the sparrows, because this thing is the cause over the sparrows, don't you see? But you might not get that. It might not be at the "*I*"
end of this goal, it might be at the receiving end of the goal. The effect line here "to shoot sparrows" is of course sparrows.

All right, "What's a sparrow? Give me another word for sparrows."

"Well," he says, "They're birds. They're tweetie-weeties. They're our feathered friends." You got the idea? And you take that whole list of synonyms for the end. Now, but "Who would shoot sparrows?"

"Gamekeepers would shoot sparrows. And then there's cats." You get this picture of Puss-in-Boots, you know, with a shotgun. [laughter]

And you say, "Cats would shoot sparrows?"

"Yes, cats would shoot sparrows. Yes, yes, definitely."

"All right." Well, after all, this is – this is his terminals list, not yours. [laughter] So you put down "cats."

Well now, that's the way it goes. You get both ends of the terminal. See, both ends of the goal is converted into a terminal. In other words, there's really two terminal lists. But they all add up to just one terminal list. So you can ask two questions about a terminal. "Who does this?" and "What is it done to?" – cause-distance-effect. And you get the terminals at cause and all the terminals at effect, and you'll find out they're both present in any goal.

A fellow says, "I want to have oysters." That is the goal that finally came up: "I want to have oysters." You have to get all the synonyms in the "Hinglish" language, and if he was born a Hungarian, in the Hungarian language too, for "hoysters." And you have to find out who would have to have oysters. "Oh," he says, "Oystermen, fishmongers, uh – princes, uhm – fishermen, uh – people who tend oyster beds, uhm – little old ladies with green bonnets who sit on pedestals, and uh…" [laughter]

Now look, it doesn't have to make sense. If it made sense, he wouldn't be aberrated on the subject. That's something for you to remember in all goals listing.

All right. Now let's take another look at how to do a fast goals list. The reading of the list is very important. If in doubt, leave it in. That is a primary rule of Goals Assessment: If in doubt, leave it in. The only mistake you can make is eradicating a goal that is still alive.

Now, to save you time – to save you time – if it rock slams on your first three repetitions of the goal or the terminal, or if it rock slams on two of those repetitions, or if it rock slams on one of those first three repetitions, leave it in. If it rock slams, leave it in; because rock slams turn on and turn off and turn on and turn off, and there's no sense in you wasting time trying to get it on again. If it slammed on it, it slammed on it, and that is all there are to it. So it slammed on a rock slam. Well, rock slams are very often sporadic. Leave it in. Simple, huh?

Now, if you get anything like three falls, the same or increasing, while reading the thing the first three times – the goal or the terminal – if you get three falls, or if it looks like it's going to go on falling, or if it looks like it is going to increase its fall, leave it in and go on to the next read. Do not try to flatten it. Got it?
But if in the first three reads of the goal or on a terminals list – this does not apply to the Prehav Scale – I want to get that note in there often – assessing on the Prehav Scale is done at one announcement of the level only. You don't announce a level twice; you just announce it once and take what it said.

Now, if you read three times and it was off, it was on, and it was slighter – you'll develop an instinct for this, (it looks like it's going to fade, doesn't it?) – repeat it more than three times to get it to null. But if by the time you've repeated it five or six times, and it's now starting to develop a good healthy fall, get off of it. Don't punch them to death when they keep falling. Only knock out those which appear to be in a declining, fragile state. That clear? All right. So the maximum test that you make is three reads of the goals and the terminal with no Prehav. Three reads is your maximum. Three reads of the goals list; three reads on the terminals list, and you make your determination out of those three reads. If it looks like it's going to fade, rub it out. Keep on repeating it and get rid of it. And if it looks like it's going to stay there, get off of it, and you make your adjudication on your first three reads. Got it?

On the Prehav Scale, for heaven's sakes, just say it once and mark what it fell in terms of divisions. Don't repeat a Prehav level, because you're auditing the fellow if you do – you're not assessing, you're auditing.

This is an old, old law, by the way. You think we've changed. Man, have we swung back to the beginning. Do you know one of the first auditing processes that ever existed was repeater technique, you know that? And on the Prehav Scale, do you know, that this – way back when, that you could always say a phrase once or twice to find out if it was hot without getting the pc plowed in. But if you said it four, five, six, eight, ten times, he'd had it. You'd thrown him right into the middle of the bank.

Your pc will actually continue to as-is his goals list more rapidly if you follow the system which I have just given you. What are you really doing? You're going over the list more times, and going over the questions less times. It's better to go over the list more times and the questions less times. Why? By the time you get to the end of the list you will have scummed off one entire chain. That chain will be gone. Now when you go back over the list again, you're not reading these goals now against the force of that chain. That chain is gone. So these things that are going to flatten will now flatten with greater rapidity. And you keep doing it.

It doesn't matter how many times you go over the list, you follow this same rule: Make your adjudication in the first three reads. Are you going to rub it out or are you going to leave it there? There's no great liability to making a mistake. It's just you're going to fog up the pc, and he's going to be a little less comfortable, and you're going to slow down your doing your assessment.

We don't care if you slow down doing the assessment, and we don't care if the pc gets restimulated while doing the assessment. We're just asking you to be sure. But I'm just giving you a system which will work faster. And it's real slippy. There's hardly anything to this system.

You say, "I want to shoot sparrows." There is wording that goes with this, and I'm going to give you a complete wording of this and I'll turn it out in a bulletin. There's no particular reason to give you the wording now. What you have to do is tell the pc that you're going to
read a new goal (this is in essence what this is, whatever the wording turns out to be) and that you want to know how he feels about it, to – in order to put his attention on this goal. And you'll shift his attention faster by having a little, set patter there.

Now, I'll give you that patter in a Goals Assessment Model Session. So there's a Model Session for assessments which is slightly different – not enough to bother with because it's the same difference in Model Sessions as you'd get in running processes. You can change processes in Model Sessions, so you can change processes in doing assessments. You just put it in that slot. That's the way you do the assessment. That's actually how this works.

Now here's – here's the essence of this thing: You put his attention on it, and you say, "I'm going to go over this goal with you which is 'I want to shoot sparrows,'" see? (Eyes right on that meter, see, because that's one repetition of it.) "I want to shoot sparrows," and then you say, "How do you feel about that?" And you don't take that read. That read is null. There is no read because you haven't repeated the goal, you've asked him how he felt. But his attention is on this more strongly, so you'll get a variation in these first three reads, so you actually only have two more reads left.

You'll say, "I want to shoot sparrows. Thank you. I want to shoot sparrows. Thank you." Well, the first time you said it, it fell about three divisions on the needle, and the second time you said it it fell about four divisions on the needle, and the third time you said it it fell three divisions on the needle. Well, that's just it. You put a slant over there in the margin. You just leave it there, and you say, "Now, I want to go over this goal with you which is," and you read the next one, "I want to shoot my mother-in-law." That's one read. "How do you feel about that? 'I want to shoot my mother-in-law.' 'I want to shoot my mother-in-law!'" See? You can acknowledge it, and you better had. It's "I want to shoot my mother-in-law. Thank you. I want to shoot my mother-in-law. Thank you. I want to shoot my mother-in-law. Thank you." And notice those three reads.

And what happened this time? Well, when you said "I want to shoot my mother-in-law," there was a nice, hard fall. And then the second time you said it, there was a little theta bop. And the third time you said it, there was a tinier theta bop. So you say, "I want to shoot my mother-in-law. Thank you. I want to shoot my mother-in-law. Thank you. I want to shoot my mother-in-law. Thank you." It's null by this time; cross it out. That goal you don't go over on the whole list again. It's gone. Got the idea?

It's not just that it changed characteristic, it actually looked like it was going to flatten. It looked like it was going to change. It looked like it was going to shift off. It looked like it didn't amount to anything.

Now you get into this characteristic. You say, "I'm going to go over with – this goal with you: 'I want to shoot sparrows.' How do you feel about that?"

And he says, "It's really eagles."

And what do you do, scratch out "sparrows" and put in "eagles"? No, no, no. That's wrong. He's given you a brand-new goal. So you write that down underneath the goal he just gave you.

So you say, "All right. Okay. We're going to cover this sparrows goal first here. 'I want to shoot sparrows.' Thank you. 'I want to shoot sparrows.' Thank you."
This looks like it's getting tough. You know, it looks like it's strong; it's a heavy thing. So you say, "Well, we're going to leave that. And now, 'I want to shoot eagles.' " And it falls. And you say, "I want to shoot eagles." And it falls. And "I want to shoot eagles." And it falls. So you say, "'And I want to shoot eagles.' Thank you." And "'I want to shoot eagles.' Thank you." And "'I want to shoot eagles.' Thank you." All right, we'll take that one off! It's scrubbed. This is quite ordinary that you'll get a sudden alter-is in the middle of a goals run. Okay?

Now, reading the list over more times and spending a little less time grinding on it will actually speed up your assessment. That's in the interests of speeding up an assessment, but these interests are not very great.

Now, what happens if you get down to the end on the sixteenth read of the list, and there were only... See, when you go over it the next time, you only read those goals that have a slant in front of them which said they still read. You use the same principles in going over this. He had 120, they have now boiled down to 40, on maybe three reads. He's got 40 left. Go over these 40, and they all go null, null, null, null. "Oh, there's one. Okay, that one stayed." Null, null, stayed, stayed, stayed. Oh, they say, "That's fine. That's dandy." And you get down to the end of this thing, you ask him, "Do you have any more goals," see, "that you haven't mentioned before?"

Now he says, "No, no. No, no." And the needle is quite flat on this.

So you go over the remaining goals and there are now 12. And you go over these things, and you say, "Well..." – same formula – and, "Scrubbed, and that one scrubbed, and that one scrubbed, and that one scrubbed. That one stayed. Okay!" [laughter]

All right. And when you get over that list, you ask him if there are any more goals, and he says, "No," and the needle is nice and null. And so you go back over it again and you now find out there are three. And you go over it, and it's scrub, scrub, scrub. [laughter]

Now, this is the kind of a problem you'll get into. That'll happen less ordinarily than you will have one left. But when you get into that, the proper thing to do is say, "What other goals are you withholding that you haven't told me about?"

"Oh, that I haven't told you about? Oh, that's different." For some reason or other, this is all different now. Well, what you actually did was pull the goals chains off the line, and you've simply been taking the overburden off of his goals. And not until it was all gone did you find you had some new goals sitting there staring you in the face.

So you can add this rule to assessment: That when you've got the goal, and you know exactly what it is, and you've got it in a total box and that is it – you could set it up in bright lights, neon signs, put huge seamen's floodlights on it; you're absolutely certain now; you've got it absolutely set; you have done everything you have been told to do, that you've learned to do and that you've dreamed up, [laughter] and you know that's it – ask for some more goals, ask for some more terminals. And put them down and assess them – first goals list, then terminals – assess them against the one you had. Because I'll tell you this little rule: Any goal which is to put up a mock-up (because of the Prehav Scale) is liable to be a false one and is a
dangerous one to audit. And it is perishable because the result of failure is to create a mock-up one's own self. That is the result of failure.

So that you get into an arts goal, this is particularly true. And just as a broad category, this most succinctly and desperately, for some reason or other, applies to arts goals. You'll learn a lot of this bric-a-brac about how to judge these things, but this is a very important one because you should always be suspicious of an arts goal. The guy isn't even putting up a mass mock-up, don't you see? He's putting up a figure-figure sort of a think-think. He's going to write music. I wouldn't ever leave anybody with a goal of writing music. He's going to sing – I wouldn't leave a guy with a goal of singing. I would just start beating that goals list to pieces! This is what experience has taught me.

Why? Because there's always the thing you can do when all else fails, and that's usually the arts. Now, isn't that a hell of a thing? That's an awful commentary on the arts, but I don't intend it to be a commentary on the arts. The Renaissance in Italy takes place after it's beaten by France. Nobody can now make machinery or masses or really put up this or get a society on the road but they could paint pictures. Got the idea? So they're going to start to overwhelm with aesthetic masses. Actual masses didn't work so they're going to go into aesthetic masses. And those are closer to the thought band.

I don't say that a preclear will never in the history of SOP Goals turn out to have an arts goal, because that's not justified. I just say it's something to regard with grave suspicion – not in life, but on an assessment.

If you go just a little further, you'll find you've improved the case enough with an assessment that he gets into a better goal channel. That's what it amounts to. Got the idea? So that all arts goals – as one single, whole category – should, if encountered, demand additional assessment. Just beat it to pieces without invalidating the pc. Ask him for some more goals.

There's all kinds of ways to ask for goals. I won't go into those today, but "What did you want to do before you'd started to sing?"

"Oh. Well, that's not possible." Claaaang! And you'll find out they usually have an answer to it. What did they want to do before they went into the arts? What did they really want to do?

Now, this also applies to these figure-figure professions like law, philosophy, these other professions. Things that are in a thought band exclusively and only, such as arts, and that sort of thing – ah, it's a very featherweight goal, man. It's pretty featherweight. It denotes a hell of a failure just ahead of it. But that isn't any reason why it won't turn out to be that on some pcs. It won't – isn't any reason why it couldn't be the perfect assessment in the long run. But it is something that very easily blows while assessing, and you can find something more solid to run, and your assessment has actually accomplished some auditing. So it's something to just be suspicious of, not something to eradicate.

All right, now let's go into this just one more tiny step, and we will find out that a perfect Goals Assessment gets the right goal and the right terminal so that the case can be run. That's what it does. And there's only one set that unlocks the case. And if you run the wrong one, you will find out about it. So the thing to do is, if the case is not running right, to do an-
other assessment. There is no harm in doing this because if the right assessment was done the first time, oddly enough, no matter how violently you assess on the second time (if you do it in Model Session, picking up the ARC breaks, present time problems, and the other things which you're supposed to do), you're going to get the same goal on the second assessment. And if it was the wrong one, it probably is gone by this time.

What mistakes, then, can you make in modern processing? You can make the mistakes of attempting auditing without your TRs, E-Meter and Model Session in perfect condition. That leads and breeds many other mistakes.

Your next mistake is you can fail to achieve a perfect assessment. It doesn't mean that you have to do it perfectly with your little pinky in the air and just exactly this and that. It doesn't matter how adroitly you do this. The perfection totally consists of achieving the result of the right goal and the right terminal for that pc. Now, if you've got that, you've got it made.

That's what I mean by "perfect assessment" – not doing a perfect job of assessing, because you could probably achieve the right assessment by doing an imperfect job of assessing as long as you were bulldoggish enough to carry it through to its conclusion and to be absolutely sure. If you have any doubt in your own mind about the rightness of the assessment for any reason under the sun – except, of course, that you yourself would hate to be that terminal. [laughter] We've already found that. Person finally got it.

And when you're absolutely sure that this is the only thing that's going to shake out of that case, and that's the last thing that's going to shake out of that case, and that's the only thing that's going to shake out of that case, and the only thing that can disturb this now is auditing on the Prehav Scale – when you're absolutely sure – then start auditing. Until that time, continue to assess; no matter how boring or how upset the pc gets, or anything else, continue to assess. Keep the ARC breaks picked up; keep the present time problems picked up; get the withholds off the case; get it whizzing, and keep on assessing till you are sure. You and the meter know; the pc does not.

Now, the pc may speak during an assessment. [laughter] But that's practically the limit of how it enters into an auditor's judgment. Now, I've had a lot of experience with this, and amongst the experience is pcs becoming wildly enthusiastic about some goal, and wildly enthusiastic about some terminal. "Oh, a balloon jumper! Boy, that's the thing, you know?" They're right in the middle of the wheee, you see? "A person who jumps from a balloon and comes down in parachutes. Oh-ho boy, that's it. I know that's it. All my life... It explains everything. It's just it."

The next read it drops out. You say, "How do you feel about balloon jumpers?"

"What balloon jumpers?" [laughter] It's discouraging from that point of view.

Now, I want you to do assessing. I don't care whom you grab by the ear and start to assess. I don't care who gets assessed. I don't care how badly they get assessed or how well they get assessed in terms of technology – the waving of the pinky, how you hold the E-Meter, [laughter] the expression in your left eye, [laughter] to say nothing of the expression in your right eye. [laughter] We don't care anything about those things. What we care about is that perfect assessment at the other end. And carry it on down. If you do one of these, you'll find
out you'll give a case an enormous advance. If it's a perfect assessment, the case gets an enormous advance. They say "Coo!" you see, it's some terrific cognition, you know? "This is what I am doing! Well! Well! What do you know!"

Sometimes it's the first "What do you know!" you had off the case. Maybe he's been audited five hundred hours before and he never said, "What do you know!" He just said, "Yes. No." [laughter] And he gets up to a state where he really has – he really has some idea of where he's going and what he's doing. You don't have to tell him that's his goal. The E-Meter and he will find that out. Now, he isn't going to find it out until after you've found it out, because you're plowing right into the middle of this fellow's beingness. Crash.

So I want you to do, at the drop of a hat, an assessment. I don't care if you start assessments on people and never finish them on that particular person. We'll get him someday. You haven't loused him up. You haven't loused him up. We can now do a complete assessment. You can take an assessment that another auditor has done, just scrap it and do another assessment of your own: If his assessment's right, you'll get the same answer if your assessment's right. It doesn't matter how many times you assess.

Now, the only time an assessment goes wrong was when it was absolutely right and it was audited for a few hours and that was the end of that terminal, and now you can't assess for the same terminal. You may get some other terminal for the same goal, but it already is showing up on the case. The case is advancing if this occurs. The case feels much better; the case looks much different.

SOP Goals running is very rapid, and you can tell the difference in the people, and you can tell the advances. Okay?

All right. Now, if over this weekend you have a person sitting, innocently, [laughter] and there's an E-Meter anywhere to be found, you might ask him this searching question, rather speculatively, "What do you suppose your main goal in life might be? [laughter] Oh, you don't know. Well, let's find out, shall we?" That's enough excuse for doing a Goals Assessment.

And you'll find out that where people before maybe didn't volunteer at once to be guinea pigs, or something, for auditing – you might have had some resistance – you almost never have resistance on that question about goals. Okay?

*Audience: Yes. Hmm.*

I think Khruschev himself could be put into session with this one. [laughter]

Okay?

*Audience: Yeah.*

Thank you.
E-METER

A lecture given on
19 May 1961

Thank you.

Well now, we've gotten ourselves a few cases moving along, and every time I see you, why, you're less plowed in. This is "Operation Reverse the Furrowing."

Okay, let's see, what is this? This is the 19th of May 1961. This is Saint Hill Special Briefing Course.

Now, once upon a time there was a knucklehead – once upon a time. And he kept doing things to people – kept doing things to people. And then a few trillion years later, he said they'd all been done to him. I'll give you an example of this – in a moment. But right now I want to talk to you something about E-Meters and assessments. This is very, very important. Then I'll tell you more about this knucklehead.

The E-Meter is a very peculiar instrument. It is absolutely accurate. But when somebody is so knuckleheaded as not to ask the right questions, of course, it apparently gives wrong answers. An E-Meter is as accurate as the auditor asks the right questions. It itself is totally accurate. But you have to find out what it is talking about. And it is not necessarily talking about what you are talking about as the auditor. But it is talking about something, and the probability is that it is very close to what you're talking about, when it's talking sporadically, but not quite it.

And when you ask the right question, the E-Meter then reads, hard and consistently. But the near-right question reads inconsistently. So when you get inconsistent reads, your question is not quite right. That is a general rule – not quite right. But when you ask the right question, the E-Meter will then tell you it's the right question by reading consistently.

You can ask for a withhold – something on this order: You can say, "Well, are you withholding anything about your house?" And the E-Meter will go flick.

And now this fellow, who comes down the track all these trillennia – having burned houses, massacred the inhabitants of houses, having chewed up the landscape of houses in general, in many wars, in many lives – knows very well that it's a house. And he becomes completely fixated on the idea that he must ask the question about the house, the house, the house. And the E-Meter goes flick-flew, flick-flew, no read, read, no read.

"All right, what about this house are you withholding?" And the E-Meter goes flick, and then no flick, and then it theta bops, and then it goes no answer at all, and then it goes totally null. And this fellow who knows very well that it is about a house – he says, "Is it a
big house or a little house?" And the E-Meter goes flick, and it goes flew and it goes null, and it goes this and that. Just nothing seems to happen, that's all. Nothing seems to happen.

And then the D of P or somebody (whose specialty was burning down barns!) [laughter] gets the pc in and says, "Well, now you seem to have a withhold here, and we don't seem to find out what it is. Is it about barns?" And there's a flick and a flew, and a null. And the D of P says, "You see now, you knuckleheaded auditor? You -- you -- you -- you missed it. It's about barns." [laughter] And there it goes. But the thing doesn't clear.

And the pc says, "No, I've never done anything to barns."

"Oh, it's -- must be barns, must be barns. It's just -- come on, confess. What is it? Barns. Barns. It must be barns. Has to be barns. Everybody knows what you do with barns: You burn them down when they're full of stock! Always produces a hell of an ARC break in the vicinity when you do that sort of thing. Leave the house alone but burn the stock up. Ugh-hu! That's best."

And nothing is going to happen either way because they haven't learned this rule: The E-Meter reacts and clears on the exact right question. That's what it reacts and clears on. But it will give you an indicator. It is nice enough to tell you "you're getting warm." But when you don't get a consistent read on an E-Meter, you are just warm; you're not red hot. When you're right on it, it will read consistently and it will clear at once that the pc comes up with what it is. That is, on a Security Check.

And if it is the chain on which the pc is totally plowed in on from one end of the track to the other, it will just go on reading and reading and reading until it's audited. The rule is, you have to audit the things that don't clear on a question. That is the rule -- a general rule -- where it comes to auditing, or where it comes to clearing rudiments.

You say to the pc, "Something or other, something or other," and you get a fall on the rudiments. And you say, "Well, do you have a withhold? Is this what that's falling on? You withholding anything?"

And the pc says, "No." The E-Meter goes clink-clank. It'll go falling on just about what it's falling on -- on just exactly what it's falling on.

And you start probing for this thing and all of a sudden you say, "Well, is it something about me?" Your fall becomes steadier and more consistent.

And then the pc says, "Well, yes, last night I told somebody you were a bad auditor." The fall disappears.

But the knucklehead then audits it. Having cleared the meter, he now goes into "What have you done? What have you withheld?" You got the meter clear on rudiments; why are you trying to do anything else?

The rule about rudiments is simply this: Rudiments are there not to run the case, but they are there solely and only to set up the pc so that he can be audited and will stay in-session -- definition of which is "willing to talk to the auditor and interested in own case." And that is what you're trying to get him to do, and if the rudiments are too flagrantly out, it won't happen.
But setting the meter on a third-of-a-dial drop and going over the rudiments – if you do not get a wild or significant fall, you just leave them alone. You know, with a third-of-a-dial drop you can't see some of the meter reactions, so you just blind yourself to that much meter reaction. That is, that meter reaction which you cannot see at a third-of-a-dial drop will not get the pc out of session. Have you got that? It will not take the pc out of session.

So advancing the sensitivity knob to a point where you get a sixteen-dial drop on a can squeeze, and then clearing the rudiments of every flick on that enormously expanded scale: You're just wasting auditing, because clearing them all up, you're running the case with rudiments.

But if you clear rudiments on a third-of-a-dial drop – and mind you, do that carefully. When you set the meter with a third-of-a-dial drop, why, you don't see any fall, any theta bop or anything. Mind you, there'll be falls and theta bops – are there but they're obscured by the fact that you're reading from the still needle. You follow me?

You told the guy to squeeze the cans. Cans squeezed – you got a third-of-a-dial drop. You just leave the sensitivity knob right there. Ask for the rudiments; it doesn't move. Now, a little flick while you got it set at a third-of-a-dial drop, you'd investigate. If it did move it, you would investigate it. But usually a little flick like this just blows up.

I mean, "Do you have a present time problem?"

"Yes, I have a present time problem. I'm worried about going out and putting in a pound note into the parking meter." (Or whatever the police are demanding these days.)

"Well, do you have to do that now?"

"Well, no. I don't have to do it for half an hour."

"Well, would it be all right if at a half an hour, I remember it and send you down there?"

"Yes, that'll be fine." Drop disappears.

"Do you have a withhold?"

"Yeah – no, no, no, no-o-o-o, no, no." You get a fall, get a flick, get a theta bop. Ah, you better find out what it is. But that's on the sensitivity knob set at a third-of-a-dial drop.

Now, if your sensitivity knob was set at 16 and you got the equivalent of – you know, this can squeeze drives the needle across and it bounces off the pin, you know? Well, that's actually probably set for about five or ten dials of drop on one can squeeze, see? Now you ask him "Do you have a withhold?" – why, hell, you can even read his heart beating! See?

It'll register this closely: "Are you withholding anything?" And 42 trillion years ago he shot down a pilot in flames and was very careful not to let his own body drop or get burned up. So he was withholding his own body, you see? So, "Are you withholding anything?" Yes, you'd get a reaction on the needle.

But, look, that reaction is his case, and it is not adequate to stop a pc from going into session. You got it? The purpose of the rudiments – 100 percent, the purpose of the rudiments...
are only these: to set up the case so that it can be audited. The purpose of the rudiment is not this: to run the case. That's not the purpose of the rudiment.

There are numberless things I could tell you about rudiments. But ordinarily, in ordinary auditing, it totally suffices to make sure you get all of the falling or observable ARC breaks, problems, withholds off – and objections to the room. You see, that's totally adequate. They fall, get them off – with the sensitivity now set for a third of a dial.

Oh well, how about the E-Meter that can't be retreated on its sensitivity? I'm afraid you've got a rebuild coming. There isn't anything you can do to the meter apparently (I was experimenting with it last night) but put a new sensitivity rheostat in it. That can be done rather cheaply. HCO will do it for you.

But after a person gets about halfway Clear, a can squeeze on old meters at zero – old British meters is what it mainly is – when the sensitivity knob is set way down, all – as low as it can be set, you get a dial drop. And you're running somebody like that? Now what are you going to do? Now what are you going to do? This rule no longer is observable. Well, what you're going to do is get a new rheostat put in the E-Meter that can be turned down to a third-of-a-dial drop, okay? Simple, huh?

And meanwhile, before you do that, if it falls on a rudiment, sigh and clean it up. Because you're not going to be sure whether it needs cleaning up or not. So you have to use judgment as to whether or not it needs much cleaning up.

In the first place, people who fall well on a can squeeze – they aren't bothered as much as some other people by ARC breaks, unless they're being audited by some auditor on whom they have a lot of charge. Then they'll ARC break.

But the usual cotton-picking ARC breaks that don't amount to anything – ah, they don't really, terribly disturb them. The better off a case gets the less it's disturbed by the environment. Definition of a Clear is he can handle the environment and isn't disturbed by it. So of course, as you start progressing toward Clear, the can squeeze gives you a greater and greater fall for the test. And the nearer a person gets to Clear, why, the more drop you will see on a can squeeze with the sensitivity knob set as it used to be.

Originally, the fellow comes in and you turn the sensitivity knob up to 16, you put the cans in his hands and he gives a can squeeze, and it falls a thirty-second of a dial. Well, this fellow is going to endure; he's obviously built out of solid oak.

The same setting, if you care to observe a meter, running SOP Goals – supposing you did a long and thorough assessment. You wouldn't do a thorough assessment on this guy. You wouldn't do an assessment at all. You would do a Joburg Security Check and then you would give him a general run on the Prehav Scale, and you'd clear up some levels on the Prehav Scale – just in general, you see? And then when you got it so it was looking much better, and the tone arm was reading much better, and you knew you weren't reading a dead thetan, and you did get a little bit of a drop on the can squeeze, and so forth; you could go ahead and assess him.
So you go ahead and you complete your assessment, and you'll notice suddenly that it's sitting at a fairly low sensitivity setting and the third-of-a-dial drop occurs very easily. The case is much looser. The needle is much looser. You follow this?

*Female voice:* Yes.

All right.

That's the way you handle rudiments and handle an E-Meter. But Mr. E-Meter will tell you that you are close, if it's answering sporadically. But if you're answering dead on you'll have this interesting experience: You are running a Joburg Security Check, and you ask the level – you ask the precise level – "Have you ever raped anyone?" And the needle falls in response to that question – that Joburg Security question falls – something on the order of about quarter of a dial, and the pc says, "No," and it falls a quarter of a dial. And you say to him, "Well, have you ever really raped anyone?" and it falls a quarter of a dial.

Now listen, you can go down the list of all the things he might possibly have raped, or done sexually that might be considered rape or anything of the sort, and if it's not exactly on, the exact same fall will continue.

On a withhold you've got a reversal of the rule. The E-Meter falls in response to the question. In this case, it continues to fall if the question isn't asked.

So there are two phenomena in which you're involved here: One is you have to ask the right question to get the fall – the exact, right question to produce the consistent fall – and the other one is to get rid of the fall, you understand. And that requires communication from the pc. And in failure to communicate, it won't go away.

Don't think your meter is busted because you were asking this question and hours later he just never seemed to get through a Joburg Security Check. He will always get the same fall. Always, always, always, forever, practically till the end of the world, would he get the same question, "Have you ever raped anyone?" You can ask him, "Is it this lifetime?" and you get the fall. "Did you rape somebody in this lifetime?" You get the fall. "Did you rape somebody in your family?" You get the fall. You understand? He has raped somebody. That is it. You have asked the right question.

Now, having asked the right question, you see, is one part of this comment. The only way you'll get rid of the fall is for the thing to be answered.

So first, there's the right question that produces the fall, and the second phase of it is the answer that eradicates the fall. And it must be – surprise, surprise – the exact answer.

The precision instrument called the E-Meter depends, then, upon the exact question to get the response and the exact answer to clear it. Now do you follow me?

Now, the individual who continues to fall on a certain terminal is so involved in electrical masses – exchanges, energies, and so forth – in the mind, that that terminal has to be audited. Only then do you get rid of it. So it is not, in that case, just the one right answer; it's enough thousand right answers to clear it.

Therefore, when the preclear does not give you the exact answer to the auditing command every time, you will continue to get it to read and auditing will continue to infinity.
You must get an answer for every auditing question, and it must be the answer to the question you asked. Otherwise, it continues to read on the meter. Well, you're not fighting the meter. The meter only indicates what's still banging in the fellow's mind.

In other words, a preclear could be audited for ten thousand hours without ever answering the auditor's question, and still be reading the same way on an E-Meter. How do you like that? You got that?

So that a case that hangs fire, falls into just these categories: A present time problem is there consistently and forever. This is what you call a hidden standard sort of a thing. The guy's got a long duration present time problem, and he knows when he will get better: It's when his hair stops standing up when he sees a horse. And he waits for this endlessly to start happening. He tests out his auditing results. He has an intensive, and he goes and he finds a horse. And he very carefully puts his hand back here, and he looks at the horse. [laughter] And if his hair doesn't stand up, he says, "I got some progress," and if his hair does stand up, he says, "Well, that auditor's a bum." [laughter]

You think I'm joking, but that is true of every case that walks the street that is having a rough time – it's by a hidden standard. So part of your Goals Assessment must always get out these hidden standards into view.

Hidden standard is our technical term. The pc will call them "problems of long duration" if they're fairly sane, but they also respond to things of "difficulties in life." A word I commend to you as very useful – "Are you having any difficulties in life?" "Now, what difficulty would have to change for you to know that the auditing was working?" Or more broadly, "What difficulty would you no longer have if Scientology worked on you?" "What difficulty would have to happen in order for you to know that auditing was working?" You got that? This is the hidden standard.

I'll show you what happens when you don't address the hidden standard. The individual very nicely goes through a whole auditing session, gets along just dandy through the auditing session, gets along splendidly, seems to be making progress; and at the end of session said, "I didn't make any part of my goals."

Well, maybe the goal that he gave you at the beginning of session was just to sit there throughout the session. And you look at this in utter amazement. He did sit there throughout the session. He must have made his goal for the session, but he tells you he didn't make any part of his goals. Well, you're an utter knucklehead if you don't consult your E-Meter and say, "Do you have any particular gains that you will have to make or establish in order to know that auditing is working? And if so, what would they be?"

"Oh!", the fellow would say, "Oh, well, yeah, if you ask me that. Yes, as a matter of fact. Yes, yes I do have. You see, every time I look at a horse my hair stands up on end, and I feel right now, actually, that if I did look at a horse, my hair would still be standing up on end when I looked at the horse."

He's got every single auditing command you have given him circuited this way. He audits "women" so that he will correct his relationship with horses. He puts a via on every command answer.
One man we found had actually— for something on the order of five or six hundred hours, at least, of auditing he addressed every auditing command through this electronic engram, in the firm and utter and complete belief that it would change him from being a man to a woman. And what was the answer to this question: "What would have to happen in order for auditing to work?" This fellow's answer was "I would have to become a woman."

Now, that's what you're going up against when you ask the pc, "Are you making any progress?" And don't let me catch any of you going out of here and auditing anybody after this, up against a bunch of hidden standards that are utterly unknown to you. Just don't let that happen because that is silly! It means that the pc violates this E-Meter thing. He is not giving an answer to the auditing command. He is taking the auditing command, fitting it to something else and then answering his impressions.

Of course, your needle doesn't clear. Not only does your needle— doesn't clear, your tone arm doesn't move. The case does not progress. The dead thetan reading at 2 never reads any place else than 2. Your E-Meter characteristics don't change. Your needle does not get looser. Your sensitivity knob does not have to be set lower.

If your E-Meter isn't shifting during the course of auditing, the first thing to suspect is that you yourself have got the wrong curve on this. See? There's something wrong; you've goofed somehow. You did a Prehav Assessment, said "Well, the fellow is obviously resisting everything so the obvious level is 'resist,' " and you just went on by— knew it was barns—and you went right on by and ran "resist" and the tone arm didn't change, and nothing changed and— wrong level. Bum assessment. You get the idea? Bum assessment will give you that. You aren't asking the right questions. Or the individual has one of these hidden standards of long duration, and so forth, and he addresses everything around to it.

A pc will not improve if he has a present time problem of long or short duration which is absorbing all of his attention. He will not improve in auditing. So you might as well take care of it and get it out of the way right now. He will not improve if he has withholds. Poetically, God 'elp him, he will not, not, not, not, not, not, exclamation point, improve if he has overts on his auditor he is not disclosing, if he has overts on Scientology he's not disclosing, if he has overts on the principals of Scientology.

For some reason— not because we dreamed it up, because it happens to be true. I scouted this out the first time, many, many years ago, about 1954. Most of the returns were in for the people who had attacked Dianetics. There were about twenty-one of them in the United States who had— well, a lot of them had actually taken money to do us in and were still with us. With the exception of seventeen who were either in jail or dead. And as they made up a primary death list for that particular time, and a primary difficulty list, I looked for some common denominator amongst them to find out what this was all about. And it was only one common denominator: Some of them had literally had, in the period of four years, hundreds and hundreds of hours of auditing. In the case of Joe Winter, over a thousand hours I'm sure— maybe even two thousand hours of auditing. And the common denominator of all those people is they'd never made a single case gain in all their auditing.

That was the first time this one showed up. It's a grim and ghastly thing. It's a built-in, automatic protective mechanism in Dianetics and Scientology. The fellow who accepts money
or goes out of his way to injure auditors, organizations, the subject, principals in it, has just
plain condemned himself to eternity. That's all. He's just condemned himself to an eternity of
there he is, going on down. Honest, sometimes it makes me gasp because I've gotten so much
data on this by this time, at the actual adventurousness of how some of these characters will
swap a couple of quick sixpences for the next two hundred trillion. Doesn't look to me like a
good bargain. [laughter]

Now, oddly enough – strangely enough, a primary fault I have is honesty. I will tell
you what I know, or what I think I know, when I know it. And if I find out it isn't true, I will
tell you it isn't true. And if it happens to be discreditable along the line, I'm afraid I will tell
you.

Along with that goes the necessity – I would say better "has gone the necessity" – to
keep enough hope going to get the job rounded up. That has been part of the responsibility.
To have not done so would have been an overt act.

Now, I frankly tell you, I would not tell you that there was a self-protective mecha-
nism in Dianetics and Scientology out of an anxiety to protect Scientologists, organizations
and the principles of Scientology and the people at the top of it. I just wouldn't tell you that,
that's all. In the first place, I don't believe I'm so weak that I would need such a mechanism to
protect it or to protect you, you see? And for this other thing to be built up as an inside, built-
up, completely arranged, booby-trapped mechanism is always filling me with a little surprise.
I think if you listen to a lot of tapes, you'll hear me being surprised about this in other lec-
tures. It's the darnedest thing I ever saw. It's just horrible. It's utterly horrible.

Gracey Zilch goes out and does in an auditor – busts up his marriage and spoils his re-
pute – and for the next thousand hours of audit ing, Gracey Zilch is right where she is or
worse. And nobody seems to be able to do a single thing for Gracey Zilch. Isn't that remark-
able? It is just fantastic.

Now, religious organizations have tried desperately to protect themselves with things
like blasphemy, and protect themselves with other you-must-nots and thou-shalt-nots. You
know, everybody talks about the Ten Commandments. Have you ever counted them? In an
actual, original Old Testament there aren't ten commandments – columns of them: Thou shalt
not eat pork that has been uncleanly raised, or something of the sort. Thou shalt sell it to a
traveler instead. [laughter]

What it amounts to is you can't look for help from a quarter on which you have tre-
medous overts. Even though the help were given you, no matter how gratuitously, it would-
't be accepted by you because it's always looked on as a betrayal. Why is it looked on as a
betrayal? Because one has betrayed that help. So of course, when one is audited under these
conditions, he has this remarkable frame of mind: that everything anybody is saying or doing
to him is calculated to betray and destroy him. So the more he is treated the worse he gets.
Now, that happens to be our little, built-in self-protective mechanism.

Now, because we are the only science of mind that has ever come up the line and sat
back on its haunches and proved itself across the board, we can also undo that. If we want to
take enough trouble we can also save Gracey Zilch.
One auditor sits on her head and the other straps the cans to her feet and a third, as she's being held down, locates what she has been doing on an E-Meter, you see – something like a Joburg or something like this, you see – and actually gets the thing taped out and then finally says, "Well, Gracey, we've got the goods on you. And now why don't you go off someplace and realize that if you don't do something decent about this, you're sunk." And I don't care it might take two hours, two years or two lifetimes; sooner or later she's going to come in and tell all. Fascinating, huh?

We can undo it. So, in a little, tiny, microscopic way, not accepting a half a million dollars from the Communist Party of America to do in a Central Organization; that of course killed a man. I bet you right now he's tagging around in a schoolroom someplace or another, wondering what is wrong with him and why he feels so spiny. Fellow by the name of Don Purcell. He died. He did this, and for three years he just went on a toboggan and died. One of the reasons was is nobody was interested enough to even try to do anything for him. And the other thing was he had made it impossible to arrive at that data earlier by causing such a tremendous disturbance that he slowed up research.

I felt like telling him once or twice, "Look, maybe someday your wife is going to get sick or your kids are going to get sick or something is going to go really wrong in your existence and you're going to need us like mad, you see? And here you are, doing nothing but getting us so upset and disturbed that we actually can't do very much in the way of research, and you're slowing us down. Maybe someday we will know something that you really need to know desperately."

And sure enough, it happened to work out. Of course, there is this – there is this: I would say that it wasn't totally, probably, the overt-withhold mechanism, I think Suzie's postulates had something to do with it. [laughter] Because if she ever wanted to see a man dead, it was that man.

Anyway, let's get over to – let's get over to some more about this E-Meter now. Do you see that if this on a much more dramatic basis can exist, your failure to find out your auditor has – pardon me, your pc has been nattering about his auditor between sessions – your failure to find this out while running rudiments – is to throw away a session. Do you see that? Because just as it isn't very terribly important, so it isn't very hard to pick up, but it is important enough to knock a whole session out or maybe a whole intensive out.

So when they've got withholds in life in general which separates them from the human race and all livingness, or in particular when they have withholds on the auditor, auditors, Central Organizations, people in the Central Organizations, you see, there goes the case, there goes the intensive, there goes the session. You want to do something for this guy; this guy will give you a failure. Why? Not because of anything that you did to him particularly, but because he just goes around nattering about it.

When people are not Clear, if they know this perfectly, they actually go around sort of holding themselves in a frozen "don't think anything bad," "don't think any bad thoughts," you know? [laughter] And then when they get a little bit better they relax, and they think real vicious thoughts. [laughter] And then they give them up as withholds; that's a sort of a revenge in itself. And then later on, if they happen to have done something that they found out the
auditor – you know, and realized suddenly that the auditor wouldn't like it or something like
this, why, you ask him for it and they give it to you.

So overts are more difficult to clean up – that is, withholds; overts which are with-
hold – are more difficult to clean up the worse off a case is. It's proportional. They go down
into not realizing what an overt is and they will go out and do some of the wildest things. The
psycho band will go out and do some of the most incredible things and not consider them
overts at all. They won't fall on a meter.

So here's a modification on your third-of-a-dial drop. You set it for a third-of-a-dial
drop and run the rudiments but your third-of-a-dial drop only goes for those rudiments and the
assessment, which don't consist of getting off withholds. So when you get that withhold, reach
over here, crank up your sensitivity, ask for the withhold and strip it good, you see?

But if it is too active on withholds and it's going bang, bang, bang, bang and you don't
clear it right away by asking what it is: Joburg Security Check. You don't run anything further
than the rudiments and that. In other words, run the rudiments and then enter into Joburg Se-
curity Check.

By the way, a Joburg Security Check is done in Model Session form. It's not done out-
side of Model Session form; nothing is these days. There isn't anything done outside of Model
Session these days – nothing. So your rule about the sensitivity knob is that the only excep-
tion to a third-of-a-dial drop – and I tell you this very advisedly – the only exception in run-
ning SOP Goals and its preparatory steps to the third-of-a-dial-drop setting is when you are
after withholds. And of course, that includes at once the Joburg Security Check and it in-
cludes the withholds in the rudiments. You got it? Hm? That makes it very easy, doesn't it?
Magnify your read when you're after withholds and it's going bang, bang, bang, bang and you don't
clear it right away by asking what it is: Joburg Security Check. You don't run anything further
than the rudiments and that. In other words, run the rudiments and then enter into Joburg Se-
curity Check.

Now, in assessing for goals, Assessment by Elimination, you of course, then, set the
meter for a third-of-a-dial drop. Why is this? If it is set for more than a third-of-a-dial drop
you are auditing the case, not assessing him. You see that? It'd be erasing goals by repeater technique. You see that? It's not a very good process. Isn't necessarily harmless. As a matter of fact it'll benefit a case, but
it's very lengthy and it can go on for a very long time.
Now, what you're trying to do in Assessment by Elimination is get them so they don't read with the meter set for a third-of-a-dial fall. Once more, if your meter can't be retarded far enough on the sensitivity knob, why, you'll just have to get your meter fixed so it will. Because an Assessment by Elimination is not a process by which you seek to reduce the goal to no electronic reaction in the mind. It is only this: It seeks to null the goal so that it only does not act on an E-Meter which is set for a third-of-a-dial drop. You got it? And it permits you then to get the goal which will fall and fall and continue to fall and go on and fall, that has to be addressed by auditing. The only thing you're trying to do is that.

Now, we have proved out this fact: That if you erase all of a person's goals, the person still has a goal which falls – still one goal that falls – if it's erased! You see, that's a valuable datum. Let's not lose it. If you erased by repeater technique every goal the person came up with the person would still have one goal. That's interesting, isn't it?

All right, you don't have to erase them all to have just one goal. You have to null them on a meter set with a third-of-a-dial drop and if you do you will still have the goal – the one goal. You understand? See, it's different. It isn't actually erasing them. It is actually erasing them as far as the meter is concerned. You see, you just take the edge off so they don't fall. Well, that's it. And it gives you a fast assessment – rapid assessment. This is mainly in the interest of speed. That's all it's in the interest of.

I imagine if this were 1325 when people had a great deal more time, or something like this, or on some planets like Jupiter, we'd probably be trying to find out how could assessment take more time? [laughter]

If the psycho-analysts were doing this, of course, at sixty pounds the hour, or something like that, they'd try to figure out how to stretch the assessment.

Well, the way you stretch the assessment is very simple. All you have to do is turn up your sensitivity knob to about 16, and every time the person comes up with a goal or every time you ask for any more goals, you of course get a read, see? You go over the goal, and with the thing set up very high, why, you say, "All right, you wanted a set of paper dolls," and the thing falls quite well.

But if you turn the sensitivity knob down for a third-of-a-dial drop, you're reading from a still needle. And the impact in the mind on the subject of acquiring paper dolls is inadequate to move that from a still needle. So for your assessment purposes it is null. You got it?

So you can go over – in that wise, you can go over literally dozens and dozens and dozens and dozens of goals. Now, part of the – I mean, in one session. You get lots of them. And you get down to the end, and because your sensitivity set is low, you say, "Do you have any more goals?" Well obviously, for God's sakes, if the person has any more goals, realize that it's a limited question. It's limited in its application. It's not a true question. "Do you have any more goals." Well now, look! This person has been around for the trillennia. Every life they had several hundred goals. Well, all right. What are you going to do? Multiply five hundred times two hundred trillion and what is that? That's your goals list. All you're after is a no-fall at the end of the list with the sensitivity knob set for a third-of-a-dial drop. That's the only thing you're after.
You can go over the various kinds of goals. You say, "Got any childhood goals? Are there any more childhood goals? Are there any more withheld goals? Secret goals? Are there any more antisocial goals? Have you thought of anything that would have to happen for you to know that Scientology worked? Are there any difficulties you haven't mentioned to me?" And look, by the time you got all of those that I just gave you, practically in order, listed, and you get down to the end of the list and you ask all those categories again and you get no fall to your naked eye – you see no twitch.

And don't tell me that if the needle rises you go on because that's getting to be a very sore point. Keeps coming in over the lines and so forth, "The needle was rising so I had to continue to run the rudiments." And somebody just today spotted that. It's because it's in the TRs. The E-Meter TR has in it "rise" as a reaction. "How many reactions there are to a needle?" and rise is one of them. And then you say, "If you run the rudiments and you get a needle reaction, you must flatten the rudiments," and the auditor applies these two things just bing, bing. When we say a reaction for the rudiments or a reaction for an assessment, we mean a rock slam, a theta bop or a fall. In order of importance it is a rock slam, a fall or a theta bop. A theta bop is the least important, a fall is the most ordinary and if you're getting rock slams, watch out because the whole bank is grouped.

Remember the old Dianetic grouper? Well, the old Dianetic grouper, if we'd had people on E-Meters in those days, would always have registered as rock slam. It's just a grouper in time and a grouper in place and a grouper in mass and a grouper in this and that, and so you get a rock slam.

In passing, just while I'm thinking about it, I better tell you something about running a rock slam.

If you're assessing and getting rock slams on the Prehav Scale for a terminal – let's say the goal rock slammed ... You know what a rock slam is, now: it's an irregular, wobbly, large or small shiver and shake across the thing. A theta bop is a very regular one, of any width. But a rock slam is a shiver and shake and it dances around and it's very jerky and it's quite unmistakable. Once you've seen a rock slam – they are – they're quite weird when you see these things turn on. You say, "What in the name of God is that?"

These little, tiny needle shivers that you see are probably microscopic rock slams. I don't really think they are a different read.

There's a point of adjudication here: Do you just run the rock slams off? Do you assess it as long as you don't have a rock slam? And run it as long as you don't have a rock slam? Assess it for the rock slam? Run it until you don't have the rock slam? You could do that, you know? This is not a hard and fast point because the rock slam is going to turn into a fall; it's going to turn into a theta bop; it's probably going to go null. The liabilities of doing that is you've got a rock slam left someplace else on your Prehav Scale.

There's a matter of adjudication; we'll have more data on this someday – in the very near future. But I would say, knowing the nature of a rock slam, that if you just followed rock slam and ran the rock slam off so that you didn't get a rock slam in twenty minutes, or something like that, the case might make better progress. But we'll find out more about that. That's not a hard and fast rule at this time.
It's just this: When you're running a rock slam, remember you're running, probably, a very short duration. If you could hold a rock slam with your tone arm so that the needle continued to sit solidly at set, what would the tone arm be doing? Yeah, it'd be quite a wild tone arm, wouldn't it? Huh? Well, that would be the one thing you can't read on a tone arm. You have to read it over on the needle because – just because you can't do that with a tone arm.

You see, theoretically, when I say process by the tone arm, I mean keeping the needle somewhere in the vicinity of set, and that gives you your tone arm motion. Well, a rock slam, you can't keep the needle in the vicinity of set, you see? The tone arm would be slamming.

Well, certainly you're going to run a tone-arm slam. You can't set a meter for a tone-arm slam. So that's what you'd run flat. You got the idea? You could run the tone-arm slam flat, and if you assessed again you'd find the rock slam has now gone elsewhere. It's a matter of adjudication, it's a matter to be proved out, it's a matter to be settled, but that is a point. And I'd better tell you what points really don't exist in clear-cut silhouette relief.

Now, what do we get into here when we ask the wrong question on an E-Meter? We're asking the fellow for goals and it's the wrong goal. Well, therefore, it's the wrong question and you get a sporadic read, and the goal seems to peel off and disappear. A meter, actually, will react only as long as things are bunched up. And as you're assessing for goals, when you first grab ahold of the pc, the goals are all in one terrific, mauled-up ball, you see? And so any goal is doing a dance.

But, as you repeat these goals, with the thing set for a third-of-a-dial fall, the goal peels off the main mess. It comes free and becomes itself.

And as you go over a goals list over and over – and later, same way with terminals; a terminals list over and over – you're going to find this is a persistent and continuing manifestation: That the wrong questions peel off and the right question remains. So that is true of an E-Meter.

If you always knew the right question to ask, you would always get the same fall. But, at the same time, the assessment has therapeutic value. Something for you to remember.

If you just assess somebody – maybe he's in lousy condition and really isn't ready for assessment and so forth – if you just assess him and you do a good job of assessment on him, you're going to get an improved case and he's going to feel better about things.

An assessment cannot, then, be classified as something which must be done to set up an intensive. Similarly, a Joburg Security Check, if run well by the auditor, with a nice, gunned-up sensitivity knob, is terrifically therapeutic – terrific – and once more could not be considered something by which you set up a case to audit it. These things all fall within the perimeter of auditing because they are therapeutic, they are beneficial. They advance cases.

Let me tell you that just this one thing of a Joburg Security Check has advanced cases that have never before moved. Why did they never before move? They were sitting there holding on to their cotton-picking withholds! And their withholds were so heavy that they couldn't communicate to the auditor, so they were never in-session, so auditing never worked.
So you can't call a Joburg Security Check, then, something that occurs outside of intensives or outside of auditing unless it is being used for purposes of security. And then, of course, you don't do it in Model Session form. You're just finding out whether this guy is safe to have around, that's all. And if the questions all clear up, voilà! He's safe to have around, providing you know how to do a Joburg Security Check. That's the other little proviso that you must be awfully sure of. Some of you, or maybe all of you, will someday have the experience in Scientology of you got a new HGC Admin, or you've got a clerk or something like that, and you've taught them the this's and that-a's of things, and you're too busy to give this new applicant a Security Check yourself, or everybody else is too busy, and you can't turn him over to a good auditor to do this Security Check. And you say, "Well, you know the rudiments and you know how to do this, so you just go ahead and give him a Security Check."

And you're going to find out where my viewpoint sometimes is: in total bafflement of how anybody can invent as many ways of doing something wrong. And my viewpoint is very often on that total bafflement. I know why it happens, so that it doesn't continue to baffle me very long and it doesn't upset me, but it is still something to marvel about.

If you were to take somebody and give them an hour's instruction on the E-Meter, show them about the needle and then turn over some raw meat off the street and tell them to give this person a Security Check so you'd know whether the person could be hired or not, your usual response is not "The person is all right." The usual response is "He couldn't possibly be hired." If inept people were running E-Meters at all sides to do Security Checks for the purpose of employment, you could guarantee this: The whole world would at once be out of work. [laughter]

Various things happen but the category of them are utterly in the thousands. And there's no sense in going over the number of things they can do wrong, except those things which are rather common errors or which can be used to clarify the right way. Then you can go over things that are wrong. But otherwise, if you list all the things that are wrong or could be done wrong with an E-Meter, you'd probably be up around ten, fifteen thousand items. It's colossal.

For instance, simple error like this: The person they're checking breathes. This is rather strange and peculiar amongst the human race, particularly people in London; they know better. But they breathe, so every time they take a breath – the meter isn't set right probably – and every time they take a breath or a deep breath (or even if the meter is set right, every time they sigh), you're going to get a fall. And if the person were doing it, they wouldn't even realize they had to repeat the question again or anything like that, and they would be saying at that time, "Have you ever embezzled the funds of an employer?" you see, or some such thing. And the person says – he's getting kind of bored with this you know – and he says, "Ahew!", you know? It falls. And they'd write down "Embezzled funds of employer" [laughter] and go on to the next question.

Now, an idiocy of this character – let me tell you some more about this instrument – an idiocy of this character is going on in the United States at this moment. If it weren't so sad and tragic, one could laugh about it, and you will laugh, too. You probably won't laugh so well until you yourself conduct this experiment. And this is what is known as compartmenting.
questions and something you will have to know in doing Goals Assessments: the compartmentation of questions.

The fellow turns in a goal: "I would like to be a fireman and crawl up ladders and rescue beautiful women." That's the goal. So you come to it on the goals list – and by the way, these goals are always put down in the fellow's own words. He'll amend them, but when he wants to amend them, you amend them and add that amendment as a new goal.

So you are reading along his goals list to him and you come down to this one. You come down the list and you've covered now maybe seventy-five goals and twenty of them are still registering after a brief repetitive read. And you've gone on and the remainder, the fifty-five, have sort of dropped out and you're just feeling fine. You come to this one: "You want to be a fireman, and crawl up ladders, and rescue beautiful women." Only you read it this way: "You want to be a fireman, crawl up ladders and rescue beautiful women," and you get a fall. And you say it again: "You want to be a fireman, and crawl up ladders, and rescue beautiful women", fall!

You say, "Well, that one stays in.", Give it a slant mark. "That one's in." You read it a few more times, you see? But it looked like it was getting a stronger read. Let's say it – after you read it two or three times, it was getting pretty – it was getting tougher! More reaction, more fall, more theta bop, more rock slam, more something. So you just left it in, and you said that was it, and you went on to the next goal. And the next time you come by this thing you read it, and by George, it's still in!

And you go tell somebody. You say, "You know what his goal is, is to be a fireman." Nuh-uh. The way you handle these category goals is you pull them apart and you go over them like this: You've read the whole goal, you see? You do read that – the whole goal – a couple of times. Thing continues to read; now let's find out what's wrong with this thing.

You say, "You want to be a fireman. You want to be a fireman. You want to be a fi- ." That's the end of that. That's the end of that read it just disappeared. You say, "Good. To crawl up ladders. You want to crawl up ladders, crawl up ladders, crawl up ladders." That's the end of that one. That's the end of that one. "Rescue beautiful women, rescue beautiful women, rescue beautiful women. Ah, that's what we were falling on. You want to rescue beautiful women. Ah, that's good. That's good." Now, because it fell apart otherwise, let's be just a little cleverer and let's say, "To rescue, to rescue, to rescue." That disappears. And what was he falling on? "Beautiful women, beautiful women, beautiful women, beautiful women." [laughter] As what healthy male wouldn't!

So this whole goal disintegrated except beautiful women. Now, usually the pc will now volunteer, "Yes, I'd sure like to know some beautiful women." You put that down as a new goal. Got it? That's getting rid of them by compartmentation. Got it?

Now, some real – I wouldn't even dignify them by calling them knuckleheads – wogs, drifting around in various places, have been let loose with an E-Meter over in the United States, and they've got it all figured out now that everybody has been PDHed and that everybody has PDHed everybody and they're spreading it all over the place and telling everybody that everybody has been PDHed. And they prove it this way: They put the person on a meter and they say, "Have you ever been a victim of PDH?"
And the person says, "What's that?"

"Well, have you ever been a victim of pain-drug-hypnosis?" And you had a nice fall "Wwahoo-haho-o-ahoo-wahoo-wahoo! Here we go!!"

"Well, who did it? Who did it? Who did it? Was it Ron? Was it Di Diego? Was it Dick Halpern? Peter Hemery do it?" All of a sudden they say, "Frank Sullivan do it?" – get a big fall! "Ah, we've got a PDH here by Frank Sullivan, ho-ho-ho-ho." Well, believe me, we might have! [laughter]

Teaching is not implanting, but teaching on the whole track often came to implanting. You never had time to teach somebody where all the leads were in a tube room of a spaceship. And there were eight hundred thousand different leads and connectors to all the electronic equipment. So you said zip! with the needle, and you turned on the super tape recorders, and it went off at a high whine. And you played it over to them hard. And after you'd done it a few times, what do you know, they'd be able to go up and hit lead this and lead that, and they'd be so on and so on, and fix up this and put it in that.

And actually there are people around who've gotten so used to being trained that way that we have today a thing called Dormaphone – which, by the way, doesn't work on anybody who didn't ever teach anybody this way. Doesn't work. "Learn the Spanish language overnight." Well now, if I know all about this, why don't I sock some sodium pentathol in my arm, or something of the sort, or take a couple of Nembutol sleeping tablets, and put a pair of earphones on, and turn on a record that repeats how to speak the Spanish language when I do this.

It happens right now – because there's a ship down at Las Palmas I'll have to repair using the Spanish language – that I picked up some linguaphone records, and I happened to be listening to them wide awake. I'm brushing up my Spanish. When I first listened to the records they were a terrible blur; I couldn't tell one word from another. Now it's getting so that I actually can differentiate the difference between the alumno and the professor. Trouble with me and Spanish is I have enough overts against the Spanish people that I have a hard time hearing them. That's true. Any young Roman officer back in the old days had a hard time this way. Anyhow, I don't mean to restimulate anybody. [laughter]

All right, well, why don't I use this type of education? Well, I just never got used to it. Why don't we use this type of education in Scientology? Well, nobody – it – Scientology is an education of reason, not an education of location. Auditing is a practice of understanding, judgment and application. It is not a practice of locating and repairing a bunch of leads. You understand? It isn't teaching some soldier the gun parts. It leaves him with the initiative to handle weapons. Big difference there, you see?

So all somnolent education is limited to the pat solutions or locations to the questions. Now, if they were all pat solutions and everything was all pat in all directions, it was mostly locational nomenclature and category and where found, you can do it. Thetans have been doing it on the whole track forever. I mean, as long as we've had time this process has been going on.
But some people have become very specialized in doing only this. And those people set up a machine that furnish an implant for any given situation and will answer with name, rank and serial number, exact date, time, location, situation and text.

Five or six times over the last nine years, there have been big fads going around with this and anybody who has used this as a consistent and continual means of education – nothing vicious about it; they've just used it as a means and method of education, that's all – can set up a machine that'll respond. It'll give an implant for any given situation. But that is much rarer.

Let's go back to how you use an E-Meter on this other thing and this will amuse you far more. If I've stepped on any toes while I've been saying this, I am very sorry. But it is simply usually used for educational purposes. You got a new crew aboard the spaceship and not a single, cotton-picking one of them knows anything about space flight. What is the best way to handle this crew? You shove them underneath the proper speakers, and you give them the proper drug, and it all runs off at a high roar, and all of a sudden you have a totally educated spacecraft crew.

Right now you could probably get a visio of lying in a nice bunk on a spaceship, and it's got a speaker over your head and it's playing violin music that is very soft and soothing and at the same time giving you the regulations and identity and so forth which you exactly were supposed to occupy, all of the duties, regulations pertaining to these duties, your relationship to other crew members – everything that has to do with your job. And finally, you get lazy enough and you say, "Well, that's a good thing," and you get up out of there and say, "I'm the first mate!" [laughter]

As a matter of fact, you have a society right here at the present moment which is going into this particular line. So don't feel abusive about it because every time you even captained a spaceship, you've had something to do with this.

But I'm talking about somebody who has made a good specialty out of it, who's figured them out, who has used it consistently and continually or who has practically never done anything else along whole and enormous stretches of track. Those people will develop an identity which gives implants. They'll implant themselves. They can come up with an implant for any given situation. That is rarer – that is rarer – but it is not rarer than 5 percent of the human race. Well, you wouldn't call that terribly rare, then; you'd just say it's a bit scarce. And almost anybody could be restimulated with auditing up to a point of where they'd produce some kind of a reaction on this thing – almost anybody.

But let's take compartmented questioning and look this thing over. "Have you ever been a victim of pain-drug-hypnosis?" – fall. "Who did it to you?" "Frank Sullivan" – fall. That's our proof. That's all you'd have to do, isn't it?

Now actually, it'd clear up and get kind of mucky, and it's awfully hard to read. And if you really don't know an E-Meter very well you don't notice the sporadic falls that you get on this repeated question: "Have you ever been a victim of pain-drug-hypnosis? Who gave it to you?" "Frank Sullivan."
"Did Frank Sullivan give you this?" If you're not used to an E-Meter, you don't notice that the thing reads kind of weirdly.

If you've got hold of an individual (seeing the meter or something of the sort) who's got a good machine on this particular basis, it'll date it. It'll make it all reasonable and logical and set the whole thing up.

Where do you get an engram bank from, huh? Actually, you yourself are making the engram bank, but you wouldn't have to erase it if it wasn't being made on a via. If it was being made directly and created directly by you it'd just blow, blow, blow, blow, blow; you'd never have to erase an engram, would you? Factually, it's produced by a machine. There are machines that produce pictures. The thetan has got them. They're invisible. He's got them stuffed away under his left armpit or something of the sort, and they produce these pictures. And it's a machine. All right, all you have to do is specialize that machine a little bit and it'll produce a PDH, at will. I could take one – such a person and actually get PDHs until it became foolish to the person. See? And one of the cures of it is to date other people and other PDHs until we find out that their mother and father both PDHed them, and everybody else has PDHed them, all the way up the line.

You could rework this machine until you made the machine practically go goofy giving you new PDHs. You got it? In other words, it dubs in a PDH. That's all. And that's dub-in, just as such. Whereas the person is actually giving you perfectly valid engrams, when it comes to this particular type of engram it's a dub. You got the idea?

Do you know that a lot of young girls walking around right now, you say, "Well, get a mental image picture of your father," and they get a hairy ape or they get something else, see? In other words, they got a machine that'll dub in fathers. Well, so there are machines that'll dub in PDHs.

But that isn't really what I'm talking to you about because that's more advanced curiosa. And that isn't really what I'm talking about at this particular time – the advanced curiosa. I'm talking about E-Meters and this single question: "Have you ever been a victim of pain-drug-hypnosis? Who did it?" "Frank Sullivan."

Listen, if you're an auditor and you know your business, you know there's such a thing as O/W. And you know this: That an E-Meter reacts to the auditor's questions. And any question that is near the truth of anything will cause a reaction on the machine. And it is up to you to get a consistent read. You have to ask the smarter question. You have to ask the varied question to polish that read up. And all of a sudden, it's reading like mad and you know exactly what it's reading on and everything else that it might have been reading on disappears.

All right. Victim? How many people do you think will get a reaction on the word victim? [laughter] How many people do you think will get a reaction on the word pain? How many people will get a reaction on the word drugs? How many people will get a reaction on the word hypnosis or hypnotism or hypnotists? And if they've had a few overts or if they've read some of his literature, how many people do you think would get a reaction on Frank Sullivan?
No, all a question proves, when it reacts on an E-Meter, is that it or some part of it has charge on it, or the question is near some question which will have charge on it. Got the idea? Now, by varying your question you can smooth out the reads and as you become used to the instrument, you'll notice that it reacts sporadically and occasionally on something. Well, you just shape your questions around and change it around until you get it consistent, consistent, consistent, always the same read, always the same read.

You can only keep it reading the same, however, if you practically muzzle the pc. The second he starts imparting information the read blows up. Because if he answers the right auditing question, the read blows up. But of course, because he answered it and the read blew up entirely, you also know what you were asking. Don't you see? You know what was right.

So with the pc totally gagged, you could by questioning – pc not permitted to talk, actually with a gag on – and you have to gag pc if you want to carry this thing out to its extremity. It's a good drill and – they get too interested.

My favorite mechanism for newspaper reporters these days, by the way, is to find an automobile accident they've been in – they've evidently all been in automobile accidents – where the accident occurred, who was hurt in the accident, where they were hurt in the accident; and find out the whole lot, such as the make of the car, and all this sort of thing, without letting the reporter say a word to me. And man does it make citizens out of them. The somatics turn on and everything turns on and they say, "Well, how did you know?"

But actually you can't get much further than them being hurt, or someone in the car being hurt, than they all of a sudden start going off like small firecrackers, you know? And they say, "Well, yes! Well, how did you know that?" Well, you haven't actually had a chance to prove that you were a total wizard. They're now convinced of it, see? "How did you prove that? Well, what do you know. Yes, as a matter of fact, it was an old Rolls-Royce. And it went off the edge of a cliff down in Devonshire. And uh – uh – that's right. There were other people in the car all right. Girls they were, and uh – so forth. And I – I didn't ever realize this before, but I must have gotten jammed under the dashboard, you know? I've got a terrible pain here. Uh – yeah, and I must have been jammed under the dashboard. I never realized that before", you know, and they go limping out. [laughter]

Of course, such a thing dies out in the course of about three days, but they don't go back to the office and write that story that the editor told them to write to clobber Scientology, mostly because they can't now sit down comfortably. It restimulates them.

This is a very effective way of handling reporters, by the way. It's a – it's a real convincer. Similarly this other drill is a marvelous convincer to somebody who believes he has been PDHed.

"Have you ever been a victim of pain-drug-hypnosis?" Well now, just as you would in goals compartmentation, you say the word "victim" – "You ever been a victim? You ever been ...?"

"Well," he says, "Ah – ha-ha – yeah – ha-ha, I've been a victim."

Yeah, well, that's the end of that read. "How do you feel about pain?"
"Oh, no, I don't want anything to do with pain." Read, read, read, read, read. And they say, "I don't want anything to do with pain. I'm having an awful lot of trouble. And during my early youth I was in agony most of the time. They had my teeth in braces," and so forth, and that one drops out.

And then say, "Well, how do you feel about drugs?"

"Oh God! Eh-e-ptuh! Every time you see a medico they never treat anything; they just shoot you full of drugs and you stagger around. And if they'd only have gone away in the first place, or you never called them, why, you probably could have died peaceably or gotten well or something of the sort. Yeah, I don't care much for drugs." That's gone.

"All right, hypnotism. You ever been hypnotized?" There wasn't any charge on it in the first place and it's dead. Now say the question: "Have you ever been a victim of pain-drug-hypnosis?" The needle is – needle is totally motionless.

Now you say, "Frank Sullivan", and it falls. You say, "Have you ever had any overts on Frank Sullivan? You ever thought any unkind thoughts?"

And they say, "Well, who wouldn't!" [laughter] "Yes, yes, yes, I have, because as a matter of fact Frank Sullivan has been talking about being PDHed from the 1st ACC. He was telling me all about PDHs. And he goes around and talks to people about PDHs. And upsets people. And they don't like to get their own PDHs terribly restimulated, only he's so convincing about it. But his message is 'You have been PDHed! You have been. The reason you are being self-determined right this minute is because you have been PDHed.'" So with this kind of a thing, of course a guy gets unkind thoughts. He says, "This guy is nuts!" you know, although he might continue to be pleasant.

And the person says, "Yes, I've got lots of overts in that line. I've thought a lot of unkind thoughts in that particular line."

And you say, "Well, how do you feel about Frank Sullivan?" You get no motion to amount to anything on the needle. You've kind of blown it. Now you say, "Well, has Frank Sullivan ever PDHed you?" Now you'll get another surge. "Well, have you ever thought anything bad about Sullivan going around telling everybody that you've been PDHed?"

"Well, yes I have."

"Well, has Frank Sullivan PDHed you?" and that's now null.

Now you say to the person – now you say to the person, "Have you ever been a victim of pain-drug-hypnotism?" – null. "Have you ever been given a pain-drug-hypnotic implant by Frank Sullivan?" and it's null. What was it falling on? It was falling on connected restimators and as soon as you blew off, and the pc actually answered directly what you were talking about ... 

Now, supposing he had been PDHed, and he told you an awful lot of stuff – "Well, yes..." and he answered all these things: "Yes, I've been worried about those things," and that sort of thing – and the fall cancelled off on all of them. And you said, "Well, have you ever been PDHed by Frank Sullivan?" and you got a hell of a fall. You know you'd never be able to clear that fall – never be able to clear that fall at all – if the person had no recollection of
ever having been PDHed by Frank Sullivan, if he had been. It would continue to fall. That would be that.

Now, this becomes a case for auditing. How do you audit it? You put Frank Sullivan on the general Prehav Scale and you simply run him flat. You assess him for level, just as you would an SOP Goals terminal. You find out where that level – it falls. You put together an auditing command on Frank Sullivan, and you just run that out. And then when that tone arm stops moving, as it very well might after about four or five waggles – See, it might only be a few dozen commands, see? You find your new level and you flatten that. And you find your new level and flatten that. And all of a sudden you can't get any reaction of any kind either on being PDHed or anything else; it will have blown. That is the magic of the Prehav Scale.

Marital Scientology – just going from the ridiculous to the sublime ...

As I said before, this thing about PDH would be amusing if it weren't so kind of sad. It's kind of knuckleheaded, you know? It's kind of terrible thinking of some people running around madly trying to tell everybody and convince everybody that they have been PDHed because they're simply dramatizing their own o verts, whether now in this life or on the back-track. And they are worried about them, don't you see? And when they've got to sell a bill of goods of this particular character and make it their life work, they might as well be writing out a confession and putting it in the hands of every Scientologist they talk to.

The guy says, "I've been PDHed! I've been PDHed! I've been PDHed! And yap, yap, yap! And you've got to believe me," and all this sort of thing. If he's making this – he's not telling an auditor this; he's not going and getting auditing; he's just telling everybody this – he's all the same as writing out confessions and signing them and putting them in Scientologists' hands. "I have PDHed the living Christ out of people for ages. You see? I'm pro." That's what he's doing. That's what he's doing.

Well, that's all right. But people who have done PDHs, ordinarily on the whole track in the best of thought that was the best possible thing to do at the particular place and time. So as a result, if they've got a machine that will produce PDHs, so what? It'll all come out in running SOP Goals. Why worry about it?

Furthermore, if some guy did PDH somebody – . Let's say. Let's say that Sullivan did go ahead and hold down somebody and slap him and cuff him and put him under drugs and shock him and put in hypnotic commands and run some patched together tape to him that told him to go and take HCA Courses. That wouldn't be a bad implant by the way. [laughter] And if he did this ...

Ah, look, look, look. Nothing can happen to you in one lifetime – not even a PDH of – not even an electric shock from a psychiatrist and so forth – that you can't handle now. All you got to do is find out – locate the fellow who did it and run him on the Prehav Scale and flatten the various levels, and that's the end of the PDH. Interesting, huh? Or just in the course of running SOP Goals, clear the guy and it'll blow off It's nothing to worry about.

And I'm sure that no smart Scientologist – now that we've got clearing going and we've got cases running so well – would waste his time PDHing anybody. Look at all that hard effort that would just blow off in a short auditing session. We're actually getting faster
today than they can be laid in. Used to be that we took them out much more slowly than – you know, an engram in general was erased much more slowly than it was laid in. Well, you look at the number of engrams, just count the number of engrams, that must blow in the process of clearing a person, and it is some binary-digit factor. The factor – you could start at – up on this wall here and write 1 and then 0s, column after column after column, the whole length of that wall, and so forth, clear down to the bottom of it, and you would not have stated a number large enough to give the person the number of engrams that he'd have; that number would not be large enough. And when you can take and blow this up in the course of, ah, at the outside, a couple of hundred hours of auditing; holy cats, how many engrams is that per minute of auditing – of actual effective auditing? It's some fantastic number. It must be billions and billions of engrams in fact. So who would waste their time?

But once more, going from the ridiculous to the sublime, what I'm about to give you is the birth of marital Scientology. Not really its birth, but it's grown up and got some pants and skirts on it.

We had marital Scientology the day we had the husband and wife sit down across from each other with an auditor auditing both of them and getting off their overts and withholds against each other. That did an enormous amount to patch up marriages and actually could be considered its birth. Now you can put pants and skirts on marital Scientology and some auditor setting himself up this way could do absolute marvelous things. All you do is take the husband by name and run him on the Prehav Scale; take the wife by name and run her on the Prehav Scale; and that's the end of the difficulties of that marriage.

Of course, if the fellow doesn't want to be married, that's his idea and he doesn't have to be run this way. At the same time, if he wanted to get unmarried, this would also be the smoothest way to get him unmarried. Got the idea? Either way. Either way.

But it would certainly patch up the marriage. You got the idea? It'd take the difficulties off the lineup. Because in the course of running it would run the O/Ws off. And what do you know, it's such a tiny, tiny, short track. What is it, they've been married for ten years. Wow! Ten years against two hundred trillion. Doesn't sound like much. So it's no track. And what you're doing is, instead of getting these little tiny, two and a half horsepower outboard motors and attaching them to the Queen Mary – that used to be auditing, see – and these little, tiny outboard motors are running mad and heating their bearings and so forth, to push the Queen Mary. Instead of doing that now, we have a ten-thousand horse Mercedes Benz pushing a rowboat. One of the precautions we have to take is it doesn't crush the rowboat. The precaution we take is do a technically perfect job of auditing and keep your rudiments cleaned up the way I've been talking to you about.

All right. How long do you think it'd take to clear up that much track on a couple? Damn short period of time. With a little experience and knowing your business, you could absolutely guarantee to set up somebody as far as this is concerned. You could absolutely guarantee. You'd say, "Lead-pipe cinch." What would you do? You'd take the husband's name or the wife's name or something like that. Now you could assess this out one way or the other, but now you'd be getting into another project. No, all we're going to do is a non-assess on the
terminal, beyond just the identity of the terminal. You got the idea? See, this is the light brushoff.

Husband's name is Joe Thompson. All right. We just take Joe Thompson, and we assess Joe Thompson up on the Prehav Scale and down on the Prehav Scale. And going up and down the level "failed endure" knocked both times. We make up an auditing command about the failed endurance of Joe Thompson and our pc's relationship to him. It may flatten in ten commands. It may flatten in ten or twenty commands. But as soon as the motion goes out of the tone arm, reassess. And then take the motion out of that tone arm. And then reassess it on the Prehav Scale. We're not talking about very much auditing, are we?

Of course, the case has got to be in the kind of a shape where they will talk to the auditor and interested in their own case before you do that. You can do that, too. You can run them general Prehav Scale and make them do a Joburg Security Check, and they'll be talking to you.

You know, doing a Joburg Security Check is not an overt. Some people will look on it as such. It's about the nicest thing you can do to anybody. All you're giving him is his life.

Now, let's take a little, brief summary of this. Mr. E-Meter is a precision instrument. Mr. Auditor is sometimes imprecise. Mr. E-Meter registers on anything the pc hears. The auditor sometimes doesn't adjudicate what the pc has heard. The E-Meter clears on everything the pc answers absolutely right. And it remains muddled on everything the pc doesn't answer absolutely right. It's as clear as that; the E-Meter is a precision instrument, but auditors and preclears are prone to error.

Now you, in your study of cases and E-Meters and so forth, have certain drills which you must undertake even though they seem to be silly drills. They may seem to be silly, but I want you here to make sure that you do these.

All right.
ON AUDITING

A lecture given on
26 May 1961

All right, this is the 26th of May, 1961, Special Briefing Course, Saint Hill.

Now, you may believe that good publicity in the newspapers will take Scientology someplace. You may believe that good public opinion on the part of the kings and presidents and janitors of the world will get Scientology someplace. And you may believe that it'd be wonderful if the head of the BMA or the AMA or the QBCs or the Ku Klux Klan or some other fascist organization [laughter], would announce that he was in favor of Scientology. You may believe all these things have value.

Well, I want to tell you today that they have no value of any kind whatsoever. They are as sounding brass and the tinkle of the temple bell. They are nothing. If you get the idea that Scientology will rise or fall by public opinion, circa 1961 or 1950, you are very much mistaken. They will have absolutely no bearing on Scientology.

It isn't necessarily that Scientology belongs to the ages, but this is vividly true, vividly: If you don't get results, all the publicity, good opinion in the world will do nothing. Your standard is quality, not opinion. From quality, opinion stems. The advance of this world does not depend on a bunch of wogs who happen to be heading the BMA, the AMA, the Ku Klux Klan or the World's Betterment Association for Emaciated Cats; it depends exclusively on better people. And the more better people you turn out, the better this world will be and that is the end of it. It goes no further than this.

It is behind this that my press policy has long been: When the newspaper reporter knocks on the door, let him climb the stairs so that you can kick him down them. We care nothing for adverse publicity or publicity that is for us. I certainly would not go ask the opinion of a tinker on the quality of the atomic bomb.

"Now", you say, "well, people will beat a trail to your doorstep if everybody is talking about how wonderful you are." This is only seeking public approval. When your case level is well enough up, you couldn't care less about public approval. Now, I don't say that I'm in the most wonderful shape that anybody has ever been in, but I will tell you this: I just couldn't care less whether there has been bad publicity, good publicity, rumors, scumors – who cares? My job, consistently and continually, has been, over a period of years, to get the ammunition to the front; that is all.

Incidentally, I try to handle administrative affairs and other things to make things run smoothly while things are going on. But administrative affairs are always secondary to quality – always secondary to quality.
If you make a better mousetrap – a fellow by the name of Emerson who is very much overquoted – the whole world will beat a trap to your door. [laughter] But nevertheless, there is some item of truth in that. If you want lots of preclears, if you want lots of activity, if you want lots of students, you have to furnish the goods. First, last and always, furnish the goods. The world itself, in its status that it is in today, depends utterly upon whether or not you can produce better people. It doesn't depend on the freakish political pronunciamento of the Duke of Algiers. It doesn't depend on it for a moment. It doesn't depend on it whether the "Race Hate Society" of north Manchester or the "Race Hate Society" of south Cape Town have anything whatsoever to say.

Look, I'll call something to your attention: The BMA, the AMA, the Ku Klux Klan and all the rest of it have uniformly and routinely been expressing opinions for a great many centuries and the world is no better off. If you see this in its proper perspective you will stop trying to fit yourself into the framework of the environment of a society which is already going down the chute. This is sort of senseless. It's a rather senseless activity.

But what would happen if here and there in this society, an able man suddenly arose? What would happen? Well, the society would recover. As a matter of fact, Southern Rhodesia probably has yet to recover from the shock of a Clear appearing in its midst. Evidently this fellow had been one of the worst off fellows: he kept walking into walls and into women and down manholes. An auditor there cleared him and the two hundred employees that worked where this fellow worked couldn't get over it. His family couldn't get over it. Nobody's gotten over it yet. You see, they're all standing back in a fantastic marvel about all this.

But that isn't the direct result. What happens is that in his immediate vicinity it starts to get calm and things start to happen and he starts to get effective.

Well now, on this particular program of clearing, we have not made very many Clears – yet. But this program is only a few months old. It began, actually, at the end of January 1961 – this new research. For the better part of that period, I've been trying to find out what people can do. I've been trying to find out what auditors will do. You see, this is a big difference between what should be done and what would be done.

I'm afraid that I have been well disciplined in this direction. I have very often produced techniques which were rather resounding techniques, but nobody ever used them. So what good was the technique? It's something like building the better mousetrap and then somebody uses it to fill up the ballast of a ship without ever setting it. See, it has no bearing on the beautiful "what could be done." It's what will be done that is important. And since the end of January I've been trying to sort it out carefully on what will be done.

Well, you have the bulletin, May the 25th 1961, which says "Preparatory Steps for SOP Goals." And apparently, from the experience I have now had over telexes and at the other end of HGC lines, this bulletin will be done. People will do these two things if they know how to do them and they can learn how to do them rather easily. So let's look at this whole subject of clearing as an effective activity, which, if effectively put into practice, will bring about a considerable resurgence of this particular civilization. This is fairly obvious that this will happen and let's stop worrying about and dividing our time around amongst a great
many superficial activities that have no bearing on much of anything. Let's just go ahead and get the show on the road.

I'm always asking this question when somebody threatens to sue me or something like this. We get threatened with suits every once in a while: suits for breathing, suits for...[laughter] And it's very interesting because I've be – had to become an expert on the legal background of about five continents now. And this is quite interesting, because when they sue you in Australia, it's quite different than being sued in the United States. Being sued in the United States is a contest of trying to wait it out, because of course it'll almost never get to court.

As a matter of fact, as one of the most serious suits in the United States was a fellow who had fraudulently obtained a great deal of money from the organization and I think it's been going on now for about two and a half or three years or something like this. And everybody has been fighting this thing and having an awful time with this thing and it's operated along the administrative lines – I'm talking now about the nonsense, you see? How you can split up your attention and get nothing done. And it's gone on continually. There've been attorneys and there've been this and there've been papers and despatches and cables about this now for the better part of three years. And it was finally heard the other day and the plaintiff's lawyer failed to turn up in court and it was thrown out.

Now, we've heard of the plaintiff not turning up in court, but the plaintiff's lawyer – and that dismissed the suit. In other words, this thing that they've been worrying about for three – or the better part of three years... And then when it finally comes to court, why, the judge throws it out because there's nobody standing in front of the bar. [Laughs]

I think if any one of you had the amount of money that had been spent on cable traffic and attorneys' fees with regard to this suit, why, you could probably buy yourself a very nice little car. Anyway, look at the wasted time. Look at the tremendous wasted time of this activity.

So, long since, I have had a method of adjudicating these things, which I don't always apply but most of the time do and that is I try to find out what game is being played and if it's not our game then I don't play it. And this is the most disconcerting type of activity that people ever had to confront. I look something over: "And so-and-so and so-and-so. Well, so? And so, and so. Well, all right. Well, that's not our game. That particular one, that's not our game, so therefore just end the game." But then they start talking to me about the moral principles of actually surrendering or apologizing or the moral principles of not fighting the situation or the this or the that or something of the sort or they talk to me about the right ways to play the game. You get the idea? Ah, I just don't listen and this becomes very maddening to people.

When I say like this – this fellow is busily suing us for 16 pounds 10 and obviously... Suzie has a bad time with this because every once in a while she comes in, in a high dudgeon and says, "Look at the unfairness of this situation," you see, "and it should be fought."

And I will say, "Well, how much is it?"

And she says, "16 pounds 10."

And I say, "Forget it."
"Oh, I know, but it's unfair," you see, "and it's not just!" and so on.

And I'll say, "Well, uh – I – so it's not a just claim! So what? Pay it! Forget it! Skip it! Don't answer the letter! Who cares what you do with it; it's not our game. We're not solicitors."

This is amazing! But do you know, it keeps more randomness off the lines than you could possibly count. You have to take some little countermeasure occasionally, but you just take the measure to end that game. You don't play that game. See, I know clearly what game I'm playing and what game we ought to be playing. The game we ought to be playing is getting ourselves technically perfect with the mostest that can be learned. And as soon as we've got that game straight and that one's all squared around – well, that's our game. And frankly nothing can stand up against that type of a game.

So all these other incidental, nonsense games that people keep shoving in to you, trying to say, "This is the game you should play in the society at this time" – and one of those games is publicity. One of those games is newspaper. One of those games is (quote) public opinion (unquote). South Africa learned with horror that there were twenty-eight people, after a newspaper blast, who believed that our tests were no longer valid and I think the whole organization worked day and night for two months on a campaign to convince the public that our tests were valid.

Oh, no! That has nothing to do with the game we're playing; has nothing whatsoever to do with it. The game we have to play is quality, producing the results, clearing and straightening up the human race. That's the game we're playing. What does this have to do with public opinion and whether twenty-eight people in Johan... You know, for the length of staff hours that were spent on this, I could have called each one of them up on the telephone – well, I wouldn't say that I would do this – but say, "Well, this is the president of Witwatersrand University and I've just called up to tell you that the tests given at the Johannesburg Test Centre are perfectly valid. Thank you very much. Goodbye." [laughter]

If you want to play these games you can play some weird games. But I'm afraid the opinion of twenty-eight people – very aberrated people; probably down there in one of those deep Rand mines eight thousand feet below the surface – I'm afraid their opinion is not going to alter the course or destiny of Scientology. And there's no sense in spending any time in on it.

Well, what is there sense in spending time on? We know what can be done. We have demonstrated it and demonstrated it. I have been able to audit and produce results since about 1947, but I haven't had a vocabulary formed up that evidently communicated because we're not talking English. When we talk about the mind, believe me, we're not talking English. Nor are we talking Latin or Spanish or Greek. Man has not known anything about the mind; how could there possibly be a language that described it?

And it's taken quite a long time trying to get some communicative syllables together that would mean something to thee and me and get them clarified so that we've got our communication straight. Now, that's Scientologese. There's something on the order of about 472 words in Scientologese. There are 8,767,942 Latin terms that a medical student must learn, so I think we're allowed 472. That's an exaggeration; they actually wouldn't be able to remember...
that well. [laughter] But if you want to look at a medical or psychiatric dictionary, we have actually less terms in Scientology than appear in the single classification chart used in Germany. We have less actual terms.

Nauticalese. Now, these days I'm amusing myself; I'm taking a shadow on the water and putting a yacht under it. [laughter] And – it takes some doing because I can't afford one of these big, beautiful, streamlined yachts, like you write somebody a check for a hundred thousand pounds and say, "Deliver to the front door with a pink bow round its funnel." And the probability is even if I could, I wouldn't do it.

You talk about Scientologese and its communication complications, imagine this one: Nauticalese, the language of the sea, even confounds sailors on architects. For instance, I've had several letters recently where we were talking back and forth trying to find out what each other meant. Now, here is a language that goes back at least ten thousand years in its development. It's made out of Egyptian and Phoenician and Greek and Latin and "Scandihovian," Anglo-Saxon. Frankly, practically every nation has contributed something to this which now appears in some outrageous mispronunciation in this language called Nauticalese. And there must be several thousand words in the technical vocabulary of going to sea.

I have just run into this head-on because I've decided to use a Spanish yard. So I decided I would translate all my English Nauticalese into Spanish. Coo! And I was impressed. I was impressed with the tremendous vocabulary that I actually had to confront translating over and becoming able to use in a brand-new language and it's staggering. It's several thousand words.

We have now, approximately, 472 words in Scientologese. Each one of these words means a very definite and positive thing. They are not susceptible to very much misinterpretation. An engram is a moment of pain and unconsciousness – oddly enough, give you an idea of the precision of the definition – contained in a mental image picture in the reactive bank of the pc.

Now, when you get a precision definition, you get a package of understanding and these words are understanding packages, but they are understandings which were never understood before. Therefore, they couldn't be otherwise than new words, but it'd be very worthwhile to know those words because they're packages of understanding.

I know right now I am working on the fringes of and have been for some little time, a dictionary of Scientology which contains the precise up-to-date definition of each word. We've been lacking that. But remember, we've also been lacking the ability to communicate to people how to clear people. And we've also been lacking a short and practical method of communicating with the preclear's reactive bank and communicating with the pc. Well, now when we're able to communicate directly and immediately to the pc, now is the time to publish a dictionary, because it means that we must have ended a sort of a cycle of communication. Do you follow that?

All right. We're in the business, then, of quality – the production of results. And not showing what we can do... You see, you don't make a Clear and then hang him up on the wall or hang him up on a signboard. This has nothing to do with it. You're not showing people what you can do; you're dealing with living beings. And when you make a living being that
can really function effectively in the society, you don't have to show people what you can do. No. Things will get done. You get the enormous difference? You put him out there in the society or he's functioning in the society and he's happy as a clam about what you've done for him and he's happy as a clam about what he's doing. And now you get a new functional aspect: You're building a society; you're not trying to show a society that you are doing something.

Now, I know the economics of the situation sometimes press upon us to have to represent this or that or attract public attention. All right, that's okay. But I'll give you this lesson: I myself to keep things going, have undoubtedly, from the viewpoint of many people, overstressed what we could do. You understand? Well, do nothing more serious than that, than hold it up as a good example. Hold it up as an example: "Well, Ron said we could do this and that and we weren't able to do this and that, so therefore this was not a good thing to do. All right. Therefore, after this, let's just do a good job of it," and then, you see, this thing will work out in total reverse. You understand?

See, I don't mean to apologize for ... 'cause all of my reality on Scientology is based first and foremost on what I can do and then secondarily on what I see other people near me do with Scientology and after that it sort of fogs out. I'm not positive about what can happen out there beyond line of sight, for one of the reasons is I get fallacious reports on it all the time. People are telling me the weirdest, wildest things and I go check up on these things and write people indignant letters and say, "Why did you do so-and-so?"

I think one of these rampages I went on one time resulted in the death of a person. A pc had died as a result of very poor auditing indeed – very, very bad auditing indeed – from my point of view. And I jumped all over the auditor and – this was many, many years ago – and the auditor up and died. This was here in England. It was a considerable shock to me. But looking over the thing, I found out the pc had been inclined toward death for many years and as a result it was rather inevitable that the pc should kick the bucket and that it wasn't the auditor's fault. You get the idea? There was actually a false representation about the bad quality of that auditing, you understand? The auditing wasn't that bad.

Now, of course, people expect me to stand back and go on a big withhold. That's a good way to damage somebody. So they expect me to get on a big withhold about everything that goes on. Well, I'm not on this kind of a withhold. What we are doing is what we are doing, not what I would like to make it look like. All kinds of things have happened. This has been a rather dramatic arena for the last eleven years. It's rather fantastic some of the things that have happened one way or the other, this way or that, good or bad. But the good of the last eleven years doesn't just overbalance the scales, it practically goes through the ground with a thud. It's tremendous, tremendous. I – the letters which I get rather routinely; the people that come up to me at congresses; the people I stumble into one way or the other; a letter I get out of the blue: "Of course you don't remember me because it was way back in 1952, but you audited me for two hours and it was a tremendous experience. And evidently the experiment failed, because you turned me over to another auditor after that. But it was tremendous and it changed my whole life and I have been well ever since. And now I want to thank you very much for that experience."
This – nine years later.

And before organizations, a letter from a fellow: "Thank you very much for saving my foot. They were going to cut it off and you came in and audited me. And I didn't know who you were or where you were until I saw an article about you the other day in Time magazine."

The article says, "Hubbard is a bum. He's a rat," [laughter] you know? My fan mail doesn't answer up to the quality of the article.

But the lesson we can learn out of all this is if we want to get anything done, we better do it. In other words, we shouldn't put up, for instance, a science and then have various armed services become very enamored with this idea and then put us to work.

You think I want to work for some armed service? You know, I resigned from the United States Navy in 1950 when they tried to pull me in and put me to work on the subject of research in the human mind. They might have been writing to people, "Well, we're -- we keep all kinds of records on Dianetics. We keep records on Dianetics..." And they had a standard letter which the United States Navy, Bureau of Personnel, I think -- I've seen so many copies of it. Scientologists have sent me in so many copies of it, it must be just a form letter. And it's to the effect that they're keeping files and watching it carefully.

But in 1950 they tried to kidnap me. They told me that I would be returned to active service to do this research if I did not return to do so as -- in a civilian capacity at high pay -- ARC break. Now they're very equivocal to the public -- they don't know. Now all of a sudden, eleven years after the fact, they've suddenly awakened once more and they have some of our people in the United States now doing the security checking for them, which is apparently official. I'm supposed to soft-pedal this. I'm not supposed to say anything about the Bureau of Naval Intelligence. One of the reasons why nobody can really list us as a Red in the United States is a very interesting reason: is because I was once an officer of the Bureau of Naval Intelligence and of course, they have my full record. So every time anybody tries to clobber one of our organizations with being a Red organization or communist associated or something like that, it runs through the files and runs into this fact.

Now that first service with which I had contact has now turned around and is apparently using Scientology. You say, "Well, this is great." No, it isn't great. Ah! To clear up the Chief of Naval Operations: Now, that would be great. If one of you were to write me a letter and say that you had made a Clear out of the Chief of Naval Operations, I would say, "Now we're getting somewhere." But that the Chief of Naval Operations has written a long letter saying how wonderful he thinks Scientology might be for some of his junior officers [laughter] -- I'm afraid I would not pay too much attention to it.

Now, perhaps by understanding these attitudes of mine, you'll be able to understand the course of publicity and what we do and what we don't do a little more easily. The final analysis of an auditor is not what a good press agent he is, but how well he can audit. The final analysis of an organization is not what a good press department it has, but how well it can train and process people. That is the final test. There is no further test.

Finance -- the amount of money a person makes -- is some index of success. It always is in this society, but it operates as an index of success: this person is that able. I don't care
how many rabble-rousers are going around saying people who make money are no good, it is always an index of a certain amount of service – the amount of money that a person makes.

But look, if it is not an index of service, then it must be dishonest money. Right? So – your basic mission is the delivery of quality in service and that is the only mission we've got. Now, if we can do this and if we ourselves in the process get the bonus of getting Clear, this gets to be pretty darn terrific. You've got the fundamental building blocks under a new civilization, you haven't got a bunch of rickety props holding up a rickety civilization. And I don't think too well of this idea of holding up a bunch of clunks that…

How many wars have we had within our own memories? It's quite numerous, isn't it? Well, war is a symptom of insanity. How many broad cataclysms of one character or another have – are we not being piloted through? You think you can bolster this thing up? I'm afraid not. But, you can lay the fundamentals and foundations of a new civilization. Not a new order; a brand-new thing – a brand-new thing; not by saying to people, "You must do so-and-so and you mustn't do so-and-so or we're going to shoot you" – that is the old pattern – but actually having in their midst people who do know what they're doing and who are not guided by their aberrations. Now, if that thing all by itself could happen, you would get a new civilization. It isn't up to us to tell people what kind of a civilization they should have. It is more up to us to put it in their reach to have one. And that's what man has never been able to do before.

The whole mission of the Special Briefing Course at Saint Hill is making people able to get results and if we don't do that, then we have failed utterly. That's the whole mission.

Now, part of getting people to get results, of course, is part and parcel of this other idea of putting able people into existence. So you notice that, unlike an ACC, here you are being processed directly and immediately by staff auditors. You're not puttering around over another case while that other case putters around over you. You get the idea? I mean, that's not what we're trying to do and we're getting rather fast results this way. Now these results may not look fast to you, but they're fast enough. Tolerance of change has an awful lot to do with how fast the result occurs.

Now, you're changing people's tolerance to change all the time, but you have to reduce their tolerance to change before you can change them. So it goes up on a sort of a – of a swaybacked curve. It starts in very slowly and then it starts going faster. That's because tolerance to change is coming up. Change is pain, to most people, because the fundamental of change is simply a shift in space of location. It's a shift of location in space. That is what change is. You have space and then you have a shift of location. This is very interesting.

And you have this other factor called "time" which is actually, basically, just a postulate. But time is change on a mechanical level. It isn't shift in space per unit of time, because that would be shift in space per unit of shift in space. That sounds kind of weird when you start thinking it over.

Rate of change is something I had an awful hard time getting through my head in engineering school. I mean, it was one of these things. Rate of change – I never could understand why this thing just wasn't quite right. Rate of change. And then I eventually found out the reason it isn't quite right is that rate of change is measured by rate of change. And every-
body was pretending to me that rate of change was measured by a constant called time, which wasn't any change, which was just some odd phenomena of some kind or another. It was a phenomenon that sort of drifted around in our midst and had nothing to do with it, you see?

Time has a temperature. Yeah, there's a startler: Time has a temperature. Time has a certain temperature. If you don't believe it, put some meat in the ice box. Doesn't decay as fast, does it? Put it out in the sun in August. It decays much more rapidly, doesn't it? "Ah yes," you say, "but this is the decomposition of the bacteria which is operating against the roodlepuffs." [laughter] No it isn't.

Time is a temperature. I don't know what that temperature is in Kelvin, but now that I know that time is a temperature, I can find it. And the moment I find the exact temperature, I could make any area, at any given instant, timeless or speed its time up. I know that sounds very strange. But this is a great discovery in physics. Only you know about it, but it is a great discovery in physics. It's rather a staggerer.

We have several of them. "C is not a constant" is one of them. You know, the constant they use in atomic physics is not a constant. The speed of light is not a constant. It varies!

"Well, yes," you say, "Well, within all practical purposes, it doesn't vary. But..." Now, what's this "practical purposes"? Whose "practical purposes"? Now, here's something else: No, the speed of light depends upon the velocity of emission.

So C is not a constant. That's one of these discoveries. Another one is "Zero is a variable." And, of course, every time you have a zero in an equation, you've got trouble and mathematicians since time immemorial have known this. All you have to do is divide by zero or multiply by zero or something and something weird happens in the equation and you mustn't do that! [laughter] And yet, these fellows have never deduced from this the horrible truth that zero is a variable. There is no absolute called "zero."

I'll give you an idea: You say, "Well, there's nothing." A nothing of what? And the second you've said "a nothing of what" well, there could be a nothing of a ton of apples and there could be a nothing of a pinch of sand. Well, which is the greater figure, the nothing of the ton of apples or the nothing of the grain of sand? [laughter]

So in other words, zero is a fabulous variable and accounts actually for what they call, inelegantly, "the bugger factor" in physics. It's a technical term in physics. It's also a technical term in the Navy, but... [laughter] we won't go into that. I'm sorry to bring it up. But zero is a variable and apparently if you divide by zero, you're in trouble – and you add... You can apparently add zeros without too much difficulty unless you're dealing with money. [laughs] And you...

Now, wherever you have holes of this character in the basic sciences of a civilization, of course you have trouble. They can't quite handle this particular zone or area and it keeps getting out from underneath them and trouble keeps occurring.

Now, zero and the constant of time most got out of control with the atomic bomb and produced, oddly enough, a difficulty with a thing called temperature. Because the atomic bomb is very hot and when exploded in amongst a city or over the top of it, succeeds in roast-
ing the population rather thoroughly. And the only real sin there is that there's nobody around to eat them, I think or some… [laughter]

Zero is a variable and they didn't know it. C is not a constant and they didn't know that. And they got this trouble called temperature – and hot temperatures and bad temperatures and so on.

Well, there's some odd things about this. When the atomic bomb was exploded in Hiroshima, nothing moved for twenty minutes – not even the twenty minutes. Something weird happened with time. And most of the survivors and some of the data that comes out of there – if you read it carefully, there's hardly any record that doesn't mention time, some disturbance of time. Well, if time is a temperature and you get a tremendous temperature alteration, you're certainly probably going to do something with time, right? That's going to mess up.

Now, that's as far as I am into it at the present moment, only I know now for sure that time is a temperature and that is a brand-new principle of physics. But what this present society at this particular time doesn't know is basically that it doesn't know. That we have also discovered.

For instance, we have diplomats running around, settling problems on international affairs which could have enormous consequence and they don't know that they don't know anything about diplomacy. They couldn't possibly, because their efforts result, don't they, in wars and upsets and so on.

All right. So there is another factor that we are dealing with, is that it is a very extremely dangerous thing to not know that you don't know. Apparently that is probably the greatest sin there is: to have an area of knowingness which you don't know that you don't know.

Well, what is Scientology doing to the society at large? Isn't it telling the society at large rather consistently and continually that it doesn't know? It doesn't know that it doesn't know and it's apparently painful for them to confront the fact that they do.

But your best road – your best road – is to find out what you don't know and remedy the situation. That is always a road to wisdom. It's not a self-cancellation, you know, or cancelling out what you do know, but it's just finding out what – honestly, what you don't know. And as soon as you know what you don't know, you are far wiser than you were a moment before.

So that all study should actually begin on the basis of finding out what you don't know, not finding out something new. Now, that's a rather odd thing, but it becomes very clear in just a moment. Several of you have had assessments on SOP Goals and have come up with your goal and have come up with your terminal: Do you feel different about existence? Do you feel different about existence? Yeah, kind of weird, isn't it? Well now, that is the exact same principle applied. Look it, a few years ago, a decade or so ago, you didn't know that you didn't know this, did you? And then for a while you found out that you didn't know what you didn't know. But you knew you didn't know something. Do you remember not knowing, but knowing that you didn't know what your goal and terminals was? Well, it's an odd feeling, isn't it?
But do you know that is way in advance of not knowing that you don't know anything about it? See, it's an increase. Even if it's uncomfortable, it's an increase of knowledge.

Now, all of a sudden as you're running in auditing, you're finding out more and more about this terminal and more and more about this goal, you see? Coo! What's this? And a great deal more knowingness and wisdom is at your command than was before, right? But it had to be entered in upon at its rockest rock bottom with finding out that you didn't know about it.

And oddly enough, the only thing that is wrong with your case is that vast area of their own beingness that they don't even know they don't know about and that's what makes them aberrated.

All right. Let's say some fellow up here is going into the subject of – let's say, some fellow in Parliament. And he's beating the drum. He is absolutely sick to the point of nausea over the fact that these poor herring are being slaughtered off of Iceland.

And he's just having one awful time, you see, about this. And he's just causing all sorts of fuss and consequences of one character or another. And he wants to sign treaties and suppress the catching of herring or something, but he doesn't even know that he's trying to suppress catching of herring. He's just trying to pass what he calls "fish conservation regulations," or something like this, all of which will amount to catching more herring, much more brutally.

He doesn't know that he spent his whole last life as a fisherman catching herring off of Iceland. Nor would he even know that this would open him up for the consequence, you see, with this many overts on herring, of now protecting herring madly. But he also wouldn't know that this reactive obsession with protecting herring will only lead him to slaughter of herring. You see what he doesn't know? So, of course, he's a very unhappy man, because he doesn't know where he's going, why he's doing it. He has no practical solution because if he did get one, he himself would be the first to defeat it. Now, he's in a puzzle. He's going around in circles.

What it would mean for the destiny of England if you in this room were suddenly turned loose as a crew to find the immediate four last lives on every member of the House of Commons. [laughter] It'd be fantastic! It'd be fantastic!

There are fellows there who just got through being officials in India – Indians – who are now running English bodies. That's for sure. There are people there who are doing this, who are doing that, who are doing the other thing. They have no understanding of why they are doing it. But because they don't, they will immediately come off with a defeat. Whatever they try to do they will defeat themselves. That's part of the aberration.

So we have a whole bureau of the government or a big department of the government, set up to prevent war. Do you know that it's going to prevent war madly, day and night, but because it's doing it reactively, not analytically, it is going to do nothing but bring on a war. What they resist, they become, because it's all reactive. They have no way of handling this whatsoever.
That's why I say, not that you can't do anything about the society as it exists, but that the best remedy for the existing society is to put able men amongst it. And the first thing you do when you do that is put men amongst it who will one, know and two, will know when they don't know. And that way you've opened up the whole highway toward enlightenment, education and a future for this race.

Now, the bulletin – to get down to much more practical matters – the bulletin of May the 25th, 1961, gives how to bring about a Release. It's the preparatory steps of SOP Goals: how you bring about a Release.

Now, what's a Release? A person is a Release who knows he won't get any worse. That is the oldest definition there is to Release. A – when he finds out he's not going to get any worse now, you can call him a Release and he knows he's not going to hit the skids and go. So that's a very low definition – very low order of definition. I mean, it's a very – very low state of case actually, but it is far better than a non-Release because this fellow knows at least that he isn't there yet. See, he knows that.

Well, Miss Zilch up here selling lingerie in London doesn't know that, see and neither does some fellow wearing enormous ceremonial robes up in London, either. He doesn't know it, either. They know they're going to get worse – amongst their knowledge – and that there's nothing can be done about it.

So the first test of Release is just that: They know they're not going to get any worse now.

What would a Release look like on an E-Meter? Well, you would have your sensitivity fairly low on a Mark IV British meter. You would have your sensitivity fairly low, down here and you would get something on the order of a whole-dial swing or a little bit better than that, when you squeeze the cans. You ask him to squeeze the cans, with the sensitivity all the way off, it's going to go plong! It doesn't have to hit the pin and come back over and hit the other pin. In other words, it doesn't have to be seven or eight dials, but it's no – your meter manifestation is something of that order.

And the tone arm here is not too far goofy. See, it's not down here at 1.2 or it's not over here at 6.5. It doesn't say that auditing won't put it there, but it does say that it stays down here in the middle range someplace – 2.5, 3.0, 3.5, 4.0, something like this. It's going to be in that zone. Ordinarily if you'd pick the fellow up anytime during the day and put him on an E-Meter, if he weren't being audited, why, he'd strike into the 2.5, 3.0, 4.0 range. He'd be in here someplace. That would be kind of an E-Meter manifestation of what a Release is.

Now, I had a question the other day which was quite interesting. And that was "The people who have loose needles at low sensitivity must be bad off because they don't get much needle action when you ask them charged questions." Well, look-a-here: The looser the needle gets, the less charge is effective on the person, so of course the questions get less drop. And you may get into a situation where you have to jack up your sensitivity on a loose needle case to get off the little, tiny withholds, because they don't really think they're withholds. But at the same time, those withholds don't prevent them from being audited. What do you know?
A PT problem will prevent this person from being audited. But a little, tiny withhold: he'd still stay in-session on it. You got it?

Now, the state of Release is no more, then, than the fact the fellow knows he's not getting any worse, probably that he knows he's getting better. This is quite important – quite an important thing for a person to be able to get to that state. That is the first, most important step on the ladder to Clear. He knows he isn't going to get any worse.

Well, this would mean, at the same time, that he has a reality on Scientology; he knows it works. So he knows there is a remedy to make him better. This would also, then, be part of the test of Release: Does he have a reality on Scientology? He knows it'll clear things up?

That appears to be something that's a – merely self-congratulatory to Scientology but it isn't. The fellow knows that he can get someplace with it. That's important. He knows he can go someplace. He knows there's a higher zone or area that he can go into.

All right. The next thing: If you were to make a Release test and get very rough about the test and actually upgrade the state considerably so that you would be sure this fellow isn't going to fall on his head; you would have your Help, Control and Communication levels in such a state that when you say "communication" to this fellow, he doesn't flinch and fall off the pin and get very upset or the needle doesn't instantly stick. You got the idea?

You don't get, then, a bad needle reaction on these buttons of Help, Communication and Control. Those are pretty good then. Now you know this fellow is going to be a credit to you before you start patting him on the back. Actually it's a slight deception because the fellow is a Release before you establish this point, but now we've got the further point: Is this fellow going to be able to hold his own? And for our own satisfaction, then we require that he isn't going to get oddball needle reactions just because you say communicate to him or help to him or control to him and then for sure you've got a Release. And that's all the state of Release is.

Now, that is the state of Release, actual – the fellow knows he isn't going to get any worse and he's got a reality on Scientology and he knows it's working. See, if a fellow knows Scientology is working, he has reached a state where he can as-is by inspection certain things. So therefore, he will tell you Scientology works.

When a fellow tells you Scientology doesn't work, he doesn't have the ability to as-is by inspection. You got that? It is nothing more complicated than that these people go around talking about "Scientology doesn't work," "Scientology does work." You know, one or the other. Phooey! They're just saying, "I can as-is by inspection" or "I am totally incapable of doing a cotton-picking thing with my bank." That's all they're saying to you in actuality.

All right, so you have this – these two first conditions, that is the actual state of Release, so that you would actually have, then, another condition, a special type of Release which we'd call a tested Release or a stable Release, which would be the fellow had no adverse needle reactions on the buttons of Help, Control and Communication. Do you follow that? Well, at that stage you can issue him a certificate and a lapel button. I mean, he – he's all right.
Now this doesn't say that if he gets tangled up with a fire engine and loses his grandmother on whom he dotes utterly, that he isn't going to practically go into a flat spin, because life still is very much capable of putting the thumbscrews on our boy. You understand? But he'll be able to come through it better than he ever would have been able to before.

All right. Now let's take our next state up and the next state up is actually MEST Clear. And a MEST Clear is simply somebody who has a floating needle with the sensitivity well off and who doesn't get reactions on normal, routine questions; and who is reading, at the time he ends his processing, at 3.0 for a male and 2.0 for a female. 2.0 for a female, he [she] has a floating needle. 3.0 for a male, has a floating needle and under ordinary questions about life and so forth, you don't get any needle reaction. That's a MEST Clear. And that's all there is to MEST Clear. That's the total test reaction.

What's important to you about it is that a MEST Clear isn't stable. So just as we have the stable or tested Release, so do we have the stable or tested Clear. And it takes a lot more SOP Goals to stabilize a Clear after he is Clear. See, he reaches MEST Clear; now we've got to make a stable Clear.

Now that's quite important. And you just run more goals. You just find more goals and more terminals and try to audit them and they actually start blowing by inspection. Because the keynote and the common denominator of any case is "The better off it is, the more it can blow by inspection, the more it can as-is by inspection."

And you get somebody who is in the zone of Clear and I won't tell you that a firetruck running into him won't mess him up, but I will tell you that the engram has no persistence. His healing rate is fabulous. That's because he can as-is the incident. He looks it over and it blows!

Now, trying to run an incident on somebody whose tone arm is 1.2, whose sensitivity is 16 and whose needle is just like glue no matter what you say to him – now we're going to run an engram on him. Of course, we get him into the beginning of the engram and that sticks him. He's better off – because he was actually in the beginning of the engram – he's better off in – now that he doesn't know now what is in the rest of the engram. [laughter] And if he were never going to get any more auditing he'd never find out either.

All right. Compare this to trying to run an engram on him – on a Release. Well, you'd probably be able to flatten engram on a Release in maybe three, four hours – two, three hours, something like this – even if you did it pretty badly. You see, it's kind of sloppy auditing. But an engram being flattened on a Clear, if you could find it, if it would react – you know, the fellow has just fallen down and had an accident or something like this and you get a reaction on this thing – the process of looking for it and trying to locate what happened is the end of the engram.

But on the other hand, he could put up the engram again and could react again if you ask him to and he might do it to be pleasant [laughter] and then you would probably get a reaction on it. But he'll do this to a relatively slight extent. In other words, its thinkingness has an effect upon the bank. That is the common denominator of all case states up to Clear.
How much effect does his thinkingness have on the bank? Now, you first start a person in – you see, giving the person SOP Goals is pretty therapeutic, actually – giving him a Goals Assessment. It goes along slowly. You're using one of the oldest processes known (repeater technique) coupled with another old, old process of about 1957 which is Goals Processing. And these two are actually processes. You're not running them for processes. You're trying to find the goal – that's the reason you're running them – but they are processes and they do result in a therapeutic gain for the case, which is pretty good. But you will notice at the beginning of a Goals Assessment that the length of time it takes to get a goal to null on some cases practically make you hold your head. I mean, the goal stays in and stays in and stays in and stays in, and then all of a sudden gets a little less and then a little tiny bit less and then a little tiny bit less and then it disappears.

Whereas toward the end of your Goals Assessment – let us say you've gone on an heroic, long-stretch Goals Assessments that's going to take about thirty-five to fifty hours – and don't be surprised if one takes that long sometimes – you get a goal, you repeat it twice and it disappears. You see, that's how fast thinkingness is able to effect – make an effect upon the reactive bank. That's all there is to that. That is the common denominator of all cases.

A psycho: The bank has total effect upon him and he has no effect of any kind on the bank. No effect on the bank; he cannot control this in the faintest, so that he does everything it says. A psycho is actually an engram bank in full dramatization, whether he's a computing psycho or a dramatizing psycho, see? The individual not only can't have any effect on the bank – this would be utterly, utterly unthinkable – the bank has a total effect upon him, you see?

Now he gets up to the point where he doesn't really have any effect on the bank, but it isn't really a total effect upon him. Then we get up to the grade: the person has a little bit of an effect on the bank. And then we get up to a higher grade of the person can affect the bank quite easily. And then we get up to a higher grade of where – "What bank?" That'd be your common denominator of cases.

Now, the thing you should do to encourage field auditors, to encourage Scientologists who don't know too much about this new routine – you who are here at Saint Hill; the things that you should say to them is, "May 25th, 1961, HCOB: Follow it very closely because there'll be two or three Clearing Series books – more than that; there'll be four or five Clearing Series books – which amplify it."

In other words, by reading these books you could do this other thing, the May 25th bulletin. And that is to produce a Release, but this is a pretty high quality of Release you're producing with this, you see? This is pretty high.

Actually it is something like building with an engineering factor of safety of about a hundred. You know – you know, most bridges are built to take five times as much weight as they'll ever be called upon to take. Well, in this particular case, if you're using this HCOB, May 25th, you're building about a hundred times as much stress as is required to qualify for Release, you see? But you tell them to do that one – that's the one to do – and to leave Goals Assessments alone and not to fool with Goals Assessments until they have had special training in them. And that way you could do the most good for auditors around. You actually
could. It – there's nobody trying now to compartment up things so that there's the nobility and the plebeians amongst auditors, you understand? I mean, nobody's trying to do this. I'm just trying to get every moment of auditing to count, that's all.

Now, supposing all the auditing done around the world – supposing every hour of it counted. *Wow*! It would be a big gain. Supposing there were none of this wasted at all.

All right. I just had a case today of a fellow who'd just had seventy-five hours of auditing and he claims that he's in ruins and in flinders and he's made no advance of any kind whatsoever. Well, I've asked for a total review of the case. But I inevitably will find that somebody has been trying to assess a case who didn't know how and spent a great deal of that seventy-five hours messing around with an assessment. And then that the person didn't know how to do a Security Check and then that the person didn't know how to do an assessment or make up a five-way bracket for running. And of course, seventy-five hours went up the spout.

Well, it's just *silly* to waste auditing like *that*. But you can encourage people to learn to use an E-Meter and to give a Security Check. You'll find them very interested in learning how to give Security Checks.

How to use an E-Meter and how to give a Security Check: that should be the most elementary action that a person could undertake with it. Because you see, if a person can't do a Security Check and get each level asked clear, he can't ever clear rudiments so he shouldn't be auditing the pc, should he? Ah!

So your first task would be to get somebody to be able to do a Security Check. All right. If he learns how to do a Security Check and can do a Security Check well and can get every level clear and get the reaction off of the needle at every level as he goes down and wind up at the end absolutely confident that the pc, at that stage of case – of course, at certain stages of case, naturally, a pc does not *know* all of his withholds. Don't go on the basis that at any given moment a pc knows everything he is withholding, because, you see, he's withholding it from himself. The only reason you don't remember your past track 100 percent is that you're withholding it from you. Forget – withhold, you understand?

Well now, the keynote of this case that made no progress during the seventy-five hours is that the auditor gave him at least two Security Checks and the case is complaining that his memory hasn't improved. Add those up: *Ahhhh*, that means that there was no Security Check given that was effective in the least bit, because if any Security Check – particularly this new Joburg HCO WW Form 3... [laughter]. You mean *that* can be given to a person all the way down the line and his memory doesn't improve? Oh, come off of it!

Nobody could convince me of that, you see, because I know exactly what forgetfulness is. Memory trouble and forgetfulness is withholdingness, that's all. You pull a few withholds off somebody and his memory improves.

I imagine your memory when you were a little shaver and had just busted the cookie jar – I'll bet you, you couldn't remember the top of the house from the basement for a few minutes. You know? For a day or two or three. You were going around, "I hope nobody finds out who busted the cookie jar," you know? And your attention is all involved with this and
you're withholding it from people. And then you've undoubtedly had this odd phenomenon happen: You forgot that you did it.

Well, withholding things from people results in withholding things from self. And when you cure up withholding things from people, you stop withholding a lot of things from self. So the inevitable result of a Security Check would be an improvement of memory. Right? Somebody says, "I want my memory improved" – security check the living daylights out of him.

Now, a Security Check represents what the person knows he is withholding at any given instant and a few little borderline things that he'd forgotten he was withholding. See, those will come up, too.

Now he's got to have an increase of – well, you could say sloppily, "He's got to have a case gain." No, we could be much more technical. He has to have an increase of responsibility on the dynamics before he'll get a different Security Check pattern.

Now, if you increase his responsibility he is going to remember a bunch more withholds. Ah, the second that you increase his social responsibility, personal responsibilities, familial responsibility, he all of a sudden is going to remember a bunch more withholds. Lord help the fellow who has his responsibility increased without getting them pulled – without getting the withholds pulled. God help somebody who is going over that hurdle! Because you know what'll happen?

Lessening the overt comes in under that category. The individual has made his withholds and overts all right by lessening the withhold, lessening the overt and he's pushed it out of sight. He says, "Well, the Central Organization isn't any good anyway, so it was perfectly all right for me to do mean things to it." And then one fine day – one fine day – he suddenly discovers that the Central Organization is doing the best it possibly can for him and does him an enormous favor and the withhold unlessens. His withhold – you know, the overt – the overt gets up in size. He realizes it's an overt!

See, it was perfectly all right before. It was all explained because "The Central Organization was no good." But all of a sudden, he finds out the Central Organization was some good and immediately, the overt that he had not-ised springs up into full life and beingness and he gets very unhappy. He becomes miserable. He comes slinking in the front door, afraid to look at anybody and if he dares confront the organization at all… You get the idea? Now, that's the unlesssening of the overt.

Some fellow said one time, "You know, when I was sixteen my father knew nothing – absolutely nothing. He was the most ignorant man I ever had met in my whole life. And by the time I was twenty-one it was surprising how much that fellow had learned." [laughter] Now, supposing this were accompanied at the same time by realizing that the guy was some good? See?

Let's say he wasn't fairly standard circle; let's say he was, finally, a fairly good guy and all of a sudden the overt appears. Everything you've done to this guy suddenly swells up. Now, when you've done a lot of overts to somebody who then kicks the bucket and then you
found out they were perfectly innocent of all the things you accused them of, you feel *terrible!* Why?

The overt unlessee, because the reverse process is the one engaged in. To make oneself feel comfortable one lessened the overt by saying the target for the overts was no good. "Perfectly all right to do to this fellow. He was only a bum. He was no good." Now, all of a sudden, we find out he isn't a bum and this unsettles the basic human mechanism of making our overts all right. You see? This is a weird mechanism.

Well now, the same mechanism occurs under the heading of responsibility. And responsibility goes this way: The individual is totally irresponsible in the society. And he's going around robbing lollipops from little babies and he's doing all sorts of weird things in the society. And he didn't consider this was wrong. But now his responsibility increases and all of a sudden he says, "Hey, what do know! I've stolen lollipops from little babies and that wasn't so good." At that moment it becomes a withhold.

You will have criminals, ten-timers, you know, they've just been in and out of the jail doors so fast that they might have caught pneumonia in the breeze, you know? They'll sit down, "Oh yes, I murdered this fellow and I robbed that one and I did this and I did that," and there's not even a tremble on that meter. "Yeah, raped, marred and burned. Took an old lady's false teeth, kicked her in the head, knocked her down the stairs. Yes, I routinely went around and upset wheelchairs with cripples in them, you know. Yeah, oh yeah, yeah. Oh, I've been a bad boy all right! I sure have!" and you don't get a tremble on the meter. The guy's social responsibility is so microscopically small that he doesn't regard any of them as necessary to withhold.

And that is the definition of a criminal and why criminals are rather dangerous fellows to have around. Because nothing they do has any faintest bearing on anything. They're irresponsible. In other words, they're at the behest of the reactive bank and they have nothing to say about it at all!

All right. You'll say someday when you're doing a Security Check – you didn't get a reaction on the needle but you asked the fellow, "Well, did you ever burgle anyone?" You know?

And the fellow says, "Oh yes, yes, at this place and that place and the other place and so forth and then I was there. I remember this. And they sent me to the pen in Cincinnati for doing that. And then I came over and I was in Wormwood Scrubs. And – uh – uh…"

You'll say, "Boy! Hey, I'm really getting somewhere with this case!" Aw, the hell you are. He isn't confessing, he's bragging. He doesn't consider these withholds. He's trying to convince you he's a dangerous man. And it is all too easy to think you have really done a good Security Check on this person, because he does have things that the needle will fall on that are withholds. You do a Security Check by the needle, not by the conversation.

It's not what you would consider a withhold, but what the person being checked considers a withhold. Got the idea? With a lot of criminals, it's out there on a second substitute: his pal – the things he won't tell you about his pals.
And you can go right back over a Security Check that a person has passed with the greatest of ease. He's told you. "Rape, murder, sudden death, revenge, arson. Oh yes, yes, desertion, mutiny." He goes down the line, "Yes, oh yes, yes, yes."

And you say, "Well, I'm really getting someplace." Needle isn't doing anything, see. "I'm really getting someplace," and so forth. Well, don't make that mistake.

When you get to the end of it and you don't think you've gotten any place and that needle hasn't wobbled and this case is no better off than he was before; you're going to have to do another Security Check on this fellow in some other guise or wise. You're going to have to find out what are withholds to this guy and you'll very commonly find they're about his pal. So ask – just Hobson-Jobson the whole Security Check into a second dynamic proposition: "Do you know of anyone being burgled?" "Do you know of anyone burgling anybody?" in other words. **Ohh, clang!** "Oh, I can't tell ya that. Day'd rub me out!" [laughter]

It's by the meter. The meter reacts on what the person is withholding.

And the Security Check is not designed to do a check on the life story of John Q. Criminal, see; it is designed to get off what he considers withholds. So that would be one of the little fine points about giving a Security Check.

So this seventy-five-hour pc was undoubtedly sitting there giving all sorts of long and sad stories about all the mad and mean, horrible things he'd done. But on none of those Security Checks did the auditor look at the meter to see if he was getting a reaction on what the pc was talking about. And he didn't probe around with those Security Check questions until he *did* get a reaction and then get it off. Do you see how smart you have to be to give a Security Check? In other words, you run a Security Check by the meter, not by the life history of the person.

And you say, "Well, you've ever burgled anyone?" Ah, needle doesn't do anything. And he says, "Well yes, there was Doakes and *buther-nth-er-nuthr*..."

And you say, "Well, thank you! Thank you. **Good! Good! Thank you!** All right, **good!** All right. Now, do you know of anybody who ever burgled anyone?"

"**Ahhhh, huhuhuhuhuhuhuh.** That's different. **Ahh-huh-huh-mm-bluthhmhm-huhu-huu-mm-huhuh-bu-hummm-huh-mm...**" You get this kind of a twist around. You have to find out where the guy lives on the Responsibility Scale in order to do a good Security Check and you have to pull those things which can be made to fall.

All right. Now you turn around and what do you do? You give him an assessment on the Prehav Scale. And you just run up that Prehav Scale assessment. And the very best way to do it is to find the level that ticks and then find the Secondary Scale and then go over the whole Secondary Scale until you find the level that goes *clang*! And then you take the level that goes clang and you run it on the person in a five-way bracket on the subject of something or someone or ... Make up your five-way bracket.

You can say "something" to the person, you get a fall. You say "someone" to the person you get no fall. So your five-way bracket is made up on "something." You get the idea. You have to test your auditing command, which is another subject entirely.
But in other words, you give him this run on the Prehav Scale. You flatten out the motion on the tone arm. And when the motion ceases to be wild on the tone arm and comes down and gets rather narrow, you give him another assessment on the Prehav Scale. And you run him with another five-way bracket till the motion comes out of it.

Now, you haven't assessed this person. You don't have this person's terminal, you know, or anything like that. And when you flatten off this second run, you pick up your Joburg Security Check sheet – a new one, a fresh form – and you roll up your sleeves and you give him a new Security Check and you are all of a sudden going to find that he has withholds that he never suspected before. Now what is this all about? It means that the individual's responsibility rises with the general run on the Prehav Scale and it brings him up to a bunch of zones and areas where the overts have unlesened – the targets of the overts have unlesened. And if you don't get those withholds off and those overts off as they come up, of course the case will make no further progress from there on. He'll be in agony.

I saw this happen to a fellow one time. He had tremendous – he was an organizational staff member and he had tremendous overts on the organization – none of them very criminal. But the more he – they audited him, the worse off he got. It was his opinion there was nobody in the organization that was any good, the organization was no good and that everything it was selling was blue sky.

When he found out this wasn't the case – He'd been sitting back there in Lord knows what corner of his medulla oblongata he was living in – if he was living in that, it was probably the back of the tip of his right – his grandmother's right ear. All of a sudden, all these overts unlesened. See, they became overts. After that, they were perfectly justified, but they suddenly weren't justified anymore because the organization was some good.

_Coo!_ How horrible! And the guy just went into misery. He just went into _agony_. It was in Johannesburg but we weren't using Johannesburg Security Checks along with auditing at that particular time. And he moped and he moped and he moped and the more – the more effective the auditing got, the worse the fellow felt. Look that over.

Naturally, if he's been saying, "Scientology is no good" to himself all the time and yet here is Scientology working on him like mad, obviously Scientology is some good. Therefore the overts were on Scientology. He was being processed into his tomb practically. And the only way he finally saved his bacon was fly out of the organization and take up a job that didn't bring him into very much contact with Scientology. He did do that, too.

You get the exact mechanism which was proceeding there. As the individual went along, then, and improved in his case, no mechanism existed to thoroughly pull off all of his overts on life. So unless you pull off the person's overts on life fairly routinely as you're auditing him, as contained crudely, viciously and meanly in the Johannesburg Security Check, the person can get miserable under auditing gains. See, he's suddenly waking up and he realizes that there are some people around who aren't total tramps – amongst them, you, his auditor, or something like this. And this makes all of the meanness of his actions against you suddenly recoil on him.

Well, all right. If you believe in poetic justice don't give him a Johannesburg Security Check; just keep auditing him on as effective an auditing regimen as the Prehav Scale general
runs. You'll practically kill him! You see why? He's gaining in responsibility, therefore his overt is looking bigger and bigger and bigger to him and then don't give him any opportunity to get them off at all. Just skip that and go on and improve his case and improve his case and improve his case and don't give him any chance whatsoever to get off that. And, of course, he will get into a double twisteroo. His case doesn't dare improve because it'd kill him and he sets his heels and makes no auditing gains. You got the idea?

Now, there's the exact mechanism behind this May 25th HCOB bulletin. Now, this is what field auditors ought to be doing – they ought to learn their – how to do a Security Check. And they ought to learn how to give general runs on a Prehav Scale. And if they could do those two things, they would be in the stars. They would be getting case gains all over the place. Do you see that?

Every hour of auditing they put in would have some effectiveness and usefulness before it. Furthermore, they would make a Release. And that is how you make a Release. You give the fellow a Security Check. This puts him in communication with you to some extent – enough for the purposes of auditing. And then you assess him on the Prehav Scale – Primary, Secondary Scale. And then you run the level in a five-way bracket and you flatten one level, you flatten two levels – that's probably enough.

Now pick up the Security Check and give him a new Security Check and you're going to find some new things have turned up. You get those things off and he is now happy to progress some more. Otherwise, he won't be happy to progress any more because he's got these overts one way or the other.

So you give him his new Security Check and then you assess him and you run him on two more levels on the general Prehav Scale and then you give him another Security Check. And you're going to find out that every Security Check is a bit different. And warning: If the Security Checks aren't a bit different, he hasn't had any gain in responsibility and is making no case progress.

So the Johannesburg Security Check serves another purpose: it serves the purpose of telling you – total absence of graphs and tests – it tells you whether or not the case is making any gain. And if the case is making no gain, then there's obviously, these two things exist: First and foremost, he is either suffering with a tremendous ARC break with you or he's being audited straight up against a present time problem. One of those two things exist if he's making no case gain. That's all that exists, by the way, because you're going to get all the withholds with a Johannesburg Security Check. So it reduces no case gain down to fantastic ARC breaks or horrendous present time problems.

Now, how do you handle somebody's present time problem? Supposing you were a field auditor who didn't have any education along this line at all and you were giving somebody a present time problem sort-out. And this is the second time the person has come in to you with a tremendous present time problem with his mother-in-law and it just seems that this one is getting in your road all the time. Now, I'll let you in on something: it would be very easy for you to do this, a little less easy for somebody else to do this. You would assess the person on the Prehav Scale – Primary Scale only. Don't spend any time at it. Assess this person in the PT problem – in other words, the personnel of the PT problem on the Prehav
Scale – and run maybe two, three brackets only. Because look, it's such a microscopic piece of track that it won't run any time and your twenty-minute rule disappears instantly – the second that you handle the Prehav Scale, the twenty-minute rule vanishes. You couldn't run twenty minutes on a level on his former wife. You just couldn't do it! You see, you're running it by name and you just couldn't run that – that – that. You could run it on "a wife" or something like this, because this has got some track to it. But you couldn't run it that way. You got it?

All right. Now, you'd have to sort out, then, your rudiments. And this can get sometimes very tricky – sorting out your rudiments, Model Session, TRs and so forth. This can get out – this can be very tricky. Various things can happen. There are various boo-boos can be made one way or the other. The pc self-audits himself between sessions, is one of them. Pc has had a tremendous bust-up of some kind or another between sessions and you don't detect it and you audit him in spite of it. In other words, you've got present time problems or something of the sort messed up here. But you did – you mishandled the rudiments. That's all this amounts to. Something went wrong with the rudiments. And when I say, "Something went wrong with the rudiments," I simply mean, the person wasn't set up to go into session.

Now, there are ways of doing rudiments with a meter, but there's also your power of observation. And the pc comes in with one arm in a sling. Well now, you don't put him on the E-Meter to find out if he's had an accident to his arm. You get the idea?

The pc has been very, very able to talk to you in all other sessions and this session isn't saying a word. Something has changed here. Well, you'd better find out what it is, even though you've started the session. You know? And the pc formerly has been able to be – communicated with you, is perfectly happy, is perfectly cheerful in being audited and in – everything's going along fine, or is awfully mean in being audited and is awfully vicious and all of a sudden isn't mean or vicious. I'd sort of keep my eye open on it. [laughter] Maybe the pc is sunk into apathy or something. Could be, you see. Or the pc's gotten better.

I would at least ask him, "Have you – have you experienced any peculiar or particular change that you have noticed between the last session and now?"

The pc would say, "Oh, yes. I've decided I'll live." Well, this would account for his no longer being mean. But these wild changes that occur without your auditing are something that you should suspect. The commonest action is the pc leaves the session with the tone arm at 3 and returns to the next session with the tone arm at 5. Now, something has gone on between sessions, that's for sure.

But this straight routine: using your TRs and a Model Session, getting a Johannesburg Security Check, then running a couple of runs – general – on the Prehav Scale and Johannesburg Security Check is what you ought to tell field auditors to do and tell people to do who don't know how to do SOP Goals. You got the idea?

All right.

Thank you.
FLATTENING A PROCESS
AND THE E-METER

A lecture given on
1 June 1961

Here we are. I think this is the first of June. What planet is this? [laughter]

All right. All right. This is a seminar, the Briefing Course at Saint Hill. Now, what questions do you have today? Yes?

Female voice: Is it possible for us in TR on Model Session to have some training in the meter, because I found yesterday that an auditor I had, just hadn't got this. And I kept feeling "If she doesn't look at that meter, she's going to miss this fall." And --.

Yeah, that's right. I get that myself once in a while when being audited. You know, I say, "Well, where are we? Just where are we?" Because the auditor is sitting there doing an obsessive TR 0. He's not doing TR 0; he's doing obsessive TR 0, you see? Which means to them, "Look at the pc. Look him between the eyes before you shoot him", [laughter] or something. And this obsessive TR 0-you find this mostly in recent HPA students. They really go mad on this. They never do get themselves between the meter and the pc, you know?

You can actually confront a pc, you know, by looking at a meter. Did you know that?

Well, anyhow, anyhow, that is a good point that you have brought up. Now finish your question.

Female voice: Well, that's all. Is it possible for us to have that incorporated at a late stage as part of the TR 0 in training in Model Session?

I should say that would be perfectly all right. I'd say it would be a sort of a high-school version of it. You give the fellow a meter and let him have the meter in his lap while he's doing confronting.

The coach, however, is not on the meter. And the only time this was ever suggested, it was suggested that the coach hold a meter with the pc not on it. I never quite got why the coach would be holding a block of wood which looked like a meter. That was the exact earlier one. It didn't have anything to do with it.

But a block of wood or anything that had mass and weight, while doing TR 0, I'd say would be an upper-stage TR 0 and would be a very good thing to do. And while running Model Session and so forth, why, have a meter parked around. This would be a good thing. Your suggestion is very well taken. Your question is answered "yes."
Okay. Any other questions? ... Boy, I'm glad you're that smart. Gee, I'm glad you're that smart. You know, I – you know, when I get up that smart... [laughter] Gee, I'm going to be real proud of myself.

Well, if you haven't got a question, I will tell you about some mistakes that are made. The first and foremost of these mistakes is while running a level flat – running a level flat. This is the commonest mistake which is being made in HGCs, Academies, co-audits, from hell to Halifax: They don't run the levels right.

Now, let me give you a very brief summary of what this is all about. In the first place, we have discovered how to establish whether or not a process is flat. We have discovered how we can obey Auditor's Code Clause 13. That's for the first time, this question is answered for auditors.

I never have any trouble with this. A lot of auditors never have any trouble with it. But the majority of auditors do have trouble with it. "When is something flat?" That was the burning question, you see? Did the needle whistle at you, or what happened?

And as a consequence they overran and underran and so on. And there was a great deal of conversation around this particular point down through the years, trying to establish this and bring it home or develop some kind of a system by which the communication would become adequate. That communication has been developed and is found in E-Meter Essentials. You run the pc on the tone arm.

Now, there is an exception to this; there is an exception to this called the rock slam. And I will cover the rock slam as the exception in a moment, but don't think that I am not aware of this odd exception (and it isn't an exception).

But as long as the tone arm is waving about on a process, you are guilty of a breach of the Auditor's Code if you leave that process before the tone arm is motionless or nearly so. Now, we can communicate that, can't we? In other words, that E-Meter will sit there and it will tell you whether or not a process is flat.

Now, something can intervene in this. A pc between sessions – you should always notice where a pc reads before he goes out of session and notice where he is reading when he comes back into session. Because if the reading has materially changed – he's gone out and played with mud pies; and you'd better find out about it because he's got a withhold from the auditor and so forth.

That's the first and commonest error, by the way, of flattening a process. The pc goes out between sessions or even during a break, in an HGC, maybe goes, calls up her husband in Cincinnati or something of the sort and says, "Dear, I've just decided that you're the dirtiest, filthiest skunk I have ever heard of." Comes back into session again and that tone arm is reading 6.5, or it may even be reading 7.

You know, when a pc can't read on the meter, he is simply reading at 7 and that's not even a joke. Seven is between 1 and 6. And you'll occasionally find somebody who (quote) "won't read on a meter." Well, it's just due to: the mechanics of the tone arm don't turn through 7.
Responsibility increases from 2 to 1 to 7 to 6. And you're going to find a pc every now and then—it's not as rare as you think, running the hot bombs you're running—reading at 7.

All right. So let's say the pc was—went off the meter. This is the most baffling thing I've ever seen happen to an auditor. The pc is ordinarily reading at about 5, comes back on and isn't reading anyplace on the meter. And the auditor is liable to report the meter broken or something of the sort. Well, it's just a fluke. The pc has begun to read at 7. All right. Seven doesn't read on this meter, you see?

Seven is actually higher in responsibility than 1.

So anyhow, there ought to be a 7 on the meter. Okay. There is that variation.

Now, as this pc goes out of session reading at 5 and comes back into the session not reading on the meter at all or reading 6, or more ordinarily goes out reading at 3 and comes back into session reading 5, and you just go on running the process; the process isn't running. Why? Because something has happened to the pc that's given him this present time problem, and so forth. And the whole thing about that is your rudiments are out.

So therefore, when you stop sessions and give breaks and start sessions after these breaks, you always start the thing with Model Session. This keeps you from making these flumdumptious errors, don't you see? So it's always a good thing to end rudiments before you've had a break and start rudiments after you've had a break. I don't care whether it's a lunch break or a cigarette break, see? As long as the pc has gone out of your sight during that break, you're going to have to run end ruds and beginning rudiments. All right. Therefore, this won't get in the road with your flattening a process.

See, because that could be a vagary and throw this whole computation out. The pc is running; the tone arm is waving madly back and forth. You have a break, comes back; the tone arm isn't moving.

You say the process is flat and then you go on and assess for a new process. And now you have a level left unflat on the case and a pc being audited with a present time problem. You see, the solution to that is always keep your rudiments in; that is the smartest possible thing. Always keep your rudiments in.

Okay. Now, if you inevitably and invariably do this, you'll be all right. And this rule applies, then, of: you run a process as long as it produces tone arm motion. That tells you whether or not the process is flat.

Now, this little rule about a quarter of a tone or a half a dial, or something like that, is a safety factor. It won't trouble the pc and it won't assess again if it has gotten down to reading a quarter to an eighth of a dial of motion. You won't find that level again as hot. You understand?

If you leave it that way for about twenty minutes—you know, it's just moving that little bit over a period of twenty minutes—you can safely leave the process. That's the rule.

Now let's see how the rule is got around. There is lots of ways to get around these rules, and this is the one which has now come up. And this is being done everywhere broadly and with the maddest abandon imaginable. Now that we have a way to flatten the process, we
have abandoned the idea that it takes a process any time to get working. So you can run five processes in an afternoon if none of them ever started to work and leave five processes unflat in a single afternoon's auditing. And it has just been done.

London is just staggering around from "ARC breaks from Ron" and unable to flatten "O/W on Ron" today. [laughter] That's just literal truth. They're having an awful time because Ron came down at 12:20 last night, getting the last reports, and found – ooo! I spent an hour taking it apart and so forth. I found that pc after pc had just been run level after level. I couldn't let it happen one more day, could I? You certainly couldn't have put another five-and-a-half-hours' worth of unflat processes on it.

And somebody just actually took their finger totally off their number, and even though this has been part and parcel, occasionally on remarks, they had not caught it as it went by.

When a pc has to read or be assessed with a fairly high sensitivity knob to get a third-of-a-dial drop, this is always true, and it's occasionally true on other pcs. This is a rough pc, now. That's some pc that reads with a high sensitivity knob to get a third-of-a-dial drop; that is a pc that has a very low profile when he comes in. Any one of these conditions, not all of these conditions, have to be present to make this true. And it also may be that you're just running an awfully sticky level on any pc. You got the idea?

So this could happen at any time, that you assess for a process, and then the first three hours of run on it don't really produce any tone arm motion except a quarter to an eighth of a dial of motion, which of course is the definition for a flat process.

Well, let me ask you this: Why did it fall on assessment in the first place? What mystery do we have here?

Now, only a person who has got an occasionally floating needle, who is getting right up straight toward Clear, can possibly flatten one of these things down in minutes. You'll notice as a person is coming through toward Clear that they do flatten them in minutes, but then it becomes very obvious. The tone arm actually stops moving and it doesn't stick. It simply stops moving, with a fairly free needle. And it wouldn't do a bit of harm to overrun the process. Case is in a kind of condition to take it, you understand?

But these fellows that are – get these jerky tone arms and have a fairly sticky needle and have different reactions of various kinds will increase in read during the first period of auditing the new level. They'll increase in read, and then they'll get good tone arm motion. And then the tone arm motion will die out. And then, when it has read for twenty minutes for an eighth to a quarter of a dial of motion, it is flat.

So that is the whole statement – with the one exception which I will take up in a moment. That is the whole statement. In other words, motion quite often has to be run into the tone arm before it can be run out. You got it? And if a thing assessed and you didn't get any motion from the tone arm and you know this pc is not in marvelous condition yet and so on, boy, you just better keep running it.

And you – funny thing, you should ask yourself this question: "Why is it that hour after hour I can run this thing and it gets an eighth to a quarter? Why?" Well, it must be running
something. See, eighth to a quarter, eighth to a quarter, eighth to a quarter, so forth. It isn't tightening up.

The other phenomenon that you're trying to avoid is the needle freezing. Now, when a process is overrun on a bad-off case, the needle will freeze. The first symptom of this, you're entitled to know, is a rising arm, not a rising needle – forget rising needles – but you got a rising arm.

This pc has just been running along fine with a half of the tone arm dial division of motion. Been running dandy. Sometimes full division, sometimes a division and a half, sometimes a half a division, you know? I mean, it's just going along. And it's all between 3 and 3.25 on the tone arm dial, see? Between 3 and 3.25 here.

All right. We look at this and it's 3 – it's going 3, 3.25; maybe it'll go up above, see – 3, 3.25, so on, like this and here we go. And we – all of a sudden, 4, 4.25, 4, 4.25, 4, 4.5 and we say, "Boy, that was a nice move."

Test it for twenty minutes because it's liable not to be that stick; it's liable to blow down, see? But the first symptom of a flattening process is a rising tone arm.

Now, there are some auditors around trying to prevent tone arms from rising or thinking they've boo-booed if the tone arm starts rising. As a case is entered into processing originally, you will see this as the first... Maybe some of the mystery of how I know whether or not your – the level you're running on the pc is flattening out will explode under just this one fact: It's the fact you've started to get higher reads consistently, see? In the last hour you've been getting higher reads and those higher reads didn't blow down.

Now, if the higher reads were going to blow down, they would ordinarily have blown down in about twenty minutes or so. You see, they would have acted.

But that, as it drifts up first from a very minute motion... This is the actual behavior on the flattening of a process on a pc who is not – he's not up even to Release yet, is quarter, quarter, quarter, an eighth, eighth, quarter, quarter, quarter. And then all of a sudden you start getting it up, and it goes up about a dial. And then it goes little bit, little bit, quarter, quarter, quarter.

Boy, then it's the danger point, because this thing can actually go up to 5 suddenly and go clank! And you can practically hear the thing go clank.

Now, there's no danger in it going clank. There is no danger in it going clank and suddenly sticking and you going on auditing it that way for twenty minutes. It is just going to make the pc uncomfortable. It's going to make the pc uncomfortable and you're going to have to reassess and you're probably going to have to reassess with difficulty because the bank is kind of froze up. That's the most that'll happen to you.

If you were to run this for three days, sitting at 5 on a total freeze, as an auditor has done – two days, this was done by an auditor. And of course, my God, you couldn't have assessed the case; you couldn't have done anything with the case except one thing: run the auditor off on the Prehav Scale. The auditor will assess.
Did you know that an auditor will always assess when he has boo-booed? You know, you can – you always take all the bad auditing off of a case, if you run into any? You know that? And if you're real clever, and because you're here and I can tell you, it's all right to run very brief terminals; but if you take somebody who's only been with the guy for twenty-five hours and you run that on the Prehav Scale, well, it's sort of one command or something like this. And it's just too brief and it is – it's messed up; it gets messed up.

So on a twenty-five or a fifty-hour pc – I mean, where the auditor has only been with him for, oh, I don't know, at the outside a hundred hours or something like this – you'd better take the case apart with some old-time process. You understand?

"What have you thought about that auditor?" "What have you not told that auditor?" Any kind of an O/W situation or something of this sort.

Now, if the auditor is, let us say, the husband or wife of the pc you're trying to straighten out on this, or if there has been a long association going up in terms of years, now this, then, is a long-duration PT problem. "Long duration" is defined as years. That's a long-duration PT problem: years. A short-duration PT problem is in terms of months or weeks, see? We say long and short and then don't leave you wondering what we mean by long and short. It's years.

So it's all right to take a PT problem of long duration – i.e., years – and assess that person as a terminal by name on the Prehav Scale and run that level, and reassess and run the level.

Now look, do you know that it's probably less than fifteen minutes a level? It may be as little as that. This is one of the exceptions to the running, flattening on the tone arm, see? It's an exception. But of course you're doing something exceptional, so it's not much of an exception.

You're doing something very exceptional. You're taking a person that – well, they've known each other for ten years and you're running it on the Prehav Scale, which is calculated to go on the whole track. So you're doing something exceptional, so you have an exceptional answer. And it disobeys the twenty-minute rule. Twenty-minute rule – you don't run that for twenty minutes to find out if it's flat, see? See, this is a – this is not the same thing we're talking about.

When is a general level of the Prehav Scale flat? That is to say, we're just running it generally. You know, "Whom have you failed to help," you know, and that sort of thing. That's a general run, the generalized terminal: "someone," "somebody," you know, something like that. General run.

Or an SOP Goals terminal, which means a selected general terminal. But it's a selected terminal, see? All right. That terminal, of course, that will just run and run and run and run and run and run and run and run, because you – the pc's attention is fixed on it. He's in – zoo-fooog.

Now, these general runs – that is, "someone," "somebody," "Whom have you failed to not help somebody?" "Whom have you desperately not intended to help and prevented everybody from helping?" You know, that kind of a question. Very broad, you know?
All right. That has a briefer run. So your longest run will be found ordinarily on the SOP Goals selected terminal. Your next longest type of run is your general run, and those are long grinds very ordinarily. And it is those I am talking about – those two types of run, where you find the tone arm unsticking and beginning to move early in the process, then moving well, and then fading out and getting down. And eventually – early in processing – they will stick.

Well, if you can stop it just short of the stick, you're a good auditor. And you'll find it very easy to assess and all is well and so forth. But even so, you won't be in trouble, even though you stick it for twenty minutes.

But look-a-here, don't you stick it longer than twenty minutes. An absolutely fixed, frozen-tight needle for twenty minutes – you would have seen it approaching for a long time if you'd been watching. Motion would have gotten less and less and less and less and less, and it freezes.

Now, that is different from the person suddenly swooping from 3 to 5 and then it doesn't move at 5 for fifteen minutes or something like this, and all of a sudden goes to 2. Or the person sticking absolutely at 6.5 and then suddenly swooping to 1. This kind of an action is not an expected – you wouldn't expect that needle now to stick.

But this sticking needle is going to come about when you were running it all right and it already looked like it was getting flat and your flat rule would have taken it off then. And then it suddenly rose up and began to move even less. Now, all of a sudden it'll either move a little bit up, usually, or a little bit down and go clank! You can smell the rubber burning. [laughter]

Now, if you continue to run that tone arm while it's in that condition, day after day, man, you're not doing Scientology because you're in violation of Clause 13. You are running a process which no longer produces change.

The only change it's going to produce, of course, is just sort of cave everything in. But it's not a beneficial change.

So the process is not producing change, so you get off of it; here and now, you get off of it.

All right. Now, what is this other exception? I said, then, that this rule is not followed – going on with these things: the long-duration PTP. The guy for the last five years has been having trouble with his leg and he just sits in the auditing session with this hidden standard. He runs cows, crocs and alligators with great happiness. And at each moment after he runs the command, or every few commands, why, he kind of thetawise looks down at his leg, you see, to see whether or not that has been affected. "Well, alligators didn't fit in that leg, so it must be something else," you see? He's running with his attention fixed on something else. And he broke his leg five or ten years ago and it has troubled him ever since.

Well, you can assess that leg – and by the way, you can even assess it this way: His name, let us say, is John; you can assess "John's leg," something of that sort. It's always best to inspect the meter for a bit of reaction, but oddly enough, you don't even have to, to do that. You just know this is a long-duration PT problem. The best way to do it is to make a list of
terminals that the pc thinks it is. And then take a specific one, not take a general one. See, you
don't want this thing to be a profession. You don't want it to be a profession, that's all. Be-
cause he'll run on it for quite a while if you take it as a general thing, see?

You could even say, "your leg" – point to it now and then; bring him out of the past –
and it'll run. It'll run on the Prehav Scale. But of course, "flat process" as a law doesn't apply,
then, to a terminal which is a specific terminal being run or a problem of long duration.

By "long" we mean years. We don't mean – we don't actually mean longer than one
lifetime, see? That's within this lifetime.

And if we do that, voilà! We will have that thing taped.

But we run it on the needle. We just keep an eye on the needle – clank, clank.

Now, oddly enough, you will get tone arm motion, but it's a kind of a waste of time to
kind of track the tone arm motion. All of a sudden, the thing kind of frees up, the needle kind
of frees up or sticks, or something like this. And you ask about it, you'll find out the tone arm
has stopped, too.

But now, look-a-here. Here's the problem. If you ran this for twenty minutes – look,
the whole run in the first place was only ten minutes. Now you're going to test it for twenty
minutes when there was a ten-minute run, huh? This doesn't – this isn't bright, see? It's some-
thing like measuring the depth of a teacup with a Kelvin Fathometer. You see, it's just not
smart.

So you have to kind of run it on the needle. That takes a lot of auditor judgment to run
one of these things. You can't be a bad auditor and handle a present time problem of long du-
ration, that's for sure. You'll flub it every time. And also you can't run a pc, horribly enough,
who has a present time problem of long duration, on any other process than a present time
problem of long duration. There it is. That's it; you've had it.

So the moral of that is, audit well.

Now, there is the exception I spoke to you about, which is running the rock slam, and
that's not really a violation of "a process is flat when it no longer produces tone arm motion."
I'll show you this very clearly that if you had set here –. Now, you know a rock slam; a rock
slam is pretty – pretty wild here. And a rock slam can be kind of this, this, this wide, see?
That's a pretty good-looking rock slam, isn't it?

All right. Now, there it is, slamming back and forth there. It's going two, three inches.
Actually, rock slams can be a quarter of an inch wide, too, you know. But they're erratic.
They're not a theta bop. A theta bop is as even as a metronome and a rock slam is very erratic.

And look – look what would happen now – look what happens to the tone arm as I
make it rock slam. You got it? See – see what the tone arm is doing while I make this thing
rock slam. Hmm? Look at what the tone arm is doing. See, I've got this meter just sitting here,
just turned on and on set, and if – to make it rock slam doing that. Well now, I'm doing that
with my hand. But supposing the pc was doing it to it with its bank.

An auditor –. I have to tell you a joke, by the way. I just got one through the lines the
other day – this just – just got it through the lines. This was very, very amusing, and I hope
when the auditor hears, he won't be ARC broke. But I was quite interested. I misunderstood him completely.

He said, "The pc can reactively influence the E-Meter, so I'm having a difficult time running the pc."

And so I told him, well, I'd exorcised all the demons out of the thing, so he needn't worry about that.

But listen, that wasn't his question. That wasn't what his question meant at all. He believed that this pc was peculiar in that the pc's reactive bank was operating the E-Meter.

Now, this is an awfully good joke on this auditor because that is what an E-Meter is for [laughter] and what it was designed to do. And of course, the E-Meter always tells you before the pc knows about it. You see, even though it's just a split second, the meter knows before the pc does. So the common and ordinary action is, of course, to ask a pc a question, you get a fall on the meter, you say, "What was that?"

And the pc said, "Oh, was there something there?"

You know, that's kind of his feeling. Whether it's just for half a second, he's still got a feeling on it. He will once in a while kind of feel the jolt in himself and tell you, but he has this "Glmmp," you know, "What was that?" you know?

And then he says, "Oh – oh – oh – well, that's the time I robbed the bank. It was nothing much. I robbed the bank, yeah. Whew!" and the meter frees.

And that's what an E-Meter is for. And this auditor asked me, actually – put the question to me that this was a peculiar pc and that the peculiarity is that the reactive bank acted on the meter. But look, that's a good thing. This auditor, when he finally gets the answer to that, he has actually made a virgin observation of the thing, and he'll all of a sudden come up with an awful cognition on this. [laughter] You got the idea?

Well, that's better than just fooling around with it – with a box – because Ron said to, you know? And I think that in past years auditors used to do that. They just used to fool around with the box because Ron said you had to have one in your lap. [laughter] Because I would find the most remarkable settings on meters sometimes, and so forth, and all kinds of things going on, that had nothing to do with the pc or the case. It is connected directly to the pc's reactive mind so, of course, you get this answer.

Now, supposing the reactive mind was moving this, that way; and instead of you seeing it on the needle here, supposing the needle were being moved by the pc's reactive mind. To hold the needle at set, your tone arm would be doing this, see? My God, what – what – how much meter action do you want? How much tone arm action do you want, see? Get the idea? Look at that!

And you see, that's about what the reaction is causing over here, see? Meter can't even keep up with it. How much action do you want?

Well, the oddity is that when you're running a pc whose goal has rockslammed…
I'll tell you another little peculiarity, while I'm going by it, I noticed the other day. You know, the goal becomes less intense after you find the terminal. Did you know that?

Do you know why that is? Because the goal is the significance which surrounds the terminal. And the person's attention has been yanked off the goal over onto the terminal, where it was fixed anyhow. You got it? So therefore the goal, after you found the terminal, usually will read less now than the terminal.

For a very short period of time the goal reads as much as the terminal, but after you've assessed an awful lot of terminals, that goal starts looking awfully thin and ragged. And it still will – will flick a bit – it'll still react a bit – but it was the right goal. And it isn't the time for you to start doubting, "Well, was that the right goal?"

Now, you could probably strip a goal off by stripping the fellow's attention off all the terminals that that goal was represented by, see, and then the goal would go null. And the terminals went null. And then you go back and look for the goal and the goal goes null.

You see, the person's attention is fixed on the terminal. See, there is nothing in a goal for his attention to be fixed on. That is just air and theta. See, that's nothing. But a terminal is something, mmm. And he got into this goals line. And what you're doing is reversing this situation. He had a problem that had to do with a terminal, so he then reactively achieved a goal to solve this problem. And the goals he comes up with are solutions: If he could just do this, then that series of problems would be solved. You see, that's what a goal is. It's a solution to the problems which have been given him, usually by terminals.

And of course a terminal can also be just an idea to him, too – which is a bum thing; we hope it isn't.

He was approached all of a sudden by this terminal, and it – he got a problem – probably got some overts on the terminal or something. And then eventually, because he got overts on terminals in this way, the terminal itself approaching him could overwhelm him. That leaves his attention fixed on the terminal.

The little tag that is hanging out on the bank is "goal." You can always reach the goal, whereas you very often don't reach the terminal with any other assessment, see? I have found a more reliable tag in the goal. It's a little label, and it's sort of hanging out here in the light from the dark, dark bank, you see? And it's a little red tag and it says, "On the other end of this thing is something that has overwhelmed the living daylights out of me. If you will pull here, package will open neatly." [laughter]

First observation that something like this would happen, by the way, is clear back in 49. Every engram, by the way, leaves its own little tag. The whole track may be in a complete, spinning loop; all parts of the track are all parts of the track, and there it is in a crumpled ball. The odd part of it is that there's always this little tag reaching out of the ball that you can pull, and the track starts coming apart. You got the idea?

I'll give you an example. This boy has always been worried about red caps. Red caps actually upset him, and for some reason or other red caps are a very desperate and violent thing, so we'd better not have much to do with them. You get the idea? Red caps.
All right. You go into this case on the subject of red caps, and you will find a nice, great big, juicy engram that the pc knew nothing about. He was in a desperate automobile accident at the age of six and he hasn't a clue about it, but the driver of the other car was wearing a red cap. You see, there's always a piece of the engram showing.

Well, now, we've gotten smart enough here so that there's a piece of the whole track showing and that's called a goal. And you start knocking these goals out, one after the other – you actually do start knocking goals out; it's a form of auditing – and as you move ahead trying to find a goal, you eventually will find the biggest tag that has been left out. See, this little red tag, and it's the biggest, most visible one and nothing will pull that tag. And that is attached to the toughest terminal that overwhelmed the pc. You got it?

So now you're going to do your Goals Assessment. Well, don't be amazed that the little red tag now isn't quite so red. See, we pulled it; we've got fingerprints on it now. And it isn't quite representing what it represented before.

So after you've found a goal, you've proved the goal out, and it's there and it won't change and it won't move and that is it and there it is, boom – now we actually follow the string down and find out what it was attached to. The pc's attention of course goes, clang! onto the terminal where it was fixed anyhow and this little red tag will not read as much on the meter now. The goal won't read as much on the meter. The terminal will now read more than the goal, after you've really shook the terminals out. You got the idea? It's only for a little while that this tag will read.

Now, when you've got that terminal flat you've got to check for the tag again. And when you check for the tag again it's liable to come back and read better, because you've got his attention freed off of it and it may be attached to something else, too. So you always inspect the goal again. So goals tend to disappear on meter read, but they still flick, they still click and so forth.

All right. As you're running this case on assessment, this case develops, on the goal, a rock slam. And as you're assessing, you just – rock slams become more and more visible, more and more visible and many falls are apt to drop into the category of rock slam. You start with a fall and you wind up with a rock slam. You got the idea?

When you've got a rock slam assessment on a goal, you'll have a rock slam assessment on the terminal or you haven't got the right terminal.

Now, you rock slam assess on the pc on the Prehav Scale. In other words, you assess only for levels that rock slam. Have you got the idea? You're running a rock slam case and it's all going to rock slam from here on out. Have you got that? Everything is going to rock slam.

So naturally in running the case you run the rock slam out. And if you don't have a rock slam – this is a conditional rule; needs to be proven out a bit more, but I think you'll find it holds true. When your rock slam has been gone – there's no rock slam of any magnitude – for a period of twenty minutes that level is flat for that terminal. You got it?

Why? Well, your rock slam is now somewhere else on the Prehav Scale. And the more you run an ordinary falling level, the more your pc is going to get upset because his attention
is affixed over on here, you see, and he can't keep his attention off of it. So he's actually shooting to another part of the Prehav Scale. Got it?

So you run rock slams out and the same rule applies. The rule applies uniformly and routinely. And that is simply this: that if you have assessed on a rock slam – whether on a general level or on a terminal/goal level – if you're assessing rock slams you must run the rock slam out only. And then for twenty minutes there must be no rock slam on that terminal. And that's, by the way, by the stopwatch practically; that's really twenty minutes. Then you can consider that level flat and reassess. And you reassess and find where the rock slam is now. And now you will get a new level that is rock slamming and you run that out. You got the idea? That's running by rock slam.

But as I've just demonstrated to you, a rock slam is a **terrific** amount of tone arm motion – fantastic amount, even though it's not visible. It's the needle that's going, not the tone arm. But if you were to hold that needle at set – if you could – you see, that was how your tone arm would be going for that level.

Now, it can happen that a present time problem of long duration can rock slam, and that means that the pc is on his rock chain, which is his goals chain in this particular case. That's why we call it rock slam, because that's his rock chain. And his goal is sitting on his rock chain. And so you're running right on down his rock chain.

Now, you're probably going to find more rock-slamming pcs than you really suspect exist. There are quite a few of them around. They are not a rare phenomenon. But that's how you do a rock slam.

If you do a general assessment and one of the levels rock slams, you've had it, because you now have to assess for rock slam. You won't find anything but rock slams on this case. You may find a fall, a fall, a fall, and then all of a sudden rock slams during the assessment.

Well, a rock slam persists. And the difficulty in assessing a rock slam is that the rock slam persists for several levels after you've turned it on. So, there is a rule about this: Every time when you're running a Prehav Assessment or you're running a Goals Assessment or something and you turn on a rock slam, don't go to the next five levels without getting rid of the rock slam.

Now, how do you get rid of a rock slam? You can run, essentially, TR 10. That gets rid of a rock slam. You just say, "Floor, floor, floor, floor, floor, floor," and there's no rock slam. You got the idea? Now you say the next level. But boy, do you note that that one you just had rock slammed because that's now what you're going to be looking for. You start turning rock slams on, on a case, that's what you'll follow down to. Okay?

All right. Good enough. I hope you're doing all right with your training, and I hope your auditing is coming along fine. You all look better.

All right. If you get a lot brighter tomorrow, why, you'll have some questions. Okay? [laughter]

Thank you.

_Audience:_ Thank you.
Thank you.

I was just looking at a car outside that's got a hole in its fender. [laughter] And I tried to audit it, and it didn't respond. So. It's in apathy. (That's what you call line charging one present time problem out of existence.)

Okay. This is what? The 2nd of June, isn't it?

All right. Now I trust you have some good questions today, and what's the first one? Yes?

*Male voice: Regard to energies and flows and the Prehav Scale.*

Uh-huh? Yeah?

*Male voice: Well, sort of a general question. Well, sort of – Could you give us some –?*

All right. I'll give you some gen on that. That's a very simple question and a good one.

We have this kind of a situation in a mind where we have a phenomenon where an individual has flowed in one direction too long. Whether that is out or in, he has flowed in one direction too long. Let's take something on which I have a fair subjective reality: A writer who has written too much. You know, he's just written-written-written-written. It's out-out-out-out-out-out.

All right. Let's take another example. Let's take a shipping clerk, and he ships-ships-ships-ships-ships-ships.

And one fine day he wakes up and he says – the writer says, "If I have to write one more book, I've had it. I think I will go off and join the French Foreign Legion." And the shipping clerk says, "Well, I feel very degraded and I'm going to quit." Why?

Because these things have flowed in one direction. Well, it's a phenomenon, an electrical phenomenon really, and we get an awful lot of our material from the field of nuclear physics, or used to, and now we're telling nuclear physics. That is to say, we're in a position now where we know a lot about energy and so forth, that the boys crawling in and out of the woodwork at the atomic-energy-university-grant areas never heard of, and are always quite amazed about. The phenomena of standing waves, of tendencies of flow, sizes of particles, or...
if there are any, and such things as this, are probably getting better known to us than to other people.

And you get a ridge because, actually, of the inertia of a particle. It's no more complicated than that. There's a little bit of Newton's law of interaction mixed up in all mental activities by people who have gravity effective on them. Now, if you're affected by gravity and you don't float off into the air, then to some degree or another you're affected by Newton's law of interaction.

Well, that's nothing much to you, nor here nor there, but actually is the basic reason for – and the postulates causing this thing – are the basic reason for frozen flows. "For every action there is an equal and contrary reaction."

All right, thetan believes this, so when he pushes a particle out, he also has the reaction, you see, of the particle coming back, you see? For instance, we push this E-Meter, and the E-Meter pushes slightly against us.

Well, Newton's law of interaction is not true, fortunately. It is only true for objects of comparable size and mass. The *reductio ad absurdum* is you stamp against Earth, Earth stamps against you. Well, I've never had Earth stamp against me, so – except when I was up in airplanes and got careless and didn't keep the airplane under me or something like that, and then it was obvious that I was standing still and Earth was moving toward me. The point is, here, that for objects of comparable magnitude – a push against the E-Meter, you can actually feel it in your hand; there's a slight backpush.

All right. The facsimiles of these backpushes are neglected. Your attention is on the E-Meter, don't you see? Be pushing it. Well, your attention – the attention of the writer is on pushing out the words and pages, and the attention of the shipping clerk is putting out books, you see?

All right. So if this is the case, then they utterly neglect and rarely as-is – because they're not terribly aware of it – this little backpush. Every time you throw a book in the mails, you see, why there was so much effort coming back toward one, and it's neglected.

Similarly, let's say, the colored gentleman who has a good, high-paid job: sticking his head through a canvas and letting people throw baseballs at him. I think that's a well honored profession of one time or another in carnivals and so on. All right. So here he has these baseballs coming in at him all the time – the visible picture, you see, is made of everything, but his attention goes on the incoming baseball.

Yeah, but as this baseball is coming in, actually there is a contrary reaction that he pays no attention to, because he's interested in the baseball. He's not interested in that contrary reaction. He wishes there were more of it, if anything, you see, to slow that baseball down. And the next thing you know, he will have too many baseballs thrown at him.

Now, he's actually the – it isn't the injuries of the baseballs or anything; it's just the fact that he's built up a ridge in front of his face that consists of not the *incoming* baseball, but the resistance going back *against* the baseball. You got the idea? Well, it's the resistance back against that baseball that sticks there, not the baseballs. So he has too many baseballs thrown at him and all of a sudden gets a horrible feeling of pushing out that way.
Similarly, the fellow mailing too many books gets a horrible feeling of a mysterious, undefinable pushing back against himself. You've got the idea? And he couldn't possibly explain what this pushing back against himself is. He feels like he has pressure on himself.

Why, I had somebody the other day talking about she felt she had pressure on her face, see? Well, it's just this – it's the reverse push. So therefore it's inexplicable. He knows it can't be books, you see, because books go out, and this pressure he's feeling is coming in.

And the fellow with his head through the canvas: He knows it couldn't be baseballs because baseballs come in, whereas this pressure makes him feel like he's losing everything in front of him. You got the idea?

Well, he'll feel like he's losing everything in front of him up to a point where he can't lose any more in front of him without it becoming painful. See, he's got an outpush. See, the reaction of the mind against this incoming object is this outpush, this outpush, this outpush.

And the next thing you know, he just figures he can't push out one more thing. If he did, it'd kill him. He's sure of this. And at this moment he has a stuck flow. If you ask him to push out one more thing, he says, "That's impossible." The one thing in the world he knows he can't do is push out that one more item, and he goes unconscious. And that is dope-off. It's flowed too long in any one direction. It's not a simple mechanism where just "flow too long in any one direction produces a stuck flow." I've given you the whole gen of it here. It actually produces a reverse flow. Flow too long in any one direction produces a reverse flow to it. You got the idea?

So frankly, at that stage of the game it's a toss up whether he's going to pass out because you throw a baseball at him, or he's going to pass out because he resists something or tries to push something away from him.

Get this exercise: "Now get the idea of a baseball being thrown at you. Now get the idea of throwing away something." That's as far as it's going to run without locking up, you see, because you – now you've got to say, "Get the idea of a baseball thrown at you. Now get the idea of throwing away something." What are we doing?

In essence, we're running, really, a flow that is all in one direction, but we're running the flow itself and his resistance to it alternately, and it goes flip-flop, flip-flop, apparently.

Now, we say, "Get the idea of a baseball being thrown at you." "Thank you." "Get the idea of a baseball being thrown at you." "Thank you." "Get the idea of a baseball thrown at you." "Thank you." Now, one of two things is going to happen: Either the field or the energy particles in front of his face are all going to go black – see, that's a symptom of a stuck flow – or he's all of a sudden going to get an avalanche triggered, and the next thing you know, all the baseballs that have ever been thrown at him, hit him.

That's an avalanche. Brrrrrrrr! – they come in, you see? He could just as easily get an avalanche of resistance. But he'd be in awful bad shape to get the avalanche of resistance, you got the idea? Actually, what we mean by an inversion is the avalanche of resistance. You see? The fellow has no longer any effect from it coming in. He's only affected by resisting it.
Now, if you want to see some guy in this kind of a state – and they are around, in practically any case you could find this mechanism on them – you say to this fellow, "Now get the idea of resisting a baseball", and he gets the baseball in his face. Now you say, "Get the idea of a baseball hitting you", and he feels like he's going to fall over on his face because he feels himself pushing out. You got the idea? These flows have exactly turned around. And that's what we know as an inversion, and that's actually why we call it an inversion. Because it's a flow gone backwards.

Now, postulates follow this kind of a thing, you see, and the fellow will change his mind on the postulate. Instead of interest, he gets a peculiar interest. Well, it follows down the mechanics of this other thing.

Now, why don't we run O/W, O/W, O/W, O/W. Of course, O/W is just dandy because that's out, it's in, it's out, it's in; it's reach, withdraw, reach, withdraw, but only from one person. And let me tell you something about reach and withdraw from one terminal: It doesn't account for all of the motions possible.

Now, as long as the individual is below change, O/W is effective. And he only runs well on O/W from what he caused and what he withheld – as long as he's below change. That's the make-break point of O/W. "O/W, A Limited Theory" – I call your attention to that bulletin. I give you another datum right on the top of that bulletin right now, and that is that the limited theory of O/W stops at the level of change. There is the point below which O/W is 100 percent effective, and above which it ceases to be effective. Change is the explanation of it all. Why?

Well, I'm sorry. I don't feel as glib today as I did the other day when I explained it to somebody very glibly. But it was sort of interesting. It's a sort of an involved explanation, and there'll probably be a better explanation for it, but I explained it perfectly and then I didn't listen to myself. [laughs] And – but it was – it's like this: the outflow and the inflow gets locked up in some particular fashion. And then below this level, the individual is totally individuated: he can no longer change his viewpoint; he can no longer experience change; and the moment he becomes very afraid of a change occurring – leaving him on some individuated point of the bracket – . And as they go crazy, they don't go down from O/W.

On a lunatic, a real raving lunatic, you'd probably have to find the bracket that was live, and it would be way below O/W. See, it'd be some, oh, I don't know, any one of thirty-two sides of the bracket, you see. It would be what others were doing to others that would be the only side of the bracket that would work. It'd be the others doing it to others or something like that, and then that would be terrible. They have great reality on others doing it to others, and as you shook his mind up about it a little bit, you'd just shift him around on the bracket and he'd say, "Well isn't it terrible how I caused World War II." When you know personally he was – he had a body in pawn on Mars at the beginning of it, you know. He'll all of a sudden come up with obsessive cause. Well, actually that's a high point, but it stays in for quite some time. As long as the individual is allergic to change, he individuates, because the change on various flow lines are extremely productive of these ridges.

Let's say the individual is fluid on the subject of change. He doesn't mind change. He can handle change; he can experience change. So therefore, the baseball coming in and hitting
the fellow with his head through the canvas – well, if he could experience all the changes that were there, he wouldn't resist it.

But if he starts resisting the changes and starts setting up this Newton's law of interaction, the next thing you know, why, he's halfway around the bend on the subject of O/W. He thinks there will be a consequence of everything he does. He just knows he won't be able to breathe without there being a consequence. All he's got to do... therefore, to go through life – it's a perfect solution – is that every time you pass a sporting goods store, you don't look in the window and see a baseball lying there on display, you see? That's a good one! That's fine! Now, we know that. That's safe. You know? He knows there's going to be a consequence to what he does – everything he does.

So he knows better than to walk down blocks that have sporting goods stores in them. And then he knows better than to go downtown where there might be that block. And then he knows better than to go out in the yard, because, you see, he might see the town. And we get the odd phenomenon of somebody being stuck in the house, and then we can't figure out: Why is this man stuck in the house? And we start running houses. No, it's baseballs. [laughter]

Now there's the goofball reach of this, and it's practically unplumbable. But you can follow it down with an E-Meter and find out why the individual is stuck in the house: He's trying to avoid being hit in the face with baseballs that are no longer being thrown at him, and this is very logical. "All – all horses sleep in bed" sort of a proposition.

By the way, that's becoming such a stable datum that somebody told me the other day that they were going to start making Simmons beds for horses.

Anyway, here's – here is your change. So when an individual can no longer tolerate change, he becomes afraid of consequences, because the consequences of change, of course, are change. And he can no longer stand by consequences, so therefore, he's going to have consequences. So the moment that he's worried about consequences, why, he's into the O/W bracket. And that's why everybody on this planet can run O/W so easily at lower stages. But as you go up on SOP Goals, you run out of this.

And I have not burdened your brains, and I have let you waste some auditing time, by making you run all brackets from the beginning on everything, because the Prehav Scale is fairly rapid and it will very shortly catch up with all brackets. You got the idea? The change gets leveled for a level of the Prehav Scale. In other words, a tolerance comes up. And all of a sudden, instead of it only being effective on himself to others, it becomes effective on other brackets.

Now also in view of the fact that the individual can be stuck on these other brackets and then it'll bring it back onto himself, for a case below average or a case above average, it is safest to run brackets. You got the idea? And for the average case, you waste a little time running brackets. But you had better not tangle your wits up with at what point he ceases to have the O/W mechanism sort of thing function – cease functioning. At what instant, on what subject does he have this function? Well, I couldn't calculate it myself, so I'm not going to expect you to. So the safe thing to do is run brackets. You got the idea?
So fear of consequence, which is to say fear of change, results, then, in a resistance to change which brings in Newton's law of interaction. The guy must resist changes or motions. So as soon as he has to resist changes or motions, he starts setting up these ridges as I described to you at the first part of that – this statement, you see. And when these ridges are set up, the only way to take them apart is take them apart on both sides alternately. You take apart the push out, you take apart the push in. Therefore, it doesn't matter whether the individual is stuck on pushing things out or stuck on pulling things in; you're going to take apart both of it anyhow. And then it doesn't matter if he's really spiny on some point or another, as most any mind is, another bracket out here to another. You know, this interchange out here. He's dispersed outside of himself and this is really the one he's running and – while he's sitting over here and not running it. So it's best to have that bracket functioning, too, don't you see? And you save time and you don't bog a case.

Now, what it requires to run the exact number of commands necessary to get the exact flow out of the road is actually beyond your ability to detect at this stage of the game. But running all sides of a bracket evenly takes care of all the flows you will encounter without jamming any. So it's a way out of the rat race.

Now, if an individual goes unconscious – which is to say he can't confront the change – if he goes unconscious at some point while you're running a good five-way bracket, one of two things is wrong: He's either got a bracket that is so unbalanced that it won't take both sides of it. (So, well, all right. So what. So he goes unconscious. He'll recover.) Or more particularly, he isn't doing one of your commands. And in view of the fact that this is the only one that can get in your road – that he isn't doing one of the commands of the brackets somewhere – then when a pc goes unconscious, you should always check if he is having tremendous difficulty with and isn't answering one side of the bracket. And if he isn't, all right! Don't hang him with it. Just check him over, you know?

The way you do that is you ask – just once around – you ask him the question, "Did you – ", not "Have you been answering it," but "Did you answer that?" Just once around. "Now, did you answer that to your satisfaction?" And the fellow says, "Well, uuhh, no, I – as a matter of fact, I never have been able to answer that leg of the bracket."

In other words, you're – you're inadvertently guilty of having given a number of auditing commands without getting an answer, and you must always – one of the basic rules of auditing is you always get an answer to your auditing command. One command, one answer. One answer, one command, also.

Although that sometimes gets disobeyed when you run into a very looped up bracket that'll avalanche. You know, you're on some hot subject with the pc, and it goes brrrrrrt! and you've got a whole bunch of them. And the funniest thing I ever saw was a pc in a staff Clearing Course one time, sitting there, he said, "I can't answer the what have you failed to help, you see, because it just keeps going through my mind..." And he looked very round-eyed at the auditor and he said, "It just keeps going through my mind: 'Who, who, who, who, who.' You just triggered the automatic side of the bracket. That's all there is to it.

Now, does that answer your question, Ken?

*Male voice: Yes it does. Thank you.*
All right. We got another question? Okay. Gee, I'm glad you're getting smarter. Yeah, Jan?

Female voice: One came up today which was on just how much, on American meter, the relaxation of the pc's hands while running a process may influence the tone arm position, and whether it's just okay to allow for this. And I checked how much it just was with somebody not being audited, and whether you could just allow for that relaxation of the hands as being indicative of some mass shifting, so you count it as process effect anyway. See what I mean?

Don't worry too much about it.

Female voice: Just don't worry about it.

It's just like I ask a pc, "Now, all right. Now, have you got a withhold?" And he wraps both cans around his head and changes the shape of his feet and – and kicks the E-Meter and backs up and coughs a couple of times and so forth. Well, I say it read. It read. I ask him again just to make sure. It always does. Similarly, this is just taken into the gross error of the situation. Trying to eliminate anything like that as an error would be nearly impossible.

Female voice: Yeah. It amounted to practically half a tone on an American meter...

Sure.

Female voice: ... just a relaxation of the hands that wasn't even visible, particularly.

That's right. I wouldn't worry about it too much ...

Female voice: Yeah. All right.

... because they're not going to relax and tighten their hands for the bracket.

Female voice: Yeah.

You know. You've got a meter – an inherent error in any meter that has to do with the pc being connected to it. And it's not a very gross error.

You can do some weird things. You can have the pc hold to the tips of the electrodes just with his thumb and finger, and get one of the highest tone arms you ever cared to see – nice, heavy, high tone arm with a heavy needle. Yeah, you can just have him hold – just hold the tips of the can, just barely touching both cans, and you get a very tough looking pc. But you can get a workman with calluses and have him hold onto the cans, and you don't get a tough looking pc because of the calluses.

The size of the person's hand might have something to do with it. A lot of factors could enter into it, but actually it's not gross. It's not enough to bother with. The E-Meter tells you most everything you want to know. And in view of the fact that you're adjudicating basically on reaction of the meter over a given period of time, we can assume that the pc over any given period of time – if the process is flat – is more or less static. So you see, it wouldn't tell you the process was flat or not flat when it wasn't flat or something of this sort. It's not even anything that you should watch for but you should do this with an E-Meter, just like it says in E-Meter Essentials. That it isn't kidding. That's a whole drill.
You should actually get somebody to sit down and go through all the body motions that there possibly could be, and handle the cans in all sorts of weird ways, and lift their fingers and put them back again, and cough and sneeze, and just watch what happens to the needle and tone arm of the meter. And then, that is the best way of sorting out body-motion reactions on a meter, and you can actually get so good at them that you don't... The only one I have to look at is when I'm getting a rock slam, or I start to get a – I'll get a momentary rock slam of some kind or another. I will normally look over at the pc's hands to find out if he lifted his finger, because that can be approximated. You can lift your finger and get a rock slam, but it isn't constant enough and you will all of a sudden see that it is the hands or it is the rock slam. You can differentiate there, too. But always make sure that it isn't somebody going – playing Morse code on the – on the electrodes.

Now there's one more point about this. You can take both cans in one hand, as you do in these "point out" things, and you will find out that the left side of the body and the right side of the body, and the right side of the body versus the left side of the body are all different. And this is apparently of great astonishment to many auditors, and it upsets them no end. Well, I don't know. So the – you remember the old epicenters? It just means the – the guy's epicenters are out, that's all. If you wanted to know if a pc's epicenters were in good shape or not in good shape, have him hold both cans in his right hand, then have him hold both cans in his left hand – put Kleenex between them, and both cans in his left hand, both cans in his right hand – see if the read is the same. If the read isn't the same, his epicenters are out.

What are you going to do with this today? Nothing. It's one of those little things we cannot live without knowing. You know, it's like reading the almanac. But I've seen – I've seen auditors get quite concerned with the fact this happens. It also will read differently if you shove them under the pc's armpits. It'll also read differently if you hold him down, take his shoes and socks off, and adhesive-tape the cans to the soles of his feet. It'll read differently, but only in terms of how much resistance it's measuring.

Now I can imagine it one day, if this E-Meter ever gets into the hands of the government, that is about the – 50 percent of the populace will probably be getting their E-Meter checks that way. The cops will jump on him and the fellow says, "I won't pick up the cans," and the cops will jump on him and hold him down and adhesive-tape the cans to the soles of his feet and find out if he murdered his grandmother. And because the guy is resenting it... Anybody who would do that probably couldn't read a meter anyhow, and if he was a member of one of these existing governments, why, he'd then, of course, say, "Well, it had a reaction. Ah-ha! Murdered his grandmother. That's good enough for us. Hang him!" Actually, they – that wasn't what they were after him for; it was because he hadn't – he hadn't not paid taxes. Yeah, it'd be a pretty confused picture.

Was there another question?

Female voice: Well, it was just that today we found out how to produce a perfectly steady, continuous rock slam on a meter with a body reaction ...

Good.

Female voice: ... with the cans.
Female voice: Just take the cans in both hands and keep rotating them like this. And you get a beautiful, steady rock slam that just goes on and on.

Good enough. All right. All right. Take the cans in both hands and twiddle them, and rotate them round ...

Female voice: Just goes round and round.

... and round and round and round and round, and you get a rock slam. That's worth knowing. It's a good way to demonstrate a rock slam. It's worth knowing how to demonstrate any of these phenomena. Very interesting. Okay, is there anything else?

Female voice: Ron.

Yes?

Female voice: I would like to have something on tape with regard to why the various levels are on the Prehav Scale. Because some people come up to me and they say, "Why is this Create here?" You see, and I have to tell them, "Well, this is obsessive create, you see? "And I'd like to have ...

'Tisn't, you know? It's reactive create.

Female voice: Well, reactive create, yeah.

All right, that's good.

Female voice: All right.

I'll answer that.

Female voice: Yeah.

Why are the levels on the Prehav Scale on the Prehav Scale? That's a pretty broad question. [laughter] I'm not laughing at Suzie but I just suddenly realized that somebody asking that question, that would be an interesting question to bring up. Holy cats!

Female voice: No, I just wanted the levels gone through, so I can take ... Yeah, well, that's – that's approximately it. That is the same question.

Female voice: Right.

Boy! How much time we got here? Well, I'll tell you, I've been studying the mind for a number of years and there are various phenomena have been noted. And these phenomena are not necessarily in agreement with a sane and normal society, the way it thinks it operates. And that's why we're winning, because with this sane and normal society that everybody thinks is operating, nobody's winning.

So you see, there would be – basically and foremost, we would have had to have recovered some of the broad differences between how people think it ought to be and how it is. Now, if we've recovered this broad difference between how we think it ought to be and how it is, then, of course, we can as-is some of the difficulties and upsets of a human being. But if
we stay with how it *ought* to be, or how we're educated to believe it should be; ah, we're hung with these alter-ises.

Now we've got in the Prehav Scale, pretty close, actually, the way it is, and we haven't got in the scale the way it ought to be at all. So it comes in with a dull crash to find God at the bottom of the Prehav Scale. What? Cause and then Faith.

Oh, I'll give you an idea. I'll give you a perfect substantiation. I don't hang around on – on the backs of auditor's chairs ready to stick out my chest like a pouter pigeon and pat myself on the back saying I was right. I merely make a disgusting habit out of being right, and I sort of take it as a matter of course when it works out that way – although it's usually very interesting to me that it did work out. It seems curious sometimes.

But it's like this: A pc the other day in an HGC was audited on Faith, and he blew straight out of his head, of course. Where would you think a level was, that the first moment that an individual touched it, he would sort of, kind of disappear out of the body and away and gone and here and there and everyplace else – wouldn't you say that was a pretty low level?

And yet that has been the most highly advertised commodity for the last two thousand years that anybody has been trying to sell. You talk about selling blue sky. Everybody has been rushing up and down the streets with a nickel on the drum selling "Faith! Faith! Faith! Faith! You've got to have faith! You've got to have faith!" We've got something here in which you don't have to have any faith to have it work, and that is, of course, the most astonishing thing in Scientology.

So, here comes Faith: I put it on the bottom of the Prehav Scale because it belongs there, because it's a non-observational level. It is the most non-observational level there is. There is no other level that is as least – as less observational than Faith. Everybody's got faith. See?

Well, by definition, faith is accepting something without inspection or observation, and no checkup of any kind. Now, that isn't anything wrong with faith. There isn't any – there isn't anything *wrong* with doing this. If you didn't have some confidence in your fellow man and walked around a little bit blindfolded, you'd never get these surprise engrams. [laughs] But I don't mean to be sarcastic. The thing actually is there. It isn't that Ron put it there. It's where it is. So there it is. All right.

Now let's take up this next thing – as long as it's amongst us girls here – let's take up this thing called, if you'll excuse me, God. All right. Let's take a one-Akhenaton proposition. See, there's only one and there he is, and he caused everything. Get that now: *he caused everything.* Do you realize what shape that god would be in right at this moment if he did nothing but make and create things, and you could never reach him and never say anything to him? Now, what do you think would happen?

I'd say that anything – if it was just one thetan that was called upon to make all these solids and spaces, what kind of a duress must this fellow be under to have to propitiate the lot of us that much? I think if there's anybody spun in, it must be this god.
You look at all the signs and analyze it anyway you can in running pcs or looking at life, and you'll find out at once that this cause -- you know, just cause, you know? Like that. "I'm going to hit you with the thunderbolts and you can't hit me." Brother, what that would do to a thetan! So I figure God plowed in a long time ago. [laughter]

Now, that's an awful comment for me to have to make but that's -- that happens to be -- actually happens to be my full belief on the thing. I've looked it all over from every side, and I can't get away from this opinion that if there was one God, man, he's had it!

And I even thought one time of, gee, you know, we could whip together a handy, jim-dandy little religion here in the "Society for the Resurrection of God", see, on the basis that the poor fellow plowed himself in helping us all out, and that we should give him a hand now. I know this all sounds very loopy and very ridiculous, but that is why that level is there. It works there.

Now anybody who is on an obsessive cause is practically nuts. Now, we are talking about, of course, the reactive reactions. This E-Meter tests reactive reactions and that's all it tests. So if we had nothing but analytical reactions on a scale, then the scale would be of no use to us whatsoever. So we're looking for the deep-seated things. The Prehav Scale is actually the reactive scale, the reactive bank scale.

When an individual is at length able to have, he doesn't have to have a bank. So of course, the bank disappears at the point Have. So there wouldn't be anything to measure of any kind whatsoever if we measured it on the analytical scale. But there isn't anybody in this corner of the universe that I know about right now that knows what that analytical scale really is except our Axioms 1 and 2. That's the best description of it.

So the analytical Have scale -- above Have, the analytical scale would simply be Axioms 1 and 2. Those are the only basic truths there are. Those are fundamental truths. If anything is true, then they're true. All other truths are the result of postulates, considerations and agreements. So as a result, it would just depend on what a bunch of thetans got together and agreed would be on that scale. That's -- that's the whole thing. And they'd say, "Well, this is the scale and we're going to have saucepans at this level and we're going to have chimney pots at that level and we're going to have singing 'Dixie' at this level and that's our scale." And in view of the fact that they were analytical and could change their minds and weren't very serious about it anyhow, of course, that would be the scale.

No, we're talking about the fixed, driven-into-concrete, now-I'm-supposed-to, this-is-it, can't-be-violated, this-is-why-we're-here scale and that's the Prehav Scale. And this is the order of the value of postulates which are fixed postulates and which are not usually changeable and have never been changeable in the absence of Scientology. And that's what that scale is all about. But as far as that's concerned, I think it's a quite remarkable scale.

Now, at some time in the past, at the beginning of track sometime, this scale must have been dreamed up just about like that. Now, to recover the scale again is quite a trick. Now, I'm not trying to tell anybody that all levels that are on the present Prehav Primary Scale that should be there are there. There might be some levels that aren't there. I could think of a dozen to put in offhand, but how much time have auditors got to assess the Primary Scale? And they're all on the Secondary Scale anyhow now.
Now, there are also some repeating levels on that scale. For instance, at Cause, you might not get a fall at Cause and you would get a fall on Blame and Blame was on the original scale, you see. So you have to watch that Primary Scale rather alertly. But there's harmonics. So you'll get more drops on the new Primary Scale with its sixty-six – sixty-five levels – you'll get more drops going up and down it, than you would get on the old scale, because there are some action words in it, rather than conditions.

There's another use to this scale that I haven't burdened anybody's wits with yet – by the way, just in passing I'll comment on it – and that is a combination inside the Primary Scale. And man, that can get so involved that it is marvelous. Let's supposing you assess No Motion – this is the most flagrant example. Let's supposing you assess No Motion and as you're assessing you found out Agree fell and – falls and No Motion falls. Now you go into the Secondary for No Motion and then into the Secondary for Agree, and you find which two falls on that, and you'll get some of the most remarkable combinations of commands you ever heard of. You just try it sometime. You won't believe some of them.

You can't run No Motion all by itself. The pc is just liable to run into a brick wall. So you can combine it with almost anything that is on the scale, but it's usually Like, Dislike, Agree or Disagree. But remember you could combine it with anything on the Like, Dislike, Agree, Disagree Secondary Scales, which gets pretty remarkable. And then No Motion could be assessed all the way out onto its Secondary Scale, and you'd get some word for No Motion. And you just look it up when you see these scales and you'll howl with laughter because it makes some of the most fantastic combinations. But listen, it's going to make sense to somebody.

All right. Well, now, I hope – I didn't mean to slight your question in any way because it should be stated. I haven't given any lectures, done any talking about this Prehav Scale. It's just sort of grown and the only lecture I know of about it – or, the only lectures I know of about it – are in the Johannesburg Congress tapes and it's advanced so far now beyond those that there's hardly any recognizing it.

Its levels may not all be exact. They might not be the exact level wherein, but they don't have to be. There's no stress on this. Now, if I ever find one of them out, I'll put it right and tell you about it. But it usually is pretty good. The top of the scale is the top of the scale and the bottom of the scale is sure the bottom of the scale. And individuals will start to get a rise as you go up that scale at certain levels just like they did on the original Prehav. So all is pretty well with it. I'm very happy with it.

Does that answer the question?

Female voice: Mm.
Anything else about it?

Female voice: Mm-mm.
You sure?

Female voice: Mm-hm.
All right. Okay. Is there anything else? ...All right. Thank you. Thank you very much. And have a very, very good weekend, will you?

*Audience: Thank you.*
Routine 1, 2 and 3

A lecture given on
5 June 1961

Thank you.

If this were a formal lecture, I would be wearing a jacket and a bow tie. But I find I'm not able to talk well with a bow tie on. Keep restimulating all the people I've hanged in France. [laughter]

[part missing]

Well now, there are a few questions before the house, I am very, very sure. So give me a question here, quick. Yes?

Male voice: You talked about what it means when a preclear comes in, a different tone arm reading than he went out at. Well, what happens if the pc comes in at about the same tone arm reading but his sensitivity has changed sharply in the meanwhile.

That's an interesting point to notice. If the pc comes in with his tone arm out, you would, of course, at once be suspicious. You always check a pc's tone arm when he leaves session – it's on your reports – and you always glance at the last reading so that your next reading, when he comes back into session again, you can check against that. And that is about the first thing you do between sessions: You look at that difference of tone arm reading; and if you find a vast difference of tone arm, you of course want to know what happened between sessions – practically even before you start one. You got the idea? It's of that order of emergency.

Now, the things I have found on pcs happening between sessions are quite interesting. What do we mean "between sessions"? We don't mean overnight; we mean solely, strictly, completely and utterly if they get out of the auditor's sight at any time – during a break, I have known pcs to instantly go to the phone, call South Africa, or something, and tell the husband, "I have just decided you are a louse and we are through," clang, you see? And having expended forty-five quid or something like this to deliver themselves of these sentiments, come back into session again feeling very self-righteous, but won't run.

You got the idea? It didn't take them very long, but that was it, man. They got a brand-new overt. And every time a pc is having trouble with a case, this is a subject of overt and withholds.

So, now the question comes up, "What if the sensitivity knob goes out?"

Well, this would be very strange and peculiar indeed, because it would mean the whole E-Meter had turned a dial or two. You know, it might have gone all the way around the
dial. It would be an accident almost that it would come up with the same reading, but you had better check both sensitivity and tone arm. That should be added in, so thank you for the datum.

You've got a considerable importance now – just speaking and carrying with that – right along with that goes your rudiments in. Definition of rudiments: what it takes to get a session running and the pc in-session. Definition of in-session: willing to talk to the auditor and interested in own case. Are rudiments a process to get the case on the road? No, they are not. You run rudiments with a third-of-a-dial drop. Why? Because you've got a Joburg Security Check these days, and you don't have to be too sniffish for those withholds. And if it's a big withhold you'll get it on a third-of-a-dial drop if it's going to stop the session. The rule is that if the needle does not drop a third of a dial on the squeeze test, and at that setting no rudiment clanks, the pc, you will find rather consistently, is perfectly capable of being audited. Got it? So you don't use rudiments to waste auditing, because the processes today in the rudiments are so much weaker than any other process we've got that you are wasting time. Got it?

However, as you're going through with a third-of-a-dial drop setting, the needle does a twitch, *kerbango*. When you say, "Do you have a present time problem?" and it goes twitch – third-of-a-dial drop – you've got to handle it. Now, how do you handle it? You say, "Now, what was that?"

And "What was what?"

"Well, I had a little drop here when I asked you about a present time problem."

"Oh well, I suppose that's my... I've got to phone... uh... I've got to phone New Siberia" (the American Medical Association address). [laughter] "I've got to phone New Siberia at three o'clock and report," or something of this sort.

And you say, "Well, is that a present time problem to you now?"

"Mm... no, no." And it doesn't twitch.

You don't run it. Also, that is the extent of two-way comm. Two-way comm that goes four questions, turns into a process. You understand? And there are processes much neater for all two-way comm situations than you're going to two-way comm.

The American auditor has this frailty more than the auditors in other parts of the world. They'll run two-way comm for two hours. Don't do it, because there's just too many processes now and Prehav is too hot. And even the rudiments processes are hotter, you see, than two-way comm.

But two-way comm does give it an opportunity to blow. And that's all you do, is give the pc an opportunity to as-is the situation. He doesn't as-is it, process it. Don't two-way comm it out of him. See? Give him a chance to as-is it by saying what it is, and the fall disappears, and you're all set. You can ask him as many times as you want to the same question or some variation of the question. You know? "Are you withholding anything" "Are you keeping something from me?" "Are you embarrassed because you are being audited today?" "Have
you had some nasty, cotton-picking little unkind thought about the Director of Processing?"
"Have you suddenly decided Ron ought to be hanged?"

If anybody is going to do anything to me, they better not try to shoot me. The only overts I've got that I'm tender on are hanging. They'll have to hang me.

Anyhow, what's the extent, then, of handling these rudiments to get a pc in-session? Third-of-a-dial drop, and right down the list of Model Session, asking them twice, six or eight times – I don't care how many times you ask them – to find out what it is. That's one thing. Now, two-way comm would be a method of getting the pc to as-is this situation.

"Oh, your withhold is that last night you made love to an ape. All right. Now, how is that now?"

"Well, I guess it's all right."

And man, if that needle doesn't move, take it, man. That's all right. Just because you have peculiar ideas about relationships with apes [laughter] is no reason to follow this up at all. It's all going to come out in the wash. Furthermore, if the pc is still dramatizing something – now, wave your ears on this one – if a pc is still dramatizing something, it is too deep-seated to be reached in rudiments or by two-way comm. You got that?

So PT problems, ARC breaks, that sort of thing: ask about them. If you see a twitch, find out what that twitch was. That's the first thing, see? Well, that's not two-way comm; that's just interrogation to find out what the devil the auditor-pc relationship is here. All right, now you've found out what the twitch is and it's still there. Ask him exactly what it was. He tells you. Don't follow that up with another question and another one and another one, you understand; put your brakes on smoking right there. You say, "Well, you had relationships last night with an ape. All right, good. Now, how does that seem to you?" Clang! Well, you're going to do something about this?

In the first place, it's some kind of a weird overt-withhold sort of a situation. But it's certainly no longer a withhold from the auditor, is it? He told you. He might not have told you all. It's all right for him to tell you all of this withhold. You got the idea? But it didn't go away. Now is the time to run a process. Got it?

This came up on a present time problem. See where I'm heading? You see, you asked him present time problem; you got this kind of an oddball answer. What are you going to do about this? You better find out, if it's a problem to him, well what it is. Get rid of it. Get rid of it one way or the other on the rudiments. That's the best rule. Don't let it go off into the processes. But you're not going to handle the situation as a neurosis or a psychosis or something of the sort in the rudiments, you understand? You're trying to get it out of the road for auditing.

So you say, "What part of that situation could you be responsible for", or something like this, because it's a present time problem. And he tells you, answers a few questions. You say, "How's it seem to you now?" You don't get a fall. On to the next one, man, quick. See?

If it doesn't as-is with two-way... You can ask him all the ways you want to. It's a misdemeanor on your part, arrestable in the "Court of High Council", for you not to ask him
something in several ways to find exactly what it's falling on, you understand? That's a mis-
demeanor not to do that.

But now to go on nattering on two-way comm, trying to get this thing as-ised as two-
way comm, is a lousy waste of time on your part, that's all. Because a process would do it a
lot better. So you found out what it was and it didn't as-is. Now you run a rudiments process.
All right, you've got a rudiments process; it knocks it out; you carry on.

Now this interesting problem comes up. Supposing the person has a big withhold from
George. Big withhold, see? So you run O/W on George. Well, in the first place, you've done
something a little adventurous. It's all right; go ahead and do it. But you get tone arm motion
on O/W on George. Aw, that's too bad. You're running O/W on George. You better run it; you
better flatten it. But there are dozens of better ways to handle George, don't you see? This is
kind of unfortunate.

The tone arm starts moving from 3 to 6 on O/W on George. Well, now you've got a
process that's biting, you've got a pc that's running, and you've had it. What do you do with it?
The rule is the tone arm has got to be a quarter of a division or less for twenty minutes of au-
diting before you can leave a process. This applies, unfortunately, to the rudiments.

That's why you're always hopeful for a null needle on the rudiments. Because you
don't want to audit the case with the rudiments. But at the same time, if you ignore a drop on
the rudiments, with a third-of-a-dial drop sensit in it, you've had it. You won't do anything
in that session.

Now, you could crank up the sensitivity to 16 and ask the rudiments. Now what are
you doing? You're running the case, aren't you? "Are you withholding anything?" Ladies and
gentlemen, fellow students of Homo sap: Takes seven hours on some people to do a Joburg,
and you've asked it in one lump question. Now, what are you going to do? Sensitivity 16 is
your mistake. It wasn't a rudiment that fell on a third-of-a-dial drop.

By definition now, what is meant by "a rudiment out"? One of the rudiments are out
and the case is being run with a rudiment out. Now what is meant by this? It means there is a
reaction with the meter set at a third-of-a-dial drop – a visible reaction on the needle when the
meter is set at a third-of-a-dial drop. If there is a visible reaction on the meter with it set for a
third-of-a-dial drop on the can-squeeze test, that rudiment is out and you've got to do some-
thing about it. You got it?

Now, what about these cases – what about these cases that keep trying to go Clear on
us? And I suddenly realized the other night, although I've given you advice that you'd better
get your sensitivity knobs fixed, you know you're never going to get them fixed? There is no
sensitivity knob that will turn off far enough. When a person starts going into a floating tone
arm state, when they're up about Release, it'll just float further and further and more and more,
and you'd have to turn the sensitivity off further and further. And at some point the meter is
going to become nonfunctional. So you would be going toward the same situation as simply
turning your sensitivity knob off. Well, if a pc insists on dropping three dials on a third-of-a-
dial drop can squeeze with your sensitivity all the way off against the off switch, see, I'm
afraid there's only one other sensitivity cutdown that you could do, and that's just turn the
meter off. [laughs]
So what happens to this rule as the person goes Clear? Well, the rule is not very important as the person gets loosened up to that degree. How do you like that? It is not very important. Because what is the behavior of a needle as the individual gets more and more up toward Clear? The needle swings less and less on heavier and heavier charges. That's interesting.

I had a D of P ask me fairly recently, "Well, I don't think this is correct about this third-of-a-dial squeeze and the sensitivity and that sort of thing. Because people that are coming in here with loose needles are obviously in very bad condition, because they don't get much needle reaction when you ask them about ARC breaks and things of that sort." Naturally it's not a charged question to them.

But on somebody who's plowed in, down on the borderline of the nether regions, you ask him if he's got an ARC break and you get *wham, wham, wham, wham, wham! And you say, "Well, what was that?"

And he says, "You lighted a cigarette while you were lecturing"

Free floating needle, as the cases advance on up the line: Well, this is about three-dials can squeeze, see? You've got it – sensitivity as low as you can get it – three-dials can squeeze. That's all you can do about it. And you say, "You got an ARC break?" And you get a one dial-division drop. See, there's a very loose needle and you get a one little dial division – one of those little tiny things that's about a quarter of an inch long, you see? And you ask him that and you say, "What was that?"

And he says, "Well, actually I was withholding it from you that I just wrecked your car last night." Only this same person would be also in this category: You'd say, "What!" you know, and explode all over the place. And you'd say, "Well yes, I also took it into the garage and it's now been repaired and is sitting in your garage." You get entirely different action. Of course, he probably wouldn't have wrecked the car.

But look, you get some kind of a reaction like this: "You lighted a match while I was thinking", you see? Three-dial drop.

Now, you see a twitch on that, see, you just see a twitch. Of course, you can only really read him in twitches on such a case. And you say, "What was that?"

Say, "Well, I wrecked your car last night. It's still lying out on M1. Police are looking for you as a hit and run driver. But I didn't do anything; it wasn't my fault. Actually, you left the keys in the ignition." [laughter] And you generally will get a smug smile following it. You get an entirely different set of reactions for the same existing situation. Is that clear?

I'm covering over rudiments with you and what rudiments amounts to and what meter reactions amount to and so forth. We go over these things quite often, but they are the most important thing, because if your pc is not in-session, you're not getting any auditing done. But we have to define what is meant by a rudiment being out. It means the rudiment is out; you have to correct it.

Well, you can always find a rudiment out. How do you like that? Just by turning your sensitivity knob up to 16 and say, "Are you withholding anything?" Or "Do you have an ARC
break with anybody in the whole world anywhere?" "Is there anybody anywhere in the world that you have an ARC break with?" And of course, you're going to get needle reaction. So your auditing is totally reduced down to doing nothing but rudiments, nothing but rudiments, nothing but rudiments, nothing but rudiments, nothing – and they're not very good processes.

So of the two hours and a half that you have for an auditing session, you spend two hours and fifteen minutes running the beginning and end rudiments, and you spend fifteen minutes on the process, see? And that isn't what's getting the case there. The rule is the case cannot be audited with the rudiments out. What is meant by rudiments out? A visible reaction on the needle with a third-of-a-dial squeeze setting on the sensitivity knob.

Does that mean that a person who has a very loose tone arm, then, could have allowances made for him, so if he gets a drop on a present time problem, and you know he's got a very – he drops about a dial, and you can't set it down any further than a dial – does that mean you ignore his twitches? No, he's in for it. But this is okay, because he'll blow them on two-way comm.

You'll say, "What is this ARC break?"

And he'll say, "Well, the cook sneered at me this morning. He put a sneer on my shredded wheat biscuits, you know."

And you say, "How do you feel about that now?" There'll be no further reaction.

You see, the looseness of a needle at minimum setting is a direct index of state of case – the most direct state-of-case index there is. This is your diagnostic switch, right here, this sensitivity.

And if you, to get a third-of-a-dial drop, have the guy sitting here at sensitivity 16, and even then don't make it, you're dealing with a CCH case, brother, and don't think you aren't. We've broken our hearts on enough of them. CCHs they get. You understand?

Now, that doesn't mean that all cases that are run on CCHs are instantly in this horrible condition. But it does mean that the case has not been showing adequate gain in processing. Processing over a long period of time: We have a record of this processing; they haven't been showing enough gain; there must be something haywire someplace. We check them over: We can't find present time problems, ARC breaks, withholds. They just don't seem to have anything here anywhere. Well, you've got the CCHs, so you return the case to it. Got it?

Now, that doesn't mean that all cases that are run on CCHs are instantly in this horrible condition. But it does mean that the case has not been showing adequate gain in processing. Processing over a long period of time: We have a record of this processing; they haven't been showing enough gain; there must be something haywire someplace. We check them over: We can't find present time problems, ARC breaks, withholds. They just don't seem to have anything here anywhere. Well, you've got the CCHs, so you return the case to it. Got it? Just like you can turn an SOP Goals case back into a Routine 2.

Now, you're going to get that bulletin in very short order, if you don't have it right this minute. I imagine we're pretty stacked up in the bulletin department; we're getting out the Secondary Scales.

But you got three routines these days. Routine 1 is CCHs and Joburg Security Checks, and CCHs and Joburg Security Checks, and CCHs and Joburg Security Checks on a one-for-one ratio. (Experimental at this moment that it's one-for-one.) Why?

The CCHs boost up the individual's responsibility for his environment. And then he blows his head off because he's now all of a sudden got withholds that he's – now feels responsible for. So you have to pull the withholds off to keep from killing the case. You got it?
You raise a case level, he runs into his withholds, begins to be more responsible for the world around him, and all of a sudden – crash, he's had it.

He actually feels like somebody is running over him like God Juggernaut is letting him have it, you know? Complete with the stone wheels. He feels terrible. You've increased his responsibility, he realizes he's guilty of many things on all dynamics, and you give him no opportunity to get rid of them.

And that is the only thing that has ever been stalling cases in Dianetics and Scientology over the last eleven years. That's the thing that stalls them. That's why they hit a ceiling and halt.

They halt because it'd kill them if they got any better. Because if they got any better, they'd be more responsible for what they've been up to on the whole track. You got it? All of a sudden they realize they have overts and withholds, and it damn near kills them. And this would work out with almost any case. So you run the CCHs to increase their responsibility, and you pull off their withholds with a Joburg. And that's the routine.

Now, I don't know quite what the optimum ratio between the CCHs and a Joburg is. I don't know if it's one for one, one for two, one for three – who knows. Hour for hour I'm talking about. What do you do? Security check them for three hours and CCH them for one? Or CCH them for three and security check them for one? Well, we're just taking it out at even level and say, well, we're going to start in at one for one. So that's what it is right now: one for one. One hour Joburg, one hour CCHs.

All right. That means that you don't suddenly stop a CCH process that is terribly unflat and give the Joburg after one hour, you understand? But if you've been five hours flattening this, you can be totally prepared to spend five hours on Security Checking. Got it? It's however long they've been running the CCHs up to a temporary flat point.

One more mention of this. CCHs are run in strict accordance with Clause 13 of the Auditor's Code: A process must be run only so long as it produces change – this is not a direct quote; this is an interpretation of it. It's a breach of the Auditor's Code to run a process that is not producing change. It is a breach of the Auditor's Code to stop a process that is producing change. Got that? What's change in the CCHs? Well, you run CCH 1, CCH 2, CCH 3, CCH 4. Let us say that all during the running of 1, the test is twenty minutes. The person, whatever they're doing, must be no change of reaction in twenty minutes. Got it? Twenty minutes, no change in the pc.

Now, what's that mean? Well, the pc is a meter. What would the pc be reading on a meter if the pc were trying to leave? ... Come on, what would it be?

_Audience_: Theta bop.

That's right. The pc is the meter. You don't have the pc on a meter; you can look at the pc, see? Got the idea? All right, now let's get another one. You're trying to run CCH 2, and there they go, and you're getting them all set and so forth. And all during the time, they're just running like a wound-up doll, see? There's no change of reaction, there's no change, no comm lag, no nothing for twenty minutes. Man, that's flat as far as you're concerned. It isn't biting or it's flat or we don't care what; you go on to the next one. You got the idea?
All right, supposing on one of these CCHs the pc is simply 1.5ing the entire time. Just madder than hell, you see? "The idea of running such a process on me. You realize this process is only reserved for psychotics?" Actually, it used to be; it isn't now. "Process is only reserved for psychotics, and you think I'm a psychotic, and who do you think I am?" And they keep this up for twenty minutes — process is flat. New look, huh? Supposing the pc lies down in the middle of the floor and can't be made to rise for twenty minutes — process flat. [laughter] You got it?

So the process is run in strict accordance with Clause 13 of the Auditor's Code: Run a process only so long as it produces change and no longer, and don't stop a process that is producing change. You got that?

Well, that means — doesn't mean by the way that you have to audit him all night. But that means in the next session you're running the same process. See? That process has got to come up to a flat point and the flat point is twenty minutes without a change — whatever the pc is doing. Pc insists every time he walks up to the wall that he turn around and with one foot, kick it, and he's been doing it for twenty minutes — he's had it.

You are no longer critical of what the pc is doing and no longer trying to force the pc to do the process. You just carry out your Upper Indoc-type CCHs and carry on as much as you can, but you're not trying to force something on the pc particularly, you understand? You're trying to do what he can do. Obviously he's incapable of giving you his hand during that period of time.

Now, you say, "Well, normally he would get over that sooner or later." Yes, he'll get over it sooner or later; go on to the next process. And when you finish up 4 you come back to 1, and you'll find out he's incapable for a while of giving you his hand.

In the first place, you're auditing a valence out and the pc up, and the only thing you get a reaction from is the valence. So if the case is progressing, why, this valence is acting up, because a valence fights for survival. You got it? There's comm lags; there's various things occurring, all the time, all the time. Well, for heaven's sakes, it's not flat so you carry it on. You got how to run them now?

That, by the way, is the original CCHs taught in London in 1957. We've gone right back to base on it. It is not for a psycho. They were originated ordinarily just for cases that weren't getting results on various processes. Case wouldn't get results on higher processes so we just kicked an awful lot of pcs over into this particular category, and London has had a great deal of success with CCHs up through the years.

At the same time, I didn't have much of a chance to straighten out the HGC as to how you ran CCHs, and they weren't running them very good. And they were, you know — I don't know — be perfectly happy to sit there and ask somebody to give you their hand, and they give you their hand, and do it just for twenty minutes. No. Six hours, twenty-five hours — the individual is simply giving you his hand. They just run it for twenty-five hours. It's a breach of the Auditor's Code. If he gives you his hand for twenty minutes on a stretch, that's it.

Furthermore, the CCHs are not run in Model Session. You say, "Here we go." "That's it." And that's the beginning and end of session. "I'm going to audit you now. This is the first
process. I'm going to say 'Give me your hand" – you can tell him anything you want to. You can even say, "Well, it isn't going to hurt you." Anything you want. I don't care what you say. But it's not run in Model Session. You don't pick up the ARC breaks; you don't pick up any of these things.

Why not? Because obviously if you're running that, the person doesn't easily blow these things. So you can just become completely involved with the case, see? Completely involved. I'd say the criteria would be this: If you did a long assessment, and finally the goal of the pc is to get even with the janitor – who is a momentary, present time terminal, and this is the only goal you can find on the pc – I'd say you were probably assessing somebody you'd have got along faster with with the CCHs. See, the terminal has backed all the way up to PT. Got the idea?

Now listen: It is not that you couldn't win with the other routines on the same case, because we are no longer doing routines because of case levels. That's a new surprise for you.

See, we've always had low cases get Routine 1, and the next cases get Routine 2, and the next cases get Routine 3, or something like this. Have you got the idea? It was always graduated that way.

Well, it isn't now. It's what is the fastest case gain you can obtain for the least amount of auditing. Got it? And it is all in the interests of saving auditing time, because all of these work, by the way – all three routines that we have – work on the same level of case.

You could take Roddy Green and find his goal, and find his terminal, and assess it on the Prehav Scale and run him. You'd get there. But your auditing ratio may be something on the order of about two to three per one. Takes you seventy-five hours to get there whereas you could have gotten there in the same period of time in twenty-five hours. You got the idea? So it's just in the interests of saving auditors' time that you do these things.

Furthermore the auditor doesn't get bogged down or upset because his case isn't winning, because he's being yakked at. You understand? Makes a smoother look all around.

So all three routines work on all cases, which is riches indeed. And you could expect sooner or later, when we hit the jackpot and pull that old one-arm bandit's hand and the gold sovereigns started pouring out of it all around the floor on technology, that this is what would have happened. You would have had at least a couple of routines that would have worked on all cases. Now we've got three routines that'd work on all cases.

There isn't a person here, by the way, who wouldn't pick up on some – the CCHs run in this fashion: CCH 1, 2, 3, 4, you see? 1, 2, 3, 4, 1, 2, 3, 4; just run as long as they're flat. It's very rapid running.

And we looked on the CCHs as being a very slow grind. Well, I point out to you that in 1957 they were not a slow grind, and they were being run in the exact style which I'm telling you about now.

See, we got it lost, because I couldn't quite grasp what was going wrong. We put it mainly down to the fact the auditor's intention wasn't getting across to the pc. That's not true.
That has something to do with it, but that's not the answer. The answer is a much more clean-cut answer than that: The auditor was disobeying the Auditor's Code, Clause 13. Okay?

He was not running processes as long as they produced change. Pc fighting, you know? And say, "Well, I'm not going to run this damn process a minute longer. I'm not going to run it..." And the pc would keep fighting him for three hours, four hours, five hours, six hours, whole intensive.

He'd say, "Well, I got to get someplace with this pc. I got to get someplace because the pc's fighting," you see? No, the pc's fighting is no change – no change by reason of the process.

But you can say, "Well look, the process wasn't being administered." Oh, you're looking physically at what happens to about 75 percent of the cases you have trouble with, is they never do the mental process that you give them. Except now you've got it physically. He's not doing CCH 2; only, you can see he isn't doing it. [laugher] I've had a pc come up to me and say, "Well, you thought that auditor was pretty good that you had there, but hu-hu-hu-hu-u-huh-huh-huh-huh 1 - I just had a twenty-five hour intensive from him - tuhum-hu-hu! Didn't do a single command he said. Ha! Ha!"

And I thought, "Why, you dumb bastard," to myself, you know. "You dumb sap! You mean to say that you wasted twenty-five hours of auditing time and gave the fellow something on the order of fifty quid, or something of the sort, just so that you could have the wonderful opportunity of never answering a single one of the auditing questions, but fooling him for twenty-five hours." Oddly enough, to the pc that would be eminently logical.

Well, you've got it out in plain, broad air that the pc is not about to do your auditing commands, haven't you? Well, so if – what if you had him on a mental process on the meter? What if you had him on a mental process on the meter, and he wasn't doing the auditing command but appeared to be? You know, saying, "Mm-hm. Mm-hm. Mm-hm."

You ask him, "What are you thinking about?"

"Oh, I'm thinking about the process. Mm-hm, mm-hm, mm-hm." Got a machine. Got a machine set up like a clockwork toy and every time you say the question, he goes, "Mm, hm-hm." Hasn't anything to do with anything you've said, see.

You say, "Do fish swim?"

He says, ("The auditor is trying to probe my secrets.") "Mm-hm." Got the idea?

Now, it's just an extremity of alter-is. Now, how much alter-is is there on the case determines what process runs him the fastest. So let's run CCHs and get any alter-is out into the clear, or anything of that sort. But anybody could gain on any of these routines.

Now, I'll go over these other routines with you very rapidly. I'll just tell you what they are.

Routine 2 is a general run on the Prehav Scale, Joburg Security Check, and the Hav-iness and Confront Processes all run in Model Session. I think that's the extent of it, isn't it? Is there anything else in there?
Mm! PT problems of long duration are assessed for terminal on that routine. You find a present time problem of long duration, you know? Keeps banging present time problem or something of the sort, and you run that. You assess that on the Prehav Scale. You find the terminal, and you find a terminal about the problem that drops the most; and you assess it on the Prehav Scale, and you run it flat, and you assess it again, and you run it flat, and you assess it again, and you run it flat, and you assess it again, and run it flat. That's a PT problem of long duration. Fastest way to run one for auditors at large. Actually you can get someplace just running engrams on them, Presession 38, but this other one is very, very easy to do and reaches all cases without any difficulty. So why not do it. All right?

That's the extent of Routine 2. What's Routine 3? SOP Goals Assessment – assessment for goal, assessment for terminal. And this is run flat, level by level, on the Prehav Scale, with what? Second step, Joburg Security Check. All three routines have a Joburg Security Check in common.

What are you trying to do with this case? You're trying to unbale this case and get this case up to a point where it is willing to make an advance. What do you mean "unwilling" to make an advance? All right, the case is unwilling to make an advance so long as and continually when the case finds he is turning on powerful and fantastic resistances and somatics and things like this. He doesn't dare get any better, because if he gets more responsible, he's had it.

Have you ever noticed that there are some very pretty girls around in the world who have a high level of irresponsibility? Have you noticed that? Well, actually, if you ran them into the middle ground, their beauty would be less. In other words, you'd audit them for a little while and increase their responsibility, and they wouldn't look so good. Have you got that? Isn't that odd? They'd be better but they wouldn't look so good. You got the idea?

Well, that would only obtain so long as they were stacking up withholds that you weren't getting rid of. So you could take a person who was quite irresponsible but good-looking – nothing they've ever done has any influence on the body. Now, you audit them, it has some influence on the body. They've got to – they've got to shoot the rapids, sort of, up the Niagara River, you know? They've got to go up Niagara Falls backwards, and it's a rather battering experience. Well, it becomes a very unbattering experience the moment that you keep cleaning up withholds, and you're going to see this phenomenon **continually**.

You make a little case advance, and all of a sudden you're on a long grind. What's happened? Well, the pc doesn't dare get any better, that's all. See? Case advanced rapidly and then something stopped it. You know? And then you grind, grind, grind, grind, grind – You've all seen this. Well, what was that point of the curve? I had to find out.

Well, it's the withholds. They suddenly get responsible for their overts and then they haven't any chance to tell you about them or unload them or unburden them in any way, and they just start kicking their heads off, that's all.

You'll find somebody who's had a case improvement, who has improved just a little bit too much for their tolerance, suddenly standing back of a chimney sobbing bitterly. You got the idea? "I'm no good!"
And we've had some casualties with that. That is to say, somebody has blown or something like that, you know? He's been improved a bit, but it was too much for him. You got the idea? Because improvement means an increase of responsibility for his past, present and future, which of course includes all the dirty mean, nasty, caviling, little two-bit tricks he's played on everybody.

And how did he get those things – how did he get those things excused? He lessened the overt. The old bulletin on lessening the overt—which by the way should be part of your bulletins. And they lessen the overt, and now you audit them, and they suddenly realize that that person they were so nasty to wasn't probably quite that bad, see? And this overt starts to swell up on them. Now you're doing it with processing and this is now a ten-thousand-horsepower operation, see? And the pc puts his two horsepower up against this thing, you see, and just tries like mad to stop the juggernaut. Only this overt keeps unlessening. Joe was not so bad; God, what's going to happen to them now, you see? So their whole effort now is to keep the overt from unlessening, and they no longer have their attention on the process. Got it? That's the exact mechanism.

So the case improves, you get a fast improvement curve, get the withholds. And you – all of a sudden you get another fast improvement curve, get the withholds; get another fast improvement curve, get the withholds. That's the system. You've three routines with which to do it.

And cases which are having difficulty answering auditing commands or having difficulty in auditing, or who would only run on SOP Goals in some kind of a present time situation, probably will audit faster on the CCHs as a general rule, than they would audit otherwise. They'll make more progress. You got the idea? You can get this person back up over Niagara Falls without so maw chain hoists. It's easier.

Instead of standing in there boxing with the alter-is – which they're not about to take responsibility for or run out. See, don't go on the basis that everybody, just because you alter the alter-is – you might not be able to find it exactly. See, the alter-is might have something to do with "have" and "would be". You know, any kind of a Hobson-Jobson situation where they're fitting one substitute with another substitute. And you might not hit it exactly. And you'd have to keep hitting it exactly. And it's very expert. Requires a lot of expertness to do that thing. You get their mind going off like a firecracker almost continuously and you can do it! It can be done, you understand? But it's probably slower. Certainly, for average auditor, slower.

All right, so the combination there is that this is the best thing to do for a case that might hang up otherwise.

Now, your next general run, your next general routine, is actually basically there. All cases could benefit from it, and it would be faster than Routine 3 in a lot of cases. But I have found out that auditors who are specifically being coached at long distance from us – which is very difficult – actually are able to do what is now Routine 2. They can do it. They can kind of dub around and make it work, you understand? But boy, you get them on goals and they're over the the hills and far away like a bunch of white-tailed antelope. And you just see these
little spots of white in the distance. Man, they don't grab that one. I've got it on my comm
lines and from HGCs and from every place ad infinitum, and they're just – no latch.

They can do general runs on Prehav Scale. Read one bulletin, do a general run on the
Prehav Scale, that's it. Do a Joburg Security Check, miss 50 percent of the questions, but it's
still functioning, see? [laughter] You get the idea? It's still functional in their hands. Do you
see that?

But this doesn't say that you couldn't take the person you're going to do CCH on and
find his goal. And it doesn't say that the person that you're going to do the general runs and
Joburgs on – it doesn't say you couldn't grind in and find his goal. You can actually find the
goal and terminal and so forth on anybody that you try. It's just a little arduous, that's all. A
little more arduous. It takes more time.

So in the interests of swift clearing is what these three routines are all about, and that's
the basis on which we're operating today.

And of course, you're here to learn about this, so I probably won't see you doing as
many Routine 2s. You'll probably get more Routine 1s and Routine 3s than you get 2s. But in
some HGC someplace, or out in the bush of – back of North Wallaby, why, you'll see an aw-
ful lot of Routine 2 – and you meet somebody back of North Wallaby, and he'd say, "Oh,
we're having so much luck on SOP Goals. Esther spun last night."

And you'd say, "What are you running?"

"Oh, we did a long assessment on her – twenty minutes – [laughter] and we finally de-
cided her husband was what was her trouble, so terminal was a husband. And it was by elimi-
nation. We talked it over in the rest of the conference, and we decided that was the only pos-
sible terminal. So we ran 'a husband' on her, and so forth. And the next time we did an as-
sessment, for some reason or other the whole scale was live, so we just started at the top and
tried to run each one flat on the husband. And you didn't give us all the data, you know, for
SOP Goals, and it doesn't work very good either." But you give them this Routine 2, and they
go off like a bunch of canary birds, and they get wonderful results. Okay?

Female voice: Yes sir.

Male voice: Question on Routine 2.

Yeah.

Male voice: The general assessment: Is that done purely on the Primary Scale or do
you carry – carry it over to the Secondary as well?

No, you can carry that on right on through to the deepest depths of the Secondary. All
assessments can be done Primary and Secondary, or just Primary. The worse off a case is or
the more Clear they are – the two extremes – both have to have Secondary runs on assess-
ments.

Second male voice: Do you ever switch from one routine to the other?

Yes, you sure do. Case isn't running very well on his goals terminal, or his assessment
or something, shift into 2. Be upsetting though to shift from 2 back to 1 because it's invalidat-
ing. Make up your mind at the beginning. If in doubt, always run CCHs. If you're in doubt whether he should be running CCHs or 2, run CCHs. That answer your question?

Second male voice: Yes, it does.

All right. The more you shift, changing your mind, why, the less sure you look and the less control you've got on the pc.

Second male voice: Precise running of the CCHs: left, right, or right and left, both hands – then do you – ?

Yeah, and on your head. And then there's CCH 1X [laughter] – there's, CCH 1X. That's a good one. That's a good one: Pc gives you both of his socks! [laughter] I don't mean to make nothing out of your question but it brings up this humorous point, Ken. It brings up this very humorous point, that the more CCHs I put out for various variations, the less CCH was run on the basics. And actually the variations practically killed the CCHs, the variations did. No, it's just right hand, man. It's always right hand. You're not trying to clean this fellow's life with the CCH; you're trying to improve his case so that he can get off his withholds. You got it? When you've got all his withholds off and he's totally responsible, and he's clean as a wolf's tooth, he's going to be floating, almost floating here on the needle anyhow, when you finish this up, you understand? And he's going to be so free on the needle that you start doing an assessment and he starts blowing clear on the assessment. You got the idea? You wait till you see this. You'll realize why you're running it. I apologize for making a mock of your question. Yes?

Female voice: Would SCS still come in the CCHs? Through the CCHs?

There are no SCSs in the CCHs. CCH 1, 2, 3, 4. There are only four of them that are valid. Now, the SCS does have a high CCH number, but you've got to read your – I see right now, you've got to read your CCHs from beginning to the end, because there are only four of them, and what was known as the CCH Routine is exactly a precise routine consisting of four processes.

And that's the only CCH Routine we mean. We mean no other variations. Okay?

Female voice: Yes, thank you.

Right. All right. Okay, any more questions? All right. Thank you very much, and that's it for tonight.

Good night now.
SECURITY CHECKS*

A lecture given on
6 June 1961

Thank you.

Well, here we are at the 6th of June.

And our course seems to be going very well. If you don't recognize me today – [laughter] Actually, as I explained to Edgar, it isn't, actually, that I like to wear my hair long; it's just that there aren't any barbers. [laughter] Go ahead, I dare you; try to find one. Since we took Edgar out of the profession, there's nobody anymore left in the world who can barber. There's a small fee for this commercial. [laughter]

All right. I suppose by this time you actually have in your small, moist palms a copy of the HCOB that has to do with these routines. Is it in your hands yet?

Audience: No.

Well, then it probably will be tomorrow morning. It's the first bulletin concerning the routines, and so on. Now, what's going to change that bulletin? Let's look at the future just a little bit.

We are not now trying to find out what auditors need as theoretical or ideal tools to clear people. We are not at that stage. We passed that stage a long time ago, actually. We are trying desperately to discover right now what auditors will use, and what they can use. And SOP Goals and its related processes have been in development for use for some time. Please understand that as a difference of action. There's two things: It's what will auditors use – what will they use? And what can they use? And these two things monitor what is put in their hands. You got the idea?

Now at first, just the Prehav Scale was put in their hands, and they had pretty good success with it here, there – just general runs in the Prehav Scale. They weren't able to goof it up too badly and they got some good success. And I had some rather resounding profiles sent in here. And everybody seemed to be very happy with the idea of assessing the pc on the general scale and cooking up some kind of an auditing command – even a bum one – and running a pc on it, and rudiments in, out or upside down, you know? And they got somewhere. They got somewhere with this. We got some good results. So we have to assume that an auditor not only will do it but can do it. See? 1) And – is it well accepted? and 2) is it within his realm of ability?

* Editor's note: In the Red Volumes, this lecture is listed as "Routine One, Two and Three" – Title was probably changed to differentiate from SH Spec 7.
You have to think of that when you're training students – training people in Scientology. It's what they can and will do. Now, if you have somebody who can only run CCHs and you have him in a group of people who are doing auditing on outside pcs, well, wouldn't you be rather foolish to give him a set of tools that he would not or could not apply. Because immediately your auditing results would break down right at that point – sharply, clearly and immediately. You get the idea?

Auditor can run CCHs, and yet you say run the hooble-goobles second differential of the integral \( zim \). That's what it sounds like to him, see? I mean, you've said something very comprehensible to you. You've said find his Havingness and Confront Process. And yet it sounded like the gobbledygook I just gave you, see? It doesn't make any sense to him. So with great willingness, perhaps salted down a little bit with making you wrong, he will go ahead and louse up the lot. Why? Well, he's being told to run something; he thinks he should understand this; and you may come around for a long time and find out that he just hasn't told you he didn't understand it.

Now, the test of anything is whether or not it produces results. But remember this – that a result is determined by several things: 1) the adequacy of the tool being employed. That is the first thing a result is established by. That is first and foremost. Nobody will argue about that at all. If you haven't got the tools, you can't do the job. That's it. And that's what Scientology is basically – the tools that do the job.

Now, this is modified by what auditors will apply or what people will use. You see? What will they use? And that again is modified: What can they use? So we actually have three sets of determinisms here on what is a good process. It isn't whether or not the process used under ideal conditions will produce every time a stratospheric flight. You see, that is not the test all by itself. Without that, nothing is going to work; that's for sure. But it's monitored by these other two things. And when you're training auditors, for God's sakes, keep that in mind. Huh! We've had the principle for a long time, but I never articulated it. And one of the parts of it was: If somebody comes in raw into an HGC, you find out from him what processes he has been having success with. You could also ask him this one, oddly enough: "What process has worked on you?"

And he says, "Oh, 8-C. 8-C. I had a wonderful gain back about '54. Nobody has run it on me since, but back about '54 I had a wonderful gain on 8-C. And I've run it on a lot of pcs and so forth."

And you say to this fellow, "All right. That's all you're going to run on pcs." And you know, you'll get better profile gains than if you told him something else. You got it? Until you can get him trained up and get a reality on something else, you had much better let him run something on which he has an adequate reality.

And if he's going to get a result, it's because he himself believes he can get a result. Now, you can enter far too far into the esoterics of all this. Look at the factor you're involved with. If an individual doesn't have a subjective reality on something, you cannot expect the individual to employ it with reality, can you? And there's nobody more sensitive to an unreality in a preclear than an auditor. But certainly there's nobody more unsensitive to unreality in an auditor than a preclear. Yeah, that's true.
So all of these things are monitoring factors on what auditors can and will use. And right now auditors broadly have apparently had considerable success with the CCHs over the years. They've been running them all wrong and backwards, because they've been running them doctored up and changed and alter-ised and "improved," see? When, as a matter of fact, it was something on the order of trying to improve the last space fleet that was developed in the last galactic empire at its utter peak, you see? And from there on all you were doing was pinning pink roses on the things. And you finally pinned enough pink roses and blue bows on these spaceships until eventually the fleet didn't fly anymore. That's about what happened.

Now, the original CCHs was the only thing on which I did any research, and it was done in the vicinity of 1957. I didn't employ them thereafter. It's an interesting story in connection with that: is I personally wanted to find out if I could audit this way. And I trained myself within a hair's breadth of auditing the CCHs. I could audit those CCHs in my sleep. You know, put on the perfect Tone 40 performance. You know, I grooved myself in – like you're learning Model Session now, you know. And I found out when I used this I got tremendous and very worthwhile gains. But it was used according to the old regimen. You see?

Now, all the research was done, all of the training of people on how to do it was done, and then I skipped it. And then we had an ACC or two, and we ran into modifications. For some reason or other, they weren't quite as keen to do the original version as they were a modified version – students.

Now, I just give you that in passing because this mustn't happen again to the CCHs. The CCHs work perfectly when done à la 1957. That was their nadir, and that was it. And it was CCH 1, 2, 3, 4. And they were done this way up in London.

There are some old tapes up there that'd utterly fascinate you – I think they're in the other room here – all about how you do the CCHs. And they're mostly tapes of "Don't alter-is it. Thank you. Don't alter-is it. Thank you. Don't alter-is it. Thank you." That's about what they amount to. That's what Ken ran into head-on here the other day. Because we had, actually, a good process system destroyed by about 1958, and it was less and less in use.

Well, why was it less and less in use? I wasn't paying much attention to it. And I was finding out that it wasn't producing the results before. And now that we need it, I've turned around and reviewed it, and I find out what is now called the CCHs bears no resemblance – any more than Little Eva did to Topsy in Uncle Tom's Cabin. They're just not the same breed.

CCHs are very simple. They're very straightforward. You do all the things it says. You put your intention into the pc. You don't Q-and-A with the things he does. You hold, actually, his body in an exact position. You run them close up. You're not trying to do anything but increase his reality and his control.

You see, CCH means Communication, Control and Havingness. And if you get this duplication – this was the sneak factor I suddenly discovered about the time of the first Saint Hill ACC: this duplication. So the less duplicative you are, the less havingness the pc has. Interesting, isn't it? Well, anyhow, there's the CCHs.

Now, the Security Check proposition. Now, I'll tell you what auditors wouldn't do the world around – what they wouldn't do. They wouldn't be imaginative enough to get the with-
holds off the case. I'll give you an example of a Security Check that was written at a Central
Organization. And I actually ought to frame it as how not to win. It says, "Do you have an
ARC break with Norma? Do you have an ARC break with Joe? Do you have an ARC break
with Bill and Pete? Thank you. You've passed the Security Check."

One just doesn't penetrate reality to that extent while one is taking responsibility for it,
see? One won't be responsible for taking the reality of this, because it's pretty grim asking for
withholds, see. All right.

Auditors were perfectly willing to make people well. They were perfectly willing to
audit people. They were perfectly willing to work with the most confoundedly gee-whiz cases
you ever heard of. But ask for that withhold? Well, they weren't unwilling to ask for the with-
hold. They were just unwilling to be sufficiently imaginative to do anything concerning it.

Oh, a fellow murdered his first wife, you see? The auditor would never bring himself
up to feeling that critical of the human race. You get the idea? Well, maybe the fellow just
beat his first wife. You ask him if he murdered his first wife, and he'll tell you, "No, I just beat
her." See, you can always overask a question, and auditors would not do that! Imagine it.
They'd sit there with their rudiments out, their rudiments out, their rudiments out, their rudi-
ments out. Well, it was killing people. I mean, not actually, but it was just murder, you know?
A guy was feeling bad, and so forth; the auditor never asked for the withhold!

So, we had to remedy this because this was a rather whirled-around condition. And
that whirled-around condition resulted in what? When I got down to South Africa, I found
that somebody had dreamed up a Security Check on my orders down there to parallel the laws
of South Africa. And these laws are very imaginative because they're dealing with people who
have extremely imaginative crimes. And actually there were things in there that I myself
wouldn't have thought of doing. Exceeded my reality. But over a period of years, South Af-
rica had collected them in their law books.

Oddly enough, the South African Security Check – here's a joke on Johannesburg –
contained originally, no single question concerning overt or withholds on the organization,
any staff members, any Scientologists, me or anybody else. Isn't that fascinating? Had omitted
that 100 percent from the zone of interrogation. And the people who were putting it out had
overt, really, only in that field. Fascinating, isn't it?

All right. Now, I put together this thing, doctored it up and called it the Joburg 1st,
see? But for a very long time – to show you how hard this one is to get into operation – peo-
ple will eventually wake up and use it. "Oh, oh," they say. You know, you've been standing
there; you've been screaming; you've been saying, "Use it. Use nothing else but it. Now use
that. That is a Security Check. That is what you're supposed to run on staff members. That is
what you're supposed to use. When you security check somebody, you use this form, Johan-
nesburg Security Check, HCO WW Form 1! You understand?"

And they say, "Okay." "Do you have an ARC break with Norma? Do you have an
ARC break...." [laughter]

Lots of people would like to rewrite this Security Check. And apparently the law is
this on rewriting Security Checks – it works like this: If the person is permitted to delete or
skip one of the levels of the Security Check, or if you give it to somebody to take certain lev-
els out that do not apply, the person takes out the very withholds he has, even though he
doesn't remember he has them. Isn't that curious? So you must never permit a Security Check
to be rewritten; you must never permit one to be edited for "special use". You understand?

I learned these things by accident. "Oh, you want all the Johannesburg Security
Checks sent in to you, personally. Well, here are all the Security Checks on the staff. We've
only given one Johannesburg Security Check." They've had it for months. They've got another
Security Check. Got the idea? So you have an HCO Policy Letter along about this time of life
that says, "The Only Valid Security Check." And when we say, "The Only Valid Security
Check," we mean the Johannesburg Security Check, or by whatever name it may be called by
HCO WW. And it will only be the complete form of a form issued at HCO WW. Got it?
That's how hard that one is to hold in.

That's interesting. They will give a Security Check. They will learn how to give Secu-
rity Checks. They will ask the most outrageous questions as long as they are written down and
are part of a Security Check. But then you've got this other impulse all the time that is going
around, a little bit here and a little bit there: "Well, it's not necessary to ask this question. It's
about illicit diamond buying. That only applies to South Africa, and we're up here in northern
Siberia."

I was speaking, by the way, as though I were in Chicago. They're trying to pass laws
out in Chicago these days that everybody who is pronounced crazy by anybody that happens
to know his name are instantly shipped to Siberia – I mean Alaska. Did you know that? Won-
derful way of get – clearing up the political scene. The only trouble is, the people who are in
power when they dream these things up never quite remember that someday they're going to
be out of power. That's because they don't know they're going to live another life, too. It's
very, very amusing that all the legislatures and so forth, on the laws they pass – because
they're old men and no longer effect them – walk into their next lifetimes and are totally sub-
ject to all of their conscription orders, to all their educational orders, to all their child labor
blah-blah. The whole lousy works, you see? And you talk about being cause of your own ef-
fect, God help a legislator.

Anyhow, in passing, this Security Check is not an alter-isable proposition. So don't let
people edit them and don't edit them when you're giving them. You say, "Have you ever done
any illicit diamond buying?" – "idb". Well, it's even a phrase in South Africa. Do you know
how many pcs we've caught in England and America on this? [laughter] Well, it's fascinating,
you know? Because it doesn't fall on illicit diamond buying necessarily; it falls on anything to
do with diamonds. And people – the weirdest things they will do with diamonds: they smug-
gle them, and they swallow them, and they ...

Now, that question alone is left in there as a bit of a gag. It's to identify the check, and
probably till the end of time I hope to keep that question in – "Have you ever done any illicit
diamond buying?" – just to identify the source of the check. But very shortly this is going to
become HCO WW Form 4 – Security Form 4. And it will be called by another name – be
called by another name – probably be called an HGC Processing Questionnaire. See, some-
thing very mild and innocuous, but it'll still be HCO W [WW] Form 4. There actually will be
a few more questions. There will be a whole section in there which could be at once applied to the student and could be applied to the HGC pc.

We found that an awful lot of HGC pcs hang up in processing because they get mad at the Chief Registrar, or they're discourteous to the Receptionist or something. And they're just having an awful time this particular morning, and we don't quite understand why they're having a hard time. It isn't what we think they should do; it's evidently what they think they should do, you see? They're having a dreadful time. And they start asking for withholds and they get a fall. And they can't imagine what dreadful thing this is, and they find out the pc didn't say good morning to the HASI Registrar. See, it's a withhold. They meant to say good morning, but they decided not to say good morning, then they decided it was discourteous that they had done this. You got the idea?

And they get messed up with withholds on Central Org personnel or Scientologists just in, really, the relatively few days that they're around the place. Because they come in, you see, on obsessive, unkind-thought automaticities. See? They walk in and they got unkind thoughts going off automatically, see? And it's going brrrrrrrrrr a thousand miles a minute. You know? Unkind thought here, unkind thought there, and an unkind thought someplace else, and an unkind thought someplace else, and an unkind thought someplace else. And golly! These things, these things get square across their processing line.

So it is in an effort to keep auditors from breaking their hearts and people from wasting their money; you have to give a full check. There will be a new section in it then that refers to students and preclears, the kinds of things that they possibly might do. And there will probably be a section in there for the benefit of the field auditor. Like "Have you said anything unkind to anybody you know about your auditor?" You got the idea?

Well, you know, you'd be surprised how many things are going to fall. And this auditor is trying his best, and he feels good about it all. And this pc is just withholding like crazy, because he goes out in propitiation and gets even with the auditor by telling everybody in the neighborhood what a dirty rat he is, and that he keeps seven women under the bed. (He only keeps two.) [laughter]

Now, the only way you can make one of these things work is to clean things up at the same time you're using it. You see, it's a two-edged sword. If you're going to be reprehensible about unkind thoughts about Scientologists and organizations, and if this holds people up, then it should be – we should be quite militant on setting it up so that we don't merit these things, you see? And this includes – oh, I don't know, I can think of several dirty words off-hand, speak – thinking of unkind thoughts.

There's been somebody crashing around the United States who has evidently – since 1952, has been complaining to me bitterly about all of the thetans that come in the night and PDH him. And he has now gone on an all-out in the United States, and he's writing mimeograph sheets to everyone telling them that they've been PDHed, and that everybody in God's green Earth has PDHed them, and Central Organization members have PDHed them, and I've PDHed them. What conceit! [laughter]
And I've shown you the little trick and actually written an article in *Ability* in America, which is probably out right about now. It's "The Sad T-a-i-l of PDH." And it's how you can demonstrate conclusively that the cat has PDHed you.

That's a piece of our technical training around here now. So those of you who have just come in, get somebody to show you -- show *you*, with *you* on the meter -- that the cat has PDHed you. The meter will say so, if you don't know how to run a meter. Or if you know how to run a meter very, very well, you can make a meter say almost anything by getting associative words in. And of course you'd really -- if you really knew a meter, they wouldn't fool anybody because they'd see the sporadic and uneven falls, you see.

You'd -- just association of words. Anybody will get a fall on "pain," anybody is liable to get a fall on "drug," anybody is liable to get a fall on "hypnosis," and anybody is liable to have done anything to a cat. So what you do is spot the moment when he's done something to the cat, and that was the date. The meter will answer up as "Has the cat PDHed you?" You just pick the moment of the overt, that's all. And he could pick the exact moment on the time track of something like this as long as he had an overt right at that instance, see? If it clicks. It's marvelous.

Difficulty is that a meter will not clear -- will not clear -- on an untruth. If the pc is -- if you're still -- you've still got an untruth and you're trying to foist off on the pc some untruth, the meter won't clear on it. But as soon as you put the pc through the jumps on this kind of thing, why, the pc clears on it, you see?

All right. How does a person get in a kind of a state that he'd run around saying all such incredible things, and so on? Well, he gets in that kind of state because he's had case advance without ever anybody pulling his withholds. So countering the fact that it might be a little bit embarrassing to have some of these things disclosed, is the fact that if it isn't administered, you don't get any case gain and actually will practically torture a pc by processing him for a long period of time without getting off his withholds. In other words, it's a very unkind thing to do, to use tools that boost his case way up and leave him with all of his withholds. Because his withholds now turn in, with responsibility, to overts about which he's going to feel very bad.

He managed to stay sufficiently irresponsible and *da-de-da-da-da-da-da* that they never bothered him, bothered him. And all of a sudden he gets a little more responsible, and he says, "I don't think it was nice to strangle that little girl. I don't think that was so nice. I wonder if it hurt her."

You know, and about this time he gets a little more case advance and he says, "Oh, God," you know? "But of course, I don't dare tell anybody. They'd execute me."

So he gets another little bit of a case advance and he says, "Blaw-rra-yea!"

He gets another little case advance, and actually he could get to a state of where he'd go -- be going around craving peppermint candy. You have forced him into a life continuum. You've snapped the valence in on him. You've increased his responsibility without permitting him to be responsible for what he's done. And when you increase a person's potential respon-
sibility without letting them be responsible for what they have done, no more desperately vic-
cious mechanism could exist in processing. Have you got it?

So if you don't administer a good, tough Security Check, and if you don't keep that Se-
curity Check good and keep it whole, you're just setting it up for pcs not only to not be
cleared but actually to start feeling miserable. Oddly enough, feeling miserable, they're better
off than they were being irresponsible. You got the idea? And they'll tell you so, too. But you
just peg them. You peg their processing gain. It isn't that you do something overt that forces
their case down; you peg their processing gain. And it'll peg right up to the point where they
become responsible for some overt act in the past. And there the case will hang. And that's it.
They've had it from there on. And you won't get any further advance out of that case.

So one of your rules is, is when a person ceases to advance rapidly, you just pick up
Mr. Joburg and start in at the beginning and run through to the end. And you all of a sudden
will find out why.

Yeah, but here's your theory: If you get all of his withholds off early in processing,
why, you won't run into this, will you? Oh, but wait. He doesn't know anything about these
overts. He doesn't even consider the things he's done overtime.

Here's this girl. She has kept all of her brothers and sisters in a state of total blackmail
and terror – the oldest girl of the family or something. She locked them up in closets. She's
responsible for one of them now being a permanent cripple, and so forth. And you give her a
Security Check. And the first check, the only real withhold that you get off of her is that at the
age of about seven she thought that her sister probably wasn't as pretty as she should be. And
that falls on the meter, but nothing else falls.

Now, the person has to be processed, and you suddenly find these other things. Those
withholds come off. You process them again. And by consistently doing this one against the other – processing against the Security Check – you
have an indirect measure of the progress of the case as well as opening up the road for the
case to drive on it. Because if the person doesn't have any new withholds, you have laid a
large ostrich egg in your last few hours of processing. See? But if you find new withholds on
a case that weren't hitherto disclosed, you know you're making progress.

So don't say to yourself, "Ah, I must be terrible at security checking, because after all,
I ran him on the general levels for about eight hours and so forth, but just before that I must
have missed all of these withholds. Look at them. How could I have been that stupid in run-
ing an E-Meter?"

No. They weren't there. Because a person has to have some reality on a terminal or a
condition before it falls on an E-Meter. And that's why you assess terminals, is because you
don't want to run a terminal on which the pc has no reality. And when this thing reacts, it says
reality. You could call it an ARC meter and you'd just be in dandy shape. It says reality! Rea-
ality!

Now, you know what's wrong. You know what's wrong with Mamie Zilch. You know
it's her husband. You know. So you take right off and you don't use an E-Meter and you run,
"Now, Mamie. Now, Mamie, you've heard of this process, O/W. What have you done to your
husband? What have you withheld from your husband? What have you done to your husband? What have you withheld from your husband?" and so forth.

And Mamie says, "Let's see, I – I uhm – I uhm – I actually find the question very difficult to answer. I really have never done anything to the brute. He kept throwing me down wells. And every time he'd back the car out of the garage, he'd call me out just to make sure that I was standing right behind it, so that he could run into me. And he used to write letters – I never saw any of these letters – but he used to write letters to all of my friends saying that I had venereal disease. Let's see. What else did he do to me?"

You say, "No. No. The question is 'What have you done to him?'"

"I've never done anything to him in my life."

You say, "Wait a minute. What goes on here?" Well, what goes on here is very simple. The pc has not taken any responsibility for any acts with regard to her husband. Now, it doesn't matter whether the husband was a good man or a bad man. You understand? The pc has taken no responsibility for these acts, and so there's nothing the pc has done to the husband is real.

So, what is the source and why do you come about with overts and withholds anyhow? It's basically, they're based on something getting unreal to the pc. So the more overts and withholds a pc has, the less a pc registers on the meter. And you'll finally find the pc floating here at 2 with a totally stuck needle, and they won't move off 2, and you can't get the tone arm off 2. The sensitivity is up here at 16, and you say to them, "Gee! You must be Clear."

You know, a lot of people checking out Clears very early rather tended to invalidate the state of Clear because they didn't know anything about a meter at all. There was very little known about a meter. But it takes that free floating needle. It takes that needle there that is going to – . When you first see one of these free floating needles, they're unmistakable. Ah, it's awfully hard to fake one. I don't think it could be faked. It's just a smooth flow with no sticks and no reactions, you see. Well, that looks an awful – that's with sensitivity way down here.

And that looks an awful lot different than a person at 2 and the needle totally stuck. And you kick him in the shins and you don't even get a drop of the needle. Well, that's a state of total irresponsibility. That's what that state is, because you're registering a dead thetan in a body that somehow goes on ticking. You're just getting the body reaction.

Well, of course, this pc is going to go down here to 1 – through 7. There's 7 on this E-Meter, by the way, but it can't turn to it. You once in a while will find a pc there, and you'll go nuts trying to get him on the meter. It'll be down here at 6.5, and then you'll get down here to 5, and you get down here to 4 – this is over a long, long course of processing – and he'll wobble around here for a while, and he'll finally get back here to 3, or if a girl, get back here to 2, and there it is. It's the same reading all over again. Ah, except the sensitivity is down and the needle is just floating, and the needle is no longer stuck. Okay?

But that's a high state of responsibility. Now, how can a person take responsibility for his acts unless you give him a chance to? And if he does take responsibility for his acts and isn't able to communicate them to you, he goes out of session. He blows. He doesn't finish his
intensives. He doesn't keep on with the auditor. He gets upset about auditing. All these various evils we have seen in the past are all explained by this mechanism of the person goes up and hits the ceiling. And the ceiling is the number of withholds for which he has become responsible and that he can't tell anybody. So you got to take out the ceiling and let him move up to the first floor. You got the idea?

So here's the picture, in other words, of this new bulletin. It just plays this mechanism about which I've been talking, one against the other. You give the person a case gain with the fastest tools you know how, and his responsibility is increased, so you get off his withholds. And the best thing to use, according to what auditors will use and auditors have used, is this thing called a Security Check. It asks them all, man. And if there's anything missing on it, they'll eventually appear on it. We don't care how long it takes to give a Security Check, because it's an unkindness not to give one. That's the story of this bulletin. That's at the background of this bulletin. Perhaps there are – a person can run SOP Goals on a person right out of an institution. If he were a good auditor, he could actually get the person's goals and so forth. Now, it might take him two hundred hours. The pc would be advancing the whole time.

It's merely what auditors will do. And at the present time you don't want anything but Routines 1 and 2 being run anywhere. You don't want to see these things run anywhere, including Los Angeles. You ought to send a cable tonight saying, "A bulletin is coming to you, date (so-and-so). Use nothing but Routines 1 and 2. And if I catch you using any other routines, I will have a few bleeding hearts. Because I can now run out my overts; I'm dangerous." Got the idea? Why? Because they've proved abundantly that they can run levels [Routines] 1 and 2. And they've proved abundantly they can't run level – Routine 3. They have proven this abundantly.

Some of the people who turn up here, some of the goals that have been found on them – man, all you do is ask them twice and you can't find it in the back of the meter or the bottom of the meter or anything else, and yet they've been run on it. Now, do you know what can happen if you find the wrong goal – wrong terminal on a pc? You can live-up the whole Prehav Scale, that's what's going to happen. And this is one of the tests: About the third time you have found a level, about the third assessment you give him on the terminal you have found, watch that list as you assess it. And if there's something on the order of a dozen levels live, eheaah, you've got the wrong terminal. The wrong terminal makes every level of it live. Look at the state you're putting the poor critter into.

The thing is so compiled that about four levels of it will be live anyway. You'll have four levels of it. But if a dozen up – a dozen or more – are hot and alive on this scale, it's not there's something wrong with the rudiments, it's just something is wrong with that terminal. So along about your third reassessment you could do a check on SOP Goals.

But that's kind of vicious, because do you know that if you only partially flatten levels on the general Prehav Scale on the goals terminal, you know you can make the fellow feel like he's nuts? He starts going kind of nuts. Well, you're driving a ten-thousand-horsepower machine, see, and it starts feeling kind of meummm. He's got level after level unflat. You yourself can demonstrate that.
We had some auditor up here – he was being coached over the telephone from Saint Hill – running somebody once. He had all of his data. He had it all laid out in tape. He could run it off like a parrot. There wasn't any reason under the sun he shouldn't have done it. And you know what he did? He ran four levels in an afternoon on one pc, because he'd interpreted the instructions – which wording, by the way, never occurred in any instructions and doesn't. He said he interpreted the instructions because they were written wrong. Well, they weren't written wrong I went and checked it out.

On all the bulletins, you never find "You barely take the motion out of the tone arm and then you reassess." That was what he thought the instruction said. It doesn't even use those words. You could say, reversewise, "You run it until the tone arm is barely moving," but not even these instructions occurred in the literature and instructions he was given, see? He couldn't even have made that mistake. It's sort of a whew!

Now, the assessment was fairly accurate and had been done for him. He didn't even have to do that. In other words, faced with goals and terminals, a lot of these people sort of go to pieces. Takes a lot of training.

Furthermore, the pc is so easily ARC broken – so very easily upset. He advances so rapidly that his responsibility is rising up to a point where he's got withholds by the bucket coming up all the time. And if he isn't well handled with perfect mechanical approach, perfect technical, perfect TRs, perfect E-Meter operation – I mean perfect – well, you're never going to clear anybody.

That's it.
POINTS IN ASSESSING

A lecture given on
7 June 1961

Thank you.

I was going to say I can always tell when somebody is mad at me: They don't come to my lectures. [laughter] That happens to be a coordinated fact, you know that? People who don't – haven't attended my lectures in the past in Central Organizations, eventually squirreled in some fashion. Odd. Peculiar. So I always look around to see who's there, you know? It's my Security Check.

All right. Now, this is the 7th of June, isn't it?

Audience: Right. Uh-huh.

Marcabian intelligence report date – something or other. Did you hear about the Marcabians who had to PDH the Thedeans who had to – in order to make Frank Sullivan safe for democracy. Anyhow [laughs] – ah, it's a wonderful life.

All right. Now, I lectured to you yesterday on HCOB June 5, 1961. Tried to give you some very fast general coverage concerning it, and this bulletin was issued to you today. This bulletin is based totally and completely on what we have found people would do and what people can do. And they can do these. And although I can tell you innumerable ways to punch buttons on cases, innumerable ways to become aesthetically telepathic about cases, read their facsimiles and all kinds of weird things like this, it doesn't happen that over the last eleven years people have uniformly been able to duplicate this. So as a result, we have techniques and technologies, and we have taken it all down out of the beautiful esoterics of esoteria and have got it well situated now into the ponderous clank of something that can be totally understood and duplicated. Okay?

The trick of communication in Dianetics and Scientology is the interesting trick back of all the tricks. That is the one thing that has been the most difficult and is probably the greatest achievement. Other people might look at other things, but learning how to get things understood is one of the most difficult things – without developing a large vocabulary.

We could easily do this by inventing eighteen dictionaries and the 8,000 new terms you have to learn as a medical student and so forth – and we've got somewhere around 400 terms that are – 472 terms, I think, include all of the oddball ones we don't even use. In common usage, I think a Scientologist's vocabulary probably isn't over about 75 or 80 words that are completely strange and peculiar and have their own meanings. But once you define these words – once these
words are defined – people look at them and realize there was no such word. See, so we've had to make something that sounds like English, you see, then mean something. And it's very odd – as soon as I get out the dictionary – which I'm doing – I do that between 7:00 A.M. and 7:05 on my schedule. [laughter]

I must have an overt on buzz saws though. I did get to bed for a couple hours sleep this morning, and I no more than closed my eyes, than Farmer Jones opened up on a buzz saw. And you know, he is perfectly tuneless on the thing. He can't play it worth a darn. So he has now got another black mark in his book and our books. And factually – not for that reason at all – everybody is being very fed up, because they open up his book now and they find nothing but total black pages. You know, he's run out of black marks.

But trying to communicate to him, for instance, anything about anything is a very good example. Here's an actual example: You try to explain what the situation is all about. You draw a blank. You draw a complete blank. But he responds like mad to processing. Even anything as corny as a Touch Assist.

I ran an engram on him one day standing out in the front drive. The odd part of it was his hand recovered and everything else. He'd been kicked by a cow in a milk pail. And at first he thought the milk pail had kicked him. He didn't know when it happened. He couldn't locate when it occurred. It was sometime between breakfast and supper. He didn't know at what moment what had happened. He had no clue, and he was having a rough time. And his hand was all crippled up, and he couldn't milk. So I stood him out here in the front drive and ran out a bad hand. He became rather pathetically curious afterwards as to what we were doing.

There's no language to talk about it, you see? That's the trouble you have, you see? The no-language barriers. It's the no-language barrier. These words do not exist in the language because the understanding didn't exist in the language.

Now, words are based on agreed-upon understandings. And English is a Johnny-come-lately language. Most of these postulates hadn't been made or thought of for the last 200 trillion years. You're going to express them in English? People don't even know these principles.

However, you tell him a definition of a word, carefully, using, oh, I don't know, using twenty, thirty words, something like that – a definition of a word – he doesn't latch onto the word rapidly because the concept is brand-new to him, and he's rather stonied by the definition. This is something that's never occurred to him before. He can sense the truth of it. Something is going ding, ding, ding. "That's true, you know. That's true. You know?" But he can't quite grasp it. And while he's still in the throes of grasping this, recognizing there is a truth there, if you threw right on top of it a condensation of your explanation and his cognition in just the few letters contained in one word, you've almost collapsed the track on him, don't you see? He has to realize the principle before he can take the word. You got that?
It goes reversewise. A child has to find out that the stove is warm before he begins to understand what "warm stove" means, don't you see? Now on a thought level they have to understand the concept. Well, this is almost like processing.

It used to be fellows would read the Axioms and read things about it and get all sorts of cognitions. And you know, "Dianetics: Evolution of a Science": We have numerous cases of people in hospitals having been given this or finding it, and just reading the book and throwing back the covers and getting up and sliding into their shoes, much to the horrors of the nurse, and leaving and never being sick again.

What did this? It was basically a resurge of hope that there was some understanding of all this, don't you see? But it was the understanding alone. So the understanding operates as processing. You got it? It operates that way – it's clarifications.

Well, until you have somebody who has wrapped his wits around some of the principles, so that he isn't still going, "Let me see. Are all men bad? Are all men good? I wonder if all men are good. All men are ... are bad. There probably is two different kinds of people. There's the good people and the bad people."

I knew a nut one time that used to say, "Well, there are two kinds of people: there are happy people and unhappy people. And you're an unhappy person." And then she would add gloomily, "And I'm a happy person." [laughter] See, she had this all worked out.

And if you all of a sudden shoot something in and say, "People are thetans. And there's the overt-motivator sequence, and what they do to others, why, they think is done to them"; boy, you've just fired a philosophic salvo of fleet intensity. See? Wham! You know, and everything is reverberating from horizon to horizon, you see. And you say, "Now do you get the word 'overt-motivator sequence'? Oh, you don't understand the word yet. Well, you're stupid." And in training people, they actually have to learn the principles before they learn the words.

That'll make this dictionary rather interesting reading, because they look at the word, and they're perfectly willing to commit that to memory. And then they read the definition, and the fleet salvo reverberates from horizon to horizon, and they say, "What word was that? What word was that? You know? You know? That's submerged. That's gone. What are we connected with? What planet is this?" you know? That kind of thing. And then they finally come around and they say – they look at it again, and then they look at it again and then they run into it with familiarity. And then they get more and more familiar with it. And then all of a sudden they know the word. See, they can package it, because the understanding of it is so easily understood that it is thoughtwise transmittable. You got the idea? Until that time, they can't learn a vocabulary.

Now, you can do anything you want to, to teach people how to learn a vocabulary, but you run against the principle of the communication of the idea that is packaged in the word. And these ideas have not been familiar to man.

All right. Doing that in a relatively simple way might look complicated to people simply because their basic difficulty is trying to grasp some principle. And they haven't got a good idea.
of what an overt-motivator sequence is, and every time they try to face it, you know, it sort of blows the words "overt-motivator sequence"; they become meaningless. And what they haven't done is grasp the principle of the overt-motivator sequence. It is not that they haven't grasped the word. They could spout the word parrot-fashion, but they cannot understand this other principle, don't you see? See what we're connecting up when we're training people.

Actually, we know – would have no sounder method of educating somebody than teaching him the principles of Scientology under the guise of teaching him the vocabulary of Scientology. Got the idea? They couldn't help but have a repercussion.

All right. Now similarly, the operational actions which we undertake apparently are liable to shortness of understanding or misunderstanding Therefore, what will be done and what can be done by a person in Scientology, by a Scientologist, is monitored by what he can easily understand and what he is willing to perform. And you have that right here, and this is quite a triumph, this HCOB June 5.

Now, to a non-trained person, this bulletin would probably be gobbledygook, because it doesn't explain too much here. It's dependent on other publications, you see? It says CCHs. Well, of course, we've been through the ropes and we know what the CCHs are, but that wouldn't mean anything to – oh, I don't know – Menninger, presuming he's still alive.

"CCHs. Oh, must be something made up. Something made up."

"No," you say, "No. It's a repetitive thing. It's actually control, communication and havingness. When you apply control, you obtain communication, which gives the preclear havingness. And it is a method of entrance on cases which is rather infallible. And that's what CCHs mean." Look where you'd leave Menninger. [laughter] See? He wouldn't be around there, that's all.

In the first place, you've enunciated to him a principle that psychiatry, if it had any teeth left, would give them all if they had a formula by which they could actually bring back some sanity, see? They haven't got that. So you've thrown him this formula and control to him is electric-shocking people, and communicating with people is electric-shocking people, and havingness to him is electric shock or psychosis. So it adds up to him: "Well, control, communication – it'll drive people crazy." Get the idea? His adjudication. You see how he'd arrive at the point where "it'd drive people crazy", because his havingness is psychotics. This is all the havingness the man has, obviously. See, so control – that's electric shocking people. And communication – that's electric shocking people, because he knows you can't, see? And havingness – well, that's electric shocks and psychosis. Oh, psychosis. You can have psychosis, so that if you ran the CCHs on anybody, you'd drive them crazy. And they electric-shock people because it drives them crazy.

You see, you're baffled because you don't realize that you're dealing with short-circuited thinking. You know: A=A=A, therefore you do it. Fact equals fact equals contrary fact, so you dramatize it. So you're not even in that case dealing with thinking. As the – I'm not berating these people. I'm merely saying there couldn't be any thinking because there's bulletin after bulletin
that they themselves put out continually, saying that surgery and electric shock do nothing but harm people. And they go right on ordering them and doing them, you see, so that it must be a short-circuited thinkingness. So you're not penetrating at that level at all. Now how are you going to penetrate?

You say to this fellow, "All right. Now look. Joburg Processing Check. That is a series of questions which are asked the person to obtain from them data which they ordinarily have not handed out." And right away, Menninger says, "Ah, Catholic church." See? Thu-thup! So we now have the fact that we are driving people crazy by using the mechanisms of the Catholic church. [laughter] You get how you get a no-think out of this? This would be the no-think.

Well, it's very interesting to see how these things add up. But they are not gobbledygook to you because you've experienced a great many of these things – experienced them all. The only thing you possibly haven't experienced is being Clear, and you possibly have not seen a Clear floating needle.

As a matter of fact, I told an auditor in HGC London the other day that they ought to take the pc around and show the auditors a Clear free floating needle. And I got into the most oddball yippety-yap you ever heard of. Why? Because this is an unfamiliarity. We're in a zone of unfamiliarity, and even the despatch was misinterpreted. It caused a great deal of randomness, this despatch. The pc got hold of it and interpreted it that I had – was forcing upon her the concept that she was Clear. The auditor must have interpreted it similarly because never showed it – this Clear floating needle type needle – to any of the other auditors. The only thing I wanted them to do, if anybody had cared to read the thing – the only thing I wanted them to do, was to be able to look at a floating needle. Nobody had ever seen one up there, see? And this is a floating needle. And it was a wonderful opportunity for somebody to see a floating needle. Instead of that, pc is ARC broke and it has to be run in the next session.

Look at the randomness that suddenly developed here. Pretty wild, you know? You say, "Auditors, I want you to show a floating needle." Pc has an ARC break. Auditor doesn't go anywhere near anybody. Pc has a present time problem. The auditor is mad at me because I've upset the pc. See? Pc was haunting HCO – shouldn't have been – watching things coming in over the telex. Oh, wild.

Well, look, that's the only thing on this bulletin that the auditors in London wouldn't have a fair familiarity with at this stage. And it caused randomness. Got it? So it takes a little while to develop an understanding of things. Right?

You shouldn't be teaching somebody above their zones of reality, really. But you can reach them with processing and they then do gain a subjective reality on the thing. And you can reach them in numerous ways, don't you see? And you actually could teach them a bunch of these philosophic-level principles and then they'd get – even get a vocabulary if they got a subjective grasp on these things. But it's an auditing process. It blows enturbation off the case. And while it is blowing off the case, the case feels confused. So the instant reaction of Menninger is, "This is terribly confusing. I haven't got anything to do with it."
I had a psychiatrist reading Dianetics, and he was rushing out every few minutes and putting the electrodes on somebody and coming back in. [laughter] And he says, "Yes. Yes. I've looked at this book. I've – this book came in the other day. It came in the other day. And I looked at it, and I've looked it over. And I've reported it to the association. I think it's disgraceful." And he says, "I'm a Horney." I said, "Well what philosophy do you follow in your psychoanalysis?"

He says, "I'm a Horney man myself. I'm a Horney man." And he rushed out and strapped and shocked somebody else and came back in again. And he says, "I'm a Horney man."

And I said, "Well ..." I saw it while he was gone, I saw the book Horney, Karen Horney. So I said, "Well, what is Horney? What is the Horney offshoot of Freudian analysis?" and so on.

He says, "I don't know. I never read it." [laughter]

It'd be different if I was telling you that for a gag. But actually that's totally factual. Unbelievably true. He was a Horney man, but he'd never read anything by Horney. I don't know – how do you get it? Telepathic?

I think they'd call it probably, Freudianly, "telepathic emission", something like that. If you keep a book on a shelf long enough, why, you get it by contagion or something. Maybe some years later he expected as long as the book sat on the shelf, why, he would become all of a sudden imbued with its characteristics.

Well anyway, none of this bulletin, to a Scientologist, is apparently incomprehensible. And the only place a Scientologist gets in trouble out in the field and untrained, is in doing Goals Assessments. And trying to run SOP Goals, he can run into too many things.

Now, for instance, we've just run into one on a case today. Case was apparently flat on a level on the case's terminal. Apparently flat, but wasn't. Wasn't. Couldn't have been, because the case was still worried about the level.

Well, we were running the principle of running the rock slam out of the needle rather than running the motion out of the tone arm. And now a question enters: Is this right? I mean, is it right just to run the rock slam out or should you actually flatten that level?

But nevertheless, this case does not answer the problem, because this case might have had a present time problem not detected by the auditor or, after the rudiments were checked out, suddenly had a present time problem. See, the rudiments sort of boost the case's reality, and all of a sudden the case realizes it has a present time problem, so now doesn't get a rock slam. You see, the process isn't biting. Actually, their mind is on something else so the auditor thinks it is flat.

Tone arm motion reduced, in other words, by reason of a rudiment out. And the tone arm moving so little that the auditor would be brought to the conclusion that it was flat. I would be brought to the conclusion it was flat, reading the report, don't you see? So we go off and assess for another level. And then we come back and find the rock slam there 100 percent, because some PTPs have been handled on the pc.
In other words, we have this odd adjudication that we can put on running terminals, and that is that if a pc has a rudiment out, a level can look flat which isn't. And you can put that down in your book, because we've just discovered it and proved it out factually. Because when we went back to this level – two levels have been run since, but the case was bogging.

And in patch-up of cases on general run of Prehav and on patch-up of cases in general – of a general run of the terminal – of the goal, if a case isn't making much progress, you had better go back – that's why you must keep your auditor's reports. This is the way to patch one up, is go back and pick the earliest level run and that might not have been flat, and flatten the level, and come on up to the next level after that and flatten that, because that will now probably be unflat. In other words, you've got to flatten every level now that you've left unflat, and all levels will tend to be unflat, since the level you left unflat. You got it?

So you must keep your reports. The case apparently bogs. Well, the case had a PTP and an ARC break or something like that, and it wasn't detected, and for that reason the tone arm ceased to move, and you say the level is flat. And it's not, and you run a few more levels, and all of a sudden the case is having more and more PTPs, and more and more obsessed with upsets and problems and so forth.

Well, the way to patch that up is to go back and review the tone arm figures on each level that was run at its end. See? Get the end run. Review the last twenty minutes of every process level that has been run on the pc. Okay? And pick the earliest one that you suspect may not be flat. Got it? And to be on the safe side, pick the earliest one that you suspect. But you could – there could be a little bit later one that you might suspect more, but you wouldn't quite be able to decide. Well, if you couldn't quite decide – it usually will be quite obvious to you – but if you couldn't decide – well, go back and pick the earliest candidate and run it, because they'll flatten off rather quickly. You got it?

Now, take all the motion out of the level this time. Just run it down to a point of where it just grinds to a brake-smoking halt. Hm?

Now, what else would you do to patch it up? Well, if you've done a good Goals Assessment, you've got the hidden standards. You know, the person always looks and finds out if his right ear is no longer burning, so he knows the process is working. This is the standards. Lots of people have these standards. And these standards are actually present time problems of magnitude of long duration. And you're running a case with a PT problem that has a hidden standard. See? Well, why run this? Now you would do much better to use what it says here about handling problems of longtime duration under Routine 2, second page. Problems of long duration.

Now, we mean by a problem of long duration, years or within this lifetime. The problem must have existed for years or in this lifetime. Otherwise, it's a PT problem. It's less than a year; it's only months or weeks, hours, minutes, seconds: it's a present time problem of short duration. These are simply artificial labels to give you an order of magnitude.
So the difference between a present time problem of short duration and a present time problem of long duration are quite important to you, because you handle a present time problem of short duration always in the rudiments only. Don't take it into Prehav or into processes or anything like that. Just put it into the rudiments. And the rudiments processes that are supposed to be run in the rudiments will handle it, and you shouldn't do any more about it than that.

But a present time problem of long duration, which means more than a year and less than a lifetime – this lifetime, see – you do a Terminal Assessment just like you were doing a Goals Assessment. And you just keep hammering and hammering and hammering and running and running. And it's not something you do in twenty minutes, the way I've been getting it in auditor reports. "Well, we did a Terminals Assessment for the present time problem of long duration, and then we assessed for the level, and we immediately got to running it." And you look up at the assessment, and it's five minutes. Oh? Five minutes? How interesting.

You mean you could get a list of all terminals which might be involved in this problem and do an assessment by elimination in five minutes? Oh, yes. Like hell you could. You're looking at a couple of sessions, man! Let's get real. This person has a hidden standard. His right ear – he knows whether processes are working because his right ear doesn't burn. But when his right ear is burning, why, then he knows a process isn't working.

You had a case go through HGC London a very short time ago who had some kind of a peculiar thing of some kind. It was something as unlovely, I think, as if you will excuse me – a vaginal discharge and when this lessened, the process was working and when it got increased, the processes weren't working, and everything was being barometered by this rather fantastic action.

Now, that's nothing against anybody. You'd have to find that out. Oh, look. There is something connected here that is real to the pc. It must be more real to the preclear than the preclear's case, by automatic definition, because the pc uses it as an indicator for his case so that this thing must then be a substitute for his case. You got that? I mean, a substitute for the case. That's why you must know about hidden standards!

In other words, the hidden standard is more real to the pc than any case or life difficulties he is having, because he tries to find out if it is functioning or not functioning. He's sort of packing an E-Meter around on the side of his head, don't you see? You got the idea? Well, his attention obviously – this is merely a problem of attention.

There hasn't been a lecture, by the way, on attention and dispersed attention, attention units and so forth since, I think, something ridiculous like the end of June 1950 at the Elks Hall in – it was – must have been someplace in New Jersey – Elizabeth! Mmmm! The Elks Hall in Elizabeth, New Jersey. There was a whole hour lecture at that particular time on the subject of attention units and how they are trapped in the bank, and the individual is running only on 1 percent or 2 percent of the theoretical 100 percent of attention available to him, because his attention is pinned down in other places of the bank, you see?
Well, that's very, very interesting to us today to all of a sudden have this old one suddenly leap into view, full-armed, see? Because here it is; here it is. You're working with it right now. You're assessing for a goal to find out where the person has most of his attention. You're assessing for the terminal and immediately the goal would disintensify that you find the terminal really, because, of course, the attention is really fixed on the goal because it is fixed on the terminal. And the second it gets fixed on the terminal, you've rather unfixed it on the goal, so the goal will read less after you've been assessing terminals a little while.

All right. Your next point here is that if the pc has his attention on a burning right ear, well, for heaven's sakes, it's practically a total computation sitting right there on the side of the pc's head. So what do you do? You say, "What is it now? Has that been -- have you worried about that for some time?" You say, "Well, what would have to happen to you for you to know that Scientology works?" That is the cute question.

The pc always answers up and they give you some of the most remarkable answers you ever heard in your life. "Well, to know that Scientology really works, my daughter would have to get over her hives."

Oh, come on. This person's attention isn't even on himself. But nevertheless that is the answer. "Well now, has your daughter having hives been a problem to you for a long ..."

"Oh, well yes. Specialists. Take him up to Pennsylvania, take him up to Wyoming, and we've gone down south. We've gone practically every place. We've imported special bees to sting her and followed the very best directions we possibly can. She still has these hives. And we keep rubbing pickle juice into them all the time. And every night I have to get up five times a night and rub pickle juice into her hives so that she can sleep. And this has been going on for some years. And I actually feel guilty about it myself, you see, because one day she walked up to the stove when she was just a little child and -- she did. And I spilled onion juice all over her. Well now, ever since that time I think she's had these hives."

Hey, what better indicator do you want? You say something about the problem, and your pc goes off like a small firecracker, see? Like a string of ladyfinger firecrackers, you know. Pop, pop, pop, pop, pop, pop, pop. Pc real interested. Yap, yap, yap, yap, yap, yap. Brrrrrr. Yap, yap, yap, yap, yap. Where do you think their attention is? Attention is on daughter's hives. So to clear this pc, you have to get her daughter's hives out of the way. [laughter] But you get her concern as a pc's attention off of these hives. If the hives cure up, it's totally coincidental. But they might. [laughter]

Now, here's the hidden standard. And this hidden standard keeps more people from getting released or cleared than any other single thing I know of except withholds. See? So it's just junior in rank to withholds for holding people up and holding cases up, you know? And actually, the present time problem is right on the goals chain. Always is. Otherwise it couldn't be a problem of long duration. It's somehow connected with it. So if you scrape the top off, the case assesses much more rapidly. That's the least that would happen.
And you might find yourself thoroughly, straight on the goals line if you did a very good assessment. You've short-circuited the whole thing, and this is running like a bomb, and after you've run three levels on this present-time-problem terminal of long duration, you assess the thing very carefully, and you don't find the Prehav Scale live on a dozen levels – oh, coo! You must be straight on the pc's line. And it didn't take you seventy-two hours to do the assessment. It took you more like about five.

So you get the values of a hidden standard? It's something to pay attention to. Something very interesting, besides being terribly amusing. I'll swear I have heard some of the weirdest statements that Homo sap has ever made, I'm sure, when I talk to them about hidden standards.

"What would have to happen for you to know that Scientology worked?"

"Oh, well – well confidentially, whenever I've been processed, I see whether or not my right foot ticks. And if it stops ticking then I know we're on the way, but if it starts ticking, I know we're off." You get the most interesting answers.

Now you say, "What else – " you don't ever ask this, but I've – can pursue the question line in other directions, and it becomes practically ridiculous. You say, "What else do you use this right foot for?" You wouldn't ask that in processing, but you get the most fascinating answers. They sometimes use it to find out if people are mad at them, what the weather is going to be, whether or not the food is going to agree with them, whether or not they're going to be sick. You know, in epilepsy the fellow always knows a certain feeling when he's going to have a fit, see, and he knows if he gets a certain condition, he's going to have a fit. Well, they use these hidden standards the same way. They know they're going to have some bad luck. Well, the nervous stomach, for instance. Fellow's nervous stomach turns on, he knows he's going to have some bad luck. He knows there's some bad luck coming up one way or the other. He uses his stomach to measure the future.

You find all sorts of people – this is the most common one: "Now, what would have to happen for you to know that Scientology works?"

"Well, my nervous stomach would have to turn off."

"Oh?" you say, "Your nervous stomach would have to turn off. Well, very interesting. How long have you had this nervous stomach?"

"Well, ever since I was a child."

"Well now, does it ever turn off in processing? Has anything ever turned it off in processing?"

"No. I keep watching it." Then all of a sudden, "Brrrrrr, yap, yap, yap, yap. And this auditor and that auditor, and we ran this and we ran that, and we did this and we did that, and the other thing, and so on, and so on, and so on, and this stomach, stomach, stomach, stomach, stomach, stomach, stomach, stomach," see? Hidden standard, hidden standard, hidden standard. You got the idea?
Well, it's almost an assessment when you strike the fire on the pc's interest, see? He's going to be in-session on that. Man, is that pc going to be in-session. Well, he's already willing to talk to the auditor about it. He's already interested in it. So his attention must be parked around there someplace.

Now the mistake we have made is, not assessing this nervous stomach.

We can ask all sorts of embarrassing questions, such as, "Whose stomach is it?" [laughter] We can do a PreSession 38 type terminal search. You can do all sorts of things with this thing. They – that's the who – or what, who and when. "What's wrong?" and "Who had that trouble?" and "When did he have it?" It sometimes knocks the whole problem out just discovering this.

But now, instead of running a PreSession 38 type of operation on it – it is a faster action but a more – not always a faster action, but more certain, you know – in the interests of certainty – is to do a Terminals Assessment by elimination on this somatic, on this standard item. Is it his ear? Is it his head? Whose head? Whose ear? You got the idea? And we just – whose might it be? And a pc guesses about this thing, and it might be this one's and it might be that one's, and it might be an... You just write all those names down, you see? It might be his inner ear, so you say "inner ear". And it might be his lobe, you know, and you write down "lobe". And it might be his aeroglopis. And you say, "His what?"

Don't challenge it. What you want to find out is how to spell it. [laughter] It's his aeroglopis. And that's the mechanism that lets air in and out of the ear. And you never even knew it existed. Neither does medical science. Nobody has ever known this one before but the pc, you see?

And you'll find that the reason this line of questioning is so intriguing is because, of course, you have hit the primary source of individuation on the pc. This is the one that makes him different from everybody. It's sort of he knows who he is; he's the one that has an earache. [laughs] So he's different than everybody else, so it's the least duplicated area of the bank. So, of course, it'll fire off as an automaticity because it's most out of communication and therefore most out of control.

So locating the hidden standard and assessing it by elimination, by which you get a long list of terminals. Oh, I don't know, somebody's nervous stomach, you ought to wind up with a list of terminals of something like two hundred, something like that. Big.

Well, ever since we've started doing Goals Assessments on a highly therapeutic level, it is nothing for people to come up with 546 goals, and then come up with 546 terminals on that one goal. This takes some time, and it takes some doing. You don't do assessments in a part of a session and then get the show on the road, because you're usually wrong.

I should talk to you about something in assessments that's just occurred to me. I mentioned it to one auditor a short time ago and used the phrase, and it's never been used before, but it certainly is something that you should know something about. It's called a cognition surge. And it can throw your whole assessment awry. It's a cognition surge, and this is the source of most of
the charge you get on the bank. It isn't – when you're going over a whole bunch of goals and that sort of thing and the individual all of a sudden says, "Well, what do you know? I have always wanted to shoot magpies. And I don't even know what they are."

The E-Meter will react rather violently. It's a cognition surge. It's a release of electrical charge that goes along with the person having a cognition. And if you watch an E-Meter carefully, often when they're having a cognition – a real cognition – you will get a marked fall. Well, when you're assessing and you ask for another terminal, the person sometimes all of a sudden says, "Hah! What do you know! Airplane pilot, of course," see. And you get a steep fall that has nothing to do with anything, really, but the fact that he's cognited that he might have had something to do with airplane pilots, and this is what it's falling on. It's sort of on the assoc... possible association, and you'll get a mad drop.

Now, another thing When you're sometimes assessing for a level – which is more common – the individual all of a sudden realizes that there is such a thing as fighting wasps. This has just never occurred to him before, see? And you do – you're reading along, you're reading the assessment, and you're saying – it says, "Fighting. Scrapping. Knifing. Burning," and so forth. All right.

Now, right about the time you've entered in this line, you say "Fighting", and you get a great big drop on the needle. And you say, "Boy, with that much drop, that must be it. I won't assess any further," and have you just pulled a bloomer. Because it says "Fighting" and drops like mad, and that's why you always do them at least twice, you see, once up and once down. And the next one, "Burning – scrapping, burning."

Now you come back over the list again, and it says "Fighting", and it is just as dead as a mackerel. And you say, "Well, that is the most peculiar thing. How was it so hot when now it's so cold?" Well, you read a cognition surge.

The person – it's a "Whaddaya know! There is a possibility of some time or another fighting a wasp, you know? Ha-ha! Ha! What do you think of that? Ha! Incredible. Nobody could possibly fight a wasp. I always have known that. And here's the idea, but it's a funny thing of I've never thought of this idea before, don't you see?" It isn't the terminal level that you should run. It is simply the fact that he had an idea at that instant. When you come back over it again, it's flat.

There's nothing disappears off a meter faster. Sometimes when you're assessing terminals, you will find that terminal after terminal in turn pick up the cognition surge. And it only lasts for about five or ten questionings on the terminal.

It just – this fellow has never thought of himself as having been even remotely connected with being a rocket jockey. This is not a possible connection, don't you see? And not being a possible connection, of course, you get a tremendous blauw, bang, thud at the idea of being connected with a rocket jockey. But it doesn't have anything to do with the fact that the terminal is "rocket jockey." Got the idea?
A cognition surge actually occurs when an associated terminal or associated level to the one you're looking for blows off rather violently. And this happens during assessments of goals, terminals and levels. And when you get a disassociation all of a sudden – the guy all of a sudden gets rid of that one, your meter will react. And your meter won't react again. And the source of probably most bad assessments, or most assessment errors, is when the D of P sets the guy down, it falls off the pin, and they say, "That's the terminal." No. It's not the terminal. That was the charge a terminal made leaving. See?

Now, you ask him again about the same terminal, and you get a little flip, and you ask him again about it, and, man, is it gone. But sometimes a terminal will look terribly hot for about twelve recounts. Just look hotter than a pistol, and the pc is getting interested in it. But the pc's interest is not because he is that terminal or is being that terminal but because that terminal is blowing. He has just never inspected the fact that his unknown terminal was connected with this now known terminal. Well, the inspection of this will give you an E-Meter reaction. But it's a very short-duration reaction.

That's why on a goals terminal you grind them out by elimination. That is why on the Terminal Assessment you grind them out by elimination. And a PT problem of long duration you always grind out by elimination, because you'll just get nothing but cognition surge after cognition surge after cognition surge. And it's the one that's left you want. Because all of these things – you've entered, already, a random area. You got a goal fast, you see, which is actually to do something about – only we're not quite sure what – or to learn lessons from a burning right ear, you see? And you're in this brrrrrr area, and so you get all sorts of fireworks on the meter, you know, and terminals blow, and ideas, and he remembers people he never heard of before. Don't be too surprised if you get a couple of hundred terminals, and by the time you've got them all assessed, he says, "What burning ear?" See, don't be too surprised if this occurs. You get how you do this PT problem of long duration?

Now, after you've got the terminal and you do assess it on the Prehav Scale, you of course now run it the same way you do a goals terminal. You just run the levels flat. But they run flat awfully fast, so your twenty-minute rule doesn't apply. You kind of have to watch the needle. And you still can leave one unflat, by the way; have to go back and pick it up. Various things have to be done. Have to retrack your steps.

That's the only other thing I know of in here that you probably don't know – didn't know how to do – I hope you know some more about it now – is the assessment for this. Because I noticed most flubs at the present instant are now being made in assessing and running present time problems of long duration. And the flub just stems from these things. They don't make a terminal list, and they don't do assessment by elimination, and they grab too quick at these cognition surges. Got 'em?

All right. Once more I didn't ask you for any questions today. Some of you are now going to have terrible withholds.

Okay. Is there any fast one anybody really has to know before session tomorrow?
Alright, thank you very much.
Good night.
QUESTION AND ANSWER PERIOD: ENDING AN INTENSIVE

A lecture given on
8 June 1961

Thank you.

All right. You haven't – let's see. What is this? This is the 8th of June 1961, solar system. Have to keep you oriented.

You haven't had any opportunity to ask any questions the last couple of lectures. I have simply decided what you didn't know anything about and filled you in. So now I want some questions. Of course, it's kind of cowardly asking you for questions in the first place because this assumes that I don't know what you're fogged up on. Yes?

Female voice: Exactly how and when the Havingness and Confront commands, and where, are fitted into a run on SOP Goals. Just where they go in relation to running the level?

When do Havingness – or where do Havingness and Confront commands get fitted into SOP Goals. Actually, I'll answer it for all sessions.

Female voice: Yeah.

If you have the pc's Havingness and Confront commands, you start the session with them after the rudiments and end the session with them when this room situation goes – when you ask about the auditing environment. The point there is you run them backwards at the end. You run the Confront and then you run the Have. You just run them at the beginning – Have-Confront – that is after the beginning rudiments – and at the end rudiments you run them Confront and then Have. This actually is quite mechanical.

You can take these two processes and throw the guy into his bank. See, you bring him into the room and then throw him into his bank. Just look at it that way, you see? He comes into the auditing room, and you say, "Is all right if I audit you in this room?" you know. You say something like this and he says, "All right." And you say, "All right." Far as you're concerned it's all right, but you haven't got him in the room yet.

Now, if you've got his Havingness and Confront, you move this over into his first process. In other words, you bypass the rudiments. You ask him if it's all right to audit in this room, and we don't care what he says. If you're going to run his Havingness and Confront Process the first thing you do – what does it matter whether it's all right to audit in the room or not? You're going to straighten this up shortly anyhow. Well, why isn't it all right to audit in the room? Well, he probably has a PT problem and ARC break and a withhold. That's why it's not all right to audit in the room. So who cares! It's there in the rudiments mostly to call attention to the fact that there is an auditing room, which might have been missed by the pc. You get the idea?
All right. So that's not anything that you handle, although there is a process given to handle it. But that process assumes – TR 10 in a Model Session – that you don't have the pc's Havingness and Confront Processes. So, you say, "Is it all right to audit in this room." And it goes wha-a-a-am, crash! And you say, "Fine", and go right on to your next rudiment. Don't use that as an excuse to waste auditing time. You got the idea? There's no point in it if you've got his Havingness Process.

All right. Now, let's finish up the rudiments. And our first process is now going to be a Have Process, and of course that nnhummp was mainly an ARC break, PT problem and withhold or one of them. So you've taken care of that now. Now you can bring him here. See, a present time problem has got him out there somewhere. So you can knock that out, of course, he's more here, isn't he?

So you run your rudiments and then you saw into the Have and Confront Processes immediately after the rudiments. Your Have first, and then your Confront. Well, you've handled his PT problem, his withhold and his ARC break and so forth, so therefore, he's more willing to be in session. You run the Havingness Process, and of course he tends to leave where he has been and arrive where he is at. And now you run the Confront, and you say – you're saying just the same as, "Just between you and me, I think you ought to take a look at your bank. It is time you ceased to avoid all this. It's a question of how can a thetan live in this much mush?" You got the idea?

So you say, "Well, let's now take a look at your bank. Let's take a look at your case." You could say this, you see, very splendiferously. Theoretically you could do that. you could – you say, "Well, here you are in the room." And you've straightened it up so the guy can be audited, and "Here you are in the room. And now, what do you think about your case?" See? Well, instead of saying, "Well, what do you think about your case?" you run a Confront Process.

All right. Confront Processes cycle. They go out of PT and into PT. So if you are very clever, you will run just one cycle. Out of PT and into PT. See? If you're very clever. Out he goes and back he comes. You say, "Look. It is safe to leave present time in this room. (1) The room is safe. We've just run Havingness on it; and (2) we are now demonstrating to you, that it is very safe for you to slide down the track a little bit. And when you come back, you'll still find the room here." What do you know!

You're saying that in essence then when you're running the Confront Process.

So, all of the processes today – all Security Checks, all everything – when, if in doubt about how to say "good morning" to the preclear, say it in Model Session. [laughter] Use Model Session for everything that pertains to auditing. This does not apply to a Johannesburg Security Check given for purposes of security only. There you don't even bother to clear the commands. You try to clear the commands, and if you don't clear the command, you look at the fellow and say, "Well now, listen. If I have to leave this one with it still falling off the pin, you realize you've failed a Security Check. Are you sure there is nothing you wish to tell me?"

He thinks this over for a minute and he says, "Well, maybe I'd better tell him about the bank robbery, you know? The illicit diamond buying" And so he sometimes gives up like that.
But you wouldn't work day and night, on and on and on and on to clear somebody's Security Check, you see, if it were to be given for an employment Security Check.

In the first place, somebody whose Security Check is so bad that, particularly on the subject ... The original question, by the way, "Have you ever cooked a company's books?" It sounded just a little bit slangy to me. It outcreated me on the subject. "Have you ever cooked a company's books?" And you now have that under the heading of "falsified", I think it is. And you strike that one, you see, while you're security checking somebody for employment, and it goes clang! And what do you want to clear it for? You wouldn't have the guy on a bet!

All right. So we finally find out, well, he only falsified them a little bit. He's just been entering everything into the petty cash column and sticking it in his pocket, or he's been doing something innocent here that should never be reprehended anyhow. When you're security checking as a Security Check – just *en passant* here – you must know what a meter's talking about.

It takes a good auditor to do Security Checking. You can't teach somebody in ten minutes how to do a Security Check and then trust any result he gets. Because what's he do? He gets somebody on the meter, and there's no – there's no meter responses of any kind whatsoever – you know that the person is totally irresponsible anyway. Dead thetan reading properly at the Clear read. And it all says, "There. That's all right with that." He asks all the way through the Security Check rapidly. He gets no reaction of any kind whatsoever, so he says the person's secure. The person just got out of Dartmoor Scrubs, you know – [laughs] just that day!

So you have to know something about pcs and a meter in order to size up the person, and if they're not getting any reactions anyplace on a Johannesburg Security Check – you know this is impossible anyway – your auditing experience. But you don't run that in Model Session, and you finish the check in any event. No matter who you're running it on, you always finish the check, but you don't necessarily spend four hours clearing up one level. You just want to know if he's hotter than a pistol on these various levels.

And one of the ways to do it is go right on through the check, *whammity-whammity-whammity-whammity-wham*, getting all the withholds that he gives you as you go by. And then you've marked several that didn't null, and go back over these and ask searchingly about them – something on the polite non-auditing attitude of "Well, you realize that if these levels retain withholds, as they apparently do, and you have not told me all, which you obviously haven't, that if you fail to do so, that is it; if you have failed a Security Check and will be rated here as an insecure person. Now do you want to tell me about it?"

And the fellow says, "Well, the meter must be wrong and so forth, and so forth."

You say, "Okay. You've had it." Reach down to the bottom of the page and say, "Failed check, such-and-such a date. Unemployable." That's it. Don't monkey with it.

That's not true in auditing, you see. You run that in Model Session and you get those questions just as clean as wolf's teeth. You see, there's a tremendous difference between giving a processing check and a Security Check, even though you're using the same list of questions. Now, you just take those things apart. So in – *en passant*, I mentioned that.
All right. Havingness and Confront is run after beginning rudiments in the order of the Have and then the Confront, and before end rudiments in the order of the Confront and the Have. Okay?

_Female voice: Thank you._

Right. Any other question?

_Female voice: Yes._

Yes.

_Female voice: You've told us this before, but it hasn't sunk in and I'd like for you to tell us again._

Okay.

_Female voice: If you're got something which has been restimulated by the questions in a Security Check, but it doesn't seem to be on the first ones, would you go on through and then check back on them afterwards?_

Not in processing.

_Female voice: No._

In doing a Security Check for employment or loyalty or something of this sort, some other purpose, yes, you would do it as you said it, but not for processing. You do not leave a falling level behind you. Leave nothing falling behind you. That's pretty hard to do. You very often get them falling on later things and in the panic about withhold – But remember, if it's been carefully given in Model Session, you will have the opportunity to ask the pc if he's withholding anything in the Model Session. And the reason you've got withhold in there at beginning and end rudiments, is because you get two cracks at the pc every session.

So, if a question were hanging up in that particular fashion and you couldn't seem to get anything out of the pc or get it clear, you might suspect, because of the sporadic reaction of the needle – if it's not on the button, you see, it doesn't act constantly, it acts sporadically. That means you're near something, but you're not on it. It falls and it theta bops and it rock slams, and then it goes null, and it falls and then it goes null, and then it rock slams and – you're just not asking the right question, that's all.

And if you were to get – I didn't say that you should get baffled at this point, but if you were to get baffled, you know, about the whole thing, a good thing to do is take a break. Well, you'd take a break by ending your session, wouldn't you?

So that gives you a crack at the withholds, doesn't it? And then you take a three-minute break. And then you start a new session. And this gives you another crack at the pc's withholds when you're clearing that rudiment, you see. And this time, you'd clear the rudiments, real hard; the end rudiment and the new beginning rudiment. And by the time you got back to the question again, you've probably gotten the withhold that he kept ticking or tacking on, and that question now will probably be free. And that is the – really the right way to handle it. I'm sure you can see the sense of that.

And the other point to make here is your pc, if he's doing this, is probably having trouble. And there's another co-related factor of this. If a pc is having trouble, his attention span is poor. If his attention span is poor, the best remedy for that is short-sessioning, which
in itself is a technique. If you were to take a pc who was having a lot of trouble and you were to begin a session and run TR 10 as the sole body of the session – just ten minutes of it, you see – and then run end rudiments and end the session, and then begin a session and run some more TR 10 and end rudiments; you would oddly enough get a lot of cases with formal auditing that are really CCH cases. So it's well worth knowing how to do that. So it is not a waste of time to do that. It is beneficial to do that. And I'd recommend that if you are having an awful lot of trouble giving a processing check, that you also add in this thing called short-sessioning. You could go at it like this: a session per question if he was having too hard a time. Then you'd sure get it every time, but that would be the extremity, the reductio ad absurdum. Okay? That answer your question?

Female voice: Yes.

All right. Any other question? Yes, Reg.

Male voice: On the assessing for goals, we have the goal, the terminal and the level fine, and you tell us that they each – reaction should be the same for each – rock slam, rock slam, rock slam, throughout.

Mm-hm.

Male voice: Now, if on the Primary Scale you get your same reaction, is it then necessary to go on to the Secondary Scale?

No. This is a matter of judgment.

Male voice: Mm-hm.

Let me clear up – clarify up some things like this. This is the same reaction on the goal, the same reaction on the terminal, the same reaction on the Primary; now would you go over into the Secondary Scale? Would it really be necessary to assess the Secondary Scale? Well, we've gotten here our first question that tells us actually a Secondary Scale at this stage is too complex. There actually will one of these days be a tertiary scale. And rather than spend the next two months keeping you from having something resembling a complete scale, I relegated my final sort-out to after the first publication. So therefore, at this stage of the game, you find the Secondary Scale rather clumsy. There won't be anywhere near as many words as that on your present Secondary Scale when I finally get them all sorted. You see? A lot of those words will be over on the tertiary scale. So your question, then in the future will also apply to if you find it on the Primary Scale, is it any reason to go on to the Secondary Scale, if you find the same reaction. All right.

It would also apply then – well, if you found the same reaction on the Secondary Scale, would there be any reason to go over into the tertiary scale? You get the idea? So the question would be – could be broadened to include the whole future formation of the Prehav Scale. And I'll answer it in that particular fashion.

I myself had wonderful luck with the original issue, and the only ones that I missed, aren't now on the Primary Scale except under "motion" and "misemotion". The emotional states of pcs are missing on the Primary Scale. So what I would do – what I would do would be to take certain selected levels as necessary levels. If somebody has an original Prehav Scale, I will read you what those levels are, and I would say that if they fell on these levels, go to the Secondary Scale as a necessity, and if they don't fall on these levels, take it. See, I
can give you a qualified answer because it's a matter of judgment. I'm not trying to be complicated with you.

Now, any level here that was on the original scale, if that fell as much as the terminal—good, heavy reaction—I would go ahead and run it. And I wouldn't much bother with going over into the Secondary Scale. But those levels here which really weren't on the original, it would be safest to assess them again over on the Secondary Scale, even though they fell as hard as the terminal, for the excellent reason that they are too pervasive, with this odd exception: overts. Overts.

Now, you've got an overt situation, that if you get the general form "overt" falling as hard as the terminal, nothing has been told you except the person has an attitude. And you can go ahead and run, "What have you done to", and "What have you withheld from?", but you've already substituted an auditing command for this word overt, or you've done one substitution. So you for sure had better find out what kind of an overt. And the overt is the longest list.

Apparently the English language has specialized in ways and means of "overting" and for that reason, pcs have enormously odd categories for these types of overts. And from one pc, when they fall on the word overt, this means, refraining to think an unkind thought about them so as to put them right, or something very complicated. And to another pc, it means hitting them over the head with a brickbat. And that is the only overt there is. You get the idea? And this is peculiar to the whole list of overts. Each pc has a different type of overt that he considers an overt.

So it's such a matter for judgment that I for sure would move over into the overt list even though overt fell like mad. I wouldn't then just automatically run "do", because you've already done one substitution. What kind of a do? Let's find out, because it will fall on overt, but what does he classify as an overt? That is singular, the way that stands out. So you'd say, well, if you fall on overt, assess the Secondary Scale. That one for sure.

Now, looking over the rest of these levels, there are two more, which if they fell, would leave you with no recourse but to do the whole Secondary Scale, and you sure better had. And that's "emotional" and "misemotional". You better find out what is misemotion. Is it standing woodenly or is it screaming at the top of his voice or what? So again it requires the secondary list to qualify the term.

Let me forget what I said there at first. I can give you a good test. I just thought of one here. Any time you yourself would have to make a wild substitution for the level, assess the Secondary Scale. That would be the rule. Yeah. Any time you'd have to make a wild substitution to find out what it was all about, well just move into the Secondary Scale and you won't be guessing. Then you'd be safe. But if that is not the case, you can run any other of these levels. Let me say it that way. If that's not the case, you can run any others.

Now let me give you one further piece of data on that that is interesting. And that is, the goal fell a certain consistent amount or reacted a certain amount. The terminal then in its turn fell or reacted a certain amount. All right. That terminal is going to remain falling that amount, but when you check it back against the goal, you're checking it back as to how much the goal now falls. And this is not—not what's meant. It's how much did the goal fall? Because the second his attention comes off of the significance of goal and onto the solidity of terminal, you get a change on the goal's reaction. Your goal's reaction on your Assessment
Sheets must be noted very precisely as to how many divisions of rock slam – put it down in inches if you're not sure, in some guesstimate of inches. How much theta bop? How consistent? How much fall? How consistent? You put that down about your goal because you're now going to lose it. And you're not going to see that reaction on the goal until you've got a terminal cleared off of it.

Now you may be able to go back and find a lot of reaction on the goal again. And you might not be able to. So let me clarify that, just as long as it's part of this clarification. Yes, the terminal must fall as much as the goal; the level must fall as much as the terminal. But the terminal and the level alone can be measured against each other. You can't measure all in one breath, the goal, the terminal, the level. You can't say, "to pick gooseberries", "General MacArthur", and "failed withhold", and compare them one against the other. You couldn't do an operating condition of this character in auditing because "to pick gooseberries" is lost back in the limbo someplace, you see, and you'd have to get that one from your notes. Now is the terminal falling as much as you found the goal falling in your notes? Because this goal is now only falling in your notes. It's not falling on the pc this much. It still will react, but not as much. So checking your terminal against the level can be done however, directly.

You say "General MacArthur, failed withhold, General MacArthur, failed withhold, General MacArthur, failed withhold." You wouldn't do that, but I say you could do that, and you'd get the same reaction for General MacArthur as the right level. And that would be the only test.

But if anything leaves you in doubt – just to answer your direct question – if anything leaves you in doubt as to what auditing command to shove into this, on this primary list here, there are several here. Inverted Communication. You get this awful fall on Inverted Communication, you see. Well, what's Inverted Communication? Of course, one of the phrases that you can use for it is "intend not – to not communicate." But nevertheless this – could be other inverted communications, peculiar communications. "Communication on a via" is also a peculiar communication. You could ask, "Would you communicate to a cat on a via?" And the terminal's a cat, you know. And you get an awful fall on this thing. Well, maybe you could run it directly. "Communicate to a cat on a via." But you've got an Inverted Communication Secondary Scale that clarifies the whole thing for you. So it has a practical use as well as a pedantic one. Okay?

Male voice: Yes. Thank you.

Okay. Any other questions? Yes?

Female voice: Well, it's still the query on the Havingness and Confront. Originally the thing on Havingness and Confront was you assessed for them after the first terminal was flying.

Yes?

Female voice: Now I know of three cases, you know, that had them added in . . .

Yeah.

Female voice: . . . while on their first terminal. When you – just at what point, now, on running SOP Goals, do we look for the Havingness and Confront?

That isn't the question you asked. If that's the question you mean ...
Female voice: Well, that's the one I intend to ask. That's the one I intend to ask.

All right. All right. Okay.

Female voice: When?

You ask when to run them.

Female voice: When to assess one and start including them in their sessions as a regular part of auditing SOP Goals?

All right. All right. I will also answer that. Answered it yesterday.

Female voice: Yeah.

How many parts or stages or stops or pause points are there in Routines 1, 2 and 3?

Female voice: Well, one at the end of beginning rudiments.

No, ma'am.

Female voice: Oh, yeah.

Now you track with me.

Female voice: You mean the other separate rudiment. Yeah, yeah.

If you're going to insist this exact question be answered, you track on this one now.

Take a look at it now.

Female voice: All right. Yeah.

How many places in the process of intensives ...

Female voice: Yeah.

... would be pause points – where you could use your power of choice on what you were supposed to do to the pc – are there, in Routines 1, 2 and 3 consecutively?

Female voice: As you finish each section of the Routine there's certainly a pause point.

No. Every – ah, yes. As you finish each and every section, any level, any Security Check, any CCH step, any anything ...

Female voice: Yeah.

... Have and Confront can be located.

Female voice: All right.

There's no point in being pedantic about something it'd be stupid to be pedantic about. You can find them anywhere, anytime, as long as you've got done what you were doing.

Female voice: All right.

So you do a case assessment, you can find the pc's havingness and confront.

Female voice: In other words there's no particularly optimum time to start using... ?

Oh, yes. Well now, that's a different question.

Female voice: Yeah.
Ah, but that's a different question.

_Female voice: All right._

You've asked me _can_. All right.

Now, you write down his name, rank and serial number and finish off with how many of his parents deserted how many of his grandparents or whatever, see? And you've got that all taped, you could turn right in, find his Havingness and Confront Process. You could do this case assessment, and you could find his Havingness Process. Then you could go ahead and run a Joburg Security Check and find his Confront Process. Oddly enough, you could find his Confront Process — and now we're getting unoptimum — immediately after you did this check, without damaging the pc in the least, or you could do it when he was totally finished with Routine 1. Wait until then to find his Confront. You could find his Havingness Process, actually, at the time he flattened his first terminal on SOP Goals running. By that time, you've _got_ to have it.

_Female voice: Ah. All right._

And that happens to be just about your last hung dog. Going from there on without finding the Havingness and Confront Processes is expensive in auditing time, because the pc never gets a chance to orient his bank or orient himself in the physical universe as he is running. So therefore, a great deal of auditing time is devoured from that point on, if his havingness and confront are not present.

Less auditing time is devoured proportionately to your being — toward the beginning of his auditing. The closer you are to the beginning of the auditing, the less auditing time is at stake.

For instance, you find that immediately after your case assessment, you're wasting time. So when we get that close to the beginning we're becoming silly, because one Joburg is going to change his Have and going to change his Confront. So you found them for what purpose? For their use in one session, two sessions, three sessions. Now you're going to have to find another Havingness and Confront Process. And you're also liable to get all balled up on "Well, let's see, his needle keeps tightening and the tone arm keeps going stiff here on his confront and I don't know what this is all about. It's just getting awfully confusing. I guess the pc is confused." No, he's changing!

And you are going to have a harder time finding the havingness and confront the earlier you find them in a pc's intensives, not sessions. The earlier you look for them, the harder time you're going to have finding the Havingness and Confront Processes. And the more time you're going to use doing it and the less use they will be to the pc because they're going to change anyhow. So you can get silly about this. See, it ceases to be just precautionary, and it becomes simply a flagrant waste of auditing time.

All right. Now let's move in to the CCHs. Let's say that this pc was going to be scraped all the way off the bottom. All right. All the way up the line. All the way through all routines. Got the idea?

All right. During the CCHs, locating his havingness and confront is of no benefit of any kind because you are not running in Model Session. You're running CCHs. So when are you going to use the Havingness and Confront? So once more you don't need the Havingness...
and Confront, but it would be perfectly all right to assess for them and get them. You got the idea?

All right. Now we get up to a point of where they become useful. They are now useful. And that would have to do with your general runs and Joburgs, you see. That would be useful.

Now, in view of the fact that you're going to run Joburgs along with the CCHs, you nevertheless haven't got too many sessions going there, so it — and your Joburg and the Havin... and the CCHs are going to change the case a lot. And you're going to have to find new Havingness and Confront Process. So you can just go on a treadmill of wasting auditing time by finding Havingness and Confront Processes practically any time through Routine 1.

You can just mark that right down in the book. That's practically a waste of time, because the case is going to change all over the place, and you're going to have to find a new one every time you turn around. So the pc's havingness runs down, so he's uncomfortable; well, he's been uncomfortable for a couple of hundred trillion years. Well, it won't hurt him to be uncomfortable a little while longer. In terms of auditing time, it's rather wasted to try to find Havingness and Confront Processes during the CCH and Joburgs that make up Routine 1.

All right. General Prehav runs and Joburgs at that level: Ah! Now we're getting somewhere. But the first run flattened is sort of the pc getting used to what's going on and getting his feet under him. He's already grasping too much! You know, "What's this? I — I my — all — all my life... Goodness gracious, could this be true? Uh, hauh! I uh ..." You know? He's terribly interested. It's — these levels are running at absolute obsessive interest, you know, practically, because you've got him of course, right where he lives.

All right. Let's say, "Well, let's stop being interested, pc, and let's stop talking about all the things you're trying to tell me about, and let's throw all this away because it's not much importance to me. Ha-ha, ha-ha, ha-ha. And we're going to find your Havingness and Confront Process. We've got lots of time to waste here. You've bought two hundred hours." Well, that's just about how it would sound to the pc.

All right. But let's get that first level flat. And let's get that good and flat, and let's get our first Joburg done at Routine 2. Let's get our first Joburg done, and let's get another level run and flat. Now the pc feels like he can breathe. And right about then it becomes economical to run your Havingness and Confront Processes. And it's economical, and continues to be economical right up to the point where it ceases to be adjudicative and becomes an absolute, utter necessity. And that's in Routine 3, first level run on the pc's goal terminal. And if you haven't found the Havingness and Confront by that time, your pc is now going to start to run very slowly, and you're going to wonder why.

Now, that's the whole story. So, possible? — anytime. Optimum? — sometime in the middle of Routine 2. Oh, I'd say in any time during the first third of the totality of Routine 2, it's kind of wasteful. But after that it becomes quite economical, to find them. Now you're saving auditing time.

And during the CCHs, oh man, are you wasting auditing time. But you can find them. And it's perfectly okay, and the pc will tell you he feels marvelous and isn't it a good thing, and his havingness is way down, and you've just set him up so that he can come into every session, and he's learned a new trick now. He hasn't got anything to think about. You're running the CCHs, see. He's learned this new trick: "My havingness is way down. How do peo-
people act? Let's see. It says in the textbook here. How do people act when their havingness is
down?" See, it's a new trick. Then he'll say, "Oh, gee, I've just found out there are a whole
bunch of things I can't confront." This is a big cognition. So he obsessively wants to try to
confront them. See, you're starting to get a process in the road of your processing. And the
pc's interest becomes unduly absorbed any time during Routine 1 with Havingness and Con-
front. That's all there is to it. Of course, I'm talking about a raw meat pc running in right from
the beginning.

That fairly clean, clear and cool and collected? Well, I'm glad I finally answered your
question.

Female voice: Thank you very much.

All right. Any other questions? ... Okay. What day is today?

Female voice: June 8th.

Yeah, I know it's the 8th but what day is it? This is Thursday. Let's see. I'd better talk
to you something about leveling off a case, in just a few minutes. I'll just give you a few min-
utes of "how do you level off a case." This would be true in an HGC. It'd be true in your pri-
ivate auditing, and so forth. A case is not going to get any processing for a while. What do you
do?

It is sequitur to exactly what we've been talking about with Have and Confront Proces-
eses, so I might as well add it in here. It is not just unkind, it is stupid, not to end an inten-
sive. Just as you would think it was stupid to fail to end a session. Similarly, it is very dull not
to end an intensive.

Well, an intensive of a twenty-five hours is relatively uneconomical. But it neverthe-
less has to be ended. I mean it's uneconomical to get twenty-five hours of auditing. Now, a
person just gets off the launching pad, and he's just going over the end of the runway lights,
and the control tower says it's time to whip stall. That's about what it sounds like, too. You
see, the guy has just taken off, you know, and he just gets the idea that he might go some-
place, and he whip stalls.

Fifty hours, that's fairly economical. He gets a chance to go someplace. All pcs could
be compared to the frog who climbs out of the well at the rate of three inches up in the day-
time and falling back two every night. But this is proportionate. The deeper he is in the well
and the earlier he is in auditing, the more gain he makes up in the daytime and the further he
falls at night. And so when we say, ending an intensive, it is better to cleanly and properly end
even a twenty-five-hour intensive. It is better to do that than to say, "Well, it's a waste of au-
diting time", because he'll feel better for it if you do end it right. Fifty hours: it's economical
to end them, because you practically stabilize the person's gains. You bring him out of the
woods and so on.

You end an intensive depending to a large degree on what has been run during the in-
tensive – what has been run during the intensive. And you would end the Routine 1 differ-
ently than you would end Routines 2 and 3. 2 and 3 could be ended almost exactly in the same
way.
Let me say what would be an optimum twenty-five-hour intensive even though it's uneconomical: A Joburg complete; one CCH flat. If you haven't accomplished those in the twenty-five hours, be rough, you see.

All right. How would you end this intensive? Well, you'd better end this intensive by making sure both of those are ended. The one CCH which you got flat, let's make sure that that's flat. And let's make sure that Joburg is now standing up and saying "okay". And that's how you'd end the intensive. Got the idea? I mean, you do no more than just check over these two items. Of course, you check over that CCH rather briefly because you can unsettle any process. Processes come to temporary flat points and then unflatten.

All right. That's about the best you could do. Except during the last hour or so, it would be very beneficial to run TR 10 – without Model Session or with it, it doesn't matter – but to run TR 10. All right.

Now let's take Routine 2 or 3. How would you end the intensive? I'd say during the last few hours of the intensive, do nothing but run the Havingness and the Confront Processes of the pc. Now, in a Routine 2 intensive of twenty-five hours, you should certainly have had one level – one general level – flat and one Joburg completely completed. And the person's Havingness and Confront Process found, and you would spend at least the last three hours of the intensive, preferably five, which would make the last HGC day of that intensive, doing nothing but running the Have and Confront Process.

Just run the Have Process to a loose needle, run the Confront to a slowed tone arm. You know, tone arm doesn't look like it's wobbling very much right this minute, so now we're going to run some Have, and then we're going back to the Confront. Now we're going to run some Have, we're going to run some Confront, and it stabilizes the case most gorgeously. And he walks out of that intensive feeling marvelous. If you do that and you do a good job, you stabilize the gains. Otherwise, he's still kind of stuck in the intensive. He's still wishing he had some more auditing. He's still fixated on all kinds of little factors. And the kind thing to do to him is let him gain from his gains, and you level him out with your Have and Confront.

Have, by the way, is never run further than a loosened needle. I see people running ten minutes of Havingness. This is incredible unless they're only getting in five commands in ten minutes or something. This is incredible! That's an awful boggled Havingness these days!

All you're trying to do is run it from needle test to needle test, can squeeze to can squeeze. Is it looser? That's it! That's it! That's it. And it's only about twelve commands. If you've got the right Havingness Process, it's twelve commands. That's it.

Now you can get fancy with the Confront Process and run it to what is called a blowdown, and that is to say the needle rises and blows down. You come off of it. See? One cycle of a needle of the tone arm, pardon me. One cycle of the tone arm. It will rise a little bit and blow down. And you run it until the tone arm rises, largely or slightly, and continue to run it until it goes thoomp! Or slides back down a bit. And you come off of it and you run twelve commands of Have, see. But somebody running ten minutes of Havingness is somebody – just like somebody eating sugar, you see – "I think I'll have some sugar. Would you hand me that hundred-pound sack?" It's very hard on the digestion. And this is factual. You see, the Have Process can run the case. And you don't want it to run the case, you want it to orient the pc in the environment. Please get its purpose.
See, you start running Have, and you run more than twelve commands of Have, and what happens? The pc's bank starts fluctuating. And the next thing you know he can run Have against the bank. And he's running – you're running the bank with a Have process, and you're not supposed to do that. You're supposed to run the bank with a Confront Process. So it's a misuse of the process. It's something like using a pair of shears to dig up a garden. Not quite clever.

And you run ten minutes with it, and you've got the guy going through engrams and his somatics turning on. That's Havingness? Oh, yeah! You can do fantastic things with Havingness. It isn't that Havingness doesn't work and it isn't that Havingness won't run the bank because it will! Boy, will it! But you've now started a new process known as "running the bank with Havingness." And you go more than about twelve commands with it and you've started that new process, and you're going to get tone arm motion, and you'd better run it now till the tone arm motion gets out of it, and ... But it's a misused process. It isn't for that purpose at all. It's to tell the pc, "Hey! Look! Physical universe!"

And he says, "Well, what do you know? Oh! Physical universe. That's pretty good."

And you say, "Good. I'm going to give you two more commands and then end this process. And, pow! That's it! And then you got the Confront, and you move right into the Confront, get a jiggle out of the tone arm ..."

[The tape ends abruptly as did the original recording.]
Thank you.

Okay, let's see. This is the 9th of June 1961, Saint Hill Briefing Course and you have had a bulletin today, or you should have had. Says something to the effect, I think sarcastic, snide, asking you if you're waiting for the E-Meter to play "Dixie" and I expect almost anybody at any minute to say, "No, we're waiting it to play 'God Save the Queen.'" [laughter]

But I'm quite happy about it, actually, in a and in a fairly exuberant frame of mind with regard to it, because I found out what's taking you so confounded long to clear people. And there's a general misconcept abroad.

And it although it's taken up in this bulletin which is what? The 8th, HCOB 8 June 61 you're auditing people's analytical minds out! That's right! I mean, this sounds incredible, but that's what you're trying to do!

And you know, you're not going to shoot any ducks if you keep going around shooting at crows. Well, it's true isn't it, huh? I know I've left you in a little bit of a mystery, but that is what you are doing.

"Dianetics: Modern Science of Mental Health", 1950. We change all the time. We change all the time, except we're always dealing with the same fundamentals. All we're doing is changing an approach to the same fundamentals. Now, I say we change all the time sarcastically, because somebody is always walking up to me telling us how fast we change and how we are changing and all that sort of thing and I say, "What have we changed lately?"

"Oh, well, what have we changed lately? Um."

"Come on, what have we changed lately?"

"Uh, well, um, we've changed the Axioms", the one thing that hasn't been changed for years. And I find out they don't know enough about the subject to know whether it's been changed or not! Which is always a good test if somebody tells you that.

Now, what we are doing is trying to approximate exactly what the mechanics which are already known to us about the mind, how these things are stacked up in people's minds, so we get a common denominator of approach. And of course, it gets simpler and simpler, but we're always handling the same mechanics. So let's get back to a very fundamental fundamental here, and let's take a look at this thing called the reactive mind.

Now, I know you're all sitting there burning with questions about other things, but I'm interested in this today, and that is the reactive mind.
The reactive mind is a mind which acts without inspection, on the basis of stimulus. In other words, when this mind is restimulated, it acts without inspection. It's a non-inspection mind. Do you understand?

And it puts into actions, solutions for problems it fancies must exist but which may well never have existed or which haven't existed for billions of years and you put in any part of the old problem and the reactive mind goes into solution. It's a sort of an idiot simplicity. So, it is a mind that solves problems without inspection.

It's taken up pretty well in Dianetics: Modern Science of Mental Health. Only thing much we've changed about that book is the second part of the book, which has to do with how we address this situation.

And heavens, how we addressed this situation in old Dianetics still is raising its ugly head. Lately we've got Presession 38 – which I haven't authorized anybody around here to use. But what is that but Book One? And we've got all kinds of ramifications on the same fundamentals.

So here's this mind without inspection. All right. It's pretty good, you know? It doesn't have to make an inspection. See, that's the first thing that's wrong with the situation. So therefore, it reacts on anything it inspects. Got the idea? So the inspections are kind of accidental. Because it's based to work without inspection.

Of course, everybody knows that this is the safest thing to do. A thetan is trying to survive, who doesn't find any necessity for trying to survive at all – which is the first idiocy.

You couldn't possibly kill a thetan. You could degrade him, submerge him, make him unable and do various things like this, or he could do these things to himself. But he couldn't possibly not survive.

So, the first thing it is doing is trying to solve a problem which doesn't exist: the survival of a thetan. Doesn't exist!

So therefore, it immediately relegates itself to the survival of form or the perpetuity of an existing state. If you can't keep a thetan from surviving, you certainly, however, could keep a form surviving, couldn't you? But if you kept a form surviving, what you would have is a perpetuation of existing state – which would, of course, take out all the time, all the matter, all the energy and all the space in a sensible arrangement and garblize them. Why?

All right. The reactive mind is the accumulated goals of survival of the individual – for forms. And that is exactly what the reactive mind is. That's – it's no more complicated than that. Its goal is survival in each case, you see?

Now, the reason it destroys is because it's trying to get something to survive. You got the idea? See? Trying to get self to survive so it destroys other, see? But it's still survival. It creates something in order to get a form to survive.

Even though you've got create and destroy, and even though you have a cycle of action, the reactive mind is that part of the cycle of action which is never going to move, and never has, according to any understanding or activity in which man has engaged, in all the time he has been on this planet. Why?
Because the keynote of it is survive – survival of a form. There's no question about the survival of a thetan.

Oh, there's a question of the survival of his capabilities. There's a question of survival of his happiness. There's a question of survival of whether or not he's interested. There's a question of all these things, but these are significances.

As far as his actual survival is concerned, he'll be here till the universe fades out, even though he's only a crumb of a Sullivan – I mean sand! Got to be careful of who I have overts on here!

Anyhow. Now, here then is this enigma. You have a mind that is trying to make something survive which is already dead. It's gone, man, it's gone! The body you had back there on the galaxy of Gee Whizzes, that, that hadn't been... that form hasn't been around for a long time. Go back and look. Dig up the old scrap heap where they threw the factory workers and you won't find anything there anymore, except a memory. Touching, isn't it? [laughter]

But the reactive mind, because it was trying desperately, you see, to make that form survive once, has never forgotten the impulse. That's pretty good. Because the impulse is survive, then the reactive mind's impulse regarding that action is surviving, you see? And it hasn't any more use to you. You could remember this, don't you see, if you didn't have to make it survive. But by remembering it, because of the impulse of survival being so great in that particular area, you get a restimulation as though you're still in the period, as though you're still there. Why? Because all the impulse of survival is trapped into that period and area, but it has been riding on up to the present time.

Here's the great game of make-believe. The form has lived forever and is still here. What a game of pretense, you see?

Well, the accumulation of these pretenses, with all of their attendant recordings and nostalgia, wind up in present time having nothing to do with the situation anywhere. But in order to guarantee the survival of this doll you lost back in the galaxy of Gee Whizzes, it is perfectly obvious that you have to do something about gorillas.

Well, this is difficult, because there just don't happen to be but about 450 of them left. They're the United Nations officials now. Anyway... [laughter] they – that's something on that order. There are very few gorillas left and so the reactive mind has a great starvation for gorillas, which can make this thing survive. So a woman walks down the street with a fur coat and a fellow has a feeling in his head of small machinery going around. Only, because it's all by no inspection – . You see, the safe thing to do is to act without thinking, because you never know what's going to happen to a form. The surprises have been multitudinous. So if you just act quick enough, the datum is, if you just act quick enough, why, the form goes on surviving.

But if you, well, if you could just duck bullets, give you an idea, see, an ambition of this character. Every time somebody fired a bullet at you, in a war or something like that, if you acted quickly enough, of course, you would never be hit. I know that's idiotic, but so is the reactive mind.

Yet sometime or another, you've had an ambition of that character. You've said, "I wouldn't ever have airplanes run into me if I ducked every time I thought there might be an
airplane in my vicinity." Well, this gets embarrassing, particularly when you're in basements. [laughter]

See, it's a – if you're going to get a form to survive, you mustn't wait until you look over the name, rank and serial number of the aircraft, you see. The thing to do is duck.

Actually, I knew a naval officer, he has only one creditable action in his whole existence and that was, he actually did identify an American fightercraft that was coming back in over the fleet. And it had been mauled up and it was making it all right. It was trailing smoke. And he did identify it, and he did restrain at the last instant, his people from firing at that aircraft. He did restrain them.

The aircraft was shot down by the next ship in line. But that was a creditable action, and I – I wish to assign it to him. It shows you that not all men are all bad. [laughter]

But this was very unusual for him to do such a thing, which is why it stands out in my mind. It's almost incredible for the man to ever have inspected anything, yet he did in this particular case. But the safe thing, reactively, to do is of course, shoot at an aircraft without inspection.

Well, when fellows get all gingered up by war, they're liable to do things like this. Actually, the only thing wrong with wars is, you put weapons in the hands of men and get them marching around, some of those guns will go off and somebody's liable to get hurt. And that's the only thing wrong with war. Otherwise, they're fine.

So, there was a little Dutch corvette, and it had escaped from Java when it was abandoned by the Associated Allied Admirals Union and – they had to work overtime, so they abandoned it. Anyway, this little corvette escaped.

Well, I myself was in a sort of a gingery frame of mind and had very often gone clang when, in approaching American harbors, the local fighter command or torpedo boats would use you for target practice and they all were under orders, that in view of the fact there were no ships around of the enemy, that they should fight ours.

And they would take practice dummy runs on every ship that was coming in and they were under orders to do this. It was almost enough for a ship to be coming down the fairway for the fighter command to leap into their cockpits, tie their girl's stockings – or was that another war [laughter] – and go screaming off down the runway and go dummy runs on you, you know?

And you'd have to hold your cap on, on the bridge, you see and the funnel would go eeueengh! and so on. And I used to object to this rather considerably, because I'd been over in – in the South Pacific, early in the war and it made me nervous. And I was getting reactive on the subject, you see?

Not as reactive as a bunch of officers I went down to meet one day, who had just come in from that area. An aircraft passed over their landed aircraft on the airport – and, they were on American soil, you see – and every one of them threw himself face down on the concrete alongside of the airplane. Of course, there were – all the people at the airport thought this was
silly, which it was because it was in the wrong time and place. But it was just a reaction, you see.

Well, anyway, this little Dutch corvette comes steaming up the line in Miami and a whole squadron of American torpedo bombers say, "Well, that's what we're supposed to do." And they jump in their cockpits and tie their girl's stockings around their necks, or whatever it is and go screaming down the runway, up into the sky and start a practice run on this Dutch corvette. And of course, they got met right in the teeth with everything the Dutch corvette had. [laughter] Well, at least part of the Air Force had a baptism of fire.

By the way, the United States government couldn't do anything about it at all. They spoke to the Dutch corvette and the Dutch corvette said – captain said, "Ve have jus' come out of a war. Uns you go running against us, you gonna get shot at. That's it!" [laughs]

And the corvette was provided with air cover all the way up the Atlantic seaboard, clear to New York, to warn off torpedo bombers and things that might make runs on it. They kept it spotted, much more carefully than they were looking for the "Deutschland". It was dangerous!

Now their reactivity of course has come up to a total insistence. It's come up to a total identification of all aircraft with enemy aircraft, you see? Because the safe thing to do is not inspect.

Obviously, if you sat around in enemy waters, you know, and the lookout, he sees an aircraft in the distance and he walks back to the phone and he picks up the phone and he said, "Give me the Captain's orderly." And the orderly comes to the phone. He said, "I'd like to speak to the Captain if he isn't busy."

"Captain, I don't wish to disturb you, but I have spotted something up in the sky. I'm not sure what it is. Would you like to come out and have a look?"

Captain says, "Well, I'm going to finish a cup of tea here and I'll be up." Of course, they would have been dead by that time. Never would have had a chance.

So instead of that, they jam time. You get the idea? And the jam of the time finally results in a no-inspection. See what happens?

So any aircraft in the distance gets shot at, until ... I think I was the first one across the Pacific after the declaration of war in WW II, in an unarmed merchantman and we were running like a hare before the wolves. And one day – one day there was a terrible alarm and we'd managed to haul some antitank guns out of the hold and mount them in sandbags. And I don't know what they could have done, but it was very interesting anyway and kept the morale up and we had a couple of Lewis guns that I'd put in action. Nobody on board knew how to operate the things and it was quite – it was quite good.

And all of a sudden, there was a tremendous, screaming rush up on the boat deck and everybody was gesticulating at the sky, and the Lewis gun goes off with a low snarl and antitank guns start banging. [laughter]

So I went up to find out what was happening, and they point up at the sky and the bridge, meantime, is madly trying to communicate with the boat deck – out of communication
totally. Nobody would listen to the bridge and finally, I spot this thing. I couldn't figure out what they were shooting at!

They knew. They were shooting at an enemy aircraft and they'd seen it circle and it was circling. The only difficulty was, in the tropics, Venus is totally visible in daylight. And they were shooting madly at the planet Venus! [laughter]

And the bridge had already figured out what they were doing and was trying to tell them madly that that was Venus. Being seamen, they have their own goddesses. Here was a totally reactive situation. Of course, the safe thing to do was shoot, obviously.

Well, that's how far off it can go.

So one day, this part of the reactive mind which has been trying to keep a doll surviving on the Galaxy Gee Whizzes, from being destroyed by gorillas, gets a whiff of a fur coat and goes into total action. Takes over, right as out of that moment. You've got an emergency situation, instantly. You've got gorillas in the vicinity and it's better not to inspect, even. People who turn around and really inspect things are very often amongst the wounded and dead. So what – what are you going to do?

It means, that when you speed up things in the universe to too great a degree, on the false basis that you are "prone to nonsurvival", but in the interest of keeping something surviving, you are then going to run into this timeless reactivity of action without inspection. Infinite dedications to the survival of forms and patterns.

This is why Goals SOP works so beautifully and why, when you start to take goals off somebody, they start nulling You think offhand, "Well, gee whiz, I'm taking all this fellow's goals away from him", you see, or something of that sort. Well, you're auditing the wrong target. You're auditing the guy.

Now, of course, you're actually auditing toward the guy in order to free him up from reactivity. So there – actually your auditing target is the reactive mind. That is your auditing target, not the pc.

And as long as you go on busily auditing a thetan, called a pc, exclusively – as the thing which monitors what you're doing – you're going to continue to make mistakes and not clear people. That's all.

Because you never look at what's wrong with him. You're only auditing what he knows. The only thing wrong with him is what he doesn't know and what he doesn't know is totally contained in the reactive mind and there is no inspection involved. So he can't see what is wrong with him and if he could see what was wrong with him, it wouldn't be wrong, would it?

All right. A lot of things stem out of this. First and foremost, you think that a reaction, probably, to your question may take place in the next several minutes. You sit and look at an E-Meter and wait for it to react. And, of course, the reaction which you have to wait for is something the pc knows. And the reaction which you get instantly is in the reactive mind. And it'll occur in something on the order of a tenth or even a hundredth of a second.
It starts to occur instantly that you enunciate it. Because you're more in control and more able to restimulate the reactive mind than the thetan whose reactive mind it is. Why? Because every time it's restimulated, it blanks something out. The no-inspection factor arises.

Well, you're not being blanked out by his reactive mind. So therefore, you can think on these subjects, and he can't. Unless you have a total case duplicate between the auditor and the pc, the auditor can always see more of what is going on than the pc can.

You take in a pc's adjudication or what a pc thinks about something as any indicator of what you ought to do – at any time – and you, of course, are always going to waste auditing time and you're always going to do the wrong thing. Inevitably and invariably, it'll be the wrong thing.

If you want to do all the wrong things, then listen to the pc. Because he's under a tyrannical dictatorship, known as the reactive mind, which knows best because it now has in it all the individualities which he has tried to make survive and all of them know best. So one of his basic goals, although he knows it's very bad for him, is to make his reactive mind survive.

So even though this fellow will sit down and be audited, this is peculiar and the peculiarity which resolves around this. He won't let you near any part of the reactive mind that ought to be audited – gluah-gluah-gluahgluah – because those parts are the survivals. So it dictates that he let them survive. So, he'll always throw you red herring.

And after you've accumulated several warehouses full of red herring, you have also wasted an enormous amount of auditing time, because you've never audited anything that should have been audited on the case and you've permitted to survive everything that should have been audited out of the case, don't you see?

You listen to the pc, you listen to the pc, about what's flat or what should be run, or what he thinks about the situation and that's just – write it over here in the loss column of auditing, for you. Got nothing to do with the case. Nothing!

You can almost go on the basis, if he says this is what the score is, your immediate reaction can be that is certainly what it isn't, aside from this basis of goals and checks against the E-Meter.

Now, the E-Meter can read the case. Why? Because everything that is surviving madly, to be computed and go into action without inspection, even though it doesn't apply anymore ... You see, things like this can go into action: If you go around and inspect things and turn around and look when you're running from a stricken field, you normally get speared. So therefore, it's very, very bad to look at the things that are pursuing you. So you mustn't look at the things which are pursuing you. So you had better prevent the auditor from equally getting in danger by looking at the things that are pursuing you. Something of that sort comes up. There are all sorts of crisscross computations involved here.

But you're going on avoiding what is wrong with the pc quite unintentionally. What's wrong with him registers on the meter, but not on the person. It'll register on him secondarily.

Now, you can actually get something to register on the meter, which then the person finds out about. And then you get another reaction on the machine.
Have you seen this happen? You say "gooseberries", and the machine says "tick", and then you get a surge of some kind or another. What's that all about? Well, the tick; you found it in the reactive mind. The surge; the pc found out about it.

Well, you go on assessing for surges and running surges, of course, you're just going on auditing what's already known. See, you're just wasting time.

Now, if the pc doesn't find out about it after the tick, you better audit it. Got it?

Now, there's another thing which makes this difficult and which has obscured your clear view of it and that is just this one little terrible factor. Withholdingness is important in auditing today because it happens to be the comm bridge between the reactive mind and the pc. And when a withhold comes out of the reactive mind, the pc momentarily – or rather continuously – withholds, too.

In other words, he does what the reactive mind tells him to do. So therefore, if the reactive mind is withholding something, it comes to the surface, the pc will instantly withhold it.

So you ask somebody, "Have you ever stolen any chickens?" And the thing goes "tick". Only you didn't really see the first tick to amount to anything and then it goes wha-a-m!

And then you say, "Well, did you ever steal any chickens?" and it now goes wha-a-m, and will continue going wham. He's now under orders from the reactive mind to withhold.

Well now, withholdingness is part and parcel of survival. All agencies of the law, everybody else, dramatize this rather astonishing fact. What is the fellow doing when he is trying to protect himself by running from a stricken field? He is withholding a body from the enemy, isn't he? He's withholding a form.

Now, the withhold of the form, the withhold of the form, the withhold of the form, from destruction, don't you see, is a nonduplication. You kill somebody, they're dead, but the form you've got isn't dead. So therefore, you have to withhold the form you've got from duplicating the form that is dead, don't you see?

So, similarly, somebody threatens to kill you, you are very likely to threaten to kill them. Duplication is quite active, you see? But if somebody tried to kill you and you killed them, during that whole period of your killing them, you'd have to hold your form from being killed – do you see this? – which, of course, sets the mechanics going for survival. And that, actually, is prior to the actual idea of surviving, is withholding a form. Or you could say surviving is coincident with it – whichever way you want to figure it out. But withholding a form and surviving are blood brothers. So withhold a form – you find the pc then withholding thought.

And the common denominator of the actions of the reactive mind are withhold, which we see as only-one, chronic individuation. There are just factors, factors, factors, factors that we've added up through Scientology. All of which amount to withholding oneself, withholding one's thoughts, withholding one's actions, and all of these things add up. Why?
Because they're a dictate from the matter of survival and are probably – they're probably prior to survival and with survival and after survival. And there's that little comm bridge and the comm bridge between the reactive mind and the pc is withhold. So what the reactive mind is withholding, if you click it, the pc now withholds. He dramatizes the reactive mind.

When he decides to give this up, he has conquered the reactive mind to that degree in that he's not following its orders. He ceases to be controlled by the reactive mind and starts to be controlled by a living being. So therefore, he feels better when he gets withholds off. This is the mechanics of it, don't you see. Because the withholds add up to keeping him separated from the human race and when he gets the withhold off, he rejoins it to that degree. See how it stacks up?

So, the pc can always be counted upon to dramatize the withhold after it's been dredged out of the reactive mind. Even for an instant, if only for an instant, he'll still dramatize it. So you get a click and then you get a fall. And if you're not being terribly observant, you will see only the hard, large fall. That's when the pc knew about it, don't you see? Actually, the click was there instantly. But now the pc knows about it.

Well, the secondary action is not to get the withhold off the pc but to keep the pc from dramatizing his reactive mind. So we say, "What was that?" and if he doesn't tell us, why, he just is going on dramatizing this "withhold it, withhold it, withhold it." And eventually he says, "Well, maybe I'll take a very adventurous step and not do what I am always told to do and I will tell this auditor what it is", and pow, then it goes clean on the meter.

So at the state of withhold, you've got a pc who is reactive. The pc himself, as an analytical being, is being reactive. But that is the crossroads and that's the only point where he is being. You got that? Otherwise, he's talking to you fairly straight, or at the dictates of the reactive mind.

Early in a case, particularly, if you kept on auditing the pc, you would be something like auditing a light bulb because you wanted to fix the generators in a power station.

Now, you can go on auditing this light bulb and it'll blink and flicker, and you'll say, "Gee, look what all I'm doing." Then all of a sudden there's a horrendous crash someplace, and it goes out; and you say, "Well, I failed."

Well, naturally, you're going to fail. You're auditing a light bulb and you're trying to fix the generators in the main power plant. Well, the thing to do is to go down to the main power plant and fix the generators. And this tells you the name and address, not only of the power plant, but it also tells you very distinctly which generator and it tells you every part on the generator and its means of propulsion.

As long as you fly with your E-Meter flat, you're all right and if you start flying with the pc flat, you're just going on auditing light bulbs. So, it's just going to take forever to clear somebody. That's all.

I'll give you an example. Now, all of this is highly theoretical up to this point, but let me give you a very practical example.
Now, we're running this Prehav Scale assessment. All right. I'll show you how to waste time in auditing, see, real good. This is the way you can burn it up and audit those light bulbs and everything is wonderful. See?

And you say, "Well, do you have faith in things? ... [long break of more than 10 seconds, audience laughs] Thank you."

You get how much time that consumes, just watching the E-Meter, just watching the E-Meter, watching the E-Meter? What are you looking for? Are you waiting for it to play "Dixie?" Because there isn't anything else going to happen.

No. You look here at your list, and you see "Faith." You don't say "Faith." You take your eyeballs and you fix them on the needle [laughter], very closely, because it's going to happen fast.

And you say, not "Is the square root of the common denominator of the differential of faith?" You don't waste all that time. You say, "Now, I'm going to say some lines here, some levels. And maybe ask you some questions about them and you don't have to answer me. You don't have to say a thing. Just sit there and be comfortable. All right. That's fine. Thank you very much. Now we're going ahead with this assessment. Okay."

"Faith. Cause. No Effect. Effect. Obsessive can't-have. Create. Think. Peculiar interest." [LRH lets approximately 1 second pass between reading off the individual levels.]

Now look, if you're sitting here doing this: "Uh – Faith – ." [laughter] Well, you remind me of a small boy the day after the race, waiting for the horses to go by, you know.

It's not only that. It's – I'm not talking to you just about missing the flick on the needle. I'm talking to you about expecting a significant flick on the needle after you've asked the thing, a half a second later. If there's not going to be any flick on the needle, there is...

Now you're going to see this kind of a thing occasionally. There's a flick on the needle and then – clong! – there's a drop. Well, the flick on the needle is the reactivity, that's what you're looking for. So there's a clong. Okay.

In a Joburg Security Check, you'd better say, "What was that?" Because you've got another activity going now. You're not doing an assessment by the Joburg. You've got that – "Have you ever stolen chickens?"

And you ask them, "Have you ever stolen chickens?" And nothing happens. And you say, "Well, okay, have you ever stolen chickens?" You suspected maybe there was a flick there, the first time. Maybe it was – couldn't see it, maybe. You ask him a second time, you get click and then, surge! And you say, "What was that?" He knows about it now. The click-surge routine has put it from the reactivity into the analytical sphere.

Now, to keep the pc himself from dramatizing reactivity, you've got to get him to tell it to you. But it hasn't anything to do with the assessment of the question as to whether or not the question's hot.

Now, you get something that's actively being withheld from you and it doesn't wait after you say, "What was that?" to go click again. You say, "Have you ever stolen any chickens?" Wham! "Have you ever stolen any chickens?" Wham! "Have you ever stolen any
chickens?" Wham! "Have you ever stolen any chickens?" Wham! And you say, "Brother, you'd better tell me about that." Of course, you are actually assuming that, by this time, he knows about it. Well, really, he does.

Of course, I conduct Security Checks much differently than you do. You're very happy to go along and buy garbage. You ask a guy a question. You say to him, "Have you ever raped any chickens?" And – whatever the question is.

And he says, "Well.... ", and you notice there's a flick on the meter, and all of a sudden it does a surge. You say, "What was that?" See, he knows by now; the surge says he does.

You're no longer assessing the reactivity of the question. Now you're assessing the knowingness of the pc. But you've got to get it off. It's another operation. Now that you've got it out of the reactive mind to him, now you've got to get it from him to you.

So you say, "What was that?"

And he says, "Well, I remember my father killing chickens when I was a little boy."

And you say, "All right. All right." You say, "Have you ever raped any chickens?"

But I don't say that. That's your notion. I believe these things. I believe these meters, see. I've used them long enough to be made very, very tame by the whole thing, you know? I know what to say, and when to say so.

I say, "Well, did you ever rape any chickens?" Click. Boom. I say, "What was that?"

And he says, "Well, my father – uh – my father uh – uh – used to kill a lot of chickens – used to kill a lot of chickens."

I say, "No, no." I'd say, "You didn't hear the question. Did you – you – ever rape any chickens?"

"Oh, well", he says, "Yes. If you put it that way, yes. I used to when I was a little boy."

You don't do it that way. you haven't been doing it that way at all. you say, "Did you ever rape any chickens?"

He says, "My father killed some chickens one time."

"Well, good, did you ever rape any chickens?" and the meter falls and you say, "Well, what was that?"

And he says, "Well, I was just thinking about chickens hanging up in the market and that was what that was."

In other words, you keep buying this, buying this, buying this, buying this, buying this. You get the idea? You're actually building the pc's belief up that he can withhold things from you.

So I say – I say very meanly – I don't necessarily advise you to do this because you can get into a lot of trouble this way. You've got to have terrific control of the pc in order to do this kind of thing. He's really got to be grooved in. Otherwise, you create ARC breaks, and
the rest of the session is all messed up and you get nothing done anyplace, anywhere, at any
time.

So that's your adjudicative idea. How much control have you got of this pc and how
much control have you got of the session? And if your control is terrific, and your ARC with
the pc is very good and the pc knows what you're trying to do and he knows he can't fool you,
you eventually get a Security Check going like this:

You've started in this way, you said, "Well, did you ever rape any chickens?"
And he said, "Well, no. My father killed some once. And uh – well, I saw a dog jump
on a chicken."

The next time you ask him, you know, "Did you ever kill any chickens?"
And he says, "Well, I – I – no."
"Did you ever rape any chickens?"
And "Where – wuh – I dunno. Uh, yes. Uh, yes, I remember something about chick-
ens. It was little boys talking about chickens one time."

And you say, "Good. Good. Fine. Good. Did you ever rape any chickens?"
And he says, "Well, I thought about it once."
And you say, "Good. Thank you. Fine." Your meter's falling, falling, falling. You're
just wasting time, wasting time, wasting time.

Well, if you're real good, you don't go at it this way at all. You say, "Did you ever rape
any chickens?" And you get a click-fall! Surge!

And you say, "What was that?"
And he says, "Well, I was just thinking about, uh – mmmm – I was just thinking about
– uh – I was thinking about my father used to kill some chickens."
You say, "No, no, no, no. I asked you, 'Did you ever rape any chickens?'"
"Well, actually, my little sister – ."
"No, no, come on, come on, come on, come on, did you, you, you ever rape any chick-
ens? That's what I'm trying to find out here."

He says, "Yeah, yes. I used to when I was a little boy."
You say, "Good. Did you ever rape any chickens? All right, it's clear now. Good. Next question." Get the idea?

And he all of a sudden has got the horrifying notion that there – you just aren't going
to buy dodges, that's all. Coo! He has met a tartar and the reactive mind after that is no longer
as powerful.

The reactive mind says, "Protect it." Says, "It's a withhold. It's valuable. You're in
danger. Give him an equivocation." Got the idea? "Feed him some muck over here, and throw
him a red herring and protect me."
So I just say, "It says here that rape of chickens – ." I think – I think even Suzie has heard me say questions like this. "It says here that rape of chickens has occurred. Now supposing you tell me about it, huh?" "Yes."

That's the end of that security question. Got the idea?

So it goes off: Boom! Question – bang! Question – bang! Question – bang! You see? Get the idea? You ask the question, see the fall. You notice there's a secondary surge. Now you do the other thing. Say, "Tell me."

The reactive mind says, "Under no circumstances tell him. Withhold, withhold, withhold, withhold." And I say – I say, "All right, but you can tell me."

And all of a sudden, the pc says, "He believes in me, one way or the other and I'll tell him right here, right now." Bang! And he tells you and the needle clears. And you ask the question again just to make sure. And then you ask the next question and then you're sailing, you understand?

Goals – you don't ask a goal ... "I want to pick gooseberries" is the goal that you're checking. You come down the line, find this thing and you say, "Well, now I'm going to ask you about a goal here." (You've already run through 200 goals, see.) "I'm going to ask you about a goal here and I don't want you to think I'm terribly personal, [laughter] but I want to know if this goal is – I want to know if this goal is still active. The goal is – is it all right if I read it to you? All right – uh, okay. Well, I'm going to read it to you now. 'You want to pick gooseberries'. How's that? Now, let's see. Now let's see what it's saying over here on the meter..." [long break]

Boy, that's the way to burn auditing time man. You're going down the list. No preliminaries. No nothing. You just say, "I want to pick gooseberries. I want to ride horses." You got the idea? You got the list over here. You've got the meter in front of you. What you really do is you look at the goals list. It says, "I want to pick gooseberries." You don't read it there. You delay your own read of it. You look over here at the meter and you say, "I want to pick gooseberries," and it goes flamp.

"I want to ride horses." Nothing there. "I want to ride horses." Nothing there. No. Next goal. Got the idea?

If you watched me doing this stuff, you'd think you were looking at a sausage grinder. You just chew right up, see, right on down the line.

Well, the longer you suppose that a pc is going to be adjudicative – it... about it at all or his adjudicativity proves only that he reacts according to the dictates of a tyrant known as the reactive mind in order to protect and not disclose the valences in other activities which exist without his inspection, so that he, as a form, can survive and it doesn't work out. You can't go at it that way at all.
No, I – I talk with the E-Meter about the fellow's circuits and if he wants to chip in once in a while, that's all right with me. That's – it's okay – I won't chop him. He'll say, "Well, I just – I just remembered something. I just remembered about riding a horse across a field as a little boy, and the horse picked up a stone – ." And I say, well, here we go and I say, "Gee, is that so? Thank you."

And at first he begins to believe I couldn't possibly be auditing him. Well, I'm not. I'm finding out what's – what's holding the show up here. I'm finding out what he's reacting to. I'm finding out what is there to react in terms of matter, energy, space, time and thoughts – which are all crisscrossed in one way or the other and suspended in time – so that a thought two billion years old is still being violently thought in this person's mind. Why?

This person is perfectly capable of inspecting. This person can't do otherwise than survive. This person is capable of being totally able. This person can get the show on the road. This person can actually make form survive. But because he's got all these dependent mechanisms and goo-gahs and things of this character and a reactive mind to help him out and pat him on the back and make it unnecessary; he acts like a nut and he destroys everything he lays his hands on. Well, don't you think it's about time you straightened it out?

Well, all right. It'd be easy to straighten it out. All you have to do is validate the pc. That's for sure. After you've cut him to ribbons, why, look up and say, "Well, you're doing all right. Thank you very much," you know?

But you can saw into these assessments with a whir and a clank, with your eye pinned right there to the needle and away you go; and you go right on down the line, bangety-bangety-bangety-bangety-bang – It's like telegraph poles passing by when you're riding in a train, you know?

And it isn't, "Well, here we are. Well, well. Isn't this unusual? Now I'm going to consult with you all about your reactive mind. Now what do you think you possibly might be having to run now? What do you think that might be?" Well, you're talking to the wrong telephone line. You've got it hooked into the wrong... you might have it in the right switchboard, but you sure got it in the wrong corner of the building.

Now, there's an example in this bulletin of a – of an assessment that could have been bought, merely because the pc believed it and you were getting cognition curves – surges off of it, see? It could have been bought. I didn't say that the auditor would have bought it or anything of the sort. But there was another one that was alive. And these were "order", "command" and "conquer", and that "conquer" was alive, man; and that's what I was looking for on the case. I said, we've missed something here, someplace. Somewhere along the line we have missed one and that's why I wanted to assess the case.

And this person was perfectly agreeable and knew completely that it was "order" or "command." But these were the little red tabs that were hanging out and they cleared up. And it was one the pc didn't mention.

Now the pc did report – because he's in pretty good shape – as I was doing the assessment (which I was still taking just the E-Meter). He said, "I just keep thinking about control. I keep thinking about control."
I said, "That's fine. That's fine." That's cooperative data. You're being helped by the pc, but I bought the E-Meter. I went over everything and settled everything down and it was "Control" so I bought it. You got the idea? I didn't buy it because he said so. But he helped me out by saying that.

He could just as easily have been throwing a great big red herring across the path, too. It – it – he might have said, "My – you know, sort of down deep someplace, the one thing I don't want to have anything to do with is Failed Importance."

See, a reactivity, you know? So, he just as likely would have said, "Well, it's 'Connect.' I'm sure it's 'Connect.'" Got the idea? "If I can just tell him convincingly enough that it's 'Connect' ..."

You don't find pcs doing this when they're in better condition, but when they're in worse condition, they will do this continually. "It's 'Connect'! It obviously is 'Connect'!" He's trying desperately, reactively, not to get anywhere near Failed Importance.

When a pc starts getting too insistent that it is something and is practically screaming that it is something, I know very well what's happening. The mechanics and the – all of the various little wheels and so forth, that are going around are adding up just this: There is something here that we had better not put our number-tens in, because it's quicksand, and it'll go straight through.

Somebody tells me, "Well, I don't want to run this level anymore. This level's boring and I don't want anything more to do with this level" and – and all of that kind of thing. I say, "How interesting! Isn't that fascinating!"

Of course, I'm perfectly reasonable about it. I don't get militant on the subject. I say, "Has the pc got a withhold?" which is very likely running these things these days. As I told you the withhold is the bridge between the reactive mind and the analytical mind. So of course, pc picks up a withhold; half an hour later, you find the pc with an ARC break.

That's, by the way, the way it goes. They get the withhold on the auditor and the auditor misses it and then they'll pick up an ARC break; and then the auditor will try to cure up the ARC break when in fact, it's this withhold back here half an hour earlier.

All ARC breaks, by the way, for your information, usually occur a half an hour before they're expressed by the pc. If you're sharp, you can always see that an ARC break has occurred.

But earlier than that, if you're very sharp, you can see that a withhold occurs and you just bust into your auditing command and say, "Now how are you doing? How's it going? How's it going now? All right. Haven't got any ARC breaks?" (You're not looking for an ARC break, see?) "Withholding anything?" Clang!

You say, "What was that?"

"Well, I haven't answered the auditing question for ten commands."

"Oh", you say, "all right. Give me ten answers." [laughter] You don't necessarily say that, but you sure as hell could and I've been known to do things like that. Anyhow.
What you're trying to do is keep the pc from being fooled about himself and if you are in a continuous, consecutive, forever and ever avoidance of the reactive mind, you're just Q-and-A-ing with the pc.

You'll eventually wind up doing something like this; and this is the ne plus ultra of Q-and-A: You're doing a Joburg All right. You say, "Now, have you ever thrown any rings around chimneys?" And the pc says – you've gotten your click and then your surge.

See, very often on an assessment you get a good read, which then disappears. Well, actually it was just the cognition surge. When the energy released, you know, that was withholding it from the pc and the pc found out about it and so on, of course, you get a needle response. But it's usually after the fact of the needle reaction on the reactive mind. That "after the fact" is the pc finding out, see? So these latent surges that you get on the E-Meter are analytical, ordinarily.

All right. He says, "Well, yes, yes. Mm-hm, I've thrown some rings around chimneys. I threw a ring around a chimney when I was a little girl. Uhm – I – I did. I – I did that. And um – my grandmother was very cross with me about it."

I'm showing you a Q-and-A now, see? And you say, "Good. Why exactly was your grandmother cross with you?"

And she says, "Well, I'd been very bad and I treated my grandmother very badly", or something like this.

And the auditor says, "Well, just where was that? Where did you live at the time?"

What the hell does this have to do with a Joburg, see? It's got nothing to do with a Joburg. It's trying to run an incident with using the excuse of the Joburg. The Joburg is totally dedicated to withholds. And that's everything it's dedicated to. And there isn't anything else it's dedicated to. And you want to know if he threw any rings around chimneys.

And he finally – you – you said, "You throw any ring around chimneys?" You get a clink, surge! You say, "What was that?"

And he says, "Well, I – as a matter of fact I did. I – I did. I did, yes. I – I just remembered. I – I did. I threw some rings around chimneys when I was a little boy."

And you say, "Good. Throw any other rings around chimneys?" Clang! And you say, "Good. Well, what was that?"

"Well, when I was a young man I used to do it all the time."

And you say, "Good. Now, did you ever throw any rings around chimneys?" Clink. Just a little clink on it that time and then a surge. And you say, "What was that?"

And he says, "Wheww! Well, I actually didn't mean to get down to this, but every night about midnight I have to go up and throw a ring around the chimney. And I – that's it."

And you say, "All right. Thank you very much. Good. Now, did you ever throw any rings around chimneys?" Deader than mackerel. Next question.

See, you're just interested in withholds and you're just interested in that question.
Now, you'll get some oddball ramifications on questions. You get some oddball ones where he's got everything connected with everything connected with everything. You understand?

If you don't get any instantaneous response, you're not getting a response on that question. Why are you fooling with the question?

Now the order is, clear the E-Meter. But what is the E-Meter and what is the E-Meter doing that you must clear? Well, the E-Meter is responding. What is the E-Meter responding on? The E-Meter is responding on a reactivity. If you haven't got a reactivity, to hell with it. Because the second time you ask the question, if the pc now knows it analytically, you'll have it reactive anyhow. It'll be an instant read.

If you're not getting instant reads, or something – the pc is dawdling around and walking over the hills and so forth – of course, I will go ahead and clean up a meter on a question rather thoroughly. But it isn't necessarily falling on the question, if you're getting a latent surge all the time.

You say, "Did you ever throw any ring around chimneys?" And 2 and 3 and 4 and 5 and 6 and 7 and 8 and 9 and surge. You say, "What was that?"

"Well, I don't know. It's sort of escaped my mind now."

Oh! This is not the time to say, "What has escaped your mind? Did your grandmother spank you that day? What was the color of your brother's hair?"

No, this is not the time. The time to say that is the original question. It turned on and will become kind of a response after a while, so let's ask the original question, whatever it was. "You ever done any illicit diamond buying?"

And watch that meter. And if it doesn't go snap, that isn't – it isn't falling on that. In other words, your E-Meter actions are as instantaneous as the reactive mind is batty. You got it? They're fast! See? They're right now!

Of course, if you get any kind of a fall of any kind whatsoever, even a latent fall, you had better find out what it is by asking, "What was that?" But that is pursued by asking the question again and if you don't get a fall on the question, why are you interested in the latent fall?

You can go ahead and clear it up if you want to – it's a good workmanlike job if you do – but that isn't necessarily what's going on here at all. There's something else going on someplace.

Well, you're doing the thing of trying to read the question to the pc and then trying to clear the rest of the Security Check as a sideline. It clears one question at a time and if it doesn't fall on that question, it doesn't fall on the question.

When is the fall going to occur on that question? Well, it might not occur on your first read, but that's beside the point. It'll certainly occur instantly on your second read. Instantaneous. Within a tenth of a second of your having uttered the question, there will be a reaction on the meter; and if there's not a reaction on the meter, but a latent reaction that is finally going bthooong, after several seconds or something like this, yeah, the pc is withholding something
of some kind or another about something. But look-a-here, it's not necessarily on that question
at all. And that's the mistake you're making. You see?

You can actually read a Joburg off – brrrrrr – right on down through all ten pages,
you see and take instantaneous falls. Plang! "What was that?"

"Nuhhhh, yes, I did."

You say, "Good. Thank you." Repeat the question. No reaction.

Now, if you sat there and waited for the E-Meter to play "Dixie", you might get a fall
on almost anything, see. You might get a fall on the fact that he was getting bored, that he
was getting tired, that he hopes he doesn't find out. He knows the Joburg. He's had it about
four times and he knows there's a question coming right up on the next page that is hotter than
a pistol and he's guilty as sin. [laughter]

Actually, he's never thought of it before, but it just suddenly occurred to him that it
wasn't quite the right thing to do to hit his father and mother on the head with an axe and it's
just occurred to him, like a flash of lightning on the head and the question that has to do with
this is on the next page!

So you've read the question. Now, the pc gets to worrying about the next page and you
get an answer in the meter here, which is reading the surge of the pc. You got the idea? It isn't
on that question.

The law is, if you don't get an instantaneous reaction on the meter, there's something
wrong with the question. It isn't the answer to that question.

If you get any kind of a reaction on the meter at all, you ask the question again, of
course. If you don't get a reaction on the second time, it still isn't it. Don't sit there and wait
for it to play "Dixie". You don't have to hang around on the street corners, leaning up against
the lamppost, hoping something is going to happen! The town you're operating in isn't that
one-horse. If you want things to happen in auditing, do them rapidly so that you do get some-
thing happening and you'll get something happening, with speed.

So your assessments do not take in the zone and area of the pc's analytical mind,
unless, of course the pc is being very resistive. Now, he's being very resistive about a with-
hold; well, that's between you and the pc. You got the idea? That's another operation. Has
nothing to do with finding it on the meter or anything of the sort. It's still on the meter. You've
found it. Now it is reacting on the pc. Well, you just say, "Stand and deliver. What is it?"

And you could go on and clear eighty-nine other questions with the pc, of one charac-
ter or another, but it isn't falling on the one you're asking. You got the idea? So clear what
you're doing.

Now similarly, on an assessment, it requires no cooperation on the part of the pc at all.
Actually, the pc could be walking around the room, if he could do that and hold on to the
electrodes and if you were speaking loud enough, the pc would hear, reactively, what you
were saying, because it's dangerous, and you'd get a reaction on the meter.

And you think you have to wait for the pc to think about it or the pc to rationalize
about it. That's not true. You don't want anything to do with that. It's very – it's a very happy
fact that he can still think. We're glad he's still alive. Cheerio! But that's about all it has anything to do with it and nothing else has anything to do with it.

All right. I've given you a very long lecture today as I am prone to do, and should start them earlier on Fridays. But I've been studying for some time why it takes so long for something to happen and I've now done enough observation that I can tell you, that it isn't a slight thing of speeding you up so that your actions are more coordinated or something. It's gross! You're auditing the wrong target.

See you're auditing the pc's analytical sphere of action and that isn't what you should be auditing at all. You're supposed to be auditing the reactive sphere. As long as you're auditing the reactive sphere, it shows up only on the meter and it shows up instantaneously; and that's what you bite. Right away – pang! And you get the job done.

Now, I'm not asking you to rush. I don't care how leisurely you go about the job of auditing, but just audit the right target, which is the reactive bank of the pc – "Dianetics: Modern Science of Mental Health", published May 9th, 1950.

Thank you.
Thank you.

Wuff! Well, thank you for giving me an opportunity to have a little rest and relaxation. You know, what – what most people consider work, I don't. And when I get cases running off the rails, far off on administrative lines, trying to prove conclusively that the organization cannot possibly survive, it seems an awful long way to have to audit, and that's just about what it amounts to. Somebody presents me with the fait acompli of "Auditing is absolutely vital and necessary twelve thousand miles away or eight thousand miles away."

That's generally what administrative things break down to, by the way. People do odd things to you. They present you with emergencies; enormous emergencies. And they think I don't know yet that they're just trying to reach me. That's their idea of reaching me. If I appeared on the ground it would be very, very simple to straighten out the thing. It's almost the heroic effort necessary to keep things running wrong. [laughter] It's almost fantastic. It's almost fantastic. I just think the people in these governments just absolutely must be just sweating, just sweating blood, day and night. I mean, how can they manage it, you know?

They just – I can see them up now, at 10, Downing Street, and the State Department, seventeen hundred-and-something Pennsylvania Avenue. I can just see those poor fellows, you know? Trying to hold things in disorder. Because you'd be surprised the ease with which things will snap into order. It isn't an automaticity, particularly, but order is always easier to achieve than disorder. You have to work at disorder.

And yet the world at large is so in disagreement with this principle that I wrote a story one time about a fellow who went ashore trying to sin, under a hellfire and brimstone Captain. And he went ashore in China trying to sin and the Captain had given him a big lecture about the ease it was, you know, to drift into the ways of wrong and all of that; and how easy this was and how simple this was for a young man to have all this happen, you know. And the fellow goes ashore, and he just overtly, you see, tries desperately to get into some trouble or have some excitement, you see, and it's all a complete flop. [laughter]

Well, what is this? This is Junio the 12th? Sesenta y uno. All right. If any student has any question he cannot live without being answered, speak up. ...You mean all of your questions have been answered?

Female voice: No. They aren't coming up till I start auditing.

What was that again? Got one coming up?
Female voice: I said mine are going to come up when I start auditing.

Oh, I see. All right. Yes, Mike?

Male voice: I don't know if it's off the point, but one of the questions we were asked was "PHD." I have no idea what that is.

Hm?

Male voice: "PHD"!

You don't know what "PHD" is? Well, now let's see, who was here when Mary Sue gave the very adequate demonstration of that. All right, Madge, would you be good enough to show him how, conclusively, you can demonstrate that the cat has PDHed him? Will you do that for him? That'll tell you all about it. That's the easiest one. That's easier to demonstrate than talk about. Nobody would believe it until they see it. you see, everybody has been PDHed according to the meter, if you don't know how to ask questions. It's a wonderful example in how to get wrong information.

I want to repeat something, speaking about a meter, just mentioning it in passing. Now, are you having better luck using instant read than latent read?

Audience: Mm-hm. Yes.

Is there anybody still in a flat one about this? Whether you use – . Yes?

Male voice: I have a problem, Ron. Uh, when the pc answers, say, "Is it all right to audit in this room?" you don't get any motion on the meter, whether the pc says no or yes. And then – say he says yes – and then you get a drop after he says yes. This is the latent read that you're referring to?

That's a latent read.

Male voice: Latent read.

That is a latent read. A meter reading on the pc's reply or response is a latent read.

Male voice: Do you exploit it?

Hm?

Male voice: Do you exploit this one? Try to find out what it is?

Brother, I'd drop that one so hard it goes plop. you know, I'd just pay no attention to it.

Male voice: Okay. Now, that's what I want to know.

Just no attention to it. He didn't know from nothing Your meter knew. So he says it isn't all right. Now, I won't act on it, but I'm still in two-way communication with the pc. You see, it's a code break not to be. So I handle this thing two ways. (1) I'm not going to handle it, and (2) I make the pc feel all right about it.

I usually handle these things somewhat on this order: "Is it all right to audit in this room?" Pc: long comm lag, looks around. Nothing's happening, you know. Meter dead calm at the instant I asked the question.

Pc says, "No, I'm not so sure."
And I say, "Well, we'll probably get more used to it as we go on. Thank you." [laughter]

Doesn't create an ARC break, the pc kind of perks up, and says, "Well, all right, you're gonna be overbearing." [laughter]

Now, this latent read is licking a lot of organizations right now, and a lot of auditors in the field. It's licking them. They don't dig this one and their Security Checks are going up toward the hundred-hour mark. We had been very successful in handling people in Johannesburg in the course and we had a terrific course and it was fine. And when Peter Williams went back down to Australia, he was utterly stunned at the length of time it was going to take to do anything in the way of an assessment or a Security Check or anything else.

Now, this was the dog datum that had slid in unnoticed. It had just crept in under the door. Everybody was reading latent reads. See, that was the difference. Nobody was getting the show on the road, and he hadn't actually noticed this essential fact. I didn't notice it myself until I'd been sitting around here for about a month watching what you were doing. And it suddenly occurred to me, "They're doing something wrong, but I can't put my finger on it", and Mary Sue, in watching what you were doing and in giving checks and that sort of thing and trying to demonstrate it, suddenly came up with the datum. She said, "Auditors are reading an E-Meter that falls after the fact." She didn't say it that precisely, but that was it. She had a lot of other things to say about it, but... [laughter] this is the way this thing goes, you see?

If you don't get a response on the E-Meter within something on the order of a tenth of a second of your question, everything thereafter is a no-response. You got it? It's a no-response now. We don't care if it whistles Dixie. It's a no-response.

In the first place, you are not auditing the analytical mind. And if all that was wrong with people was the analytical mind then you'd have it made, you see, because a guy could think his way straight so fast it'd make his head swim. He is responding to the reactivity of the reactive mind, and therefore all the auditor is interested in is the reactive mind. And the only thing which responds instantly on the meter is the reactive mind. That's all. Anything else – his blood pressure's responding or his sudden memory that he didn't put out the cat (oh, my God!) and there's the cat home all day in the apartment. This kind of thing, you see, gets in.

Now, we have another order of read of this character and these two things are similar. We have to give this other one a name, now. We got several orders of magnitude of read that are really high school E-Meter reading. One of those is the rise. You don't pay any attention to a rise.

Now, we have some new students here and I'm very happy with you and you're all welcome and nobody is going to be cross with you. We'll try to teach you everything we know how to teach you until you report to us that somebody's needle rose. Why don't you report that there is air on Earth? Or some other astonishing fact? Why not send a telegram to the prime minister concerning the fact that farms in Sussex are covered with dirt? I mean, it's just the same thing. So it rose!
Well, why do you ignore this phenomenon of a rising needle and say nothing about it? You cannot establish what started it rising because the preclear did not observe what it was, started it rising, and you might have had five words in your sentence, and any one of them may have started it rising. Or the fact that a bee just buzzed past the window could start it rising. It's anything the pc would be unwilling to confront.

But to establish what it was would require perhaps fifteen minutes to a half an hour search of going over every possible element. All to what event? To find out that the pc can't confront. Well man, everybody knows that! If he could confront everything, he wouldn't in the least bit be having any trouble in existence anywhere at all. So all the rising needle has said is that the pc is not Clear. And you know that and I know that, so why should we re-search it? See?

What triggers the rise of the needle? And there's some old nursery rhymes and so forth that go along with this thing that I don't remember very well, but they have a ... oh, yeah, I think there's some character by the name of Chaucer, wrote one about it. So what? I mean, you're not announcing a knowable factor. See, you're announcing an unknowable factor, so there's no point in it.

Now, what stops a needle from rising you can establish. This fellow is able to confront cats, and something, Lord knows what – an electronic circuit going off at the North Pole causing a difference in the variation of the intensity of Earth – could start a needle rising. So what? He can confront cats, so we say to him, "cats" and the needle stops rising. And we stop saying "cats", the needle keeps on rising. So we know "cats" stops the needle.

Now similarly, in giving a Security Check, if you ask a question and the fellow has a rising needle, you're not reading the rising needle, you're reading a change of characteristic. And you ask him, "Have you ever illicitly diamond-bought?" you say, and the needle stops. Ah, but that's a change of characteristic. It didn't fall, it didn't theta bop, it didn't rock slam. But if you've got an instant read on "Did you ever illicit-diamonds-bought?" you press it.

You see, the instant read is, instantly it stops – if just for a second, see? It's going up very nicely and all of a sudden you say, "Did you ever illicitly diamond-bought?" Man, that's a change of characteristic. Get your jackrabbit ears flapping. That means he has illicitly diamonds-bought at some time or another. Probably in this lifetime. Probably got them in his pocket right now.

But you'll find a pc who is having a very rough time, who reads on a very, very high sensitivity knob here, will very often just rise and rise, and rise and rise, and rise and rise, and up goes the needle. And you'd just ask them Security Checks. And you know that they've done practically every question in the Security Check, they have a major crime on for which they're being looked for by Interpol, see? And you sit there in fascinated amazement!

Irresponsibility on all dynamics is so low that they have no reality on an overt or a withhold. So you of course get no needle reaction of any kind whatsoever, because the indi-
Individual must to some degree connect with the reactive mind to spark it off, you see? There must be a connection between the individual and that area of the reactive mind.

That's why you can't take somebody who has a bad neck, and all of a sudden say, "Well I'm going to cure your bad neck," and you work on him for days, and then you happen accidentally to ask the question of "How's your neck?"

And he says, "How would I know?"

And you say, "Well, isn't your bad neck getting any better?"

He says, "Well, it's never been bad." See, his head's always over this way, you see. "Never been bad. There's nothing wrong with my neck!" It's a fact! I mean, the guy has no reality on it. It's out of his reach.

So you can only reach those things in the reactive mind that the individual himself is capable at that time of becoming responsible for or aware of. And the E-Meter tells you what he is capable of becoming responsible for or aware of. It spots this responsibility factor for you, which gives you a reality factor. Therefore, you can audit, find, exploit things that appear on the E-Meter. But you cannot audit, find or exploit things that won't appear on the E-Meter because they're beyond the zone of responsibility of the pc. Completely beyond it.

Do you – if you were to go down here to Dartmoor Scrubs and fish out the warden or somebody else and put him on the E-Meter, and you say, "Well have you ever beaten up any prisoners? Have you ever been mean to any prisoners?" and so forth.

And he'd say, "No, we just do the best in this best of all possible worlds." And so help me, look at his knuckles, you know, and they're bleeding!

Well, you say, "How about those knuckles bleeding? Well, what about that? Have you done anything with any prisoner lately?"

"Oh, well, no, no. Fellow got in my road coming up here to see you, but of course, he was in my road and he shouldn't have been there, you see. It was his fault, and I didn't do anything to him at all."

This becomes utterly, pluperfectly fascinating There's the evidence. The evidence is right there, and the fellow has no reality on it. So don't be dismayed, because it's this responsibility factor. He's incapable of taking responsibility for the action, even potentially. The E-Meter only reads on what an individual is responsible of taking the reaction for, and that's all. That – it'll only read on that. If he's potentially responsible for taking responsibility – if he's potentially responsible – then and only then, you're going to get an action on the meter.

So it doesn't, you see, read a catalog of crime like an IBM machine. You know, every crime he has on the whole track between now and the beginning of track are not all cataloged, and will not all fall out with certain degrees of read. If you have an idea that an E-Meter is going to do that kind of thing, then disabuse yourself of it. The E-Meter will eventually do it, but just as the E-Meter reads the reactive mind, and reads reactivity and nothing but reactivity, so it also, ergo, perforce, must read what the individual can be potentially responsible for.

Therefore, when you give repetitively a Security Check of an individual, when you potentially have that individual capable of being responsible for certain of the crimes on the Se-
So this is an instant and immediate test of whether or not you are advancing the responsibility factor of the pc by auditing. If the pc has become more capable of taking responsibility, then and only then are you making progress in auditing, and then and only then will you get new withholds.

So don't be surprised when the meter starts reacting on a Security Check that you just finished giving. Ten hours of auditing before you finished a Security Check. Now you've been auditing a person and now all of a sudden he's got a whole new set of withholds. And you say, "Well, what a fool I am that I didn't catch these in the first place." This might be an amateur's response. "Why didn't I catch all those withholds in the first place?"

Well, you know the guy has to be potentially responsible for withholding on those exact things before they register. See, he doesn't even consider them an overt. And as you process a preclear who is going motivator, motivator, motivator, "How mean they all were to me," "How mean they all were to me," motivator, motivator, motivator – when they're going along this line, don't be amazed that they have never done anything to anybody, and that you can't find it on the E-Meter that they ever have done anything to anybody anywhere ever. Don't be surprised. See?

It's simply an index of the responsibility of the pc, and it's terribly bad. You process him for a little while on the Prehav Scale, one way or the other, and what happens when you process him? He gains in responsibility and as soon as his responsibility is up, any way, shape or form, all of a sudden it isn't motivator, motivator, motivator. The pc did something. Amazing! You don't hear about the husband beating them day and night, just standing there wearing his arm out. The pc at least comes up to the point of where "Well, it must be very tiring. I must have worn the man out", [laughter] and so forth. They've come up that high. And eventually – after you've been auditing them for hours and hours, and running general Prehav levels or SOP Goals or something – you give them another Security Check of one kind or another, and you find the astonishing fact that the way these fights start is she usually takes a hot iron and takes his best shirt or any of his clothes, and starts pressing them and then leaves the iron on, you see. And that's usually the way these fights start.

Now, we get it going a little further, and we – there's more hours of auditing, and we give a Security Check, and we find this astonishing development: that the person calculatedly plotted to make the husband mad! It wasn't an accident. The person has become aware of the mechanical processes and is taking responsibility for the mechanical processes which make them turn an iron on and put it on a new shirt, or something like that, and burn straight through it. They're getting even with him, and now they will begin to wonder what's wrong with them that they're doing something like this.

And there you're really seeing a case start operating. And when you don't see a case start operating at least that much, watch out, because you're not making progress.

If somebody is going motivator, motivator, motivator – fifty hours of processing later, motivator, motivator, motivator, motivator, motivator; no good. You're not making any advance. Now if a case, for instance, is given a Security Check, and then given a general run,
just Routine 2, and then given another Security Check and you don't now find new withholds on the Security Check, watch it, because something happened there. You goofed. There's something wrong with that general run. The case didn't make advance. That means you're running the pc with the rudiments out. That's what it means.

There's something you can do about it. Yeah, well, run through your Security Check on the basis of instant read and when you get to the end of the run it's just, you know, give it a lick and a promise. Look for instant reads; that's about it. It's almost as fast as you can read a Security Check, by the way. You aren't going to find very much on it. When you get an instant read, clear it up and go on to the next question.

Get right back to auditing. And now, what is the present time problem? What is the ARC break? What external activity is the pc engaging in that is countering the auditing? Let's get real curious. You know these great big fruit horns, that they sometimes display. You know, there's one up in the Monkey Room, by the way. There's a monkey sitting there with a Mexican hat on with one of these horns of plenty.

Well, it's just like turning one of those things upside down, only the fruit squashes all over the floor. Crash! Yeah, well, outside of the fact they've been getting drunk every night before they came in to auditing sessions, and outside of the fact they've been trying to ruin your reputation while you're auditing them, and outside of the fact that they had already had a bet with somebody that they wouldn't get any gain in processing, the case is good. The case is making progress, see, aside from that! And it's gross! Don't look for little, tiny things. It will be a gross error.

All auditing errors which can suspend a case today are gross. And what do I mean by gross auditing error? Complete, stupid, stumbling, unfamiliarity with the TRs and Model Session and the E-Meter. It really has to be bad.

Next – complete and utter disregard of the rudiments. Just whole hog. Not paying any attention whatsoever to tone arm reads when the person leaves the session and tone arm reads when they come back into the session. Not – not even being vaguely curious about it.

Assessing the Prehav Scale, for instance, by only assessing the level for "Compete." Well, they read in a bulletin that when you assess the level on the Primary Scale, why then you go over into the Secondary Scale and that is one level. So you just – what you do of course is just take every word in the Secondary Scale. And not only that; if a person would do that that stupidly, they would also do this: Well, you just run one leg of the bracket. Like, "What has your husband done to you? Thank you. What has your husband done to you? Thank you. What has your husband done to you? Thank you." And it's gross! Don't look for little, tiny things. It will be a gross error.

Now, when you get errors of auditing adding up like that you get no gain. And I'm telling you, and you're going to learn it, and you're going to get a subjective reality on it, just like I had: the blunders which prevent cases from advancing are so gross as to stagger you. They are so gross that you won't believe them; therefore, you don't look for them when you're training auditors or something. You just don't look, in an HGC or something like that, for errors this gross!
You're taking it for granted that the errors are minor. That the pc had a little ARC break at the beginning of session with the auditor and therefore didn't advance in the session, and that's what this is all about.

No. You ask about this, and you try to clean up this little ARC break, and everything is ooooh! somehow or another. Pc doesn't still make any gains. And you go along, and you just flounder and fumble, and you wonder where you're going and what you're doing. No, the error there is the auditor never shows up for sessions. You think I'm kidding, but that's the order of magnitude of error!

It's big, you see. I mean, it'll be big! It'll be something on the order of, well, every night after the auditing day, the auditor has a date with the preclear's wife. See?

You take my tip. You look for gross errors. Just as we're running at ten-thousand-horsepower today, plus, so it takes a ten-thousand-horsepower error to combat it. And don't you go looking – when you're training auditors or supervising processing, or trying to look a – don't you go around trying to find that little, tiny, little thing that would've held it all up. Because you're asking the same silly question as "How can you put a matchstick in front of the Twentieth Century Limited and stop the train?" Well, you can't. It has to be another Twentieth Century Limited. And it will be, too.

But you'd be amazed. I've done some cross-checking of this character that is – just would stoney you. Just gone over it and over it and over it, trying to find out why we weren't making a gain, why we weren't making gain. And I just got one the other day. We had an auditor who just wasn't getting good results, that's all. Wasn't getting good results. And look: What he learned about running an E-Meter was the totality of running an E-Meter a few days ago, and he thanked me very carefully. Look, the guy's been assessing on the Prehav Scale. He has been running Security Checks. But he didn't know anything about setting up a meter. What he had learned is the third-of-a-dial-drop test. He learned several things about a meter. And he told me what these things were that he'd learned about a meter. He'd learned how to set up a meter. He'd learned to set it up and he knew now that you read by the needle ...

You talk about gross error? I mean, how could the guy have gotten any gains at all running assessments when he couldn't read a meter? You get the idea? So this is as gross as the errors are, that's all. They're just horrendous! I – I see that you really don't probably believe me; you don't have much reality on what I'm saying there, but you will have. You will have. It's grim! And you, sweating your brains out.

You know, the worst thing that a person who is supervising auditing can do is start inventing unusual and gargantuan solutions because the auditor he's giving them to just can't seem to make a gain on the case. So the auditor keeps coming in and saying, "That didn't work." Well actually, this is the old whizzeroo on the California response. There's a thing called the California maturity test, and the California this and California that. Well actually, there's an – in Dianetics there was the California response. Inevitably, if you said something about a new process, when I was working out there, somebody would say, "Oh, yes, that's very interesting, I was using that last year."

Sounds strange, you see. You said, "Well, there's this new scale and there's the ..." "Well, I was using it last year." They always used it last year, you see? Now I listened to this
for over a year before I finally got a proper response to it. And that was – became the California response. And that is "What were you using a year ago?" Well, that's a cooker! They've even forgotten what you said practically, see. They don't remember anything that you said and they come out with some wild rendition and you've just told them about the No-Effect Scale, you see? All right.

And they say, "Well, yes."

"Well, what were you using a year ago? Exactly what was it?"

And they say, "Well, just what you're talking about."

"No, no, no, no. What exactly were you using a year ago?"

And they say, "Well – well, we put these phonograph records on a phonograph, and we clamp the earphones on the pc you see? And we'd say 'Be calm. Be calm. Be calm.' That's what we were doing a year ago, and it was just exactly what you said."

You try to get any sequitur out of this, you see! That's the way to handle those characters.

Anyway. Similarly, the most common failure that you have in managing several cases at the same time is this one: Person comes in and says, "You know that – that you told me to do yesterday?"

And you say, "Yes. Uh – well – uh..." (That was your mistake, right there, you see?)

They say, "Well –" triumphantly, see. "Ah-hah-hah-hah! Well, it didn't work!"

And you say, "Well, I don't know. What is it doing?" And they give you a big rundown. You think up a new and extraordinary solution, you see, and you give them that.

And they go away, and they come back the next day, they say, "Ha-ha-ha-ha-ha! It didn't work! Oh-ho! No! It didn't work!"

For God sakes, get bright enough sooner or later to say to them, directly and positively, "What didn't work?" And you inevitably get some outpouring of sewage that has nothing to do with anything you have ever been talking about! "Well, I keep standing the pc on his head in the corner, and he – the blood keeps rushing to his head." [laughter] "And it's obvious that he isn't Clear, because he can experience a physical effect." I mean, it'll be some gross nonsense of this character. And you have been pounding your brains out, trying to get this case moving, you see, thinking – putting it on automatic – that your instructions and advices were all going to be followed. And if you get that type of repetitive action, that is one of your gross errors that you must be alert to, that you must wake up to.

Listen, if you've figured out a case from A to Izzard, knowing Scientology, and you ask somebody to run this on the case, I'll sw... I'll promise you something is going to happen. It isn't going to be "Well it didn't work!" See?

So obviously it's a gross error. You keep looking for something that works on the pc when the first order or instruction you gave, which is "Take the pc up to the auditing room," hasn't been followed yet!
I'm not getting 1.5 on the subject of auditors. I'm talking about auditing failures. And auditing failures always stem from gross, very gross, errors. And they are so gross that you will overlook them. And when you start giving extraordinary solutions on top of these gross auditing errors, of course, you're just getting no place at a hell of a rate. The thing for you to do is pick up a bulletin and say, "Now, let's see. It says something here about Routine 1. Now, describe to me in a few words what Routine 1 is."

And the person says, "Well, that's tell a person to be three feet back of his head, isn't it?" Yeah, well, he has never read that bulletin. And you've been telling him to put it into effect; and he's never read it.

I've got a wonderful example of that right now on the administrative lines I was just making a crack about. I have a report through the lines that a certain area was utterly disregarding all bulletins, because they were so busy in the middle of an emergency they couldn't put any of them into an effect, you see, because of the emergency they were having with finances and other things, you see. I got that report through from an independent source, that they just didn't know anything about any bulletins.

And sure enough, about three days later, I get a total 1.1 piece of nonsense about how everything is going broke and it's all a big emergency. It's just a total glee of insanity all the way through this report. How do you like that? Just glee of insanity. Backing up the hearse, telling you how bad it all is and so forth. Well, look, if these characters have never followed any instructions of any kind whatsoever, I can guarantee you they'll be in trouble. See, they'll just be in over their heads. Particularly if they had carefully reversed every instruction they had heard a rumor of. You see how that goes hand in glove?

So it happens on administrative lines, and it's something for a man in business to know. If somebody's department is going all wrong, and you just can't seem to put it right, and you just can't seem to issue orders that put it right, and you just can't seem to do anything to put it right; it's about time you looked for the gross error. Because it's not a little error of he has one too many motions in feeding the stuff to the accounts machine, see. It's not that at all. It's the fact that every time he receives the mail he dumps it in the waste basket. See, it's that kind of an error. And this is – goes hand in glove with he feeds you bad news and he says he can't do the job and there isn't any way possible to get the show on the road, and usually goes along with he needs more appropriation for his department and more help. All these things sort of fit in, in a package, see.

All right. You say, "Well, the poor guy. He's struggling there and maybe he isn't very bright," and you are being very, very kind, patient, and so forth, about this. And so you try to give him help by giving him instructions. And he keeps coming back and telling you the instructions didn't work. And the department doesn't get any better.

Well, the whole thing about it is, you never gave instructions that had anything to do with what was wrong in the department. What you should do about the time something really starts to run real wrong is to go look for the gross error. And just keep looking for the gross error, because you'll find so many minor errors that they will trap your attention. And so you never see the gross error. Get the idea?
You look at these little errors – Naturally, such a person in auditing a case would have all of his rudiments out, or something like this, naturally. But look – look for the gross error. What is the error here, when you've got a case that just doesn't advance, or things just aren't going. What is the error? It – it's big. Be something like the order of he just hasn't a clue. You might discover it by looking at him to find out he holds the E-Meter upside down. I mean, it'll be something weird like this, you know?

And it almost exceeds your imagination. But it also comes out of the impulse to make nothing out of something. They've got to make nothing out of something, and this comes back to a subject known as productivity, which businessmen are very interested in, and which Russia's going to pieces on, and which England can do much better with, and the United States is going down for the third time on.

The effort to produce is one-half of the dichotomy. And all strikes and everything else are on a single button, and the – that is the effort not to produce. And you've got people all over the place who are totally dedicated to non-production, totally dedicated to no results. I'm afraid that's a fact. Totally dedicated to the no-survival of a situation. Well, it comes about naturally. You come – it's half of the dichotomy. You keep telling them "All right, the organization has got to survive." The organization, the state, the nation, the group, mankind, got to survive, got to survive. And it just runs, it gets into a stuck flow, and you develop a bunch of people that quite automatically go on the basis of the organization must not survive and are just thinking day and night how to put it out of business, thinking day and night how to put the government out of business.

There's one department in the United States that just must sit up all night long just trying to figure out ways and means how to stop the United States from surviving. If they just sat back and relaxed or they all went home or all went and played golf or drowned themselves in the Potomac, or something like that, you'd be surprised. Probably United States' international relations would right themselves instantly. Because there's an enormous amount of guys doing business all over the world who probably are far, far more competent than anybody in the State Department.

Similarly, we look down here in the Treasury Department or we look down here at the Chancellor of the Exchequer, and we find him all the time trying to figure out something new, extraordinary and strange and different. And the only time when it really got to going good in the last few years is when I think he got sick or something. And it was just going dandy there for a while. And there were a whole bunch of graphs published showing during the period of minimal restriction that everybody's savings increased, the purchasing power of the country almost doubled and so forth, until they all got active on financial planning. The plan balanced economy thing.

By the way, they get that from Marcab. Marcab always had plan balanced economies. Everybody was broke and starving all the time. And so, what happened? They put on a bunch of restrictions, because all of a sudden everybody got into a panic.

Now Jersey, right now, is a little tiny dot of rock over here, and Jersey had a lot of hot money coming in. It was tax money, and if you had the money in Jersey, you didn't have to pay income tax on it. So here was this flood of hot money coming into Jersey. Jersey's broke,
it's poor, it doesn't have very much to do with, has nothing much to build with. All of a sudden people borrowed this hot money, and started building hotels, and doing other things around, and right away, everybody in Jersey, almost without exception, got around and started to complain, and groups started to form to stop this hot money, because it was somehow or another bad – because the balloon might suddenly be pricked and there might be a tremendous crash.

Now, did they sit around and think how to employ that money? Did they sit around and think how to fix up a community here, with all the available capital they needed, so that everybody had a good show and they were all nicely employed and it was all running off gorgeously? Did they put in a moment of time doing this? They sure didn't! No, they just said, "How can we stop this flow? We've got to make this prosperity stop, man. Or we've had it. We've had it." But what's had it? The ambition not to produce has had it. And that ambition would cease to exist and therefore would die and perish. You see how this could be?

So you get strikes. And never kid yourself much about strikes. Strikes will eventually slaughter free enterprise. Strike in the last half-century has drifted these nations over into greater and greater socialisms. Oh, I'm sure there was a – there was some recourse to low wages and working twenty-four hours a day and all this sort of thing – I'm sure. But I'm equally sure that nobody found the remedy yet. That I'm equally sure of. I'm sure communism isn't the remedy, socialism isn't the remedy, none of these things are. That I'm sure of.

Because all it is, is this button of "no-produce." It is a hot button. It's no production. You will find it there on your Create Scale. If it isn't in your Secondary Scale, which I haven't looked over, finalized yet, or checked against everything, it certainly is a wide hole missing on your Secondary Scale. So you ought to put this button, "produce" in there, and you ought to put "non-produce" right in alongside of it. And that one I know isn't in the scale. I've just been exploring this.

"Non-production. Our goal is non-production. If we can just keep everybody fooled enough, we'll have it." Now, the goal can also be "no results." "If anybody obtains any results around here, it'll be over my dead body, personally. My primary goal and ambition will have utterly ceased, and that will be the end of it if anybody ever makes a gain." You got the idea?

Well, that could be a psychotic state of mind. And when you see errors of gross magnitude, continually occurring – We all make mistakes. I can make mistakes, you can make mistakes, everybody can make mistakes. The trick is to be right a majority of the time. Most of the time, be right. Don't ever try to be 100 percent perfect. Just try to be right most of the time; and boy, you're batting so high above the national average that you really succeed, see.

A lot of people go around with total perfection, you know? They can't get anything done because, well, it wouldn't exactly be right. I had a guy like this on board a yacht one time. And he managed to try to burn the boat down a couple of times and I finally decided I'd better send him ashore. I wasn't around. He was just a boat guard, see. But he would start monkeying around with washing a bulkhead, and he would get into a frantic state about the bulkhead, you know? And you'd go into the yacht and you would find this bulkhead has been washed. And he'd say, "Well, no. No, not yet. I'm not finished with it." And you'd happen to
come back a couple of days later and this bulkhead is still in the process of being washed. And a week later the bulkhead is still in the process of being washed.

And you say, "What in the name of common sense is going on here? You're washing one bulkhead!"

He said, "Yeah, but it's not clean yet." you see, his idea that if he did anything it had to be absolutely perfect. And if it wasn't absolutely perfect, why, then he couldn't just leave it.

You'll find artists down in Greenwich Village – they've got canvases around that are two-inches thick with paint, because they're trying to paint the perfect picture. And they're trying so hard to paint the perfect picture that they never paint a picture!

It's good discipline sometimes for yourself, that after you've done a sketch of something or after you've planned something out – It's actually good discipline – sounds weird, sounds anti any training you have – of just say abruptly, "That's – that's finished and that's complete, and that's the way we're going to do it", and never work out the final details. You know, and say, "Well, we'll do it that way." Just to teach yourself that not everything in the world perishes because you left out one little tiny detail on something.

Now, people get too panic-stricken at making a mistake. And they get so panic-stricken at making a mistake they become unreasonably tense and unreasonably upset about learning the right way to do something and they can't relax. You understand? So if they figure anything is worrying them this hard, then it's very easy for them to go over the borderline and just start insisting nothing get done. And there's a very thin line between total perfectionism and accomplish-nothing. That's a very thin boundary. And it is very, very easily crossed.

I'll tell you that sitting back with a cigar in your mouth, one of you girls, with your feet on the – on the other chair, reading an E-Meter occasionally but perfectly willing to sit there and audit, actually could get results on a pc. Actually! You could actually do it. That's an interesting view of it, isn't it? In view of the fact we're talking about perfection, perfection, you've got to do them absolutely perfect – the TRs and all that sort of thing.

It's only after you can do them all perfect that you can relax and put your feet on a chair and smoke a cigar and get results on the pc, you got the idea? Because your anxiety is no longer present. Your anxiety is no longer present and is no longer communicating to the pc. Les resultats! You are in the clear, so what you say counts.

As a matter of fact I can audit with tremendously precise formality and I can do Tone 40s with great, precise formality. But I can also, with my pen still in my hand, midway toward writing a letter someplace or another, pick an E-Meter up, stand it on its edge, at the desk, make somebody sit down and pick up the cans and do a good job of assessing them. And then turn the E-Meter off and thank them very much and tell them I'm not assessing them, and I'll go back to writing a letter.

But that's because they haven't got any feeling of anxiety about it and I haven't got any feeling of anxiety about it and I can do the job and they know it and there isn't any monkey business about it. Get the idea? But this tremendous strain of to get everything right, get everything absolutely right, "If I can just get this absolutely – If I can just get my little finger held just right as I'm gripping the E-Meter, you see, and I look at the pc just, just right, and I don't
make any mistakes of any kind whatsoever, why, maybe I'll get a result." No, you won't get any result. Because the gross thing about auditing is missing. You don't have any confidence. You don't exude any confidence. And what's the primary thing in Dianetics? The old thing. The one thing that you could always do. You can give people hope and you, with all this tension, have given them no hope at all.

Now, I'm not trying to make a big bunch of nonsense here and build up this idea of gross auditing error and then tell you a lot of minor auditing errors and tell you they're gross. But look, being one of the fundamental purposes in dissemination or one of the fundamental actions which you can undertake to make anybody well, how about omitting it from the sessions, huh?

Now, let's just omit it, totally. Pc comes in, sits down. We don't pay any attention to what he's doing and so forth, and we make sure that our feet are planted right on the floor, and we're getting all set to do TR 0. We aren't even aware of who the pc is or their trouble or anything else. They sit down in the chair and you say, "Is it all right...? Let's see, where's my paper? Yeah, well... Is it all right with you if I begin – uhm – this – uhm – the session? This session? The session! No, no, that's not right ..."

See, the fundamental has been neglected. The fundamental is simply that you are there to make somebody better. In view of the fact that goal is all out, then the results you receive from there on are quite minor. Because you're not trying to do anything for them. See, what you're doing is trying to be perfect.

So if I can teach you how to do all these things perfectly and get you to a point of insouciant confidence, so that you could put your feet on the chair and a cigar in your mouth and balance the E-Meter and wiggle the tone arm with your big toe and still get results and not have the pc feel that this is the least bit strange. You get the difference of frame of mind? The pc wouldn't feel this was strange if you really knew your business. "Why," he'd say, "that's the way he audits."

Of course, now he makes his fatal error. He goes out, he asks you covertly, "What brand of cigars do you smoke?" [laughter] The same old gag, you see?

The fundamental error you can make, of course, is not wanting to help the pc and not helping the pc. That would be the fundamental error, isn't it? Well, you – you can get over worrying at all about your technology, see, worrying at all about Model Session. Just do it standing on your head. You know, TRs – pang! TRs – you can do them. Man when you can confront somebody leaning over a rail on a ferry boat, and do a better job of confronting than anybody else on that ferry boat, you could audit in that position.

See, in order to break the rules you have to be able to be acquainted with all of them. And then you can go ahead and break all the rules you want to. As long as you don't commit any of these fundamental errors like not being present at the auditing session, you see. Or auditing with a dead meter. Or auditing with one that's got one of these grains of dust into its pot so that it does nothing but rock slam, and you just go on auditing the rock slam out of the pc – and of course, the pc hasn't been rock slamming on anything – and then justify it all by saying "Well, Ron says that rock slams persist often ..."
And did you know one of these meters will rock slam if it gets a grain of dust in its pot? Mm-hm. You know, the way to cure it is just to shake the tone arm around a little bit. And if that doesn't cure it, drop a little bit of lighter fluid in it, and shake it around a couple of times, and it won't do it anymore.

All right. I've given you a very random discourse, but I hope I've given you something to operate with.

Instant reads. If right now you can get accustomed to this instant read, that's another brand of confidence. And you'll get this brand of confidence. Sooner or later, you'll get it straight. You right now are, I'm sure, in a slightly leery frame of mind about "Well, let's see, did he say one-tenth of a second? Let's see, was that one-tenth of a second or one-twentieth of a second? Or was it really a half a second? How long did it take the needle to react? Well, we'll - we'll spread it out to three seconds, and we'll call that 'instant', and then we'll be safe." No, you won't.

And then you'll feel very funny about going across a question, and you read this question and there's no reaction on the meter, and you'll feel very funny about leaving the question. You'll say, "Well, that's being very unthorough.", so you read the question again, you get a latent response. Well, maybe your latent response is something on this order: You read the question. This restimulated something in the pc that really isn't on the subject of the question but is a borderline, you got the idea? All right, you restimulate the borderline when you read the question. Now you read the question again just to be sure, because you're unconfident, you see. And the moment you do that – you wait for it for a moment – and all of a sudden it reacts.

You have not got an answer to the question. What you've got is some allied activity of some kind or another. You got it way over in left field. And you'll get that when you get to it. See, your Security Check is thorough enough, now. You'll get it, someplace, on the Security Check, you'll get it as an instant response. Got the idea?

But you could spend hours cleaning off all the fringes of the chicken house without ever getting the chicken to eat. You could! Just spend hours and hours and hours, cleaning off these latent responses. They're all elsewheres.

All right. You just have to give yourself some experience of watching that meter, and if it doesn't go pang, you just skip it. That works with Goals Assessments, too, you know. You read off the goal, and then you say, "And one, and two, and three, and four, and fall!" And you say, "Well, that one is still hot."

I don't know whether that one is hot or China is hot or anything else. It's the same question as "What did the needle start to rise on?" Your latent response is "What did the needle start to fall on?" You cannot answer the question, so therefore you might as well neglect it. You're not sure. You're liable to leave the pc in a total flub and fog. "Why is that needle falling?" he will say. And you'll still get latent responses. If you've got the question, he always gets an instant response.

It works like this: You say, "Well, did you ever illicit diamonds-buy?" and he illicit diamonds-bought. Believe me, you haven't got "buy", out of your mouth "bu – " you got a
fall. "Okay, that's it." And until he gives you that one, on a Joburg, it will just keep falling – instant response. You ask the question, get an instant response. You ask the question, you get an instant response. It won't erase. It'll just stay there. It doesn't matter how many times he thinks of it. He's actively withholding it from you. But you'll get these latent responses on and on and on and on.

Now, I want to point this out as a gross error, not only in auditing generally but in my communication of auditing. And that gross error is simply this and only this: You were auditing the analytical mind and I hadn't noticed it. You weren't auditing the reactive mind; you were auditing the analytical mind. Therefore your auditing target was off. And that all by itself could explain no Clears, see. Instantly.

I don't know how fast you can do an assessment now, how fast you can do an assessment now using only instant responses and erasing only instant responses. You do it the same way, by elimination. I don't know how fast you can do it. But it's probably something on the order of a hundredth of the time you have been using to do it, okay?

That was the main thing I came down to tell you today. Don't immediately think I'm trying to blame you or giving you a bunch of stuff here and saying, "Well, he's proving us all wrong." No, no. It hasn't done any harm to take off all the fringes. It hasn't done any harm. It's advanced the case, sort of the hard way. It hasn't done any harm to assess a case the long way, you understand, and take all the ramifications and all the latent responses off it. That has not done anything at all that is bad. It has wasted less auditing time than you think, because you were trying to run the whole case on the instant response and the latent response. And you were trying to run the reactive mind and the analytical mind. And it's only that time which you devoted to straightening out the analytical mind, which was all right anyhow, that you wasted.

So it hasn't been any vast catastrophe. But on the contrary, has been a considerable win, because I know now what you're trying to do, see. And it was different than what I was trying to do.

I'm trying to knock out of the reactive bank those held-down fives which a person can't think about and which add themselves into every equation. And if you just knock out those held-down fives, the case will get all right fast. See, and if you go on worrying with the pc about why the fives are held down, but never under any circumstances really go looking for a held-down five, of course you're going to get minimal results and minimal recoveries, and minimal profile gains and all the rest of it.

So it's all to the good. I mean, we've speeded up auditing right now a thousand for one again. If we keep doing this, we'll have to watch it because a person will write us a letter, but two days before that, he got Clear.

They know when they were going to write us a letter because they went Clear suddenly! Okay?

All right. I've held you rather overlong. There were some things I wanted to cover with you. I hope you think they were important enough to stay for.

Thank you.
Thank you.

This is what? This is the 13th? Ah, you see? See, unlucky for you, lucky for me. Born on Friday the 13th, you know. That was awful bad luck for the American Psychiatric and the British Medical Associations.

What questions do we have today? Now, I know how bright you are by the number of questions that you find out...

Gee, that's pretty stupid, Suzie. What are we going to do about this?

Yes?

Female voice: Ron, this is for very late in Routine 3. Say a terminal has reached the point where it no longer reacts at all on the Primary Scale.

Mm.

Female voice: Is your next step then just to take it and methodically check off everything on the Secondary Scale before declaring that terminal flat, flat, flat and assessing for a new terminal?

Well, you've got now a very advanced case of something or other. There are several things that are conditional to this.

The question is, "What do you do late in a case about a terminal who no longer reacts on the Primary Scale?" Well, we used to just find another terminal. That was the first answer that was given to this thing – just find another terminal for that goal. And couldn't find another terminal for the goal, why, find another goal. Do another Goals Assessment.

And you're in trouble right about that point, because your Goals Assessments keep running out. And you'll go all the way – you'll find a goal, you'll find a terminal, and it is all dandy, and you've got it all assessed; and you find one level on the Prehav Scale, and that is the end of that whole package. It just took – just a look at the level, and said, "Well, what do you know about that?", and the fellow blows it. It's quite interesting.

So your contest, actually, is not to go into the Secondary Scale, and try to flounder all over the Secondary Scale, and scrape this thing to the bone. The thing to do when you no
longer can get – remember, you can also get a no-assessment because of the rudiments being out. But your Primary Scale – no more reaction, your case well advancing, needle very loose, two-, three-dial drop on a can squeeze test with your sensitivity at zero – got the idea. It's banging against both pins of the can, you know. You just can't close it down.

Well then, what you'd have to do, is do a new Terminal Assessment for the goal you were running. All right. That's fine. Terminal Assessment, all by itself, may very well wind up that goal. The goal'll still be live to some slight degree. Well, you go ahead, however, and try to assess and then – assess on the Prehav Scale and run these terminals for that same goal.

Well, eventually you can't get any reaction on the goal, you can't get any reaction on any more terminals, that's it. You've got to do another Goals Assessment, just like you did originally. And this Goals Assessment will usually go fairly rapidly, and now it is less critical getting a wrong one. You can get a wrong one now and it isn't going to do anybody any harm. You get a wrong one in the beginning, you can really throw somebody in the soup.

So that is the way you handle this. And it's a very precise activity, actually. Once your first terminal that you're running can no longer assess on the Primary Prehav Scale, you do a new Terminal Assessment for the goal you were running. If you \textit{can} assess, you carry on as before with the new terminal. You finally get that goal totally out of the road, you do a new Goals Assessment, a new Terminals Assessment, a new Level Assessment, and now the fun begins. Because you will start doing a new Goals Assessment, a new Terminals Assessment and a new Level Assessment, and five commands and that's the end of that level, that's the end of all levels, that's the end of that terminal, that's the end of that goal – \textit{boom}!

All right. Now it gets more rapid than this. You do a Goals Assessment, and you can find a terminal for it. And the second you've found the terminal, you don't any longer get to the Prehav Scale. It's now evaporated. It's gone utterly.

Now, you have to keep your rudiments in. The only thing that'll fool you – if the rudiments go out on you, because, you see, you can null the whole meter because the person's got a PT problem, his attention is on everything else.

All right. It eventually boils down to where you get the goal, and you get the terminal, and you can't get it over to the scale. The first Clear that was made in South Africa, we were in stitches! Because the poor girl for two days had been trying to find goals and terminals and get them to the scale. She would find them all right and try to get them to the scale, or get them run, or get a command, and they'd just fold up. And then she'd try this again, and then it'd fold up. And she would do it again, and it'd fold up. And \textit{thuuhhh!} And she finally was in a panic, and she came to the Instructors and she said, "Oh, my goodness, I've just ruined this case!" Yes, she had, she sure had ruined that case! [laughs] And then after she'd kept this up for just a few days, actually, all of a sudden the case no longer reacted in any way, shape or form on an E-Meter. There wasn't anything you could do to this case.

Now, that's a complete difference from your bottom-scale case. Bottom-scale case – you can hit a guy over the head and you get no reaction on the E-Meter. But the needle is not a floating needle, and the sensitivity knob is very high, and this case cannot answer questions regarding help or control. So know them by these marks.
Now you get it up at the other end, and it's just a floating situation, and it goes on and on, and there's nothing you can do and you can't get the E-Meter influenced. And that person is Clear.

Now, you go ahead and stabilize a Clear by going on and trying to do this. You understand, it's not good enough just to get a floating needle at the end of the run, you go on trying to find a goal, trying to find a terminal. Your effort to do so blows up the remaining stuck goals and terminals on the track. It isn't that you're conducting a fruitless search, just 'cause you can't find it on the E-Meter. And you have to do this for quite a while. And all of a sudden, why, you're now approaching up to a level of Theta Clear, and you get a stable MEST Clear. This person won't fall downhill.

We've got a Clear right now that is just ruining a whole Central Organization. It's disgraceful. She went down to HASI Joburg to help teach a course and didn't find any people for it. And she found everybody sitting around at their desks not doing very much. So she wound up and started giving a PE Course as well as giving the day course, and found out they weren't writing anybody any letters – that she considered this. And so she started – after her PE Course, apparently in the evening or something, however it goes – she started catching up on their mail for them.

Here's the thing: You've got stuck-valence serenity mixed up with the state of Clear. And you do have, practically until you get to be Clear. And you say, now, a Clear would always be serene and would never be the effect of anything. You get the idea? You've got the Buddhist definition here. And man, that was wrong-end-to. That was an absolute guarantee of plowing somebody in.

Well now, a Clear doesn't act that way. They are rather responsive. Not reactively responsive in that you say good morning to them and they fly through the roof like aberrated people do, but they have another type of response. You say, "Well, it can't be done, and it's all too sad, and isn't this terrible?" And you're liable to get almost anything! It's a grim thing to be around one. Because they are volatile. They react to life, in other words. They are alive. And of course, as everybody knows, that's very dangerous.

They also, however, don't get into irrational arguments with you. That is what's devastating, is that when they say something's wrong, it normally is! It isn't that they think it is wrong. It normally is. That's it.

So what you're looking at is somebody who is alive, and who can react, and so forth. Remember the biggest invalidation that the poor Board of Directors of the Hubbard Dianetic Research Foundation – they had me all mocked up as Clear as near beer – and I got mad at 'em one day for telling me that everybody ought to be run upside down at the end of the corridor, or some perfectly valid thing. And I got mad. And they all went white. Could hardly see them – the walls were white, too. They all rushed out, and went back to their offices and sat there gloomily, and "Well, we thought you must be Clear", you see. So this had invalidated the whole thing.

Ah, brother! That's not true. It wasn't that I was Clear, but been my experience on the thing: A person, when he approaches sanity, reacts very sanely, and they react volatilley on the emotional scale. They're not unpredictable. They're very predictable. You come in and
drag an old dead dog that's been rolled in carrion and throw it in the middle of the rug in the living room, you're going to hear about it, man! They're not repressed concerning what they think about this activity.

So you're not making a bunch of serene beings, you see. You're not trying to put somebody at ninety thousand feet up, flat on his back, looking at the clouds for the rest of his existence! And I think probably the reason Joburg got allergic to developing Clears in the HGC is the Clears kept saying – they got this kind of a notion: When a person gets Clear they tell you, "Let's get the show on the road! Let's get something going! Let's get something doing around here, and let's do this and that. And that big stack of papers you've got there; they're probably not very important. Let's get on to something else here, now", and so on. And the money starts coming in, and things start happening, and people start getting well and everybody starts getting happy and enjoying life, and you just can't have that kind of thing.

So the way to keep from having that kind of thing, of course, is to cut back clearing. That's the normal answer. Yes, I know I'm branding an organization on tape that'll go to other organizations, but this one needs branding. I left it in perfectly marvelous condition ten weeks ago. It only took them ten weeks to pull the rug out; to get it in a State of Emergency. Only they're unlucky right at the present moment, because they've got a Clear in their midst. Horrible.

So clearing them up, don't leave them just because the needle only floats. Clear them up all the way. You audit them as far as you can audit them, and after a while it'll even look foolish to you to audit them. They're exterior. They blow by inspection. Everything is blowing by inspection. Everything rationalizes by inspection. You could keep up this process, but after a while it is senseless to have the person on a meter, because the meter hasn't reacted for about ten or fifteen hours of processing, don't you see? So you'd run them without a meter.

But you could keep up the same process and probably arrive at much higher states. You'd probably arrive at Theta Clear with this same thing I've just given you, see. You'd probably arrive at OT with the same thing I've just given you. There isn't any reason why you really have to shift gears into something else. Only trouble is after a while they cease to have answers to these things, because they think of them and they evaporate. Now, there are other processes that you can do.

Now on the final thing – I'm just thinking just off the club, here, what I'd finally do to somebody before I actually released them: I would read to them, probably, the whole of the Secondary Scale, from one end to the other, still on a meter, you see, and ask them to look over their consideration about these things. And you'd probably blow the latent and remaining reactive locks.

All right, that's how it is done, okay?

By the way, there's something on – pertinent to Clears, I must make a remark. Every once in a while when the little red brothers are amongst us, they have a ball waving their hand over somebody and getting them Clear. And you get rumors all over the place about how this is occurring now. This is occurring. All you have to do is spit in somebody's direction or something like that and they're Clear. And they have this marvelous new technique.
What they actually do: They have this marvelous new technique that kills somebody, or something like that, you see. Hasn't anything to do with the price of fish. It's very, very interesting that this always gets afloat any time the organization is successful and is clearing people. You always pick up these "Instantaneous Clear" rumors. And they are not true, and don't fall for them. Because I'm telling you, I have had cases over the jumps now for, man and boy now, these fourteen year or better, and there is no thought process – no thought, single-button process – I tell you this advisedly – that will produce a Clear. There is no single button. Nor is there any shot in the arm that'll produce a Clear.

The fellow has got to get out of the trap the same way he came in. He's got to walk out the labyrinth the same way he walked into the labyrinth, which was overwhelming and getting overwhelmed. And if you don't over and under – if you don't underwhelm him in reverse to all of the overwhelms, you've got a guy who simply goes into one of these superserene valences and sits on Buddha's navel or something and regards his cloud nine. You got the idea? That's just a bunch of balderdash.

When you think of the amount of overwhumping that has been going on in the last two hundred trillion years, it is no wonder a few people get in the wrong valences. Particularly since we continue to overwhump valences that are not desirable valences. And then we have no mechanism – had no mechanism – to un-overwhelm having overwhelmed. Got the idea? Scientology is the first mechanism which does both. And that is why it is good and valid. And if it didn't do both it wouldn't be valid.

In other words, after you've overwhemed something, the penalty for having overwhemed or eradicated this badness, you see, can itself be erased. You see how this is? So it's the first thing that ever did it both ways. And when you hear about somebody picking up the magic needle and by giving somebody a shot in the arm concerning this, and the person went Clear as near beer, why, yawn for me, will you? If there had been such a thing, I'm pretty sure I would have found it.

This is a very odd remark for me to make, but I would have found it in the last fourteen years. Because there isn't any thought combination or direction of combinations that we haven't been into. There isn't one left. I've even calculated it – calculated it totally out: How many possible potentials of thought combinations are there? The mere fact that flows exist defeats at once a single button. Just the fact that flows exist. Immediately you've got two buttons – you've got them doing it to you and you doing it to them. There's some kind of a wild rumor going on that the phrase – this single phrase – is clearing people like mad around in England, and it runs like this – let me see, what is it now – "What would you be pleased to accept?"

Oh, that's a wonderful way to plow somebody in! Just look at it. And the flow's gonna stick. And I'll tell you something: It was run to its ragged bottom in 1954. Look it up in the records if you don't believe me. That subject has been covered and covered and re-covered, and there wasn't anybody Clear, and as a matter of fact, one poor little girl from Canada was walking around – she couldn't enter a room without walking around and hitting each wall on the process, on practically that exact process.
You have in this case, by the way, somebody who has picked up an old record list. They're picking up all these old processes that produce a rapid result for a few minutes. And I can give you lists of them. If you want to prove Scientology works to somebody by spinning him, I can give you a long list of how to do this. Exact phrases. One of them is: "Look around here and find something you can go out of ARC with." This is what the fellow's trying to do! And all he's got to do is spot this a few times.

And if he just spots it just a very few times, this is okay. He'll feel fine. He feels marvelous. And then, of course, he walks out and falls on the sidewalk flat on his face. Because you've said, "What in the physical universe could you go out of communication with?" with the connotation of, "What could you go out of affinity with?" and "What in the physical universe could you consider unreal?"

These old-time cults like psychiatry, university-ism, any one of these old cults, has its button. And they are formed up, normally, on a single button – a monomania on a single button. And if you smoke out what this button is and run a reverse process on it, you will make that kind of a person out of the pc.

Find out what the button is that would bring about a soldier. Just figure it out: What would a soldier be most monomanic about? Probably wanting to get out. Probably wanting to get out of the army, or trying to get people out of the army, or not destroying anything, or whatever it is that you work out, finally. Work it out. You get a few dozen soldiers and just run each one of them – professionals, you see – and run each one of these things, a bunch of tests; you'd finally find a common denominator that'd make a soldier.

Now, all right. Now, fix that up so it's nontherapeutic, you see, so it busts him out of communication with things, sticks the flow as a single button, and run that process; and the guy will all of a sudden look at you very fixedly and says, "I think I will go join the army." And don't think this hasn't been known on the whole track. This is how they got recruits for space opera, for the State Department, [laughter] for all kinds of places. Got the idea?

Actually, universities run these single buttons on people. One of the ways they do it in engineering schools is to continue to tell people that engineers are not wanted anymore. That is usually stabilized and standard. And the fellow comes up and tries to be a better engineer so that he'll be one of the few select that are wanted, and all these little mechanisms. See?

In the Christian church they get you stuck in God by running the line "blasphemy." "Thou must not talk to God." See? You mustn't say anything bad about God. You mustn't be in communication with God. You mustn't – God isn't there. You can't talk to him. You mustn't communicate with God. All right, if you set somebody down, and say, "All right. Get the idea of not communicating with God. Good. Get the idea of not communicating with God. Good. Get the idea of not communicating with God. Good. Get the idea. . ." and ARC broke him while you were running it, and get your rudiments out, and have somebody ring him on the phone in the middle of the session and tell him his wife has just left him, or something like this. In other words, get ARC breaks and present time problems good and restimulated, and go on and run this, "Go out of communication with God. Go out of communication with God." All of a sudden the fellow gets a starry-eyed look on his face; he actually could be walked right straight out and join a nunnery, or whatever it is they join. You got the idea?
In other words, you can take the whole track fixations of a person and restimulate them selectively and bring about momentary resurgences in certain goals directions. And you can do it. It can be done.

So any time we start cleaning people up, always somebody's going to step forward and remember one of these old – you know, reactively, they get the way they got trapped, see. And then they decide that if they run that on everybody, then they'll all be all right. You see, just that one thing. In other words, they're auditing their own case on somebody else.

You hear these rumors every time. I had to put that in, by the way, as a footnote because it's rather unusual to have two continents go crazy at once. But it is also equally unusual to not have any continent crazy at one time.

Wing, you had a question.

Male voice: Oh yes, pertaining to what you said about Jane's question. You remember that list of Ultimate Processes?

Hm?

Male voice: Remember that list of Ultimate Processes?

Yeah. Outlawed processes, right.

Male voice: Fit them in for me, please.

Huh?

Male voice: Fit them in for me, please.

Well, now do I remember the same list? These processes are the reverse processes that are nontherapeutic? Is that . . . ?

Male voice: No, no, no, no, please! Uh . . . !

Female voice: The Ultimate Processes.

Male voice: Ultimate Processes.

Oh, the Ultimate Processes!

Male voice: The Ultimate Processes. Uh . . .

Those are OT processes.

Male voice: Right. Now . . .

You flatten them. Way after you've done everything I've just talked to you about.

Male voice: That's all I wanted to know.

Yeah. Then you'd flatten those. Make sure you however, you had a free-floating needle, that you'd exhausted every ramification of SOP Goals, there was nothing left, because only then will those other processes function.

Male voice: Thank you.

Good. Okay, any more questions? Yes?
Female voice: Yeah. Uh, I've been kind of surprised that on SOP Goals, nobody that I know of has had a sixth dynamic terminal turn up and get audited on it yet. Certainly, Theory 67 we're sure is pretty correct because of all the good results running stuff like . . .

That's right.

Female voice: . . . motion and objects and . . .

Uh-huh.

Female voice: . . . things. It just is surprising. What I was wondering is, are they likely to turn up – would there be any objection whatsoever if somebody's got a box or a sphere or something representing the goal and go ahead and run it?

Oh well, you want to know why no sixth dynamic terminals are turning up on Goals Assessments. Well, that's just the peculiarities of the game. They're totally allowed for in the assessment, nobody's steering them in it. But actually, you're talking to the person normally as a human being and this in itself tends to throw the assessment. Uh ... 

Female voice: We had a woman in South Africa, had a spacecraft.

Thank you. Thank you. I can tell you how this sixth dynamic thing works: When the person can no longer be a beingness, they, you might say, extrovert into and permanently permeate some object or housing or familiar thing around a beingness. And it's just like the fellow gets hanged and he goes and becomes the headsman's blocks or something, because that was less painful, you know. That's – he's been overwhelmed. Or he's been a headsman for several lifetimes, and all of a sudden somebody makes the mistake of hanging him and this isn't right and it upsets him. It throws his beingness way out, and he ceases to become a person, and then he goes into an object.

You could very well have a case that you would miss on because it couldn't be assessed with SOP Goals; apparently it just was having an awful time being assessed with SOP Goals. And you go along happily trying to do something for this person and you just can't seem to find a terminal, well, you should inspect your interrogation for a terminal as to whether or not it is totally throwing the question into a live beingness. Such as, well, "Who would be a person who would want to create a mathematical scale? Now, what person would want to commit a mathematical scale, see? What person? What person?" And your question might actually be putting nothing but beingness on the line, in terms of livingness. And it might totally exceed the needs and necessities of the case. Whereas the case would respond very easily on "What would invent a mathematical scale?" you see?

So you can throw an assessment off of the sixth when it should be on the sixth. And I'd say if nobody is doing that at all – nobody ever finds a sixth at all – I would say there's possibly something awry with the patter, which tends to sling it over onto the other dynamics and keep it off the sixth. Because it's very true. People make terrific gains, terrific gains with sixth dynamic terminals. As a matter of fact, lots and lots of cases run most easily on sixth dynamic terminals.

For instance, I know I myself probably could do something about the beingness of a typewriter or something like that. When you've pounded – just thinking of it offhand, of a
beingness: When you've knocked, oh, I don't know, twenty, thirty, forty million words through a machine, why, it's a cinch that now and then you begin to wonder if your ribbons aren't unwound! You get the idea. But just the fact that I would know about it would probably preclude anything very desperate being there.

You take – Well now, there was one case in an ACC one time. In the first fifteen minutes of play, this fellow was gonna leave and go back to Chicago. And he was all very upset and so forth, and I grabbed hold of him for fifteen minutes. I traced back his last life, by the way. He'd been killed at the battle of Jutland on a British destroyer. And this was over in Arizona. Shows you how far you'll run sometimes from a battle. Get to – a total water to no water, you know? And this boy had been killed on the foredeck of a destroyer. And in this lifetime had been a machinist. And the bug of the factor – you know, the guy didn't know, and what he didn't know was that it wasn't machinery or that sort of thing that was upsetting him, it was a ship's metal. And I picked this up, wham-bam, just investigating this kind of a havingness thing. Made him mock up a few destroyers and shove them into his body, and that was the end of the case. The case made terrific case progress afterwards. The case was just totally stuck in that incident, in other words.

All right, there was a case where the resolution of the case depended on the discovery of a sixth dynamic terminal, but rapidly, because he was busy being destroyed. Another case that was a total hang-up on the Third South African came back to battery fast – I remember Suzie telling me, with what disgust, that she had finally found this fellow's terminal. She herself was having a little trouble with space opera at the time she was doing this. And she told me with enormous disgust that she'd found this fellow's terminal. And she said it so disgustedly that I said, "Well, all right. What's the matter? Is it the right terminal?"

"Oh, yes, it's the right terminal."
"Well, did he refuse to run it?"
"Oh, no, no."
"Was he interested in it?"
"Oh, yes, yes, he was very interested in it."
"Well, how did it go in the first little period of auditing?"
"Well, it went fine, went fine. We found his level, just easy", you know.
And I said, "Well, what's wrong with this terminal?"

Well, she said, "It's a spacecraft. I can't imagine anybody having a terminal like that!"
Auditor's response to the pc's terminal. Very amusing.

Anyway, that's the gist of it. Sixth dynamic terminals will turn up, and if you can't find any kind of a terminal to fit something or other, look – inspect your question. You know, you're saying, "Well, who would shoot kings? Who would shoot kings? Who? Who? Who? Who? Who? Who? That's maybe what you're using And you probably should ask the question, "What would shoot a king?" And somebody says, "A gun, of course!" Bang! There it is! There's your terminal. Terminal is a gun. Yes?
Male voice: Ron, when you have exhausted a great number of terminals and – I mean goals, rather – and run terminals flat for that – for a particular goal on a whole big list, we'll say . . .

Hm.

Male voice: . . . now, what happens when you have to assess for a new goal, let's say? Do they go back over those same goals ...

Oh, no, no. I don't – I wouldn't waste time on the original list, you know, most of them, but some of them are going to come back.

Male voice: Well, that's what I mean.

You're going to get some of those goals back.

Male voice: Mm.

But I'd say the fastest way to do it is to go make a new goals list. I'd say that was the fastest way to do it, rather than to plow through a bunch of other stuff. But if I was unable to find a goals list, only then would I go back and dig up the fellow's first goals lists. And now I would go over this goals list again and see if anything is live now, you see? I'd try to do it the easy way, and get away with it often enough to have saved time, you see, which is just make a new goals list, and so on.

You realize of course that if, at the end of clearing, a person is blowing by inspection or blowing by repeater technique, which is constant repetitive inspection – if a fellow is blowing at that end of it – don't be so surprised, or don't be amazed, that it takes a long while to do Goals Assessment. What you're doing is running SOP Goals.

And a comment came the other day from the area that's under a curse just now – they'll probably have plagues there any minute [laughter] – was that the Assoc Sec told the D of P, "Well, this pc isn't getting many gains!" (or vice versa) and the Assoc Sec says, "Well, what's happening with the case?" and so on. And the D of P said, "Well, he's just had twelve hours of assessment. That's why there's no change." And the Assoc Sec said, "Well, all right, that – then that explains it."

Please tell me what this explains? I don't get this. You see it just would not explain anything. You mean, you can assess somebody for twelve hours and get no gain on the case at all? Well, that's silly. You're actually running the end process of SOP Goals at the beginning! And you're cleaning this case up in all directions, so obviously the case is being run in an auditing room he can't tolerate, with a PT problem, with a big ARC break, in an improper assessment with an auditor who is invalidating him and who is doing the other remaining clauses of the Auditor's Code backwards. And I would say offhand, that would probably account for no gain whatsoever in twelve hours of Goals Assessment. But only that would account for it, see.

So they said, "Well, that explains it." Yeah, well, the devil it does! I was talking to you yesterday about – watch it now, if you're getting no gain then the error is gross, not little. The error is big. So it wasn't the Goals Assessment at all that was the trouble with the case, there was something very wild about this case. You do get gains along this line. If you do a Goals
Assessment right, every hour of it is auditing. If you do a Joburg right, every hour of it is auditing. And man, you should see those needles loosen up!

What are you trying to do in the last run? You're trying to loosen up the needle, bring down the sensitivity knob and straighten up the reading of the tone arm, right? Well, the Goals Assessment does all those things, so it must be getting somewhere. Furthermore, it improves profiles and does other things. Otherwise, there is no advantage in an assessment.

But you shouldn't develop the notion that it's because it's taking you so long to assess that you're not getting anywhere, or you shouldn't feel disappointed because your assessment is not getting anywhere. Yes, your assessment is getting someplace, all the way. If your rudiments are in and if you're doing it by the Auditor's Code in Model Session, you are doing more for the case for every hour of assessment than was done in twenty-five hours just two years ago. See, that's hour for hour, we're speeding it up, speeding it up, speeding it up. And it's damn good auditing.

One of the reasons it might prove to be untherapeutic is the person didn't think it was auditing, and didn't think it should improve the case, and therefore became very careless on how he did it or how he handled the pc. I've seen a case of that. I have a case of that, yeah, where the auditor finally said, "Well, it isn't as if we're running a session!", and having invalidated a lot of the pc's goals, and so forth. Of course, the pc practically folded up. Right in the middle of session he's told that they're not having a session. That was when all Goals Assessment went instantly into Model Session – the history of that.

Okay, any other questions? ... All right. Well, I understand that you're making progress, I trust. I trust.

Now, let me ask this. Let me ask a couple of questions here before we wind up this lecture. Is there anything you don't know? [laughter] And the other question is: Any of you think you're totally hung up and making no progress of any kind whatsoever? ... Any case think it's in that kind of condition? All right. Okay. Good enough.

We do have some equipment to be installed down the hall here in the old wine vat. You look down the hallway, you'll find the old wine vat, and it actually already has its lead door. We've had the lead door installed and so forth. So if your cases don't make any progress, why, it isn't the last resort. [laughter]

Okay. Thank you very much.
Thank you.

All right. This is the 14th of June 1961. I have to be careful with these dates, you see. I get stuck on Cause, you see, on the Prehav Scale, and I would say it was the 15th of June, you see, it might become the 15th of June. And it'd cost everybody a day's pay, you see? But for a certain fee from some large corporation ... Okay. [laughs] Very good.

I'm sure that you have a lot of very highly integrated questions of one kind or another that are springing full-armed, ready to shed light in all directions. In short, any questions?

Female voice: Yes.

Yes.

Female voice: What would happen if you are giving a Security Check to a preclear and you tell him that you will destroy the paper afterwards with the – with his answers on it. And does he get benefit solely from having been made free to talk to the auditor...

All right.

Female voice: ... or are you taking away from him ... ?

All right. Here we are. You've asked whether or not if we destroyed the paper, or told the pc ... If we destroyed the paper of a Security Check immediately after we gave him the Security Check, we would destroy the value of the Security Check, period. We have told him at the same moment and the same instant that we are going to withhold for him. And all we've done is just do a vague, little, one-stage Release.

You will see a difference – if you care to make the experiment some time, waste some time: assure somebody that you will never tell a soul that wild horses would never drag any part of these withholds away from you, that you will destroy all record of it and get brain-washed immediately after you've given the session. And watch the fact that he doesn't even get tone arm reaction. Got it?

You see, there are eight dynamics. And in auditing you are actually only concentrating on the third dynamic. Auditing is a third dynamic activity.

Now, the third dynamic is good enough because his withholds are mainly on the third dynamic. But someday you're going to run into somebody who is a real loop, who is busy withholding from God. And oddly enough, he will tell you about the withholds, perhaps, in
some kind of a *sotto voce* that is designed not to be overheard by the gods lurking in the various chairs and furniture, you see, or on the naked pedestal or something of that sort. Or he won't tell you at all because God might overhear him, and God, as we all know, is everyplace including the sewer pipes. Well, it's true. If God was everywhere, he'd also be in the sewer pipes.

And – I'm sorry to make nothing out of this situation, but I'm afraid somebody beat me to the draw. I think a couple of thousand years ago somebody made nothing out of religion in a grand way. They invented a totally invisible religion. And it's very interesting. Everybody, of course, has had trouble with it ever since. The general point about a Security Check is the fact that you have not stressed this.

Now, you should understand that when you are doing a Joburg Security Check, you are not doing failed withhold – you're not running failed withhold on the person at all. You should understand what the character is. As long as you've opened up this whole subject, I'll give you a digression, okay? I've answered the other question. The answer is "Ixnay."

The fellow says, "Well, I don't dare tell you because you might tell somebody else."

You say, "That's so. I might."

"Uuuuuudududududududu. Well, I can't tell you then." And you would just instantly see the fact that it is withhold on more than one dynamic.

All right. Let's go into this. Why are you giving Security Checks? What is the exact process you are running in giving Security Checks? It probably occurred to you before now that you were running failed withhold on the pc. That would be your first conclusion, that you were actually running a failed withhold.

Actually, these – the individual is withholding these things, isn't he? So making him give them up, of course, would give him a failed withhold, right? Well, you could look at it this way.

That isn't the process you're running at all. The process you're running is the old, old, old, Native State, not-know-know cycle. We have achieved, as I was telling Peter a little while ago, the level of complexity and the level of simplicity necessary to resolve a case.

Now, I'm not telling you it's perfect. Absolutes are unobtainable. But I think you'll find it'll move all cases. I don't think you'll have any real difficulty with it. You won't go home sweating over some pc all night long. You'll know very well that when you audit him the next morning on whatever you're doing, you'll get whatever it is. That type of confidence and relaxation has already moved in on me.

You see, I've been straining for eleven years trying to achieve some sort of a – something that auditors could and would do. And we were never short on theory, and we were never short on what was wrong with the preclears. I brought you up with a dull yank the other day. I told you we were addressing the reactive mind, and you better not go on auditing analytical minds because there's nothing wrong with them. Nothing wrong with them, except they can be influenced by the reactive mind. Well, you say, "Well, you can short-circuit this and fix the guy up so he can't be influenced at all by the reactive mind."
Well, that's fine. Get your pc in a state of no-effect. And that is how the lamaists and so forth achieve serenity. You put the pc in a no-effect; total no-effect, total serenity. Jam those two levels up and you have a lama – not the kind that's bleating back and forth over the Andes and causing so much trouble to the authorities down there, and the sanitation authorities, but the other type.

Now, here is your – your plow-in on the basis: The individual must be able – the individual must be able – to get some kind of response. He must be able to experience. If a person cannot experience, a person cannot live. And that's why you look at these abbots of monasteries and they look like dried up mummies. This is why, when you finally collide with the Pope Pius and so forth of this world, they have myopia. See, they're educated into a total no analytical effect from the appetites and horrors of the soul. Huh-huh-huh. See?

Now, this is the generality. It is possible to plow somebody in on a level and make them look good. Don't desert that datum. Know that datum well. It is possible to plow somebody in, absolutely fix them on a level and make them look good. Do you understand? You could plow some radio announcer in on communication so that he would never do anything but communicate. You know, narrow the whole Prehav Scale down to one thing: communicate. He's got to communicate – talk – communicate, and he'd be a good radio announcer until he dropped dead, which would be in a short period of time. But that's all right. People are expendable. That's the way they've looked at it, don't you see? It's what's known as education – education by fixation.

On the other hand, the fellow actually couldn't communicate if you did that. Why? Because his communication, thereafter, would be harmful because it's too fixated. He's too concentrated on this one thing. No. He has to be able to do everything on the Prehav Scale. You're not trying to fix him up so he can do nothing on the Prehav Scale. You're trying to fix him up so that he could do anything on the Prehav Scale.

Now, the fact that his ethic repairs by reason of processing: you, of course, have done away with the impulses to do very vicious things on the other eight dynamics, you see? And having done away with these vicious things, he nevertheless can relax on the whole situation. In other words, you have restored fluidity and action as a result of inspection, not action as a result of inhibition. The whole world right now is running on action as a result of inhibition, and you've got crime and wars and religion. You got all kinds of things going on.

All right. Now, action as a result of inspection by a person who is ethical gives you an entirely new view – completely, entirely new view of human conduct; because it's no longer human conduct. It's more the conduct of a – of an able being. That's what you're doing when you get up to the level of Clear. And oddly enough, what you're doing with a Security Check does not appear, as such, anywhere on the Prehav Scale – except "want to know", but that is the closest shadow to it and it really is not the same thing at all, because that's curiosity.

All right. Therefore, there is some kind of rationale or theory which stands out and beyond the Prehav Scale. And we have run it ragged and we have done everything necessary to resolve the case with it. And we have put it in the hands of auditors and they have gotten nowhere with it. It is a level of simplicity which cannot be achieved in the practical world.
It is a perfect theory. There's nothing wrong with the theory of Native State. There are four stages. There's a lot of literature on this, by the... When is it? 1958, isn't it? Fifty?

Male voice: Two.

Female voice: Nineteen fifty-three, fifty-two.

Well, that's way – fifty-two, fifty-three. It's back that far.

Male voice: Yes, sir.

Well, we were practicing it like mad and did an awful lot of processing with it in 57 and 58, if I remember rightly. And we did a lot of work with that. We ran it on an awful lot of cases and so forth, and it was over here in England, probably in 57, 58. You remember it. The Native State is a total knowingness. And the Native State deteriorates by the person postulating that he won't know. And then this becomes a necessity to know. In other words, he has to know, because, well, he's postulated that he doesn't know. You got the idea?

There are actually about four stages. They harmonic. "Forget" is part of this harmonic scale, see. That's a don't-know. That's a can't-know, see. That's a withhold from self – "Forget" is. So all... And remember, by the way, is a know. And now you're down on the harmonics. And I think their levels – I've forgotten what they are – five or six or something like this.

Anyway, these are the Native State harmonics, and we ... There's a terrific simplicity to all this.

But look-a-here. We have simplicities that nobody has been able to make work because they were so simple and their generality was so expansive, that as long as they were in this terribly simple state, they were nonfunctional. Do you realize all you have to do is run on a preclear, theoretically, "Tell me an intention that failed." "Tell me an intention that succeeded." "Thank you." "Tell me an intention that failed." "Tell me an intention that succeeded." "Thank you." And theoretically, you'd clear him all the way along the line. So much for your one-buttons. Theoretically.

I told you yesterday there was no such thing as a one-button. Well, that's as close as there is to it, because it's right up there at the top of the Axioms, see? And it is! It is. If a person could run this, he runs like a startled gazelle. But it's something like an OT process, you see?

It is too complicated for anybody to plumb the reactive mind with. It is something like trying to take a wand of light and stir a mud pool. And you put the wand of light... Where did it go? No. It takes a certain level of complexity to do anything with the case at all.

Now, we have been resolving cases since the end of January 1961 with considerable ease. But we had to attain a necessary level of complexity, and I have been trying to attain a level of complexity that is acceptable ever since January of 1961. In other words, you have to attain the optimum simplicity and the optimum complexity at the same time. You see that? The complexity is a very necessary part of the entire operation.

So there's no sense in going off, swinging into the high theory of it all and running on nothing but total high theory. Because we've been there, we have lived there, we furnished a
house there, and we sure didn't collect any rent. And we didn't pay any and nothing happened. Why?

It is a level of simplicity which exceeds the difficulties of the individual. You'll find a person – the worse off a person is or the more Clear they are – you know, the bottom harmonic or the top, see – the more you have to go into the Secondary Scale. And in the middle band, you can just run the Primary Scale. A person is getting along fine and his needle is pretty loose – good, Secondary Scale: the hell with it. Just take it straight, you see? But if they're having a bad time in any way about anything, you better assess the Secondary, or if they're coming Clear you'd certainly better assess the Secondary, because these little particularities are still hung up. And do you know how many buttons there are?

Well, there's all the buttons of beingness, which are infinite. There's every verb that man has ever used or any being has ever used on the whole track – that's your doingness. And that's pretty near an infinity. That's lots.

And then there's anything anybody could have or not have. Now, that's how many buttons there are, and if you want to get yourself ... If I had that calculator, I'd probably be able to rack up enough numbers to represent it by saying that they were binary digits and by saying that they were powers. They were this many binary digit powers of 10, or powers of a billion or something, see? And there'd be that many buttons. Now, that's a lot of buttons.

In other words, they're in three categories: beingness, doingness and havingness. And each one of those categories has a near infinity. When an individual gets fixated on one of these things, there isn't anything else; there isn't anything else anyplace. There is nothing else to be inspected. So you try to tell him that this is part of a generality called intention. So therefore you say, "Well, you silly fool. You say you want to make your wife happy. You keep saying this. Or you want to make your cat eat more cream. Now, you – you just keep saying this. All right. Now, we're just going to run 'When has one of your intentions failed to influence your wife?' 'When has one of your intentions failed to influence your cat?' And we'll just run this up, and of course it'll straighten up the whole track because you're obviously fixated on it."

And he'll say to you, "All right. Seems reasonable."

Trouble with it is, it's reasonable. It isn't. It isn't in the reactive mind that way. It doesn't stack up that way.

Intention doesn't stack up anyplace in the reactive mind, but the cat doesn't even stack up to cream. The cat stacks up to gateposts. And that's why the mind is reactive. All horses sleep in beds, you see? Now, you're trying to force an association upon the fellow that he cannot grasp reactively even though he can grasp it intellectually, and so it doesn't do anything for the case at all. So analytically we can say, "Well, that's very easy. All I have to do is run intentions on this fellow – run failed intentions, successful intentions, and that sort of thing; even run brackets of intention and he'd be Clear. There's nothing to it. One button. And Ron's all wrong, and that's it, blehbleh-bleh." Oh, man, we've been there.

The trouble with mental research from this point on is sort of this way: Every time you get to a brand-new frontier, you find our footprints all over the place. It's like members of the
Explorer's Club have occasionally remarked on this. They get in the darkest reaches of Borneo, you see, at the end of a most horrendous trek that was surrounded with heroic deeds in all directions. And when they finally get to this little-known hamlet in the middle of the extinct and forbidden volcano where there's -- headhunters still abound, and so forth, a Chinese merchant comes out and offers to sell them some coffee. I'm afraid we're now in the category of the Chinese merchant because, boy, we sure covered some ground here in the -- in the last -- well, actually the last thirty years, and certainly in the last eleven.

And this is one of the conclusions about it: that there is a certain complexity necessary to a process. And if that complexity doesn't exist in the process, it becomes nonfunctional at a reactive level even though it might be theoretically feasible at an analytical level. Understand that? So the process must be complicated enough to work on the reactive mind and simple enough to be administered. And that you can describe the optimum state of a necessary routine or a regimen. And you've got them in Routine 1, Routine 2 and Routine 3. And you've got the whole package. There is nothing outstanding from that.

That's how complicated you've got to get and that's how simple you can become. And it's just hung right there in space at that level of complexity or that level of simplicity. Of course, it looks terribly simple compared to somebody that had to know a thousand processes, to only have to know about eight different operations. And pooh, you can do that.

And if he's using the right one of the operations to match the case, his judgment isn't too much assaulted these days because it's done by graph. It doesn't even have to be done by E-Meter. You don't even have to judge the case by it. You can pick up a graph and say, "Well, that case has to be run on so-and-so." You'll be right. And furthermore, it leaves a margin for error.

You can use all three routines on all types of cases with only the difference that they -- some work faster than others. So this is quite a remarkable piece of complexity that we've achieved here. Do you see that? Now, do you see why it is that way?

The CCHs: We made the CCHs much more complex. You'll find old lists of processes called the CCHs and you'll find -- oh, I don't know how many there were of them. And there were A, B, C, D versions of each CCH, and so forth. An unnecessary complexity. CCHs ceased to work when they got that complicated. But the original CCHs -- 1, 2, 3, 4 -- with the exact method of application which is by Clause 13 of the Auditor's Code: Don't run a process that is not producing change and run a process as long as it produces change. And as long as you've got that one in and run the CCHs like that in sequence -- 1, 2, 3, 4, 1, 2, 3, 4, 1, 2, 3, 4, 1, 2, 3, 4 -- it'll always work.

You'll find some cases, by the way, run this way in the CCHs: They apparently are flat, all of them; none of them apparently working because the change is so microscopic; you're not getting any change. Remember the beginning of the process on the tone arm. At the beginning of a process on the tone arm in a case that's stuck up a bit -- sticky on the needle and so on at the beginning of the case -- you get no tone arm motion. And if you leave the thing, saying, "Well, it's twenty minutes; it hasn't moved." Hadn't moved? Hell! It hadn't started. But it started a little bit. And it started so slightly, you don't even notice the difference. But it has started slightly. And now all of a sudden you can expect this case, probably,
somewhere up the line to be terribly unflat and uneven on the CCHs. You see that? They'd go from apparently nothing happening at the beginning of the CCHs, as you run through the line. They run to more happening and more happening and more happening and more happening, and then they – you get up to a point where they all bite – 1, 2, 3 and 4 – although they are flattening more rapidly; they're all biting now and they're biting hard. And then gradually they'll start dropping out again, and then you'll suddenly notice an entirely different aspect in the pc.

It's just like an E-Meter. You see, you flatten them. They can go from a no-change, to a change, to a no-change, and that is the cycle of motion that you ordinarily run into. You see this, by the way, on every level that you start. Be a moment or two, even if it's only a tenth of a second, when there's no change of the process, and then it starts to change, you see? Well, that tenth of a second could also be ten hours. See, it's the right level and you're running it. And you know it's the right level and it's producing no great shift of the tone arm. You'll notice, however, that the tone arm is – shifts slightly more and more and more, even though it apparently isn't really shifting very much at all.

Then all of a sudden it shifts more and more and more and more and more. And now you've got really what you'd consider good tone arm motion. And then that gradually fades out less and less and less and less and less and less and ... stop. Now it's flat. To run it any longer than this produces no change on the case.

All right. Now, I'm talking about these simplicities, I'm talking about these complexities, for the reason that I notice a tendency in general in the world – not necessarily – not with you, to chase after an identification which peculiarly fits an individual case. They want a total identification of everything to one button.

Well, look on it as an identification. As close as you can get to an identification is Axioms 1 and 2. You go to a little less dense an identification, you get 3, 4, 5, 6, 7, 8, 9 and 10, because that's a total agreement. We all agree on those things, so it must be a hell of a roaring identification, you see? So we all agree on those things; it's quite normal, you know, like gravity. Gravity – gravity is normal. Well, gravity to somebody that didn't have the thing wrong with him called gravity, and wasn't having any trouble with gravity and wasn't flying off planets either, would think that your ideas of gravity were quite psychotic.

You can take somebody who is in fairly good shape, he'd have looked at even Einstein and said the man is a raving lunatic. Look at the things this fellow believes in. Well, just look him over. He believes water runs downhill. It's not necessarily true, but everybody agrees, you see. Even the water does.

The most fantastic things happen, by the way, to MEST when you violate its laws. I'm not now talking about find some way where it will do something different. No. Water is trying to run downhill and you say, "What's this?" you know? Pthooh! The water does the funniest thing – it becomes solidly gluey, becomes plop. It looks like big globs of gelatin suddenly. You get the idea? I mean, you've violated any basics on which it was running, and it changes the characteristic of the mass, because it believes that it is no longer it, although there is no ability to believe in it. But the basic intentions that are built into it have been invalidated. And the second they are, it changes characteristic. Quite interesting
All right. Now, what are we getting at here. We're still talking about the security, even if circuitously, but this data is necessary to you. Very.

The Security Check is running the not-know off the case that it has run on everybody and everything for God knows how long And when you're doing a Security Check, you're running the Native State cycle of sequences. You're not running withholds at all.

You're saying to this character, "Hey, bud, let's find the overt acts you have committed in inhibiting other people's knowingsness."

Let's look at a typical withhold: The guy says, "Well, I robbed a store once." He admits to this. Do you know what lies behind that? It isn't that he stole something or disobeyed the law or did something like this – has nothing to do with it, whatsoever. The overt act consists of putting a not-know, a violent and vicious not-know, into the third dynamic. Clank!

All right. He says he robbed the store. Let's see what happened. Let's see what really happened. Let's forget about the pc now. Let's find out what happened on the third dynamic. The next morning the storekeeper comes in and finds his premises knocked apart. Now, he doesn't really know what happened, and he tries to scout it out, and he looks for the jimmy marks on the door and a few things of this character, but he can't really make it out because he's no expert. And he doesn't know what's happened, and he's kind of in a state of shock about all this. Furthermore, his survival has been threatened, and so forth, but he doesn't know what has happened. That's the thing. He doesn't know what has happened to his store. And also, another thing has been entered in on it. He doesn't know when it's going to happen again! There's the third dynamic overt, see?

All right. In addition to that, he goes and he calls up the police, and he says, "Is this Sergeant Doakes? All right. Very good, Sergeant Doakes. I have a robbery down – I'm – what did you say? Well, yeah. Oh, you were yawning there. We have a robbery down here."

And the police say, "Oh, God, and we have to get up and we'll lose our swivel-chair spread and..." And they say, "Well, the taxpayer." And they come down, and they don't care anything about it just now. They've been leading a perfectly good, smooth police existence, you know? Do nothing, see nothing, you know, be ineffective, to hell with the crime. They've been doing all right. And they get down to the store and now they get a not-know run on them.

Instantly, they say to the shopkeeper, "What happened?"

And the shopkeeper says, "I don't know."

So the police go tearing around looking all over by rules of evidence for the jimmy marks, and measuring the footprints and taking the hired girl's plaster casts of her finger marks, or whatever they do. And they accumulate this vast store of useless bric-a-brac called evidence. And then they don't know either. And it goes into the police files that somewhere in the third dynamic in this particular area there is somebody who robs stores, but we don't know who it is. And an invented not-know, you see, has occurred in that particular area. And these accumulate, and they eventually wind up to become the aberration of a society which can't trust each other, which can't produce, which can't do anything. And there's where it's broken down. It's broken down on vicious, violent and dangerous not-knows. Do you see that?
All right. So you got this pc sitting in the chair, and the first time you go over this – you go over this Security Check – he'll get to all these realizations eventually, see – and the first time you go over the Security Check, you say, "Well, have you ever stolen anything? Have you ever burgled and entered?" At first, he'd stolen anything? – he didn't get anything on it. Burgled and entered – all of a sudden, about the third Security Check you give him, this thing goes tick!

You say, "Well, what was that?"
"Uhrrr... I robbed a store once."
"All right. Well now, have you ever burgled and entered?"
"No, that's it. I robbed a store once."

In some mysterious way he can't account for, he feels better. Why does he feel better? He's gotten off an overt known as creating ignorance. So as he goes up the line ...

You're not through with that question yet. No, no. Several Security Checks later, if your processing is really biting like mad, you hit this thing and you say, "Have you ever burgled and entered anything?" And you get plong! And you say, "Where on earth did this come from? Now, let's see. He's told me about robbing the store." And you – so you say, "Well, what was that?"

"Yeah, I probably worried those people. Yeah. That probably wasn't so good, you know."

All of a sudden, what's he finally come up to? He's finally coming up to realize that he entered a not-know into the society. But he expresses it now as worrying somebody.

Well, time goes on and in the process of processing, other things happen, and you come to this question again somewhere up the line in a new Security Check, and you say to the individual, "Have you ever burgled and entered anything?"

You say, "Well, he's told me about robbing the store and he's told me about worrying people. There certainly can be nothing left on this. You know, this man is getting to be near Clear."

Right about that time, "You know, I've just been preventing people from finding anything out for years. They never did catch up on me. I bet that's still down in those police records. Yeah, I guess they just wouldn't know."

He will tell you at the same time that his memory is improving. Isn't that an odd thing? You give a man a Security Check and his memory improves. Well, naturally it improves because you've got the overts of running don't-know, can't-know off. And you've run the overts of him making people stupid, so eventually he got to be stupid. So his IQ goes up and his memory gets better, because forget is an harmonic of not-know. You get how this thing works out?

All right. You say, well, why don't you just run on the fellow directly, "What could you not know?" "Thank you." "What could you not know?" "Thank you." "What could you not know?" We have people by the ton who have been run on this and never got any better.
See? Empirically, it has actually worked out. It's a matter of record. They didn't get any better. Their graphs didn't shift around enough. And yet we run a Security Check, and all of a sudden the needle loosens up and the person starts feeling better and wham!

I remember an Air Force major who all of a sudden turned up on my front doorstep and wouldn't tell me his name. It was very weird. I did – I went along with this just as a gag almost. But I processed him every afternoon for an hour, and at the end of the hour – because he couldn't give me his name and address, you see, and it was all not-know anyhow, and everybody – why, he'd hand me a fifty-dollar bill. Which is kind of – very amusing – handing me money anyhow – because I don't – normally will take the money, because it's curious and wondering what the reactions are with regard to giving and separating the money.

For instance, I charged somebody one time – I told somebody I'd cure his stuttering. And he was buggering around, boggling and yapping about curing it, and so forth. So I said, well, it would cost him five hundred dollars. Well, this made it worthwhile, but he couldn't possibly give me five hundred dollars. You see, how this thing works out? This was – he was incapable of doing this. So to cure his stuttering, five hundred dollars ... You see, if I'd cured his stuttering, he knew he would feel obligated to pay me something even though I didn't ask for anything. You got the idea? This was the way it added up in his mind, anyway.

So I charged him five hundred dollars, but now he couldn't have any processing, because the next item on the agenda was that he couldn't separate from five hundred dollars. He had five hundred dollars. He had lots of five-hundred-dollars, but he couldn't separate from this. So what I did was process him, and I cured his inability to have or give money. And then he – then he paid me the five hundred dollars, and I cured his stammering and then gave him the five hundred dollars back again. (I never told anybody this whole story.) And he started to stammer instantly. I didn't care about the five hundred dollars, you see? Very amusing.

Same guy, I pulled the same gag – another gag on him. I hypnotized him – this was early in research – and turned his stuttering off like that. Hypnotists do this rather well. The guy goes around in a total fog after this, you see, but he can talk just fine. Of course, he can't think of anything to say, but... [laughter] And I said he would cease to stutter until I said the word boggleboo or something to him. It was very funny. I called him up on the phone. And he was at work; he worked in a shipyard. And I called him up on the phone, and he answered the phone. And cheerily, cheerily, he was saying, "Well, well, well. How are you today, Ron? Yes. Oh, I'm getting along fine. Everything is going along fine."

I said, "Boggleboo."

Interesting. Ideas of posthypnotic suggestion, and so forth. Actually, he felt much better after he didn't have to not stutter. There's no telling what he might say if he had to go on talking. It's very interesting. And later on, this five hundred dollar gag came up. Anyway, he got along fine. He won in the long run.

But this Air Force major with his fifty dollars at the end of every session – not knowing the man's name, not knowing anything about him, who had been sent in from someplace
or another – I'd give him an hour's session. All of a sudden, I pulled off this tremendous overt. He was talking motivator, motivator, father, motivator. And all of a sudden, I pulled this tremendous, fantastic overt. He had come in, and his old man evidently had had a couple of drinks, and he had just ... This had been just a few years before. He had just rolled up his sleeves and beaten the old guy to a pulp. Just plastered the blood all over the walls. And at the moment he did this, why, it was just phessseew. Boy, the relief just fell off of him and lay in pools in the auditing room, you know? You could just feel it. Wow, man. And that was the end of that.

I'd really done something. He knew that. And he gave me this fifty dollar bill. I used to throw them in an ash tray along there. And I added it to the pile. And he disappeared. And I never saw him. Interesting thing.

That was the first time, although we'd been working with overts rather continuously, that I actually got into a case that experienced a 100 percent total recovery on having gotten rid of one overt. These cases are rare, but they happen often enough to make the Freuds of the world and the Roman Catholic Church hopeful. So anytime you do anything wrong, you can always go whisper it into a secret confessional which guarantees to destroy the confession.

You know, they have these little private boxes. And the priest sits in the middle box, actually, and the person sits on one box and the other person sits on the other box, and they both talk in. And they don't know whether the priest is listening or not. You get the not-know? You get how the church has Qed-and-Aed with the not-know of the withhold of the confessional. Got the idea? So it's very easy to Q-and-A with the not-know of a not-know. See, it's very easy.

He says – he's right away thinking, "Look at all the not-know I've run on everybody. I want everybody to not-know this." So he'll ask you to destroy it or hold it secret or something. He's saying not-know. And you're saying, all right, not-know. Now he tells you. Of course, you haven't run a not-know, because you've still got a not-know. That's the end of that. There isn't any – any argument further.

But there is your levels of simplicity, your levels of complexity, and there is your basic purpose and rationale lying behind the Johannesburg Security Check. I have found by experience that auditors could not and do not run Presession 37 as a whole effectively. They do not run it. They try. Their hearts are in it, but bless them, there is one thing they won't do: they just won't imagine there's that much evil in the world. And you actually have to tailor up the questions, and that's all it amounts to. So Presession 37 is put into the complexity called a Johannesburg Security Check or a Processing Check. Now auditors will run those like a dream. They're fine. You understand?

In the first place, it's much better to run it on a list of questions because you're not-knowing a not-know on yourself all the time. You're sitting looking at the pc and you're saying, "Well, let's see. What do I not know about this person?" You have to keep creating the not-knows that you not know about the person. Now, why do that to everybody? Give them a list of all of the mean, nasty, vicious not-knows that they ever could possibly have run on the world at large, and let's go down that list with a horrdrdrdr on the idea and leave nothing left
to the imagination. Therefore, you're not running a not-know on the auditor, because he knows what he's going to ask, you see?

Now, he doesn't immediately know what he's going to find out. But he can sure guess, but he doesn't have to worry about it, don't you see? So he can audit, then, something like Presession 37 in its virgin simplicity, he can actually audit in a more complex form, which is far easier for him to do. And he will do this, and they do a good job of this. So there is your Security Check.

Now, I don't guarantee that I won't add some questions to this check or change the form of the check. I don't guarantee that at all. But I also guarantee I'm not going to change the existence of the check or the type of question in it. And you're liable to get short Security Checks in processing. How short they should be for optimum, I don't know, but it'd be something like a page, and on that page there is a sample rundown which would also include each time ... You see, actually, it's the ten-page Joburg in ten pages, but each one has a few more questions added on to it that gives you the generalities – like the end questions of the Joburg are on every one of these pages, don't you see?

Now, you've got a stack of Security Check Form 1, 2, 3, 4, 5, 6, 7, 8, 9, 10. And you could give a person one or two of them. And if you were covering the lot, which you would have to do – you'd have to cover the lot eventually – you nevertheless can give them a section of the lot. So, actually, these would be put out in little booklets of all pages, and you mark the pc's name on your mimeograph or your booklet, and then you could give them a page of it at a crack. And this is very good for CCHs, see? You flatten a CCH and you give them a page of Security Check, and you flatten a CCH and give them a page of the Security Check, and you flatten a CCH and give them a page of the Security Check. You see, it speeds up the amount.

But in not knowing right now what the optimum administering factor is – not knowing exactly what is the optimum of the situation – you haven't got the form yet. And you probably won't have until I've done enough experimentation with it to find out what is an optimum or average situation between processing and the other ... You also might eventually get the complexity of different kinds of Security Checks for different routines, so that you might have a Security Check for Routine 2, and a different Security Check for Routine 3, and a Security Check for Routine 1.

We are already running into trouble because we haven't got them. The Security Check for Routine 3 is finding entirely different withholds as the person runs on a goals terminal – entirely different types of withholds – than you will pull off somebody who is running on Routine 1. They're entirely different types. And if you don't, somewhere halfway up through running SOP Goals, start asking for – somebody for full track withholds, the case just absolutely goes berserk. He just practically goes out of his mind. Because he remembers clearly, mysteriously, in his little lonely self, going into an enemy town and setting the torch to the whole thing, and nobody ever knew who did it. He remembers this all of a sudden. And he can't tell the auditor about it because it's a withhold. So you ask him, and then you keep saying, "Well, is it in this lifetime?" "All right. What withhold have you got in this lifetime?" "In this lifetime? Have you ever burned anything down in this lifetime?"
"No", he says rather doggedly, "but there was this town, and it was about two or three thousand years ago, and we were camped outside this town, and I went in and thought it'd be a good idea ..."

And you say, "Now, was that in this lifetime?"

And the fellow says, "Nope. Huihuiahuai!" So what have you done to him? You've made it impossible for him to get off his whole track withholds at a time he starts remembering them, so his memory on the whole track then becomes occluded. And it's only the not-know he has run on everybody by picking up bodies and by murder, rape, arson and sudden death back along the whole track that has got his whole track shut off. This is the answer to a whole track memory. Whole track memory depends upon some gradient scale of whole track Security Checking. Got it? So it'd be another kind of Security Check coming out. But it'd be administered the same way; the directions on it would be what type of Security Check it was and when you gave it, and that sort of thing; under what conditions, so that you'd probably wind up with a little battery of tests of one character or another, you see, that fits the immediate occasion. And so you gave the wrong one. All right. No damage is done. Got the notion now?

And you see what this Security Check is all about. You're not running failed withhold; you're running the not-knows off of the case. And these are the ones that matter.

This also should answer the mystery which will come up sooner or later to you – this other mystery: why when they give you some withholds they feel better, and why when they give you others, they don't. And what is a withhold?

Well, a withhold is running a don't-know or can't-know on others or on oneself, see? On some dynamic, you've run a don't-know, can't-know, mustn't-know. And those withholds, when they come off – when the overt act has been overtly a can't-know or don't-know on anybody else, don't you see, – boy, that thing hangs up like fire drill! And when it comes off, the case does a terrific resurge.

You see, it wasn't that this Air Force major beat up his father that caused the Air Force major to be aberrated. His father didn't know why he was being beaten up. The Air Force major never informed any of the neighbors or any in the family why the old man was in this kind of condition. The old man was so ashamed of the thing that he never told anybody who beat him up. You get the idea?

This thing was sown from one end to the other with can't-know. So when it released, it released like a Conger rocket. And yet you got this fellow in wartime, maiming, shooting, killing, burning, having a ball, getting medals in wartime for what he would have gone to jail for in a second in peacetime.

It's so funny. It's no wonder people get confused. You know, there are times when things are noble and times when the same action is a crime and ignoble. So you get mixed up in the good and bad of it all, and the individual is liable to be so plowed in about the good and bad of all of his actions, that when you ask him this, you'll get this mystery hitting you in the face, unless you know the basic answer to it: Why, when they are released, do some withholds cause a case to improve so markedly, and why do other withholds, when released, don't – why
they don't do a thing for the case? And the answer is, is really not who is he withholding it from? The answer is, who is he not-knowing with it? You see? It's not even really a withhold. He's doing something quite overt. He's making a not-know occur in his vicinity, and as he's making a not-know occur in his vicinity, he of course gets damned stupid about it.

Now, you get your other phenomenon of new questions appearing all the time. Of course, as the person can take more responsibility for things, he is less unwilling to prevent everybody from knowing. So as he comes up the line he includes himself in the dynamics, so he finds out about the things he has done. And you get whole track memory being recovered. But as his responsibility comes up, then, he of course begins to realize something about what not-knows he's run on everybody.

And there is your machinery that whirs and clanks back of the Joburg Security Check, which is apparently at first glance merely a police interrogation of some kind or another. And it's very, very complex machinery. And it's based on this terrible simplicity that doesn't work – as a simplicity. That doesn't work. Audited on people, they never fall through on it at all. In the first place, they never get off their don't-knows and can't-knows and all that sort of thing. They just won't audit that way, that's all. I know. We've tried it – no case gains.

Okay. So much for that. That make any sense to you?

Audience voices: Yes. Sure does.

All right. We haven't got any time for it, but give me one more question. Yes?

Male voice: The guy – the guy that puts in substitute false knowingness like me – you know, one of the world's worst liars.

Yeah, yeah, well, that isn't the same breed of cat.

Male voice: What happens to him?

That is only making time mess up. You're only messing up time. Some editor one time said I was a professional liar – as a writer, you know? Perfectly true, perfectly true. When one is writing fiction stories, one is lying, if you want to look at it that way.

But let's take a look at this strained situation. That editor was rather bad off, by the way. Let's take a look at it. You weren't at all; you were creating. And that would make all of life a lie if it were wrong to tell a romanticized episode. [laughter] Do you see that?

Male voice: I feel better already.

Yeah. But all life would instantly be a lie because what is it but an invented, romanticized episode. Your whole life is an invented episode. You're sitting way back there somewhere with some little gears going one kind or another: "Now I will invent the next chapter in the history of George."

Male voice: Well, I arrived at that, but it's small comfort to me.

Yeah. Actually, I suppose to some degree – to some degree an individual – I'm sure our aesthetics are ordinarily dismayed because he does such a terribly bad job of writing
sometimes. The script through which he is walking is so soap opera that it just offends our aesthetics. And if you looked at auditing – if auditing is an overt act, it is really just a literary criticism of the life this fellow was authoring for himself day by day. And he's just going to get worse and worse as a writer. We know that, too. So this we cannot contemplate, you see? So the literary quality of it is what's under the gun. Of course, speaking very, very facetiously, but you could look at it with this idiotic sidepanel.

No, I looked this over when he told – this man told me I was a professional liar. I looked this over. Years afterwards I remembered this one way or the other. And I wondered what button here was awry? Was time being messed up? Or was what being messed up? Or was anything being messed up? Was there anything wrong, in other words, with writing a fiction story? Well, let's get the intentions behind it.

The intention is to amuse and to inform. It doesn't look to me like that's very aberrative. And it isn't. And it isn't. And the only thing you could find in it that is slightly awry, in writing a fiction story, is you're preventing the reader, to intrigue him, from knowing the end of the story throughout it – whereas you do. And that is the only not-know that you are running on a situation. But the intention is so far from being vicious that the aberrative quality of it is zero. Is there anything wrong, then, with romanticizing in writing? Well, if there's anything wrong at all, it's because you're creating. And the action of creating sometimes can wind you up a bit in the soup. You see? Your – the effort to create, the effort to produce, and – sometimes can be traced back along the create line to being aberrative, just like people apparently can't run Step 6.

But I call something to your attention. I must, myself, have had no idea whatsoever that there was any difficulties with creation on the part of anybody. Yet you find people who were sitting square at create on the Prehav Scale – the very few of them – made it necessary to withdraw all of Step 6. It is not inevitable that the person goes into the soup because he makes something. If it were, why would hobby therapy make people so happy? You got the idea?

And why is it that you're so miserable when you aren't doing something or making something. You see? All these things add up to a different key. But it does mean that people can have the create button on the Prehav Scale badly out and actually get terrible masses accumulating in their vicinity the second they get the idea of creating, you see? And this is not necessarily true that this happens to everybody.

You can – think of the number of people on whom Creative Processing – mock-up processing – was run, and think of the remarkable results that you can get with the stuff. We've cured alcoholism with it, and we've done all kinds of weird things with it. Do you understand?

But there are enough people around who just go mnuuuuh. You know, their whole bank gets tough. Now, you can actually make a bank pretty up, and you can make a bank get tough, and you can do it wrong, and you can give the tests of the thing, and you can do various things with it to move it in. But it isn't necessarily wrong.

If you tell a lie to obscure your own guilt – ahh – we're talking about something else now. Now we're talking about running one catastrophic not-know: not only do we rob the
store but we tell people that somebody else did it. So a not-know is compounded with a false knowingness, and the individual who has done this particular type of operation eventually winds up with a horrible feeling of unreality. He feels he's a fraud or he feels he's – he feels he's in a pretense. He feels "All life is really a pretense, isn't it?" And what he's tried to do – the only thing he's tried to do – is deny his own responsibility, don't you see, by... First, he's run a big not-know on everybody so they couldn't find out what it is, and then he's compounded this and gone right in on top of it by giving them a false knowingness that assigns a piece of knowingness that doesn't exist which obscures the other knowingness. And boy, is he getting complicated by this time. And when you pull that on the Security Check, you'll get a whoooooool! Wow!

[The tape ends abruptly as does the original master recording.]
Okay. Here we go. What's the date? Fifteen? Gee whiz, 16th of June.

Well, it's like this. I think I better disabuse you of something that at least one auditor was worried about today. And that is the fantastic boil-off ability of pcs. They just boil off. I mean, it's really bad. What is boil-off? Now, I can tell you what it is on the mechanical side of it. Now, I can tell you what it is on the thought side of it. And between the two, you will now see that you shouldn't worry about it. There's no reason to worry about boil-off. The situation is that you are very prone to worry occasionally when the pc suddenly conks out and you think you're doing something wrong or something of this character. I know this because you always comment on it in your auditing reports.

Well now, if a pc was to boil off for a half an hour at a crack, and you were to get in no auditing, I would be very happy to know about that. See, if they were to boil off and you didn't get in any auditing, I would be happy to know about that. But otherwise, forget it, huh?

It's like this rising needle. I found one auditor in an HGC who was practically hysterical on the subject. I mean, "God almighty! The n-n-n-n – the needle rose! And ohh, de-e-e-ear!" Somewhere in the world it is raining. Somewhere in the world it is raining. This is the same order of importance. And listen, I got special, screaming, urgent, telex despatches on it now. "This pc's needle is rising." So it's a matter of something to worry about. Well, it was along about this stage of the time…

And now, actually, the whole thing has come up again. The auditor in this particular case, we now discover, wouldn't run anything on the pc if it made his needle rise, because it made his tone arm go up, and that was bad. How do you think you're going to get somebody over any bump without their tone arm going up?

Do you know that your case may be behaving so beautifully, and not changing any, and the thing going up a whole tone and down a whole tone, up and down from 2 or 3? And you say you're just getting along fine. And their graph doesn't change and the pc doesn't change and nothing happens to amount to anything. Now, that would be a very severe circumstance, but would be true on a sort of a dead-thetan case. You could get some sort of wobble on the tone arm. You could get a wobble on the tone arm, and it never went up to any extremity, and it never went down to any extremity, and the person just went on being calm and serene forever. You could.
But gee, on these new processes, you'd really have to work at it. You know, I don't know quite how you'd do this. You might – I don't know, you might plug in the ashtray instead of the E-Meter. It'd be pretty hard to do. I don't mean to be sarcastic, but it'd really be pretty hard to do. But nevertheless, it could be done.

Look, that pc's tone arm is going to go to 7, to 1, to 5. And now you're really going to see something happening. I mean, over a course of three or four sessions you're liable to see reads like this. Wham, wham, wham. Wild and weird reads. The tone arm starts around the dial, don't you see.

Because as responsibility increases, the tone arm falls from the dead-body Clear read of the thetan – dead – through 1, down through 7, which your tone arm won't register. Down through 6.5, down through 5, down through 4, down through 3, down to 2, down to 1, down to 7, down to 6.5, down to 5, down to 4, down to 3, down to 2, down to 1.5.

And it could be expected to do all those things in the course of clearing from a case who was on the extreme bottom when you picked him up. You got it?

Now look, if you get worried about a rising needle, look what happens: You're going to say at once, "Well, the tone arm mustn't change position." Because they're hooked together. Let me point this out: that for the tone arm to change position, the needle must rise, at some time or another. It's also got to fall at some time or another, right?

So trying to restrain the action of the tone arm or trying to restrain the action of the needle, on the part of the auditor, is actually an effort to restrain the pc from recovering. And yet we hear of it every once in a while.

Now, boil-off is not in this serious a consideration. Out of your kindness of your hearts – you know, sometimes you are too kind. A lot of you are suffering from an overdose of kindness.

Kindness goes an awful long ways, and I couldn't live without it, and I think it'd be wonderful, and there's been far too much violence. And all these things we understand. But kindness can be overvalued. You can be kind to somebody – so kind to him that you'll kill him.

Supposing you started running a pc and the pc objected one way or the other because the pc had a somatic. And you said to the pc, "Oh, well, we'd better not run that because it's hurting you," and we changed it and ran another process.

And then, we ran a process, and it turned on a somatic. And then we said to the pc, "I'm not going to audit you through that because it's hurting you." You got the idea?

And by the time we'd done that about the third time, the pc would spin straight in. And you would have been kind to him; you would have helped him to death. You see? So there is a fact.

Actually, you sometimes get a very kind manager or a very kind officer who simply winds up getting everybody court-martialed, shot, murdered and burned, you see? They manage it, one way or the other. Because it's just a totality of kindness with no idea of effective-
ness. See? Effectiveness gets laid aside, and only kindness stands in its stead. And when that kind of a condition exists…

Some bird's doing a bad job, you see? Somebody's doing a bad job, and he's kind and he doesn't mention it. And the guy's doing a bad job, and he's kind and he doesn't mention it.

And then, one of two things happens. Either this fellow's accumulated ineffectiveness costs the lives of a dozen men, or the jobs of a dozen men, or quite unaccountably, the fellow who's being so kind finally gets absolutely outraged when he finds the consequences and shoots the guy in his tracks.

In other words, they're kind right up to the point where they pull out the pistol and drill him in the heart. You got the idea? And very often you'll see kindness under this particular stress. And you'll see somebody being shot down in flames because they're being kind.

I try not to do that. I mean, an organization a short time ago had a warning, had a warning and then got shot.

And now they're convinced, and I have a cable on my desk, and all is well. And they all of a sudden, mysteriously, have produced out of the blue, students, pcs, see? It's very mysterious. The Academy suddenly got full. I mean, it just happened within forty-eight hours after they received the cable.

I don't know what they did! Maybe they went out in the street and found natives. [laughter] It wasn't running this way just forty-eight hours ago. But here was kindness.

Now, what would have been the right thing to do, from a "kind" viewpoint, was just to have not said anything about it because it would hurt somebody's feelings, and let the organization collapse, and let the fellow have a big lose, and let everybody in the area that's dependent on the organization all of a sudden, go without service or interest or hope or anything else. And you could have just been kind until you would have killed the whole, lousy, cotton-picking lot. You see that?

Well, this shows up in auditing as never before. If you haul off of a process because somebody boils off on it, you are hauling off of the process which is running off their overts.

Now, what's the matter with a pc? It's his overts, that's what!

All right. Now, theoretically, it's a stuck flow – on the mechanical side. Mechanical side – stuck flow. Flow flows too long in one direction, it gets stuck. When you trigger that flow or try to flow it a little bit longer in the same direction, the pc boils off. Boil-off is a stuck flow. You can make anybody go unconscious by making them stick flow long enough, mechanically. But why is this?

That's an interesting thing, that you can merely make a guy get a stuck flow and boil him off. You can boil off almost anybody.

Some guy who was quite alert, and so forth, you can actually say, "All right. Now you put the ashtray on the table. Thank you. You put the ashtray on the table. Thank you. You put the ashtray on the table. Thank you. You put the ashtray on the table…"

SHSBC TAPES 001-100 239 04.02.15
It isn't going to show up that way quite as fast as this command: "All right. Get the idea of somebody putting the ashtray in your lap. Get the idea of somebody putting the ashtray in your lap. Get the idea of somebody putting the ashtray in your…" *Thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-thu-*.

It doesn't seem right, you know? Well, he'll do it. "Get the idea of putting the ashtray in your lap. Get the idea of putting…" *Zub-zub-zub-zub-zub-zub-zub…*

We've got a little red character running around England right now who is running a one-way-flow process, and it's making everybody nice and unconscious. And she's very happy about it, because she's never had any other target in her life but to make people unconscious. You get the idea?

She's found out if you run a stuck flow, they konk out. But there's nothing, nothing, you see, of any importance about this. You can't ruin a pc.

But look, where did all these stuck flows get parked? Are they over at Graftie Manor? No. Are they in East Grinstead? Probably. Just where did they all get parked?

And as you audit a pc, don't you suppose this pc has ever had stuck flows on the track? Well, where are they going to go when you audit them off? Or are they supposed to be delicately taken apart so it doesn't boil off? Well, you're not taking the case apart that delicately, so the fellow gets a stuck flow – running off. And when he gets a stuck flow running off, he tends to go *woag*. You got the idea?

There are stuck flows in the bank. And when those stuck flows start coming off, your pc *woags*. And that is all you can say about it. Got it?

Now, it happens to be a very curious thing, but most of the time, if a pc were to go unconscious, apparently, and you were to continue to give the auditing command, without any acknowledgment on the part of the pc that he was doing it or had done it, the pc would do the auditing command if given at about the same frequency or a little slower than he was getting it when he was awake.

Because the pc doesn't go unconscious. Like the little pea in the seven mattresses of the princess, he is sitting down underneath all the layers of what-not, being quite alert. But he can't keep his eyes open, see? Got the idea? And he actually will obey auditing commands. Why should you stop giving the auditing commands? If he doesn't hear you, he won't obey them, and what have you done? Nothing.

But if he did hear them and he did obey them, he will come out of the boil-off with great rapidity. And I've audited many pcs straight out of a boil-off. Now, I found in about 56, something like that, that you could do this. You could audit a pc through a boil-off by continuing to give the auditing command while he was boiling off. And it is not an implant situation, although it looks like it to you. He comes right on out through the boil-off. Of course, very often he won't remember having done it. And this brings us to "What is boil-off?"

Boil-off is the accumulated not-know that the pc has run on everybody. That's on the mental, not mechanical – the thought-postulate level.
And if the pc has gone around – well, let's say he's been a university professor. And let's say that he has insisted, absolutely, in teaching nothing but the theories of Hegel. And he has held the fort against all comers on the theory of Hegel. Even to the point where, when they discover an eighth planet, he proves conclusively that it is utterly impossible for there to be an eighth planet, because the perfect number is seven.

Do you know that the discovery of the eighth planet by telescope was utterly and completely denied for a long while and the evidence was thrown away of its discovery? Because, according to Hegel, there could only be seven planets because seven is a perfect number.

Now, supposing this university professor teaching this also insists that nobody ever look for any truth anywhere. Oh, klow! You get this bird, a million years after the fact or twenty days after the fact or something like that, and you audit him, and what's he going to do?

He is going to boil off. And I don't care how many ways you try to run the flow, he's going to boil off. That is all. Because what is unconsciousness but the intensification of unknowingness? And that is all that unconsciousness is, is the intensification of unknowingness. It is the final mechanism of how not to know.

Unconsciousness is well below death, because a person very often gets knocked off and goes right on knowing all about it. What gives with an anesthetist? Don't you suppose – here's a more direct Q and A that's more easily understood. How about this anesthetist? You start auditing this anesthetist and she goes blooeea-bong! Why? She's running a not-know about the operation, not-know about the operation. They roll in another patient, she puts the mask over their face and shoots them the juice, or whatever they do these days. I think they feed them the needle and the whiff all at the same time, and then slap the ether on top of it. They're being thorough these days. If they aren't permitted to kill them, they can certainly put them out.

So you start running this girl and she says – you say, "Well, we've got a little process here which is ARC Straightwire. And we're going to run this process, ARC Straightwire." And we say, "All right. Now recall a time you were in communicati –" She's gone!

And you say, [whistles] "Hey! Tsk! Tsk!" Kick her in the soles of the feet or something like that, the way used – we used to do Dianetically. That's all right; it works.

And say, "I didn't even get to finish the auditing command. Now come on, let's get the auditing command here."

She says, "Auditing command?" Fumph!

And you practically will have to hold her up in the auditing chair with broomsticks, you know? Go get the broom and prop them under her head and prop her so she'll sit there. Why? She's been running not-know, not-know, not-know, not-know, not-know, not-know, not-know, not-know. You understand? Day and night, she's been dramatizing not-know with velocity.
So there we are. There is an excess of kindness that winds somebody up in the thorough soup. Because, of course, every time she anesthetizes somebody, she lets them be less familiar with pain, and they will recover much more slowly.

"Oh," you say, "pain is a good thing?"

Yeah, I suppose any remedy is a good thing after a guy has gone completely off – completely over the rolly coaster and completely off the end of track, and he's lying there in the bushes, and there's no way to audit him at all, and he is suffering. Well, by all means, whip out your morphine and give him a shot in the *gluteus maximus*.

But there isn't any point in doing that if you could be effective, you see? But it's only a symptom of ineffectiveness. If you can't be effective, you can be kind. And I suppose that should appear on the tombstone of practically every movement, organization, government and great man that has bit the dust and seen his goals in flinders. "If you can't be effective, be kind." And he didn't try to be effective, he just tried to be kind. And there he went. As a matter of fact, probably all that happened to the Romans and Christianity is they were kind. I've, incidentally, gone over a lot of these court records about the early Christians and the martyrs, and it's quite interesting, quite interesting.

The courts were trying to be fair and trying to be nice about it. And they'd be sitting there in session, and all of a sudden some wild, whirling dervish would scream into the court-room and say, "I'm a martyr! Execute me!"

And the judge would say, "Well now, boy, bailiff, would you please find out what the man wants there?"

And this guy'd come screaming up to the front of the room, throwing his arms around, saying, "I'm a Christian! And it's on the imperial tablets that I am to be executed for being a Christian. Now, I am a martyr, so execute me! Because then I will go to heaven and eat pie in the sky from here on out."

The guy never thought twice; he's probably lousy with a harp. But it's been his whole unaesthetic career that he only does those things he's lousy at.

And they frankly would refuse to do a thing to him. And they'd kick him out in the street and go on with whatever trial they were going on with, and all would calm down.

And a few minutes later, the fellow would be bursting into the room and say, "You are not doing your duty! I am a Christian; execute me!" So they executed thirty.

And in one year in Alexandria, the Homoiousian sect of the Christians fighting with the Homoousian sect of the Christians – and we can only find one difference in their creeds, is one spelled its name with an *i*, and one spelled its name without one. And in one year, they killed one hundred thousand Christians. Quite interesting what might pursue immediately after this.

The Romans were very kind; the early Christian was very, very cruel. So now we find out the Romans were very cruel and the early Christians were very kind. But the records don't bear this out.
Now, as far as survival is concerned, if you want to survive, I guess, be cruel. I suppose that's the most short-term method of survival. But it's not any long-term method of survival.

But being kind and being ineffective, of course, is a fast way to the electric chair; it is a fast way to insolvency; it's a fast way to bankruptcy of all kinds and descriptions; it's a fast way to the death chamber and the cemetery. And more important to us, it is a fast way to oblivion on the whole track – being very kind.

"Well, we understand that you're having difficulties, Mr. Jones. We understand you're having difficulties, and we will try to help you out, Mr. Jones. You say we're going to have this fence down here, and we'll build this fence for you a little bit better so it keeps your cattle in."

And the more you're kind to Mr. Jones, the more things Mr. Jones realizes he can now get away with. And all of a sudden he moves over too far. And you suddenly say to Mr. Jones, "That pasture, you can no longer pasture your cattle in. And yes, I know that means bankruptcy for you, Mr. Jones, but you've had it." And I think this is a rather cruel operation.

We've just done it here at Saint Hill. Just done it. Of course, we haven't made the man bankrupt, but the staff has gotten so impatient and so screamingly angry at this fellow who always wants favors, that nobody has ever said to him, "Mr. Jones, why don't you pull up your socks?" Nobody has ever said this, you see?

And as a result, we've got a kind of a not-know running in the middle of kindness, don't you see? Because the guy is left unwitting of the fact that he's actually making enemies. You see?

So these people that have been going around saying "Love, love, love thy neighbor, love, love, love" – I think there have been a lot of songs written about it, a lot of hymns written about it. A fellow by the name of Bach wrote some music about it one time. He was an organ player. Played in some cathedral someplace. He couldn't hire musicians, so he had to train all of his kids into an orchestra.

And anyway, this fellow used to write boogie-woogie, very complicated boogie-woogie, that sounds something like a spiritual orgasm from New Orleans, you know. And he called it "Loving Sheep" or something. [laughter]

And of course, I figure the abbots of that day were all tone deaf. So they'd look at this music, and it says, "Sheep Amongst the Meadow Worshiping the Lord" you see, as the title of the script.

And he'd say, "You'd better give me my ten bob," or whatever they gave him to write a song.

And they'd say, "Well, that's very nice." And they would buy it, you see, and didn't know what they were listening to afterwards.

Now, you listen to this music, and if you don't listen to the titles, you know, you say, "Boy, those guys – those hepcats get a little more speeded up, they'll almost get a Dixieland, you know?"
I know this is sacrilege. Sacrilege. It's sacrilege against the worship of music.

But let's take a look here at the anaten factor that stems from all of these various philosophies, all of these oddities. Until we finally get a philosophy that is so gargantuan in its unknowingness, that it is its principal philosophy. And when that philosophy arose amongst this particular race, it stopped philosophy. So that today, doing what we are doing, we seem odd.

We are thinking and we're not supposed to think. And if we do anything in the field of philosophy, you see, what we're supposed to do is read Immanuel Kant. And he said everything there was to know on the subject of philosophy.

You see, he writes a book to prove that you are immediately disciplined anyway and that the overt-motivator sequence really does exist. And then he writes another book immediately afterwards and says you're paid for it, you see? He writes one book to say that... You know, that's his two main books.

And I just noticed the other day, there hasn't been a philosopher since. It's quite interesting. What did he introduce into philosophy?

They call him "The Great Chinaman of Koenigsberg." Well, I don't know, I don't call him that. [laughs]

The only thing I've got against this runt, this intellectual pygmy, is just this – is just this – this one little thing: He invented the fact that the highest level of knowingness is to be totally ignorant and you could never find out about it. It's called transcendentalism.

And he says, "Anything that is really going on, you will never know about. So go ahead, little, stupid blinkety-blanks, my children, and you will realize that anything that you begin to know about, you can't know about it. So there's nothing you can know about anything anyway, so you might as well quit."

Now, it is said in much different language. But the reason it has to be said in such polysyllabic, German compound-felony language is that in bare terms, and in a bare statement of fact such as I've just stated, it's totally unpalatable. And yet you want to read all there is to know about transcendentalism and you will find out that that is it. It is the great philosophy of not-know.

It says, "No matter how much you study the physical universe, you jerks, you ain't going to know anything. You're just a bunch of ignorant bums, because all of that is unknowable."

How do you like that! It's all unknowable.

And you know why the mind has not kept pace – technology in it – along with the pace of physics is because it was stopped on the track by the basic theory that you can't know about it anyway. It's impossible to know about, so therefore, you can't know about it. So ever since that time, all they've been doing is quoting Greek philosophers.

Man, I had a few too many Greek tutors to go around quote 'em! Aw, come off of that! You mean, you go upwards to twenty-three hundred years later, you've still got to have these guys haunting you? No, no thank you. No thank you.
A Greek tutor – that's something you get rid of in very early childhood. And you certainly don't keep it through adulthood. And you certainly don't keep it for twenty-three hundred years. Because the Greek philosophies are very fine, and we're glad that man thought. But the last time I was down in Athens, I found out what the Greek philosophies were all about: if you couldn't lick 'em, you could confuse 'em. [laughs] And they did it with two things – philosophy and entertainment.

And I have seen better nightclub operation in a perfectly lousy hole-in-the-wall, nobody-ever-heard-of-it nightclub in Athens than you would find in the finest theaters of New York City. Guys just operating for buttons. They were really good. They were very, very good. They were very good at it. They have saved this all through the centuries. They are the original cabaret owners.

After you get the enemy there and he's conquered you and so forth, you show him conclusively that he can be out-created by turning loose a bunch of dancing girls on him that really get his eyes popping. And he forgets to conquer. They did it to the – they did it to race after race. They did it to Persians, and they've done it to Egyptians and they've done it to Romans. And they're still on top. Pretty interesting. It's a modus operandi for conquest.

And so is philosophy. If you want a complete catalog of the Greek philosophies, take something on the order of the Prehav Scale and figure out each one totally dramatized, and write a total philosophy around that level of the Prehav Scale. And say that is it, and there is only this, and you've got one of the Greek philosophies – or one of the Persian philosophies, or one of the Egyptian philosophies.

Try it some time. Just try and look at the level of the Prehav Scale and figure out what would be a philosophy that obscured everything under the sun except this one thing – what kind of a philosophy it'd be. After you've thought about it for a while, it'll suddenly dawn on you that you are looking at the philosophy of something like Rosicrucianism. That is it, you see? Or you're looking at the philosophy that was practiced in Egypt, or you're looking at Stoicism.

Just look at No Effect. There's No Effect on the Prehav Scale. Now just figure out what kind of a philosophy would you work out that would totally bar out any slightest effect of any character. And you wind up with Greek Stoicism. And similarly, you can do this with every level of the Prehav Scale. It is a reactive scale. So, of course, there's a broad appeal.

Any time you're too broke, your case has gone to pieces, and you've become utterly unprincipled, somewhere up the track, and you land amongst the wogs, always remember that you can dig up a piece of the Prehav Scale and get in a marble palace with a gold roof.

Just figure out where they sit on the Prehav Scale and dream up a philosophy to prove it. And if you prove it conclusively that that's where they sit on the Prehav Scale and this is the very best thing to do – ahhh, they'll make you the governor of the joint as well as the high priest.

You see, most philosophy has deteriorated to some kind of a yip-yap agreement with what they have already got. This is a natural impulse, because all you had to do was open a book of the compound philosophies of the ages that is in the library. And you take it down
from the library shelf and look for a copy of it where book markers have been at work. And you will find the most fantastic banalities underscored.

Here's a perfect gem of wisdom sitting there. But do they underscore that, you see? Oh, no, they will underscore something heavily, you see, with marks in the margins and notes over here, "God is love." [laughter]

And you say, "Come off of it, man!"

And you read on both sides of this, it proves conclusively that the guy, actually, is talking about the fact that religion divides itself up into love and hate. And the phrase "God is love" has gotten into a compound sentence. And it says, "In most countries, the more inane religions subscribed to by the very weak pronounce the theory 'God is love.' Whereas, anybody on a casual inspection could demonstrate that if a god is love and yet keeps hitting people with lightning bolts, it couldn't possibly be a mono-theoristic religion."

And this book marker has read that whole thing, and he's gone right into the middle of it, and he's underscored "God is love." And then he's put over in the margin, "This is certainly true!"

Man, I'm telling you, ladies and gentlemen, your postulates and operations on the whole track really stick in the philosophic line! It's a great compliment to your ability to make a postulate stick.

Well anyhow, as you come up the line and look all this over, you get into an interesting frame of mind about this sort of thing. You're liable to get into this kind of frame of mind: The truth is a subjective phenomenon and only exists as a subjective phenomenon, and there is no broad or agreed-upon truth or anything. You have the philosophy of the only-one: general semantics. See? General semantics.

They've gotten it down to the fact, not only is there no truth, but there is no meaning. And nobody can talk to anybody because everybody means something different by everything that is said.

Well, they might have trouble talking to people, but I tell you, I don't! So there must be something wrong with their theory. All you've got to find is one wild variable on their theory, of course, and it blows up, and that's me. [laughter]

I don't have any trouble talking to people. I don't have any trouble getting them to find out what I mean, either. And I don't have the least bit of trouble finding out what they mean. I may ask them three times, and they may practically blow their stacks and figure out that I must be the most stupid guy they have ever met, but I eventually find out what they mean. See? And I'm not out of communication, even if general semanticists are, see? There are all these levels. Failed communicate – we've got it with us.

We have one philosophy on the Tone Scale, totally built out of one level on the Tone Scale: 1.1-ism. It's – was brought forward by the fellow of the name of Dale Carnegie. It's how to be a successful 1.1. Read him if you don't think so.
Man, you never saw such stuff. And you meet most salesmen that have been super-trained in this, and you wind up dodging, never answering your phone, going nowhere near your mailbox, just for fear these people will appear. [laughter]

So I think Carnegie, having accomplished his goal, pleasantly kicked the bucket and went on to happier rewards. But I think his effort was to stop all selling everywhere! Must have been, because you just try and monkey around with this 1.1 type of selling. Try to communicate with a no-reality. Try to talk to people by never uttering what you think.

You can't communicate with people by never uttering what you think. They'll get this odd feeling of the unreality of it all. Now, why do they get this feeling of an unreality of it all? Because you're running a not-know on them, aren't you?

See, you're talking to them, and you think this guy ought to be thrown down the nearest well, see. You think his product would not even make a good bonfire. And yet, you say, "Well yes, Mr. Jones, yes, we're very interested in – product," and so on. "Why don't you call later or talk to our general manager about it?" and so forth.

What are you doing? You're just making yourself more stupid, that's all. Why? Because you've got a not-know overt.

But believe me, he will sense this. Somehow or another he'll sense this. It sort of comes out of the atmosphere, somehow or another. It sort of drips off the walls that there is no sincerity being accomplished around here. So the communication doesn't occur.

And we get our old ARC triangle. And where reality is not present, a not-know is substituted for it. Tsk! Tsk! Tsk! So you have a definition of unreality. God, I never thought I'd get to that! And the definition of unreality is a substitution of a known for an unknown. If you want to create a big unreality, all you have to do is just substitute an unknown for a known.

The Russians do this rather well with communism. Everybody knew it was cold in Russia and that Russians were hard to govern, and a whole bunch of things like this. And so they put a bunch of unknowns in the line. They even got an iron curtain. You can't even communicate about, with or around the country. And people have an odd, odd feeling about Russia.

And yet Russia is working like mad trying to communicate to everybody. Well, that's interesting, isn't it? They must be running a vast not-know on all of us. Maybe there's some good things in Russia, who knows? Maybe there's some bad things. Maybe there's something workable in communism, who knows?

Because you know desperately, in the final analysis, that the reading of an entire Russian exposition of what the Russian is doing is the substitution of a series of unknowns for a series of knowns. They know what their production figures are. And you get the weird idea that you don't know.

You've read them, see. "Eight-hundred billion pairs of shoes a minute are produced in Russia," you see, "under our great system, and with our great dictator," and so forth.
And you read that figure and some feeling comes over you that somebody has tampered with the statistics. [laughter] So this winds you up, actually, not just believing that this is false; it winds you up with a whole series of speculations, most of them bad.

You try to figure out how many pairs of shoes would really be produced in Russia per minute. "Let's see, there are three Russians working, and I'm sure they're not making shoes." And you wind up this way. And you finally say, "Well, you know, there's..." You conclude only one thing in the face of commie propaganda – eventually, anybody who can think at all – eventually concludes one thing: that you don't know anything about it. They spread this as a big unreality. They are the kings of mystery on this planet at the present time. They have taken over from religion as being the czars of mystery. And that's how they do it.

You can actually get pretty annoyed with a person after a while if every time you asked them how they are, they say they're fine. And you know damn well that they've got a backache and a headache and they feel like hell.

And you say, "How are you?"

And the person says, "I am fine."

You do several things. Amongst them is go down the Tone Scale with regard to this person. The person is substituting a nonfact for an observable fact, you see?

And you keep getting this unreality thrown at you. And eventually, the person starts to kind of disappear. And this very curious phenomena will occur around a person who is doing this to other people. One man, eventually, could not see his wife when she was in the same room. He'd look straight through her and would see nothing but the wall on the other side. Now, that is one – an interesting phenomena. It is reproducible in hypnotism. You can hypnotize somebody and tell him the table isn't there, and he'll see straight through the table and see the carpet on the other side of it, which was of great mystery and interest, and probably formed one of the primary bulks of research of people like Charcot and Mesmer – these boys. They did an awful lot of interesting things. They'd make people sense things at a distance and do all kinds of things.

Now, what is this factor of reality and communication and not-know? They just add up to a tremendous woag, you see? And it'll demonstrate itself mechanically with boil-off, so that everybody gets more and more stupid.

Now, in the field of philosophy, a fellow comes along and with great authority says everybody, if they achieved it to the ne plus ultra, would finally find out that they couldn't know. And oddly enough, it had enough effect on this society that I think there are people right here who used to buy it. Or you've certainly heard it, but you didn't buy it very hard. But you know a lot of people who have bought it.

"You shouldn't research into the mind, and you shouldn't do this, and you shouldn't do that. And you shouldn't think about it, because you couldn't know anything about it anyway."

Oh, wow, what is this? See? I mean, well, the least you could do is put some invented knowingness there, the way the Christians did.
But to say that it is totally unknowable – all of the secrets of the existence are totally unknowable. Oh, my contempt. I spit! What fabulous conceit the man had, to know that it was all unknowable. What a conceited dog!

Now, if there's a tremendous not-know associated with a person, he tends to persist like mad. And you get all sorts of oddball aberrations going in the society. For instance, the monk Dharma who existed ten thousand years ago in India has formed the basis of most Indian religions. And not a thing is known about him or what he said. Isn't that fascinating?

I mean, Indian religions are based to a marked degree upon the sayings, findings and so forth of Dharma. Chinese religions are based on Dharma. We think it means "fate." That's how far it goes. You look up in the dictionary and you'll find Dharma has something to do with fate or something of the sort. Doesn't tell you what it is.

And you look up in one of these textbooks of one of these Johnny-come-lately Indian hoaxes that they call the great revelations and – Suba-bubaba-boo-ba-booba I think is their last one. [laughter] You look up for the – you look up in this textbook on this and you'll find Dharma described in a very fantastic definition which is long and drawn out.

Actually, everything in that textbook, by the way, is incorrect. You read over the – all the definitions of the various missions and words and so forth, of past philosophies in this new gu-gug and you'll find they're all defined with a big zzzzz curve, see?

Actually, Dharma was the name of a monk and that is it. And of course, he had a fantastic influence upon Indian philosophy, so they began to regard him as fate itself. But he is actually a loftier name in the philosophies of the East than Buddha. But nothing is known about him. Nothing. So here you have a fabulous not-know, don't you? And you get a terrific persistence of this not-know, don't you?

Well now, look, if it can ride so thoroughly in the philosophies of a country or a people, how do you think it rides along in somebody's reactive mind? Hm?

You might say the least known philosopher on the whole track Earth – immediate track Earth – current, present-time Earth – is a fellow that we don't even know what his name is. We don't even know it's a fellow. Got the idea? It's a fate.

No, it wasn't a fate. It was probably somebody who washed his feet in a brook and put his begging bowl out where it belonged and laid down the law, and said what he thought was right and so forth. And yet, this fellow's been totally devoured in time.

I happen to know something about this particular character myself. But if he can ride that unknown up the track and be the influential background to somebody that we know rather well – Lao-tse, see? Confucius. A Buddha. They all go back to this fellow. And we don't know anything about it. Why is he still there? It's because we don't know anything about him. He's held in place by the not-know. Not-knowingness does not result in an obscurcation, but is known to you as not-isness, you see?

So there he is riding on the track like mad, expressed in everybody's mind through India, through China. He's the background of the most broadspread religion of peace that this planet has had. And yet, we call the background of this planet "Buddha," see, the Eastern re-
ligions. We say, well, Buddha or Confucius or Lao-tse, or – see? But, actually, sitting right back of their shoulders is this Dharma and we don't even know it's a man; it's fate. You got the idea? Do you see the alter-isness, so forth?

Well now, just take that as an example of what happens in somebody's reactive mind when you get a not-know riding along the line to this degree. What happens? He boils it off, that's what happens! He runs into the Dharma on his track. The total not-know that is still totally in place. And he starts to go clog, woag, thud.

Not-know is the extreme manifestation – in its most extreme manifestation is unconsciousness. Not-know in a lesser manifestation is death. The most extreme manifestation is when a person cannot go unconscious. And we call that insanity. And insanity lies on that band. You have death, which is simply a state of beingness rather than an action. It means the fellow is no longer inhabiting a body. But we can't say what his condition was in at the time he left. He normally wasn't unconscious.

And we go down into unconsciousness and we're below the ramifications of death. And now we go down in below the ramifications of unconsciousness and we find insanity and at that level a person is unable completely, totally and utterly to not-know it. But what is he trying to not-know? By this time he's trying to not-know about the fifteenth substitute. And you get a delusory state that the person cannot not-know.

And you'll find people who are incipiently insane are going around all the time a little bit worried about something that might be just around the corner. They – "Let's see, thuhhh…"

You listen to them. Just get the common denominator of all of their conversation. It's the inability to not-know a substitute. Or it's the inability to not tolerate not-knowing a substitute.

It's the ability – their sole ability left is just to recognize that there are intolerable not-knowingnesses that they cannot escape – and that they lie in wait for them. They lie in wait everywhere, everywhere.

And they walk down the street, and just outside the circle of the lamplight… They don't even dare articulate it, you see? Just outside the circle that the lamp is – street lamp is making on the pavement there…

And you find them all in a – always in a constant, inarticulate terror about something. Or you find them in immediate and terrible combat against something that is undesignatable. And you find them in a state where they have collapsed before the not-knowingness of what assails them. And you'll get them running the whole Tone Scale about a not-knowingness.

But that Tone Scale occurs after unconsciousness. And it's a Tone Scale – is not-knowingness. They go from an inseni – serenity about a notknowingness. You can find a total nut who's going around saying – he's just entering the field of nuttiness, but it'll be something like this:

"Well, I don't know, but it doesn't matter. Nothing matters, really, that I don't know. And I don't know really, but it doesn't matter! It doesn't matter and I'm being very serene."
best thing to do is to be calm about it all. And I will just go on being calm about all this, and so forth. And what happens happens and uh, so forth. And uh, I just won't think about it anymore. I'm going to stop thinking about it now. That's right. And what happens, happens. And uh, I just don't know anything about it, so there isn't any reason to perturb myself about it at all. Because I don't know anything about it, you see? And therefore, I have forgotten it all.

"And I'm in that pleasant state, right now, of not even being – not dwelling on it for a moment. And I just don't give it another thought, so that is the state I am in. And that is very nice and I am being very happy. And it's a sensible state to be in, you see, because there isn't any knowing about it, you see? So you just might as well be serene about the whole thing.

"And that's why I'm so serene. I never worry. You think for a moment I am worrying, you're very mistaken. Because it doesn't matter anything to me that I don't know about this. Never enters my mind that I don't know about it. In fact, I don't even know what I don't know about!"

You run into this person. They usually pass for a sane person. They're pretty sane compared to the rest of them.

Now you go on down Tone Scale from that and you get each point of the Tone Scale about a not-know. The person is angry about a not-knowingness. But remember, it – this – in insanity it is always a not-knowingness about an unknown. They don't know what they don't know about. You got the idea? They have no target.

It's interesting. You get a classification of this. Don't hang this appellation around somebody because he's simply upset because he can't find his car keys! This boy is all right. He knows he doesn't know where his car keys are. Not only that, but he also knows that it's car keys that he doesn't know about. See?

Well, that's sane as can be. And he can be very misemotional about this thing on the misemotional scale without being insane. He might be frantic, but he's not insane. No, no, you're looking at an entirely different phenomenon.

This person does not know what he is in – frantically looking for. You got the idea? If you can envision somebody who has lost his car keys but doesn't know that he has lost his car keys and is looking for his car keys but doesn't know it's his car keys that he's looking for, but is just going around, just going around, looking, looking in a terrible frantic state of mind, looking, looking, looking, looking

You see them in asylums. You'll say, "What are you looking for, bud?"

And he'll say, "Don't disturb me! Don't disturb me! I might forget what it is."

Well, forget what it is! He doesn't know what it is.

Everybody – of course, people like Freud immediately go kling-klonk, and try to find out what the man is looking for. Well, of course, the man is looking for nothing. It's simply a phenomenon of looking. You understand?

It's franticness about it. He'll be in grief. You'll see somebody sitting there crying and crying and crying. You say, "What are you crying about?"
Well, they can't articulate what they're crying about. They don't know what they're crying about. They haven't a clue what they're crying about. But if you stated it one way or the other, they're crying because they, of course, haven't been able to find out about what they don't know about.

And that is the way the reactive bank stacks up. Just *ting-ting-ting-ting-ting*. Right there, *bing-bing-bing-bing-bing*! They're crying about not being able to know what they're crying about. You see, it's a total reactive-thought device. You'll find them all up and down the Tone Scale and characterize every one of them.

If you want to put together a new scale of insanity and make a name for yourself amongst psychiatrists, go ahead. Because you just describe the Tone Scale and describe each one of these states. But describe the person being unable to conceive what it is that is in this state that he is upset about, envisioning what he would do in those mental reactions, you of course wind up with a hundred percent and only just this one thing, totally fixed on that misemotional state, because he can't know or mustn't know or is curious about knowing or mustn't let anybody else know about what he doesn't know about. And there's where your knowingness doubles up and there's where you get the guy totally fixed on the track.

If you've ever worried about whether or not you're potty and going around the bend, up the chimney or something of the sort, just ask yourself this question: do you know what you're going up the chimney about? Just ask yourself that question, you know? "Why am I unhappy tonight? What don't I know about tonight?" Well, if you can find out about what you don't know about tonight, why, you're very far from insane.

Insanity is the manifestation of *not* being able to. A fellow can't even find out that he is in grief because he can't find out about what he can't find out about. See? And of course, that – the mere fact that you are able to speculate, moves you out of the total-dramatize category. Just the fact that you'd say, "Let's see, what am I unhappy about tonight?" – just the fact that you could say that – you're not nuts. It's just as easy as that.

But of course, there isn't anything when a person gets into that state. There is nothing there – anyhow. If you understand these various mechanisms, when you look at somebody then they won't baffle you. Because your bafflement is simply a Q&A with their not-knowingness. And the reason you get concerned about insanity and that sort of thing, and the reason you very often find an auditor going puppy to the root on an insane case, and not being able to stop auditing the insane case, is because the auditor starts Q&Aing, trying to find out what the insane case doesn't know. And the auditor gets to try to find out what it is that the insane case doesn't know and the hideousness about it is, is factually, the insane case doesn't know about a don't-know, which of course adds up to the double-compound felony of it all.

So when you don't know about a not-know, you don't know whether not-know, and what it is, and whether or not you not-know it and you don't even know what it is that you don't not-know, you're a candidate – you're a candidate for the spinbin, you see.

There are two things that move it out. One of these things is the fact that you can speculate as to what you don't know. If you can do that, that's sane.
By the way, it's very interesting: you can introduce to a person who is even feeling spiny, you know, a sudden feeling of sanity by just asking them to think of one person who doesn't think they're insane. Did you know that? It's one of the most interesting tricks I ever dreamed up. You just say, "Well, think of one person that doesn't think you're crazy." Person will eventually think of his dog or something and turn sane just like that. Why? You've introduced a knowingness into his unknowingness. And you can introduce just one knowingness into an insane person's perimeter and you'll turn them sane. You just say, "Look around this room and find something that is really real to you." And this person will look all around the room and they may take a half an hour to do it and they eventually pick up a silver tea pot or something of the sort and say, "Boy, this is really real." And you'll just see them go sane.

It's good for one command. That's why it sort of tends to drop out of the lineup. But that's a terrific trick. That's a terrific trick. Both of those. Both of those. You get somebody who's going to blow his brains out and commit suicide and they're so terrified of all the terrifying things that they don't know what's terrifying about them, which is what makes them terrifying. If you were to say to them, "Think of one person who thinks you're sane." That's evidently a total non-sequitur to them, but they'll think about it at once. They're almost incapable of not thinking about it. And you don't hear any more about suicide. So you see, it's an interesting little trick to have in your war bag. Hm?

Now, so much for all that. I've given you a very long, rambling discourse here today and I haven't answered any of your questions, and I can see that I have slugged you to some degree. You look a little overwhumped. So I'll tell you how to unwhump yourself – unwhump yourself. We're going to start to give the students Security Check practice. We'll start giving them a Security Check, insofar as possible, along with their auditing. In other words, you have to learn how to do Security Checks and you better learn how to do lots of them of various kinds. So if you just spend an hour or something like that a day or one page of the Joburg a day, security checking somebody, then you can be supervised as to how you're doing the Security Check. And you can be looked over about what you're doing, at the same time you're catalyzing the auditing which is going on.

And those auditors that are running CCHs on somebody shouldn't, actually, be doing a Security Check on them also. That Security Checking should be relegated to this other program. And then you will see faster case gains. It's almost a double-auditor situation.

But you need experience in doing Security Checking. And you need to do enough Security Checks that you become familiar with doing Security Checks. And with your familiarity, there may suddenly pop up something you feel you don't know about doing Security Checks and this is the place to find out you don't know. Because the information is all over the place. Got it?

Okay. Sound like a good program to you?

Audience: Yes, very good.

All right. So that's my contribution to unwhumping you.

In addition to that, I think you're making pretty good progress. I just looked over all of your case reports. There doesn't seem to be anybody hanging up here particularly badly – ex-
cept you, of course! You seem to be doing all right. I'm actually very pleased with the way things are going on the thing.

But if you don't think that should be the state of affairs, don't get into a frame of mind that you mustn't tell Ron because it'll hurt his feelings. Realize you're just running a don't-know on Ron. Okay?

If you don't think things are running all right for you or your training or something like that and you can't nerve yourself up to say it to an Instructor or something – you think I ought to know about it, something like that – why, by all means just put a despatch on my lines. Okay?

And if you do miraculously find out there's something you don't know that you should know while you are here, and so forth, and you don't find it out, I'll think you're stupid!

Thank you.
Thank you.

All right. This is the 17th of something or other. Sixteenth? Sixteenth of June. Thank you. I depend on these lectures to find me on the time track. [laughter]

Well, you have reached the end of a week, and I hope that hasn't made you reach the end of your tether. You look younger. All except Reg. [laughter]

Okay. And undoubtedly this week you've accumulated enormous numbers of questions. ...I'm waiting. Yes, Kay?

*Female voice:* When you're running SOP Goals with the Have and Confront Process, as you run, do your Have and Confront Processes change?

Yes. Thank you. I should put you straight on this. When you're running SOP Goals using the Have and Confront Processes, and actually running Routine 2 with Have and Confront Processes, the processes change with considerable rapidity. They can be expected to change, so you have to be very alert.

Now, you're not trying to run the tone arm motion out of the Confront Process. You're not trying to, but the Confront Process must move the tone arm. You see, a Confront Process is a very junior process. It is a very mild process, but it has the effect of making people feel sane. It is quite good in that, you see? This fellow, he's feeling all confused or something, and he's had a lot of cognition's, all of which are opposite, and a Confront Process is really a doll. It changes the immediate state. And actually it has almost no long-term benefit. You never saw the results of any process fade out as quickly on a Confront Process except maybe Have.

Objective Havingness and Confront are both unlimited processes, but if you run them in an unlimited fashion, like you would run SOP Goals or something of this sort, your pc would feel absolutely marvelous – just feel absolutely wonderful. You – I'm sure right in this room there are people who have had this happen to them. And they just had seventy-five hours of Havingness, you know. Just marvelous, you see, and they just feel fine, and a week goes by and they still feel
all right. And another week goes by, and they don't feel that good. And then another week goes by, and they're right back where they started.

Same way with Confront. It has this odd aspect. That is why you don't find the word Confront on the Prehav Scale. Well, that isn't the original reason. The original reason is another one, but you don't find it on the Prehav Scale because it is of no lasting benefit. It is just marvelous for making somebody feel good. They get unconfused, and they come up to present time, and so forth. And the Have Process, that orients them.

And actually, to know more about these processes, to know the answer to your answer – I'm not digressing – you actually have to know really what these processes are. And then that alone would give you judgment in when and how to use these processes, see. And it would answer all sorts of things, so I wouldn't have to be telling you, well, you run eight minutes and seventeen seconds of Confront and eighteen seconds point three of Have, you see, because that's silly. It can really depend on your judgment exclusively if you understand really what these processes are supposed to do and what they are. And when you've accomplished that end with either of these processes, you of course have accomplished that end of it. That is all.

The whole criteria is this: "Do you feel better now?" Fellow's running Havingness, you see. Well, your meter will tell you whether or not he feels better because the needle is looser. If the needle loosens up between the front test of the Havingness and the end test of the Havingness – which by the way you always use – (get your pencil busy). You always use this test in every session that you run Havingness. You always have him squeeze the cans at the beginning of the Havingness and squeeze the cans at the end of the Havingness, and see if the needle has loosened. You got that?

So every time you run Havingness you go through that little routine. That's part and parcel not of just testing for havingness, but that is part and parcel to using it. And all you want out of Havingness is a loosened needle. Now, how loose? Well, it's just like the one-command process, if you ask somebody to look around the room and find something that's really real to them, and they all of a sudden find one object in the room that is really real to them and they're not pretending about in any way, shape or form, that is really alive. It's a marvelous process. And that is its total effect. It's a one-command process.

The other one is "Think of somebody that believes you're sane or doesn't think you're insane." The person thinks of one person and that's it. Now of course, he might think of two or three more, and you might be able to kid yourself in believing that – and it might even appear that it'd be a good thing, you see, to run these processes for ten more commands or twenty more commands, or fifteen or twenty hours. If they're this good, you see, they ought to be that good. Well, they're not that good. And until a person is way up and almost Clear, Havingness has no lasting benefit. The valence eats it up. See, the valence and consumption circuits eat up the havingness. Got the idea?

Now, it's absolutely necessary when he is almost Clear to stabilize his whole case, and his whole case will stabilize, and his stabilization at Clear will take place when havingness stays
stable. Once run, it stays there. And this isn't a needed test but happens to be one of the tests.

Well, this person is awful close to Clear because when he runs Havingness it stays with him. This orient him in the environment. He goes out and looks around the world and it stays that way. He gets a good reality on the world. For instance, he remedies his havingness in this room, and his havingness is remedied for this universe. Got it?

Until a person is up in that kind of state, he remedies his havingness for this room but it is not remedied for the next room, see?

All right. As long as the fellow has a dominant valence or dominant machinery, it's going to eat up all the havingness you run on him. And you can run the whole bank with Havingness. You can sit there, and the engrams will run by, and the case will change, and it'll just be dandy, and boy, are we producing an effect. But that's all you're doing. You're producing effect.

You're not giving the case any lasting gain. The lasting gain of Havingness occurs somewhere in the vicinity of eight or ten commands. Very short. Very brief. And when you've done that, you've done it. Now what you've done, then, is sort of peg the guy at a new level. And that havingness, that much havingness, remains constant. That's okay. He's got that. He can have that. But if you run another half an hour of it, he can't have any of that, you see, so it's just a waste of time. Let's run the case by music therapy, Los Angeles fashion or something. You've heard of that I imagine. Let's give the case some good auditing with some ARC Straightwire, and then let's spend the next – rest of the week on music therapy. And then, of course, any benefit he got, you see, occurs in the first few minutes of ARC Straightwire – which, by the way, is another one of these processes that works dandy for a few commands. And then the rest of it is just lost. See, there's no use doing it. Yes, it'll run the case. Yes, the pictures will change.

Yes, the person – but look, this is a hell of a way to run a case: to get his attention on the wall so he'll run his bank. See, what you're doing is run a shift of attention. After Havingness works, after about twelve, fifteen, twenty – the zenith I don't know, but the zenith certainly wouldn't be more than about thirty-two commands. I mean, it'd be up in that range. After that, all you're doing is saying, "Take your attention off your bank. Thank you. Take your attention off your bank. Thank you." And, of course, the bank changes. And the engram that he was halfway through mysteriously moves the rest of the way through. But in view of the fact that it moves the rest of the way through without the pc inspecting it in any way, of course, it's no benefit. It'll also move through the next day.

If you want to run an engram perpetually, forever, why, just keep running it with Havingness. Say, "Now, you're nicely fixed in that engram. Good. You've got that engram. 1601 it was when you murdered the king. Very good. All right. That's fine. Now you're sure you're there? That's good. All right. Now we're going to run some Havingness."

And we run twenty commands of Havingness and then we say, "Well, how about that 1601?"

"Oh," he says, "that went."
"Oh, well, you'll have to get that back. Let's get that back now. And just -- just how was it that you went about the assassination? What kind of a weapon -what kind of a weapon would you most hate to be assassinated with?"

"Ohhhh!"

"Oh, all right. All right. That's good. Now get your idea of that weapon. You got that real good? All right. That's fine. *Now* look at that wall. Thank you. Look at that wall. Thank you. Look at that wall."

And the engram will *reel* straight through again. And you could actually run it through perpetually. I don't think it would ever run out unless those little beginning commands of getting him into it and the little datings that you were doing happened to blow it. But the Havingness itself will move the engram through, move the engram through, move... Like making somebody sit in a cinema through the picture time after time and making him look at the usher. Years later they see the motion picture and they say, "What's this?" you see. "Never seen this before." So you get the point here that ...? So that's a limited sort of a process. Yes, it'll apparently produce enormous results after run for a few commands -- apparently. And this is very inviting.

Back in '55 I was investigating this like mad, and I knew there was something there in this Havingness Process, but I couldn't establish exactly what. And it was mysterious, and actually if you review the old tapes and bulletins and things like this, you'll find out I said so often, that I didn't know what Havingness was all about.

Same way with Confront, because Confront is actually Subjective Havingness. Now you're going to run the reverse. You're going to make him face the wall. You're going to make him face the bank. I don't care what the Havingness command was, exterior, or what the Confront Process was, subjective; all you've said to him is, "Now, look at that wall. Now you got the real universe? That's right. That's real good. Got it real good. Well, look at it a few more times. Oh, that's fine. Feel better now? All right. That's dandy. That's it." You got it?

All right. Now you have him look at the bank, and you say, "Bank, bank, bank, bank." I don't care what command you're using, see, for the Confront Process; you're saying, "Bank, bank, bank, bank, bank, bank, bank, bank, bank. You feel better now?" The guy says, "Yes, oddly enough, I do."

Well, don't expect him to go on feeling better for the rest of his life, you see, because it's too arduous, as a process. It -- there -- they do things. Odd things will happen doing them. There're vagaries. The full benefit of the Havingness Process and the full benefit of the Confront Process, as far as therapeutic value is concerned, is realized in something on the order of eight to a dozen commands in Havingness -- zenith about thirty-two commands. And Confront? Well, it's a little harder to establish in terms of time, but what you want really is a wiggle on the tone arm.

You want the tone arm to wiggle and preferably go lower. If you can make the tone arm do that with a Confront Process and you can get it done in ten minutes or fifteen minutes or something, why, you've done it. And if you're not doing it in ten or fifteen minutes, you'd better
say, "Well, it's just too bad, but this pc will have to feel bad till the next session." I mean that's it. Because a process is nothing to fool with if it is not producing benefit. And if it's not producing benefit, you won't get a tone arm motion. Got it?

So therefore, the Havingness and the Confront Processes apply all the way from the bottom of Routine 2 to the near top of Routine 3. Routine 2 to Routine 3. Hm? And they are always used exactly the same way. You use them exactly the same way. But look, this case is changing. So if you find them too early, you're just going to have to shift them every time you run them. And if you find them too late, all you're using them for is stabilization of Clear. And in the middle ground it's sensible, but you keep your eagle eye on the needle for the Havingness and you keep your eye on the tone arm for the Confront. And if all of a sudden – this person's been running along fine on the Confront Process of, "Get the idea of your bank flying by at ninety miles an hour" – that was his Confront Process – and the hitherto – if he was sitting at 4, it would go to 4.5, and it would then blow down to 3.5, see? Some much – such evolution as this ...

I've gotten more data on this, since I've given anybody any of it, by the way. I'm glad you asked the question. I've had quite a bit of data accumulated on this one way or the other. I haven't even written a bulletin on it.

And it works just fine – "Get the idea of your bank flying by at ninety miles an hour. Thank you. Get the idea of your bank flying by at ninety miles an hour"; whatever the Having... Confront Process is. And hitherto it would go up a half a tone and then it would blow down a tone. Something on that order. And as soon as it blew down a bit, you'd come off of it and you'd skip it after that. Ah, that's good. That criteria, by the way, used to be used for the Havingness Process, and it's not used there. Use it for the Confront now.

All right. And you start him in on the Confront Process, and the tone arm doesn't go up. And you run ten commands, and the tone arm doesn't go up. And you run ten – fifteen commands, and the tone arm hasn't gone anywhere yet. Well, it's too confusing to find another Confront Process right at that moment You simply come off of it, run your Havingness Process and that's it.

And the next time you audit the pc, say, "Now we are going to find a Confront Process," because that Confront Process is no longer functional.

All right. You always do the can-squeeze test. You wouldn't have had to have done any of these things, you see, if we weren't traveling at a fast rate of speed with our auditing progress. It was perfectly all right. The finite period of time that they lasted before didn't require all these cautions, but they certainly require it now.

So here you are with your case going along at a whizzing bang, and you give that can-squeeze test just before you run the thing. All right. You say, "Squeeze the cans." You watch the needle, you see. "Squeeze the cans" – watch the needle. Don't necessarily set the sensitivity knob, who cares? And then you say, "Look around here and find something you can agree with. Thank you. Look around here and find something you can agree with. Thank you. Look around here and
find something you can agree with. Thank you." Run it about eight times, something like this – maybe twelve times. And, you don't count them. It's not that exact an action. Counting them is something on the order of the ensign going out and holding the sextant upside down in a bleary-eyed way and shooting Venus when it should have been Arcturus. And then he comes back down and spends three hours of the most minute mathematical calculations you ever heard of, don't you see. And he reduces the ship down to a pinpoint, only he's 150 miles north of the headwaters of the Nile, you see. It's very amusing, you see, to take something that is of a gross application and then figure it out minutely, and yet the world of mathematics is doing that all the time. That'd be something on the order of counting the Havingness Processes, don't you see.

You run it kind of watching the pc. Don't watch the needle on the Havingness Process. And the pc says, "I agree to that. I agree to that. I agree to that. And I agree to that, agree to that, agree to that, agree to that, agree to that. Yeah."

And you say, "All right. Thank you very much. Okay now. Would you give the electrodes a 'squoze'." And you look at it. Wham! You say, "All right. Thank you very much. That's the end of that process." No bridge out. Don't bother.

Confront Process is run before the Havingness Process. And what you do there is you say, "Now get the idea of your bank flying by at ninety miles an hour with a witch on it. Thank you." Whatever your Confront Process is. Watch that tone arm. Watch that tone arm, and it goes zzz-zzz-zzz-zzz-zzz-thoom! And you say, "Thank you very much. That's very good. Ah, that's real nice. That's fine. How do you feel now?"

He says, "I feel much better."

You say, "Good. That's it."

And all they are – are stabilizers of the gain. Now, an individual gets no idea of what else is going on. He is running this horse, you see. And he's running Fail Leave on a horse. And my God, he just runs Fail Leave on horses and Fail Leave on horses and Fail Leave on horses, and Fail Leave on horses, and Fail Leave on horses, and Fail Leave on horses, and horses failing to leave him, and him failing to leave horses, and others failing to leave horses and horses failing to leave others, and horses failing to leave horses, and – man, he's just been having a ball, you see. And all this time he's been having trouble, see. That's the way the bank is going on this silly valence, and the valence is separating out, but he's having trouble this whole time. What's happening here? This is – gets to be very amusing when you're running a valence directly, because what's happening here?

You know, there are other quadrupeds that failed to leave. Namely donkeys. And he's gone along through the course of auditing, obeying the auditing command very nicely, except every once in a while something in the bank would say "Hee-Haw", you know, or something of this sort. And he'd say, "Well, down. Get away from here now. We're supposed to be dealing with horses." [laughter]
And during the process of his auditing, he will stack up quite a few donkeys over here. Somewhere on his left or somewhere behind him there'll be some repressed donkeys. Get the idea? This is inevitable, see.

Well, now listen. Let's give him a chance to get rid of the donkeys, and that's why we run the Confront Process. Whatever the Confront Process is, the first thing he's going to confront are the things he kind of restrained himself from confronting, because he was running horses. The mechanics of the process, in other words, have prevented him from confronting certain things. Well, so he blows that off; you don't hear any more about the donkeys. Donkeys aren't any difficulty for him. They're just an associated terminal, see.

All right. Let's say we have one case running on a terminal that doesn't occur in this lifetime. Never occurs in this lifetime – the terminal doesn't, that's it. Or if it did, it'd be so slight. But the person for various reasons – not necessarily this particular case that there aren't any in the present lifetime, but just the case is the person is incapable of being one in this lifetime by reason of sex. So we're running this person when and how? We're running this person out of the present lifetime, all the time, on the terminal.

Well, let's give him a chance to catch up. Let's give him a chance to come up to present time. And the best way to get him up to present time is a Confront Process. Confront is the old answer – 1950 – of how you got a pc up to present time. You could have confronted any pc that got stuck on the track back up to present time. If you moved him out of present time, you could have confronted him back up to present time, don't you see?

On such a terminal, if you do not run the Confront Process, no vast catastrophe is going to occur, but the pc is going to be perpetually uncomfortable. And the fellow will finish the session over here holding down these eight donkeys, you see, and he will find himself going around until the next session with these damn donkeys. [laughter] You see? It's not even catastrophic. It will not hold up his progress, so it is not a vital action. It simply keeps the case on a little more even keel and maybe speeds it up because the case might not get so many ARC breaks out of session, because they're in a little bit better shape in the physical universe, don't you see? That's why you use the Havingness and Confront Process.

Now when you use it, naturally – you would certainly be wanting to use them on somebody who kept feeling a little spinny. If the person's kind of feeling a little spinny, level by level, and you don't have his Havingness and Confront Process, you haven't got the weapon necessary to set him right. A little bit of Confront does marvels for the fellow's spinniness. You know, guys can get pretty far off beam with this spinniness. They can get pretty nyarowrrrow, you know?

Anyway, where do we have a borderline between not running them and running them? It's just auditor's judgment. It's just the state of case and auditor's judgment. And they run all the way through from Routine 2 right on down through to the bottom of Routine 1. And the more the case is progressing, the more rapidly the Havingness and Confront Processes will change, and you will start somebody out, and he'll be getting along fine...
They don't necessarily go up scale or down scale, you know. Just as a word of warning. A person starts out, "Look around here and find something you can have. Thank you." This remedies his havingness beautifully, you know. "Look around here and find something you can have." Wonderful. It just remedies his havingness gorgeously. And about eight sessions later, he's made a good case gain. See, he's had a good run on a level or something like this. And he's got a lot of withholds off on a Joburg. And you run "Look around here and find something you can have. Look around here ..." eight times. Squeeze the cans again, you know, and it just goes clank! Almost stands up and barks at you, see. It doesn't move anywhere near like it did on the first can squeeze. Well, this is running his havingness down now.

Well, it's not a temporary condition that will fade out in – during the next session, something or other. He might have gotten an ARC break you haven't caught, or some other things might have caused this. But you'd catch those on the end rudiments. This Havingness Process has ceased to work, and now you're liable to find something corny. Here's a Havingness Process: "Why, look around here and find something that would substitute for something if something wasn't there." And you say, "How in the name of common sense can this Havingness Process ..." you see – which you've picked off the list or any existing list; there are lots of them – you say, "How could it remedy anybody's havingness."

Well, it's doing so because the can-squeeze test before and after shows it loosens up the needle. And you'll get along and you'll suffer with this – along with this one, and your curiosity and mystery and not-know of how this could remedy anybody's havingness. And all of a sudden, why, clank! Can squeeze – it didn't work. You're going to have to find another Havingness Process. And this time you find, "Look around here and find something you can have," and "Look around here and find something you would rather not want", or whatever it is. And that remedies havingness now. And then we get another one: "What scene isn't that wall part of?" Oh, that works like a breeze.

You see what's happening here. The bank is shifting. The valence is going nuts. The pc is getting better, but the valence is going crazy. And you can expect the Prehav level on a valence to deteriorate. And you can expect the level of complexity of the Havingness Process to deteriorate. And you can expect the level of complexity of the Confront Process to deteriorate as long as they're being run on a valence, and he's not rid of the valence yet, so therefore you're running on a valence. Got it? So therefore, they deteriorate.

And there's only one other thing I'd like to add on this general subject. There apparently is some idea abroad that the only thing that will clear anybody is running a valence directly and immediately. You look what happens to valences on a Routine 2 run. All kinds of little side-panel valences start flying off the main valence. And you get rid of plenty of extra secondary valences on a Routine 2 run. And when you finally ask the fellow for his goal, after you've thoroughly done Routine 2 ... Ah, it might be 150 or 200 hours later; we don't care. But if you ask the fellow for his goal, and his terminal and so forth – there's his goal; there's his terminal! Bang! It falls. You assess them for level, and all of a sudden they run out.
Where's this goal? Where's this terminal? Well, you assess them for a level, and what are you doing now? You're just doing SOP Goals, but of course you've – your general runs hit all these valences. Only they hit them less speedily. They separate them out more. They do different things with valences, but they get rid of valences.

And CCHs, Routine 1, gets rid of valences like mad. They all do the same thing. The whole criteria on Routine 1, Routine 2, Routine 3, is not how nutty you are, but how fast these things will operate. And I will lay you down an operating rule right now for these. An operating rule in no uncertain terms. And that is, if a case in large quantities of auditing has not had a significant change – and I'm talking about past processes or even present processes – if he hasn't had a significant change over a long period of time – he's still got his lumbosis; his zorch is still out of order, you got one answer. This is policy. It has to be policy because valences protest on it. Regardless of graph, meter read, opinion or objections, you run Routine 1. Got that one? HCOB 17 June 1961.* I just put it in the mill. I might as well tell you what it is.

Don't monkey with this one, huh. If a case hasn't been rapidly changing on auditing, the most rapid way to make the case change is the CCHs with a Security Check. If the case hasn't been changing over a long period of time in auditing, the most rapid way to make them change is CCHs and Security Check. It has nothing to do with their nuttiness. We don't care whether they're nutty or not nutty or anything else. It's just what's the effective thing to do, that's all.

So if you follow that as a policy ... I'll give you an idea, Wing goes into New York City and there's a perfectly nice fellow, and he has always been a nice fellow, and everybody knows he's a nice fellow, and he is very sane, and he has been very helpful and so forth in Scientology, and Wing says to him, "All right. You say you want some auditing? All right. I'll give you some auditing. I'm going to run the CCHs on you."

And the fellow says, "No, no, no. Under no circumstances." Well, my God, he just did an assessment on the man, didn't he? Do you know all of us have got the CCHs unflat on us, practically? We've had them run a little bit. It's too beefy a process to leave unflat. It'll flatten off. Of course, you get up toward Clear, it'll flatten off in a morning But sooner or later, you're going to have to collide with them and face up to the fact that they require finishing. It's no more serious than that.

The reason Wing would say, "I'm going to run CCHs on you" is he happens to know that the fellow has had lumbosis ever since 1952 and it hasn't disappeared and the fellow has had a bit of auditing – quite a bit of auditing during that period of time. Without monkeying around about it and without running into whatever it was or trying to analyze what it was that kept this fellow from cutting free of his lumbosis and spending eighteen hundred hours in the arena, bleeding and raw, fighting this lion to find out what is this that is so tenacious that is continuing lumbosis on this case and getting very brilliant and brainy about the whole thing; just "Give me that hand, brother." That's all.

* Editor's note: HCOB 17 June 1961, "CCHs and Routine One"
And all of a sudden, Mr. Lumbosis, when you combine "Give me that hand" and the rest of them with Security Checks – that lumbosis, first it runs up a little white flag ... First you see this helmet being waved over the parapet, you see, rather meanly, you know. "You can't get me. You can't get me. You can't get me." And then finally you see a dirty pocket handkerchief, you know, being waved. And then they finally help you – and then they want to beat a parley. And all kinds of things. And then all of a sudden, why, "Oops! There went my lumbosis. Hey, it did, you know." And that's it. What I've done is figure out a way that you can't make a mistake with a case.

You see, there are several things you can know about a case. You can put them on an E-Meter and find out how they read. That's very reliable. You can give them a profile; you can read the profile. That's very reliable. There's another way of reading a case: Looking at them. You can look at them, make up your mind about it, and that's another way of figuring out a case, you see.

All right. There's yet another way. This person has been audited for the last four years and hasn't had much gain. Isn't a Release yet or something like that. Well, that's a complete assessment of the case, isn't it? Otherwise, we'd have to assume that all auditors are bad auditors, which they aren't. We'd have to assume that no processes have worked in all these years. And they have. See? And we'd have to assume these various things.

Well, why sort all this garbage out? Why spend hours and hours and hours and hours and hours monkeying around with this? Because look, somebody else has already spent hours and hours and hours monkeying around with this one. Well, there's one answer. And that is, it evidently doesn't surrender to the basic mechanics of formal auditing. Whatever it is that's wrong with the guy doesn't normally – he's alter-ising the commands or he's auditing through a machine, or he's going on a big via, or he's got a present time restimulator that is very, very rough. It's this. It's that. It could be ten thousand different things. And you can worry yourself to death over it. But look, out of all those things there's only one common denominator for the whole lot. And that is, he's been audited quite a bit and hasn't had a significant case change. That's fine. That's all. That's it.

So you get up on the pitcher's mound. Let's see, what's a pitcher in cricket? A bowler. You stand on the bowler's box or you get in – on the pitcher's mound, and you wind up and you pitch CCHs, man. That's all. Or you bowl them. God, I'm international today.

Anyway, there you are. You ask for a simpler tear-apart of a case than this? And there's no reason to be upset about it because actually the very reason that a person gets upset about the fact that somebody thinks they're a little bit potty is an index in itself. You see this? Because it tells you they must be worried about the world's opinion of them. You see? It tells them that pride is entering into processing.

Well, I don't know. I've been run on the CCHs. I don't see anything very bad about it. I know other people who've been run on the CCHs. It produced results on everybody I ever saw it run on actually, if it was run right. So what's the difference here, see? That's all there is to it. I hope I answered your question anyway.
Female voice: Thank you very much.

Good. All right.

Male voice: And a big one of mine.

Good enough.

Male voice: Same here.

Good. We had an interesting incident, by the way, going on in a course – special course that's being run someplace. We had a boy – he's pretty stormy. He's quite a guy. Pretty stormy. And he walked in on this course and found out that there was kind of a lot of yow-yow-yow going on about, oh, well, this stuff about Security Checks and so on, you know. [laughs] All these cases, no advance, no spins and so on. And he got down and he told them, "Now look, you guys. This is your last chance, see. Because if you don't make it in this course, I'm gonna make sure that you just go out and spin forever. So you better get serious about these Joburg Security Checks, and you'd better snap and pop, and you'd better give up those withholds and get it whizzin' and bangin'!" And everybody says, [feeble voice] "Well, all right," you know.

They got in and started standing and delivering as though we were being attacked by highwaymen. Then the most interesting thing evolved. A very important person in that area had been invalidating Security Checking and most of the students had withholds about that person. And that one little speech all by itself cleaned up a whole Scientology area. They had been practically under orders to regard the Security Checks as just a nonsensical idea.

And I've just heard from another area that wrote a special Security Check for the Academy. [laughter] I think that's very nice. I like that. Sooner or later, we'll get out one for the Academy. And the only difference between that and a standard Joburg will be in every third question "What unkind thought have you thought about your Instructors?" [laughter] and so forth. Get the idea? It'll be Scientology personnel about every third question, you see? That's the only difference it'll have.

But this was a nice, sweet Security Check. It consisted of something on the order of about twenty-five, thirty questions, and it all says in a high generality "Have you ever been a paid agent working in Moscow directly and immediately for Khruschev?" That's good. Well, we've taken care of communism. "Now, have you ever been a homosexual? Thank you very much." Or I don't think it's that general. "Have you ever been a homosexual in this organization?" or something. Real cute. Probably says something on the order – I didn't read it all, but probably said something on the order "Have you paid your bill?" or something. And that was a Security Check. That ranks with this other one, "Have you had an ARC break with ... ?" That was another doll. That was a real wowie one.

So it just comes down to the fact there must be no special Security Checks. There must be standard Security Checks, and that's it. And is – it happens at this moment that it's HCO W[W] Form 3. When we say Security Check, we mean HCO W[W] Form 3. We don't mean the special Academy edited check, because you see "It's very rapid to give it, you see. It's very rapid to give
it. And the other takes too much time." And – because people still will walk around their with-
holds, that's all. Somebody writes a Security Check independently in some vast different part of
the world that is in objection to the Joburg Security Check, you can just be sure that it has noth-
ing whatsoever to do with a Joburg taking too much time in the Academy.

In the first place, certainly in an Academy, for God's sakes, these people must learn how
to do complete Joburgs, not be given a little twenty-five-question short form and not ever be
permitted to have a Joburg anywhere near them – which is what this adjudication amounted to.
You know, "It must not be given in the Academy. Only this one is given in the Academy."

Interesting, isn't it? You've got to watch that one wherever you are. You see somebody all
of a sudden saying, "Well, I think it's perfectly all right." I'll give you the pat answer to this be-
because we're not stopping anybody putting together Joburgs and Security Checks.

It works like this: Unless we lay down a blan-
tet rule that the Security Check given shall
be an official HCO WW form with a number for a certain purpose – unless we lay that down –
then, although we have opened the door for anybody who is inventive to write himself a lot of
Security Checks and actually contribute to Scientology, we have also opened the door wide for
isolated areas of the world to carefully omit their own overts from the particular list and issue it
as another check. And that is what happened in this area, I am sure. This is too nonsensical.

This other ARC break one that came out – that came out before the Joburg. That came out
before there was any real importance being put on Security Checking I just use it as an example
of how mild a Security Check can be.

But if you want to put together a Joburg, if you think there are a lot of questions missing,
and there certainly must be, I'll tell you how to put together one. I've got a special category going
right now. Did you ever know anybody that had about thirty or forty baskets sitting in the same
space? Did you know that thirty or forty baskets could occupy the same location in space? That
would have driven Hayakawa mad, wouldn't it? Or even Korzybski. But I've got one on the cor-
ner of my desk. It'd be absolutely impossible to rack up enough basket systems and enough filing
systems to take care of all categories of my immediate projects, so I put them all in the same
space over here at the side of the desk.

But oddly enough, although they get up to tow-
ing, I let the projects accumulate, and I
know I'd better not let them go to files, you see. If they go to files... I have now put the rest of the
office staff to work – and I'm going to put them to work, but not this senseless filing. When I get
a stack this high, and it's all questionnaires to Ds of Ps that I've put out, and I finally see that the
stack is high enough to justify my believing they have all replied – like, "Send me all the profiles
you have on all new Academy graduates." Nothing of this sort, that – too silly a project. But if
there'd be such a project, I'd just let them stack! See, stack. And I don't send them to file.

And then my basic system that I have newly been putting into effect is simply pick up the
whole lot on a donkey cart someday and turn it over to somebody and say sort them out. And
they sort them out, and they bring them back. But I know if I – you see, the answers of these pro-
jects are addressed to me. We have so many things going. I don't have time to advise everybody what every project is. So the easiest thing to do is collect them. And I do collect them. And I do sort them out. And I do all of a sudden fire one of these things when it's all accumulated, because we are now in a zone and area of accumulating information from organizations and people and auditors, you see, and that sort of thing.

And when I ask them for some information, because we're so far flung, it takes an awful unconscionably long time to get something all the way down the Congo out through the various pirates in the Congo now, such as the United Nations and Kennedy's special emissaries, and so on, and it takes a long time to get here. But it gets here. And then I accumulate them, and I put it together.

So don't think that something you send me on a project of this character is just waylaid and neglected, because it very often isn't. Verner, when he was over here looking over the organization – one thing stuck thoroughly in his mind. They showed him all the files and papers and routes and it all looked very fantastically interesting to him. And amongst these oddities was the fact my initials appear on everything or my routings appear on everything. And he had the idea that I sat in an ivory tower somewhere, you know, and never saw anything, and you couldn't communicate with me and all that sort of thing. And he looked this over and he saw this vast ocean of accumulated detail, papers, despatches, all this kind of thing. Yeah, I see them. I don't always answer them. I try to get them answered, but I don't always answer them.

Sometimes there is no answer. I think, "Well, later on I'll have an answer to something like this, and I'll put it out in a bulletin." Sometimes your despatch gets answered very – on a very odd via but not too often. And I'm saying this, giving you this preamble of the thing: If you've got questions that do not appear on these Security Checks or you think should appear on these Security Checks, just address them to me on an ordinary piece of despatch paper. And this file system where the twenty or thirty or forty projects all sit in exactly the same area of space eventually accumulate these things. And one day, why, I'll get some time – some 2:30 in the morning sometime – and sort them all out and stack them all up and give them to somebody and say type them up. And there we are. And then we'll sort them out. We'll find the questions repeated very often. And we can sort them out, and we will have a new Security Check. Now, Jan right now is doing a very nice rundown, and Dick, with a whole track Security Check.

One question that they originated stuck in my mind on the thing is, "Have you ever wantonly, viciously and villainously destroyed hostages given to you to hold under your sacred trust?" or something like this. So various questions on the line like this and they're good questions. This is a bearcat. And it's the result of saying that one of these days, why, we need a Security Check, that when a person got up about halfway to Clear and his whole track keeps opening up, and he's got withholds on the whole track, and we keep trying to check him in this lifetime, and the withholds are no longer in this lifetime, he goes practically potty. If somebody would just ask him some of these questions, why, it'd all turn up and work out, you see?

All right. So there's a project: whole track questions. There's another project: What pecu-
liar questions should be asked in an Academy? That's another project for another Security Check. And: What peculiar questions should be asked on a repetitive-type Security Check which, while covering the whole Joburg, yet covers it a page at a time? Well, there's got to be certain repetitive questions occur. You see, every time that page is asked, certain other questions have got to be asked with it. So that you could get in the CCHs a one-page administering of the Joburg at a time. You got the idea? And the fellow would always be getting new Security Checks, which yet wouldn't neglect his old Security Checks, you see. It's an interesting problem.

The whole track Security Check, there – actually is basically the improvement of the existing Johannesburg Form 3. And the more minds we get to work on what horrible things people should have done to people, why, the more broad and effective that Security Check can be. And it could even be something wild or as far approached, "Have you ever done any illicit diamond buying?" [laughter] And nevertheless would catch some case.

Remember that a security question or a withhold-type question – remember that it doesn't produce any bad result, it really doesn't waste enough auditing time to worry about now that you're doing instant read, and yet will catch some off-base case. And you yourself as the auditor sitting there reading one of these checks down will say, "What on earth? How could anybody possibly have ever done anything like this? That's a very unlikely question." And then all of a sudden one day you ask this thing, "Have you ever put any cats in slingshots," you see, "and fired them over walls?" And the thing falls off the pin, and we get somebody who has devoted his whole lifetime to doing nothing else. [laughter] There it is, brother. Bang!

And then, of course, there have been other codes of justice than the South African code of justice that was the original derivation of the original Joburg. South African code of justice is very precise. You can do more things wrong in South Africa than in most other countries, but in South Africa they have more problems, and all of these things are wrong in other countries except they aren't forward enough to say so. It's just a franker code of laws, you see?

They don't have so many of these catch-basket laws, you know? "Have you ever done anything the government doesn't like?" You know, like – that's US law now. US executive branches in their law, after they've gotten Congress to write up their laws, they always add this catchall law. "Have you ever been non persona grata with any official in this particular and peculiar department and refused to bribe him?" [laughter] or something like that. And they add this catch law, you see, on top of all the other laws, and then you never know where you're going. You never know what you're doing. You never know what the law is, you see? You don't know whether you're breaking the law or not. A big not-know enters into the scene. As societies tend to deteriorate, not-knowingness enters into their laws.

But there have been many other law codes. There's been a Code of Hammurabi. There've been Persian law codes. There've been Egyptian law codes, Greek law codes. There are Spanish law codes right at the present moment. There's French law codes. And all of these things announce crimes of one kind or another that are rather unlikely, you see, to the Anglo-Saxon. For instance, our own law codes in England and the United States have gotten a little bit sloppy in
various ways. There's tremendous numbers of laws on the books that don't get enforced, and there are a tremendous number of things that get enforced that aren't on the books, you know. It's getting slopped up this way.

Well, the Joburg actually has to follow through two legal systems because it's basically jurisprudence because it deals basically with the third dynamic, you see. And the best area to find the misdemeanors of the third dynamic, of course, is the justice codes of the third dynamic: What have these things included as being withholdy? Because somewhere on the track people were made to withhold things by a justice code, you see. And they were taught to believe these things were bad and then they deteriorated these things, and then they got inventive about what they did wrong with them. And then a law finally got passed to tell them not to do these things.

The Polynesian legal code, for instance: If you were to run a Security Check on a Polynesian under his old taboo system, your Joburg wouldn't apply. That is, at least 50 percent of the Joburg is perfectly legal in Polynesia, but there must be something on the order of a thousand other things that you would consider perfectly ordinary that would be absolute sudden death, "Throw him into the volcano", you see – that kind of thing. "He has walked under a kapok tree." [laughter] "Hmmhmmhmmnhmmnhmm! Hang him!"

So the more – the more minds we get operating on this sort of thing, why, the better off we are. And I – I believe we'll probably be evolving Security Checks up here in the next ten years, easily. I can see it now. Maybe someday somebody'll even find Peter's crimes. He wasn't looking for that. That's a bad thing to pick on him this way.

Okay. Now I think you're – the basics that I know about at the present time, that I think you're grappling with one way or the other, might be pretty well answered at the present moment. Are they? Do you feel you're adrift? Do you feel you're seriously adrift anyplace? Hm?

All right. I have no fault whatsoever with anything you are doing. You might possibly put too much emphasis on picking up data here and too little emphasis on practicing. There is data available here which isn't available generally. And most of that data is – well, Mary Sue, myself, Instructors, that sort of thing – they can give you this data, but the perfection of practice is what we're terribly interested in. Because you will dream up questions, as you try to apply it, which will become burning questions to you, which won't be included in any bulletins anyplace merely because nobody ever dreamed you'd ask these questions. You got the idea?

Nobody would be able to foretell exactly what you would become confused about. And not being able to tell this, of course, you can't write a bulletin. It'd take a bulletin for everybody's blind spot, don't you see? And there's nothing wrong with having a blind spot, but the way to handle a blind spot is to not worry about feeling silly about it – and not jump on Ken one – in answering it the way I did one day. He startled me. Sometimes you get startled.

The criteria is that I am more interested in what you find out is a zone that is unknown to you, in the process of application, and that you get that zone cleared up. Because frankly, there are no unknown zones in Scientology at this particular time.
The only thing that is unknown is a question I always leave up at the top of the scale:
"Are we all one, or are we separate individuals?" That's an unknown zone. But it's an unknown zone in theory only, you see. You get a reality on it. If it's true, it's true. Whichever's true is true, you see. And when you lay down facts and say "Now listen, you. We is all one. We is all – we is all 'Nirvanese', and that's why we is – we'uns is so nervous. And when the great pearly gates of Nirvana open up and we all merge with the infinite ..."

Well, you start laying down stuff like that, and you've obscured truth with your inevitably certain zones that remain unknown. But they are not in the zones of "How do you clear somebody?" They are not in the zones of "How do you apply a process?" They are not in the zones of "What is the basic rationale back of why you do this? Why, for heaven's sakes, do you do this?" Well, believe me, there's probably a darn good reason.

And you might get to wondering about this "Why does – CCH 1 – why don't you run it with both hands?" Well, you've gotten the idea you're trying to clear hands, you see. That isn't your purpose of CCH 1. CCH 1 isn't trying to clear people's hands. If you wanted to flatten CCH 1 for its own sake, and just for itself, you'd have to, of course, bodywise, flatten it on the right hand, flatten it on the left hand, flatten it on both hands. Flatten it on the right foot, flatten it on the left foot, flatten it on both feet. Flatten it on the right ear, flatten it on the left ear, flatten it on ...

[laughter] You have to call a halt on this sort of thing so you might as well call it right up at the front of the parades.

It's very easy to go into superdeveloped, evolving systems of this particular character. It's like the gardener today. Our boy out here that handles stone masonry and bricks and that sort of thing – he came up to me rather worriedly. He had been trying to see me, and the gardener wanted him to start a brick wall which goes from the exit at the back gate there on up the road in front of the garage, see. And he intimated to me he didn't think this was too good an idea, and he didn't really have any good reason why he thought that was a bad idea, but it just seemed to him somehow that that was a poor idea.

Actually, it was a poor idea. Where do you stop? See, you start in running a small brick ledge. Where do you stop? Because if you're going to run it up there ten feet, you've only made it obvious that you had better run it twenty feet. And if you've run it twenty feet, you had better make it up there because it won't match the front of the garage now, you see. So you'd better run it the distance of the garage. But that doesn't go up to the gate up there at the top there, at the top of the side road, so you'd better run it to the side road to make it neat. Yeah. But then this doesn't take in the field there. That field there. That better be bricked up, too. The next thing you know, we're in Manchester. [laughter] Now, we didn't intend to go to Manchester at all! We were ...

You can get strung out this way very easily in research of application. It gets very ridiculous.

Okay. All right. Well, now I hope you have a nice weekend. And I hope everything goes well in any other activities you're taking up. And those that are doing a lot of the auditing here and so forth – hope you get in some sessions on one another over the weekend. And I haven't
looked over your case reports yet for this week because I've got all day and all tomorrow to do it, but apparently you're doing all right.

How do you like, by the way – just as a general question, any one of you who's on Routine 1 and a Security Check, how do you like it? How do you think it's going?

*Female voice: Very good.*

It's going very good? Good. You notice how those new things keep coming up on ... Do new things keep coming up on Security Checks or ... [laughter]? Huh?

*Female voice: I spent twenty-five hours on one.*

Oh, no! Coo! That's rough, man. [laughs] I'd say – I'd say that doesn't just stop the Security Check. I'd say that must have stopped an awful lot of thinkingness someplace or another.

All right. Very good. Well, that's coming along okay.

*Female voice: Yes.*

Do you get new material on it all the time?

*Female voice: Well, what I got, I certainly shouldn't have thought was the answer to the question, but it seemed to answer it.*

You what?

*Female voice: The things that came up didn't seem, analytically, to answer the question, but it seemed to lift the charge off it pretty much though.*

No kidding. Weird. Weird. Something like that'll blow out at the other end of the roof. That's very unusual for something like this to happen.

All right. Those of you who are on Routine 2, how do you think Routine 2 is going?

*Male voice: Great.*

Good. Good.

We haven't got quite as many goals being searched for here at the moment or terminals and so forth being searched for – and I don't want to put a stop to that by a long ways. In addition to doing Security Checks, I guess, start looking for goals. I mean, I don't care what ... [laughter] Interesting combo. It'd be perfectly all right to look for goals while you're being run on Routine 2 by somebody else because you do it all the time anyhow. You're – every day and night you're walking around, you're wondering, "I wonder what my goal in life is?" and so forth. And everybody's always walking up to you, you know, sort of saying – inferring – that they ought to be informed of what your beingness is. You know? What is your name? What is your name, rank and serial number? Who are you? You're answering this question all the time, you know. Every time you've put up the body – is every time you walk in down the hall and walk into a room that somebody else is in, you're answering the question "Who am I?" You got the idea?
I mean, you run this one perpetually in this universe, you see – identification of self, which is terminal finding – And people are always asking you, "Well, what do you really want to do here?" You see? "What are you really trying to do?" or, "How can I help you out?" or, "What don't you understand?" Well, you're actually announcing to them "My goal is ..."

You could look for goals and run Routine 2, but I don't think – and a Joburg. You could probably run Routine 1, a Joburg and look for goals. You could probably run Routine 2 in its entirety and look for goals. You could probably do S... Routine 3 and also get some CCHs run. You probably could combine these things in the most infinite and scrambled fashion, you possibly could. And the only danger you'd get into would be being run by two auditors at the same time on, let us say, Routine 2, you see, and they're both looking for levels and doing general runs on you [laughter] – irrespective of what the other one is doing. But oddly enough, two people could be looking for goals on you and you wouldn't get mixed up.

All right. We've even run two people on one person on the CCHs and not gotten too upset by it. And certainly we already are doing two people on Security Checks on the same person, and nobody's getting mixed up in it.

In other words, you've got a variety of combinations here which are occurring. And you can keep Routine 1, Routine 2 and Routine 3 in very tight compartments and do just those and they are themselves. But also realize that they're sufficiently related that most of them could be done concurrent with the others. Okay?

So have a good weekend. And thank you.

Audience: Thank you.
Okay, this is what, the 19th of June? It was a few minutes ago.

I want to welcome the new students here. I hope that you make it. It's probably doubtful. You see, most people won't put forth the effort to make it. And most everybody has come to us too late. [laughs]

Now that we've got the psychiatric clichés off the line that have been extant for the last few thousand years, let's get down to business.

Now, I usually ask for questions at this period, so are there any questions? Thank you. [laughter] So, what's the question?

Female voice: Which is the senior – or is it known which is senior at the moment – Opening Procedure by Duplication or the duplicate level of the Prehav? And which one will run the other out if it's unflat?

Which is senior: Op Pro by Dup or the duplication level of the Prehav? What's very interesting is when Op Pro by Dup is left unflat, there isn't anything that will flatten it. No thought process will flatten a CCH-type process. And if you've got somebody that Op Pro by Dup isn't flat on, it'd be a good thing to flatten it.

However, the two things are not particularly related, since on the one hand the individual is trying to do a think duplication, you see, and the other he's getting an actual physical CCH duplication.

And you find Op Pro by Dup is pretty marvelous and it's still very extant and many hours should be run on a new student in an Academy. But they usually don't flatten it. And if it bites it bites, and it bites hard and actually should be flattened.

It's quite an interesting rigor. But being a CCH-type process it, of course, falls into the lineup of CCH 1, 2, 3 and 4. If you were going to flatten Op Pro by Dup on a Routine 1, you would simply add it somewhat in the vicinity of CCH 2, making it halfway between CCH 2 and CCH 3. Put it into that lineup, rather than try to flatten it all by itself and it'll flatten faster.
It isn't also necessary to run Op Pro by Dup in just one session. That is not necessarily necessary. It is a good thing to do and it's a good test of an auditor and so on to be able to do so, but it is not a vital thing. If it is unflat, it can be picked up later.

Now, the reason we saw Op Pro by Dup fade out, apparently, between two sessions – in its effectiveness – was usually the rudiments went out. And of course, this is in view of the fact you weren't handling the case with rudiments and that sort of thing. So it appeared to be flat next session when it was not finished biting in the last session you ran. And that's true of all CCHs.

And the best way to get around this is not handle rudiments, but to put it into Routine 1, if you're going to use it. And put it in between CCH 2, CCH 3 and just flatten it as you come around and so on – which, of course, would give you five CCHs in CCH 1.

You'd only do that if somebody'd had some Op Pro by Dup run on them and it wasn't flat and you wished to flatten Op Pro by Dup on somebody you're running CCHs on. Just put it in that slot and carry on with it.

Run it, again, by the rules of the CCHs. Which again, run it only so long as it is producing change and run it as long as it is producing change and cease to run it when it no longer produces change for twenty minutes. That would be the actual proper way to handle the thing.

It's rather been – you see, it was a – it's hung with its own postulate, which is to say, it was developed to get students to duplicate auditing commands. And so, it stayed that way, as a process, ever since. And it's never been added into the routines, but there's where it belongs. Okay?

*Female voice:* Thank you.

You bet.

*Female voice:* Yes, I – I can understand when you assess for a goal and get a terminal; it's quite sufficient just to read through the Prehav levels. But suppose you assess for a long term PTP? Now, suppose you got Mary and her trouble is she can't have an effect on Joe, who has Faith, or something.

Uh-huh.

*Female voice:* Now, if Joe's the terminal, do you want the No Effect, or do you want the Faith?

Now, let's go over this again. Give me that question again.

*Female voice:* Look, suppose you've got Mary whose trouble is ...

Yes.

*Female voice:* ... Joe.

Yes.

*Female voice:* Now, Joe has Faith, but Mary has a No Effect on Joe.

Right.
Female voice: Now, which is the level that – that you're looking for? The Faith or the No Effect?

Oh, you're trying to do a Goals Assessment on a PTP by doing both ends of the PTP. Is that right?

Female voice: Yeah, well, which do you want? Which – which should you go with?

Well, you want the one that falls the hardest.

Female voice: I see, so you ...

You want the most meter reaction. Run by the meter, always.

You would do a real Terminals Assessment, in order to isolate a long-term PTP. That's a real Terminals Assessment, you find both ends of this goal. You assess it. You take the one that falls the hardest, if you were doing a thorough, 100 percent assessment.

And then, you would assess that terminal on the Prehav Scale. And, of course, it is going to fall only on one level of the Prehav Scale. And actually, there's only going to be one terminal that falls hard on this long-term PTP. Okay?

Female voice: Hm-hm. So you wouldn't bother to ask the question. You'd just say – you'd find the terminal was Joe, and you'd just say, "Cause, Failed ... "

That's it. Well, let's – the reason you've got a question, is because you're not looking at, perhaps, a Terminals Assessment as a thoroughgoing thing to do with a long-term PTP.

Now, when you've got a long-term PTP, it isn't up to the auditor to say what the terminal was. It's up to the E-Meter to register it.

And when it's a long-term PTP, you would get the thing stated as to what it exactly was. And then, having gotten this statement – you see, it's sort of a Goals Assessment on difficulty, is what it really is.

You get the same thing as, you say, "Well, just what is your difficulty?" You know? And make a list of the person's difficulties with regard to a certain thing, if you want to just go at it ad nauseam, the final ne plus ultra.

And then, having found that, then you would go ahead and do a Terminals Assessment on this goal just as stated. And you'd get the cause-and-effect end of the difficulty.

Female voice: Mm-hm.

And you'd take those two ends of the difficulty. You would get terminals lists for each one. Then you would get the – by this time, probably, your PTP has disappeared, but you'd – you'd assess the thing down. You'd finally get one terminal that fell on it, and then you would assess that one terminal on your Prehav Scale.

Now, it's very possible I have missed and haven't answered your question.

Female voice: No, you have answered it and that brings up the other thing. Suppose – the two terminals in it – one of them is herself? Now, would you ever assess on self?
Oh. Well, yes. You run into this problem though: "Who is this person?" And you have to assess it on that basis.

And whenever anybody comes up with self as a terminal – you can, of course, run in some kind of a sloppy fashion – you can run O/W on self. As a matter of fact, we just did this afternoon.

We can run almost anything on self. You can get a Dynamic Assessment and find the first dynamic is the only one that falls. All right, well, you can run self. It's sort of a sloppy way to go about it. But that's pre-SOP Goals, you see?

Now that you've got SOP Goals, one of these terminals is self. Now, you would Q-and-A off into the long, far horizon as to "Who is self?" And very often the person's main terminal will fall out of the assessment. Got the idea?

Female voice: Hm-hm.

And you won't be able to get rid of the fall, and you'll find yourself sitting there – I did this identical assessment down in Greece. And the goal the fellow had was so-and-so and so-and-so, and "self". And it was something like he wanted to improve himself. And it fell off the meter and it wouldn't go away and so on. So, this left me with a Terminals Assessment of he wanted to improve himself: You get the circularization here? It's like a closed circuit.

Well, all right, you ask – for the beginning and end, you're asking the same question "Who is he?" and "Who is self?" You see?

But you – I sorted this thing out, and the fellow came up with this preponderous [preposterous?] – well, this actually creaking statement that, well, he didn't know and – and so on. And he got to thinking it over and all of a sudden, his eyes lit up and went round as lighthouses. And he says, "I'm a seeker." And that was what really fell. I got a lot of terminals, but then "I'm a seeker." And this explained, actually, everything this butterfly was doing, you see? He was going around and lighting on all the philosophies he could find, one after the other, you see? And he was a seeker.

It was a very applicable terminal. As far as I – I don't know whether it ever got run or not. I simply assessed him. The other fellow that was in the area was having a great deal of trouble, one way or the other, and I don't think they ever got down to any serious auditing. All he had to do was assess "seeker" on a Prehav Scale and he would have been off like a rocket.

But that was his PTP. That was his basic goal. It wasn't really assessed as a PTP, but his PTP and the basic goal and the difficulties he was having improving himself and all of these things all fell out of the hamper. And his goal fell right in the middle of it.

So you could commonly suspect that one of two things will happen on a present time problem of long duration when assessed just like SOP Goals – arduously, arduously, arduously. And when this is assessed very, very arduously – and by that I mean just a routine, hammer and tongs, down-to-earth SOP Goals Assessment, even though this thing is only a little snivelling PI problem of long duration. You get the idea?

One of two things is going to happen. You're either going to blow it – if it isn't on his terminal line – and never run it. Because it'll blow in the process of locating it.
You just run "What is your problem?" or "What is your difficulty?" or "Explain that difficulty." And that, all by itself, keeps changing, changing, changing, changing. The person's various difficulties start getting as-ised, as-ised, as-ised. And you find yourself chasing all over the south pasture, you see, trying to look at this thing, and through the woods too.

All right, now you've finally got one that does stick, that does fall; he has defined it. Now you get both ends of the terminal on this, the causative and the effect terminal on the thing, and you sort that on down to this PT problem. It's – it's liable to blow.

Or you've got his goals terminal. It's not a waste of time.

One – one of two things will happen: It will cease to exist, or you do have the fellow's goals terminal. Well, you've been assessing for goals all the time, although you've been calling them difficulties. Got the rundown on this?

So there is no difference in the assessment for present time problem of long duration and the assessment of goals, except just this word, one word. You don't ask for goals, you ask for difficulties.

Female voice: Thanks.

And you get that assessed.

Never take the pc's statement and run it. That I've learned the hard way. Don't take the pc's statement that his back is his real difficulty, because you all too often start to assess "back" on the E-Meter and you find out it doesn't live on the E-Meter.

He has been told by his dentist he is having trouble with his back. And he – and actually, he's having trouble with a dentist, not a back. Get the idea? He doesn't know what his troubles are, but you can sort them out. And of course, this is terrific – I mean, this is terrific auditing.

The other day somebody said well, Goals Assessment had been going on for twelve hours. Person had a twelve and a half hour intensive, didn't get changed. And the D of P and the Assoc Sec were totally agreed that it won't – didn't change because they were only doing an assessment.

Hey, come off of it! Come off of it. How – how could you assess somebody for twelve and a half hours without a change? I don't think you could do it.

You'd have to really try, you know? You'd have to get in there and put both feet in the preclear's lap and smoke a cigar, knowing he was allergic to cigar smoke and go out of communication. Connect your E-Meter up to the radiator.

And then – now and then at random intervals, tell the pc that you're in a terrible hurry and you had a train to catch and couldn't possibly, really, finish up the session because you might have to go at any minute. So he was to be prepared for this, you see?

And then run it all by Pavlovian model session. Which is have some dog's saliva, "Here is a circle. Now we'll make you into canned meat." I think that's about the way that goes. Got the idea?
So there would be a tremendous change of case if you did this. And one of those two things will happen if you assessed a present time problem of long duration all the way to its ne plus ultra of an SOP Goals. Man, he wouldn't have a problem left on the track.

That's also, by the way, a method of finding out hidden standards. You see, the lower on the scale and the less prepared a case is before you start finding an assess – a goal and terminal, the lower, the more difficulty you're going to have and the more complications you have to go into to establish the person's goal. You got the idea? In other words, the sooner you do it, you might say, earlier in the case – let's say you took a case that isn't necessarily a low-scale case that must be run on CCHs or Routine 2. But let us say you took this case, felt very uncertain, very queasy, had a lot of present time problems, rudiments were all out, CCHs would bite like mad, all kinds of complications are occurring between sessions, you see? The normal things. Because a person that's having a hard time in life, adds to the hard time they're having in life practically every moment they live outside the auditing room, you see? And it just gets more and more complicated.

And supposing, however, you just took that case and you said, "Well now, we're not going to do it the fast way. We're going to do it the – by SOP Goals."

You see, any one of these three routines can be run on any case. Except a totally unconscious person. Only the CCHs would work on that. But any one of these. It's just a question of how fast.

Well, supposing we said we were going to do an SOP Goals Assessment on this case and we did it the right way, you see? If we did, you'd probably get farther if you started assessing it sort of halfway between difficulties and goals. Because you're going to find this person with hidden standards. And the test of such a case is – whether or not a case should have been run, actually, on the CCHs – is whether the case does have hidden standards. That's a pretty good test. That's a safe test.

Not all cases that have hidden standards should be run on the CCHs, but it's a good test. One of these off-the-bat tests, you see? You say, "Well, I wonder what we ought to run on this person."

"Well, what would have to happen for you to find out that Scientology worked?"

And he says, "Well, my right ear would have to stop burning. Uh and uh, my eh – neighbor would have to get along better with his wife."

And you say, "Are they Scientologists?"

And he says, "No." And "My son would have to stop stealing chickens and uh ..."

Doesn't even have personal goals. I mean, this person – if you audit this person, somebody else gets well. I mean, wow! I mean, the pc's never even in the auditing room. And the fastest progress you'll make will be CCHs, see?

Now let's take a – a flip of the coin. Let's say to this individual, "Have you got any hidden standards about the thing?" Only, we say it in a different way. We say, "What would have to happen in order for you to know Scientology was working on you? What do you want to really have done? What do you want, really, Scientology to fix up in your life?"
And he says, "Well, uh... I don't know, nothing, nothing, no, nothing."

And you'd say, "Well, what do you consult to find out if the last session worked?"

And he says, "My left foot." [laughter]

And you say, "Well, what has to happen to your left foot for a session to work?"

And he says, "Oh, has to stop burning. It burns, you see, all the time and if it – the burning increases then I know the processing didn't work. And if it decreases then I know it did work. And if it just remains the same, why, I know it didn't work." The person says, "You know, it's kind of funny, I nev – hadn't really thought of it that way before. But that's what I test it on."

Well, this person would be an awful good bet for Routine 2. Or CCHs, you see? That's just, a – you know, an off-the-bat; you haven't got the guy's graph, anything of this sort. That – that's a good one for general runs, just starting out with. Why?

Well, actually, you make a little more progress, a little faster and you'll be able to do a faster Goals Assessment when you get around to it. All right. Oh, faster by about a tenth.

Nevertheless, on – on both of these cases you can do an SOP Goals. But on either of these two cases, you would do well to ask for difficulties as well as goals. In other words, particularly on the first one I mentioned that had to have their neighbor grow purple hair in order for him to work – Scientology worked. You'd better ask for difficulties.

You see, the rougher it is for the person to concentrate and the less a person remembers about his life, the harder it is to assess him and the more expertise and the more vias and the more twists you've got to employ in order to assess him for SOP Goals. Now, any auditor that is well trained in the assessment for SOP Goals, and so forth, would – would be able to get around all these humps. It would op – would not operate as an insuperable barrier. You would be able to get over that.

But you – you've got another problem, here. You – you know you've got complications in the lineup. And you know you're going to have to be much brighter and you're going to have to be much more alert. You're going to have to keep your rudiments in much harder. You'll find yourself occupying a tremendous amount of time with PTPs and ARC breaks and things like this in the session. You – you won't get as much goals running done, don't you see? All of these things tend to barrier, which simply stretches out the amount of time necessary.

Yet, frankly my attitude toward SOP Goals is simply monitored by what I have seen auditors doing. It isn't monitored by my own experience.

My own experience is, you take this fellow, his tongue is hanging out, he keeps tripping in it – over it as he comes in the door. His eyes are looking north, east, south and west. He has little spurts of fire come out of his temples occasionally. And he sits down, says he feels very repressed, and all three of him are having trouble. [laughter]

I'm sufficiently insouciant about it all to know that I can assess him on SOP Goals. And practically, at that case level, have done so very successfully, without too much time. So, my attitude on it is just a little bit different than the put-out attitude.
But I have seen people flubbing on this. And I have seen them getting incredible goals. They get impatient with the pc. I'm talking about a relatively untrained person, see? And he gets impatient about it, and he feeds the pc goals. And he puts his own aberrations in there. And he -- he isn't content with the pc's goals, because they don't fit what his goals would be. And I've seen various things like this happening. Well, the best action that can be taken there, rather routinely, is for the person who is auditing them to do them on CCH 1 or CCH 2 and prepare them for assessment. And they would have more success. They would do it more accurately. They'd improve the case more per unit hour of auditing. All of these other considerations enter into the thing.

On the other hand -- on the other hand -- if I were to see that a case, in eighty-nine hundred thousand hours, or whatever poor old Joe said that he had had, in terms of auditing. He spent two hours in the auditing chair for every three hours he committed overts against the organization. And didn't ever seem to add up with him. This boy -- I'd look at this tremendous backlog of auditing, you know? And I would see that nothing much had happened during that period of time. And I would say, "Well, what's the most economical, easiest, surest, surest route on this thing? Heah, let's get the CCHs. Let's break them out."

"Give me that hand."

And now, we'd know we were going someplace. You got the idea?

I suppose I, myself, would do that. But at the same time, I don't doubt my ability to get the present time problem of long duration, the pc's goal, get all the terminals associated with it and get the correct ones out of it. I haven't any doubt about being able to do that, either. And I haven't any doubt about it that, if I hit it right on the button, everything that was wrong with this pc would fold up, too.

You're going on a basis here which has to do with the fact that any of the three routines can be run on any case. It's just what can you have the most luck with, and what do you get the most certainty out of. That's about what that amounts to. Okay?

*Female voice:* Yes, thank you.

You bet. Okay, good enough. Any other questions? Yes?

*Male voice:* How do you measure a Release? How do you test a person and know that they are a Release?

How do you test a person and know that they're a Release? That's very easy. You'd say the first consideration on the thing would be an E-Meter test, if the person is not reading weirdly on the E-Meter. By weirdly, I mean his sensitivity isn't up to 16 and -- in order to get a third-of-a-dial drop. Something like that. Sensitivity is pretty reasonable.

In other words, the tone arm is down. The sensitivity knob would be down to zero. You got about a full-dial or two-dial drop. Something like this.

You got a heavy bang, you see, when the sensitivity is down to zero on a modern Mark IV British meter.

He would have to answer these questions, without getting an E-Meter reaction:
"Do you think you're getting any worse?" or "Do you think you will get any worse?"
"Does Scientology work for you?"

And "How do you feel about help?" without the thing falling off the pin.
"How do you feel about control?" without the thing falling off the pin.

If those considerations occurred and panned out, you for sure would have a Release.

This is, by the way, upgrading the state of Release quite considerably. The state of Re-
lease has always been defined exactly as follows: "Do you think you are getting any worse or
going to continue to get worse or are liable to get worse in the future?"

And the person, with great honesty, could tell you, "No, I don't think I'm going to get
worse now. I think I'll get better from here on." That was a Release.

Now, we have to make the Release testable – testable in HGCs, testable in HCOs. And
so the considerations which I just now gave you would be the considerations that you would
monitor a Release by. There are a tremendous lot of Releases in the world, only nobody ever
bothers to check them out. Answer your question?

Male voice: Yeah.

Good.

Okay. Now, I've got a few things to tell you. There are four new additions to the Pri-
mary Scale. Another Primary Scale will be in your hands shortly.

The only additions that come to a Primary Scale are those things which are actually
hanging up a case, that the case isn't likely to get to on a Secondary Scale very often. In other
words, the determination of what is on a Primary Scale – is a button important enough to stop
any of the advance of a case? You got the idea? Which would not necessarily check across
from the old Primary Scale.

Other consideration is, I don't know that the misemotional scale shouldn't be on the
Primary Scale. I still don't know that. I mean, the standard old Tone Scale of which we are
greatly enamored from a long way back – I think, actually, it belongs on the Primary Scale.
Because I see some people going around in anger. I see some people going around in resent-
ment.

The Clear in – in South Africa there, probably wouldn't have made it if I hadn't taken a
look at her. And I said, "Well, regardless of anything else, run 'resentment' on her in a few
brackets." And it took off. And that was the end of that case hang-up.

This was simply an expressed emotional tone. And because you haven't got these emo-
tional tones on the Primary Scale, you could miss this one. And I went at it half-heartedly and
put shame, blame and regret into the Primary Scale and then took them out and put them un-
der the heading of Misemotion and Emotion.

But I don't know now and probably will put back into the Primary Scale all of the old
standards – you know, shame, blame, regret, grief. You know, the rest of'em – anger and fear,
resentment, antagonism, boredom, enthusiasm.
By the way, did you ever see a needle on enthusiasm? It's quite interesting, the old Tone Scale. That's why it should be in the Primary Scale. You never fail to get a reaction someplace on that lineup. And it doesn't take too long to flatten those things off. But it's quite interesting.

There's another one that might belong on the old Primary Scale, by the way, is "Displease." Apparently, it's a very general button. "Approve" and "Displease" – they – they're apparently very powerful buttons, from way back. All we're doing is culling off of our experience, you see, of about eleven years now – culling back things that, generally would move cases and – though they become the Primary Scale.

You got some interesting things, though, on the old – the old Tone Scale. And one of them is, if you put somebody on the E-Meter – this won't happen with every case, I suppose. This only happened with those cases which I have put on the E-Meter when I happened to think about it and asked them about enthusiasm.

It's almost a rock slam question on almost any case, apparently. I mean, ask them about enthusiasm – their reaction to enthusiasm. I haven't put too many cases on, but I have noticed some odd needle responses to this single thing – enthusiasm.

It isn't the responses you would ordinarily believe should be, to enthusiasm. This is what's shocking about it, you see? This individual, apparently, responds very easily to enthusiasm – but gets a rock slam when you mention it to him, you see? But there are some oddball reactions on the old Tone Scale which, of course, do that.

And naturally, the Tone Scale is a denominator of human behavior. And we now have a great deal of technology on the old Tone Scale, and so forth.

And I don't see, in actual practice, the levels of Emotion and Misemotion leading very many cases off into the old Tone Scale. So it's not a very effective detour, you see. It's – the Tone Scale kind of would be a sub-Primary, not a Secondary, you know? I mean, it's – it falls in that category. Well, the easiest way to get it in there is just put it in the Primary.

I think the Primary Scale could probably get up to about three hundred words without getting too desperately in your hair. I would rather it stayed below a hundred. If you think that this is getting terribly long, it's because you're taking too long – your comm lags are too long on reading the E-Meter.

For instance, Dick was watching me the other night run a Primary Scale assessment and it didn't take very long, did it? I let the pc respond, heavily. I gave the pc ample time to respond. Considered it from all angles. Actually gave the pc time to even have a secondary reaction. And ran a Primary Scale. I think the first run on the thing was probably something on the order of about oh, about 110 seconds for the whole run. And I was doing it slowly. Under two minutes, probably.

You see, if you don't get that needle reaction in a tenth of a second, you haven't got anything. And the more you let your pc talk, the more body motion you have to sort out and the more latent reactions you get. So, apparently the best way to assess, when all is said and done, is the way I was doing it in the first place.
The pc sits down and – you're always doing that to me, making me detour off to something I know works for me. The pc sits down and you say, "Shut up!"

And you aren't talking to the pc anyhow, you're not assessing the pc, you're assessing a reactive bank, don't you see?

And you say, "Now shut up." Oh, you say it politely, of course. You say, "Now, you don't have to answer any of these questions I'm asking you or acknowledge any of these things. Just sit there and pay some attention to what I'm saying and shut up!" [laughter]

And then you go off, bark, bark, bark, bark, bark, just reading your levels, at about that speed, you know? Bark, bark, bark. If you haven't got a reaction in a tenth of a second, you aren't going to get one anyhow. What takes you time is, having found a reaction, you have to make a notation on your paper.

Now, you read the whole thing, from the bottom to the top – Faith being at the bottom. And you go on up to the top of the scale and then you've made certain marks. Not "one and one-thousandth divisions fall," or anything like this. You've just made a pencil-touch.

You can use up an awful lot of mimeographed sheets like this, but who cares. I stretch a mimeographed sheet by going it over one time with dots. I'll assess a pc with dots and I'll notice that this sheet is pretty gummy with dots, so the next time I will assess the next pc with circles. Do you see?

When they react on a thing a second time, I put down a – first time, I put down a circle. When they react on the second time, I'll put down a circle. If they react a third time, I'll put down another circle after the level, you see?

And I notice this thing's getting gummy with dots and circles, so now I assess the next one with X's. The test of the sheet is, whether or not I can still read the scale itself. You don't get lost doing this.

So anyhow, you read them just from the bottom to the top. Of course, it's – the scale is arranged backwards, so that's easy to do, Faith being at the bottom. And you go bark, bark, bark. That one reacted so you put a dot. Bark, bark, bark – just reading your levels, you see?

By the way, you look at the sheet and pick up the word and then look at the meter and bark. You got the idea? See? You don't look at the sheet and read the level and then look at the meter to see if you get a reaction. Because, actually, the reactions you want will have probably be gone by the time you looked up.

You look at the sheet, you read the level to yourself and say it at the meter. Don't say it till your eyes are on the needle. It give you an odd sensation the first few times you do it, you know? You feel like you're double-duplicating a something or other, you know?

You read – you read "Faith" to yourself – you see, "Faith" to yourself and then you look at the meter and say "Faith", you know? "Cause." It's like reading elocution lessons to a fast-talker. Anyway, that's the fast way to do it. And don't say the word till you get your eye on the needle. And if it doesn't react within a tenth of a second, you simply read the next one.

If the needle agitates, however, on some secondary or latent reaction or something like that, why, you let it settle down again, which it'll do in a moment or two.
So what you really are doing – let me put this exactly straight. You look at the level, so that you know what level to say. And then you look at the meter, see that the needle is quiet or only rising. Say the level. See if there's a reaction within a tenth of a second. And if there isn't one within three quarters of a second, look back at your paper, pick up the next level and so forth.

And if there is a reaction, you merely touch your pencil to the Prehav sheet that you are using at that point, making a dot, a circle, some other symbol that won't tangle you up.

When you get to the top of the list – remember you're assessing a reactive mind and boy, does a reactive mind react. Why does it react? Well, it reacts because there's no time in it, that's why. There's an electrical charge, but no time. Time is jammed in the reactive mind a hundred percent. All right.

So therefore, wait for a second, you'll get the latent read. You've now got a reading on something else! Now, you go chasing that down and we've just got a case that is going to take seventy-five hours on one Joburg. A seventy-five hour run on one time through on a Joburg. Now what is that auditor doing?

Oh, yes, he's getting all, all kinds of things. And he isn't doing the case any harm. But he also is not following down the center of the road. He's driving over to see the outskirts. And he's looking at the cathedral. And he's looking at the place where the ashman was buried and, that's where the witches were martyred and so on. And he – having a good time going down to the river to see what they're catching down there. And he hasn't anything to do with getting an assessment done. He's running a paid – or an unpaid tour of Irrevelancia, which is a country that auditors sometimes like to explore.

The latent read – the read that occurs within one second, or within three seconds, or within five seconds of after you say anything – whether a Security Check question or a level or a goal or anything else – is a related read. It is not a read on what you have said. It is a related read and it is only related. And no matter how many ways you slice the cake or crumble the cookie, it turns out that you have gone on a self-conducted tour of Irrevelancia.

Oh, it does a case a lot of good. You say, "Have you ever stolen any cats?" And the pc says, "Hmmm..." – clang. You have now read an analytical response. The theft of cats is in the analytical sphere. Why explore it? Since it's explored! This is something like everybody going over the footsteps of Columbus to find out what he discovered, you know? The pc has already been there. There's probably not even much charge on it.

So Irrevelancia would now present this interesting scenery:

"Well, I had an aunt once who stole a cat."

"Oh. Oh, I see."

Now, if you're really in Irrevelancia, even wearing the uniform of the day in Irrevelancia, why you inevitably, of course, ask the next question, which is "Well, that – did that give you any idea that you had stolen any cats?" "What kind of cats were they that your aunt used to steal?" Or better still, "Did you know your aunt very well?" [laughter]
Now you're not on even – you're not even in the State of Irrevelancia. You are over there beyond the border into nothing but Dispersal. And the State of Dispersal is poorly governed at best.

So, here is where you are – here's where you belong, is on that tenth of a second boulevard. And you'll find out, "Did you steal any cats?" ... twitch. "What was that?"

"Well, I had an aunt once that stole some cats."

"Well, what was your aunt's name?"

Now, this is a 75-, 125-hour, one coverage of the Joburg. As compared to this:

"Have you stolen any cats?"

"Have you eaten any bonbons?"

And the pc says, "On the subject of cats ..."

And you say, "Yes, what about cats?" Mustn't go out of two-way comm with your pc. Purely courtesy. "Yeah, what about cats?"

"I just happened to think, I haven't stolen any cats. It was my aunt that stole some cats."

You say, "Thank you. Thank you very much. Now about these bonbons... Good."

"Have you any illicit diamonds bought?" [laughter]

Here we go, see? It's just bang – bang – bang. Wait for the needle to settle. Read the question – bang. Here's the question, question, question.

And you find, all of a sudden, the 199-pound wins are all in your lap. The State of Irrelevancy is not well explored and the State of Dispersal has been totally ignored and left to its own congress and president.

All right? You see how you do these things right? I don't know what got me started on that, but that's – you can get an awful lot of auditing done on instant needle response.

So get these two terms down, because you're going to have to criticize them in students left and right, center – HGC auditors left, right and center. When you see them again – Ds of Ps – sneer!

The person says, "Well, here's this case and he's been twenty-seven and a half hours here on this Joburg."

At that moment you say, "Ow. You're following latent reads, eh?"

Auditor says, "Latent reads? Latent reads? What's a latent read?"

"I don't know. Did you learn to read latent light?" [laughter]

You say, "When that e-meter doesn't react in one-tenth of a second – bap – you leaves it alone. You don't twitch the steering wheel. You go right on down the road. 'Cause it's just a Burmashave sign, I don't think they make it anymore." [laughter]
Latent read – a read that occurs within two to three seconds after the answering the question is nowhere for an auditor. It is nowhere on a goal, it is nowhere on a terminal, it is nowhere on a level. What you want is instant reads. Your pc shuts up, and you read it. You don't have to have the pc answering the auditing question verbally or giving his opinion on how he feels that this assessment at this particular level is going at this time.

Because you're auditing a reactive mind. And that's your proper auditing target. And all auditors using the analytical mind as an auditing target make nobody any better. And there is the primary slow-down in auditing and I found it not very long ago, and that really blew the lid off. All of a sudden we got speed, speed, speed, speed, speed – it isn't that we have to go in a tearing hurry, but this state of irrelevancy is getting so boring to me – if I hear about just one more aunt, you see?

See, I'm not auditing his aunt. I'm auditing the pc. Got it? It's whether he stole any cats, he, it. I don't care while he was being a "what".

Well, a person said, "Well, when I was a ... a street sweeper, in... Athens... well, I sweep up an awful lot of dead bodies of cats, and, ah... so forth... and actually did steal some cats at that time, but while I stole them, I was just being a street sweeper. So of course I was not responsible at the time, for being a street sweeper, so the answer to the question is – no, I myself have never stolen any cats."

I don't know how we made any auditing time up with this one, you see. All we found out is that he's irresponsible for the beingnesses he's being, and we know that all the time, because that's why we're auditing him. [laughter]

So there is your – there is your line-up. Got it?

Okay, when he can take full responsibility for as a street sweeper in Athens, he not only remembers having been a street sweeper in Athens, but he takes responsibility for the deeds of the street sweeper in Athens, and that's why your Security Checks pan out and he gets stronger and stronger and better and better, and the person has more and more withholds and so forth – and you see all this phenomena I'm talking about, of fast responses, when you do by instant read. And you never see it when you do by latent read.

So it all looks very silly, you see, if you say, "Well, we're getting marvelous gains these days", it sounds like an advertising agency, you see. You will not ever gonna get any if you go on latent reads. It's just gonna cut them all out.

When you ask this pc this security question or this assessment, you are asking in present time, right now, whether this pc's reactive mind does or does not have charge in it on the subject of, which means he's come up to the borderline of being able almost to take responsibility for it himself. And it'll blow [claps] like that, and it'll blow [claps] like that.

And those which are so buried that he doesn't even remember them and he can't dig them up are latent reads. The instantaneousness of it says, "This apple is about to be plucked. Stand away from underneath this tree. We is about to have a shower."
When you say – when you say, "Have you ever stolen any cats?", and it's just pang right there, bing!, you see? Instant response. The pc can find out about that right now and tell you right now or not tell you right now.

Now, a consistent and continual instant read taking place within about a tenth of a second after the question – the pc knows about this. He and his reactive mind are now occupying exactly the same strata. The more he withholds, the more knowingness which he denies the human race, people around him and himself, the more stupid he's going to get and the more reactive he's going to become.

That is why you run sec checks. So this individual will get better to the degree that you pluck the instant reads, and he will hang-fire to the degree that you pluck the latent reads, and that's all there is to it. Then you're auditing straight at his reactive mind, you're picking up what is in his reactive mind, your e-meter is behaving exactly right, all the rules of auditing fall exactly into place, and everything goes off at a startled zoom!

IF YOU DON'T DO THAT – POOH. IT IS MONKEYING AROUND. THIS IS OF COURSE ABOVE AND BEYOND KNOWING WHICH IS THE TONE ARM. YOU TALK TO SOMEBODY ABOUT INSTANT READS AND LATENT READS, AND HE'S ALL THE TIME SAYING, ... [FUMBLES WITH THE E-METER]... [LAUGHTER] "MAKER'S NAME, MADE BY INSTRUMENT, TAKE A LOOK WHO THEY ARE. WHAT IS THIS THING? WHY, IT'S AN ASH-TRAY." YOU TALK TO HIM ABOUT THE E-METER WHEN HE HASN'T GOT HIS TR 0 FLAT. SO HE'S TRYING TO CONFESS THE PC, BUT HE CAN'T CONFESS THE PC, SO HE CAN'T READ THE E-METER, "WHAT'S THIS?", HE'S DISTRACTED, "E-METER?", DOESN'T UNDERSTAND THE E-METER, [FUMBLES WITH THE E-METER]... HE'S GONE MAD, YOU'VE GIVEN HIM TWO THINGS TO DO, EITHER ONE OF WHICH HE CAN DO, AND IF YOU THEN CAME IN ON TOP OF THEM AND SAID, "LISTEN HERE. IF I CATCH YOU READING ANY LATENT READS, I WILL BE VERY UPSET WITH YOU, SO DON'T FOLLOW DOWN LATENT READS." AND HE SAYS, "LATENT... LATENT READS." [LAUGHTER]

ON WHAT? ON WHAT? SO THERE'S OTHER THINGS YOU HAVE TO KNOW BEFORE YOU CAN FAST-READ AN E-METER.

NOW, THE OTHER THING IS YOUR, YOUR RESPONSE TO THE PC AND YOUR WILLINGNESS TO Q AND A, THIS IS THE OTHER SLOWDOWN. YOUR WILLINGNESS TO Q AND A, YOUR WILLINGNESS TO INVESTIGATE THE FISH THAT ARE NOW JUMPING DOWN BY THE STREAM UNDER THE BRIDGE THAT IS 12 MILES OFF YOUR COURSE. AND THE PC AT THIS MOMENT SAYS, "THERE ARE SOME HERRINGS JUMPING UNDER THE BRIDGE, AND WOULDN'T YOU LIKE TO SEE THESE HERRINGS, BECAUSE IT'S GETTING AWFULLY UNCOMFORTABLE WHERE I'M SITTING HERE. AND IF YOU ARE GOING AT THIS WITH THIS TOO MUCH VELOCITY, MAN, YOU'RE LIABLE TO CLEAR ME OR SOMETHING, YOU KNOW?"

YOU SAY, "HAVE YOU EVER STOLEN ANY CATS?", AND THE PC SAYS, "... ER... UM... SEE, I'VE GOT A BAD PAIN IN MY SHOULD – HAVING THIS PRESENT TIME PROBLEM – I HAD THIS PRESENT TIME PROBLEM FOR SOME TIME NOW DURING THE SESSION, AND ER... SO THERE'S ALL THESE HERRINGS UNDER THE BRIDGE, YOU KNOW?"

AND YOU SAY TO HIM, "HEY, ER... THAT WAS A PRETTY FISH, I'M SORT OF TIRED OF SITTING HERE AUDITING, TOO", AS THE UNDERSTOOD SITUATION, YOU SEE, AND YOU SAY, "WHAT COLOR ARE THESE HERRING?" AND "HOW LONG HAVE YOU HAD THIS... SHOULDER?" [LAUGHTER]

"WELL, MY... I HAD... EVER SINCE MY FATHER HAD A BAD SHOULDER, I'VE HAD IT EVER SINCE... MY FATHER, ACTUALLY, I HIT HIM ONE TIME ON THE SHOULDER WITH A STICK, AND I'VE HAD THIS BAD SHOULDER..." BOY, THE GUY IS SAYING "BOY, I REALLY GOT HIM OVER THE HILLS AND FAR AWAY NOW. IF I CAN JUST SHOW HIM A FEW MORE FISH UNDERNEATH THIS BRIDGE, WE'LL SIT HERE A-A-ALL DAY!"

And an auditor is, actually, tremendously respected by a pc if he simply says, "Well, very good. How's that seem to you? All right. Is it all right if we go on with the session?"
"Yes. Well, I ... it's all right."

"Now, have you any illicit diamonds bought?" Obviously expecting this, you see?

*Boom!*

"Yeah, I was head of the ring for twelve years."

Now, you're getting auditing done, don't you see?

Every valence fights for survival. The pc can do nothing but survive. The valence can perish. And so, learneth and runneth the lesson of lifeth. And whenever you have anything struggling for survival, it is not the pc. It is the valence.

So, you have somebody saying, "Put me down, put me down, put me down. Because, if you – if you just ask two more questions, I'm getting off ... And – and this pain um – and the head, y – is – ah – uh – gosh! Uh, you know? And – and uh, so forth and I just don't want ...

And when you get all these things, you couldn't possibly be looking at the pc. That's all there is to it. You're seeing a struggle for survival of aberration. Because nobody can stay around us very long without finding that willy-nilly, they do get better. And if they don't easily learn this lesson, why, it's just a valence struggling one way or the other.

I'm not now trying to give us anything that's self-congratulatory or an easy way out. We don't need any alibis. But where we see the red herrings being pitched, the pc is very often doing it against his will. And is saying to himself, "I really shouldn't be doing this to this auditor."

But if the pc is a very clever pc and he is a very smart pc and this valence that he is wearing is notably well educated into the roads and byroads – in fact wrote the guidebook; wrote the guidebook for the State of Dispersal – he will take advantage of his auditor.

And sometimes he does it so persuasively and so convincingly that anybody is sidetracked. And it looks so good. And from the moment that this occurs, on through, you don't get any auditing done. And it's just a waste of time, even though it seems like something's going on.

And there's where your Releases and Clears are going. It's just on that one basis. And on that one basis only. The auditor is being taken advantage of by a reactive valence which is struggling for survival.

Now, there is a very interesting thing about auditing: is you must keep the reactive valence quiet enough and give it no motivators by which it can object. That is the rest of the game. And the Auditor's Code is totally devoted to keeping the valence unwarned, giving it no motivators, so that its survival does not feel challenged. You got it?

And if you do that, all of a sudden the fellow says, "What am I doing sitting here wearing this trash heap? That's an interesting thing to be wearing! How fascinating. By golly, I've gone along for the last several million years wearing a trash heap and everybody said it was a Paris hat." [laughs]
So, here's the conflict that is going on all the time. It looks so very funny, but actually the pc gets most upset by the auditor's failure to take care of – bulldoze through the case. And that is where a pc's real upset with an auditor occurs. It's something to remember. If you're going to get a pc that's going to be ARC breaky, it is because the pc has lost confidence.

In other words, the valence sat up and said, "Red herrings, red herrings, red herrings. Look under the bridge, look under the bridge," and the auditor looked under the bridge.

And the pc says, "Oh, God, am I going to spend another eight hundred trillion years in this ash heap?" See? And that's the ARC break.

You watch it. The auditor fails to push the pc through something. And then, you just watch that pc for the next few sessions. And it may take him a few sessions to become unmanageable, but he will.

Why don't I get in more trouble with pcs? When I audit pcs who are recalcitrant – I don't advise you to do this sort of thing, but the pc blew the session and was en route to the door – did you ever see one of these adagio dances? Well, I didn't bother to get out of my chair. I just reached up, grabbed the pc, whirled the pc around once. The pc went back in the chair, crash. And I repeated the auditing question and never mentioned the incident.

The pc went square into session again, answered the question and we went on as before and we didn't hear any more talk about blowing. And quite in addition to that, the pc made a real gain in that session.

I didn't even say, "Hey, you, come back here." I didn't even validate the valence that much, you see? I just reached out with my right hand, grabbed the pc, spun the pc around once and sat her back in the chair – boom! And I repeated the auditing question. Wasn't even any misemotion involved with it. And the valence sort of said, "Well, send for the stonecutters. I's gonna need a tomb. I has met mah match." And that was it.

But supposing I had let the pc get out the door. The pc would have been mad at me from there on. Because I pulled an ARC break? No, because there was no ARC break. Nothing caused this but my insistence that the pc answer an auditing command, which was highly uncomfortable. I wasn't even insisting. I just gave the pc the auditing command.

The auditing command was very uncomfortable and the pc said, "Nyah-nyah-nyah-yap-yap-yap-yap." And I said, "I'll repeat the auditing command."

And the pc flung herself out of the chair, went to the door, found herself back in the chair again. I repeated the auditing command. The pc answered it. And the session went on and all was beautiful. And there was no three hours and seventy-five minutes devoted to clearing up the ARC break with the pc.

I cleared the ARC break up with the pc by giving the next auditing question, by showing that as an auditor I was perfectly willing to handle the situation and take responsibility for my environment and see that the pc got some auditing. And that was what I was there for and that's what I did, see? Without any apologies.
And you'll find out, this approach to auditing has a certain deadly certitude about it which penetrates through the most knuckleheaded valences, but which must never happen with any misemotion. It's just positiveness. It's just certainty. You want the pc to do that. You are certain the pc is going to do that. And when the pc does that and the pc makes a gain, the valence loses.

And when you don't approach it with certainty and when you don't approach it with — well, you sort of approach it nebulously and, "I'm going to patch it all up. And I'm going to be very, very careful here. And I — I hope I didn't offend you terribly by — by throwing you halfway across the room while you were trying to get away under 8-C. And — and I — I hope not and — and so — so forth ..." You're "kinding" the pc to death.

And you're just patting that valence on the head and saying, "Good valence, you're dangerous. Good valence, you're dangerous. You know, I think you really should survive, valence, because you're so dangerous. And it's very difficult, you know, to handle you, valence. And you're very, very difficult to handle."

And I never believed this. So the valence never gets a chance to believe it. The valence says, "Well, I've had it!" And the pc says, "Well, thank God!" It's just a difference of auditing certainty.

And you'll find this instant-readed approach boosts up that appearance of certainty. And the valence sits up and says, "Oh, no! Here I've been out of this bottle for eighteen trillion years and nobody's found me out yet. And here is a guy and there — he just keeps sawing away chunks of smoke. Do you suppose this fellow I have overwhumped here, totally and one hundred percent, is actually going to get away from me? Hmm!" Valence ceases to activate.

The more you audit apologetically, the more weakly, the less certainly you audit, the more you validate the pc's circuits and their power. And if you know what you are doing, if you know your business, you don't have to be rough and tough. It simply communicates to the pc, while you are auditing the pc, in terms of certainty. And when that certainty goes through, it goes straight through to the pc. And the valences he's got and all this nonsense — they're just invalidated like mad. You're trying to validate the pc and invalidate the valences. And that's all there is to good auditing.

I've seen occasionally, in an ACC, I all of a sudden will get very enthusiastic. And I'll go around and hit all the auditors in the back of the head, practically — you've seen me do it — and say, "Go on in there. Go on in there. Ask him now and don't pay any attention to that. Just ride that thing through. Come on," and that sort of thing.

And the auditors sit up and start to audit for blood, you know? Just real, dripping gore. They — they want raw meat. And the valences all say, "Well, we've been sitting here getting away with this — God! Look what's happen — uhngh!"

And they just start running up little dirty handkerchiefs, you see, as white flags and so forth. And you don't even pay any attention to that. Don't even let them surrender. Just blow the fort apart. It's very unnerving to a valence.
And all of a sudden we've got tremendous case changes. We just get a tremendous re-
surge of cases and so forth, as long as we persuade through that attitude of auditing. "Go to it, terrier! We know it's a long deep hole, but you can make it."

And all of a sudden, the auditor sits right there, you see, and the pc's been saying, "Well, that's – these chairs are awfully hard and the cats are crawling all over the roof. And you keep answering – asking these embarrassing questions," and all of this sort of thing.

And the auditor keeps saying, "Well, I'm awfully sorry, but you see, I'm being made to do it. And I'm not taking any real responsibility for the session here, because they're forcing me to do it. And the Instructor is really auditing you. I am not."

No gains occur. Why? Because the whole thing is devoted to the validation of a false valence which is interested in survival. Okay?

All right. There being no other questions before the house, I think we had better ab-
scend. Thank you very much.
SEC CHECK QUESTIONS, MUTUAL RUDIMENTS

A lecture given on
20 June 1961

Thank you.
Give her the applause, she's doing all the work! I don't know how she does it. I think she's got you all fooled.

I've seen her tremendously popular. I've seen her step up on a congress stage and I didn't think anybody on the whole continent had ever heard of her, you know. And, you know, for the local Assoc Sec everybody applauds, you know, a little bit. And everybody applauds, and applauds for the others. And all of a sudden, you introduce Mary Sue, and the chandeliers jump! You know? I don't know how she does it.

I'm sure that being a very excellent D of P, always getting results, all that sort of thing – I don't think that has much to do with it.

It's the prevailing opinion in most Central Organizations and Scientology areas, current moment, that getting tremendous results and big wins has nothing to do with administration or income or keeping the show on the road or doing anything about the world. And this we are trying to change. And one of the things this Saint Hill Course is devoted to is trying to change just that. Okay?

Now, let's see. This – when I last looked – it might have changed since I came down here – but it was the 20th of June when I was upstairs, and it was 1961. But looking around here, I see that it isn't 1961, in a couple of cases.

Now, I see a note here, that a question has been asked sufficiently of Mary Sue, that she wants this answered by me in this briefing lineup.

She says, "When doing ..." – I haven't read this in advance. "When doing a Security Check, don't just keep repeating the same question, allowing the person to say, 'I don't know.' Vary questions, so as to give the pc a hand, returning always, of course, to your original question in the Security Check."

Oh, man! This is a wide-open invitation to a Q and A, like I was talking to you about the other day. And every time auditors get turned loose on varying the question, a tremendous amount of randomness enters into auditing. And tremendous auditing failures occur, madly, in all directions.
So, when I tell you that this is something you have to know very well – the difference between varying a question, and Q-and-Aing with the pc.

Now, if you can get that down, you can really do a red-hot Security Check. But let me tell you, that this has been a very difficult point to get across.

Now, I'll give you – try to give you a couple of examples, here, off the bat, that are like this:

Auditor: "Have you ever stolen any cats?"

Pc: "Well, I don't know."

Auditor (having seen a reaction on the meter): "Well, do you know anybody that has stolen any cats?"

The pc says, "Yes, my aunt once stole some cats."

The auditor: "What was her name?"

Now, that is a Q and A. In the first place, who does it ... what does it matter who else stole some cats? We're not auditing his aunt. Well, we couldn't care about this. This is not a varied question.

The next point is, that is a direct Q and A. Now, a Q and A is defined, this way. The reason it exists – it is question and answer. But there is a technical fact that the perfect answer to any question is the question. It is colloquially used.

This is the Philadelphia Congress of 1953 – Philadelphia Congress, fall 1953 took this up, completely, and it's never been mentioned since.

It is an oddity, and a perfectly worthwhile one to know, that the perfect answer to any question, of course, is the question. Therefore, when the question is phrased exactly right, it answers itself. This is the engineer's version of this.

There's a fellow by the name of "Ninety-nine Percent Johnson" at MIT, and every student from time immemorial called the man "Ninety-nine Percent." I don't know that he ever knew this. But he was fond of saying, "The question which is asked right is already 99 percent answered."

And this is very true. You can take an engineering problem, or any other kind of problem, or a human problem (if there's any vast difference), and if you can ask the right question – the exact question – it's already practically answered.

You're trying to lay out, let us say, the location of serving equipment or something, in a hotel kitchen. And you keep pushing escalators and dumb waiters and so forth around on your drawing paper, you see. "And you get this and so on." And you finally wake up and say, "Well, what the hell am I doing here?" You know?

This is all a good thing to do, sooner or later, after you've been working on some problem, it hasn't solved itself in a few hours or days. "Why, what am I doing? Just what am I doing?" And that is an awfully good question.
And you suddenly wake up to the fact that what you have been doing is arranging machinery. But what you are really doing is trying – trying to arrange serving equipment in a hotel kitchen.

And you say, "Well, what am I doing?" you see. And the answer is "What am I trying to arrange?" or "What am I trying to get accomplished?" And these questions are different questions.

And you all of a sudden say, "Well. Ah, yes! I'm trying to get food." I'm not fooling with an engineering dra – .

This is why there's very few good layout engineers, or very few good design engineers. A country's mechanical progress goes along as fast as it gets good design engineers, by the way. And they're, accidentally, only as fast as or only as good as they are able to ask questions of themselves or their work or the world at large.

And a smart one will go down – after he's worked with this for a long time and he can't seem to get all his pantry equipment in straight – he's liable to get the actually brilliant idea of going down and finding the man who's going to use it, and asking him, "What do you try to do in a kitchen?" you see? "In getting – what are – what are you trying to do in a kitchen?"

And the fellow gives him this terrific, revelatory answer, you see? Which is, "Well, we're preparing food for the guests."

"Huuuu..." [laughter] That's a new one, see? "Aw, then, all of this stuff I've been fooling with on the drawing board ... You mean, I'm trying to get food from the kitchen to – how many rooms? How many dining rooms?"

"Well, there's eight private dining rooms. There's the staff dining room. There's the main dining room for hotel guests. There's a public dining room. And all the food comes from this one galley – this one kitchen here. And it all goes ..."

The guy says, "Yeah! Now, let's see. You're trying to get food there. What condition must the food be in when it arrives?"

"Well..." The guy says, "Well, it must be hot. It must be still crisp. It must be this, it must be that. It must be easily identified", [laughter] "...and it must be very rapid. And there must be a place, down here, for the cooks to get orders, to put it together and throw it up onto things, and then it can be recovered and shunted ..."

"Oh," the fellow says, "what you need is a – an IBM sorting system."

The fellow says, "An IBM sorting system in a hotel kitchen? What are you talking about?"

And the dining engineer says, "That's what you need. That's what you're going to get, too."

And then so all of a sudden, mysteriously, at the Conrad – the Conrad Filcher, new hotel in Glasgow – which never before has it ever happened that anybody in the dining room ever got anything to eat – all of a sudden, this starts occurring. And everybody gets very
happy all up and down the lines, and so forth. Why? ’Cause somebody asked the right question. That's all.

Well, old Ninety-nine Percent Johnson – he claimed that if you phrased the question that you were asking exactly right, that it was instantly answerable, see? Well, theoretically, the 100 percent – not the 99 but the 100 percent answer to "How is the weather today?" is "How is the weather today?"

See, that's a perfect duplication on the cause-distance-effect communication line in Scientology, see? So, "How is the weather today?" – "How is the weather today?" Now that's the 100 percent.

What you're trying to do is come as close to the 100 percent as you can. You want this withhold. So it's "What am I trying to do? I'm trying to get the not-knows that this character is running on the world off of the case, so that he'll brighten up and get on the run." See, "What am I doing here?" That's the first thing you've got to ask yourself.

Now, that you know – I told you just the other day – this is why you are giving a Security Check. Not to be nosy, not to make people feel embarrassed, and not because Ron said so, see, but actually, to get the characters to release these tremendous overts of not-knowingness, because it's got them parked in total stupidity. You're not running failed withhold on the pc. You are running overts called "Keep 'em stupid." Got it?

Now, when he stole something, it disappeared and its owner couldn't find it. And a tremendous not-know was entered into the owner's sphere of livingness, right? It's an overt. To hell with whether or not mest passed. That is the basic overt.

So when you make these things known and scrape them out of the pc's reactive bank and get them up into his zone of knowingness, you raise, of course, his intelligence. Therefore, you raise his knowingness. Therefore, his responsibility comes up enormously, right?

Processing, in general, raises his responsibility and throws these not-knowingnesses into restimulation. And unless they are released or vented, then the pc does not make any further progress. And the fastest way in the world to stop a pc's progress is to do a lousy Security Check.

Now, you can audit with your finger just exactly, properly, correctly held in holding the E-Meter. You can say all the right incantations and rituals. You can have incense in your electrodes, swinging from right to left in a rhythmic way. You can do your auditing with the proper Latin chant going in the background.

No matter how good this auditing is, no matter how expertly you have assessed your pc, no matter how minutely you have followed through the auditing command and cleared each one, no matter how well you've gotten the rudiments off; you are still going to run into this one: You're going to get that case along just a few yards up the line, and you've increased his responsibility to a point where his overts now hurt.

These withholds, these not-knowingness overts now hurt. Because you're increasing his knowingness, so therefore they're being revealed to him. And they're not-knowingnesses,
and he cannot vent these things, and he can't get rid of it. And that not-knowingness just stays like a cyst in his mind. See, his case progress stops right there. Boom.

This makes another method of stopping case progress.

One of those methods is to audit with a rudiment out. The way you can deteriorate a case is to audit with an ARC break in existence. A case will deteriorate with the ARC break. A present time problem? The case will not change. With a withhold on, the case will not change.

And by failing to give expertly administered Security Checks at routine and regular intervals throughout processing, you stop the overall progress of the case, just as though you had let him run into the bumpers on the end of a train track.

He's going to get unhappy. And the better you audit from there on, the unhappier he's going to get. Why? Because auditing begins to hurt. So he all of a sudden realizes that it wasn't a smart thing to do to jilt these nine girls in high school, that he really upset them. That years afterwards, actually, he found out that he'd made a tramp out of a couple of them, you know? And this was not smart.

You're auditing away on the "Failed Sneeze." And he all of a sudden goes, "...Uuuuuh." You're asking this boy to confront his life, aren't you?

Well, the reason he didn't ever get well in the past, automatically, was because it was too painful to take responsibility for the things he had done. It hurt. So he'd take his theetie-weetie, Dale Carnegie Dramamine pills, and get to feeling a little bit better. And he'd go thumm!

This, by the way, is the manic-depressive. He feels wonderful until he suddenly realizes he has an overt. So he feels lousy. Then he recovers from this, and then he feels wonderful till he realizes this same overt again. Well, it just will keep going in the same stupid, dizzy cycle, on and and on and on. It'll never release.

So when Scientology got hot and its case advances got rapid, all of a sudden this new factor showed up. And it was a brand-new factor: that cases exceeded – could be made to exceed, through auditing, their ability to tolerate their improved condition, and what you had to do was let the steam off. And the mechanism to let the steam off – that was absolutely necessary in this particular case – was what we're calling Security Checks, more properly called processing checks.

And unless those are given well, wow! You're just going to park a case. And your rudiments can be out, and you won't get gains on the case. You can have a wrong assessment – that'd really be a nice way to get no gain on a case. And you can fail to give Security Checks properly and, man, then you'll get no gain on a case, beyond a certain zone.

Why does this fellow's leg hurt? You audit it, it feels better, and then the next day it hurts. Why? Well, you audited it up to a point where he could recognize his responsibility for it, and then you didn't give him any chance to come off of it. Isn't this cute? Isn't that fascinating?
About the cruelest thing you could do to a case would be leave its withholds on it, for any reason under the sun, not to clean up this case's withholds.

Now, we found that auditors don't do well when they're just turned loose to ask, "Do you have any withholds? Thank you. Do you have any withholds? Thank you. Do you have any withholds? Thank you. Do you have any withholds? Thank you." They don't do well this way. So you have a Security Check that particularizes all types of withholds.

As a matter of fact, there are some new Security Checks. We were dreaming them up the other day. I said there could be Security Checks. Jan got real busy, Dick got real busy, and man, they really whipped you up some Security Checks. There's some staff member Security Checks, there's an HGC pc Security Check, Academy student Security Check. The staff member Security Check isn't being yet, but the others are.

Now, that's just particularized types of withholds that would be – if any of them were out – it's like rudiments – if any of those were live, the case would only do so much advance and then stop advancing. Unless that withhold is gotten off, in other words, the case is going to stop in its advance, right there. Screaming brakes – boom! Do you see this?

Why? Because the auditing increases his ability to take responsibility. His ability to take responsibility blows into view the withholds!

As soon as the withhold comes into view to him, if he has no chance to impart this withhold, oh, he's miserable! So of course, he says, "I'd feel better if I were aberrated." And he's absolutely right. He'd feel much better being stupid and aberrated and president. You got the idea? I mean, he halts his own forward progress.

And there's the primary reason why you had Clear slumps. That's the reason for your Clear slumps, not the guy postulating himself into the ground. He ran into his own bank. He had to confront it all at once. And gradually, as time went on... I said there was a settling out period for a Clear? Well, if any time during that settling out period he all of a sudden found himself confronted with the tremendous irresponsibilities of his own background, and it became too painful, he said, "I better be aberrated."

Absence of Security Check, then, is the most effective way of halting a rapid case gain toward Clear. Have you got that? This was a bug.

We used to have another mechanism, and actually have had for seven years another mechanism, which we used rather constantly. And we don't find it in our midst right now. We used to do this with a responsibility process of one version or another – Confront or Responsibility. You got it?

We used to accomplish, less ably, the same mechanism. Unless you ran responsibility on an engram, we used to say, why, it wouldn't stay stably gone. Okay? You remember that? All right. Well, now that was the same mechanism at work there, but not well articulated, not well understood, and so forth. Now, we've got another mechanism that supplants that and that does it a thousand times better. So, you've got to learn how to use that ably.

But just as the pc does not clear up well on "Have you got a withhold? Thank you. Have you got a withhold? Thank you. Have you got a withhold? Thank you. Have you got a
withhold? Thank you. Have you got a withhold? Thank you. Have you got a with..." You know you can run him for a week and a half on that process with no difficulties whatsoever? They did it on the 22nd American, didn't you? And it didn't arrive anywhere. All right, why?

Well, the pc is trying to avoid all of his withholds. And if the auditor can't remember all of the viciousness of man all the time, you then don't get any interrogation which results in a release of the exact withholds the pc is withholding. So this is fast! Presession 37 went back to the oxcart. You know? We relegated it to the Metropolitan Museum.

I heard from them today, by the way, or yesterday. And I find out, they have all the art objects of any kind that they will ever need, and know all there is to know about the whole track.

And I'm on an awful withhold today from the Metropolitan Museum. On two or three occasions, I've been doing work with Scientology organizations and other things – sitting up at my desk, talking to Peter, doing other things. And it's a terrible temptation to write them and say, "Congratulations." You know? "Congratulations upon the abundance and finality of all of your collections."

How I'd come to hear from this, I'd asked them an embarrassing question or two, and I found out that they don't need anything in their museum. Nothing. They've got everything.

I wasn't trying to give them anything I was – I thought that there was a possibility that there was a place they might get something. And we find out they have everything they want.

I think that's pretty good, isn't it? It's like some self-satisfied pc. And you'll get this self-satisfied pc that doesn't want to improve. Well, why doesn't he want to improve? Because it might be painful, and something might show up.

You would have to audit the curators – combined and collected – of the Metropolitan Museum, and get off their whole track overts, before they would accept the specimens that they ought to have in the Metropolitan Museum of Art of New York City. Because it shows up grandly that these characters are restimulated by the crown jewels of Ophir. Because they, of course, stole them once. That's why they're there. They're now in the valence of the brass watchdog they used to have on them. [laughter]

But any more collection would lead to more knowingness. And more knowingness to these characters – because of the peculiarity of their position – might be painful. So we have whole societies becoming very self-satisfied about what they know. They know all there is to know about everything. That is a mechanism.

"Let's not run into the pain of having taken responsibility for what we've done. If we knew that, it would be painful. So therefore, if we know more, it might be possible that we would come to know that, too. And if we came to know that, then that would be very painful.

"So we'd better keep telling everybody, 'Well, psychology, that's – ha-haha-ha-heh-heh – that ... that's ... that's the kind of a science we want – ha-ha-heh-heh! Doesn't reveal anything. Ugh-ugh. Yeah, that's what we want. Nice, nice, stupid sort of thing, you know? And the more stupid the people we can get in it, why, the happier we'll all be."
That's true, too! The crazier they'll all stay! That's true, too. And the crazier they'll get. That's true, too.

So pcs play this game on you just like societies do. And you'll find the pc sitting there – Dianetics 1950. That was enough for him, that was it. He's got it. Doesn't care to know anything since. Doesn't care to know anything since. That's it. Why?

It might be painful if he found out his own overts. If he knew a little bit more about the mind, he might find out about overts. And so, you had something on the order of a third to a half of the people who were interested in Dianetics 1950, and so forth, very content to stick with that level of it. And not at all willing to advance up into Scientology. Do you remember that as a phenomenon in the States? It was interesting, wasn't it?

Male voice: Yes.

All right, that's the mustn't-know-any-more factor.

Now, the mustn't-gain-any-more factor and the mustn't-know-any-more factor is something that you, as an auditor, can Q-and-A with the pc with. If you yourself aren't getting auditing and getting off your withholds, then you're liable to get into a situation where if this pc found out more, it'd be very painful. So the kind thing to do is not to do anything else but just say the process. Let's do the minimum; let's do the minimum.

So, when we ask, "Have you ever stolen any cats?" the pc gets a fall on the meter and it says, "I don't know." Do the minimum.

The minimum is "Have you ever stolen any cats?"

And the pc says, "I don't know."

And so you do the minimum. And you say, "Have you ever stolen any cats?"

Believe me, you're just going to get nowhere from there on. That is the slow way to go about it. But you've found a nice eddy from the mainstream of life. And you can sit there, under the banks, with the willow trees full of pigeons. And use it as a repetitive question.

The Security Check is not a repetitive question process! It's not!

Now, because you might Q-and-A, your Instructors don't get enthusiastic about turning auditors loose with this.

So we get the "Have you ever stolen any cats?" – fall.

"What was that?"

"Well, uh ... hmm ... Uh, no, no, no."

"Well, have you ever stolen any cats?"

See, that's the extreme one. "I don't know."

"Have you ever stolen any cats?" Repetitive question.

All right, now here's the next version: "Have you ever stolen any cats?"

This is a Q and A.
"I don't know."

"Well, what was that fall?"

"Uh, well uh ... hmm, I don't know."

"Uh, well, has your ... has ... do you know anybody that has ever stolen any cats?"

The pc says, "Oh, yes, my aunt stole some cats."

"Now, well, uh, what was your aunt's name?"

Now, of course, this is the same mechanism as the repetitive question.

This again, blocks any further knowing on this line, which we all know will be painful. But in a Security Check this is the only way to take the pain off. The only way you can reduce the pain, of this additional knowingness is give a decent Security Check. So the Q and A is... is well... is poorly situated.

So what do we get here? "Have you ever stolen any cats? What is your aunt's name? Where did she live? Do you remember what she used to wear? Have you got a picture of your aunt there? Uh, do you have a picture of the house? How long did you live with your aunt? Do you have any of the illnesses your aunt had?"

That is a mechanism of denying further knowledge. Because you don't get any more knowledge on the subject of has the pc ever stolen any cats? And that's all you want to find out.

So now, here is a non-Q-and-A, knowledgeable, advance version of this. And here's – here's – here's the way it'd go:

"Have you ever stolen any cats?"

Pc (gets a fall) says, "I don't know."

And you say, "Well, what was the fall?"

And the pc says, "Well, I don't know, because I have never stolen any cats."

All right, now there's a dozen things you can do. But they all have to do with the direct and immediate question of the cats and the pc having stolen them. Not his aunts, cousins, sisters or the moon.

Now, the way to illuminate this, the first rule – don't try to do this by rules. But a rule, that goes back of this is compartment the question. That's one of the nice, handy, good things to do with any security question.

You're asking somebody, "Have you ever – have you ever been in DC before?" The pc falls off the pin. And you say, "Well, when was that that you were there before?" And you don't get a reaction. And it's all very mysterious and gets very confused.

DC were the initials of Davy Crockett. The pc is in full restim on this. So whenever you say "DC" to the pc, you mean Washington, DC, and he means Davy Crockett. And believe me, you're not getting anywhere.

All right. So you ask the question, something of this order:
"Have you ever stolen," (no reaction) "any cats?" (reaction)

"Well, what gives with you and cats? Have you ever stolen any cats?" (reaction)

"Any cats?" (reaction)

"Have you ever stolen ...?" (no reaction)

Phuh. Promptly, the whole thing clarified.

"What gives with this cat? Cats?"

"Yu-uhhh."

"Well, what about cats?"

"Thh-uhhh!"

Now, you're pressing the button that the meter fell on. And it's awfully smart to stand there with the unlimited switchboard of the pc and your great big wide thumb.

You need bartender thumbs, see, from the mother-lode district. They used to hire bartenders with inch-broad thumbs, because a drink was a pinch. And the bartender would reach into the prospector's poke, with his thumb and forefinger, to take out the pinch of gold for the drink. So they'd get this inch-wide thumbs, you know?

Well, you need these great, big, inch-wide thumbs, actually, to run this here switchboard called the pc; it's not just the E-Meter.

And what you're trying to do is find out what is the meter falling on?

And you may come to one of two conclusions: that it's falling on one or more parts of the question, or that it's falling on the question. Now, it's falling on something in the question.

There's nothing mysterious about this. You don't have to clarify the question on this basis of "Well, are you allergic to cats? Have cats often disturbed your sleep?" No. Once more you're off the line, because you're trying to find out what the pc has withheld about cats.

And by compartmenting the question, "Have you ever stolen ...?" That's null.

Why are you pursuing this question, then, "Have you ever stolen cats?" as long as you get a fall on cats?

So this kind of questioning opens up, "What's a cat?"

And you find a cat is a feline object that has long teeth and is colored purple, and is very often forty feet high, and is used to moor ships.

And you say, "Aw, come off it."

So, you clarify the question. And you say the whole question again, because this was the question you were trying to clear.

"Have you ever stolen any cats in this lifetime?" No fall. Go to the next question.

All right. You say, "What's cats?" – clarification.
The E-Meter says, there are certain parts of the question that are alive, or all of the question is live. So it's up to you to find out what part of the question is burning. And then take your bartender thumb and step on that button hard, hard, hard, hard. And the pc all of a sudden says, "All right! All of my life, I haven't been able to understand cats. I just haven't been able to do anything about cats. That's all I can do, is just every time I see a cat – heh! I used to keep this Holland and Holland 50-caliber elephant gun. And every time I heard a cat meowing outside, I would shoot him! Hooh!"

Or you hear something remarkable, "Well, I used to have a trap in the backyard. And whenever a cat would get into it, I would take him down in the basement, where nobody could hear him, and I would cut his paws off one after the other. And I've begun to realize, recently, that this probably isn't nice." [laughter]

Now, the E-Meter says there's buttons to be pressed. And you in your interrogation are only trying to find out what button. Exactly what is the button? So, for a while you press with your bartender thumb. And then you take your little finger, which has a long, pointed, Chinese fingernail that you can actually press very delicately, and you press the exact combination. And the pc goes – boom! And it's in a hurry. It happens fast.

You say, "Have you ever PDHed anyone?" And you get a big fall.

Well, for God's sakes! say, "Have you ever?" You get a fall. "Have you ever? Have you ever?" – get a fall and get a fall.

All right, "PDHed someone? PDHed someone?" Null.

"Well, have you ever what? What? What? for pity sakes? Have you ever what?"

"Huh – I was afraid you'd ask that." [laughter]

See, it means something, exactly and immediately and directly to the pc. And he finally tells you, "It's just you asking all the time, 'Have you ever, have you ever, have you ever, have you ever,' and I have never." [laughter]

And you say, "All right, what have you never?" if that's the button.

"I've never had nerve enough to ask a girl. I haven't dared tell anybody."

Bang! You've sprung the trap. You see how that would work?

It is a matter, actually, of not playing any instrument more complicated than a one-finger version of "Home Sweet Home" and "God Save the Queen" on a piano. And you can even play it out of tune and still get it done. But you will never get it if you do this other thing.

Either you just take no responsibility for getting the question answered, and you say, "Have you ever stolen cats?"

"Don't know."

"Thank you."
"Have you ever stolen cats? Have you ever stolen cats? Have you ever stolen –"

Did you ever hear of this process, "Have you ever stolen cats?" I've never heard of this process. I've read all my bulletins and I don't read it in them anywhere. "Have you ever stolen any cats?" No such process. So it certainly is not a repetitive question.

The other way of debarring information is to w-a-a-a-ander.

You see, here sits this console keyboard in front of your face, and lights are lighting up. You know, like a pinball machine. You know? The meter is saying "Something's hot! Something's hot! Something's hot! Something's hot! Emergency! Emergency! There is smoke in Number Ten compartment!" And you say, "Well, well, what do you know!"

Well, this is no time to say, "Well, there's too much motion in that thing. I think I'll put that aside, and we'll go on with this calm thing of finding out... Because I very well suspect that he doesn't like pea soup. I think so. And I think I've found the person here, in his aunt, who made pea soup. I think I'll just find that out now."

And this poor console is sitting over here and "Smoke in Number Ten compartment, smoke in Number Eight compartment, smoke in Number Two compartment, smoke in the engine room. Abandon ship! Abandon ship!" You know?

And you say, "Well, it's got too much motion in it. Let's get rid of that thing. And let's carry on something here with a true professional mien, that has dignity and aplomb. And let's not get into any of this wild excitement." Because it can get pretty exciting.

It's like if you don't know how to interrogate on an E-Meter, you can get the E-Meter to say anything, anything, anything! You can say that it's PDHed the pc, and so forth, just by associated think. Because it falls on this, it falls on that, it falls on something else. You find out what it's falling on. You got that?

Now, we had somebody the other day who had the word "shop" mixed up with a business. Got the idea? So it's a good thing to say "What's a shop?"

You take everything apart, almost syllable by syllable if you're having any trouble, and give them each one of these things. And you say, "Aha! That's hot, and that's hot, and that's hot. And these three things, added up together, make something else. Now, what gives here?" See?

And the person says, "A shop. A shop. Well, a shop – that's a business."

"What kind of a business?"

"Well, that's an administrative office, a shop is."

"Oh, it is?" And right away, why, the interrogation, of course, narrows down promptly and instantly.

And your taking something on the order of twenty-five hours to clear a question, is a bad comment on your ability to compartment a question and to step on the buttons. Because the pc is very often quite willing to answer your questions if you ask them. So if you don't ask the right question, you're not going to get a right answer. Follow that?
Now, this is very true. In fact, nearly all of your Security Checks depend utterly on your skill in taking apart each question, asking the fringe questions necessary to it. Now, what do I mean by a fringe question? Well, your fringe questions actually occur after you've taken the question apart.

You say, "Have you ever stolen a cat?"
"Have you ever stolen ... a cat?"
"A cat" is dumb – numb. You get no reaction on it. You get a latent reaction. Pooh! Ignore it.
"Have you ever stolen?"
And the pc says, "No, really, no! No, no!" and so on.
You say, "Well, have you ever stolen?"
He said, "No."
Aw, come off of it. Get good. Get good, right at that point.
"Have you ever been accused of stealing?"
"Yes. Yes, yes! And I didn't do it! I didn't do it! I ... I really didn't do it, and nobody'll believe me," and so forth.
"Well, were you lying at the time?"
"Well, yes, I was." [laughter]
Smooth, swift resolution of withholds depends upon the auditor asking the right question. You've got to be right there on the ball.

The pc actually needs help, because the thing is still about two-thirds or better in his reactive sphere. He is not very conscious of what it is.

The borderline between the reactive mind and the analytical mind is the broad savanna of "I don't know." And when something moves out of the reactive mind of total unknown, it moves into the foggy mist that is coming up off the bayous. And it's just a mist. The pc needs help.

It isn't this kind of a situation:
You say, "Have you ever stolen a cat?"
Instantly name, rank, serial number of all cats stolen appear, magically, and go by in a little railroad car, and all he has to do is read them off. Well, that isn't what happens.
You say, "Have you ever stolen a cat?"
The reactive mind says, "We've had it boys," and so forth, and goes clamp! And the mist goes up.
And the pc says, "Whoo-ooo-ooo-ooo!"
Because there he is attached into the "I don't know" of reactivity, you see?
And he says, "Whoo-oo, wait a minute, wait a minute. Whoo-whoo-oo. What – what's going on here? Phoo! Just a moment ago, I could look clear out there. And I could see the palm trees and the city in the distance. And there's nothing now but this horrible miasma which is coming up around me, and so forth, smelling of dead fish. I wonder what this is!"

*He's* wondering what it is as well as you are, you see?

But it's just moved into view, he knows something is there. You ask the question again, it clarifies the question a little bit. But that's about all you'd ever accomplish on a repetitive question.

You say, "What fog are you in, Mutt?"

And, of course, this machine is going to tell him. Tell you and tell him. Because "Have you ever stolen ... a cat?" *Pang!*

"A cat? Well, what gives with cats? What have you done to cats? What have you done to cats?" *Pow! See?*

"What have you done to cats?"

"Oh-oh-oh-oh," fellow says, "Didn't amount to very much. Never felt bad about it before. This just doesn't seem right, right now. But when we were little boys, why, we used to lower them into boiling oil, an inch at a time. Because their screams annoyed our mothers. And I don't think that was so good."

Get the idea? And right away, why, your Security Check picks up in velocity, picks up in velocity, picks up in velocity, you got it?

You must also be able to compartment a goals question. All of these things are subject to compartmentation. You got it? All right. So much for that.

All right, there's one other thing I want to talk to you about. I have just discovered something of magnitude. This is a magnitudinous, cum laude, ne plus ultra discovery that ranks with a cognition on the part of one of our early pcs. It's big. No kidding.

We for a long time have known there was difficulty in some co-audit teams – for a long time, knew there was difficulty in a co-audit team. They make slower progress.

They sometimes kind of went out of this world. And they would go on grinding, grinding, grinding, grinding. And per hour of auditing, their auditing was less effective than HGC auditing, or something like this, you see? It's been a big mystery. And this has been on the track for years and years and years and years. They make slow progress. And I found the answer to it. And the answer you wouldn't really suspect.

Now, the first inroad I had on this "Why do they go so slow?" – the first clue I had for this – was that when a D of P checks the rudiments on an auditor's pc, he often finds them out, even – that the rudiments are out, even when the auditor, having just checked them, found them in.

This is rather constant. This is rather constant. All right. Take it from there.
This has led Ds of P into the belief that the auditors were careless and couldn't run rudiments, and has lessened executive opinion of auditing ability, and has lessened Instructor opinion of auditing ability, and so forth.

The truth is that the rudiments weren't out with the auditor. Because that auditing crew, grinding together, even so much as twenty-five hours, can develop a mutual set of rudiments. This is the dizziest thing you ever heard of, and yet this phenomenon exists. They develop mutual rudiments and their mutual rudiments are out.

The rudiments they have in common are flat to each other but not to anybody else. And they make a solid, small island in the middle of the sea of not-know, where they don't have their rudiments out to each other, but their rudiments are out to the rest of the world.

Now, let's get a good one on this. Let's get a good one on this. They are both agreed that the family of one of them are a bunch of swine. So, of course, no rudiment really goes out on the subject of the family, because the pc is in perfect agreement with the auditor and the auditor is in perfect agreement with the pc about the family being a bunch of swine.

But somebody else comes along and checks the rudiment and what does he find? He finds there's a fall on "family." Because he's not a part of the agreement. You got that? He's not a part of the agreement. This is quite remarkable.

It's almost as if the auditor is saying, "Now, has anything unusual or is there anything unusual going on about the family?"

And the pc says, "No, it's just the same old grind. The stinking swine, the skunks, are just the same as ever."

And the auditor knows they're swine, so he says – he's out with them too, you see? And he says, "Well, all right. Well, there's nothing new or unusual about that." And of course, there's been no fall on the meter.

Why is there no fall on the meter? Because the meter registers disagreement, and you have a pair of people who are in perfect agreement. [laughter] And it's as simply, mechanically, as that. Don't you see?

Now, this is the dizziest one that has ever come up. And you know, I've been tracking this thing and sneaking up on the edges of this thing and sniffing at a spoor seen in the far veldt for years.

Why didn't co-audit teams make more progress, or more rapidly? Because, actually, their ARC should build up easier, and they know each other's cases better – every reason in the world why they should get along well.

Well, I attributed it, to a marked degree, with the fact that they had spats and upsets with each other and ARC breaks with each other, and they'd chew each other up. But therefore husband-wife teams had a liability, or guy-and-girlfriend teams had a liability, you see? That the two – something like this.

That isn't the answer. That isn't the answer, because auditors have these things with pcs, too, anyway. No. The answer is mutual rudiments.
Now, there's a dozen ways to solve it. The most thorough way to solve it is do a new –
do an old-time Formula 13. List of all the people, you know, in the physical universe at this
present time. Let's make a list of them. And now, let's run them each and individually.

Let's assess the list for a fall, and then let's run something on that person. And then,
let's assess it again for another fall and run something on that person. Assess it again for an-
other fall. Have you got the idea? And just clean up all these people, irrespective of whether
one agrees with this or not.

Now, one of the things odd about this – I must mention it in passing is – the reason I
never noticed it is Suzie and I never have this trouble. This is one – one spot where we've
evidently had a variation of some kind or another from the norm.

We're both sufficiently coldblooded about auditing. That is to say, auditing is auditing,
you see? And evidently, there's a recognition that if you feel bad about something or some-
body, whether it is agreed with or not, it will show up. And I will go in like a small or a very
large pavement-breaker, one of these widow-making drills they use to bust up concrete, you
know?

And I'll finally say, "All right, what is it? What is it?"

"No, I don't have an ARC break with the maid. No, I don't have one", and so on.

And I can understand it perfectly, that the maid is probably giving her a bad time, and
that sort of thing. But I don't buy it. Because she – I know she probably has an ARC break
with the maid. And I want to clear it up with the maid, you see, something like this.

So I'll keep on going on with the pneumatic drill, and I will finally spade up the fact
that, agreed upon or not, "Yes", and actually knock out the mutual-agreement factor practi-
cally every time, and so forth. And she'll do the same thing.

You got an ARC break; well, that's it, you know? An ARC break with is an ARC
break with, and an ARC break is an ARC break.

So I was slow to notice this. I don't say we're better than others, but we've ...
Co-
auditing has its adventurous aspects, you know?

The auditor, who has just run all of the mean, vicious, violent things he has ever done
done to the pc, out of the pc, has had to sit there, tamely, listening to the damnedest distortions,
[laughter] ... the wildest interpretations of things he never could have been guilty of, you see?

And the – and on the reversewise, why, it goes reverse end to. But for the twenty-four
hours after that session the auditor, willy-nilly, will be rather cool. [laughter] But the pc, in
this case, is galumphing up and down the halls, feeling sprightly and wonderful to get rid of
all of that burden of woe.

And then they get to the next session. And now the pc is the auditor. And the guy goes
in, sits down, suddenly settles into the irresponsibility of being a pc and starts to give.

He'll say, "Well, goddamn you!" [laughs] Some polite opening! [laughter] You get this
kind of a notion? Well, it's real bravery. It's real bravery.
The only time you can't make it is when one – a party is – just won't audit, won't do any auditing, and won't be audited. And that's a total impasse. And those people are nuts anyway. So... hell, you could probably even do it with the CCHs.

But the point I'm talking about is that a co-audit can have its ups and downs. And I thought these ups and downs of, you know, the overts and the withholds and the this and the that, and "Now all is revealed. And that is why, all during 1957, you treated me like a hound dog. O-ohh-hhh! No kidding! And you'd been out with that guy five times, and didn't even tell me!"

You see? This kind of thing. "Blaa-hhh!" You know, that gets rough.

All right. Now, what do you do? What do you do? It must be that, that was keeping co-auditing teams from advancing. Well, it wasn't. That was just so dramatic, and it was so well known, that it looked logical.

And the thing that slows down a co-auditing team is the mutual rudiments out. They have an agreed-upon regard toward the rest of the world. And they begin to settle more and more into this agreed-upon "that's the way things are." And so their rudiments aren't out to each other.

The first way of blowing it up, as I say, a Formula 13 (even old-style Formula 13) or a Prehav 13. You take an assessment of everything – everybody the person knows in the physical universe, and you assess them all for the heaviest terminal at the moment. Run that terminal on the Prehav Scale, preferably with a two-way command "What have you done to them?" "What have they done to you?" That sort of thing, you know? Two-way command, at whatever the level they assessed at, see? Not a five-way bracket, but just two-way. Bang. You find out it'll knock out fairly rapidly. Prehav Scale is very powerful.

You don't even make a twenty-minute test on that sort of thing, you know? That's – you just take the needle action out of it, and go on to the next person and assess them. And you just clean up everybody they knew in the physical universe in this particular fashion. That is new Formula 13. That's Prehav 13.

All right. There's another, simpler way of doing it – is just substitute "we" for "you" in the Model Session rudiments, beginning and end rudiments. And you won't find those rudiments are now calm. Just substitute "we."

"Have we got an ARC break?" [laughter]

And you'll find out that all of a sudden the thing livens up and becomes very wild. We've got an ARC break, but I haven't got an ARC break, don't you see? It's an incorrect question. It's very sequitur to what else I was telling you, about Security Checks. It's an incorrect question.

You say, "Have you got an ARC break?"

No, he hasn't got an ARC break, we've got an ARC break, you see?

"But I haven't got an ARC break that you don't know about. And you would agree, perfectly, with this ARC break that I've had. Because all day long, salesmen have kept com-
ing to the door. And you know how busy the place can get around here. And I have an awful ARC break with salesmen." That might be the actual answer.

But you say, "Do you have an ARC break with anybody today?"

The pc knows that the auditor would totally understand that salesmen interrupting every fifteen minutes when they're trying to get something done would be very annoying. And he'd say, "Well, that's too bad." But he knows, also, that's usual.

And the present time problems are usual. And the ARC breaks are usual. And the withholds that they have, mutually, are all usual. And their opinions of other people are all usual. And their unkind thoughts are all usual. And so they don't fall on the meter.

And that is quite a discovery. And you can count on the fact, this isn't just a co-auditing team. This is any auditing team that's been going longer than twenty-five hours. It happens that fast. It happens in HGCs all the time.

Somebody has been going for a hundred hours, and the D of P calls him in, checks the rudiments to find all the rudiments out. Yeah, but they're not out for the auditor. And the auditor'll stand there practically jibbering. And you've seen them, you know?

And they say, "But the rudiments ... " (they always say the same thing, the same words) " ... but I just checked them before I came down here and they weren't out!"

And the D of P thinks an unkind thought about the auditor and says, "I'll bet you did, you knucklehead!" or something like that. Or maybe he didn't think that exact question or that exact answer, but it's something like, "Well, yes, yes, we'll have to get some more expert auditing done here. He's kind of..."

Actually, that was a totally incorrect judgment. It was absolutely true, the rudiments were checked and they weren't out. And he came down to the D of P, and the D of P checked them, and boy, were they out!

Now, we made enormous progress in the South African ACC, 3rd South African, by making everybody... All the students were checking the rudiments of all the other students' pcs and pointing it out with a nasty, long, bony and critical finger. In other words, on an auditing team, we were routinely making other students do D of P checks on other auditors' pcs. And we were making very nice progress.

And I thought this would be a good idea, in case any of those people ever got to be auditors or Ds of Ps, they would know what this was all about, and it'd – already had the advantage of doing a police job, you see, on the thing.

And there was an accidental lying in that whole thing. There was an accidental.

But it is the mutual – the mutual rudiment. And that could hold up cases, that could keep them from advancing, that could get them all upset, that could just throw it down to a walk. You got the idea?

So I found a new method of slowing down auditing. Just get into total agreement with your pc that his viewpoints against life, and get in total agreement with your auditor, that this viewpoint against life is ordinary and usual, and therefore isn't out, but would be considered
unusual by somebody else. So if somebody else checks the rudiments, of course, they're out. And if the auditor checks the rudiments, they're in. You got that?

That's a sneaky one, isn't it? Well, you should think it was sneaky, because let me tell you, it has taken I don't know how many years. I don't know how many years this observation has been made by me or how often.

And I looked that over and my eyes popped, and I said, "By golly, here's this old problem sitting here in front of me again that I've tried to solve time and time again. Maybe I'd better look it over a little more closely." And just the night before, I had checked a co-audit team where this exact thing had occurred again. And I just looked at it, and I said, "Oh, wow, now, what is this? There's something here."

And then, Mary Sue – I was checking rudiments on Mary Sue with her auditor, and they were out. And then she gave me some data about this other team. And all of a sudden I said, "Oh, no!" And that's the way it is. That's the way it is. It just fell out of the hamper, just like that.

You see it, don't you? It's perfectly crystal clear what'll happen. You've got an island against the storm of the world. And it doesn't react to the rest of the world, after a while, because, of course, the E-Meter reacts only on disagreement. Got it?

Three solutions. I repeat, three solutions. Old Formula 13, the failed-help proposition on everybody you know under the sun, moon or stars – that's the longer one, but very thorough. And I point out that the first Clear made in South Africa had fifty hours of Formula 13 immediately before she came on course. Not a bad process, huh? All right.

The next one – next one would be to do Prehav 13, which is just Prehav Formula 13, which is just to make a list of everybody they know. Assess the terminals very rapidly. Take the one who falls the most on that particular assessment. Assess it, then, on the Prehav Scale. Form a two-way command for that particular level. Run the needle action. Just that.

Soon as the needle is still on this person, you ask them again, "How do you feel about this person?" You get no twitch? Come off of it, right now.

Do another terminal assessment. Take that terminal; do another primary Prehav Scale assessment. Form another command for that particular level you've now found this next person at.

Run the needle action out until you can say, "How do you feel about Joe?" and they say, "Oh, I feel all right." And the needle – the needle now doesn't react on Joe.

That might happen, you know, in five minutes or fifteen minutes or an hour or two hours or it's a very undetermined period of time. So you ask the question often "How do you feel about Joe now?"

All you're trying to do is clear Joe as a mutual rudiment. You're not trying to run processes here, you see? You're trying to clean this person's ARC breaks out of existence as a rudiment.
And what you're doing is broadening the question "Do you have an ARC break?" And you're broadening this question to include everybody they could possibly have an ARC break with in present time.

And you're just running – you're assuming they're...all these people might have ARC breaks. And you're clearing all these people off for the immediate lifetime. And then the pc doesn't get ARC breaks and interrupt the auditing, and the case doesn't worsen, and it speeds up. Okay?

There is that Prehav 13. Okay?

The next one is a very fast one – maybe not as good, but certainly more broadly applicable – is "Do we have an ARC break with anyone?" See?

"Do we have a present time problem?" Got it?

"Is it all right if we audit in this room?" You got it?

"Now, do we have a withhold?" You got that?

This is sparked up by the fact that I found out there was another pc who is having difficulty and is worried about Security Checking because he thinks he is holding some data that has to do with another person that might be discreditable in some fashion. Well, part of the data is correct and part of the data is false. But this pc has not bothered to clarify this data but is afraid of being security checked to protect somebody else. Interesting state of affairs.

Now, this could be broadened up into a basis where they have to have a special auditing team. This fellow has to be specially security checked by some special person, and now the two of them think they're going to make some progress. Let me tell you, they're not going to make any progress because we now have a withhold. Do you see that clearly?

So the road out is not a special Security Check by a special person so that all will not be revealed.

I happen to know, by the way, that about three-quarters of the data which this pc thinks he has is a lot of bunk. So he's not only holding on to something that way, but he's also holding on to something that's highly fallacious. Well, boy, how about – how about having a delusion as a withhold?

Pretty grim, huh? That's what this person is doing.

So you got this "mutual rudiments out"?

And I think we can end, right now, a lot of slow gain on the part of an awful lot of long-drawn co-audit teams. And we can also end slow gain in HGCs when the auditing goes up to a hundred hours, or something like this, or fifty hours.

After about twenty-five hours you've got a unit there. You've got an agreed unit. The auditor agrees that the pc has been treated badly, and the pc agrees this, and so on. And they agree so thoroughly that it's never a fall on the meter. Okay?

All right. You're welcome to that one. And we're already overdue, so go and get your mutual rudiments in! [laughter]
Thank you.
Thank you. Thank you.

Well, your auditing has improved, so I'll wear a jacket. [laughter]

All right, what is this? The 21st, or what?

_Audience: 21st._

Well, I haven't anything bright to tell you today. I've shot the bolt now. Now you know everything there is to know. And I'm certainly glad of that! I'm certainly glad of that. Certainly you know everything there is to know, because I don't.

There's a couple of bugs kicking around of one character or another. And I don't know yet if you've got them totally licked or not. They're basically just slow assessment, slow, slow, slow assessment, slow, slow, slow security checking, slow, slow, slow, slow SOP Goals. And nobody's trying to make you unthorough, and nobody's telling you that you should uniformly and routinely rush your auditing through, but there's a difference between getting something done and wasting time. And that's all I've got my eye on. And I think I've spotted the bugs of what's making it go slow, but I actually haven't got all the returns back. That is to say, I don't know if it's going faster for you now or not.

But it wouldn't make any difference to me if it took seventy-five hours to get somebody's goal. That, you'll find, is the slowest haul. I think we speeded that up with instant needle read. I wouldn't care if it took that long, but it's kind of nonsense. But for it to take very long to do a Security Check, this is what's weird. Because all you do is read the question, and then don't wait for the strains of "Dixie". Make sure that that thing is... didn't fall when you read the question. And then go tearing off to the next question. And when they fall, you probe them by compartmentation of the question.

Something that Frank Aloysius George Q. Sullivan should have done, before he started blasting around about PDH. He, by the way, has got me very suspicious now, because there's now been a big to-do on the part of the California mounties. I think that's what they call the police in California, isn't it? Mounties? Well, they're always on everybody's back. And they have corralled some poor guy up in Eureka. And they're accusing him, because he's a Scientologist, of practicing brainwashing and PDH on people. So it doesn't look like Mr.
Sullivan was quite as innocent as it seems, because he forecasted attack which was also duplicated on the – oh, practically the same day in Detroit. Interesting, isn't it?

Of course, according to you – according to you in general – everybody is reasonable, and all actions are good, and there's nothing you've ever plotted. But we hear about "Scientologists are PDHing people in Australia", then we hear about it in South Africa, then we get a magazine that he cannot afford to publish, being published, saying so in the United States. And then simultaneously in two different parts of the country two thousand miles apart, the police suddenly swoop down on a Scientologist and accuse him of PDHing people.

And then simultaneously Pinkerton swoops down on the police, sent by the organization, and it all blows over. But it's hard on the people when it's happening.

And you can say it's all for the best in this best of all possible worlds, but the Panglossism doesn't go down with me, and I usually say, "Well, ready on the right, ready on the left, ready on the firing line – Fire!" Somebody at the other end says, "Goddamn, we can't fool this guy!" That's a fact.

So don't feel surrounded, because you're the only people that have the weapons. But please, for the sake of my morale, don't be so reasonable. Don't leave me standing there all by myself, you know? Don't start telling me, "Well, Ron, it's just human nature." Yeah, it's human nature to get itself in such a stew, but that's no reason. There's also some political nature back of it, too.

You see, we're actually not just stewing around in the bullpen, you know, because we are so happy about people's aberrations, you know, and "It's not their fault," and "People are leading unhappy lives," and so on. That's really not what we're doing. We're also doing that.

And that is fine.

But let me tell you something: that if we weren't here, the lights of Earth's civilization would be out in another twenty-five years – if we weren't here. And people know who is sitting, baying at them. But you see the great ease it would be to scoop me up, or shoot me down or do something to me. You might ask, why is it that this has never really happened?

It's come close to happening a couple of times. There's been an airplane out on a landing field warming up, waiting to kidnap me, and a couple of hoods standing by, real tough mugs. Only they couldn't handle a .45, and I could. This in the confines of Los Angeles.

The war cooled off, as far as I was concerned, many, many years ago, and I don't expect it to hot up at all. I don't even bother to lock the doors.

And it's not case as far as I'm concerned. I'm just pointing that out to you as a matter of record. Because if I had a man – number of overts here, or if I had a bugginess going here, the attack on you and the attack on me would be fantastic. But you see, if you haven't got tremendous motivators, they can't get a big enough overt going against you, because you just don't suck it in, that's all. You see? And that mechanism alone is why we're still alive.

And there isn't anything going to happen to us. Just around the fringes – just around the fringes – here and there, why, there'll be a little popgun. Down in Perth all of a sudden, why, somebody swoops down and picks up some auditor, they ... And it works out this way:
He himself has got some kind of a wild series of motivators that has nothing to do with us. And listen – we can't even help him. In this Perth affair, we tried hard to help this person. And they wouldn't even accept an attorney from us. Nothing much happened to them, they went down and paid a small fine and that was it. But wouldn't even permit an investigation.

We've got a backflash going right now in Australia which is – actually, it went. We've been on the winning side of this picture in Australia now for many months. We've had tremendously effective people there. These people are awful fast on the draw. They remind you of what the Western movies would like to believe the old Western bad men were all about, or the police marshals. Because, boy, those guys are awful quick on the draw in Australia. You shoot in their direction and, the enemy, long before the trigger actually gets pulled, the air just begins to hum all around their ears.

There's a guy down there who wishes to God he'd never been elected as the head of the BMA of Australia. Every night when he goes to bed at night he says, "And Dear Lord ..." [laughter] and all of a sudden, why, the wolves came off, and there hasn't been anything happening down there since.

And now the other day, one of the leading trade union papers published a very congratulatory article on the E-Meter, and that sort of thing. Well, that's gaining ground.

Well, the Australian knows he's under fire, so he cooperates. In the United States they don't know they're under fire. They think it's all for the best in this best of all possible worlds. And it's all so reasonable, and Ron is – "You know, got – well, he's a little bit aberrated on this subject", and so on. "He's fighting a shadow", you know, and "it doesn't work," and so forth. "Actually it's Ron that's PDHing everybody, and..." You know, reasonable, stupid kind of action. And it's getting knocked off.

One of these days, one of these days, people, more and more, month by month – you'll watch it – will start coming up and backing us up, and backing us up more and more. And backing us up more and more and more. And all of a sudden, there'll be a splash in the Pacific and a splash in the Atlantic, and that will be the end of subversion in the United States. You watch it happen. I promise you it's going to happen.

But it's only going to happen because I'm quick on the trigger, keep my eye open, and everybody in HCO is very, very fast on the ball along this line. When you want them to act, they act. Consequently, within hours private detectives will be swarming around Eureka, asking questions. We have only one weapon. We investigate loudly. Investigate very loudly. That's the only weapon. But we'll make it to the degree that our technology is good, sound and fast.

We're on a wave of the future. And if anything, we are the wave of the future. There is no technology that can approach anything we are doing. And you'll find if you study great civilizations that they roll forward with new technology. The sweep of the Romans resounded with the clash of arms. But basically England was conquered by Rome as much as a century before the first Roman soldier ever put his foot on English soil. Look up history and you'll find out it's true.
Roman culture and know-how had invaded England. It was coming over from the Channel ports. And everybody thought it was very nice to be able to grow a crop. That was pretty good. And instead of finding out about this (the Roman military intelligence didn't find out that they probably would have got roses in the street), they landed an expeditionary force. That's something like you, after you've cleared a pc, decide he's aberrated and attack him. Not quite as extreme as this, but that was kind of what happened. But every new civilization is forecast and is a new technology, and that is all it is. And philosophic technologies are far more prone to the founding of new civilizations than otherwise.

So you're working on more than you know, and the eyes of the future upon you, and all that. So you better find out something about it, huh? [laughs]

The caliber of what you are doing improves with such rapidity, as soon as you land here, that you can almost tell how many days you've been here. This is from the reports I get. So there is a right way to do things, and nothing actually does better than knowing just exactly how it is done, being able to ask questions immediately and directly to find out if you're doing something wrong about it, because it develops a certainty. And I want you to develop this certainty. I want you to, whenever you think up a dumb question or think you're astraddle of some kind of a riddle-raddle or something of the sort, well, for heaven's sakes speak up.

Now, Jan has been speaking up quite interestingly – last night asked me, "On this Prehav 13, do you ask all of the names over and over, or do you do Assessment by Elimination?" She brings up a point there which very well might go terribly crosswise somewhere. On your terminal assessment for Prehav 13, you're not doing an Assessment by Elimination. You are doing simply a runover. And as a person gets his overts off, of course, against all the people that he knows, the people you have already passed over and found null on your scale all of a sudden live up.

It actually doesn't matter much who you choose to get the overt off, as long as there was some immediate action on the E-Meter. So what you do is make a terminal assessment sort of thing. You collect all the guy's terminals that he – everybody he knows in present time, you see. And you write all these people down on a piece of paper. And you start down the list. And every time you get a fall, well, you see if you can't clear the fall by two-way comm. And if you can't clear the fall by two-way comm, you run the action out of the needle. And then go on to the next person and see if you can't do that. And it's more a Security Check than an assessment. Have you got it?

Now you find somebody you don't clear with – you say, "Well, how do you feel about that person? What have you done to that person?" or something like that. And it doesn't clear. The needle keeps reacting. All right. Assess the person on that terminal on the Prehav Scale, and run enough two-way commands to clean the needle.

Now, you're not going to get too many of them to the Prehav Scale, probably. Most of these terminals are going to clear just on a glance. Now, you go back to the beginning of the list. And you can keep adding new people; he keeps thinking of new people and so forth. Well, just put them down and go on about your orderly affair. But now go back to the beginning of this long list of terminals and go over the thing again, and you're all of a – going to – sudden find that terminals that weren't hot are now hot. See, you're raising his responsibility.
for the people in his environment, and as you do this, of course, you raise his ability to see what he has done.

It's just a list that you go over and over. This is not necessarily something you would have to do as a full-time activity. You could do this for half a session and run whatever else you're running for another half of the session.

I call to your attention that the girl who went Clear on the South African ACC had — here's a missing item for you — had fifty hours of Formula 13 immediately before that ACC. It was almost impossible, you see, for her to have ARC breaks, so forth. She had all these people in her environment pretty well cleaned up. And in view of the fact that they were pretty well cleaned up, what did this leave? This left the fact that most of her auditing session was devoted to getting Clear, not to patching up the environment. And rudiments didn't suddenly go out on her all the time. You understand?

All right, now, that is a somewhat imperfect statement of how you do Prehav 13. I see it still leaves you just a little bit puzzled about it. But I will go over these steps just rapidly here, now, very rapidly.

The way you do it is in a Model Session form. You clean your rudiments, and then you — clean them rather indifferently because you're certainly going to do nothing but clean rudiments on this Prehav 13, you see. And you just take a list, you say to the person, "Now, I'm going to make a list of everybody that you know" — you can say, "intimately," or something like this, or "everybody that you're associated with"; whatever wording, ah, "...in present time. Everybody that you know in present time." They'll ring in a lot of dead people on you and stuff like this. Well, put them down. Who cares. It's not a precision activity anyhow.

And you make this long list, see, and it'll go two, three pages. Well, while they're thinking about this, they're actually exteriorizing and they're getting their bank straightened out. So that, itself, is auditing, because they're doing differentiation. It's a differentiation exercise. And if you just did it as a differentiation exercise you'd find it was quite unusually therapeutic for people. Because they have all these people crossed up with people. And you'll find out as they're doing this they'll separate these people out, and they become individuals instead of masses, and so forth.

All right, you get this long list. All right. Now, you go over this thing, and I frankly don't care what approach you use in order to straighten this up or ask this. Ask the person, "Well what have you done to ... ?" or "What have you withheld from these people?" But I'd say "done to" is probably more productive than anything else, because they often add up "done to" as "withheld from."

And you say, "Well now, all right. Now we're going to take these people, and we're going to cover your relationships with them." And this is all right with the pc. And you start in at the beginning of the list, and you say, "All right. Now here's Joe. And here's Bill." You know, you're watching for that instant reaction, see? "And here's Pete. And here's Oswald" — pang! Of course, a fellow with a name like Oswald should get a pang! [laughter] And so — any similarity to persons living or dead is purely intentional. [laughs]
So anyhow, bang! This word goes "Oswald." All right, your next approach is "Well, what have you done to Oswald?"

And the person says, "Well – I – oh, so-and-so, and so on, and so on," and you get a big rocking needle on the thing.

And you pull an overt, and you say, "Well, how do you feel about Oswald now?" And you get a big rock on the needle again, and you say, "Well, we've had it. Now, we are going to take this person," and we take out our – remove it from its Lawrence leather scabbard – the Prehav Scale, and lay it out here on the E-Meter board, and say, "Now, is Oswald ...?"

Now, don't be surprised if by the time you start to run the thing that Oswald has vanished from the face of Earth. Because you say, "Is Oswald faith?" Or "Would you have faith in Oswald?" And just go on down the line, and find the Prehav Scale as applied to Oswald, see? And you're trying to find the level to run Oswald. That is your intention. You want to find a level, and you honestly and sincerely are not sitting there hoping he will just vanish, you'd like to find a level for Oswald. And this isn't going to happen very often.

It'll take somebody like – oh, I don't know – they've been married to somebody and in business with them, and eventually wound up with a law suit with them, and so forth, and that reminds them of everything on their own rock chain. Now, that's that person. All right. Now, all of a sudden we find as we're assessing the Prehav Scale, which we're reading on down the line – we find that several levels are live. We go back and try to pick up these levels that have livened up on Oswald, and we find out that one does still react.

All right, put up a command like this. Let's say the level that's still reacting is Failed Withhold. All right. "Now, what have you failed to withhold from Oswald?" And, "What has Oswald failed to withhold from you?" Those are the commands, see. "What have you failed to withhold from Oswald?" "Yap, yap", he says. And you say, "Thank you. What has Oswald failed to withhold from you? Thank you." And that's all there is to it. And you do those a few times, and that's the end of Oswald, even then, see.

You watch the needle. There is no twenty-minute test on this. You just watch the needle, and you say, "How do you feel about Oswald now?" And you don't get any instant reaction on the E-Meter, you instantly and immediately say, "Well, all right. Thank you very much. Now, is it all right with you if we return to this list?"

And he says, "Yes."

And you say, "All right." And you do so. You can close the end of the process out, as far as that's concerned.

All right. Down we go, down the list here, and we've got the next person now, and we've got the next person, we've got the next person, they're all null. And then we hit one, and we say, "All right. Well, what have you done to this person?"

And he says, "Wow, row, row, row and yeow."

And you say, "Well, how do you feel about this name?" and you read the name again, you get no reaction. And so you say, "That's dandy," and you read the next name and the next name and the next name and the next name.
And he says, "Just a minute. I just remembered – I just remembered – I knew a girl by
the name of Bessie Ann. Bessie Ann. Just remembered this."

And you say, "Well, all right. That's good. Thank you very, very much."

Now, if you go ahead and Q-and-A, you of course will say, "All right, what have you
done to Bessie Ann?" And we won't have anything more to do with the list, but we'll move it
all over here in the next county and only assess new names and forget the list and get all con-
fused.

No, the pc responds to an orderly progress. So we put Bessie Ann down at the bottom
end of the list and say, "Thank you very much," and take the next name which was under our
thumb up here, which we were clearing, and we will find that it's that name that has the asso-
ciation with Bessie Ann.

All right. So we go down, and we're now twenty names down the list, or twenty-five
names down the list. Here we are. And we say, "And then there's Mr. Stiffwhistle." And the
E-Meter goes clang on an instant read, you know. And you say, "Well, all right, what have
you done to Mr. Stiffwhistle?"

"Well, 'tisn't so much what I've done to Mr. Stiffwhistle. Actually, it's what he'd
done..."

"Well," you say, "that's good. Thank you very much. It's what he..." "Thank you very
much. Now, we're going to assess Mr. Stiffwhistle over here on the Prehav Scale," and so
forth.

And now – "Would you have faith in Mr. Stiffwhistle?" You get the idea? And we can
even vary this around. You can actually run "Faith in Mr. Stiffwhistle," "Would Mr.
Stiffwhistle have caused anything for you?" see? You could just take your opposite sides of
the thing and read them crisscrossed. You got the idea? You read your odd-numbered levels
with "you-Mr. Stiffwhistles" and the even-numbered levels "Mr. Stiffwhistle-you." You got
the idea? Keeps you from developing a stuck flow on "Stiffwhistle." You see how?

You can do a lot of tricky things like this but you can keep a flow from getting stuck,
and you'll get a better assessment. Well, by the time you've gone over the list once, you've
knocked off four levels where Mr. Stiffwhistle fell.

Now, you've gone over the list wholly once. You only go back, just as you do in any
assessment, to these four levels that you've made a dot after, and you read that one, and you
read that one, and you read that one, and you read that one. And if they're all null, don't be
surprised. Don't do anything further if they're all null. If one stays alive, form the command
for it. Still ask, "What about Mr. Stiffwhistle?" and only if Mr. Stiffwhistle still falls do you
actually run the command. You got the idea? Because he's evaporating here at a great rate of
speed.

All right. You make sure that he's flat, and you go to your next consecutive name on
the list. You go on, clear on down to the end of the list in this fashion, paying attention only
to those that fall, and paying attention to them only so long as they fall.
You don't go overshooting the thing with great enthusiasm here, and spending a half an hour on Aunt Betsy Crocker just because she made such horrible cakes. Let's get into something else here that's more important. Let's find out periodically if Betsy Crocker still falls. See, you can overshoot this kind of running madly. You know? It's like – in the first place, you're shooting – you know these little water bugs that scoot around on top of the water, you know, and walk on the water tension very amazingly, so forth? Well, you're just the same as shooting water bugs with a sixteen-inch gun. If you're not very adroit about it, man, do you get splashed. Because you can go too far. You can overrun this level, just madly, you see? And the pc's bored and upset and so forth. Of course, this guy's evaporated. He's not interested in this anymore.

All right. Now you go back to the beginning, the first beginning of the whole list when you have finished it. Every time he has thought of anything you added another person at the bottom of the list. Of course, you covered those too eventually in their turn. You go back to the beginning of the whole list and assess it once more. And in a relatively short time – not anything ghastly in terms of auditing – in a relatively short time you've got a clean list. You can go over everybody this person knows in present time without getting a needle disturbance. And the person begins to feel wonderful about these people, and begins to feel wonderful about everything. You got it?

All right. Now, that's how you run Prehav 13. Did that straighten it out for you a little bit better?

Male voice: Yes.

You see what I meant by saying I had to give you an accurate idea of exactly how you did it.

My basics – I'm telling you how to run this. And the way to adjudicate just how to run this, is – I know the behavior of the Prehav Scale. I know the behavior of present time terminals on the Prehav Scale. And please be advised, I want to repeat just one more time: if a terminal continues to fall, which is a present time terminal, or continues to react badly on the present time list of this character, I don't know, you're running the pc with the rudiments out, or you're doing something else that hasn't got much to do with it. Don't you see? Something else is going on.

And we had a case here of somebody – well, I'd written a snifffish note to the D of P of London, actually. Pushed in her anchor points a little bit more violently than she deserved, to tell you the truth. Auditor started auditing me on her. Now, I think I've only seen her about, oh, I don't know, not more than two or three dozen times in my lifetime.

He started to run her, and he started to settle into a profession [laughter] ... of running me out of this one person. Now, that wouldn't be right. So there's something else going on. He probably has done this. He probably said, "Now, look. She's gotten a bad despatch, and this has upset her, because she says so. All right, very good."

Now, he's made up his mind that this is what is wrong with the pc, and he hasn't consulted Mr. E-Meter. See? So he starts running something that isn't particularly wrong with the
pc. You get this? And runs it with the rudiments ignored because he is so certain this must be what's wrong with the pc.

Of course, he's now running on a completely sour assessment. It wasn't determined at all. See, he didn't try to do anything about it. So constantly – he actually, I think, tried to run two whole sessions on this thing. That was impossible. It was frankly impossible. He just couldn't have done this. And yet he did it. But that was how he would go about this. He'd say, "Obviously, because she received a rough despatch, see, that says, 'Pull up your socks, to the knees if necessary,' and so on, obviously then this is what is wrong with this pc."

So he takes off and says – doesn't assess a terminal; says "Well, this is the terminal." Then assesses the terminal on the Prehav Scale, gets some random and wild falls here and there on the Prehav Scale, picks one up at random, forms up a five-way bracket and starts in a profession. And goes, of course, for five hours of run without even vaguely flattening it. Well, what do you mean "flatten it or non flatten it"? Well, the tone arm kept being different, and things kept being different, and they kept being different. The pc wasn't changing, things were just different. You got the idea?

If you want to see this happen, by the way, do this with SOP Goals or Routine 2. Just make up your mind that the pc's level is "grapeshot." "Yes, 'grapeshot.' That's the proper level we ought to be running on this pc because the pc is always spitting grape pits out while I'm auditing, and so, therefore, 'grapeshot' is the right one." And we start running "grapeshot". And we start getting tone arm reaction on the annoyance of the pc, see? And we get tone arm action on the ARC break of it all. We get tone arm action on the unreliability, and the unreality of the whole thing, don't you see? The mystery in the person's mind. "Why is he running 'grapeshot?'" "Have you ever shot any grapes?" [laughter] And the person gets very, very puzzled.

And of course, what does this do? It pulls in all the "not-knows" on the track. So the "not-knows" give you an action on the tone arm as they naturally would. But the pc isn't running. Now, if you were to – have – you go at this right, you don't ever make up your mind this is what is wrong with the pc and run it.

It's perfectly all right for you to make up your mind there's something – "this is what's wrong with the pc." But don't feel so invalidated when you put him on the E-Meter and find it isn't so. Always have nerve enough to test your theory on the E-Meter. And instead of "shooting grapes", you find out what's trouble with the fellow is "cellar doors". He goes around cellar-door all the time. He just can't leave cellar doors alone. And way up the line someplace you run into some weird computation that if you cellar-door enough on the right side, it makes you spit grapes. You know, it'll be something utterly incredible. You say, "How in the name of God did he ever arrive at that?"

Well, if you're auditing at the reactive mind, this question won't enter your mind, "How did he ever arrive at that?" That's what's wrong with him. It's the held-down five. The thing isn't connected right, and it doesn't make sense. It doesn't make sense to him; it doesn't make sense to you. And your trying to outguess the reactive mind is, of course, an heroic activity, because you'd have to be as crazy as he is. [laughter] So don't be at all surprised if you're all set to drive down Center Street, and you step into this Hispano-Suiza, and you're all
ready to tear down Center Street at a 120 miles an hour and clear this case up like mad; and
you suddenly find yourself driving a Buick in Chula Vista. [laughter]

Don't be so heartbroken about it! Because that's what's the matter with the pc. He gets
into the Hispano-Suiza on Center Street and has always wound up driving an old, broken-
down 1922 Buick in Chula Vista. And this is what's upsetting him. You get the idea?

Actually he tries to do this: He tries to get into old, broken-down 1922 Buicks in
Chula Vista, hoping someday he'll wind up in the Hispano-Suiza on Center Street. And it's
one of the heartbreaks of his life that he never does. His method of realizing his goals is quite
often to run them backwards.

The goal is to enliven and make wonderful and beautiful every woman you meet.
That's his goal. Now, obviously every time he does this, something happens, intervenes, and
he finds this poor girl winds up being a knocked-apart old bat. Get the idea? And he – this
upsets him, see? You know, his intentions are pure. And yet he just seems to just practically
knock any girl he ever had anything to do with right out of the – right out of the firmament.
And he can't understand this. So he will eventually start going about his goal something like
this: "All right, if you take some knocked-apart old bat ..." You see? [laughter]

And yet, that is almost logical for the reactive mind. That's almost too logical for it.
He's much more likely to start piling up stones on the beach, and this has something very
definitely to do with realizing this goal of making all women beautiful. "If you just pile up
enough stones on the beach..." And you say, "What the hell?" But of course, that's what's the
matter with the fellow. It's a case of "What the hell?" [laughter]

I tell you, life is never dull when you have the reactive mind for a target. So as a con-
sequence, when you make up your mind as to what the level or action or the pc's regard in a
certain direction should be, don't feel so whip-cured, see, because it's something else. It isn't
an invalidation of you. It's an invalidation of him. If he was perfectly sane, your computation
would undoubtedly be absolutely right. But of course, the reactive mind is not sane. Anybody
that's walking around that has a long line of reactivity, know that they're sort of walking with
just their eyes out of the water, and there might be a little splashing wave any minute, you
know? Just – they're liable to trip themselves up any second. Have to walk pretty careful, be-
cause somewhere from the depths, some long fangs are liable to all of a sudden appear from
nowhere, see?

So it's no invalidation of somebody. As a matter of fact, it's a validation of somebody
to try to do something about it. You see, the bulk of people that have gone around the bend
and are being "normal" – these characters not only don't think there's anything you can do
about it, they don't think there is anything else. They think that is it, and that is life, and that's
the way you live it. Absolutely screaming messes. They're not living any kind of a life that
anybody would want to live, much less them. And they tell you so, you see. But there isn't
anything you can do about it. You might say they have totally surrendered to the disorderli-
ness of existence.

All right. So much for all that. Have you got a question before we end this? ...Yes?
Female voice: Is there any difference – I mean, apart from the fact that their goals aren't different - between one case who expresses his goal in terms of beingness and another who expresses it in terms of doingness, and another who expresses it in terms of a havingness? Does it tell you anything additional about the case? The fact that they choose to express it, or that it is expressed in these...?

If you had three cases that had more or less the same goal, but one of those cases expressed the goal as beingness, another expressed it as doingness and another expressed it as havingness?

Female voice: Yeah.

Would it tell you anything different about the cases. No, actually not, at first glance. Because be-do-have harmonics. You could pick it up on any harmonic. You could pick up an excessive – obsessive beingness on the part of a person and move him up to havingness, and then you could move him up to beingness, and then you could move him up another one and he goes into doingness. But that's reversed, isn't it? So you push him up a little bit higher and you would now find him in beingness again. And now you find him in beingness for some time, and all of a sudden he'd go totally into havingness. You got the idea? So it's a disorderly progress.

Female voice: Yeah.

So you're liable to pick up a case at any level of disintegration, and you can't adjudicate too much about it. You could say on the upper strata that the be-do-have level – on its first levels, before they start inverting and harmonicing, and so forth – you could say that the beingness is higher than the doingness is higher than the havingness. It is easier for somebody to run on those higher levels on havingness, and it's a little less easy to run on the doingness, and it's pretty rough for most people to run on the beingness. But you're talking now about the upper harmonics of it.

Female voice: Hm.

Okay?

Female voice: Yeah, thanks.

Any other question? Yes?

Female voice: This is just a casual observation that I noticed for myself, that if my sensitivity was at 1.75, say, very often the tone arm would be 3.0 or above. If it were at 2.0, sensitivity would be at 3 or 4.

Yeah.

Female voice: Why?

No, there is no coordination between the sensitivity. But there is an awful lot of error being made on can squeezes, and I'm glad you brought it up. There is no coordination on that. You're saying, well, it's – if your tone arm is at one place your sensitivity is at a coordinated place for that. In other words, as your sensitivity rises your tone arm rises, or your tone arm rises, your sensitivity rises. Not necessarily. Doesn't hold true.
Female voice: Didn't seem to me it ought to be that way, except I observed in ...

No, well ...

Female voice: ... people's sessions that it did that sort of thing.

... it isn't, it isn't true. And it doesn't follow. You don't get a coordination between sensitivity reading and tone arm reading.

I'd like to bring up this, however. The way you're doing can squeezes is probably why I took sensitivity knob out of diagnosis, having put it in – diagnosing by the sensitivity setting. I've taken it out of the lineup. Because, boy, the way you let pcs hold cans varies so fantastically as to hardly have any comparison from one case to the other, and I just found it out the other day in doing some observation. You can make the sensitivity knob do almost anything by holding the cans in different ways.

Now, the proper way, and what we mean by a third-of-a-dial drop, is to have the pc – and this is one of the things you say to him – "Now, holding the cans, put your hands comfortably in your lap." And the pc does this. He stops waving them around and directing, "God Save the Queen" with the cans. And drops them down comfortably in his lap.

Now, you say, "Gently now, squeeze the cans." And you get a proper fall, that we mean third-of-a-dial drop. The way you've been regulating this gives you all manner of wild reads. The pc has the cans terribly tightly gripped. They are just gripped, gripped, gripped. And as soon as you get a ... See if I can make this do this now. Well, here you are, more or less. The meter isn't even tuned in. Now let's do this properly. Now, hold the cans lightly, in your hands, or comfortably. Now squeeze them. Squeeze them with a jerk, see? You get this jerk? Now, I'm even going to exaggerate this now. All right. We're going to exaggerate this now. Didn't see the squeeze at all, did you? What am I doing? I'm sure squeezing the cans! And you don't see that needle move at all, do you? There's a zero move to it. And look, your sensitivity knob is set up there almost at 2.0. I'll do that again. There we go. I made it do a reverse squeeze. How do you like that, huh?

All right, now let's set this thing up so that it makes some sense, shall we? All right. Now we're going to set the cans relaxedly in my lap. Well, if you're going to do that! Somebody has a passion for – you want me to do the first one again? Did everybody see that? All right. Here we go now. See? Unmoving needle. Got that? All right. Now I'm going to put the – now, tune it down below set; this side of set. All right. Now we're going to put the cans comfortably in my lap. I'm going to sit here relaxedly. See? I don't know what it's doing.

Female voice: We have here pong, pong, pong.

Which is my normal drop. Get that? In other words, when the cans are held relaxedly in the lap – you know, you just hold them, you know, relaxedly and then simply squeeze them with the hand itself, not clear on up to the shoulder! [laughter] That's the way you test a third-of-a-dial drop, see?

But you actually – this other trick is to hold the cans, wrap your hands very hard around the cans, very carefully around the cans. You get the idea? Now increase the pressure enormously. Now, I'm holding them very hard right now, see. And then try to squeeze them
right from the shoulder down. And of course there's not a thing going to happen. You got it? Because you've already got the things utterly locked in as tight a squeeze as you're going to get. This thing is – all the squeeze end is already registering. You got that?

So there's no sense in making a diagnosis out of something that is going to be done randomly. It's – the proper thing – what we're talking about when we talk about a third-of-a-dial drop, then, has to have this additional data: that you put the hands relaxedly in the lap. Hold those electrodes relaxedly in the lap, and then squeeze the cans. You can even say, "Gently now, squeeze the cans." And you will get your third-of-a-dial drop, see? And you notice that my proper third-of-a-dial drop is not obtainable on this meter.

This is another thing: There is no sense in backing off sensitivity and backing off sensitivity, and backing off sensitivity and backing off sensitivity, hoping that you can keep it down to a third-of-a-dial drop, because as a person starts getting Clear, what do you eventually run into? Their needle gets so loose, charge is less and less registering. And you've done the same as back the sensitivity knob off the read. And as a person is halfway Clear, if you could set it to a third-of-a-dial drop, by some electronic mechanism inside the thing, you would get no registry of any kind on the needle.

So another factor is visible here. And that is the factor that as a person approaches the state of Clear, their mental charges have less and less reaction on the meter. Not more and more reaction on the meter, as somebody thought once. Their needle gets looser and looser and looser and looser, and the charge as that happens, of course, is less and less expressed. They do not get anywhere near as upset as they used to, even though they can be more volatilely upset. You see?

So you could easily back this sort of a thing off with – electronically, you could put a new rheostat underneath this sensitivity knob that would back it off so that much pressure, to give a third-of-a-dial drop, was all the reading you could get on the thing. And if you did that, as a person was about halfway Clear, they would no longer read in any way, shape or form on the meter.

And in order to finish up clearing, you will find out that you have exactly reversed the whole activity that you did in the beginning. Your person at the beginning was reading down here at a very dead-body 2.0, and you said, "Have you ever killed your grandmother?" and actually they're doing time for it right now.

And the fellow says, "Well, no," and you don't get any reaction.

And you say, "Well could you help anybody?"

And the person says, "Well, I often do, you know. I often do help somebody."

And you say, "Well, what do you do?"

And they say, "Well, I just often do help somebody."

"Yeah, but what do you do that helps somebody?"

"Well, I just do. I just help somebody. I wouldn't tell you," or something weird like this, you see.
And – "Well, name something that would be helpful."

"Well, let's see. I could hold the door open – well, no, that wouldn't be helpful. I could give you some money – no, that wouldn't do any good. I could – I could buy you a din- no, no, that wouldn't be helpful. No, I guess there just isn't anything you could do that would be helpful. People just really pretend there is such a thing", or some kind of a weak, oddball, weird answer accompanies this. Which is, by the way, your most positive test.

All right. Now, this thing starts acting up, goes all over the place. A person that is reading anywhere over the dial here now – you ask him, "Did you ever kill your grandmother?" and it falls off the pin. You got the idea? That's the first time you've ever run into it, and just, bang, you know.

You say, "Do you have a present time problem?" – bang! "Well what is your present time problem?"

"Well, I've eaten all my candy." [laughter]

See, it's a little tiny microscopic problem – this tremendous read, you see?

Guy gets toward Clear, and your needle is going bong-bong, bong-bong, you know, every time he squeezes the cans once. And you find out – "Do you have a present time problem?"

The fellow says, "Yes, I have a present time problem."

You say, "What's the matter?"

"Well," he says, "I've lost fifty thousand dollars today", and you got a two division fall. He says, "That's all right. I'll get it back tomorrow, one way or the other." [laughter]

"Is that bothering you now?"

And the fellow says, "No. It isn't."

You say, "Do you have a present time problem?" There's no fall on it now. You say, what's happened here? Well, it's just that the actions of life are not having just this much disastrous effect upon this guy anymore, that's all.

All right. Now, to clean up this case toward the end of the clear run – this is something that I might forget to tell you and you certainly had better know. At the end of the run, in spite of the fact that it's almost impossible to read, in spite of this, you have got to set this floating needle up here with a sensitivity 16 to stabilize your Clear.

It's almost impossible to read. You'll be here dancing around with your E-Meter all the time. You spend most of your time adjusting the E-Meter. And you say, "Let's see now. Whoa, let's see now – all right, all right. Faith. Do you have faith in Uncle Joe? Has Uncle Joe caused anything?" And you say, "Okay, what was that?" And "Good, that's pretty good. The guy thought of something that got a reaction on it. All right. Fine. Now let's see if we can't get a command worked out here. What has Uncle Joe caused?" Look at the meter. "What has Uncle Joe caused?"
"Well", the fellow says, "I guess he caused quite a few things." There's no reaction on the meter. Uncle Joe has blown. And that was it. But you have to crank that sensitivity up here to 16 to read these last few charges on the bank. And when you're stabilizing a Clear, you're doing an SOP Goals Assessment the same old way, over and over and over. You're trying to assess for new goals, trying to assess for new terminals. You do find a new goal, it does fall. Now, hold your breath; hold your breath. Now let's find a terminal for it. Let's find a terminal for it now. "All right, you've always wanted to fly to the moon on a washboard. Very good. All right.

It's gone, you see! You blew it! Because you've got somebody who can blow these things by inspection. Instead of the loss of his candy hanging around for the next two months and driving him into dementia praecox, [laughter]...you get an entirely different meter reaction. And you actually have to read the last stages of Clear with your sensitivity enormously advanced, which is a great oddity.

In other words, there is a point of insanity, called "normal," at which you get an optimum meter read. It's optimum. Everything falls. The fall lasts. Everything's just wonderful. It's all smooth, not difficult. You get the goal and it just stays there for weeks, you know. And you get the terminal, and it hangs around forever. Everything is just dandy here. And you run it. You can assess it. Everything we've been saying, you see. Form commands for it. You can assess it on new levels. You can assess it on new levels. Boy, you can have a ball, you see.

And then, by the time you've got your next goal selected, just about from there on, you're in trouble, trying to get SOP Goals in a completed cycle. Find the goal. Find the terminal. Assess the terminal on the Prehav Scale. Find an auditing command. Get the auditing command run, you see. And all of a sudden this whole cycle as an action starts to foreshorten, just as the individual with higher and higher increased sensitivity on a floating needle is getting less and less charge, and it's less and less lasting. And so, you eventually are just short-handing it. "Well, do you have any more goals? Thank you. Do you have any more goals? Thank you," you see. It'll actually beat you down to a point where you say, "Well, there's no sense in getting to a terminal or anything like that."

Well, there's a danger point. You could become unalert. He might still have a sticky one. He might have one that'll last for an hour's auditing, you see. And it's that one that you've got to look for. And the end of SOP Goals, Routine 3, is just search, search, search, search, search, search, search. Search it, find it, lose it. Search it, find it, lose it. Search it, find it, lose it. And it happens faster, it happens faster, it happens faster, and pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa. Then there isn't anything else you can do with the case. Not in the framework of "think" auditing or reactive minds.

Yes, there are other things you can do with a case, but until you've got that one totally stabilized out, the person is not going to be stable 100 percent. There are other things now
you can do with a case. We've invented them in the past, they already exist in the past. He'll, oddly enough, be able to do some of these things.

Oh, what do you mean? You know, Route 1. You mean "Copy, copy, copy, copy, copy."

"Oh yeah, sure, sure, okay. All right."

"Good. Copy, copy, copy."

"Yeah, fine, fine, fine, fine."

"Go outside of it, inside of it, play hopscotch with it."

"Oh, you want an ashtray?"

Okay. Now, if you do have any questions that suddenly rise up and smite you in the face during the course of the day's auditing, and you don't get them answered by the end of the day, why, remember to ask me, okay? All right?

Thank you very much.
Running CCHs

A lecture given on
22 June 1961

I had a piece of interesting news today. The Explorers Club just awarded me Flag No. 163 for the Ocean Archaeological Expedition.

Some of you are wondering, "What's this expedition?" [laughter] Yeah, what's this expedition?

Well, it's a long story. But in 1950, a fellow name of Palmer walked into the Explorers Club just as I was leaving the mail room, and Palmer says to me, he says, "Hey, Ron," he says, "you want a – you want an expedition?"

And I said, "Well, sure."

And he said – he said, "Well," he says, "there's a whole bunch of Greek and Roman statuary that was being brought from Athens to Rome, and the ship went aground on the north side of the Dodecanese." And he says, "Been there ever since. And they've just located it at about thirty fathoms of water." And he says, "Nobody's having anything to do with it." He said, "We have permission from the Greek government, and so forth, to recall the thing.

"But," he said, "I was getting it all organized, and everything was going along fine," he said, "and all of a sudden the government of Ecuador" – he was in an awful rush – "the government of Ecuador has just grabbed all of us to explore the hinterland of Ecuador."

And that's always a very juicy activity when one of those South American governments tells you to explore the hinterland, because they pay you. [laughter] And that is almost unheard of. And they actually pay you by giving you a half a million square miles of headhunter-ridden jungle or something of the sort.

But anyhow, anyhow, he was on his way and he was picking up a couple of fellows instantly. And as a matter of fact, they were walking into the club. And they had the spiked mustaches and looked very Ecuadorian, and they were seeing him to settle these affairs, and so forth.

Well, anyhow, this fellow threw all of his papers and so forth with regard to this expedition in my box at the club. And a few days later I was just about to put my hand in and recover them when May 9th occurred, 1950. That was an interesting day: it was publication day of Dianetics: The Modern Science of Mental Health.

I want to call something to your attention: this is eleven years later; there's eleven years more algae accumulated on this statuary. And I haven't had a breather. I haven't had a breather at all. It doesn't take very long. Doesn't mean I would be vastly absent for any length of time.
Actually, what you do is you take the sunny, stormless period of the year (which is not necessarily summer, as anyone in the West Indies will tell you), and, oh, you take a run down and get your feet wet and let the diver get his hose snagged on the coral, you know, and do what you got to do, survey it and lay it out. And next year you go back and push it around a little bit further. And then you happen to find out that Alexander the Great's Wall of Tyre is very interesting, you see? So you drop down and see what's happening there. And you accumulate various things.

We have now accumulated the Maritime Museum at Greenwich. It is now one of our boosters, and the museum at the United States Naval Academy at Annapolis is one of our boosters. And we're accumulating left and right. And actually the nephew of Round-the-World Slocum – you've heard him, around-the-world-single-handed-in-a-twenty-eight-foot-boat Slocum? Well, his nephew is a Royal Navy retired captain, so he has now joined the ship's company. This kind of thing starts snowballing, you see? And all you do is innocently lift your head and say, "I think I will go on an expedition", you see? And you've said it; you've said it.

Actually, it doesn't take very much time. You decide, you see, that an expedition is something that people disappear into small igloos for six months at a crack, or something like this. This isn't the way it goes at all. I call to your attention there are aircraft these days, and they put you in the area where your people have been working getting things ready. And put you in the area on a Tuesday, you see, and you can pull out from that area on a following Wednesday. And you can keep up with it pretty closely.

Anyway, we have a ship that's a 111-ton, twin-screw diesel schooner that I have rebuilt on paper, now, into an expeditionary vessel; arguing with the United States Coast Guard as to whether or not it's a scientific ship or a yacht, or whether it can remain to be a yacht and still be used as a scientific ship. And almost ready to throw up my hands and fly the Panamanian flag, if not the Jolly Roger. [laughter]

And I've just been sort of working on this in my spare time and – of which I have quite a bit, actually – and getting it together. Nothing very dramatic in the way of progress.

But we hit these dramatic points, because you have to be pretty well accredited or reputed in order to get accreditation on an expedition; they don't give that to everybody. So the Explorers Club hadn't written me and hadn't written me and hadn't written me; they had me right there on Wait on the Prehav Scale, you know? And I finally wrote them a letter and asked them if the letter was – my letter had been lost, or something of the sort, you know, or if I'd been taken out of the files or something.

And just today, why, they – their delay was explained. They had already put it before the Flag Committee and the board of directors and that sort of thing. So the expedition, as of that action, became an official scientific expedition: ocean archaeological survey with the purpose of discovering various periods of marine history in the past, as possibly represented on the floors of sunken harbors long since passed from the view of man where there are, of course, still ships.

And I don't guarantee that we won't stop by on some of the stuff sunk during World War II and pick up a few tommy guns. [laughter] But anyhow, an expedition of this character
does get a sort of a lonely activity, because people always are smelling the idea that you might bring up the crown jewels of Ophir, or something of the sort, and no telling what might happen.

Anyway, the wide blue horizon opened up and there it is, and I just thought I would tell you about it.

You ever see the Explorers Club flag? It – Oh, I've got it upside down, I sure have. There it is.

Yeah. Now, this flag is not in bad shape – not in bad shape. It was just carried by Waldo Schmitt in his expedition into the Belgian Congo just before the recent difficulties began. My old flag, as I was – I pinned it up there on the bulletin board for you to see – is reported to me to be in such a state of dishabille that it couldn't be issued to anybody else, [laughter] which is absolutely true. Hurricanes are only supposed to go about 100 miles an hour. But that particular flag was flying all through a hurricane that was blowing at 185 miles an hour at Anchorage. It was really rough. Yeah.

All right. Well, I probably used up tape there I shouldn't have used. But anyway, that's the tale about it. Thought you might be interested. I don't always have my attention on the hot brains – don't always. But actually, although I do other things, neither do I let them get in my road. All right. And I keep my job up – try to, anyway.

Now, understand that you're probably going through a number of catastrophes, you probably have run into some imponderables. And I wish to tell you somewhat amusedly that Johannesburg has found a new way of running the CCHs, which is you just sit there and pump somebody's hand for many hours, hoping there will be a reaction. That's pretty good.

I have a hint for that area: they should read a bulletin. [laughs]

Now, they've got one guy on a course that isn't progressing in spite of the fact that they have run him for hours and hours and hours and hours and hours on CCH 1 with no reaction. So Routine 1 "isn't working."

Oh, no! Yeah. That's right. Well, a three-hundred-word cable has just gone out. [laughter] We insulated the telex up here. Actually, the cable is pretty articulate, hardly gibbers at all! [laughter]

Now, I'd better cover the running of the CCHs just for fun, just for fun, just as an amusing activity that, of course, has no relationship to anybody that's ever going to make a mistake; particularly here.

And the way the CCHs are run is CCH 1, 2, 3, 4; 1, 2, 3, 4; 1, 2, 3, 4 – just like a waltz step. [laughter] You just continue them over and over and over and over and over and over and over and over and over and over and over and over. And it is a breach of the Auditor's Code, clause 13, to run a process longer than it is producing change; and it is a breach of the Auditor's Code, clause 13, to cease to run a process that is producing change. And nothing we are doing these days has exceeded the Auditor's Code in any way, shape or form.
The odd part of it is, the more we seem to change our minds, the more they remain the same, as far as what we're doing is concerned. People who accuse us, you see, of always changing our minds miss the point that we haven't changed very many fundamentals. But we've sure been looking for an opening in other people's minds, and CCH is one of them.

And the CCHs were basically pioneered, I see, back in about 1956. And that is the first way they were run, and that is the way they produce the maximum change. And after that, I didn't pay too much attention to them, and they slopped into very careless ways. And people started adding additives to them; that is the usual thing that happens. And people started to endure while running them, and it hadn't anything to do with the CCHs.

Hence I'm calling this back to your attention. Commands have been added to them, like "Put your hands back in your lap." Now, what that has to do with the CCHs, I'm sure I don't know, because I never heard of it until I picked it up on a sheet of paper not too long ago.

Somebody refined it and I okayed it carelessly and then forgot about it, and so forth. Truth of the matter is, the words in a CCH process have practically nothing to do with the process.

Now, I had a question on an auditor's report here the other day, as to whether or not you were really supposed to put the person's hand – or touch the person's wrist with your other hand. At least that's the way I interpreted the question. Well, how are you going to get the man's hand? It's a matter of seizure, as far as you're concerned; it doesn't matter whether he's hanging from a chandelier or anything else. You take his wrist delicately between your thumb and forefinger and put his paw in your paw, and you execute the auditing command for him. And you continue to do that. It's always the same repetitive motion; you always do it the same way.

And there are exact motions that you go through. I won't try to describe these verbally; I'd rather show you. They're very simple. For instance, when you're doing CCH 1, your knees are interlocked with the pc's knees. Try to get out of a chair when somebody has got your knees clamped. You see, you don't sit back across the room and so on. You do so much formal auditing that you've forgotten that there was an awful heavy routine regimen laid down here on these CCHs. They were quite precise.

Anyway, you're moved in practically into the pc's chest, and you've got at least one of his knees between your knees, and he starts anyplace, why, there he is. He isn't going to get up, not if you close your knees. And furthermore, you should be between him and the door Always. Your back's to the door; his face is toward it.

Now, he's got a wide perimeter to leap through to get to the door, but you're covering all of it. If you're suspicious of him, back him to the far corner of the room on a CCH 1; so therefore he has to walk through you to get to the door. And you don't lose pcs. I mean, they sit there and run CCH 1, that's all.

You do a certain routine with your hands, and you present the hand into your hand, and you don't shake it and wish him happy days and all that sort of... He has given you his
hand, and at that moment you put his hand back. See, you don't tell him "Now, put your hands back in your lap."

What was this – telepathic CCHs? Well, the CCHs are run with meat. They are very meaty protesses, you see? They're not a verbal "Let's all get along ..."

We had a student one time on one of the ACCs that was running CCH 2, and the pc was giving the auditor a very bad time, you see? But it was just a coaching session because they were doing Upper Indoc. And this pc was – acting as the pc, of course – was slumping and doing unexpected twists and turns. And this dear person who was running this TR, all of a sudden just abandoned the whole thing and turned around to her Instructor – I think it was Dick or Jan, and said, "Pcs never act that way; I'm simply not going to run that TR anymore."

Well, time went by, and she ran into one who did act that way, who acted much worse in an actual session. So all of your Upper Indoc was simply basic training by which you could then do the CCHs. But unless you'd done Upper Indoc, you see, and got your confrontingness up on this amount of motion, then it was difficult to do the CCHs.

Now, two of the CCHs are as rough as bear wrestling. Now, the other two CCHs are not. Nevertheless, they, too, are done by compulsion if necessary.

You can run one-handedly CCH 3 and CCH 4, and you run it one-handedly. That's an interesting aspect of it. You take the pc's hand and you make the pc's hand touch yours and follow the motion. That's all. And then you release his hand. I mean, that's as simple as that. It becomes a kind of a CCH 1 all over again, but it was with motion in a different pattern each time, don't you see? So if the pc is running fine, you run it two-handed and if the pc is not running fine, you run it one-handed. And that's all there is to it.

And Book Mimicry: He says he's not going to do Book Mimicry because when he was very young he got hit by a book. And you say, "That's fine," and you take the book and you put it through a motion, and then you put the book in his hands and you put it through the same motion. And then you take the book and put it through a motion, then put it in his hands and go through the same motion. You understand?

This pc never has an opportunity not to execute the auditing command, and that's all there is to it. And that's CCH 1, 2, 3, 4. The pc never has an opportunity not to execute the auditing command.

And the auditor who will let the pc get away with a non-execution of a CCH – oh, my. It just isn't done – not at all, not even in Chelsea. Not done. The pc always executes the auditing command, no matter if you have to sit on his or her chest and get it done! And you could fully expect the pc to turn up to high-C, high-G, soprano, contralto, or just get into a roaring funk or anything else. Who cares! It has nothing to do with your Tone 40ing through the CCHs. It is just that way. It is not nice; it is effective.

Now, the consequences of letting a pc get out of a CCH are very grave, and you only have to do it once and you will wish to God you never did it again.

I saw a pc let out of CCH 2 one day, and that pc went crazy. How do you like that? It was an institutional pc to begin with. And the pc was getting better under CCH 2 and all of a
sudden made a break for the door, and the auditor did not stop her. And she rushed out into the street. And the auditor walked along behind her trying to persuade her to do the process. And she walked all over the town and was eventually picked up by the cops and thrown into the local spinbin – where she had come from originally; I'm not trying to tell you that CCH 2 drove this person crazy. But do you know that pc didn't get all right for years? Now, the consequences of it are pretty fabulous.

That auditor just stood there and let the pc blow. You got the idea? He heard about it for years, too. Whenever he was getting out of line, why, we'd mention it to him, see? We'd say, "Well, at least you didn't let the pc blow out on the street", you know? And he'd cringe.

No, it's a serious thing. Now, all he had to have done was just to have blocked the pc's leaving. Yes, it was an institutional pc; yes, the girl had been in spinbins till you couldn't count; yes, she'd been electric shocked and all the rest of it. So what? All he needed to have done was simply to have stopped her going out the door and put her back through CCH 2, through the next command. And that psychosis was blowing and would have blown. We know by experience that this is quite common and quite ordinary.

The CCHs run out electric shocks; they run out surgery; they run out almost anything you can think of, if they are run right.

The darnedest physical manifestations turn on. And, of course, the CCH is not flat at its points of higgest volume of reaction. Your pc doesn't, oddly enough, sustain tremendously high-volume reaction, and you almost never see a pc screaming for twenty minutes so that you have to say that it's flat, don't you see, and go on to the next CCH. Almost never happens.

Neither do you necessarily wait till he stops screaming and then say it's flat. Has he stopped screaming for twenty minutes, you see? That would be the test.

But, of course, by rule now, what do we mean by flat? We mean the same aspect of the pc for twenty minutes, which by ne plus ultra, reductio ad absurdum, would be, if the pc were screaming at exactly C-sharp minor exactly, for twenty minutes, that is a no-change. So you'd go on to the next process. You got it?

If the pc is lying on the floor in a funk for twenty minutes, that process is flat. Have you got it? You're executing the auditing command, and the pc remains on the floor for twenty minutes, there's no aspect change of the pc, so that process, as far as you're concerned, is flat. Now, you got that?

Now, how slight a change is a change? A somatic enters and leaves in that twenty minutes. Well, that's not flat. You've got to run it for twenty minutes without the return of that somatic. You got it?

Now, most CCHs run rather calmly. Most of your CCHing is not done with this tremendous duress. About the only time that tremendous duress sets in is usually when the pc is going through something he considers quite painful.

Now, the CCHs turned it on and the CCHs will turn it off, and that is in the oldest rules of auditing: That what turns it on turns it off.
What do you think is going to happen? You've got a horrible, strong, beefy process of this character, and you've turned something on with it. Well, when is he going to get the CCHs run again? See, you didn't run it on through and turn it off. Well, that's a serious thing, you see? That's a blunder of magnitude.

But it's twenty minutes, and it's by the clock. It's not about twenty minutes; it's twenty minutes, by Greenwich meridian, navigational chronometer, sidereal time. Twenty minutes. And if there's no change of aspect in the pc for twenty minutes, then it's flat.

Well, what if the pc, during the whole of the run... nothing happens? Pc just offers his hand and he offers his hand and offers his hand and offers his hand. Well you ... Nobody said anything to – you ran it till you got a reaction!

Now, let me point out something: An E-Meter very often, on a level (and this will fool you sometime if you don't know about it, so know about it pretty well) – the E-Meter, assessed on a level, sometimes for the first three to five hours of run will be giving you the answer to a flat tone arm. A flat tone arm. It's giving you less than a quarter of a division of motion for the first three to five hours, in an extreme case. Less than a quarter of a division for twenty minutes is the signal to change to another process, isn't it? How can you call it flat when it hasn't yet begun to bite?

But there is some motion in the tone arm; there is some motion in the tone arm. Therefore, it is not flat at the beginning of an assessed level run in Routine 2. In Routine 2, it's moving an eighth of a division. It moves an eighth of a division, it almost reaches a quarter of a division, it moves a sixteenth a division, it moves an eighth a division, it moves almost a quarter of a division. You get the idea?

Well, those all say – according to the test – "process flat," because it's moving less than a quarter of a division. Look, how can a process be flat when it hasn't begun to run? It can't be. And you needed some subjective reality on this; you'll run into it soon enough, because it happens to people early in processing, particularly on a Routine 2. But it sometimes happens when you've assessed the goal and you're running on a Routine 3, too. All right.

Here's this little crea-eak, crea-eak, crea-eak, you know? And you say, "Well, by all the rules, it's moving less than a quarter-division in twenty minutes; therefore, I'll come off of it." And then you say, "Well, the pc was ungratefully spun." And the process has not yet begun to run.

Three to five hours, sometime in that period, all of a sudden it suddenly picks up and moves a quarter of a division. Now suddenly it moves a half a division. Now, all of a sudden it moves a division. And then it gets down and you say, "Well, thank goodness, it's coming on down now, and this level is flattening." And it's only moving about a third of a division, and pretty soon it'll move a quarter-division, and then it goes from 1.0 to 6.0 to 7.0 to 5.0 to 3.0 to 4.0 to 2.0, because when they do this, sooner or later they get hot, hot, hot!

Now, the only danger in overrunning a process, of course, is sticking the tone arm. And the only danger there is that you stick it for a couple of sessions, and you can't reassess. But you could stick it for a half an hour and still reassess. So if you're in doubt, while you're feeling your way over this, go ahead and stick it!
It's like I told Barry up at HGC London. He kept telling me, on this one pc, he said, "Well, it's just ... I just ... when will it ever get flat?" You know, it had picked up and had gone very slow, and he'd come off it and he'd reassessed another level in the same afternoon. And of course there I was, looking right down the telex wire at him.

And I said, "Ah-ah-ah-ah-ah-ah-ah-ah-ah-ah-ah-ah-ah!" I said, "With a tone arm doing that little, the tone arm has not yet begun to move on that level. That tone arm will begin to move on that level. So let's get on the ball here." And he promptly and instantly went off of the second one he had assessed and went back to run the first one he had assessed. And much to his amazement, the first one really started to pick up and fly!

And then he finally wrote me in desperation, about six or seven hours of auditing later. He says, "When is this thing ever going to flatten?"

So I said, "All right now, Barry, you just run it to a stuck tone arm."

And he did; it took quite a while, but he ran it to a stuck tone arm, and then reassessed – stuck the tone arm for twenty minutes and learned how long you could run it and what it looks like.

In other words, this tone arm action, sometimes early in auditing, takes a long time to get going; and at no time can you consider that flat, because it's never run yet. It assessed, so if your assessment was good, it will run. And it may take three to five hours for it to start to run, and we've seen that quite consistently.

Now, that's just one level of the Prehav Scale. Now, let's apply this same thing to the CCHs. This is why I'm taking it up.

Now, your CCHs are run without Model Session and without an E-Meter. We care nothing about the E-Meter in running the CCHs because the pc is the E-Meter. Just as you've learned to watch the tone arm move, so must you learn in the CCHs to watch the pc move – the body reaction. It isn't what the pc says; it is what the pc is doing and is what is happening to the pc. Now, the pc may communicate to you that certain things are happening, and that's fine – that's a change. But the pc is the E-Meter.

You have to consider all four of the CCHs as one level of the Prehav Scale, in this wise, for this purpose: sometimes the CCHs do not begin to bite. So, what do you get? You get twenty minutes of CCH 1, followed by twenty minutes of CCH 2, followed by twenty minutes of CCH 3, followed by twenty minutes of CCH 4, followed by twenty minutes of CCH 1, followed by twenty minutes of CCH 2 and followed by 18 1/2 hours of CCH 3. You got that?

Just as it takes, on a normal level, a while for a tone arm to pick up and run, so does it also take a while on some cases for the CCHs to begin to run. But if you sit there and grind on just one CCH, this won't happen. And if you don't run the CCHs ...

The reason why the CCHs were trotted back out of mothballs, dusted off, the smell of camphor whisked off the top of them, and put back into the lineup, was because you had what happened in the CCHs: the person would run up against the withhold block. In other words, the person would accumulate more responsibility and become aware of more withholds, and
there was no way to get rid of them because the pc wasn't being talked to and no rudiments were being run. So the CCH game was limited by the fact he never had a chance to get his withholds off. Right?

So, in running the CCHs today, you are going to run a processing check – a standard HCO WW form. I repeat, no Security Check is permitted to be edited or altered, changed or added to, ah... period. If it doesn't say HCO WW Form something-or-other at the top of it, it isn't a Security Check. Okay?

And, of course, you don't use a staff member Security Check – that is to say, a new ... one of these new HCO WW Form 6s or something like that – as the repetitive Security Check for processing, or something like that. It means right what it says.

You run a Joburg. You take your most violent versions of Security Check, and you run them one for one. If the pc is an hour on the CCHs, the pc gets an hour of Security Check. You got it?

Now, if you're really booting somebody over the horizon and just really giving them the rocket in a mad way, swap their broomstick for a rocket: give them the CCHs from one auditor and a Joburg from another one. Perfectly feasible. Now, you can actually go ahead and assess for SOP Goals with a third auditor, all at the same time.

In the morning pc gets his CCHs, and in the afternoon he gets assessed for goals, and in the evening gets a Security Check run on him. How fast can you get a gain? Well, wait till you've tried that one – wait until you've tried that one and seen that one go, because, man, you get a gain. It's really inevitable.

But the CCHs are quite powerful, and they throw overts into view quite easily. And the person who is pegged down gets a little bit of auditing and all of a sudden these overts start to loom a little large, and they have to get rid of them.

Now, I don't want you to run into trouble and I don't want you to be abused in auditing, but I hope it happens to you at least once that you get a lot of wonderful auditing that gives you a beautiful case advance without a Security Check, and then suffer for two or three days, and it'll sure make a citizen out of you. Boy, that gives you a subjective reality, right there.

An auditing gain without a Security Check – an auditing gain with velocity, you understand, such as we're handing out now, without a Security Check to clean it up – and you've really handed somebody a bad time. They just practically start bleating, you know? "Why am I doing all these horrible things? My life is such a horrible mess. I have..." You know? They didn't think it was; they were in a wonderful state of fixed irresponsibility just a day before and then something got run on them, like Routine 1 or Routine – I mean, the CCHs or assessments on the general scale. And this was run and all of a sudden, there they are, off to the races.

And you let them improve and improve and improve and improve, and don't inquire into their private lives, because that wouldn't be nice. You'd practically kill them.
I don't wish you any hard luck, but there's nothing that makes a citizen out of you like having that happen to you. You get miserable!

So the CCHs are highly functional as long as they can produce a change in the pc. And the change in the pc is ordinarily stopped by the fact that the pc can't get off his overts. And he's to become more responsible by running the CCHs, and then can't get off his overts and so, bang! – that parks his progress on the CCHs.

Now, how many ways could you park progress on the CCHs? One, you could fail to run Tone 40 auditing. You could go at it in some old crummy way, you know? You got so used, in the Academy, to putting it into the ashtray that you keep putting the intention in the ashtray throughout the auditing session, you see? Be pretty wild.

You run it sort of permissively. You say, "We shouldn't be mean to the preclear," and we just sit back and we don't really press it home. And the pc says, "Well, I'm tired today. And I really don't feel ... I really think this CCH 1 is pretty flat now, and I'm very tired today, and so forth, and I'd rather it wouldn't ... weren't run. I'd rather you'd go on to CCH 4. I think that was the one I was interested in."

Go on to CCH 4, you've had it. Here we go, because you violated C. The first C is control, the next C is communication and the H is havingness. Control, communication and havingness, or communication, control and havingness. Either way, because you apply control, you get communication; and if you apply control and get communication, havingness will result. If you communicate with somebody you can apply control, which will give you havingness. Whichever way this adds up, the end result is havingness.

Now, irresponsibility can deny havingness. Irresponsibility, then, is pulled off of a case by the Security Check, which results in havingness. All O/W results in havingness. So Routine 1, whether looked at from above, below, plan view, or projected, gives you havingness. And the final net run of it is havingness. Routine 2, all the prehavingness buttons, are the things that prevent people from having. Prehavingness might as well mean "prevent havingness" buttons. But we don't call it that because somebody would say the scale was designed to prevent havingness. And by that overt, of course, they prevent themselves from having any gain.

Anyhow, prehavingness, and the end result of patching up somebody's various buttons on the Prehav Scale is to give him havingness. And when the individual has enormous numbers of unrealized goals all over the track, the net result of all of these all up and down the track was to deny him havingness because he never attained the goals. So that when you do a Goals Assessment – just the assessment – the end product of it is havingness. And you've got three havingness routines. Now, all three routines – you have in these routines the inherent fact that you run O/W on a preclear and he gets havingness.

Now, why does he get havingness? Because the individual individuates from things because he can't have them. And therefore he develops overts only on those things he can't have. And when you get the overts off, he can then have.
Here's one of the tests: If you can't get the havingness of the Havingness and Confront Process to work, did you know that all you had to do was run some O/W and you will achieve the same thing?

Supposing we did this weird one: We had him ... This is just taking it straight from theory, you see? I don't say it's workable or anything else, but it's just theoretical. You look around and you say, "Well, notice that cupboard." And you say, "Well, have you ever done anything to a cupboard? Have you ever withheld anything from a cupboard?" And he recalls one. You say, "Good. Look at that floor; notice that floor. Now, have you ever done anything to a floor? Have you ever withheld anything from a floor? Oh, you have. All right. That's good. Now, notice that fireplace. Have you ever done anything to the fireplace – a fireplace? Have you ever withheld anything from a fireplace? Oh, you have. That's dandy. Very good."

You didn't force him, you see, to have actually done something to fireplaces, and so on, because some of these will draw blanks. He says, "No," that's right; you say, "We'll go on to the next one."

And all of a sudden that room will become the most fantastically real room he ever was in. You just – theoretically, that would be the normal outcome of it. You got it? You give him the environment.

But of course you have shorthanded ways of doing this with all of those thirty-six Havingness Processes that you run on a pc objectively in the room. They all more or less do just this. You see?

So your routines are all devoted to increasing the pc's havingness. And they are devoted to – Routine 1, applying control so as to get him into communication so that he can have; Routine 2, getting out of the road the fixed reactive buttons which prevent him from having things; Routine 3, getting out of the road all of these unrealized goals, each one of which has been a defeat for him at some time or another – any goal – all of which goals had as their end product havingness. You can't help but raise his havingness.

Now, running right along with this you run O/W and get off all of his withholds which are preventing him from having. See, he gets the impulse – he can now have, but he'd better not have because he's done bad things, and if he had these things he would ruin them. And therefore, if you don't get this out of the road, you've left him stuck with the idea that he now could have these things but he'd better not, and he's never noticed before now. And it becomes quite painful to him. He says shame, blame, regret, guilt – oh, he says all kinds of things, but that's what it results in. You got it?

So everything you are doing in auditing at the present moment has the end product of havingness. And, of course, if you could have the whole ruddy universe, I assure you it wouldn't be the least trouble to you, not the least bit of trouble. It's only those things you can't have you have trouble with.

Next time you have a PT problem, look it over – look it over. And just ponder this: "How many things are involved with this problem? All right. What blocks off my having of these things or people?" You'll see a problem blow up.
You see, individuation: individuation from the thing, from the object, from the universe, from the dynamic is what brings about the trouble, because you get into an obsessive games condition. And an obsessive games condition simply adds up to the fact that you can't have it; and it, of course, by your determination, can't have anything to do with you.

Had a fellow around one time who had a games condition going with fire. And my Lord, that fellow burned up couches and suits and fire just pursued him everyplace. He could stand in the middle of a street without a bit of fuel anywhere in view and have a roaring bonfire almost consume him. [laughter] And he was in this terrific games condition with regard to fire.

Now, if you'd improved his havingness in general, sooner or later along the road you would have hit the reactive button "fire", see? What has he done with and to fire? In some way he's made it discreditable, in some way he has made it guilty, in some way he's become irresponsible for fire.

All of a sudden, fire no longer has this obsessive chasing effect. Fire just doesn't pursue him up and down all the boulevards and through his whole life, you see? Because fire isn't pursuing him anyhow: he simply cannot have fire, he cannot control fire, and he can't communicate with fire. Soon as he gets into that condition, wow, he's had it. Because no matter where fire will occur, he has to retreat from fire and pull it in on him. See, he's part of the same universe this fire's in, only he hadn't noticed that.

All right. Now, the CCHs, then, are no different than the other two routines. Where an individual is having any difficulty whatsoever with their physiological beingness, where the individual has been obsessively abused, particularly in this physiological beingness that they find themselves in at the moment, the CCHs knock out individuation from the physical beingness. That physical beingness – individuation has been caused by duress on the part of the preclear toward his body and by, apparently, his body toward him.

He's having difficulty: he can't get in his head, he can't come near the body, he can't do this, he can't do that, and therefore, the body is giving him somatics and he's having trouble with the body. You've got the natural concatenation: he's just individuated, that's all. He's one thing and the body's another thing and he can't have it.

And of course the CCHs attack this one particularly, right on the button. It isn't necessarily the criteria for running CCHs, but it's its most immediate and direct result.

So you take somebody that's been given electric shocks. Of course, this has individuated him from the body, because of his own giving the body electric shocks of one kind or another. Well, what happens to this fellow? You start running the CCHs and his havingness on a body starts rising, inevitably. So he has to become aware of all these electric shocks. So as soon as he becomes aware of them, they start running out.

All right. But as soon as they start running out, if he himself takes no further mental step to find out what he's done to bodies and get rid of his overts against bodies, he's left with the somatics running out – but they stop running out – and his overts against the body in full bloom. Pow! This hurts.
So you've got to improve a pc's responsibility if you're going to improve his having-ness, because he won't permit himself to have unless he can be responsible for having. And that's the other philosophic button on which this rests, which we've known for a very long time. Now, you got this?

So the way you run the CCHs is directly, immediately and so on, precisely, and you pay very little attention to the pc's mental reactions. All you do is give him a demonstration that that body he's sitting in can be controlled; as soon as he sits in on this one and says, "You know, somebody's controlling this body. Heh-heh. Somebody's controlling this body. Maybe I can." And so he'll try.

Now, if you let him get up to a point where the body flies out of control and you say to him, "Well, that's all right. That's giving you some trouble. You want to rush out in the street and not come to session and so forth? Well, go ahead" — mmmm, you've shown him the body can't be controlled, haven't you? And he retrogresses like mad. So you mustn't do that to him, because it's a direct reversal to what you're trying to do.

You're trying to show him that his body can be controlled; a failure to execute the CCHs show immediately and directly the body can't be controlled. Of course the body wins.

Now, all you'd have to do if you're going to ruin somebody — I can tell you how to ruin somebody — is start the CCHs and if the guy says, "Oh, I'm tired of this silly process, 'Give me that hand.' What are we doing? Getting in practice to join the Elks?"

And you say, "Well, if you're tired of it, then we just will go off onto something else."

All right. And we go off onto CCH 2 and we march him up and down the room, and eventually he suddenly throws us off a little bit and says, "You know, this is getting awfully annoying to me."

And you say, "Well, all right. We'll go on to something else. Now, let's sit down here in the chair, and now, you put your hands up there ..."

"Well, I don't know that I want to!"

"Well, all right. Then here's this book. All right. Here's this book and ..."

Fellow says, "I never read books. I don't like books. Don't want anything to do with books."

You say well, there's nothing you can do about it, and you go and see the Instructor, the senior auditor, or call somebody long distance, or send them cables from Johannesburg, you know? [laughs] And you say... you say, "Well, we have this pc who we can't make any progress with, with these CCHs."

Now, do you know that you can take Routine 2 and Routine 3 and do — I'm being very hard on Johannesburg. Actually, Johannesburg is snapping out of it, and I'm very happy to notice it. I have noticed it. It was sure in the basement for a while.

But, anyhow, if you were to do the same thing with any auditing activity, and let the pc get out of control at each and every turn of the road, you of course are giving them the side
effect of proving it to him that his aberrations are so strong that they cannot be controlled. And don't be too puzzled if the pc eventually becomes practically unauditable.

Don't be too surprised, if you fail to exert heavy auditing control during a session, if the pc starts getting mad at you, chopping you up, doing this, doing that, doing the other thing; because by not controlling him, by taking his advice all the time, by asking him, "How do you run this process, anyway?" by doing this and doing that, you have shown him that you are not controlling him in the session. And showing him that you are not controlling him in the session, of course, results in the model of "no control" taking over and he himself is defeated because he sees that he cannot control his mind, he cannot control his body, he cannot control. That's true of any auditing process.

That might give you a new shading on this idea of control. Whereas you would look on it very bad – I've mentioned this to you just the other day. I was auditing a pc, actually on a think process, and the pc said, "Oh, I've had enough of that," and leaped madly out of the chair from a very, very calm demeanor, and actually said "I've had enough of that" while springing through the air like an impala. And was springing straight to the door, and in mid-flight I simply grabbed her by the wrist, turned her around in mid-flight and brought her back sitting down in the chair – its legs almost spraddled out into a total splash, you see? – and gave the next auditing command. And that pc began to run like a doll. Nothing to it, man. And we had that process flat just in no time.

And you say, "God, that's awfully harsh!" No, I wasn't being harsh to the pc; I was being rather decent about it. If I'd been mad at the pc, all I would have had to have done was not reach out and grab her wrist, let her reach the door, and then not audit her. Oh, pow. She's had it. She's had it! She'd go around now in the total belief, "Well, if Ron can't control this much aberration and so forth, it's uncontrollable," don't you see? And "Zzoooh! What can poor little me do about it?" You know, some kind of a stupid rationalization like this, you know, to herself. She'd go off hiding from herself in corners.

All right. So she did have a black-and-blue addendum. That was an awful lot better than having a black-and-blue psyche.

And if you for a moment think you're being anything but ornery when you fail to control a pc in session, get rid of the idea. Don't get this kindness all mixed up. I saw I didn't get through to you too good the other day on the subject of kindness, but that's right on the button now. By misguided kindness, you let the pc take control of the session; by misguided kindness, you let the pc off from finishing off the somatic; by misguided kindness you consult endlessly with the pc to make sure that he isn't displeased with what we are doing; and out of that misguided kindness, you practically drive somebody to the bottom of a well.

Be the most vicious thing you could do to a pc is to fail to control him.

The factor is so strong that even if the pc is right in his advices, you had better not take it, because he will suffer more from having been run rightly but out of control, than wrongly in control. Now, do I make myself clear?

Just the fact that the pc has said, "But this has been flat for days!" And you were just that moment going to open your mouth and say, "You know, I think this level has been flat
for days!" You were just about to say this. But the fact that he says it, that's enough, man. You have no choice but to run it. Why? Because his announcement of the fact throws him out of control. And it is more serious to let a pc out of control in session than it is to run the wrong process or to overrun a process. That can't louse him up, but letting him go out of control can practically kill him.

So if you ever want to err, don't err on the side of sweetness and light, man; err on the side of the heavy-handed parent; err on the side of the lion tamer; err on the side of the machine gunner. Keep the Auditor's Code, but keep control. And if you do that, your pcs will never do anything but recover, because the hidden factor of the CCHs are present in whatever you're running, even though you're doing formal auditing.

"Well, is it all right with you if I end this process?"

And he says, "No, it certainly is not!"

And you say, "What objection do you have?"

And he says, "Sa-rowr, rowr-rowr, rowr-rowr."

And you say, "All right. Okay. Thank you very much. Now, I'll give you two more auditing commands and end this process."

"Oh, God! What are you doing to me?"

And you say, "Have you ever shot the moon? Thank you. Have you ever shot the moon? Thank you. Is there anything you'd care to say before I end this process?"

And you know, about that time, if you've done the job right, he'll say, "No, as a matter of fact I don't have."

You say, "Good. End of process."

What happened to the ARC break you knew was going to occur? It wasn't that he was knuckled under and overwhelmed – that was not what happened. You say, "What do you know? This outburst is easily controlled. Look, pc controlled it."

Pe's controlled it. "Not only did the auditor control it, I controlled it, too. Heh-heh. What do you know? Tooh! Nothing to it." Got the idea?

All right. Wrong – wrong way: "Well, is it all right with you if I ask you two more times and end this process?"

"No, my God, I will say it isn't! I've got a somatic eight feet thick, and why don't you ever pay any attention to your auditing, and what is the matter with you anyway?"

"Well, how wide is this somatic? Okay. All right. Well, we'll carry on the process a little while longer then, and see if you get rid of it."

"Well, you'd better."

Fifteen minutes more auditing and you've got a real roaring ARC break. What's the ARC break over? You did what the guy said! You tried to flatten this terrible somatic; you were being nice about the whole thing; you were being reasonable about the whole thing. Well, the test is, did the somatic get better? No, as a matter of fact, it will always get worse.
Always. It's better to end the process wrongly on the auditor's determination, than to end it on the pc's rightly. Remember that. Of course, it's a happy chance that you end it rightly on the auditor's determination. [laughter]

Give you a new viewpoint of this sort of thing?

_Audience: Yes._

Yeah.

Now, the auditor is running the session, and if the pc starts running the session, expect trouble – expect trouble, man. It's not a kind thing to do; it's a rotten, mean, dirty, nasty thing to do to a pc. It's almost covert hostility to do that to a pc.

Pc says, "Oh, God, you're not gonna ... you're ... you're actually ... no, my God! You're not going to run any more 'failed can't'!" [laughter]

And the auditor says ... My normal response to such a thing is "What's the matter?"

And he says, "Yow, yow, yow, yow, yow! And yow, yow, yow, yow."

You say, "No kidding! All right. The auditing command is, 'What have you failed to can't?' 'Who has failed to can't you?' " And he'll all of a sudden – he's suddenly good as gold. He says, "Well, it (kmpf-kmpf) wasn't flat. Process wasn't flat."

The pc can steer a session wrong on me by being too informative of actually what is the exact situation, because he opens a gate there that you can't let him go through. And he says, "Well, this 'failed can't' has been flat for the last session. I know it." And you were just about to open your mouth and say, "This 'failed can't' has been flat for the last session, I'm sure."

And he says, "This 'failed can't' has been..." _Whooh._ Well, here goes a half an hour of "failed can't".

In the first place, I wouldn't believe it was flat if he was protesting against it. And the other thing, even if it was flat, it would do him more harm to let him start running the session than it would be to overrun a process or underrun one. You got that? It would do him more harm.

Now, many people have trouble ending sessions, and that's because they keep consulting the pc as to "what's the state of the pc," so as to determine when the session should end. And I'll tell you a good test sometime, is the next time a pc says to you that the session shouldn't end, or he has something undone, or he feels very bad about it, or he hasn't made his goals, why, that's just dandy; just nicely, firmly and pleasantly end the session – and find no ARC break. And you'll say, "What happened to the ARC break that we knew was coming?" It didn't materialize.

No, what happened to it was, this is an effort of a breakout, an effort at a continuance, and you come along behind the thing and you say, "You see? It wasn't necessary to continue it."

And he says, "It wasn't necessary to continue it."
So the next time you have trouble ending a session... This, by the way – a new auditor on an HGC almost always, has this difficulty. They say to the old-timers, "How could you possibly get your sessions ended by 6 – 3:30? How can you end a session by 3:30?" And the new auditor is staggering out of the auditing room, you see, at 6:45.

Well, that's a sure indicator that the new auditor does not have his pc in control, because he's said to the pc, "Now, how do you feel now? How do you feel about the process we've been running, and so forth? How's your general health?"

And the pc says, "Well, it's pretty bad, actually. My aunt Methuselah matildaed the other day, and it's pretty bad." And the new auditor would say, "Well, the poor fellow. Why, we ... the best ... the best thing for him to do is to carry on here and get this matildaing out of the way." And so he does that, and then he'll find something else, and he'll find something else and it goes on and on and on. And the pc as-is less and less, and makes less and less progress, and is slowed down more and more, and the auditor's getting into more and more trouble, and he wonders, "What on earth is happening to me?"

Whew. The only thing that's happening is, is back there at 3:30 with the tone arm moving – it could have been, you see, as bad as this: The tone arm was moving on a rock slam – the tone arm was rock slamming, you see, not the needle. And 3:30 was about to come around, and he just had time to get in his end rudiments before he reached 3:30, and he said, "All right. Is it all right with you if I give you two more commands and end this process?"

"All right with me? My God, I'm just getting going!"

You say, "All right. Thank you very much." Give him two more commands.

"Is there anything you'd care to say before I end this process?"

"Well, there certainly is. My God, I never saw such horrible bad auditing, and you're doing me in," and so forth.

And you say, "Good. End of process." And then you run your end rudiments. "Now, is there any ARC breaks?" And you expect immediately that you're going to get your head taken off, before you get used to this kind of thing, you know? And you're sitting there all ready for the meter to blow up. Ah, there's a little twitch.

And you say, "What was that?"

"Well," he says, "you didn't end the ... you ended it. You ended the process, and I don't know if I can ever get back into it or not."

"All right", you say. "Well, is it all right with you if we take that up tomorrow?" And you say, "Okay. Now, do you have any ARC breaks?" And there is none. And you say, "All right. And here we go", you see, and run off the end rudiments and that's it. The pc goes out whistling and everything's fine, dandy.

But the new auditor, the new auditor at 6:35, you see, streaked with sweat and coal dust, comes staggering out of the auditing room, you know, and he says to the others, he said (who have now assembled for an evening briefing session or something of the sort), "How do you people do it? You must be terribly cruel. You must just chop the pc off in the middle of nothing, you know, and you must just be thinking about yourselves and nobody else, and ..."
They say, "Well, I don't know, we end it, and it never seems to do any harm." And that's the correct way to go about it, that's all. You run the session.

Now, that's very, very observable in the CCHs, but, of course, it carries over into the remainder of auditing. In the CCHs it is so observable that if you let the pc start running the auditing session, he will practically spin, and in the others he just has an ARC break.

You want to know what an ARC break is? Sometime or another the pc went out of session and you lost control of the pc. And it sometimes takes as much as an hour to an hour and a half for that ARC break to materialize in the physical universe. That is so true that when I get a pc who is ARC breaking (which doesn't happen very often, because I do this other one), I say to them, "What happened a half an hour ago?"

"Half an hour ago? Oh, a half an hour ago. I'm not interested in a half an hour ago. It's what's happening right now. I mean, I'm ... after all, I feel these bayonets in my chest and so forth, here."

"No, what happened a half an hour ago?"

"Oh, I remembered a half an hour ago, I -- yeah, that's right. There was something there. I ... I remember about a half an hour ago I'd forgotten to phone my wife at noon and she's probably furious with me." There was your ARC break; didn't have anything to do with what you were doing in auditing.

Now you, not understanding what ARC breaks are, or how to take ARC breaks apart, find your auditing apparently under criticism all the time from the pc, and then you try to put your finger on what it is that you are doing wrong in your auditing so as to set it right. And the truth of the matter is, the only thing you're doing wrong in your auditing is not being pigbullheaded. And a half an hour after you have broken down and relinquished control of the session, you get an ARC break and get all this criticism from the pc of your auditing. And that happens an hour and a half an hour after you have committed the "fox pass"1. And you let them "foxes" through and you've had it. [laughter]

And that's what occurs. You got it now?

_Audience: Yes. Hm-hm._

Try sometime to be overbearingly, stupidly domineering about a session. Just try it sometime, just for the hell of it! Have the pc make a perfectly reasonable suggestion, such as "Could I have a break so that I can go to the bathroom?" and look at him as though he has suddenly stolen the crown jewels, see? And say, "Well, we'll get a break in an hour or so", and note the peculiar lack of an ARC break.

And then sometime have a pc say this to you, "Well, actually, I don't quite feel up to running the process at the moment." And you say, "Well, we'll do something else," and watch the ARC break materialize in an hour and a half to a half an hour.

You see? And because it's an hour and a half to a half an hour afterwards in most cases, you don't associate cause and effect, because it's such prior cause that you haven't no-

1 Editor's note: pun with "faux pas"
ticed where you lost control of the session. But the best way to patch up an ARC break is to find out where you lost control of the session and reassert control of the session, not Q-and-A with the ARC break! Now, there's a real way to patch them up.

So you're very graduate in the way of auditors, and you ought to learn that one, and you ought someday, just for the hell of it, just to find out that it's true – as you're auditing, just be pigheaded about something sometime or other, just utter pigheaded. Pick out one of the cartoons they used to draw of the German army back in World War I, you know, and put it on.

And the pc has made a perfectly reasonable request. The pc has said, "Can we end the session by 4:30, because I have a date with a millineuse?"

And ...look at him pityingly, you know, and just disregard it utterly. Just make as if – pointedly – he'd never said a word. You're going to be charitable; you're going to disregard this terrible thing he has obviously done.

Now, to your way of thinking, that would cause an ARC break. No, the way the ARC break is caused, you must also do this one – do this other one, see?

Sometimes a pc says, "Oh, I don't know if... I ... you ... God ... God almighty! I ... I don't ... I don't have to run this. You say you found a present time problem on that meter. Well, look, I'm so tired of having all of my auditing time wasted on present time problems! Can't we just skip the present time problem for once?"

Go ahead. Skip it. Just knuckleheadedly skip it, pleasantly, and just say, "Well, all right. Well, if you don't want to run it, we won't run it. Okay. Now, let's take up the next one here." And watch it start to arrive. You can actually measure it on your clock. The maximum time you will have to wait is one and one-half hours of auditing, but somewhere – certainly, certainly within an hour and a half, and in certainly not less than a half an hour, you're going to have an ARC break on your hands.

"Your fingernails are dirty. Your fingernails are dirty. You know, you really ought to get some training at the local Academy, because if you ran your confronting a bit better, I'm sure I could make some progress or something. Do you realize that you have crossed your legs?" Any kind of an ARC break you can think of that has nothing to do with the price of fish. No, it was right back there.

And you say, "Well, naturally. We had a present time problem. That's making him edgy." No, that is not what happened. You let the pc run his own bank for a moment and showed him that you were an incompetent, weak schnook. [laughter] And showed him that his bank was not controllable, and you've proved this to him conclusively that his bank was not controllable, so what materialized? The simplest thing in the world materialized: the bank, having been demonstrated to be uncontrollable, of course becomes uncontrollable. And you get what is commonly called an ARC break.

And auditors who have constant, continual ARC breaks with pcs can be rated just exactly this: no control of pc. Pc says, "I am schnooking today", and the auditor says, "You poor

---

2 Editor's note: probably meant as female form of milliner.
fellow, so therefore we're not going to schnook." You know, he says, "It's schnooking. Naturally, we'll avoid schnooking then. We won't get into that nasty field.", or the pc says, "I keep hearing these violins in my ears", and that sort of thing. And the auditor is sitting down there just to do one thing, which is to run an assessed level of the Prehav Scale – get the rudiments in order to run a level of the Prehav Scale. And the pc knows very well what's going to happen. And he says, "Violins in my ears", you know, "all the time!" and so forth.

And the auditor says, "Well, is this a present time problem with you?"

And he says, "It certainly is."

And the auditor just goes right on down the line and gets the rest of what he ought to do and runs the assessment, and we don't hear anything more about it. And the violins turn off because they were part of the level.

But, this one: The auditor says, "Oooh, violins. Well, we'll have to do something about violins. Now, what trouble have you had with violins in your life?" and just throws the session away. And you've got an ARC breaky pc from that point right straight on. You got it?

Learn that one well. Because it's the difference – no matter what tricks you learn, that one that I've just been talking about, which is very much in keeping with the CCHs, that one is the difference between auditing and no auditing. You've got a black and white: auditing or no auditing. Auditing, the auditor's in control of the session with a capital C and a capital T. Got it? All right. Auditing takes place. Auditor not in control of session, reactivity takes place, because there's nobody now in control of the session, so there couldn't be any auditing.

And the easiest way in the world to get rid of auditing is to delete control from an auditing session. Then the auditor isn't controlling the session, the pc can't control the auditing session, the reactive mind damn well won't control the auditing session, so where is the auditing?

Actually, a lot of your feeling about auditing, or some of your flinches that you occasionally get about auditing, simply stems from times when you have not controlled an auditing session; and only then did you come under heavy criticism from the reactivity of the pc. Only then.

The only thing that could ever be criticized about any of you as an auditor is that you do not control a session heavily enough.

So take your cue from the CCHs and control the rest of auditing the same way, and the results which you get will be five to ten times as fast as they are right now. You want to know how to speed up auditing results? Just try it. Okay?

Audience: Thank you. Hm-hm.

Righto. Said my piece.

Thank you very much.
QUESTION AND ANSWER PERIOD: CCHs, AUDITING

A lecture given on
23 June 1961

Thank you.

Okay. Well, we have arrived at a Friday. And I think the last time I looked it was the 24th, wasn't it? The 23rd. It just shows you: You start looking at the time track, and no telling where you'll land.

All right. Well, here we go. What questions do we have today? Oh boy, I'm happy you really got it taped. Oh man, I'm happy you've got it really taped.

Female voice: I had a question of at what age would one give Joburgs?

At what age can one give Joburgs? Well, I'll tell you, that below thirteen or fourteen, a special Joburg should probably exist, and it should probably go down to the age of about six. And then another one should exist down to the age of about three. And it should be compartmented in that direction. A Joburg would simply stir up a kid under twelve on the whole track. Okay?

Female voice: Yes. Thank you very much.

All right. Any other question? Yes.

Another female voice: Will a properly assessed Havingness command ever cause the needle to tighten, say within the first eight commands, and then loosen?

Well, you're asking would a properly assessed Havingness command first cause the needle to tighten and then loosen? What you are looking at is what will tighten a Havingness needle? And what tightens a Havingness needle is an ARC break. Your Havingness is working on Tuesday just dandy, and on Wednesday it suddenly tightens the needle. Well, it isn't necessarily true that the Havingness Process is now defunct. It is true that the Havingness Process is being run against an ARC break. And your rudiments aren't clean on it, that's all. And it will make the Havingness Process look momentarily invalid.

There is another method by which this happens. A Havingness Process run too long creates an ARC break. And you start running a Havingness Process fifteen, twenty, thirty commands. About that time your pc, if he has any inkling that this is wrong, develops an ARC
break and the havingness needle tightens at that moment. And the overrunning of a Havingness Process, then, will tighten the needle.

Now, in a case where it tightens and loosens, what you had is a pc with a rudiment out, and the havingness took care of it. And you're looking at this kind of a spooky situation where you didn't really realize what was going on.

You get the idea? A havingness needle, however — your stable datum on this is, the Havingness Process has been running and now suddenly doesn't run; two things are wrong — could be wrong. The first one is the most common, that you have a rudiment out. And you are actually merely distracting somebody's attention madly. And it upsets him.

So, so much for that. You got it? But an ARC break will tighten the havingness needle. The other method by which happens, of course, is the Havingness Process has expired. That's less seldom and in fact it's sufficiently rare that you should always suspect the ARC break. Okay?

*Female voice:* Is it ever unusual for — as case gets advanced — the exactly right Havingness Process will tend to repair their havingness in just two or three commands?

Oh, yes.

*Female voice:* And run any longer than that will then suddenly ...

Well, that's why I've said eight to twelve ...

*Female voice:* Yeah.

... commands. That is very safe. And their havingness actually repairs with great speed. The havingness will repair on one command.

*Female voice:* That's what I'm thinking of. Yeah. Okay.

I wouldn't trust it. I'd still go on running it five, eight commands.

*Female voice:* Mm-hm.

Okay?

*Female voice:* Yeah.

All right.

Okay, any other questions? You know a lot of you people that just arrived, I know there's an awful lot of things you don't know yet and you're sitting there being very, very quiet about it. Is this quietness a symptom of you don't know enough to ask a question here? [laughter]

All right. It's a case of, I'm afraid, you don't know what you don't know. Yes?

*Female voice:* I know something that I don't know. On what you talked about yesterday, on running the CCHs 1, 2, 3 and 4, did you say you should run each one twenty minutes and then shift to the next one, and on and on and then, you know? Twenty minutes of 1, twenty minutes of 2, twenty minutes of 3, twenty minutes of 4 and then start over again?

Hmm.
Female voice: And on and on? And then...

I say?

Female voice: Well, I'm asking...

That's the way it works!

Female voice: I know...

That's her job. Go on.

Female voice: I'd like to have it run on me.

Go on.

Female voice: And then you do that for an hour and then you shift to an hour of Joburg and then back again to the CCHs for an hour?

Uh-uh. Uh-uh. Uh-uh. No, no, no! No! No! No, no, no, no, no, no. This is why they don't ask questions, is because I scold them and chop them up, see?

Female voice: I've seen it recently in auditing Will you straighten me out?

All right. No, it's one for one, which is if you have run two and a half hours of CCHs or five hours of CCHs, you should do two and a half hours or five hours' worth of the other. But you don't ever expect anything to happen with CCHs running them for a whole auditing period of a whole hour.

CCHs are not an endurance contest. This question has too many ramifications. In the first place, it infers too many things. You have said if you run the CCHs twenty minutes and then twenty minutes and then twenty minutes... No, my God. No, no, no, my God, no. No, no, no, no. See? That's what I'm saying no, no, about. See? Don't run the CCHs twenty minutes apiece. Run a flat CCH only twenty minutes and if it is flat... Now, get that one right. Because, boy, you can lay an awful egg with the CCHs, see? Got it? Get that one real good. You run a CCH that is flat for only twenty minutes. It's got to be flat for twenty minutes before you leave it.

Now, if CCHs are not biting, then you discover this oddity: that you'll be running a CCH for twenty minutes and the next CCH for twenty minutes. But that's only if they're not biting. You got that?

Female voice: Yes.

Yes?

Female voice: But I don't have it real well.

All right. Now, your CCHs are run only so long as they produce change and no longer. And they are run constantly that they produce change.

Now, your CCH is run as long as it produces change. Now, have you ever had CCHs in the Academy?

Female voice: No.
Ahhhh! Here's what's happening We're going up against a battery of processes which are unknown.

Female voice: I have had CCHs run on me, all of them.

Oh, no, but you've got to be trained in running CCHs. Assign somebody to train her running CCHs. Okay. Because there's a lot more to it than having them run. Yeah.

Now, a CCH must be run as long as it produces change. And you cannot get auditing compartmented into time brackets without observation, which is what I see the tendency is here. And we mustn't do that. We audit a pc. And the only reason we say twenty minutes is because that is the period of observation that is safe. That's a safe period of observation. That's not too long, that's not too short. Got it? All right.

Now, when a period of twenty minutes has elapsed without any change, if we exceed that, the pc feels he is being punished. He's doing the auditing command, and he's apparently being punished for doing the auditing command by the auditing command continuing to be run on him as though, then, he is not doing it right.

The biggest danger in running CCHs is invalidation of the pc. And to run an unflat process flat is not an invalidation. But to run a flat process, consistently and continually, operates as an invalidation. And the only trouble we've ever had with the CCHs is an invalidation of the pc.

Now, the way that CCH 3 and 4 can be run would stand your hair on end. Let's supposing we didn't have that little clause in there of "Did you do that?" on 3 and 4, you see. The idea of asking the pc if the pc has done it. Get the idea? All right.

Now, supposing that we had the auditor – this is what's happened countless times – we've had the auditor deciding whether or not the pc did it. And immediately the CCHs become totally unworkable. As a matter of fact that was the first great invalidation of the CCHs and why we tended to come off of them slightly.

The CCHs were working just wonderfully until all of a sudden a bunch of people got ahold of the CCHs, and they would make a motion with the book which the devil himself couldn't complicate, and which they themselves couldn't have followed immediately afterwards. And they've said to the pc, "Now, you didn't do that", you know, in effects and grabbed the book back and take the thing away into the air and give it to the pc and ... Pooh, you know? I've watched it man, I mean, it's grim! The auditor takes the book and goes flip-flop and hands it to the pc, and the pc takes the book and goes flip-flop. And the auditor sighs, and takes the book back from the pc and does the same flip-flop again. And the pc takes the book and goes flip-flop. And the auditor sighs and takes the book. And then I finally would say to the auditor, if I was observing it, "What the hell is wrong with you? The pc did it!"

"Oh, yes, but the title is reversed when he does it."

And you say, "Man, just knock off of this auditing and go get audited, will you?"

But it's just using the mechanism of invalidation – mechanism of invalidation. All right.
A pc, if they're invalidated while running the CCHs, tend to go *mmmm!* And it can be done by an auditor. He can actually invalidate the pc by a misrun of the CCHs. They've got to be pretty flagrant. But we ask the pc then, "Did you do that?" or "Are you satisfied with that?" You've gone flip-flop with the book and the pc scratches the back of his neck with it. And say, "Did you do that?" and the pc looks at you cunningly and says, "Yeah, I did it all right." And you take the book away from him; that's all right. You're through; you've had it. And you do another motion.

It's whether the pc thinks he did it, and you would be absolutely amazed, gazing into the quicksand and morass that some people call a mind, what they think they have done and what they think they have observed. It's marvelous. Do you know that some 20 percent of the people who are walking around in the streets right this minute never see a wall and never see a curb, ceiling or a person. They only see their own facsimiles of the wall, curb and person. They put them up here driving automobiles and give them medals for killing everybody. They can't even *see* the object; they see a facsimile of the object. And you very often will see this cease to exist in the CCHs.

You'll all of a sudden say – the person will say, "This wall is terribly bright. There doesn't seem to be anything between me and the wall." Well, man, that's right! Hitherto, they've looked at a picture of the wall that was on the wall, and they see the picture and there's the wall.

Now, here's one of the things you can have somebody do. You say – there's a bird going tweet-tweet outside, and you say, "All right now, make a picture of that bird out there. Now bring it in and look at it. What is it?"

They say, "It's a crane." [laughter]

And they hear an automobile going by in the street, and you say, "Now, put out a picture – you know, make a picture of that automobile. Now bring it in the room and look at it. And what is it?"

And they say, "Steamboat." They say, "What the hell is wrong with me?"

Actually, they will get the facsimile they're stuck in duplicated, if they do that.

Now, that symptom goes forward considerably further. It goes forward to the fact that the person doesn't ever see the wall or the carpet or the ceiling or the floor or anything. He sees a picture that he has made which he has interposed between him and it. You can generally detect this person because their depth perception is fantastic – awful bad. You know? They run into walls and door sides, and so forth, and then they go to the oculist and get fitted with specs, and then they run into more doors and more windows. Of course, the specs don't help you to see facsimiles. They never *see* anything, you see?

All right. Now, you take that person. Now, he's very easily invalidated. Because why is he doing this? He makes a facsimile of the wall and looks at his facsimile of the wall because it is not safe to look at walls. In other words, this fellow is nervous. He is upset. He is – he's quivery, you see? He's real shaky about the physical universe. So this thing's liable to bite him at any minute, you know. And lions and tigers would be quite an – wouldn't be unusual at
all to have them just jump out of the fireplace at any minute, you know, or suddenly materialize from nowhere. And this sort of thing's liable to happen.

Now, he starts to get a spark of confidence, you see, in actually having observed you, and then he did it. Now, this tells him he's in communication with you. He must have seen something, otherwise he couldn't duplicate something. So the auditor begins to be real. All right. Now the auditor says, "You didn't do that" in some way. Of course, the auditor ceases to be real at once, because the fellow's whole protective mechanisms go up, and he thereafter makes pictures of the auditors, and he can't do the auditing command and it all goes to pieces, don't you see?

In the first place, all you're trying to do is convince him the auditor is real. Now, if the auditor becomes part of the dangerous environment by tending to invalidate the pc, by over-running a process ... The process is perfectly flat; the pc to the best of his knowledge and belief has done it for a long time all right. Yet the auditor continues to run the process. The auditor is tending to say to the pc it isn't all right. So the pc all of a sudden doesn't know what's all right, and the pc gets nervous and doesn't want to come to the next session and so forth. This is all auditor invalidation of the pc.

All these various mechanisms occur to retard the use and operation of the CCHs. Now, if you know those basic mechanisms, you know why you're running the CCHs which – the basic goal of the CCH is to make the auditor, the physical universe and present time real to the pc, to show him that he can observe the auditor, the auditing room and present time. That's all it's doing. See, it isn't doing anything, really, more significant. It's familiarizing with these things. But it uses these various mechanisms of duplication and so on, on up the line, auditing commands, the control of the auditor, the communication of the auditor. All these various things all add up to additives, so that this reality on the auditor and the auditing room by the CCHs far exceeds anything you would get this way:

"Look at me. Am I here? All right, that's good. Now look at the wall. Is that there? Ah, that's fine." Now we've run a thousand hours of the CCHs, you see? It's just – it wouldn't work, that's all. Because there isn't enough duplication and there isn't enough anything.

Now, let's take this fellow that we're gradually bringing out of his chrysalis. He's getting fairly confident, he's getting downright cocky about it, and he's giving you his hand, and we don't look adequately at what's going on in his mind. Actually, one of the first things he knows very often is that you don't exist or that you are a figment of his imagination, or something of this sort. And all of a sudden he says, "Hey." It begins to be very, very evident to him that there is somebody else alive, and that there is an other determinism somewhere in the universe. And his scarcity on other determinisms is fantastically low. That is the scarcest scarce people get. So they even start mocking up thetan bedbugs to keep him company at night and so forth. And they don't know any other determinism exists anyplace.

But through the process of the CCHs, you get – this condition finally appears that somebody else exists and that a universe is here. And that's the only result you're going to get out of the CCHs.

Now, at any time that you introduce into it this factor, is "I may be real, but boy, you're sure be wishing in a minute you hadn't found it out." Ah." This room may be getting
awfully real to you, but we'll just make it as horrible as we can. Because it's really – you're really not doing right, you know; you're doing wrong." Now, this is how you can run the CCHs wrong.

Now, any time you settle down to a timed routine that has nothing to do with the pc, you're in instant trouble. Instant and immediate trouble. We know more or less on the average what the safe margins of anything are. But I will tell you that twenty minutes is an awfully long time for a child. It's safe for an adult. But it's quite a long time for a child whose attention span may very well be only ten minutes.

And the child in the course of that twenty minutes may get to feeling terribly invalidated. They're doing their level best to give you their hand and be obliging, and they're liable to feel terribly invalidated. So as you shut down the line in age, when you're running it on a child – well, call it something like seven or eight minutes. And if the child did the process consistently seven or eight minutes – call it 7.5 if you want to be precise – [laughter] the child won't feel invalidated.

*Female voice:* I find a big difference in children, timewise.

_Hm?

*Female voice:* I found that there was a tremendous difference in how long was long enough between children. I ran it on two different children age three, "Give me that hand," and one just did real well for about twenty minutes, and the other one, about six minutes was ...

And then what happened?

*Female voice:* Well, then he just fell clear, clear, clear apart.

And then what did you do?

*Female voice:* And then I just kept on and kept on ...

_Yeah.

*Female voice:* But I only – after that I shortened the length of the sessions. But for the first time, I stayed with it for the time – the whole twenty minutes that I had done with the other child. After that when I arranged the time I made shorter times and he did better after that.

Shorter times for what?

*Female voice:* Like ten minutes ...

For the process changing or the process being unchanged?

*Female voice:* For running the process. I'd say ...

_Oh man, look, look, look, look, look. We're talking – you just better talk this over with Mary Sue, because you got this backwards and inside out. I see that clearly. Because look, you don't run a CCH by the clock. You run it on the pc. It's the pc's change that determines this. Now, you're talking about a ten minute flat area before the process begins to bite. Ixnay. There is no flat area before the process begins to bite.
Female voice: Non that's not what I was talking about.

Huh?

Female voice: I was talking about length of sessions.

Oh, the length of session. That's incredibly short. That's nowhere. If you run the CCHs – if you don't run the CCH that is biting at least an hour, the kid practically spins in.

Female voice: On a three year old?

Huh?

Female voice: On a three year old?

Oh, man! Teach her!

Another voice: Good.

Teach her some fundamentals here. We're discussing them now. Okay. I imagine... Now listen, you'll do better with them if you run them right. Okay? All right. I didn't mean to invalidate you for asking a question, but it makes me nervous sometimes when I see how far off these processes can get.

A CCH on a child that is only run for ten minutes, the auditor ought to be shot. If it's biting, you see, and the auditor quits the process at the end of ten minutes – oh, man! He's giving the kid something like a headache for the rest of the day or something like this, or he's driven the kid into some of a propitiative state. No, a CCH has to be run – that is biting, actually has to be run for about an hour, at least, before anything could be expected to occur. You got it?

Female voice: Okay.

All right. Okay. All right. Any ARC break?

Female voice: No.

All right.

Female voice: That's why I came.

All right. Okay, any other question?

All right. Now, let's take a look at auditing in general, shall we? Auditing in general is an activity which is engaged upon by an auditor on a pc, and it is regulated and monitored in its attack and approach by the pc, behavior of.

First thing that establishes what you do as an auditor is the pc's condition. What has just come out in a bulletin is not what establishes what you do with the pc. It's the pc's condition that establishes what you should do with the pc. But in view of the fact that a tremendous width of randomity, activity and upset can occur – tremendous – you have to have a standardization, because you get too many ideas mixed up in what you're doing in the way of auditing, and the clear view of what happens or should happen in auditing tends to go fizzle, and has for about eleven years. Particularly in California. Dear old California.
We just had another blowup today out in California, so you needn't feel bad, Johannesburg. [laughter]

So anyhow, there are certain things that work, and there are certain things that don't work. Now, when you've had as much work put in on what works, and as much understanding and research background as has been invested in this particular activity, you can't help but come up with some right answers. So there are right things to do with pcs and there are wrong things to do with pcs. And if you don't know the fundamentals, I'll lay you a thousand golden sovereigns to a crooked halfpenny that you won't pull any of the right ones. Because the laws of averages, if they were so rigged that pcs or patients or people would have become Clear or well in the last fifty thousand years on this planet – if the laws of averages would take care of it, it would have happened. And we can show you clearly that it has not happened. So therefore, random running will not get anybody anywhere. That you can make pretty sure of.

Now, we have to know first and foremost how the mind goes together. Man didn't appreciate this before. He was busy trying to save the thing and send it to heaven. Or he was trying to get it nullified or he was trying to get various things, and he was working with the spirit. And from time to time did work with the spirit. And he got no place.

We probably got further in 1952 to '55 on the subject of exteriorization than man had ever gotten before. And we learned quite a bit about it. And one of the things is, is the sudden change of exteriorization is such a sudden change that it deteriorates rapidly as a condition. Quite remarkable how fast it deteriorates. We can do today all of the things we did then. You can blow people out of their heads and suddenly have them talking when they stuttered before, and have them seeing when they couldn't see before, and all kinds of weird odd phenomena occur. But these things are all unstable phenomena.

I spent some time trying to stabilize these phenomena and make them into something that was highly useful. And then I found out that before a thetan can experience a sudden change – like the total loss of his body – he has to be up to being able to have a body first. Before he can walk out of a body, he's got to be able to have one. And the people who most easily present themselves to be bunged out of their heads are people who wouldn't have anything to do with a body if you paid them. The person who wants nothing to do with the body at all exteriorizes at the drop of a skunk. All you've got to do is say to this person, "Phhff!" and there they are, heading past Arcturus.

Now, how the Buddhist, the Lamaist, missed this, I don't know. But he patently knows nothing about it. The mystery of the East has been exploded. Man, anybody who would be stupid enough to sit still for twenty years and regard his navel so as to exteriorize should have his thetan examined. [laughter] You don't have to sit still for twenty years. Get somebody to say to you something on the order of – the first exteriorization process is "Try not to be three feet back of your head." Wham! There they go, you know? Well, Buddhism is accomplished. That was the end of track as far as Buddhism is concerned, and that one little set of English words took care of everything they were trying to hand out. Oh yes, they were also trying to hand out "Peace, peace on you too, brother," and so forth. They were trying to hand out various other principles, which got into other religions, and we had people being quiet.
And the whole subject is devoted to how to keep people quiet. It's a police operation, a whole track police operation.

You're always getting space jockeys and space-opera people who are sailing in, saying, "Let's see. How are we going to quiet this down? These people are moving. These people are dangerous. They move. They walk around and they whistle and they sing and they move. And therefore, they're liable to do things. So the thing we'd better do is introduce some peaceful philosophy of some kind or another that'll just stop all this tendency toward motion." That's a fact.

And you get things like Buddhism, Christianity – the quiet philosophies, I call them. And of course, how quiet can you get? Dead. And you might say it's a covert effort to kill everybody off. And it's true that if you get somebody falling totally – well, I can trace the background, in some pcs that have done so, the most amusing concatenation you ever had anything to do with. Say, "Well, when did you begin to feel bad?"

And the pc says, "Oh, about 1941. Something like that. I began to feel kind of bad. I was young then, but I began to feel kind of bad and so on."

"What happened then?"

"Well, uh, nothing much happened. I just felt that I'd – You know, well, it was about that time I felt I'd rather – I'd better take it easy. I might do things, and I might – you know, kind of put myself under restraints a little bit, because something had happened then that was quite dangerous and quite upsetting, and so forth and, yes, I became quieter. I matured."

You'll find these spots of sudden change of pace to be the spots which broke the person's life. Those sudden changes of pace. And what do you find sitting in the midst of them? All kinds of collisions and upsets and accidents, most of which resulted in the advice "Take it easy now and you will be all right." Whether they gave it to themselves or it was given to them exteriorly, they got the idea that if they just took it awful, awful easy, they'd be all right. And from that time on they were all wrong. They were all wrong, and they could not figure out from there on what was wrong with them.

They were being asked to confront motionlessness. And man has a rather difficult time confronting motionlessness, as any space-opera boy can tell you. All you have to do is persuade somebody to be totally motionless and to take it easy, and he's had it. He gets sick; his life goes wrong; he ceases to be able to communicate; he has an awful time afterwards.

So therefore, these philosophies that wait for a fellow to hit a disaster so they can then tell him to take it easy, are all of them very much in use, and very active use, on the part of people who mean nothing well for man.

Now, amongst those philosophies are included medicine and psychiatry. The reason they give drugs is so that the person will be quiet. The reason they give electric shocks is so the person will be quiet. The reason they do prefrontal lobotomies is so the person will be quiet. A lot of the times the reason they give a medical operation is so the person will be quiet. You never heard of so many reasons why people should be quiet.
Well, unless a person can confront motion, he's had it. He's dead and done for. That is your first condition of life and livingness. If a person cannot confront motion at all, he can't work, and you have the background of a criminal. You've automatically made criminals.

And don't wonder that the whole Roman criminal population joined the church en masse. They did. And don't wonder at all these fellows who have just gotten out of stir and who have suddenly embraced religion. Natural consequence. It's the motionless philosophy adopted by somebody who can't move. I dare say if you held somebody in straps in a chair or up against a wall or in a bed any undetermined length of time, you would eventually find he'd gotten religion or he'd become a Buddhist, [laughter] or almost anything. And you never would have had to have talked to him about the philosophy at all.

If he'd never heard of it on the whole track, he would probably invent it. You see this? All you'd have to do is introduce the factor of motionlessness into his life, prove to him that movement was bad, and you've had it.

The reason we are having more and more accidents, and the reason I resigned, I think last week, from the Road Safety Committee, in England, was because all propaganda in all teachings will wind up in more accidents. And I can't go along with something that is as stupidly destructive as that. There is no emphasis on deleting the fellow who can't drive before they license him. There is no emphasis on putting on the road cars that can travel on the road. There is no emphasis in trying to take the trucks and passengers and freight off the roads and put them back onto the railways where they belong. No part of any of this program makes any sense, because it's deteriorated into "Teach them to be quiet. Don't drive so fast."

I doubt speed has very, very much to do with it. Because you start looking at accident tallies, and you'll find it's mostly the old ladies who were driving safely in the middle of the road at ten miles an hour. [laughter]

Now, your general situation, then, is that a philosophy of quietness, of motionlessness, has been introduced into this sphere of reducing traffic accidents. And with a great certainty, the more this philosophy is introduced, the more criminal actions will occur on the highway. Driving will get worse and accident statistics will rise. And that's just about all there is to it. There isn't anything further to it than that.

The more you make a populace quiet and non-motionless, the greater crime rate you will have. The influence of TV, for instance, on the general crime rate around the world has been remarked upon many times. But the program material is what is being blamed, not that the child is being pinned motionless. And that is what's happening. I don't care if you showed them Little Orphan Annie sighing over the dog in just one pose on a non-moving picture and so forth, with maybe some violin music playing in the background. And if this was all there ever was on TV and the children still sat in front of TV at an active time of life when they should be moving, you'll get a higher crime rate. It's inevitable. See? All you've got to introduce is motionless, you get aberration. Because you're preventing people from taking over the situation.

Now I'll give you something interesting with regard to this, talking about how the mind works. I very busily spent my hobby time, which has now become – my hobby time now has become relegated between 3:00 and 7:00 A.M. – that's the rest of my day, you see –
and I've lost any time much to sleep in now. And I'm now trying to find some sleeping time. And I think there's another time track around here someplace so that I'll take care of that. Anyway, last night, up at about three o'clock, four o'clock, I was studying some pictures for a boat, on this theory: That people get seasick because of motion. That was the theory.

And I went along blindly with this, not on inspection or examination at all, because a man who has had a lot of time at sea and so on tends to become rather conservative about the sea. In other words, "It's this way, and that's the way it is", you know, and everybody has said that it is motion which has caused seasickness. So therefore, I thought it'd be an awfully good idea to put, 'tween decks and in people's cabins and in the dining salon and so forth, pictures of very quiet scenes. That that would be the thing, you see. If you put some pictures of very quiet scenes around – nice, pleasant, quiet, still scenes – a person who feels queasy could look at one and feel better.

So I spent some time looking in some – various publications for – which advertised prints, you see, and old masters and things like this, for some proper pictures, in order to take care of this condition. There are various things. It's like the sweep of light back and forth across the ceiling, reflected from the waves outside, and all of this sort of thing, is what has been blamed for seasickness.

So I went ahead, and I chose all of these pictures which were very silent pictures. They were very motionless pictures. They were very unmoving pictures. And I was sitting there at my table up in my bedroom looking over all these pictures and thinking about all the seasickness this was going to save, you know. And after a little while I started to get a little bit seasick. [laughter] And I wasn't quite seasick; I felt an odd constriction on the front of my body, and I wondered "What is this all about?"

And about 3:55 A.M., I had to revise this whole theory. So the list, although it's been picked up now, and the pictures will probably all get bought – I'll have to give half of them to the medical association. [laughter] About 3:55, I realized what this was all about: that if you gave people pictures of motion, it would give them a chance to sort of accustom themselves to the idea of motion. But if you gave them a stillness, you gave them a total motion of the ship and sea against the total no-motion of the picture, and they practically would have had it. You've given them a terrific thing. And boy, have you pinned them aboard that ship. If I want to keep a crew, all I've got to do is put up those motionless pictures, because here will be the horizon going up and down like mad, you see, and inside the vessel here will be all these pictures of stern, solid oak trees standing there, you see.

One was called "Dawn". It was an oak tree reflected in the mirrorstillness of a river at dawn. And boy, that picture was really quiet. And when I first picked it out I says, "Well, that's going to take some girl or Scientologist that's aboard at the present moment, and they'll look at that, and they'll say, 'Thank God for the tree'", you see?

No sir. No. Much kinder to give them a racing sloop throwing spray in all directions, don't you see? Much kinder, because they at least get a chance to look at the motion in pictorial form. And it gives them a gradient. Got the idea?

Yeah, the cure for motion is motion, not stillness. Well, that's quite interesting as an observation. Has nothing much to do with this, or you, but there it is. I got a good reality on
the thing. And of course, after I'd looked over several of these pictures of days of adventure – and there's one ship of about 1757 just shooting the living daylights out of another ship, you see, and her sails are all full of holes, and the deck's on fire in a couple of spots and so on, and cannon balls flying all over. It's good enough so as you can practically hear them whistle, you know? And I looked at that after looking at all these still pictures, you know, and I looked at that and I said, "Whooo!" and instantly ceased to feel a little seasick. Got the idea?

So the philosophies of motionlessness are not safe philosophies to imbibe.

Because they lead people toward illness and inability to work, criminality and an inability to control their environments. Philosophies of motion, on the other hand, have not necessarily led to noncriminality. Witness space opera.

Show me an honest rocket jockey who has never bombarded a planet in a loose moment and who has never raped a town, and I'll show you somebody that's never been on the whole track. He's just never been on the whole track.

We don't know where he's been [laughter] for the last few hundred trillion years, but he's ...

No, the worship of motion, the worship of speed, and the worship of motion itself is no guarantee. Because there are periods of rest between them.

If you could keep it up at the speed of light from there on out, you'd probably never be affected by motion. But how about going quiet between them? I remember every time a submarine crew used to come in, they used to put them to rest. They used to give them a rest.

And I know my mother used to come up, and typewriter keys and file cabinets and so forth would be flying out of my studio left and right, and some circus music would be playing on the tape recorder, and it would be noisy, you know, and active. And she would come up and she would look at me and she would say, "I really think you ought to take a rest. You are look working much too hard."

And I used to wonder, "Now, I wonder if she's got an operation going here, somehow or another. I wonder if there could possibly be an operation connected with this." And there was. There was. Never affected me very much because she actually never talked to me very much. But I'd notice that people that didn't quite like me quite ordinarily are advising me to get some rest. Check it over. I think you yourself will have a subjective reality on that sort of thing.

Now, as soon as you become incapable of handling the shift and change of things, you become incapable of withstanding the duress of life and begin to experience pain. And the experiencing of pain is – actually comes about after one has lost a tolerance for motion. If you want to know why somebody is hurting as you're running a process, you are running out their intolerance for motion.

Now, you can run motion, or you can run no-motion, or you can run what you please along these various lines. But motion which is predictable motion, of course, is better – that's from the pc's point of view – to unpredictable motion. So unpredictable motion is something that is intolerable. And the person doesn't know what to confront. Something is happening in
front of his face and then something happens behind his face. And he doesn't know which of these things to confront and he gets into a fine state of affairs.

But first, he must consider that there is something unconfrontable about it or that it is bad not to be able to confront everything at once. And as soon as he gets the idea that it is bad not to be able to confront everything at once, he starts to butter all over the universe and stick on the track, and experiences and all this sort of thing begin to occur.

Now, there's another phenomenon which occurs about the mind, is every time a person has been hit hard by life – and he could be hit hard because he has hit others, and he now gets the motivator for his overts and so on – as soon as he's been hit hard, or as soon as he begins, as they did in Arslycus, a program for coercing people into working harder... Well, you get how that is. Working harder – that means you produce more or you will be shot. You know, that kind of thing. The Russian philosophy. You get – people will obsessively start producing.

Production follows defeat. Production follows defeat. Germany and Italy have outstripped all other European countries in the production of goods, just in the last few years. That is because they were the defeated countries. And the countries that won the war don't much now look like it. And that's a result of defeat.

This is rather consistent. Any defeated area can be counted on to produce. And any defeated person can be counted upon to be putting up more bank than a person who feels victorious. Bank and reactive mind is the result of failures or defeats.

So you're eradicating mechanically on the one hand a person's intolerance of motion or their intolerance of motionlessness. And on the other side, you're eradicating their failures or defeats. And between the two of these things, the bank disappears. Just that; the bank disappears.

Now, today we don't erase a bank. The bank is not erased. A person is, as we did at the beginning, accustomed into not needing one. Takes over the automaticity of creation, in other words, one way or the other. He takes over the automaticities of doingness. And we have beingness – the person he should be in order to survive. We have doingness – what he ought to be doing in order to get creation or do creation or something of the sort. And we have havingness which is the result of creation.

Havingness is apparently more important because it's harder to arrive at, but you can see from the rationale, is the result of a defeat. That's not a philosophic ambiguity. Most havingness is the result of a defeat of some kind or another. Man couldn't walk on water, so he began to push logs out into the surf, see. And we get the whole cure sequence, so that everything in the universe practically is a cure for past failures. Quite remarkable but very true.

Now, in addition to that, we have another factor which enters into the situation, and that is that every goal is the immediate and direct result of not having done. So we get these various combinations of intolerance for motion, the feelings of defeat. And your next one up the line, of course, is your ability to have without having defeated. And if you can remedy those various things in somebody's mind, you have then produced a completely new being. He is not the same as an old being who has never had the experience. He's not somebody who
has been in a plastic container for the last two hundred trillion, you see. He's been over the jumps.

Now, his knowingness, his knowledge of what has happened all the way along the line, doesn't leave him. He still knows. But the consequences of having done, with a renewed ability to do, makes him, of course, not a virgin that has drifted along for a couple of hundred trillion now, and is innocent and steps out of the auditing room as a shy, giggly girl would, or something like this. That is not the condition in which he emerges. He emerges in the rather interesting condition of a totally rehabilitated, hard-barnacled warrior who is a veteran of innumerable campaigns but doesn't show any of the marks of any of them.

And that's an interesting state of beingness. And when we say Clear, we are actually saying about the weakest statement we could make on what we are doing. See? We just – it's a very weak description of what we are really doing. But the other description would be far, far too frightening, I'm sure. [laughter]

I heard a fellow say one time, "Gee. When I think of my days back there in high school – a coeducational establishment – when I think of all those pretty girls, and if I'd known then what I know now, oh wow, you know. Wow, you know!" Interesting. Interesting point of view. Because you're setting somebody up who theoretically would know then what he knows now. So he knew it now then, but he'd carefully forgotten it all, because he knew what he was liable to do. His best mechanism was to become stupid. That's a fine mechanism, isn't it? That's a very fine mechanism.

You at the same time don't get the tremendously dangerous situation of the fellow who is – has a high level of wisdom messing up an area in which he is in. He doesn't. I tell you, if this fellow, knowing all he knew on the subject of the second dynamic, were to appear in a high school amongst all those girls, they would probably from there on all live better lives. That's probably the net result of the introduction of such a situation, because the fellow doesn't have the covert aspect of criminality hinging on every action, you know?

Oh, he might get in trouble. But nobody would get him in trouble very thoroughly, I guarantee you. First time they came down in the basement and found him giving a lecture to the girls on the second dynamic, they might – the principal might be horrified. But the principal at the same time would probably find himself being run on Routine 1 very shortly. [laughter] See, all sorts of new complications occur.

Now, that which strips the game from the universe or strips all games from the universe or cancels all games or ends all games, of course, would normally result in motionlessness. But how about ending certain games for somebody who doesn't have the consequence of ending in motionlessness? You've broadened a person's aspect and ability to play a game and recognize what a game is and have some fun out of life.

Now, the second that you have broadened his view with regard to this, you of course have put more games into the universe. Because most of the games they're playing were invented so long ago and are so moth-eaten and so moldy that nobody even knows they're games anymore.
I ran into one the other day which was very interesting. Just yesterday I think it was – yesterday morning I was running into some stuff and going over some things, and an old version of "I'm-supposed-to" suddenly turned up. An interesting old version. It's the difference between play and work. And that's an interesting difference. I finally found out what play was. Play is unreal or delusory motion about which you're not supposed to be serious. So you're not supposed to as-is it.

So an individual eventually gets trapped in this thing called play, because everybody tells you, you see, that play is something which is not serious. You see, you're not really playing – you're not really running a train when you're running a toy train. So therefore, the facsimile of the toy train doesn't get as-ised as a train. It doesn't get as-ised as a train either, because all the time you're playing with it you're saying it's a real train. Well, as a matter of fact, it is a real train that is a miniature train that you are doing something with, and play is a dishonest doingness. It's a delusory or dishonest doingness.

And work is not a serious activity. Anybody who says work is a serious activity is also opening up the bear pit in the middle of the trail. There's no reason why a fellow shouldn't work at a sport. And there's no reason why a fellow shouldn't have fun at his job. But some barrier got added in here, and the operation simply consisted of "play is a delusory activity," so therefore you don't as-is it. And you might say a lot of people walking around in delusions have played too hard. Get the idea?

In other words, they weren't doing what they were doing; they were doing something they were pretending they were doing. So of course then, this really got them – really got them hooked up and short-circuited.

Now, as we move ahead a little bit and look at this as a further consequence, we find out that a fellow who decides that work is hard or that he can't work is getting into the interesting thing of every time he plays, he has to say, "Now I'm supposed to." Every time he works he says, "Now I'm supposed to." Now I'm supposed to what? "I'm supposed to be doing something else."

So we get another method of not as-ising anything. Did you ever read a book and have a guilty conscience because you ought to be doing something else? [laughter] Well, you know, you'll sooner or later hang all such books up on the end of your nose. Because you're not doing what you are doing. You're doing what you are doing when you were – at the same time should be doing something else. And you aren't doing something else; you are doing what you are doing. And probably one of the heaviest marks of a person's disappearance of aberration is on this particular facet of motion. Which is to say that the person does what he does, whether he is supposed to or not supposed to be doing it. And if a person did what he did, and it wasn't work, and it wasn't play, and it wasn't ramification, it wasn't "I'm supposed to," and it wasn't an "I'm supposed to be doing something else" – if he did all of these – paid no attention to those things but just did this one, he did what he was doing, he would live an entirely different life. What he was doing was what he was doing, you get the idea, without further qualifications.

Now, the morality of existence is once more a test of the play-work thing. Morality is a now-I'm-supposed-to. So that these fellows that run around committing very immoral acts
are saying to themselves all the time that they shouldn't be doing them. So they never as-is
them, so they continue to do them. Well, I think it's the most – the most weird mechanism
anybody ever saw. It's a certainty that one gets a persistence, then, of the things he doesn't
want, or gets a tanglement of the things he does want. And eventually, all the things he does-
'n't want is what he's got, and all the things that he does want are completely confused, delu-
sory and tangled. And then he wonders why he feels odd! [laughter]

And if you wished to make a clear, clean statement of what auditing was, it is simply
straightening somebody out so that he has a tolerance of motion and a tolerance of motion-
lessness, and so that he can have what he should have or not, as the case may be, as he
wishes. Restore his power of choice over this fact.

But to do that, you have to erase the oddities of doingness in order to handle work and
play and motion. And motion of course becomes pain, and becomes all these other things.
And motionlessness becomes boredom and then apathy and all these other things. You have
to take the tremendous significance out of these states so that a person arrives at the situation
where when he does something, that is what he is doing. He's not doing something else. Got
the idea? And when he's not doing anything, he is simply not doing anything. He's not sitting
there not doing anything, while he's supposed to be doing something else.

In other words, he has a clear view of what he's doing or not doing as the case may be. Therefor,e
he never gets fuddled up with funny circuits telling him he ought to be doing this
or saying that or something of the sort. Where do these circuits come from? They just come
from the basis of doing things that he shouldn't be doing while he should be doing something
else, and not doing things which he should be doing. And of course, these automaticities
eventually get set up, and he has avoided them to such a degree that they become solid
masses. And he's eventually in a situation where, of course, he's dictated to from every corner
of his beingness.

He sits down to read a book and all the time he is reading the book he knows he ought
to be doing something else. So he goes over and does something mundane like straighten up
the – straighten up all of the ties and shirts and so forth in a desk drawer, and starts putting his
room in some kind of order one way or the other, like putting the shoes on the mantelpiece.
[laughter] And he wonders, "Now wait a minute. Why did I do that?" It's be-
cause all the time he is moving around pretending he should be working, you see. Actually he
knows that he would like to be reading a book.

So we get this dualness, half-heartedness, half-mindedness about all actions, which
comes down to quarter-mindedness, eighth-mindedness, no-mindedness, and the person be-
comes simply a dictate of these things because his power of choice can no longer be ex-
pressed.

Now, just from that you can see what the Prehav Scale is, very, very cleanly. It's the
thing that disentangles all the things from the things. [laughter] And you'll eventually run into
all these things. You'll eventually run into it all, because they're the key and principal doing-
nesses that a person gets mixed up. Okay?

All right, then in trying to accomplish that, if you yourself, in auditing the pc, make
him intolerant of motion, then you reverse the process. That is to say, by your actions and
unsmooth auditing and dropping the ashtray and throwing him out the window or something like this, you've fixed him up to a point of where he can no longer tolerate motion. All right, now, at the same time, let's make him sit still when he can't, and give him a bunch of sit-stills when he can't do it at all. And this makes him intolerant of being motionless.

Now let's go further than that and take the next factor of wins and loses, and let's fix him up so that every time he does something right we convince him he has done something wrong, and we add a new lose on top of his bank full of loses. All right, your win-lose factor now is gone because he's getting failures in auditing. We keep handing him failures; he'll go out the bottom.

Now, you're next one up, if you don't duplicate things and don't make them duplicative and don't square him around on the subject of havingness in general, he'll wind up not being able to have anything. And you could just reverse the whole process by doing those things, you see, just exactly backwards.

Now, what he should – what you should be doing in auditing is making it possible for an individual to be still or to be in motion, to win on the things that he wants to win on, to accomplish the things that he thinks he ought to accomplish. And one of the things you do this with in Goals Processing is take out of the road all the other things he should really be doing. Goals to a large degree are a do-something-else. You'll find somebody working in an operation, and they're going along and they're doing this job all the time, and all the time they're saying to themselves, "I ought to be a singer. I ought to be a singer. I ought to be out studying singing. I ought to be out studying singing. I ought to be out studying singing." You finally get tired of it and you say, "Why don't you go out and study singing?" They sit at their desk and say, "Well I ought to study singing I ought to go out and sing" You get the idea?

Just the fact of sitting at their desk makes them feel they ought to sing. The second you put them out there to sing, as a professional singer, they know what they ought to be doing, they ought to be sitting at their desk. [laughter]

By straightening out, then, their various goals, they know what they are doing and they don't have these absorbing impulses that take them off of what they are doing. Because anytime a fellow is sitting there with a real hot, desperate goal which is totally unrealized and unrealizable, of course, he doesn't know what he's doing. He can't be doing anything he's doing, because he's got to be doing something else that he can't do.

Now if you upset the environment for the one way or the other by running his Havingness in various ways, and running his Havingness backwards, forwards and upside down, making him allergic to the walls and so forth – you know, run the wrong Havingness Process and so on. "Now, all right. Take a look at this room. Now make sure – doesn't it seem rather small to you? [laughter] Oh, it doesn't? Well, it seems small to me. Maybe you're just putting up facsimiles and looking at them far out, because the room really is small."

Any kind of a gag of this character, you say, "All right. Now look at that nasty wall over there. [laughter] Now get the idea that that wall – get the idea that that wall, if you got totally cleared up on the wall, would be a terrible enemy of yours. Supposing you knew all of the secrets of the universe, wouldn't it be terrible if they turned out to be terrible things that would make you unhappy for the rest of your life?"
Isn't that an interesting operation? And yet that interesting operation runs along in the field of philosophy continually, and I have heard it mouthed by high-school girls in this lifetime: "Well, you'd really better not know too much about existence, because what if it turned out too terrible to know about?"

All right. So when you familiarize somebody with it and let him make up his own mind about what it is, he finds out it isn't so bad. He can have the stuff. Therefore, he can do what he is doing, and therefore, he can be what he is being. And when you – when he's in that frame of mind, his mental activities are not so completely absorbed with all of these reactive computations that he cannot decide what he wants to be, do and have. So the individual can make up his mind what he wants to be, do and have. But because he doesn't have any particular barriers in it, of course, he can be them and he can do them and he can have them. And then that is a very peculiar state of mind, and everybody will find something wrong with that sooner or later, particularly the Catholic church.

But you have defeated, not the motionless philosophies nor the motion philosophies, nor have you defeated particularly all the working philosophies or nonworking philosophies, or the various doingnesses and moral philosophies and immoral philosophies, or the can't-have-must-have, communist, capitalist, socialist, laborist, Lord-knows-what-ist philosophies – you haven't defeated any of these philosophies. You have picked people up to a point where they can inspect them. You're not interested in guiding them away from these horrible evils. The truth of the matter is all they would have to do is inspect them – I don't imagine if it'd take more than twenty or – thirty people to inspect all of one of these philosophies to have it disappear. You know? I mean, really clear-sighted people. I don't think it'd take very much.

Because it's awfully hard to make a lie continue to exist. It takes some real trickery to make a lie persist, although lies apparently persist with the greatest of ease. Look how fast the aberration of a pc folds up when he finds out what is the alter-is that is causing it. As soon as he really finds what that is, it will fold up. If it doesn't fold up and he thinks he's found it out, he hasn't found it out. He's got to look a little further. And then it'll as-is. That's what you're trying to do with auditing.

Now, we lay down rules, we lay down routines, we lay down various things that you can get away with and you can't get away with, and so forth; but actually all those things are supplementing what I've told you in the last half an hour here.

We've gotten a lot of experience on the track now on this subject. And we know certain things you can get away with and certain things you can't get away with. And most of these things are applied to a specialized being known as Homo sapiens.

Now, you start auditing grasshoppers, you may find another set of conditions of how you handle grasshoppers to immediately take place. There'll be another set of conditions of auditing, but the principles of auditing will be invariable. You will be trying to do the same thing with a grasshopper you were doing with Homo sap. But I imagine Hand Space Mimicry with a grasshopper is not quite [laughter] – not quite as easy as CCH 3. So the processes would be different, the targets of the processes would be the same. The routines and activities that you would go through would be different, but the exact auditing targets would be the same. The conditions would be the same. Do you see how that works out?
Okay. Well, you've got a long weekend ahead of you, and nothing at all to do in it. And so I think I'd like to add a little additional work. A little additional work. And I want you, over this weekend, to review this fact – these facts. Ask yourself this burning question: "Do I know the TRs? Do I know Model Session? Do I know how to administer the CCHs? Do I know the Prehav Scale and how to assess on the Prehav Scale for general levels? Do I know how to security check?" And this brings up burningly, "Do I really know this E-Meter? And do I know how to assess for goals?" Seven things there. Only one has been added which is old, which is the old CCHs. And I want you to ask yourself those questions over the weekend, and come up with the answer, and tear into those things which you feel shaky about on Monday, okay?

All right. Thank you.

Thank you.
DEALING WITH ATTACKS ON SCIENTOLOGY

A lecture given on

26 June 1961

Thank you.

You know, give her the applause. She's the one that's doing all the work. [applause] It's very funny. It's very funny. She never takes over as D of P anyplace but what they don't stack up pcs in all directions, you know. And all the cases crack brrrrrrrrrr and so forth.

We haven't told people out in the field their cases would be personally supervised by Mary Sue in the running or we wouldn't be able to hold the course. That's – that's the truth. I'm not... She's just depreciating now because [laughter]... She's running – I think the level she's running at the moment is "Failed Depreciated." [laughter]

What is this? Twenty-sixth of June 1900 and AD 11. Okay.

I want to say a word here at first about tactics and strategy with regard to anti-Scientological activities. It might be of some benefit to you to know this. After all, I've been fighting this war now for eleven years, very often without very much help. Every once in a while Scientologists tell me how reasonable it all is that somebody has a casus belli or something of the sort. It isn't true.

Our people are trying their best and they're doing their best and I'm very proud of them. If we had anything at all to hide, we long since would have been blown out of the water with various salvos. All we had to do is have a few Achilles' heels and we would have had it. Well, we don't have Achilles' heels, so recently the Better Business Bureau of Washington, DC wrote a letter, which is the most backwards letter anybody ever heard. Although many government agencies have tried to get something on this organization, none of them have ever been able to turn anything up and – can you imagine somebody writing something like this, you see? And as for Lafayette R. Hubbard who is a principal in this particular organization, well you can look him up in Dun and Bradstreet. And they just dismissed the whole thing.

Well, they used to run an entirely different line of approach. They used to say, "Oh, they shoot people and kill babies. And they've been well known to throw people off top of St. Paul's Cathedral. That is their specialty." Anything ridiculous or stupid. The British – that medical association, by the way, has written letters to its doctors urging them to tell patients how bad we were and so forth. We've not had whispering campaigns; we've had loudspeaker campaigns going. But that type of backfire is inevitable.
I call your attention to an essay on the circulation of the blood by a fellow by the name of Harvey, who was a graduate of the Royal Medical College of Physicians. He was I think a physician to the Crown. I think he was everything you could think of. And this man dared come up and say the blood beat, not because of the tides of the body but got pumped through a bunch of tubes. And he very carefully carried on a lot of experiments this way. And promptly the whispering campaigns and so forth which rose up around this were fantastic. It tore the whole medical profession to pieces about 1620 or thereabouts. Tore them all to pieces. Ripped them up one side and down the other. And one doctor was heard to say, "I would rather err with Galen than be right with Harvey", which I – is the most marvelous, I think, statement ever made in a controversy.

Let's go back a little earlier. A short time ago I was standing outside the prison of Soc-rates on Phynx, I think the name of the hill is, in Athens. And it rather struck me as very peculiar that the story they have about Socrates in Athens is quite different than the story which we hear about Socrates in our own textbooks. And of course, there's always local information about various things which has a sort of a verbal tradition when they come on. And apparently Socrates said that those gods of stone and marble and so forth didn't have much to do with the regulation of the universe; that man was basically a spirit. And so they finally tried him for heresy against the pagan religion of the day and had him drink the hemlock. That's the local tradition about Socrates. It's not the story we read in the Encyclopedia Americana, Britannica or anything, you see. But everybody got upset because here was a new idea. But let me show you something.

Today people feel a pulse. They don't look at the sun to measure the tides of the body. They know very well there's body circulation. When somebody gets his arm cut, they put a tourniquet on it. Got the idea? This is very well accepted theory. Actually, it became a well accepted – don't think these things take a long time – it became a well accepted theory by about 1628. There was hardly a ripple by 1632. In other words, this had become an accepted idea, but in the first early years of its advance, there was an enormous amount of upset.

Now, Socrates was henpecked and unfortunate in his choice of wives. And being so, of course, the man was emotionally unstable to some degree, and worrying all the time that he daren't be out talking in the club or the – or the groves, you see, because he ought to be home and he shouldn't be wandering around like this; he ought to be making a living like honest men do and all this sort of thing.

But anyway, he decided to give it up. And he gave it up. And the charges of heresy and so forth that followed with his relegation to the prison and all that sort of thing – Well, it is interesting that about a quarter of the people of Athens, that particular night that he was put in jail, were standing there with tickets bought on the nearest ship to Crete, see. People all over the place were trying desperately to get Socrates, who was not under very close arrest – his guards were very, very happy to turn their backs – they were trying to get him simply to walk down to the dock and walk up a gangplank. And everybody thought that this was what he would do – and he didn't. He stood around and said, "Well, for the principle of the thing, I ought to take this hemlock." He really made the government of Athens guilty, because that sort of thing ordinarily, you see, didn't happen. They'd condemn somebody to death, and then
the fellow would walk out the back gate and over the hills, and that would be it. It was actually a charge of banishment or something of this sort.

But in his particular case, he had so many friends who would have paid his passage, who were trying to pay his passage that night, who were trying to get rid of his guards, who were trying to help him out, that they went into a total dismay. What is wrong with this man? Well, as I say, you make wrong marriages, and you're liable to get all sorts of repercussions and suicidal impulses. [laughter]

So this thing about Socrates hasn't anything to do with the price of fish at all. Fact of the matter is that promptly and immediately everybody in Athens practically was talking Socratian philosophy and have continued to do so ever since. His critique stayed as one of the primary philosophic modes right on up to the time when Kant overdid it.

And this – this is a new idea, however, in a society. Not necessarily attended by fatality at all. You hear a great many martyrs, but every time you find yourself a martyr, you find yourself somebody who is bound and determined, you see. What happens is, well, on the whole track you may have been a tyrant yourself at one time or another, you see. And this fellow kept going out in the public square, you know, saying, "Regulus the Third is a schnook and he eats herring. And he does this just to popularize it so that the populace will eat it and he can collect the duty, you see. And herring is actually very bad for you and will rot your teeth, you know", and so on.

And this fellow kept prowling around and telling people things like this, and I dare say that for, oh, I don't know, for maybe months and months and months, you'd keep getting ahold of somebody or sending some of your police or something like that to go see him and say, "Look, son. Just lay off, will you? You know, skip it." You'd probably offer him a free passage to Gaul or almost anything you could think of, you know, and say, "Just go away and get lost", and so on.

And eventually, why, he just kept saying, "Well, kill me then if you believe this", and you had to. You got the idea? I mean, there's this idea of being so stuck on the idea that you have to get stuck on the spears, you see. But it's perfectly all right to be dedicated to a thing, but when one consistently fails to advance an idea, he feels, then, that he must commit suicide to fan – to further the idea. You got the idea?

In other words, it's a failure to advance the idea which brings about this suicidal frame of mind. I imagine if anybody at all around Galilee had bought the Nicene Creed, I'd imagine Pontius Pilate for – for a split sesterce would have knocked that whole thing off, you know. But it was a failed idea, and – he made it stick by proving it with suicide, right?

I've never been in a very suicidal frame of mind; must be something lacking in my makeup or something of this sort. I believe first in making the idea effective. I don't believe in the idea that you should fail with an idea, you see? If you're carrying something forward, you're standing for something, you shouldn't be ineffective about it. You should go forward and carry out the idea.

The object is not to fail at the idea and then make everybody guilty because they kill you. You got this? I'm not putting us in any category of any religious or philosophic lineup.
I'm just showing you that new ideas are very often attended with tremendous success, although we are taught carefully that people should martyr themselves for new ideas or sacrifice themselves for new ideas. And that's to prevent new ideas, don't you think? Would do so rather effectively, wouldn't it?

So if you got enough philosophy abroad whereby, that anybody comes up with a new teaching or a new idea is then martyred – if you got that philosophy abroad, of course, the old ideas are protected. And somebody sooner or later – Socrates or somebody – will fall for it. You know, you'll say, "Well, this is the thing to do", you know. "I seem to be failing in getting this stuff across, so therefore I'd better commit suicide."

Harvey, on the other hand, lived to a ripe old age, revolutionized the whole field of medicine. A few years later, why, his worst enemies were patting him on the back saying, "Good boy, good boy. You remember when I was right in there with you." [laughter]

Now let's come up to more recent times. Of course, I'm talking about magnitudinous ideas because it's something about which we all know something about.

Let's take a fellow by the name of Albert Einstein. Of course, Einstein should have done some of his thinking in a private notebook. He shouldn't have been writing Franklin Delano that he could blow up Earth, which was in effect what he did, and then years afterwards worked all he could possibly do and then gathered up all the funds he could gather up to wipe out what he had done with atomic fission. He organized organizations, societies; they maintained offices every place. The man – old man worked himself into a grave through having actually made a discreditable creation.

Nevertheless, the actual course of history of Albert Einstein is quite interesting from our viewpoint. The man advanced a brand-new theory of mathematics called "relativity." There might even be some truth in relativity. Who knows?

At one time a fellow by the name of something or other in the University of George Washington was holding his job as the Chair of Mathematics, simply because he was one of the twelve men in the world who understood the theory of relativity. I went in to see him one day to interview him for the college paper. I wanted him to tell me something about this theory of relativity this fellow Einstein was kicking around with and so forth. And I never had such sneers, contempt or was turned out on my ear quite so fast, you see. I turned out one on our Mathematics Department instead. "Mathematics: Has It Come to Stay?" I think was the name of the article. [laughter, laughs himself]

You probably don't know the theory of relativity too well. You think you have a talking acquaintance with it because everybody's dressed it up now so that it fits with modern atomic physics. And you'll read textbooks and pocketbooks off the bookstalls all about the theory of relativity and so forth.

Actually, the theory of relativity is that c is a constant. You can't go any faster than light. It brings up all kinds of wild surmises, such as if a man went the speed of light he would then be the – as big as the universe, you see, and that time would not exist if you were going at the speed of light. I mean, it's a whole bunch of fantasies and fairy tales is what this thing originally was, you see. Well, it had "MGs equal Jaguar squares", or something like that as its
primary modus operandi. And nobody could, of course, prove this fellow wrong because this "c" that he keeps throwing into all these equations, of quantum mechanics and so forth, is not a constant.

The speed of light is not an exact constant, so therefore, all these equations go a little bit wrong. So you never can quite prove it. It's very interesting. When they developed the atomic bomb, they did not use Einstein's theory. They put stuff in and out of a pile until they found that there was something called "critical mass." And they thought "That's very fascinating", and they took it from there. And every atomic bomb you've got today was developed empirically. None of them were calculated. But he led the way, and it was a new idea, and so forth; the old man was sorry he did it.

But what is actually the history of the Einstein theory out in the public? In 1928, a paper was read before the combined societies of mathematics in Germany – and you can imagine how many people that was. The paper was the wildest piece of slander and libel that anybody ever heard. And it condemned the Einstein theory as the greatest mathematical hoax of all time.

Einstein was in trouble with this theory for years. He was practically hounded out of jobs in universities, and everybody was on his back, and he finally went to Princeton and wrote Frankie, and we've got the atomic bomb. That's the history of the Einstein theory. But look-it-there. In spite of the fact that it was a discreditable creation, the old man died with his boots on, and the – and the old retainers weeping around the bedside, you know. Why, he was actually totally successful. There's no martyrdom connected with this at all except he was sorry for having developed the atomic bomb.

Now, what about many other creations of this character? Take Freudian analysis, for instance. Old man Freud, he got thrown on his ear by the medical association of his day. And they just gave him the yo heave, and they wouldn't have anything to do with him, and they just raised the devil down around Vienna and it just went on for years. And finally, about 1894, why he made some startling statement and made a breakthrough of one character. He announced his libido theory in 1894 and from that time thereon, why, all was good roads and good weather. And look, the man would – had practically nothing to go on. He practically had no results, he practically had nothing but a dreamed up theory and so forth. It was terrific, I mean, that he'd go so far.

But he did have a new idea. And that is that man's physical ills could be assisted mentally. And that was a new idea. And that was the idea that Freud put into the world. But the old man died with his boots on surrounded by the old retainers who were weeping to see him go, you see. Sung the world around and very successful. This man was a very successful man in spite of the fact that just before he died, he wrote a paper called "Psychoanalysis: Terminable and Interminable." And he had learned that some people go on and on and on and on and on, and you can't seem to do much about it.

The paper and this sort of thing is now a woof and warp of our existence, and it isn't even true. Eighteen ninety-four, and he was totally over the top by about 1933. That's very interesting, isn't it? There's an idea the breadth of the world.
But don't think the idea in its early stages wasn't fought. Harvey's ideas were fought. Galen, Socrates: any new idea gets fought. That's the nature of man, is when he sees something new, it threatens change and man is a great believer in no-change while he obsessively changes. While obsessively alter-ising everything in view, he believes in no change. And of course, that's why he obsesses everything of this character. That's why his alter-is is so obsessive, is because his basic belief is on a zero.

All right. Now, I'm just talking to you about this, just looking coldly and dispassionately. What's the chances of Scientology, of success? Well, we've been told it takes a hundred years to get anything done. And we've been told all sorts of discouraging tales, that it's martyrdom, that it's this, that it's that, it's the other thing. Nah, we're over the top. We're over the top. But we still get fought; and we're still in a period of being fought.

And you can be fought with the velocity that you are right. Because then you are terribly dangerous.

You think of the thousands of philosophies that must have come up since 1950. There must have been just libraries full of books written by people all over the place detailing theories about life. Where are these books? Where are they? They just don't exist. And right now the psychologist is changing his own textbooks; and all sorts of weird things are happening in the world. The medical profession now will tell you most glibly about prenatals, and we've long since forgotten them.

But the point is, is we've made our incursion, but we threaten to upset far more than somebody's belief in whether or not the god was of marble or lightning, you see. We threaten to upset far more than that, if you're looking at it in terms of upset. The only reason it's safe for us to do any of this is because we can undo what we do. And Mr. Freud couldn't undo what he did. And Mr. Einstein couldn't undo what he did. And Socrates couldn't undo what he did. Let's take a look at this, you see.

And they're all kind of sorry for it. And they got into a suicidal frame of mind. But we're in a very safe channel because we can undo what we did. Do you know that you can take somebody that's been very thoroughly badly audited and simply run the auditor off? And the auditing disappears. Why do you suppose that I include and will continue to include in any Security Check – there's two reasons – questions about overts against myself. This seems an odd thing to do.

Actually, there's two things: One, if a person has a lot of overts against me that he thinks is bad, he won't get any benefit from Scientology. That's quite obvious. He's got overts against the source. That's the thing. And you think basically that's the only reason that's there. No, there's another much more subtle reason why you have to keep these overts off. The only way you could acquire a forceful, overwhelming valence called "Scientology" would be by piling up a bunch of overts and motivators on it. Think of it for a minute. Isn't that the way, basically, you got into any valence you're in? So this would be the first time that anyone was going along the track saying, "All right. Here's what I say. Try it out. Run me out." Don't you realize that? So there's no overwhelm mixed up in this.

In the early days, people who had been all mixed up with Taoism, and all that sort of thing, they kept telling me that we needed tremendous aesthetics. You know, we needed a
swinging incense pot and all that sort of thing. And these tremendous aesthetics which we were supposed to have something to do with, of course palled on me in the very earliest stages, because I've said you can always overwhelm a thetan with aesthetics and we haven't the least desire to overwhelm a thetan.

So if you wonder why Central Organizations don't hire the Empire State Building or we're not flat out to make a totally overwhelming ritual of it all, don't you see, that's all part of the same picture. If it's true for you, it's true. It's not true for you because we have overwhelmed you. Get the tremendous difference there? This is the first time this has happened to man so, of course, it appears very dangerous and very strange. They could understand it if we were simply trying to overthrow the established church, established science or established governments. Then they would understand this and you'd probably find that we weren't being hard fought. "Oh, well. Oh, yes. Oh, those people? Yeah, we understand them. Revolutionary group. Revolutionary group. One of the things which they're going to do is blow up Buckingham Palace and the White House. Yeah, that's what they're going to do." That's right. And you'd probably find the cops coming around and seeing you, being quite chummy – I'm not kidding [laughter] – and understand you.

But to understand somebody who was – basically has no evil motives ...

Every man who has been overwhelmed by what he considered evil valences, asks himself this question: "What's the pitch? What's the pitch? What's the pitch?" He's just totally frantic. You know? "Well, you audit this fellow, and he gets more intelligent and he gets more able and he's happier and he – what's the pitch?" And, of course, with running Security Checks all the time on pcs that come up the line, what's the pitch? Well, there his question becomes totally unanswerable, because we're running ourselves out as auditors, philosophers, teachers or anything else. Of course, if you can't make a thetan commit tremendous numbers of overts against you or set him up in a situation where he can commit tremendous overts against you, and then remove any possibility of his ever running the overts, that's the only way you can actually overwhelm him and get him so stamped down with a valence that he can't thereafter wriggle. You see that?

So these former efforts were entrapments, and this is not an entrapment. This is not even a total freedom. I've even told you occasionally total freedom would be existence without barriers, and I think you would find everybody very miserable.

All right. We're an incomprehensible factor. This is the first time, actually, a high-powered, rather selfless philosophy has hit Earth which didn't at once demand of its practitioner or in – the person who embraces it, that he totally subjugate himself utterly and become enslaved by the philosophy, don't you see; and which didn't say that the originator of the philosophy must then be carried as an un- ... an imperishable valence from there on to the end of the track, and everybody should bow down to this, don't you see. That alone is incomprehensible amongst the – the works of man. These are different. These are different.

And these are the differences that man becomes alarmed at, because he's certain that if there's this much and you neglect these obvious factors, which he sort of senses you neglect, there must be some much deeper, much more vicious motive mixed up in all of this, you see.
And they can become quite excited. And recently some chap out in California took his finger off his pc and probably didn't flatten the process. The pc went out and assaulted her husband on the street and had him arrested and tried to have the auditor arrested, and signed a check over to him. The police raided the building and took his E-Meters and tapes and made the usual mule's south ends out of themselves (because I like horses) [laughter], and went ramming around madly, you see. Now look at the hysteria. Look at the *hysteria*. They sent a telex to every police department in the state of California about this terrible case which they had just uncovered. What terrible case?

Well, with a good attorney on the job and this thing sorted out and everybody keeping calm about the thing and not fighting it violently but just putting up a consistent and continual effective pressure against that particular attack angle, ... and it will not wind up in 30 days, I assure you. Courts are not rigged that way. Nor will it wind up in 60 days, nor a 180 days. You will *still* be hearing about this in about three years. And there is never any reason to rush anywhere and do anything about characters like that. What you do is just put up a steady pressure in that particular direction. Just take the effective actions and let it coast. Do not become absorbed in it, because it is out of *terror* that the attack is born and people who are in terror make mistakes. And all we do is just don't make any mistakes and continue to put up an effective pressure against this sphere.

And investigate loudly is one of the things we do. We have a regular modus operandi and these people become more and more terrified because they now begin to feel guilty of an overt act. I saw the president of a law university who had me arrested one time as a witness in a bankruptcy.

You see, in the United States, if you're a witness in a bankruptcy in a Federal Court, you can be arrested. Because you're liable not to witness, you see. They even fingerprint you, you know. It's very degrading. Witnesses in bankruptcies – that has to do with money. And after all, all the money in a bankruptcy belongs to the attorneys and the judge. [laughter] And you can't – you can't go around – you can't go around being a witness lightly, you see. And these fellows – the only way they could be coaxed and the judge could be coaxed, and everybody could be coaxed, was to issue this silly witness in a bankruptcy warrant. You see, that's totally meaningless, you know.

You watch – you see an accident happen and in New York City the cops can grab hold of you and put you in jail for three days. As a consequence, accidents and murder happen in broad daylight in New York City and you just ask anybody around you what was going on, and they look at you rather searchingly and don't answer. And you say, "Is there anything that happened on this corner?" And the fellow said, "No. I wasn't here" – his twenty cigarette butts littered around his feet you know. [laughter] He wasn't there. He just arrived. You can't get anybody to interfere in New York City or witness anything in New York City, just because of these silly witness rules.

Anyway, the president of a law school had been employed to obtain this warrant and the Chief Federal United States Marshal – I think they have a sort of a feeling like they're still western marshals or something. They go around with big guns hanging on them and so forth. The only trouble is they normally pick people off skid row to have these jobs, and it's rather
incongruous, you see – And this fellow, he was utterly mad-dogging because he was sure that I had just beaten up two of his marshals.

Actually, I hadn't beaten up a marshal. I had taken the gun away from one and told him how to use it and put it back in his holster, because I thought he would get into trouble. I explained it to him. I said, "You'll get in trouble waving that about and so forth; and this is the hammer, and this is the trigger." And he handed it over to me, and I said, "These are the butt plates, and there's the ammunition", and so forth, and slid the cartridges out of the chamber and told him to put them in his pocket, and put the gun back. Don't – nobody was picking on him, and it was all all right, and he did it. You think I'm kidding you, but he did it.

People that walk up to you shaking and nerves with a drawn, cocked gun – you don't – you don't monkey with that sort of thing. Teach him – teach them how to use it! Anyway, this was pretty wild. This was years and years and years ago. It was clear back in 52. Anyway, these guys began to realize that, one, they were not dealing with a criminal, that somebody had told them some lies.

And they gradually ran up little white flags, and they became more and more apologetic and more and more apologetic. And in the course of about three or four days, finally took me down to the court where I was supposed to give my testimony, and I sat down, and I said, "Yes, I knew of this company. Yes, my relationship with this company was so and so. No, I didn't have any money from this company." And that was it. Oh, yes, and I said, "I don't even have any money now."

And that was it, and that was the end of my testimony. The judge, however, he'd heard some rumors, you see, that two US Federal marshals had been beaten up and so on. And he said, screaming (and I won't blast the microphone), "But isn't there anything on which I can hold this man? Isn't there anything?" You see, he had been told by everybody that this fellow had a new idea and therefore ought to be shot, you see.

And the Federal marshal and the president of the law university ran – they did not walk – they ran up the aisle to the front of the judge's bench. And they said, "No, no, your honor. This is a perfectly decent man. You've got the whole idea all wrong", And they were just interrupting each other and, "No, no, your honor. You don't want this man. He didn't have anything to do with that. And you have been improperly informed and so forth, and this whole thing is a mistake! And you must let him go right now. There's nothing else you can hold him for, and there's no reason to hold him."

And they came back, and they said, "You know, you ought to do something about it. You shouldn't let people say bad things about you like this because this is a terrible mistake." And they escorted me out and took me down to my airplane, by the way, in a gold-plated limousine (as near as they could make it), you know, and shook my hand and so forth. Sure was terrible what mistakes people could make, namely them. [laughter]

So when they run that many overt, they get propitiative; and when people are in terror, they make mistakes.

Now, let me tell you the denouement of the last attack on Scientology through the law courts in Washington, DC. The witness in this particular case would not state – would not
state – that he had not been financed in all of his attacks on Scientology by the APA (the American Psychiatric Association) and the American Medical Association. This was the one question he wouldn't answer. He would answer questions to the effect of, yes, he had been in jail. Yes, he had been in insane asylums. Yes, he was wanted for this or that crime in various states. Yes, he'd answer these questions, but he wouldn't answer this one question. Was his whole attack financed by the American Psychiatric Association and the American Medical Association?

That question he refused to answer.

Now of course, in a regular trial, he would have to answer that question.

But his witness deposition was simply being taken in open court. And he could not be forced to answer all the questions, but when he was – finally, when the whole thing came up for trial, he would have to answer those questions. Now, he was attacking us. We weren't attacking him. He was suing us for false arrest. He kept calling up the office and doing various things around and about the place, having swindled the organization out of about fifteen thousand dollars. I took my finger off my dollars for a second, and there – the organization's dollars – and there it went. And then, because he was arrested for pulling this, he was arrested in the wrong county or something. There are several counties and nobody can quite tell which county is which there at that corner of Maryland, so they arrested him in the wrong side of some line. So therefore, he had this fantastic charge of false arrest that he could bring about, don't you see.

Look, this kept going for nearly three years. Well, there were nerves during all these three years. There were people investigating things and calling things up and doing all kinds of things. For three years. There were people – you were hiring attorneys and hiring detectives and listening to reports and so forth for three years. The man's name, by the way, is Et
ttleman. And the Et
ttleman case is very much in point. Three years this goes on!

Every principal in the Washington organization was being sued for a minimum of a hundred thousand dollars cash. Why, you say, that ought to make you nervous, man. That's a lot of money. Three years. Marilyn and Sue and myself, and anybody else connected with it. Everybody was sued for a hundred thousand dollars cash.

As a matter of fact, the only one that got any satisfaction out of it was Susie, and she, I think, knocked the attorney silly. He tried to attack me in the lobby, and I knew better than to hit him. It was a great temptation, you see. He was not very big. And they were serving a warrant, you know, right in the middle of a congress, and it was a great temptation, and I was gripping my hands rather tightly in my pockets so that I wouldn't succumb to it. Because all he needed, you see, was an assault charge; then he would have had it, you see. He would have had it made.

But evidently even he realized it was silly to bring a suit against a woman for assault. [laughter] Mary Sue wouldn't have anybody talking to me that way, and she clobbered him. About three times. He sort of looked at her like, "You shouldn't have done it", you know. [laughter] Wrong attacker.
Well, anyhow, after all of this nonsense and cops and robbers and everything else that you could think of, you see – three years worth of it; considerable expenses in courts and all that sort of thing – finally it comes up the great day for trial. The great day for trial has now arrived, and Ettelman is there spitting as usual and being paid to say this and that and the other thing and everything is all set and raring to go. And the judge who should have dismissed it – he should have dismissed it two years before, because they kept altering the bill on him. You see, they kept altering the statement of charges – Ettelman's attorney did. And it was very illegal, but he still didn't throw it out. Everything had gone wrong.

And we were all there – that is, I wasn't there, but the representative of the organization was there. Marilyn, actually, was there and our attorneys and all this raised and waiting on the fall of the gavel. And we look everywhere in vain, but Ettelman's attorney has failed to turn up [laughter], and has forgotten that it was this day [laughter] that the trial was supposed to be held. Of course, the judge dismissed the case and the attorney, Houston, couldn't even get it reinstated again. After three years. If you wait them out long enough, they sooner or later will make a mistake. That's all it amounts to. If you just go on being effective.

Now, the only thing that can be done to a Scientology organization or a Scientology personnel is to be worried to a point where he doesn't do his job, either in an organization or an individual auditor.

Now, remember that. That's all that can happen to you. You can be worried and harassed and upset to a point where you are made ineffective. And the whole gain of the people who oppose new ideas is then, by making one or more organizations or Scientologists temporarily ineffective. You got it? All the time you spend on this, of course is lost time. And the more you worry about it, is lost worrying.

Go ahead and be effective. But remember the only thing they will ever gain in the long run ... They have never yet thrown anybody in the clink, you know. I mean, it's just all yippe-yapple. They never can. They never have any evidence. It's just the amount of time you lose in worrying about it. You understand? And the amount of despatch time you absorb and the cost of cables and attorneys. You got that? That's the whole loss. That's all that ever happens. It is the lost time of a Scientologist, one or more, being rendered ineffective for a period of time and being tied up and worried because he's involved in some kind of a yickle-yackle. The way to fool them is go on and be effective with regard to them and go on being effective as a Scientologist. Go on being effective in an organization. Go on running things effectively – keeping the show on the road, in other words – and just don't fall for the only loss that you can be thrown for, which is to lose your own time and forward pressure, you see, and a little money one way or the other. That's the only thing you can lose.

Well now, if you go ahead and concentrate a thousand percent and put everything on a high, high, high, high emergency priority basis, of course all that is wasted motion and action. And the more you indulge in it and the more you worry about it, the less Scientology you get done, so it's only to that degree that the enemy wins.

They get a negative gain. They take one organization or one personnel or one auditor or something, and they move him out of the lineup for a short period of time, and maybe blunt a little bit of his enthusiasm because he says the world is an evil place after all; and that is the
sole thing they can win. They can't win anything else. And of course, if they're going to play a
game like this — and we have no other choice than to play some of this game ... I always ask
myself, by the way, "What game is this that is being played?" Sort it out pretty well. Find out
what game is being played here; and then find out if it's our game. And believe me, ladies and
gentlemen, if it is not our game, there are no marbles of mine lying in the ring, there are no
cricket bats out there on the green that have my name on them.

They can go ahead and box with their own shadows and climb mythical ropes and do
anything they want to do, but they're not playing a game with us. Do you understand? But I
will go ahead and do the effective things. In these effective things you usually get very com-
petent assistance and get it fast. Force people to accept our assistance. That is to say, if some-
body is being attacked, don't let him avoid our help. The only time we lose or the only time
anybody loses is when they avoid our help. You know, they say, "Well, really I probably
ought — shouldn't have any help from HCO or something like this, because it's all possibly
very bad, and it'll all wind up bad." And they do. They lose.

There have been one or two minor little cases of where they did lose badly. Or they
don't say anything that is at all bright. If it's totally outside of our perimeter of control, some-
thing like some... a knucklehead one time down in Phoenix keeps going in and saying, "I
practice Dianetics; I don't practice Scientology." He wasn't. He hadn't practiced Dianetics in
his whole lifetime. He didn't even know how to run an engram. The only thing he could be
cuffed around for or told not to practice was Dianetics. So he keeps telling everybody that he
practices Dianetics.

We keep telling him, "For God's sakes, shut your mouth. Tell people you practice Sci-
entology." No, no. He couldn't do that, so we couldn't help that man. And there was a fellow
out in Australia — a fellow out in Australia around Perth and so forth, and he wouldn't even
accept an attorney, he wouldn't accept anything. All he got was a small fine. But he just
wouldn't accept a thing. And we even knew — we even knew — things about the person who
was bringing the charges and the doctor bringing the charges and so forth, that were practi-
cally unprintable but very provable. And he wouldn't let us enter any of these things — nothing
like that — so we lost in that particular sphere.

Now, how much time can be developed by one of these attacks? That is how much
time can be involved by one of these attacks? Plenty. Morale can be shot. Various things can
happen, and so forth. For instance, we've never had a day's worry really about the government
since I told the Food and Drug Administration in Washington, DC to go fly a kite, if they
knew how, if they had intelligence to read a book about flying kites.

And the way I did it, is I read their law and I found out that if you manufactured any-
thing that came under their purview, then your whole organization was under their authority,
which is quite interesting. That is, if we manufactured an E-Meter, they were in charge of all
E-Meters, because obviously an E-Meter is both food and drugs. [laughter] That's the way the
law reads. That outfit passes psychiatric machines which kill people. Murders them. I'm not
lightly stating it now; it does. They have shorts in them. They're ineffective electrical equip-
ment. Completely aside from being a shock machine; they are badly made. And the Food and
Drug Administration has a purview of those things, and they let them go on killing people, but that's all right with the Food and Drug Administration.

But somebody has an E-Meter. They said the E-Meter was a diagnostic, therapeutic instrument and it was used to cure people of things and the small current that went through it titillated or agitated the brain and made the brain cells well or something. I don't know what they had figured out. So we just stopped selling E-Meters and we stopped selling these Dianazene antiradiation bombs because people kept asking for them. You know the little pills.

And we just quit that and the Food and Drug Administration said, [in a whining voice:] "You shouldn't have done that." But I also caused him an enormous amount of work and I imagine our name is an anathema to him. Because every time I turned around I had him writing letters to senators and congressmen explaining why he was attacking this church.

The poor man, the head of the Food and Drug Administration, with all of his administration had to write additional letters all the time. We turned them out on Robotypes ourselves. They all looked like personal letters. They weren't. And then the senator would write him and say, "What is this?" and then he'd have to write a long explanation. Part of his text was "You'll remember, of course, L. Ron Hubbard because he's the one that's had so much publicity in recent years." He always included this phrase in his letters to the senators and congressmen. They, of course, would instantly forward his letters to us. We just set it up on an administrative line. It just went off one, two, three, four. We were worrying them to death.

And then all of a sudden when I found this clause in the law, that said that they had no purview over you if you didn't manufacture anything out of which they had any purview, see, but if you did manufacture, then they could run your whole organization for you. So I just said, "Kick these items out of our immediate sales bill," and that's why they're not there anymore, and the Food and Drug Administration had to go away and get lost. All right. And they did, because it wasn't our game.

So my cricket bat was no longer lying on the green. Don't you see? And their poor, unemployed agents had to wander and go to movies in the afternoon instead of in... [laughter]

But the only thing you can lose – the only thing you can lose – is your time and your equanimity. That's all; that's all. And if you rig it up so these things are not disturbed and you have gone on being effective the whole time and taking very effective steps to handle this all and square this all around and realize fully that there's nothing wastes as much time as the law...

You see, the law has overts against men's time. It puts them in jail.

Overt against time. Overt against time. So of course the law has slowed down to a point of where to get a civil suit tried of having bought a package of biscuits at the store which was moldy, and you're suing the store, that will be heard in two or three years, you see. That's the way the law goes. But – because it's overt against time, it goes this way.

All right. Now, don't worry for a minute about the future health of Scientology. It is going through these exact periods that every new idea goes through. It is actually being fought much less expertly than many things have been fought in the past. There are tremendous things which could be done, but I've begun to realize that nobody is going to do them. So I never bother to provide against them anymore to amount to anything.
But there are some sleepers back on the track. If anybody tried to attack a Scientology organization and pick it up and move it out of the perimeter or go over the hills with it today – this happened to us once – why, they would find themselves involved in the most confoundedly weird mass of legal – well, it's just like quicksand. Quicksand. It's an interesting trick. Every time they shoot at you on the right side of the horse, you're on the left side of the horse; and then they prove conclusively you're on the left side of the horse, you prove conclusively that you're on the right side of the horse.

They go mad after a while. This is what the basic legal structure is. Furthermore, Scientology is so fixed up these days that if any one continent shut down, the enemy realizes much better than you do – because it's happened – that any area so closed off, could be flooded from an exterior source. You understand? So it doesn't do any good to close any area of Scientology out in the whole world; and no agency exists which could do so. You see how that would work?

They might close them all out in the United States or they might close them all out in England. But their apathy comes about at once by the fact that if they closed them out in the United States, they would be bombarded from England. And if they closed them out in England, they'd be bombarded from the United States. And in the United States, the difficulty is that if they attacked in one state, they'd find you operating in another state, don't you see? That isn't the same corporation that you're attacking, you see. It's all very involved, but ...

[laughter]

And this drives, by the way, the Better Business Bureau berserk. They know what they want. They're mainly subsidized, by the way, by the American Medical Association. They're always putting out tracts about quack medicines and all this sort of thing. They blackmail you. And we never buy blackmail, is another one of our defensive mechanisms. We never pay blackmail. Drive us to the wall, shoot us down, but we won't pay blackmail. That's it. And people realize this and it's very upsetting to them.

So the upshot of all this is, is there is an unpleasant side to the business of dissemination and that is the backflash. And it's a very interested backflash, but a very terrified one. It used to be a ridiculing backflash. But now it isn't; there is fear in it. There is more than fear in the United States in it. I had a fellow investigating Scientology for the government. He was told to by the White House, so he didn't dare do anything but actually investigate it. Finally he was looking more and more whipped and more and more whipped and more and more whipped and he finally picked out one profile showing a bottom to the top gain and he said, "If just this one profile were ever published in the American Journal of Psychology, it would upset the whole field. Do you realize that?"

And the other fellow says, "Yes, well, we don't really blame you for keeping it all to yourself and keeping a monopoly on it." Yeah. Keeping it all to ourselves. Just let anybody stand long enough to listen and a Scientologist will give him the works, you know. [laughter] And yet psychology was upset because we kept it all to ourselves.

No, at no time – at no time have we ever really faltered now since about 1953, we're – been going pretty good since '53. Up to that time, we had no corporate control. People say what I did before 1953. Well, what I did before 1953 was try to keep the show on the roads
and fight them off single-handed and after a while, why, we got enough people in line so that it wasn't quite this tough; and that's really what happened. And now, on a present time, our modus operandi is so well worked out that an attack in one quarter of the United States brings about a certain series of actions in an entirely different quarter in the United States. And suddenly, why, the enemy is looking at all kinds of attorneys and looking at various backflashes. And now an investigation has been started of the people who were behind this attack on Scientology; and that investigation will go forward and these people will be very discredited before we get through.

Don't think that this is an enttheta operating atmosphere. It is not one. I'm trying to tell you what we do to fight back; and what we do to keep going. And that is to say, above all else, we keep on doing our jobs, and we're effective in combating the attack. And if you just remember those two factors, why, you've got it. Be effective in combating the attack. Don't let it keep you from doing your job. That's the only thing the enemy can win; and all else is of no consequence.

Frankly, not for years has anybody been hurt in one of these attacks. Not for years and years and years. I first laid down the modus operandi of what to do about it – various ones have been laid down – about 1955. And they have been uniformly successful since that time. I haven't got any wood to knock on particularly, but I do have a lot of faith on Scientology and Scientologists. I've got a lot of that to knock on and that's good.

All right. Well, that's a long dissertation which you probably feel didn't have too much to do with you. [laughter] But it's something for you to look at and realize that you would be as nothing; What you would be doing would not even be important if nobody fought you, anywhere. If nobody disapproved of what we were doing anywhere, do you realize it would be like reaching into a soundless void?

Think of the thousands of philosophies that must have been developed in all parts of Earth by two and half billion human beings in the past eleven years. There must have been quite a few. There have been rivers of books written, all of which had new, startling and strange ideas. None of these are ever fought. Not one of them; and nobody's ever heard of them. But we have the enemy – aberration, ignorance, enslavement – we have these things on the run. And the hallmark of having them on the run is that somebody gets excited about it.

Right now the American Medical Association – I don't know what their mood would be today if you walked in – opened the front door, and walked in to the receptionist, and said, "I'm a Scientologist." I'm sure you wouldn't be unknown. They might try to pretend they didn't know you, but that's it. Yes?

Male voice: A couple of years ago, Ron, a man who didn't want his girlfriend processed, wrote a letter to the American Medical Association. Got a letter back from their secretary saying, "These seem to be fine, earnest people who are in a totally different field from the field of medicine, so they give us no trouble and we give them none."

Oh, is that so?

Male voice: Right.

That's how far it's gone. I wish I had a copy of that letter.
We've just received the surrender papers of the Better Business Bureau.

*Male voice: Good.*

They're sort of written backwards, but they're nevertheless that.

But there's the point. As you move forward in life, and as you move forward across the face of man's thought fields particularly; think of the hospitals, think of the vested interests, think of the utterly wha – billions of dollars and pounds that are undoubtedly invested in education and all these different spheres – the facilities. Why, I think if you put together all the electrodiathermy machines that won't cure anybody out here in this ten-acre park, they'd probably make an awfully nice mess of a mountain. When you think of all this vested interest, when you think of the electronic organization, when you think of the drug people, when you think of all these vested interests, think of what they'd lose. It's fantastic. I think they're being gentlemen about it, myself. I think they're – so on. They eventually will turn over their sword and that will be the end of that.

But if you weren't fought and if you didn't have backflashes and if you didn't hear wild rumors of one character or another running around the field, start worrying. Start worrying. Right then, start worrying because you're not getting through. What do you think the highest level of approval of the human race is right now? What would it be?

*Male voice: Communicate.*

Yeah. But when you don't hear any of it, know you aren't being heard. Okay?

Well, I didn't mean to give you such a lugubrious talk on this situation, but it's been a bit on my mind, and I thought you might know something about it; how we are alert to these things, and what we do concerning them, and why you don't find me tearing myself wrong side out every time somebody jumps up. But where you do find this, you do find us doing something effective. We move in rather rapidly. Our communication lines are much more rapid than the enemy's. Much more rapid. They're very fast.

The speed of HCO's communication lines is your best guarantee of defense, and that's why you must keep the speed of HCO lines up. They must be rapid and there mustn't be any comm lags on them. Whether there's anything important going over them or not, keep them up.

Because this alone is very discouraging to people. Very upsetting. They think we'll hear about it in a month or two and maybe do something about it. When within something like hours after this incident happened, anybody who – in authority in Scientology knew all about it within hours after the thing occurred. And of course, they just started moving up various artillery units and that sort of thing and lining up things one way or the other. And you've got some isolated unit that was making an attack on a Scientologist, and he's going to wonder what the hell cooks after a while.

Now of course, the backfire is going on the basis that in view of the fact every police agency in California has been informed of this terrible case and these terrible people, well, naturally they've made it inevitable that we have to get them investigated thoroughly. And so that is happening. And the next police report that I expect to come through on this line proba-
Dealing with attacks on Scientology.

Bly won't be through for almost a year. But it'll be somewhat on the basis of this: "You remember that case in Eureka?", "What case?", "Well, the case about the Scientologists up in Eureka, you know? How they were drugging everybody and so forth. Well, I think this case we're into right here in Portland", (which will have something to do with nothing connected with us, you see) "I think it's similar to that. Yeah, I think it's just similar to that Eureka case, you remember?" And they'll be using it as a model of comparison of how to subvert an organization, you see. Only we won't be the people they will be saying were bad, see. It'll be somebody else on this thing.

Well, those are good things to know. I'm giving a talk about it because I see that once in a while your judgment can be startled on something like this. You hear some fantastic rumor of some kind or another. And you say, "Well, there must be truth in it. Couldn't be, otherwise." No, the only truth is, is we're making progress.

You never get rumors when we're being ineffective. If we're not getting wins on cases, and HGCs and Academies aren't good and that sort of thing, you know we never hear a thing about us. It's all of a sudden, though, we go into a wild wingding of clearing them left and right and straightening out organizations and so forth, and the enemies say, "Oh, my God, there they go again", you see. And I use as a positive indicator of the strength of a Central Organization whether or not it's got any backflash. Is anybody yelling about it? Is anybody complaining about it? Is anybody screaming about it? And if there is nobody, I say they must all be sitting there doing nothing! They can't possibly be getting any results in the Academy. They can't possibly be getting any results in the HGC. They can't possibly be doing a blessed thing, because nobody's worried.

But you give me a big flood of letters coming in from someplace saying "Those dogs down in Sydney are just doing the terriblest things and everything is bad in Sydney, and Sydney is terribly bad..." Oh, I'll forward it through for information. I'll even look into it a little bit. But the basic thing that registers with me is somebody in Sydney is being effective. That's the thing to remember on these things. And I received a letter today asking me to return Ken quite rapidly so they could do something about this; and I'm putting it in its proper perspective. It's much more important that Ken finish off some effectiveness.

You see, by withdrawing him from a course, we immediately make ourselves less effective. See, California would be less effective. You get how we'd lose that way?

In addition to that, people have a grandiose notion that this is going to take place, that something is going to happen. Nothing is going to happen. It's going to go on for months and months and months. It'll leave somebody sitting on the hot seat for months and months and months. Nineteen sixty-two will come and go. Nineteen sixty-three will arrive; and still nothing drastic will have happened. Okay?

That's the status of rumor. That's the status of combat with the society. When there's nothing to lean on, there's nobody listening. If there's nothing flashing back, there are no ears hearing you nor eyes seeing what you are doing. So I don't care how much entheata you stir up. Just be effective.

Thank you.
CCHs – CIRCUITS

A lecture given on
27 June 1961

Thank you.

Okay. Well, this is the 27th of June, or was the last time I looked. But it might have slipped.

You're apparently doing all right in a mild sort of way. The biggest difficulty people are having right now, although they don't know it, is CCHs: how they are done. What was that, way back there in the dim, historical past? You know, that sort of thing. Big conferences about it all.

The monitoring and regulating factors which lie back of the CCHs should be placed in your hands. There are some monitoring factors that answer all of these questions if you want to get down and figure them out. And that is simply, the CCHs are a physical activity. They are not a mental activity.

That tells you at once that they are not verbal. So if you go ahead and whistle "Yankee Doodle" and give the Lincoln's Gettysburg Address, compounded with William Pitt's lecture on the protection of colonies, what's this got to do with the CCHs? Got the idea? I mean, you could give the CCHs totally mum and they would work.

Look at what this answers as a stable datum, see? Therefore, do you ever ask the pc (and take his data) the following question: "How is it going?" And then do you take his data? Do you then use the data to determine whether or not the process is flat? No, I will say you don't.

Now, why do you say, then, occasionally to the pc, "How are you doing?" Why do you say this at all?

Well, I call to your attention – I think it's clause 16, isn't it, of the Auditor's Code, which has to do with remaining in two-way communication with the pc. And that is all that has to do with. And it wouldn't matter if the pc said, "I have eighteen bayonets protruding in my stomach." The pc has not visually been observed to have a single change of comm lag or physical twitch, jitters, screams, fusses, yammerings – there's been no change in anything the pc is doing for twenty minutes.

And you say to the pc, "Well, how are you doing?"

And the pc says, "Well, my stomach is full of all these bayonets. And I've had this somatic turning on and off in my left zorch, and so forth."
And you say, "Well, that's just fine. Well, thank you very much. All right. We're now
going to do the next CCH."

That sounds weird, doesn't it?

Now, two-way comm with the pc. Now, in CCH 3 and CCH 4, why do you say to the
pc, then, "Are you satisfied that you did it?" That restrains you, fellow Scientologist, from
pulling a gag I've seen happen too often. We don't care if the pc said he did it or didn't do it or
couldn't do it or hadn't been able to do it or was satisfied that he had done it or thought he had
halfway done it or if he answered you in Arabic. We would say, "That's fine," and we would
give him the next command. You got the idea?

Now, to keep the pc in two-way communication, we do the same thing, only we talk to
the pc. But talking to the pc in the CCHs, you might as well be talking to the birds. It has
nothing to do with your running the process. Just make up your mind to it. Because I'll tell
you what I do; and the CCHs work for me very well. And I tell you what I do.

Never with an invalidative statement or frame of mind or anything of the sort, I move
a book from the left to the right. See? My left to my right, you know? And the pc, I hand him
the book. And the pc picks up the book, and the pc scratches the back of his neck with it.

And then I say, "Well, are you satisfied that you did that?"

And the pc will say, "Oh, yes, I did that."

And so I take the book – and maybe not the exact motion – I turn the book on edge,
and I move it from my left to my right. And I turn the book upside-down the next time. (He
thought he did it that time too, except he stepped on it.) And I'll turn it upside-down, but I will
keep moving this book from the left to the right until the pc does it. Otherwise, it's a flub. It is
a flub.

It's a delicate balance between invalidating the pc, you see, and making sure that you
duplicate the auditing command that isn't flat, because the one from the left to the right is not
flat. Couldn't be. He hadn't a clue. You got the idea? He just didn't have a clue.

You moved the book from the left to the right and the pc picked up the book and
scratched under his armpit with it. And you say, "Well, did you do that?" And the pc says,
"Oh, yes. Yes. I did that." And you take the book back, and to keep from invalidating him you
turn it around the other way and you move it from the left to the right. And you faintly differ
it in the position of the book or something of the sort, or your hand or whether you extend
your little finger or something, but it's still a motion from the left to the right at the same rate
of speed. Got that?

All right. And I keep duplicating that type of motion until the pc is flat on it.

Hand motions, same way. Same way. I asked him if he contributed to the motion, and,
shucks, he was running halfway across the room, you know? And he says, "Yes. Yes. Oh, yes.
Yes, yes. I contributed to the motion all right."

That's good. He gets almost the same one again, and he gets it until I think he did it
too. You understand? That's a delicate balance.
If a pc starts feeling invalidated because you were repeating the same motion, well, a lot of things could be wrong. "But I did that", he says. Ah, yes, but a pc can say, "Well, I did that" if you moved the book from the left to the right, and then on the next motion of the book you moved it in a circle behind your own head. And the pc says, "But I did that." What did you do, pc? Yes, he just did that. He moved the book from the left to the right by scratching the back of his head with it. You got the idea? You'll run into these.

Well, so why plunge in that deep before it becomes idiotic, don't you see? The pc did it, he did it, and if he didn't do it, he didn't do it. But you mustn't be pedantic, because instead of an acknowledgment you give an invalidation. And as soon as you start giving an invalidation instead of an acknowledgment, why, the pc starts going downhill, not uphill, because you're giving him lose, lose, lose, lose, lose. And you've got to give him win, win, win, win, win. All right. He thinks he did the same one by scratching the back of his head with a book when you moved it from the left to the right.

Well, that gave him a win. You said, "That's fine."

Now I go ahead and move books from the left to the right, don't you see? I keep going on moving books from the left to the right, but not accusatively. It's a very delicate point.

Physical motion is all that counts in any of the CCHs. And it doesn't matter what the pc says. You're trying to keep in communication with the pc, and that is all there is to it. Follow? That's all there is to it. You'd feel awfully strange if a robot clanked into the room, sat down in the auditing chair and began to pump your hand. As a matter of fact, you'd feel a little queasy. And in view of the fact that this has probably happened quite often on the track that a robot walked in and started to dismantle you or something of the sort because you'd just had your doll body revoked – you react very badly to something that doesn't communicate. You probably wouldn't even object to the robot dismantling your doll body if he came in and said, "Well, I got an order here from the general council that you, having been guilty of mepery and dopery in high space, are herewith deprived of one doll body, and we're going to take it apart and leave it on the bench for seventy-two hours."

(Now, that's what I used to do. This is a different one.)

And you probably would have gone along with it. It wouldn't have been quite so bad, but some inhuman, unspeaking, unthinking, unfeeling set of cranes suddenly move in and start pulling the doll body apart, some uncertainty has entered into the situation.

So therefore, I keep the uncertainty out of the situation in doing CCHs. I say, "Well, this is what we're going to do." And I do it.

Now, you can make all kinds of mistakes in running the CCHs, but that stable datum will set you right on most of them. It's a physical action, it's physical observation, and those are where the CCHs live.

Now, there's another one; there's another one: No command in the CCHs is left understood. You don't clear a command and then insist that the pc do it from there on out. In other words, you don't say, "Now, you're always going to turn counterclockwise", and then we never thereafter give him an order to turn counterclockwise. That violates the rules of auditing commands. And the principal rule of an auditing command is, it is given now, in this unit.
of time, and nothing has any validity except this unit of time and the command that is just
given. You know that, as an old standby from way back when.

Well, don't violate it with the CCHs. Don't say, "Well, now hereinafter as aforestated
you're going to turn counterclockwise", and then correct the pc if he turns clockwise. Oh, no.
The pc has no orders to turn clockwise.

You say, "You give me that hand." If there were no designation of any kind, it would
be perfectly proper for the pc to give you either hand.

If you say, "You turn around", in CCH 2, and there's no designation of any kind which
way to turn around, then any way that the pc turns around is right. Right? There's no designa-
tion.

Now, if you want the pc to turn in a certain way, then before you give the auditing
command, put your hand on his shoulder and start to turn him and say, "Turn around." You
got that? That's a designation, isn't it?

And "You give me that hand": you nod at the hand. Pointing at the hand, you will find
if you practice it, is not feasible. You can't point at the hand and then pick up the hand and
then do this with the hand; it is just too much. But you can nod at his right hand and say,
"You give me that hand." It's a physical thing, anyhow, you see?

The thing is all actually done by theta communication and physical motion. The two
things are combined, and the English language has nothing to do with it. But we just stay in
communication with the pc. You got the idea? So that's why we have the commands.

Now, putting the hand back in the pc's lap causes a great deal of difficulty to one and
all. Now, what do you do? Do you put it in his lap or something?

Well now, if the pc's hand were to be very limp as he extended you the hand – if the
hand's very limp, you see; you've actually had to take it by the wrist, and it's out there in an
acute state of catatonia right now – and you drop his hand, if by some accident it were to
strike his knee or strike the edge of the chair, you would have been in violation of a primary
function of an auditor, which is to safeguard the pc from harm during a session. If anything
makes a pc scream – it's you preventing somebody from coming in the room, you preventing
him from lousing himself up. You get the idea?

Because it's your responsibility that the pc can be audited in that session, particularly
at that moment of the auditing command. And you go ahead and drop his hand in thin air, and
he knocks his wristbone, or something like this, against the edge of his chair, and so forth,
well, that's a silly thing for you to do, don't you see?

The same time, it is equally silly to take a pc's hand, when the pc is putting it decently
back in his lap every time – to call out a couple of destroyer escorts and have it escorted back
there. You got the idea? That again is silly. So the things that are silly in the CCHs or that
seem silly to you are probably wrong. You've probably got them wrong. You got the idea?

There really is no one-two-three-four-five-six drill. This was invented later while try-
ing to teach the people, you see? There really is no such drill. The pc is giving you his hand
quite nicely. Well, all right. So you take his hand. And he's removing his hand from yours
quite nicely, on an acknowledgment, and putting it in his lap or on the arm of the chair. Well, what else is called for at this point? Nothing else is called for. You simply sit there, give him the command, and take his hand, thank him. But then all of a sudden he's getting coy and he doesn't want to give you his hand, so you pick his wrist up and move his hand over and put it in your hand. Right?

All right. Now, at this time you notice that the hand, as it touches yours, is in a complete state of inertia. Well, you certainly are not going to drop it any more than you'd drop your watch. You've got to put it someplace, so you put it back in his lap. You got the idea?

So reason governs these things.

All right. Now, let's take this fact, which has got some auditors a bit loused up, because a lot of auditors knew 8-C, and 8-C is not Tone 40 8-C. 8-C is not a CCH. We only carelessly refer to CCH 2 as 8-C. It's not 8-C. It never was. 8-C goes something like this: You say to the pc, "Look at that wall."

No – not 8-C; not the first 8-C. The first 8-C is "Walk over to that wall." "Touch that wall." See? "Walk over to that wall. Thank you. Touch that wall. Thank you. Walk over to that wall. Touch that wall. Thank you." That's it. "Walk over to that wall. Thank you. Touch that wall. Thank you. Walk over to that wall. Thank you. Touch that wall. Thank you." That was old 8-C in, I think, in its most virgin original form before it got raped by misunderstandings. [laughter]

The next evolution on this line is unimportant, because it evolved pretty far. But frankly, Tone 40 8-C, unlike CCH 1, Give Me That Hand, improved through complication. It is better in the final form that it was in. But the final form of development I don't think was ever printed. And it was a you preceded each part of its commands. "You look at that wall." And the auditor would point to the wall. "You walk over to that wall." Now, there was a further point of complication, is "You walk that body over to that wall." Skip it. That's getting too complicated. But "You walk over to that wall. Thank you. You touch that wall. Thank you. Turn around. Thank you. You look at that wall. Thank you. You walk over to that wall. Thank you. You touch that wall. Thank you. Turn around."

Now, that was a high point of complication from old 8-C. Now, this point of complication went further. It's "You look at that wall. You walk that body over to that wall," or "You make that body walk over to that wall. With your right hand, you touch that wall. You turn that body around clockwise." Now, you see, that's going just a little far.

It is what works. It is what works. And that earlier one that I gave you, "You look at that wall": All right, the pc looks at the floor. Clank! Straighten your hand out on his jaw, and wham! he looks at the wall, see? That's it. You grab him actually by the back of the neck and his jaw, and he looks at that wall. If he squinches his eyes, that sort of thing, you've still got this hand ready and you pull his eyelids open. That's correct. That's a perfectly correct action. Got it? All right. And he's looked at the wall.

And now, "You walk over to that wall." And he walks over to that wall or he gets carried over to that wall, but there's some kind of action takes place where he transports himself from where he is to where you want him to be.
Now, when you say, "You touch that wall", you therefore don't pick out a spot for him to touch and you don't pick out a hand for him to touch with because it is not an understood proposition at all. You haven't said it in the auditing command, so therefore his putting his right knee against the wall is an adequate response to the auditing command. Correct?

All right. Now, in view of the fact that you actually intended him to touch it with his hand, after a while if the right knee seems to be just a little bit too insouciant or something of the sort, I have been known to add in "With your right hand, touch that wall" – not as a correction of my own auditing command, but on subsequent commands. But that's a change of the command and so it isn't so good. And you'll find out that if he will touch the wall even with his knee, it takes a little longer but it will run out his resistance to performing the maneuver. Do you understand? So there's no sense in being pedantic about it.

Now, I'll straighten you out quite clearly about this. It is "You look at that wall." He does. You say, "Thank you", Tone 40. And you say, "You walk over to that wall." And he does. And you say, "Thank you." And then you say, "You touch that wall." And he does. And you say, "Thank you." And then you say, "Turn around. Thank you." And that is about all there are to it.

That is a very simple evolution. Now, as I say, you can get too pedantic and so forth. But that factually – that factually – is a more operable command line than a complicated command line, and it is more effective than old 8-C by considerable.

Now, when you've got this fellow whizzing and dealing, you could hand yourself some loses if you said to yourself, "Now, I intended for him to touch the wall with the heel of his left foot by Tone 40 intention, unspoken, and he didn't do it. He touched it with his hand. Therefore, I've had a lose." Yes, you could fix yourself up to have some loses that way. But that's nonsense. It exceeds the process. It has nothing to do with the process. You want this fellow under control and you want him to get the communication, and you want him to gain havingness, and this is a very fine process with which to do it.

All right. As far as CCH 3 is concerned, this is old Hand Space Mimicry, and it just doesn't matter much what you say. There are a set of commands. They haven't become unduly complicated or anything of the sort, except you don't even tell him ... you don't dispose of the hands. You don't do anything like that. You give it one-handed with an unwilling pc. You only use one paw, and with the other paw you steer him through the motions. Okay? And the book, same way. You make one-paw motions with the book. And if the pc doesn't do it, of course, you tuck the book in his paw and you move the book in the motion, and you thank him for it and take the book back. All right.

Now, CCH 1, now, has as its additional ramifications – had the left hand, both hands, all kinds of hands. You understand? Well, why call it another process? Why call it another process? You don't have to do these things. You don't have to not do these things. But you do the process that isn't flat. That is to say, if you're saying, "You give me that hand" – pardon me, you don't have to say, "You give me that hand," just say, "Give me that hand" – the pc has been giving his right hand for about twelve, fifteen hours of auditing, and this is getting dull even to you, because he's been flat on it for some time, every time you went by it and so forth, start nodding at the other hand. See? Bust down his automaticities.
Now, I use these things that every time I come back through the CCHs I will break down an automaticity on this proposition. I bust up the installed machinery. And that's the only reason you flip over to the other hand or start saying, "Give me those hands", or anything of that sort. Now, there's another point here. It has value, in other words. It has value. And that is the only thing that regulates an auditing command or process. Does it have value? Well, it does. It has value.

Another thing I do consistently in running the CCHs you might be interested in is that I change my pace every now and then. It's "Give me that hand. Thank you. Give me that hand. Thank you." (pause) "Give me that hand." (pause) "Thank you." (shorter pause) "Give me that hand." (short pause) "Thank you."

Now, originally, when this was being done in London, they were studying, actually, to give the same auditing command newly in the same unit of command, and they were actually building up machinery this way. And the guy could build up machinery against this thing faster than you could tear it down. [laughter] And the way to bust up machinery on CCH 1 is by occasionally varying the pace.

And the pc will jump it. I just sit there and look at him. You just never heard of his hand, you know? You haven't said, "Give me that hand" yet, you see? And here's his hand out there practically busting your chest open, you know? He's jumped the command – jumped the command one way or the other. It's a good control factor. And I will actually pick up a person's hand, put it back in his lap gently, something like that, and then give the auditing command. You got the idea? I'll refuse his hand if I didn't ask for it. But that's only when it's too pointed, and there's no particular reason to communicate it because the communication is usually enough. The person is made aware of the fact that they've jumped the auditing command, and they haven't been aware of the fact they've been jumping the auditing command, you see? The last five or ten that you gave them, they've been jumping the auditing command. Their hand is halfway over at the time you say the auditing command. Of course, it doesn't have too much to do with the verbalization of the thing, but you haven't even laid the intention into him yet, see? So you're not auditing the pc. He's gone on some kind of a machine.

Well, the way to bust that down is put comm lags in your auditing. Speed it up or slow it down slightly. You don't even have to do it extremely. And the pc is giving his hand at this rate: "Give me that hand. Thank you. Give me that hand. Thank you. Give me that hand. Thank you."

So you say, (short pause) "Give me that hand. Thank you." (short pause) "Give me that hand. Thank you." "Give me that hand. Thank you." "Give me that hand. Thank you." "Give me that hand. Thank you." (rapidly) "Give me that hand. Thank you." (pause) "Give me that hand." (pause) "Thank you."

Got the idea? You can practically see the cogwheels on the machinery fly off. You know, the guy – "What – what's this? What's – what – what's going on here?" [laughter] "Oh, there's an auditor here. Oh! Oh, oh. Something new has been added to this room. I hadn't noticed this auditor before."

Now, of course, the original of the CCHs was that the individual was given an auditor by the CCHs, and we found out the main thing that happened – we found some auditors, by
the way, who were never found by the pc. For some peculiar reason, the pc just never found these auditors, and it'd sometimes happen, factually happen, that pc after pc wouldn't find the auditor. And yet we found, when we taught this auditor to run the CCHs, that he normally could get away with this, and he called attention of himself to the pc.

But this wasn't when we had the CCHs. This was afterwards. This first mechanism was given to a pc ...

I think it is trait – well, it's actually traits B and C, I think, are the main traits, see?

*Female voice: A, B and Cs Ron.*

Well, it's A, yes, but it's C that I keep my eagle eye on; and if C doesn't rise during an intensive, well, I just conclude he never found the auditor, that's all. And if he never found the auditor, there's no reason to blame the auditor. It's just the pc has a rather poor power of observation. And you should have been running the CCHs, that's all, because they were the remedy for this sort of thing. When we'd see graphs of this character we knew something else was indicated, and so on, and developed some drills by which this could be done. There were a great many of these drills, and they finally peeled down to the most effective of these drills, which became CCH 1, CCH 2, CCH 3, CCH 4. Those are the most effective of these drills. These are the ones that seem to have an effect on almost any case.

Now, the purpose of those was to find the auditor, and therefore, if the pc goes on automatic, he hasn't got an auditor, has he? Well, a pc can go on automatic. Now, you needn't worry about it too much. It doesn't put any strain on the situation. You just run the CCHs right, and this automaticity takes care of itself. But I will call to your attention the fact that it is silly to continue to pace your auditing commands on an automaticity if you don't expect one to occur in the pc. See, if you want one to occur in the pc, always keep your auditing commands exactly the same pace.

On doing CCH 2, you'll find this pc is halfway across the room and you haven't said a word. And I am rather fond of making him look a little silly.

You know, somebody's been jumping the gun, I'll just stand there. You know? "What's this all about? What's this?" See? They normally come back to where they were. I don't even tell them to come back. They will, usually; they come back and stand there, contrite. It brings it home. It brings it home.

But, of course, these points make them find the auditor, don't they, without invalidating them terrifically; because actually you are not invalidating them, they're doing something weird that has nothing to do with the process. This makes them very aware of the fact, too. Busts it up quick.

Now, running the CCHs are then based upon what is doable, and making every auditing command newly, and based as well on the fact that they are a physical process. They have to do with theta-MEST.

It's a direct theta-MEST process. Your command is a theta command. That is to say, you're laying it into the guy. If you were real good, you could probably do the CCHs without opening your mouth. If you don't believe me, if you're running real hot someday, think the
auditing command to the pc. You know, in other words, transmit it to the pc. I'm calling this
to your attention because an auditor could really muck up a pc this way, you see? Puts the
intention into the pc's head, and then comm lags, and then gives the verbal auditing command,
and then criticizes the pc because the pc has jumped the gun. This would be a wonderful way
of invalidating a pc. You get the idea? You actually could do it.

Because in running a pc, it happens all too often. I mean, I'll be coaching or something
like that. I don't play fair on Upper Indoc coaching and that sort of thing; I start doing it Tone
40, and they'll eventually go straight into the process, bang!

What you can observe, however, is think the auditing command at the pc, you know –
I mean, put the intention there, independent of your verbalization. Put the intention in the pc's
head and watch his hand jump to touch the wall. It's quite interesting. If you're good at it, you
can make him do it. But that you can't do it is no particular reason for anything, because one
of the things that can make you fail to do it, the pc might be rigged wrong. And you put the
intention in his head to touch the wall and he stamps his foot, you see? [laughter] Doesn't
mean anything, except he's got his switchboards crossed.

For instance, I was very much invalidated one time. There was a fellow came to call,
and I didn't particularly want to see anybody that particular day. I had a lot of work to do or a
lot of loafing to do or something of the sort. I was trying to figure out something. So I thought
an intention into the living room, you see, that he would leave. And, by gosh, he didn't. And
you know, I thought, "This is very upsetting", you know; I mean, "What's the matter with me?
I'm slipping my cogwheels and I have failed utterly", and so on. I went about my work and
eventually the nattering and snarling and so forth kept on coming. Didn't have anything much
to do with what we were doing, you know?

Had some acquaintance with this particular individual a couple of years afterwards,
and I found out something very interesting: The individual was on an intentional reverse. See,
his was totally inverted on intentions. And thinking the thought into his head that he should
leave would glue him in the chair, you know? [laughter] Just stuck. I never did run the reverse
experiment on him of thinking he should stay glued in the chair, particularly, but I have, on
others, and actually seen them practically be catapulted out of their chair. Fantastic thing, you
know? "Stick in the chair" and wham! They're going, "Well, we got to go now." And they just
came for the evening, you know? Terrible, terrible situation.

So, you're actually ... actually, unless you were doing a whole-body control of the pc,
you could think – like you can think at a mest object and make an ashtray sometimes move or
do something weird. People running Upper Indoc sometimes have funny things happen with
ashtrays, and so on. They get quite upset about it and they think they'd better not do it, and
things like this. But the best thing to think at an ashtray is "You have gravity; you have no
gravity", you know, that kind of thing, if you want something funny to happen with ashtrays.

Anyway, if you're just thinking an intention at the pc, you're just as likely to activate
one of these crisscrossed ... It looks like the janitor relieving the switchboard girl during a
noon hour in which an emergency occurred, you know, and every wire is out of its socket,
and they're all in crisscrossed across the boards, and all phones are plugged to all phones and
all of them wrong. So, of course, you call up the president's office or something like this and
you get the electrical-maintenance shop, you know? And it's just all crosswired. And you run into that in running the CCHs.

So it actually isn't, quote, "all the pc's fault", unquote. The pc is not necessarily being recalcitrant when he doesn't follow your auditing intention or starts to blow up or wogs or does something like this. What you're actually doing is you're giving him the intention and the guidance to carry out that intention, not the intention then called upon by the switchboard.

If you want to have some fun sometime with an E-Meter, start talking to the entities in a body. There's all kinds of screwball phenomena that we've run into. We probably have more phenomena and nonsense that we have discovered about life and so forth in Scientology than they've accumulated in the whole of the last fifty thousand years – infinitely more. It's really, really goofy.

But if you ... You could sit down and start talking to somebody's circuit and just get the pc to relay what the circuit said. And for some peculiar reason, you hook in the circuit harder and harder and harder and harder and harder. And of course, the oddity is that a circuit hooks in on drop of havingness, and that you're making a communication line talk across to a circuit.

You are (1) validating the circuit, and (2) you are running down its havingness. Because a circuit has no livingness in it. It is simply a motivated mass.

And if there's anything running it at all, it is mass. So you get a circuit to communicate very much, and mass goes. If you want to pull somebody's circuits in on him, run his havingness down.

There's a funny experiment that goes with this, by the way. It takes rather special conditions to operate, and you have to be pretty sharp to get this thing. There's two or three of these. One of them is a problem. That's the commonest one and the easiest one to do, is the individual tells you he has a present time problem. So you say, "Think of a solution." And he gives you a solution. You say, "Good. Think of another solution to this problem. Good. Good. Think of another solution to this problem." And you wonder why this pc is starting to go wog, man. And he does. He starts to go wog.

Because you're doing something to the stable core of an area of motion, and you're leaving all the motion on automatic, you see? And I got the mechanism on this a few weeks ago, and it's in my notes somewhere – but what happens is actually the person is not confronting the actuality of that thing at all. He's not confronting what is actually going on, he's confronting a solution to it, which means he's trying to not-is what it is, and the problem mass moves in on him. And it's quite interesting to watch.

You can ask a pc, "Do you have a present time problem?" You're fortunate, yes, he's got a present time problem. All right. You say, "Now, do you have any masses anywhere in the vicinity of your body?"

And he says, "Yes. As a matter of fact, there is one out there about four or five feet."

You say, "All right." Now, here's the exact mechanics of this: You say, "All right. Now, what is this present time problem of yours?"
And he says, "Uh ... well, um ... actually, uh ... Joe and Bill and Pete uh ... have all ganged up on me and they won't speak to me."

And you say, "Where is this black mass now?"

He says, "Well, it's eight or nine feet out there."

And you say, "Well, describe this problem you have to me."

And the individual says, "Well, it's uh ... it's Joe and Bill and Pete, actually, and uh ... the problem is, is I don't seem to be able to get along with them. I don't talk their language well."

And you say, "Well now, all right." You say, "Well, where is this mass now?"

And he says, "Well, it's fifteen or twenty feet out there." You're liable to get this type of response, you see? All right. You say, "Well, good. Good. Think of a solution to that problem." And he does. You say, "Where is this black mass now?"

And he says, "Well, it's out there eight or nine feet." "Good", you say.

"Well, think of another solution to this problem." And he does. And you say, "Where is this black mass?"

And he says, "Well, it's out there about four or five feet."

And you say, "Well, that's good."

You say, "Think of another solution to this problem." And so he does, and you say, "Where's the black mass?"

"Well, as a matter of fact, what black mass? Things have gone black."

All right. Now you say, "All right. Now, think of a problem of comparable magnitude to that problem." He does. You say, "Where's this black mass now?"

"Well, it's out there about a foot from my face."

"Good," you say. "Think of another problem of comparable magnitude to that problem. All right. Now, where is that mass now?"

"Well, that's – it's five or six feet out in front of me."

You say, "Good. Think of a problem of comparable magnitude to that problem. Where is it now?"

"Well", he says, "it's out there about twelve feet."

"Good." You say, "Well, think of a problem of comparable magnitude to that problem. Where is it now?"

And he says, "Well", he says, "it's way out there."

You say, "Well, think of a problem of comparable magnitude to that problem." And he does, you know, and so forth. "Where is it now?"

He says, "It disappeared."
You say, "Well, that's good. Good. Think of a solution to that problem. All right. Where's that black mass?"

"Well, it's over there on the horizon." "Good. Now think of a solution to that problem. All right. Where is it now?"

"Oh," he says, "it's out there about twenty feet."

"All right. Think of a solution to that problem. Where is it now?"

"Well, it's out here about four feet in front of my face."

And, "Good. Now think of a solution to that problem."

"Well, it's gone black."

And you can run that silly problem... For some reason or other, people who have problems who are capable of seeing at all visually will always tell you that there is a black mass connected in the vicinity, and solving the problem brings it in, and getting problems of comparable magnitude pushes it out. It's a matter of confrontingness, is the clue to this. If they're not confronting the problem – they're avoiding it, you see – it, of course, on any vacuum arrangement at all that's bringing it in, of course it just moves in closer.

And then if they are looking at it, it tends to move out, don't you see?

Now, you can do the same thing with havingness. You say, "Well, what problem have you got?"

"Well," he says, "Joe and Bill and Pete and they won't talk to me anymore."

You say, "Good. All right. Now look around the room and find something you can have. Thank you. Look around the room and find something you can have. Thank you. Where is that black mass now?"

And he says, "Well, it's out there about nine feet."

And you say, "Good. Look around the room and find something you can have. Look around the room and find something you can have. Look around the room ... Where is that black mass now?"

And he says, "It's out there about twenty feet."

And you say, "Well, look around the room and find something you can have. And look around the room and find something you can have. Where is it now?" He says, "Well, it's disappeared."

You say, "Good. Think of a solution to that problem."

Back it comes.

And you can just play hurdy-gurdy with this problem, you see? Out it goes, in it comes. And it's within your control to move this black mass in on the pc or move it off of him, just on whether or not you have him gaze at the stable datum in the middle of it: solutions ... You see, that stability alone is being held there by the motion, the unapparent motion in the mass. That's all confusion, you see? You're getting him not to look at the confusion
when you ask him to get a solution, you see? And you've got that mechanism. Then you've said the same thing as when you — "Think of a problem of comparable magnitude to that problem", you've said the same thing as confront it. It's a similar statement, in other words. "What is the problem?" you see? Well, you've said confront it. You get the idea?

"Invent a problem of comparable magnitude to that problem." What if you had him doing that? Well, you've taken the automaticity over of his bank creation of that black mass, except people don't for some reason or other do well on this. I do all right on it and a lot of pcs do, but enough people don't that we don't use it anymore. No creates. That is to say, we don't run create loosely. If it turns up in the Prehav Scale, run it. So it half-kills the pc – he'll run out of it.

Here's the crux of the matter, however: that you can move around, by the regulation of problems and solutions – or mass and no mass, which is havingness and no havingness – you can move around black masses in the bank.

Now, that is a simple one, and anybody can do that particular set of experiments and achieve those results, more or less. Of course, the pc has to be able to see a black mass. Sometimes they see only invisibilities and this and that, and sometimes they're so snarled into problems that nothing can move off.

But on the average pc, you could probably run this experiment.

Now let's take the next experiment that proceeds from here – I said, the more difficult one. The pc has a circuit. You say, "Do you ever have voices? Ever have any voices talking to you?" The psychiatrists have been worried about voices ever since there's been psychiatry. It's practically synonymous with insanity if somebody has voices talking to him. Well, gee whiz, they ought to look at my collection, man. They ought to really look at my collection, because – it isn't so much voices, but I usually compose piano music by listening to it. And I will set up a circuit that plays piano music and then forget to take it down, and a half an hour later all of a sudden here's some piano music, you know? I'm never startled about what it is. And then I say, "Well, that's it", and that's the end of that piano music, and will take it down. You get the idea?

I wonder, for instance, how wind will sound in a certain rigging rig, you know? Is this going to be a real noisy rig, you know? And I'll set up a ship and some wind and let her howl, you know? And that's how it sounds, too. And then say, "Well, I've found that out now," and I will set the whole thing aside and skip it, you see? I just cease to create it and it's no longer there.

I can set up moments of force – moments of force, tension, compression and that sort of thing – and check something out visually, rather than set it up mathematically. Just set it up and – well, give you a problem in a derrick, something like this. Now, when the derrick is stayed at certain points, and the stress is added at certain other points, which way is the derrick going to bend? And actually will build the derrick up and push the points to give it the stress, don't you see, and see which way it's going to bend and that sort of thing, and it works like that. And it sure saves an awful lot of woodcarving and string tying and all of that sort of thing. And these things are usually right. And this is just methods of setting up situations synthetically to find out how they will operate in the real universe. And that is not uncommon.
The weirdest one I ever heard about – it was Nikola Tesla, when he invented alternating current, set up an alternating-current motor. He had set it up so it would work, you see (and we've had the same motor ever since; nobody's even changed a bolt in it. And it's too bad he didn't set up a better cooling system in it). And he let it run for two years to find out ... his problem was will it last, you see? So he set this thing up in mental imagery, you know? He set it up in the bank and let it run for two years, and at the end of two years he decided that it was pretty well designed, so he built it. That's Nikola Tesla. That was the way that boy invented everything.

Now, I'm not above doing a mathematical problem on an abacus. You know, put an abacus up out there and shuffle the beads on the abacus back and forth, carrying over decimals of one character or another, and keep carrying these decimal setups, and finally add it over on the left and right side of the scale.

An abacus is a very ... interesting piece of machinery. It's almost an adding machine or a multiplying calculator. They give it to little kids in school and I see these little kids in school going wing-wing with the beads, you know, and they're counting one, two, three, four, five – learn how to count on it or something, or add. That isn't the way you use one. You use them on complicated septisignal systems or decimal systems or something like this, and you keep carrying them over from one side to the other. I suppose you could write a book four feet thick on the use of an abacus.

Anyway, set one of those things up. Well, of course, that's a very easy thing to set up. It's a very easy thing to set up a column of figures and find out whether or not the figures are right. It is actually much more fun to simply set up a computer that, after you've done the problem, will verify the result. This is tradition – people like Lecky and so forth. I think it was Lecky, the guy that wrote probably the basic text on navigation for guys that didn't like pedanticism. He said a navigator is no good unless – when he calculates the position he doesn't have a sixth sense to tell him that the answer is right or wrong. He said a navigator is no good who can't do this. Actually, very few people can do this, but the best navigators can all do it. They'll add up columns of figures, and so forth. Suzie's seen me do this: go down the line on – not navigation – go down on the line and get about halfway through a problem and say, "Well, that's wrong. That's wrong." You see? You got six columns of figures or something of the sort, but the answer is wrong, and just throw it out and do the problem all over again. Sure enough when I get down to that point, something was off, see?

All right. This simply is an establishment of rightness or wrongness, and it's also done by circuitry.

I'm talking now about useful circuitry. Let's go a little bit further over into useful circuitry. Common circuitry – this is not obsessive circuitry. This is just ordinary, run-of-the-mill voices in the head, you see? But this is the way they are really set up.

We get into a situation where we want to know what it's going to be like tomorrow – weather. We call the Weather Bureau, and they give us a lot of calculations all based on the rudimagoojits and the wingdings that are going whizzle-whizzle on top of the mutt-wutt. And this all calculates with the dice-o-therms and the cat-a-bars, you see?
Man, there have been more aviators plowed into fog banks and so forth by these dice-o-thers all twisted around the cat-a-bars. I wouldn't be seen dead with one of them myself.

They finally got a practical method of investigating hurricanes. They fly an aircraft patrol over the area all the time, and when they see one, they take its latitude and longitude on Loran bearings and report it. And then they plot its course and speed, and they say where it is going. And even then they predict its destinations wrong.

Weather is not something that is trustworthy. Actually, do you realize that if you plotted out for England "Tomorrow will be fair", that you would be 50 percent right? [laughter] Did you know that? And you know the Weather Bureau only hits 38 percent? It's interesting, isn't it? So if they just took it at random and told us every day tomorrow would be fair, at least they'd be giving us hope. [laughs]

But the science of weather prediction is – well, let's be kind – it's in its infancy, and they figure out what the dew point is on the rye up in North Manchester, and that gives us the Sussex coast, you know? I mean, it's real nice. I've studied with these boys, and they have a very serious approach to life. Let's say that. But what I used to twit them about was their tremendous overweening confidence in the things that were going hurgle-gurgle and their total avoidance of ever reading yesterday's prediction [laughter] – the only way they could keep their morale up, is the way they used to inform me.

Well, you can set up a circuit that will give you tomorrow's weather. Very easily. I wouldn't go to sea without one.

Now, some people do this and then blame it on the rheumatism, because they hook it into the rheumatic circuit, you see? And then they say, "Twinge – bad weather tomorrow," you see? But you needn't get that drastic. There's no reason to set up an alarm system just because it's going to be foggy, you know?

The facts of the matter is, is what you set it up is out here, and you say, "What is the weather going to be tomorrow?" So you take the increment of time known as tomorrow and you observe it. And that tells you what the weather is, of course, because you look around the scenery, having looked at the increment of time which is tomorrow, having looked around and found whether or not it is raining, windy, foggy, cold or hot, you are then pretty safe, providing you can with equanimity look at tomorrow. That's how simple a circuit is.

Compare it now to all these substitute calculations. If you could simply say, "All right. Let's take a look at the weather tomorrow ... " In view of the fact that the weather hasn't got very much consequence to it – almost all of you have lived through rainstorms without melting – this is an element of tomorrow which almost anybody could mock up, or almost anybody is willing to observe. There's no great danger in it.

Oh, quite something else: We are in a tremendous emergency with regard to court actions or something of this sort, and we want to know, man, because our whole life is hanging on the rim of the precipice, what is the judge going to say tomorrow, see? Or what is ... who is going to win – is Greasy Knees going to win the third at Pimlico, see? We've got the family jewels on it, and we haven't bothered to tell anybody that we put the family jewels on it, you see? Now, there's lots of pressure connected with this sort of thing. So we say, "Let's see."
Well now, look, with what confidence are we regarding tomorrow, you see? We're regarding it with no confront, because there's tremendous numbers of confronts mixed up in tomorrow that we don't want to have anything to do with. We won't look at the bad decision the judge is going to make or the fact that Greasy Knees is going to live up to his name, and... [laughter] See? We won't look at those consequences, so we get a one-sided view of the increment of time known as tomorrow. And then that becomes very untrustworthy because we are postulating at the same time that Greasy Knees is going to win the race and the judge is going to put down a favorable decision. So we wind up looking at our own postulates, not looking at tomorrow's weather. And then, of course, we get a wrong predict about 90 percent of the time. Get the idea? So you can predict to the degree that you can confront. And if a person's confrontingness is very bad off, never trust their prediction.

Wanda the psychic reader ... All of a sudden I was going down a boulevard in Phoenix, Arizona, driving along minding my own business. I must have had some kind of an overt that day (probably thinking bad thoughts about Purcell or something), and I got halfway down through the middle of the block, and Wanda the psychic reader suddenly diverges from a stream of traffic on a four-lane highway and drives casually, not even rapidly, this way across the street and runs into me. [laughter]

**Male voice: She "wanda'ed!"**

You said it! And her father got out and gave me her professional card. I don't think I would have had any confidence in that girl.

Now, her confront was a thing to be horrified about, you see? Nobody got hurt, nothing happened, but this is pretty weird. But her confront was terrible. We found out she was trying to turn a corner, [laughter] but that was half of one of these five-hundred or six-hundred-foot blocks behind her! She was turning a corner where there wasn't any!

Now, wouldn't you think her confront was rather poor? All right. Now we're going to base a lot of reliance on her prediction. Ah, but her prediction is directly related to her ability to confront.

Now, people who can't or won't confront anything don't even confront present time, much less tomorrow. But they will try to confront obsessively tomorrow or yesterday in the hopes that they won't have to confront today. And, of course, there isn't any tomorrow that they're confronting. That is a totally goof tomorrow, you see? And the yesterday probably isn't right either. Ask them what they had for breakfast, and they'll give you the awfulest ramifications, which is just a total not-is substitute of what they really ate, you know?

Now, here's the situation. If you're in fairly good shape on the subject of confrontingness, you could rise well above weather.

But let's supposing that hiking up into tomorrow was of no great consequence to us. You know, we didn't particularly want to go through the ritual, you see, of saying "Let's see. What is the date? All right. What is the hour? At what time will we be doing something tomorrow? All right. Now, let's confront the area in which we're going to do that thing. All right. Now let's see. Are they cirrus, cumulus, 'altocastalatus', nimbus," you know? And do a
complete catalog of the situation. Take out our wet-and-dry-bulb reading, you see, and so forth, and get the whole thing straight and write it down. Seems a little bit arduous.

So what you do is set up a secondary circuit. Not because you can't confront tomorrow but because you don't take time to confront tomorrow, you set up a secondary circuit and make it look at tomorrow. It's a prediction circuit. Now it looks at tomorrow, and you set it up to look at tomorrow instantly and give you only one result: yea or nay. You can set up these instantaneous circuits with the greatest of ease, so long as they're just yea-or-nay circuits or something like this. They're not going to give you any complex result, you know? You know, you could even set it up for tomorrow and if it's going to be nice weather, wave a green flag, you know, and if it's going to be bad weather, why, wave a red one. I don't care what, see? It's just boom, you know? And you eventually find yourself possessed of some kind of a circuit that tells you the weather tomorrow.

And one day you're scrambling around, doing something else and you suddenly look up and something is waving, you know, a brilliant red flag.

Now, where you go nuts on circuits is when you say, "Who put that there?" – no, "Who else put that there?" and "What does it mean?" And we can get quite a game out of this. It's a big game of mystery and so forth. Well, all you got to do is find out the purpose of the circuit and it'll ordinarily blow up, or you can set it up.

Now, pcs that haven't got control of their circuits or haven't taken over their circuits for many, many years, haven't inspected them – I say many years, I'm talking about many billions of years; they've just let this bric-a-brac accumulate and they've not done anything about it, and so forth – you start auditing them and something waves a red flag. They say, "What's this? What's this thing?", you know? Or a little train goes by on the track with a sign in each car. You know, a little sign in each car, and it says "It – Will – Be – Bad ... ," and the next three signs are blurred. [laughter]

And the pc says, "I'm going round the bend", you know?

Or you ask a pc, "How did you know the answer to that question?"

He said, "Well, this little train went by and it had a word in each car." That's the answers to the question.

You'll find some people go around on circuitry auditing, don't you see? Only their circuits are so old, so forgotten, so neglected, and were put up in such an anxiety of not-to-confront that of course they can't confront anything about them now. And any time they get in the vicinity of them, then the circuit tells them what to say and do. And you're running into this in auditing all the time, that's the anatomy of the circuit. It's just a no-confront of any kind whatsoever. Therefore, running Havingness and Confront along with processes actually improves the circuit.

How does it improve the circuit? It improves confront; naturally, that improves the status of circuits, because circuits go... only go bad when an individual refuses to confront an area and puts a circuit in it instead. He first did it to save time; later on he began to believe that he couldn't confront that area, there was something very unconfrontable there. Why is it
unconfrontable? Well, he has a circuit doing it, doesn't he? So therefore it couldn't be possibly...

It's like the fact that they put a television camera in the atomic blast furnace, you know? Because they can't put a nuclear physicist in there, they know that. They've tried it, you know, and they just can't make it. I don't know why not.

Anyway... Anyway, that's remote viewing, or remote knowing.

Now, it's this other thing I was telling you about. You hear a bird chirping outside, ask the pc to make a picture out there and then bring it in here and look at it to find out what kind of a bird it is. And my God, you get anything from a rhinoceros to a three-tailed whoosis, you know? Hasn't anything to do with this cuckoo that is out there; nothing to do with a cuckoo. And you very often ask an individual this. This is an interesting diagnostic question.

You talk about bric-a-brac that we know in Scientology; we know so darn much that it's... I tell you, the boys... if we were handling this as a scientific activity which cataloged everything we knew, you see, in relationship to it, and then took a paper down on everything there was there; when you realize that a preclear is capable of an infinity of differences, you just multiply infinity times the number of preclears there are and you got that many papers we'd have to file, and I don't like to file papers.

Somebody will curse me someday for not having written everything down that we ever knew and put it in a library file. But let me call to their attention that people have been doing this for a long time and they still didn't know anything. There might be something suspect about the method. All right. You tell this pc, "All right. Now, your primary aberration, and the exact terminal we want to run now: All right, that's what we're interested in. We're interested in your primary aberration, the exact terminal we want to run. All right. Now, over there where it is, or wherever it is, make a picture of it. Good. Thank you very much. Now look at the picture. Now tell me what it is."

And you know, they will tell you some of the most remarkable things. It may or may not be the right answer, but they certainly are remarkable. They're certainly remarkable. They'll get some pictures of childhood influences.

A psychoanalyst would go absolutely drooling mad. The absolute deliciousness of this particular modus operandi would have thrown him into a tizzy, you know, like tigers get when you put perfume on them. Man, that would be marvelous. He'd just have an unlimited data. He wouldn't have to depend on dreams anymore; he wouldn't have to depend on anything anymore, anyplace.

All he'd have to do is tell this person, "Now make a picture of what's wrong with you. Now look at the picture and tell me what it is."

And the fellow says, "Well, it's a picture of my grandfather sitting in front of the stove. And I seem to be in the stove."

(I did that myself one time – surprised myself half to death.)

"Now what's this? What's this?"

"Yeah, well, that's what it is."
"What's this?"

In the first place, you told him to make a picture of the bird that he heard and you heard outside the window, and then bring it in the house and take a look at it. And he didn't get a picture of a bird, he got a picture of a rhinoceros. Or it was a different kind of bird, is the 'usualest' thing. It's an alter-is.

Well, naturally it's an alter-is, because this action of taking the picture of the object and then looking at the picture is of course an alter-is of confront. You didn't tell him to take a look at the bird and say what it was – You told him to take a picture of the thing and say what it was. You got it? So you've removed it that much, so therefore he's just that far from being able to confront it. Okay? All right. Our next point, then, as we're looking at this is, is a very simple one, is that you're trying to get individuals to look directly at things, and their circuitry encourages them not to look at things because it's normally set up to spare them the trouble of confronting, or to avoid having to confront something, so they confront it on a via. And as you audit the pc, these things go live.

Two things make them go live. His havingness drops, so therefore he becomes a little anxious, so therefore he starts relying on circuitry to predict and that sort of thing. Or his confront drops. Or his confront improves, or his havingness improves, and either way these things can go live. In other words, his havingness or confront drop, they go live, on a deteriorated basis. His havingness and confront is improved, they go live because he's coming up through it, don't you see?

And all of them are observation on a via. So everything he's trying to do basically is characterized by alter-isness or observation on a via. Auditing on a via, everything on a via – it's just on a via. That is the motto of the thetan.

It's not direct, it's on a via. And your methods of getting him there are to walk him up rapidly so he has less and less vias, less and less vias, less and less vias, which means less and less circuits, less and less circuits, less and less barriers – you get the idea? – more and more confidence, more and more assurance. More and more ability to confront, actually, isn't it?

That's why you don't have confront on your main list, because itself is a result and an end product; it itself isn't a doingness, it's an ability.

All right. That explains to you, then, some of the oddities that occur, particularly in running in the CCHs. And these oddities are considerable. Because you're activating circuits and you're knocking out circuits, because the direct control and communication brings about a continuous shift of circuitry in terms of havingness. And then because you've got him in PT and he is confronting another body, another being, his own body and the physical universe, of course his havingness is also coming up on that particular basis and you shift through lots of circuitry. And it's a way of plowing straight through circuitry. And you get all kinds of things going live and shutting off, and so forth.

Now, if you were to turn around and talk to these circuits, and said "Well, how do you think the pc's doing now?"

"Oh, you think it's going to rain tomorrow. Oh, I see. I get it. Hm. I understand. Hm-hm." If you're plowing somebody rapidly through circuits, what are you trying to do? You're
trying to plow him through circuits and raise his havingness and his confront, basically, with the CCHs, which is communication and control, improve his havingness.

Well, what's your end result if you suddenly go into communication with these circuits? Because circuits are coming live and circuits are going out and circuits are coming in and circuits are going out, your pc's liable to say anything.

This is a beefy process, you see, your CCHs. And your pc at any given moment is liable to tell you anything. He's liable to predict anything. Anything is liable to happen. So the less attention you pay to what the pc is saying or what the pc thinks or what the pc feels while you're running the CCHs, the better off you're going to be. And that's why you never end a process just because the pc thinks it's flat. And as you're plowing somebody through circuitry of one kind or another, as he is moving up the line, he gets somatics, he gets comm lags, he dopes off, he does this, he does that. What's dope-off? It's just a no-confront of magnitude, you see? And it means that something is happening to the confrontingness of this pc. It's a good indicator.

Comm lag means something is happening to the confrontingness of the pc. Dope-off also means something is happening to the havingness of the pc. Dope-off also means that something is happening to the confronting of the pc. There we go. I mean, it means all those things.

Also there are many other manifestations. All of a sudden a circuit that was set up in cave days in order to remove him from the path of snakes – that when he saw a snake he was supposed to leap violently eight feet to the left – and all of a sudden he starts moving and this old circuit goes into action. And he'll may... try to explain it to you in fifty dozen different ways but he hasn't even confronted the circuit. The trouble is, he's moved eight feet to the left, or he's tried to, or he feels he should, and therefore he doesn't look that he should move eight feet to the left. What he thinks is there's something dangerous under his feet. You got the idea?

So he's getting all kinds of (quote) "survival mechanisms" (unquote), which are coming in and out, and prediction mechanisms are coming in and out, and series of forebodings and that sort of thing will all operate. Why? Because it's all on this basic circuitry.

Now, you, as you sit right there, use circuitry of one kind or another. As long as the circuitry isn't out from underneath your control and you haven't parked it on the basis that "I will never be able to confront this, I will never be able to cope with this sort of thing, so I'll set up this machine to cope with it because I myself am incompetent" – and when that is totally the basis of circuitry, from that time on, that circuit gets hidden. When you're running the CCHs, that circuit is liable to spring out. But what end of it springs out? It's liable to be "It can't be confronted", or "I will never be able to confront this", or "It is impossible to confront this." And the pc thinks it's the circuit that is impossible to confront, when, as a matter of fact, it's the fact that elephants spray water all over you in circuses, and that mustn't be confronted because your mother gets mad at you and spanks you.

This kid goes out and he says, "I'll get even with my mother. I'll set up this circuit and ... " or any kind of a computation, don't you see?
And these circuits are absolutely infinite in their purposes. They're as infinite as a pc can make postulates. And they run out and a pc is liable to tell you anything in any kind of auditing, and therefore it's only up to you to tell whether or not any of these CCHs or anything else is flat.

I don't think I've ever talked about this at any great length – circuits – but they appear, actually, in Book One. I've never said this much about circuits before. It isn't a matter that circuits are all bad. What gets bad about circuits is somebody sets up circuits because he himself is unable, he says. And when circuits have this type of postulate mixed up in them, why, they get very haywire indeed.

As you get on up the line, you all of a sudden find out that you will set up and knock out circuits just for the hell of it. You wonder what you should eat for lunch. Well, you do this right now, undoubtedly: you wonder what should you eat for lunch. Well, set it up, set it up in front of you and taste some of it. You know, that's quite a common action.

And don't, however, go through this oddity of having finished lunch at a Howard Johnson's or something of the sort, and their pickled pigs' knuckles that day happen to be sour and rancid or something, and don't then take your eating circuit and set it up so that it'll be impossible after that ever to set up pigs' knuckles. Because then something infinitely bad is evidently wrong with pigs' knuckles, so you even smell pigs' knuckles and you feel bad, you see? Where, as a matter of fact, the pigs' knuckles were a long way back. You put them in the bank so that you'd never confront them again, which seems to me to be an odd rationale. But a thetan is very capable of it and does it consistently.

My apologies for making this an overtime lecture, but I thought you might be interested.

[Audience: Thank you very much. Okay.]

Thank you.
This is the 28th of June 1961, AD 11, and you are in the throes of having now established that you know everything there is to know. I'm very glad of that and so on.

But I want you to think for a moment. I want you to think for a moment of Aloysius Q. Schnook of Lower Ambovia. And he's going to ask you, he's going to say, "Well now, you've been to Saint Hill, so you know all the answers. Now, why is it that you stand the pc on their head before starting Routine 5?" I want you to be thinking of what you will tell him. Or what you will do with him. Because you'll be embarrassed. You will now be in the horrible situation of people knowing that you know. The question is, do you? Do you?

All right. I'm looking at one person who's going back to a part of the world as the first pioneer to practice Scientology in that part of the world: Riverside. [laughter] And another one where Scientology is going to be tried. It's been attempted: Los Angeles. [laughter] And another one where they had every opportunity but forgot to read the subsequent bulletins: Johannesburg. [laughter]

There are quite a few like this. I wouldn't call you all by rote, but one of these questions came through from as near away as London, which is almost on our backs. Although, sitting down here in the beautiful calm of Sussex, you would never really suspect London existed if you didn't have to go back there. And it came burningly and screamingly through the wire. A bunch of questions about the CCHs that apparently had nothing much to do with the CCHs that I could figure out. So my answer to it was as follows: that I was writing a whole bulletin rather than answer the telex.

Now, the reason I can't tell you what this said is I myself couldn't figure out what it said. But fortunately we have someone amongst us who will be going back to London very soon, in the organization, will be able to answer all these questions sharply, glibly and with enormous permeation. Isn't that right?

Female voice: Yes. [laughter]

Now, you may be in the throes of absorbing knowledge, but let's not forget the fact that somebody is going to want to know about it from you. And there you are on cloud nine being very proud of having actually gotten through and endured the Saint Hill Briefing Course and so forth. Let's make sure you don't get yanked off that pinnacle and look at them, you know, as they ask this question, your jaw drops slightly and a sort of a blank look comes
in your eyes. And you say "The CCH 1. Now, let's see, what is that?" Or "Let's see, uh-uh – the needle, I think the needle of the E-Meter… Yeah, yeah, the E-Meter has a needle." [laughter] Let's not do that. Let's not do that. Let's be able to speak up quickly, loudly and authoritatively and, above everything else, correctly. The time to find out about that sort of thing is here and now. And if you don't ask questions about that sort of thing, of course, you won't find out. And you'll be in a bad state. Now, I didn't mean any slurs on Riverside or Johannesburg or something. It's because we're friends of these areas that we want to help them out.

The number of questions I've been asked lately on these lectures are very few, so maybe you have one now. Yes, Bob.

Male voice: Ron, if someone comes in who is raw meat from the street, and you want to decide what routine to run on him. How would you make that decision?

All right. That's a very good question. Raw meat walks in off the street. What do you decide – how do you decide what routine to run on him? All right. There he is. You have several criteria. Your first and foremost criteria is to give him a battery of tests. And if you're not able to give and correct tests, you will find yourself denied this particular rule. They can sometimes look very reasonable, and yet their profiles come out all wrong.

Now, in view of the fact that the profile is much more reliable – much, much more reliable – than any other single means of determining what's to be run, it'll be a very good thing if you knew how to administer one and grade one.

All right. They come in. Make them do a test. I'm assuming, now, a field auditor in operation. Well, make them do a test. Actually, this is a fairly professional thing to do. All right. They do this test. Now, you take the test and you evaluate it in this fashion: If it is riding all the way along the bottom or if several points of it are at the bottom of the graph, it is inevitably CCHs, so therefore it's Routine 1. All right? That's inevitably Routine 1 – inevitably. Don't let anybody fool you. That is the only thing that'll get this case on the road with great certainty.

Now, there are many things that might get the case on the road, and we know lots of things that might do it, and we've wasted more time being hopeful than any other thing. Because we bring hope to people, we are apt to dramatize it ourselves a little bit, you see. And we're very hopeful that this or that will occur, and the thing we know will make something occur is a properly run Routine 1.

Now, what was missing and why the old CCHs didn't move this one, by the way, this low-graph case – the reason for that – was that nobody was pulling the overts off. And they could run in the overts faster than you could pull them off. So CCHs work on that very positively if properly run. Run 1, 2, 3, 4 – just the way you're running them now. All right.

If the case is riding very high on the graph, extremely high on the graph, and when you get them on an E-Meter particularly, the needle appears to be a little sticky, that's Routine 1. Now, as you look at a graph with the graph facing you, you'll notice that over on the left-hand side of the graph you have your A, B, C, D columns. Those are the important columns. That part of the graph which goes from the left to the middle. That is to say reading horizon-
tally A, B, C, D – whatever the letter that occurs in the middle of the graph. That whole section is the vital part of the graph to pay attention to.

The rest of the graph mainly hinges on current havingness. Even though it might be pretty well pinned down, and it might be kind of unchangeably so, you, by simply neglecting to find the pc's Havingness Process, can actually depress that side of the graph, without actually messing up the case at all. So you might say that the left half of one of these profiles or graphs is the important diagnostic area. And if columns A, B or C are either very low or very high, you can then expect the pc to have a great deal of difficulty following an auditing command. So therefore, Routine 2 is really not possible.

They alter-is the commands obsessively. There's another way to get around that, and that is to take the Prehav Scale. You can get around all these things, but you have to be clever and tricky and so forth.

You can take the Prehav Scale and assess the Change Scale, the Secondary Change Scale, and keep running the pc out in that area, and you'll take off this obsessive alter-is. It could be done. There are lots of things that could be done, but your safest bet, your easiest bet and your fastest bet is Routine 1.

Now, the person who is at the very, very top of the left-hand side of the graph can be expected to come on at the very bottom of the graph. That person is actually worse off, more overwhelmed than the person who is low on the graph. So don't be fooled. Don't be fooled. That is not necessarily derogatory. That means simply this – there is no connotation to this – it's simply this:

When you first find this person's terminal on SOP Goals, you see, assuming you ran SOP Goals on a person, you would find that the terminal assessed way, way, way up at the top – 63, 62; level 63, 62, 64, see, way up. That means the terminal that has overwhelmed them is in a terrific state of high serenity. And that terminal deteriorates as the pc is audited and will deteriorate. And you very often don't register that terminal anymore on your next profile, but get the pc, who is now coming on at the bottom. And that's the pc's graph that comes on at the bottom.

Now, because you're not giving them one every few minutes or every few hours or even every few days, you actually fail to note the gradient scale of progress of the pc as measured by the graph. And that, of course, would be off the top and on the bottom and up. But remember, something else is going to happen here at the same time. The left side of the graph is going to deteriorate as this valence is discharged and dismissed. It actually is going to deteriorate. And it'll look, offhand, as though something bad is going on in auditing.

Now, the way we determine if something bad is going on in auditing is to look at the right side of the graph. If the right side of the graph depresses that is, from the middle letter on up to the end letter of the graph – if the right side of the graph depresses, you know that ARC breaks are present.

The rudiments are out, you see, because the person's havingness is deteriorating. So if that right side of the graph drops, this is an index of deterioration of havingness, and it only has one source in auditing, and that is ARC breaks with the auditor. Remember that now. It
only has one source in auditing: ARC breaks with the auditor. That's terribly important. You look over on that side, you see that in one week the pc had it at about twenty plus on the right side of the graph, and the next week we audit the pc, and then we get another graph, and it is now fifteen minus on the right side of the graph. I'm talking about these column figures, now, up around H, I, that sort of thing, see. That area. Ahhh, if we were to take the pc at that moment and put him on the E-Meter and say, "Have you got an ARC break with your auditor?" Clang! Clang! Little flags wave, and the needle plays "Yankee Doodle." Yes, he's got an ARC break with the auditor.

If you wanted a pc to wipe out all liabilities to havingness doing auditing, you would clear up ARC breaks with a rough-off pc about every ten minutes. That's how fast they occur. Usually the auditing itself wipes it out, and you don't notice it. But you should sometime, just for the fun of it, clean up an ARC break with a pc. Just insist he has one and find it every time. You know? "What is it now? What is your ARC break?" It's mirrored in the deterioration of havingness, and so you get a drop of that side of the graph.

All right. Now, supposing the right side of the graph remains constant, and you get no change on the right side of the graph at all. It is neither up and it's not down. Ho-hooooo. That pc was being audited with a present time problem. There was a present time problem. Another rudiment was out all the time he was being audited. Only that will also reflect on the left side of the graph over in the lower letters A, B, C, D and so forth. Present time problem will blow straight across the graph. In other words, you're getting no progress at all.

Now, that the left side of the graph deteriorates is meaningless, see. That's meaningless. But that the right side of the graph deteriorates, that's very meaningful. That the left side of the graph remains unchanged is very meaningful – present time problem. That the right side of the graph remains unchanged – present time problem. Got it? That the left side of the graph deteriorates under auditing simply means the decline of a valence. It does not mean a criticism of the auditor. I'm talking about left and right sides now as you have the graph in your lap looking at it.

Now, these are the determinations as far as a graph is concerned. And that is the best way to measure up what is going on with this case.

But let's suppose this case was running at about minus seventy on the left side of the graph. Now let's get to Routine 2. It was running about minus seventy or a bit above and was middle grounded or high or low on the right-hand side – we don't care what. Now, let's supposing it was somewhere between minus seventy and the center line (the zero line of the graph) through the left-hand side of the graph. You can run Routine 2 on this pc usually with the greatest of ease. This is what you've known as a mean graph. It's not an average graph. It's just a graph that a person isn't in too bad shape. I mean, they're just sort of loused up, but they kind of know it. You got the idea. You can run Routine 2 on this pc.

By the way, you can also run Routine 2 on a low graph, a very, very low graph. Routine 2 does not work, hardly at all on a theetie-weetie high graph. It doesn't work at all on it. You can just beat your brains out. SOP Goals works on it, but with what complications do you have to execute SOP Goals when you're running it below the case level? It'll run all the way to the bottom. Any case could be run on SOP Goals, but now we get tricky. Now we get
complicated assessments. Now we've got complicated situations. Now we've got large numbers of goals. Not necessarily that large numbers of goals means the case is rough, but we – it's one of the things that happens as a liability when we try to run SOP Goals on it. Now Routine 2, in other words, would be the most effective process to run on somebody who was minus seventy up. No points lower than minus seventy and maybe some points up to plus twenty on the left side of the graph.

In Routine 2 this case would take off like a startled gazelle. As you see diagnostically, if you want to use that word, you are paying no attention at all over here to the right side of the graph.

All right. Now, supposing the person was riding up at the center line or above. That is, on the left side of the graph. The fastest thing to do would be SOP Goals. Now, we're not talking about what we can do to this raw meat off the street. We can do any of these things. We can do any of these things. We're not talking about what we can do; we're talking exclusively about what is the most effective thing to do. This is the fastest thing to do. Got it? And that actually answers in full the question which you just gave me: What are you going to do, how do you measure up, and what to run on this person?

Diagnosis on an E-Meter is – has the liability of the cans being improperly squeezed so your sensitivity is improperly set. Furthermore it requires a lot of judgment and adjudication. This judgment and adjudication is all done by the graph. Why worry about it?

There are other symptoms, however, which are quite interesting, and one is that you can have somebody at a misread on the tone arm dial or at exactly Clear read on the tone arm dial, but with a sticky or misbehaving needle – a very jerky or hectic needle or a very still needle or something like this. You're looking at somebody there who doesn't register hardly at all, and you're actually not going to get anyplace, really, running a thought process on this case. You can do it. It's going to take you a long time. It'll be successful at the bitter end, running Routine 2 or Routine 3, but my advice is don't do it.

Now, as far as the routines are concerned, you can run Routine 1 – which is remarkable about the routines – you can run them 1, 2 or 3 on any case that is still breathing. If you can get into communication, verbal communication, of any kind whatsoever, you can run Routine 2 or 3. Of course, if the case is unconscious completely, you've only got the CCHs. But that is – that's going a little bit below our level of adjudication. So you could run 1, 2 or 3 on practically any pc that walked in the door. If he could walk in the door, he could be made to have a gain on Routine 1, Routine 2 and Routine 3. And the sole criteria that you're reaching for is which one, the fastest. That's what you're reaching for.

Now, we're out then, of a total lose proposition providing these things are run right. And that is the other thing that enters into the thing, and that is to say if you have a couple of auditors and one of them just can't run CCHs – you know, this fellow just can't put an intention into things or something like this. They have a hard time with the CCHs, you see. Don't get much of a gain. There's this vagary amongst auditors. They practically don't do them when they don't run. But there is this: that some auditors do it better than others.

Supposing you had two pcs and two auditors, and one of these auditors ran very fine CCHs, and the other one could use an E-Meter. Then you'd better set up both pcs to be CCH'd
by the same auditor and swap the periods of the day or swap the consecutive periods around in such a way that both auditors would keep working, but one would be doing Security Checks and the other one would be doing the CCHs, don't you see? Something on that order.

Or supposing you were running a bunch of Routine 2 and one of your people there wasn't too hot at running Routine 2. Well, let's run Routine 2 – the same auditor runs both pcs on Routine 2, see, and the other auditor runs them both on Security Checks. You can split it up like this. In other words, you could take an HGC, you could take somebody who just comes in off the Academy, and you could set him up, doing the bit and piece work. Got the idea?

And this brings up: what is it safe to do? You said, "How do you determine what to do?" Well, if you wanted to carry the question out to its *reductio ad absurdum*, it had to include "What can you do?", you know. And that is part of being effective. So supposing we had this other kind of a condition whereby some of our auditors weren't very well trained. We were running an HGC, you see, and some of them weren't very well trained, and we were conscience stricken about, you know, putting them on the public, and that sort of thing. Well, there are several things that it's very safe to do. Oddly enough, one of them is SOP Goals Assessment, providing it's done even moderately correctly. Not running it. No, no. That isn't safe. Not letting him say that is the final goal. No. That isn't safe. But just digging up the goal and then digging up the terminal under some sort of supervision – yeah, that's a safe action. And very therapeutic and very good.

All right. That's safe. Security Checking is safe. You can let anybody Security Check. You can show them what the meter looks like and so forth. Even though they're kind of goofy and they – they don't quite – and they let the rudiments get out, and a lot of things – weird things happen, nothing is going to happen but benefit on Security Checking. Got the idea? So there are two actions that can be undertaken independent of all of the other actions. So you could set up people to have these things done, you see, by auditors that weren't particularly well skilled, and have them sort of get familiar with it all and that sort of thing, doing these two actions. So therefore, "What could you do?" has to do with, "Who are you going to do it with?" And there are certain elements in Routine 1, 2 and 3 which are safe to do by almost anybody. That's pretty good. One of them is Security Checking, and the other is actually assessing for goals and terminal. Not running them; that's different.

All right. Now, there are several things that are unsafe to do. And that is let somebody who just knows from nowhere attempt the CCHs – somebody that's liable, actually, to blow up in the session or leave the pc high and dry or skit out from under or something like this. That's dangerous. That's dangerous. So you'd pick auditors that you – were reliable to do that with.

Routine 2 requires a fairly accurate assessment, fairly accurate. But it's only the accuracy of a what? Of a significance. And therefore a person could be poorly run on Routine 2 without too much happening providing the processes got flat. That is dangerous, to leave the processes of Routine 2 – general runs, Prehav Scale – unflat. If you leave one unflat and go on to the next one and then leave that unflat and go on to the next one and leave that unflat

---

3 Editor's note: to skit, probably colloquial for to skitter
and go on to the next one – by that time, if your pc doesn't feel like he or she is spinning, why, I'll eat the E-Meter.

The pc will feel spinnny. Now, this condition actually can turn about in SOP Goals the same way. You leave a level unflat and then you go to the next level, and if that level were very unflat and the person is very queasy about it, you see, at the time it's left, and then the next level, the person starts in on this level, they will feel like they're spinning. They just feel spinnny, that's all. They've got two levels going at once here, and they're counterpoised, and they're all messed up with each other, and so forth.

So, general Prehav runs and SOP Goals terminals runs are limited by this factor: that a pc can be loused up. Now, SOP Goals has a further limitation: You can choose the wrong terminal. You can choose the wrong goal and then choose the wrong terminal. You can make the pc run the goal or terminal which ought to be run on the auditor or something stupid like this can occur. Really, I've seen it occur.

So choosing or deciding whether or not that is the right goal, and deciding whether or not that is the right terminal for the goal, is a job for an expert. That is really an expert job. You get that thing wrong and all hell is going to break loose. There's a test on whether or not you've got the right terminal. On the second assessment, when you go over the Prehav Scale, have you got about a dozen levels live. If there are a dozen levels falling on that scale, the probability is you haven't got the right terminal. Because the more you run the wrong terminal, the more you are avoiding the case and the more the actual terminal starts kicking levels live. And every level that you run or touch, kicks over into the main level which is then without relief and the correct terminal is getting stronger and stronger and tougher and tougher and meaner and meaner, and the pc can't tell which way he's going.

So that it is very, very dangerous – I couldn't impress this upon you enough – to choose the wrong goal and the wrong terminal and then run it.

Choose it – nobody's going to be harmed. But after chosen, run it – oh, wow!

If it's the wrong one, the pc has had it. There is only one right one. So of course, where does this put the actual running of SOP Goals when you say raw meat off the street?

All right, assess him. You could assess him. Almost anybody could assess him showing him the ropes. But running him? Ahhh, we're not so sure. Now, the other thing is, how well can an auditor keep in a rudiment?

How well can they keep in rudiments? And you can get around this by getting the rudiments cross-checked by supervision and one auditing team checking the rudiments of another auditing team and so – such mechanisms as this – and you also keep the case running.

Now, all of these things apply to "What do you run on a pc?" Well, what do you run on raw meat? It applies to whether it's raw meat. It applies to anything else. There is this addition. We have run into this trouble. A fellow comes in, and he says, "Well, I've heard of this Scientology and I would like to get some auditing." And you start running CCHs on him. You don't ask him anything. Ah, he's never heard of this. He doesn't know what you're doing. He doesn't know why. He hasn't got a clue. He's wrapped up and going nowhere. You got the idea?
All right. He will go nowhere faster and faster and faster, and the present time problem in this case is "What the hell are you doing?" So he gets no change.

So therefore, it requires this factor to give some attention to. You have to sort of run a tiny little bit of SOP Goals Assessment on this person when he walks in off the street. And this SOP Goals Assessment simply consists of this: "What difficulties are you trying to overcome?" It's the answer to the question, "What would have to happen for you to know that Scientology works?" And he'll say, "Well, it's my memory. It's my memory. That's what it is. I realize my memory is going. And it worries me", and so forth.

Well, frankly – this is an exact case – we had a pc in Johannesburg; walked in and he was immediately run on Technique Zed, Q and Alpha, you see, and he was going nowhere in a hurry, and Mary Sue called this to my attention, and I said, "Well, for heaven's sakes," I said, "what's his goal?"

"Well, he just wants to improve his memory. That's what he wants to improve. That's all he wants to do: improve his memory."

I said, "Well, all right. Run 'Something you wouldn't mind forgetting' on him for twenty-five hours."

They did. His memory improved. He was tremendously satisfied. He was very happy about the whole thing. We used a slow process, don't you see. Now, he'd attained that goal, so now he had a reality on what was going forward, and the next time we had anything to do with him, we could've put him at once on Routine 2 or even the CCHs. You got the idea?

But to take a case who knows nothing about it whatsoever and just run Routine 1, Routine 2 or Routine 3 with no further introduction, explanation and without any reality on what is going on is very, very hard on the case.

Now, the one process that gets around this is an assessment for SOP Goals, which is very therapeutic. That would be a very good thing to do with this case, see. You don't have to think up the extraordinary solution like I had to, you see. Just assess him for goals. Just like you're doing, you see. You just go on. Oh, you'd be surprised. I mean, the littlest child or the oldest man or the dumbest medico. One of whom was just trying to kid me about Scientology. He said his leg got well because I had sent him a cable after he had gotten it broken, you see. And I kept telling him to be careful with it. I got even with him. Kept telling him to be careful with his leg there, and so forth. He was outside, parading around and giving me the all, and so on. And sure enough, when he came back, he was limping. I did get him, didn't I? I told him I wasn't really worried about his leg. I was worried about the psychic trauma driving him around the bend. Mary Sue came up at that moment, or somebody did. And he said yes, he'd been worried about it for some time – going around the bend. And he was off the subject, and so forth.

But goals, goals – they'll all respond to goals. Now, you could do something like this with him. You could get somebody running SOP Goals on him, you know. And then at the same time, run him on a CCH, you see. Mix the routines. He'd wonder what you were doing. But it was all right. He was perfectly satisfied with auditing, so he'd go along with this. And all of a sudden he'd go whir clank, and suddenly realize these CCHs were doing something.
And he wouldn't quite decide what, and then you'd say, "Well, if you're feeling bad because of that it's because you haven't had your Processing Check." And you'd give him a Security Check. And he'd realize that was confessing, which he realizes he should have done back there in 1492 instead of burning the church down, and he'll go along with this.

In other words, you could use SOP Goals Assessment, not run, but assessment as a break in on this particular case who was ignorant and from nowhere, okay? I have spoken on the answer to that question.

Male voice: Thank you.
You're welcome. All right. Yes?

Male voice: On trouble-shooting cases, what factors do you look at before other factors?

Oh, all right. Trouble-shooting cases. What factors do you look at before other factors? Of course, Ken would be very interested in this because he probably has – let's see, how many people are there in Los Angeles now? Anyway, there's that many impossible or stalled cases out in that particular area, and you don't ever audit in the Los Angeles area; you trouble shoot. [laughs]

Basically, somebody comes in and he's kind of going "Bleahp-glup, bleah bup, bleah-blup."

And you say, "What's the matter? What's the matter?"

"Well, I've been bloop audited lately, and bloo boop", and so forth.
And "You've been audited lately. You've been audited? Well, what – who audited you lately?"

And they say, "Oh, ah, somebody or other."
And you say, "Oh, yeah, audited. Well, now, what did they run?"

"Well, we were doing 'music processing'." [laughter]
And you say, "What is 'music processing'?"
And they say, "Well, 'music processing' is, you take several narcotic pills, you see, and you put Bach running at high volume in the bedroom, you see. And when you wake up, you're 'Bach-y.'" And something like this. You'd be amazed. So that question is well asked.

It isn't that I have a low opinion of the auditors in California. It's just that I feel for them. And they Q-and-A with the public that demands unusual answers. And it's very difficult to operate either in an HGC, where everybody is demanding unusual answers, or in an HCO office, where everybody wants something new and unusual, or in Los Angeles, where nothing else is salable. And you're liable to Q-and-A with it. I catch myself doing it once in a blue moon. Catch Mary Sue doing it once, twice, but less often than others.

Somebody sails in and they say, "You know that process you gave me to run on the pc? Well, that didn't work." So this is your first point of trouble-shooting. This is the first and most interesting point of trouble-shooting. I see you already know it. And that is "The process
that you gave me to run on that pc didn't work." And then you say, not "Gee, it didn't? Well, I'll have to think of something else." That's the wrong answer. The right answer is "What process did I give you?" And you usually find they don't know. That is, unfortunately, the usual response.

And then the first thing you do in trouble-shooting – "Well, what I told you to run the first time, you go and run." That's your first point in troubleshooting. Find out if what was supposed to have been run was run. That's number one. And it stands up something like San Gorgonio above the desert compared to all other points in trouble-shooting. See, there's this tremendous point: What was done?

Now, the way you establish what was done is this way: You put the pc on an E-Meter and you say, "What was run on you?" Maybe he doesn't remember. He will if you joggle him after a few times. And you're liable to find something fantastic has been going on. That's the first and foremost source of difficulty in Scientology. It is way up there. It's interesting that it is much greater than you would ordinarily suspect, until you start looking for it. And when you start looking for it, your eyes will pop, man.

What is done in the name of Technique Zed, believe me, is fantastic. So trouble-shooting? Find out what was really run. What was really run. Get the pc on an E-Meter and discover it. And don't let him sit there and malign the auditor either. Just find the facts, man. That's all you're interested in – like Sergeant Friday of the Los Angeles Police Force. I understand he was relegated to the suburbs recently. Yeah, he actually solved a crime. [laughter] They couldn't have that.

That's the first thing you find out. That's a piece of police work. What was done? What was really done? Because it's based on this fact: the auditing flubs today are of magnitude before they begin to upset a case. They are of magnitude. It's something on the order of the auditor never reported for the sessions. You get the idea?

It's something of this weird nature. And they're so offbeat and varied, but of such magnitude, that you very often won't look for them. You right away have made the assumption that the auditor sat in the auditing chair, that the pc sat in the pc's chair, and that something was run on the pc. You've made this assumption. You've made the assumption, you see, that Model Session was utilized or that the CCHs were properly run or that they were run at all, or that something was going on here. You see, you've assumed all these things, and you actually don't have the right to assume any one of those things when you're trouble-shooting on a case that is bogged from some kind of a D of P or D of T level. You have no right to assume those things.

So that your line of questioning sounds rather idiotic to somebody who isn't in the know. It's "Well, did you have a session?" Get the idea? "Was the auditor there?" "Were you there?" And they sometimes think you are being very sarcastic or sometimes very good for a laugh. But it prepares them to answer some more searching questions.

So that your trouble-shooting is not relegated only to finding out what bug has this pc got that these processes aren't affecting. That is the standard bug we had assumed existed.
The actual bug that exists is what has been administered to this pc that I don't know about? What has happened with this pc I haven't a clue on? See, that's your first and foremost action.

Now, you all have to do trouble-shooting. You think I'm talking from an executive standpoint. You all have to do trouble-shooting. What do I mean by that? You get pcs who have been audited before. And if you don't troubleshoot this pc, you're going to be in trouble. You should have been troubleshooting, so – and you didn't, so now all of a sudden you're in trouble. And you're going to assume that everything that has been run on this pc is flat.

I'll give you an example. There's a very noteworthy character in Scientology down in Australia, who had this interesting thing wrong with her case. And she was in a very important position, and her case was making no gains whatsoever, and I wasn't troubleshooting it. I was actually running an extraordinary solution. I was running a new process on her of one character or another, and in running it I all of a sudden elicited this interesting, interesting, interesting response: "Well, when I was down in New Zealand a few years ago, they ran CCH 3 on me, and I got tremendous gains, and I've never had any gain since."

You know, it's almost a case of my sighing deeply and saying, "Why the hell didn't you tell anybody this?" "Auditors have been beating their brains out over your case", I could have said to her. "And you had a process on which you were making gains and you've never made any gain since? You've just complained about it. And you never told a soul." This was obvious. You see that.

The trouble-shooting, then, consisted of finding out what was run a long time ago. What is the history of the auditing? And this is all part of it. Now, you get that as an executive or a technical expert in an organization, you see. You get that consistently. But working in the field, you almost never ask this question: "What's been run on you? What is the history of your auditing?" And then you take up an hour or two – take up more than that with this pc – and you're going to find some interesting things.

Well, we got a pc right here in class, right this minute (namely you). And what happened? The pc had a profile of some type or another, and then was audited, and then had another profile which was entirely different. But the second profile hadn't changed.

Got the idea? Here was a period of auditing on which a profile deteriorated. We just assumed – whether right or wrong; didn't even ask the pc. We just looked at the profiles and found out what had been run, knew something about the auditor, and already, and simply ran the auditor off the case. It's interesting that it took so many hours to run the auditor off the case. Fascinating that it took this many hours to run the auditor off the case. That should be a blink for you at once. We didn't even ask what was being run by this auditor. We simply knew here was a profile that sat one way, the pc got audited, here is this new profile. Wow! See? And the profile has deteriorated in the wrong places. All right. We'll audit the auditor off the case. All of a sudden, the pc's profile – I don't know whether this pc took a profile immediately after that or not. Did you?

Male voice: Yes.

All right. What did it look like?
Female voice: We haven't graded it yet.

You haven't graded it yet. Well, when we see that, I'm sure you will see that the profile snapped back to what it was before the auditor audited the case. You got the idea?

The person must have been audited with ARC breaks in full bloom, or audited with PTPs in full bloom, you see. Audited with the rudiments way out with very powerful processes, and something went wrong here. We don't ask what went wrong. We just see that this was the case, so therefore, we audit off one auditor.

The first time this was ever done was in an Academy. A student suddenly came down with measles; only the doctor couldn't find anything wrong with the student. And I got very clever about this time and asked the burning question, "What had this student been doing just before these measles broke out?" And I found out that the (quote) "auditor" in that particular case had blown the session.

Blown the session! The auditor had blown the session. Get somebody halfway through a measles engram and then blow the session. Pretty good, huh? So I just got somebody to run O/W on that auditor, or the equivalent at that time. And it didn't take a half an hour, and there were – the measles were gone. Got the idea? We took the auditing off the case. So you can always do that. You can always remove the auditing.

Oddly enough, if the case made any gains during that auditing, the gains are preserved. If the case had any loses during the auditing, the loses are vanished. That's a fantastic thing.

So in trouble-shooting, you can always do that. And that's one of the primary things to look for. And every one of you, I repeat, should be troubleshooting. You should be looking over the auditing this case has had.

Now, failure to look over this auditing will sometimes leave undisclosed, oh, five years in psychoanalysis – only, I can spot those from a way off. All I have to do is get the responses of the pc to the auditor.

Well, the pc says, "Well, I think um – I think, actually, my mother had a lot to do with this. It's very fixated on Mother. I've been very fixated for some time. Probably had a complex; caught a complex. And, uh, I felt inferior, you see. And I keep saving these fetishes. And uh…"

Along about that time, if I hear anything like this, I get very brilliant and assume the person has been psychoanalyzed. And I say to the person, "Have you ever been psychoanalyzed?"

"Oh, yes."

"Well, have you ever told anybody around here?"

"Oh, well, no. Why should I do that?"

Nothing except the person has been ground down to a nub, and actually now is in the frame of mind of believing that therapy can't do much for them, because they've had one whopping big failed help. Well, there sits the case.
Now, you could probably overcome this with the CCHs. You can run out psychiatric treatment with the CCHs. So obviously, you could run out psychoanalysis and things like this with the CCHs. You see, that's easy. But nevertheless, it's something you sure ought to know. You got the idea?

So find out first and foremost what has been going on. What is the auditing history of this case, or the treatment history of this case. And that's the big one. After that, they all dwindle off onto more interesting, lesser statted things. All of which, by the way, are very important. But they have no great stature compared to that one.

All right. Let's take up the next lower echelon of things, okay?

The next lower echelon is simply this: rudiments. Rudiments? Rudiments. When in doubt, check the rudiments. When trouble-shooting a case, check the rudiments. Look for the rudiments.

After you've found out what's been run, what's being run, what's the general history of the case; rudiments, rudiments, rudiments. All the rudiments. Not just the beginning rudiments, but the end rudiments. Even though they're both the same. Check rudiments.

Now, because you get a mutual withhold and a mutual ARC break with the world and so forth, in long duration auditing teams, the phenomenon occurs that when an outsider checks the rudiments on an auditing team, invariably finds them out. And this makes the auditor look very silly. But actually they weren't falling for him.

He could have made them fall for him, we know now, you know – by asking the question, "What are we withholding?" you see. Something on the order of "How do we feel about the auditing room?" You know, that kind of a rudiment. "Well, we feel about the auditing room sort of badly because you don't like to audit me in here." Got the idea?

So therefore, the room is really out. "The room's all right with me. Well, I know it's not all right with you."

The wrong thing to do is to turn around to the auditor – we know now, you know – and look at him sneeringly, you know, and say, "You knucklehead. Why didn't you find this?" You know? It wasn't there. That's why he didn't find it. Because something is wrong with the auditing room for him. He's complained a couple of times about it being drafty or something of the sort, you see. And that's enough to put the auditing room out with the pc, you know.

Pcs sometimes wind up protecting their auditors and all kinds of wild things occur. Actually auditor's doing very badly. But just make something that is even vaguely slurring about the auditor. You run into this both ways. You sometimes get obsessive agreement, you know, on the part of the pc. But as commonly, you get the pc right in there fighting with brass knuckles to protect the auditor, you know. "He's doing all right. He's doing his best." Or "She's just doing fine." Or "I really never had a better auditor. I never made any gains until this auditor came along."
And all you inferred was that the auditor would do better after they were trained a bit or something like this, you see, and blaaaaaaah. You've stuck your foot in it. So you have to handle this kind of diplomatically.

But anyway, check rudiments. Check them from the beginning to the end and back again and around and round and round, and keep them checked.

Because do you realize that the rudiments out in one session is one wasted session? If the rudiments are out for one session, that session is wasted. The optimum checking of the rudiments, then, is every session.

Now, next to the fact that "Does anything get run properly?" the next question of, "Are the rudiments in?" is your main grind. Is – are they in? And you'll very often find the rudiments out.

Now, no auditing can occur with the rudiments out. Furthermore, you don't have to keep the rudiments in so strongly that you've got the sensitivity over at 16 checking for the pc's withholds. That isn't enough to throw a session out.

You're now running a process known as the Joburg. Got the idea? You're running TR 10, because you turn the sensitivity knob over to 16 and say, "How do you feel about auditing in the room?" You get flinch! The thing goes bang! "Ohh", you say, "the TR 10 is out. Well, ooooh, well, all right. Well, we'll just have to run that." And we run it, you see.

And then we say, "Well, do you have an ARC break?" Plang! "Well, who do you have an ARC break with?"

"Well, I – I didn't know I had an ARC… Let's see, I think with my dog, yeah. My dog, yes. I had an ARC break with my dog. He woke me up about five o'clock this morning and wanted to go out. And – yeah, yeah, yeah, yeah. I had an ARC break with my dog."

"Well, all right. Good. Now, do you have an ARC break?" Clank! "Well, who do you have an ARC break with?"

"Well, I have an ARC break – I don't know. Did it say something?" They try to look at the meter.

"Yeah. It said something all right. Now, who'd you have this other ARC break with?"

"Oh, let's see. Oh, I know who that'd be. Yeah, yeah. Over at lunch I almost got shortchanged in the restaurant. Yeah. Yeah! As a matter of fact, I did. Oh, well, what do you know, man? Yeah."

"All right", you say. "Good. Well, you got any other ARC breaks?" Clank!

"Who is that with?"

Wrong way to ask the question, see. "Who is that with?"

"Oh, I don't know. Did it fall?" You got the idea?

Wrong way to run rudiments. Because things that are falling with sensitivity 16 on the average pc – well, of course, you can always get a fall at sensitivity 16 on any one of these questions. You're running the whole case by rudiments.
How much does a rudiment have to be out in order to interrupt the case?

It is enough to show on the needle at a third-of-a-dial drop. And that's something you better put down because you'll have to tell everybody under the sun, moon and stars this when you start saying "Keep the rudiments in."

And immediately they'll get very conscientious, and they'll turn that sensitivity knob over to 16. And after that you get nothing audited but rudiments.

Look, if rudiments could have made somebody well, why, we would run nothing else but. Because they've existed since 1956, but there have been a lot of failed cases since 56. Test enough?

All right. How much does the rudiment have to be in? It's enough to show a change of characteristic. A reaction on the needle with the sensitivity knob set for a third-of-a-dial drop on the can squeeze. And that is the exact technical response. You can't see a rudiment at a third-of-a-dial drop, ignore it. You got it?

Of course, you can always, then, play a good trick as an executive. As a D of P or something, and then turn your sensitivity up to 16. After you – the auditor has been running at a third-of-a-dial drop, why, you turn your sensitivity up to 16, when you check his pc, you know. And you'll find all the rudiments out, of course.

Now, how thoroughly does it have to be in? Well, I've answered that question. It has to be in to that degree. Because if a rudiment will react at a third-of-a-dial drop, it is enough to interrupt the session.

All the rudiments are for is getting the pc into session. And any rudiment that is going to louse up the pc is going to be flagrantly out. Flagrantly out. You're going to see that reaction. And don't let me catch you with the sensitivity knob sitting for a third-of-a-dial drop – don't let me catch you finding a PT problem falling a couple of divisions or four or five divisions on that thing and passing it by because the pc says it's merely a mention of the idea of present time problems that's got him and that's falling on this or that. And he explains it all away.

Don't do it. Because you're going to have a pc exploding, going into apathy or going out of session within an hour to an hour and a half. You've just predicted it right there. Not only is he going to get no gain, but he's going to blow up, one way or the other on a PT problem. Don't pass them by. You understand?

But you turn the sensitivity up to 16 and you ask the pc, "Do you have a present time problem?" you will almost always get a needle reaction. Almost always. Since high sensitivity knob readings are used for the Joburg, and there you pick the bones clean. You got the idea? Or where you're looking for something or trying to trace something down or date something.

If you're trying to find something, you can always put the sensitivity knob up high. But the liability is that when you do it on the rudiments, you have immediately set up the rudiments to be the session. And that isn't what you're supposed to be doing. If they don't fall at all at a third-of-a-dial drop, they're in. And that's all you can say about it.
Now, the next thing that will happen in trouble-shooting a case, is that somebody will have been run on a level that isn't flat, or run on the CCHs, and that one wasn't flat before they went on to the next one. And you have to check this flatness. That is the next most important thing. Are these things flat? You go back and go over what's been run and find out if they're flat. Look over the auditor's reports. Say these things to the pc on the E-Meter and see if you get a needle reaction on them. Find out if these things were flat because the next most fruitful source of case stall is failure to flatten the process.

And immediately following that is then – in order – the next most fruitful case, and almost as frequent, is this horrible one: It's been flat for days, and it's still being run. It's just been flat for days, that's all. It's been flat for a session or two, or something like that. You'll find these real goofs, you know?

Now, the only disastrous thing that can happen under that circumstance is that the needle will stick so that you can't reassess. And the remedy for that particular thing is one of several, but amongst them is not running the incident that the overrun has stuck them in. That's not a remedy.

The most fruitful remedy is, is run the auditor off. And you'll all of a sudden find it'll come back to battery. And you can assess it again.

Where a pc consistently has the rudiments out… Now let's get down to trickiness. Now we're down to being tricky auditors and so forth, and we're not really fooling with the case. You know, and we're not looking for these gross errors. We're just trying to set up a case better. The pc is running all right, but they just always have an enormous number of present time problems and ARC breaks. And it just seems to be continuous. And we take two-thirds of the session to clean up the rudiments. And then we take one-sixth of the session to run the process, and then the remainder of the session is spent on running the end rudiments.

First check to find out if the rudiments are being established properly – third-of-a-dial-drop test – or are we trying to run all of the reaction of a needle out of all of the rudiments forever?

And if that is not the case, the next thing you do immediately after that – clang, bang, sock – is you assume this person is running continuous overts against the present time environment and everybody in it. The person is going pocketa-pocketa-pocketa-pocketa, you know. Unkind thought overts. Unkind thought, unkind thought, unkind thought, unkind thought, unkind thought. They look at you: unkind thought, unkind thought, unkind thought. They look – if there's another person around: unkind thought, unkind thought, unkind thought. You got the idea? Pocketa-pocketa-pocketa, automaticity. Unkind thought which leads to ARC breaks, present time problems. They have a hell of a time in life. And underlying these various things is pocketa-pocketa-pocketa, automaticity, unkind thought. You got the idea? And you're trying to run somebody that's stacking his case up with overts faster than you can unstack it with processing. And this is a very common, common, common source of difficulty.
And we've got an answer to that in Prehav 13⁴. You just take everybody the pc knows, do an assessment and so forth. And I've given you the details on how you do this Prehav 13 before. But you run Prehav 13 on the case. Just skip whatever you're doing on the case and just flatten Prehav 13. Just devote four or five sessions to getting Prehav 13 out of the road. And all of a sudden this person feels wonderful. And actually, if you do it right, they'll make all their goals for auditing right there, apparently. Of course, they aren't anywhere. But it's a very temporary situation, because that valence – which has already got to be licked, you see – in a few months at the absolute outside will be going again pocketa-pocketa-pocketa-pocketa. So you actually just clean them up so they can be audited. That's the value of Prehav 13.

All right. Now, you're not running into this one as often now because in the routines it is provided for cross and center. But it used to be, that a major – much earlier in value than this list I've been giving you – source of auditor-pc difficulty and trouble-shooting and so forth was the withhold. The case had the withhold, and therefore was not in two-way communication with the auditor. But you're using Joburgs, and that's taking care of this in the auditing. So it is less in this. If you suspect this now, you order a Joburg. You say, "Well, that's all right, lay aside what you're doing and go on a Joburg." You get a reaction on a withhold, don't try to dig it up particularly. Just order a Joburg. Okay?

All right. And if you do those things with these various routines, you'll find more cases straighten out than all of the tricky solutions you ever could dream of. Because in opposition to all of these practical solutions of how to trouble-shoot a case, is the continual insistence by the pc, by the public, even by auditors under your supervision, that you think of something new, strange and wonderful that solves this case, because it is so different. And you're liable to succumb to it.

Once in a blue moon, you have to succumb to it. But that's when all else fails, man. That's really when all else fails. And then you'll find out it comes under the first category. There's something weird, wild and wonderful going on that nobody has communicated to you whatsoever. Such as the fact that the girl's living with three men simultaneously and none of the three men know about it, [laughter] or the fact the pc self-audits all night, or something else is going on here, you see, which you just didn't happen to find out about. But that comes under the first heading.

Now, the trouble-shooting of the case is very important because by doing that you actually also keep Scientology on the track. And if they think there's somebody going to be around in the establishment or in the town, or something like that, that can trouble-shoot a case, and will remorselessly do so, everybody starts to be better.

They all of a sudden think, "Well, you know, a month or so this person might wander over and Ken might look at her. And then all of my sins will out." As a matter of fact, it's a very good thing to foster that particular piece of propaganda.

"Well, go ahead and waste the next two hundred hours of auditing if you want to. Sooner or later, why, I'll have this case sitting here on an E-Meter. And I'll find out what the

---

⁴ Editor's note: How to run Prehav 13, see SHSBC-026, page 6ff.
devil you've been doing in those two hundred hours of auditing." You know I can hear now the certain names that I could mention out in Los Angeles all go ulp-urp.

You realize that by the Code of a Scientologist, if you weren't administering Scientology to the pc, he doesn't have to pay you. My God! What a horribly fiendish thing. Well, I won't put ideas in your mind. [laughter] There are ways of getting it done right.

The job of the D of P is trouble-shooting. The job of the D of T is quite different. D of Ts often turn their Academies into clinics. And they start making sure that all the cases of the students get progress. And that's not what they're supposed to be doing. And fellows come out of there, out of Academies in pretty good shape casewise, but you say "CCH" to them, and they say, "CCH – now, he did – we did hear something about CCH. Let's see, what was that? Oh, yes, yes, yes. That's one of the levels of the Prehav Scale." [laughter] But their cases are in good shape. You get the idea?

So in trouble-shooting in an Academy – you don't. You just don't. That's it. Some Instructor comes to you or somebody who's teaching Scientology or something like this, you know, and he's teaching courses of some kind or another, and he comes up to you, and he says, "Having the awfulest trouble with this case", you see?

"Oh? You are? Isn't that interesting? Do you have trouble with bulletins, too? I imagine you have lots of trouble with bulletins."

And the fellow says, "What do you mean?"

"Well, haven't you read anything about what you're supposed to be doing in the Academy? You're supposed to be training people in the Academy. If you think there's something wrong with this fellow's case, sign him up for some processing over in the HGC."

And this'll be a new, wild, strange one. I have seen an Academy with a full clinic, full clinical setup, from one end to the other, nobody learning a thing, and the Instructors just frantic about everybody's cases, these cases. Well, now look how shortsighted this is.

They may be frantic about those cases that are in the Academy, but let me point out to you that they are neglecting all of the cases these auditors will audit. And the only thing you can really do wrong with Scientology – you can use it backwards and upside down and run it wrong and everything else, and you actually won't commit much of a crime. But improper or incorrect or failure to disseminate Scientology adds up to one awful overt. Ask yourself for a moment, why?

Well, if Scientology is abroad in a workable state, even though this fellow kicks the bucket, he'll be picked out of it someday. But if it isn't properly disseminated, he'll never be fished out. You got the idea? He could be improperly audited and fished out in this lifetime or his next five. You see? But to be improperly instructed, or dissemination to be improperly done – that's an overt. It obviously is because you've barriered the track against his being fished out. You see?

You've said "The very best thing that you could possibly run is musical processing. And musical processing, that's the thing. And the way you do musical processing is you take this book on Suba-ooba-ooba, and you stand in the middle of the floor, and you go round and
round and round and round and round, you see. Then you stand very still, you see. And then the Gods communicate with you." [laughter] "When you fall down in a dead faint, why, then you're Clear." [laughter]

All right. So this character gets loused up by processing, and next life, next life, next life, he has run on him, "You take this book on Suba-ooba-ooba-ooba, and you stand in the middle of the room, and you go around in circles, and then when you fall down you're Clear." It's no road out. And that's happened to Buddhism, Lamaism, the original Daoism. Happened to any development they've had here on Earth. Started out free – by bad dissemination – booby trap. See?

I imagine Christianity was all right sometime or another. I imagine it didn't have some of the intentions which it eventually expressed, such as Inquisition and burning people in East Grinstead, and a few other things. Oh, you didn't know there were people burned in East Grinstead?

They're lying right up here in the courtyard. You want to drop into the church cemetery there someday. You'll see them. They're buried right up on the High Street. I mean, they were burned on the High Street and buried eventually in consecrated ground. It was interesting. But what's most interesting about it is that it didn't sour people on it; it only soured people on a branch of it.

Okay. Enough of this propaganda. [laughter] Okay. Well, I've kept you overtime again.

Thank you very much.

Audience: Thank you.
Wrong Target, Sec Check

A lecture given on
29 June 1961

Thank you.

Now, you'll have to give me the date today. I get on this automatic outflow of giving you the date.

Audience: The 29th.

The 29th? But, what year?

Audience: AD 11.

That's the right year; AD 11.

All right. 29 June, AD 11, and here we go with the Saint Hill Briefing Course, and boy, I tell you, how do you manage? I mean to say, how do you manage?

Anyway, I gave a talk earlier, which some of you heard, about wrong target – wrong target. And I've said since 1947, really – and you'll find it in The Original Thesis – the auditor plus the pc's analytical mind versus the reactive mind, tsk! you win. The pc versus his own reactive mind, nyaaah. The auditor versus the pc analytical mind, nyaaa-ah. It takes the auditor and the pc's analytical mind to whip the pc's reactive mind.

Did you ever see any – any steam locomotives or electric locomotives, or so forth, go over to a – a grade? They keep hooking locomotives on, you know? They can't pull the slope up to the high hills of Birmingham or something, so they put an extra locomotive on. Did you ever see anybody do that? Did you ever hear of that?

All right. That's the same thing as auditing is. You're hooking on an extra locomotive. But why? Why, hmm? Why would you hook on an extra locomotive? Well, it's because the locomotive that is on the train can't make it. It's one of these horribly obvious things, see? The locomotive that's on the train can't pull the grade, so you hook another locomotive on and they pull the grade.

All right. As long as your target is the pc's analytical mind, you're not going to win. If you're trying to clear his analytical mind, it will take you 75 hours to do a Security Check, 295 hours to do an SOP Goals Assessment. You get the idea? I mean, Scientology will work even in spite of that. If you want to know what the drag factor is, it's just that one. Wrong target.
I had a letter from Peter Williams today. He's halfway round the bend. That's pretty good for a Clear. That's where the auditors have got him. He can't figure out what they're doing. See? I mean, he can't figure out what they're doing, you know?

Well, I've had lots of experience. I can always figure out what you're doing – not only figure out the human mind, you have to figure out what the auditor's doing. Because, in all honesty and in all decency and trying like mad and through no willfulness on his own part, he gets the wrong curve on something, and all of a sudden this fantastic amount of time begins to occur. Tremendous amounts of auditing begin to elapse. Processes which would ordinarily work don't work. Well, what's wrong? What's wrong? There's a breakdown here in understanding of some kind or another whenever this occurs. You see that?

All right. Williams had a tremendously successful course. He made a Clear. He made a couple of them, as a matter of fact, down in Australia. And it was no small feat. He was doing fine, and all of a sudden I get a despatch from him today, and he's going, "Wha – well, I'd almost lost hope and then I got one of your tapes and I'm going in again, and so forth, but this exact...."

I got a telex today from London. And Herbie says that the auditors can't get any Sec Checking done in running Routine 1 because it's taking them two and three hours to clear the rudiments. [laughter] Well, all right. There's another one – just a curve, misapplication. But it's a very simple thing. He's asking me for an extraordinary solution, which is wipe out the rudiments on the Model Session used for Sec Checking, or at least wipe out part of them. That's an extraordinary solution. See? You get driven to the wall, think of an extraordinary solution and the next thing you know you're not doing Scientology. You got the idea? That's the ordinary course of human events.

Now, Ken was asking me yesterday about how do you spot – do troubleshooting. And I told him the first big, big pinnacle here of trouble-shooting was what the hell is going on? I mean, that's the big one, you know? Because there you're up against a tremendous amount of alter-is and counter-create. People are trying hard. They're not being vicious about it. They are understanding it to the best of their ability, and so forth.

All right. You're in the same situation when you're doing something like that that I was with – in with regard to life when I was trying to figure this thing out, see?

Here's life with this tremendous facade of the super-mystery and how you mustn't penetrate it and you can't and all of this sort of thing, you see? And just wasn't anything you could do about it, and all of these weird propositions. Well, that's because there's so doggone much alter-is and so darn much counter-create that the truth of what life was all about had been totally obscured. You got the idea?

So naturally, in relaying a communication about the simplicities of life, these things get restimulated, and people begin to look around corners, you know, when actually the cop is standing right in the middle of the sidewalk. So they go and peer around the corner, and they look up and down alleys, and they come back and forth to look up and down the road, and then turn around and bump into the cop. He's been there all the time. Just failure to observe some fundamental.
So don't feel bad if you do this sort of thing, because, look, I've been over this ground. I can tell you that I did it constantly and continually. That's what life was doing in trying to sort out any of its secrets. They weren't secrets. They were obfuscations. There is no secret about life. It is just the fact that life is surrounded by alter-is and obfuscations to such a degree that you can't see life.

You know, the fellow can't get his job done because there are so many other things to do. This is rather typical. You find this in organizations. You look around and you say, "Now, look, we want the halls clean." Something elementary. "Want the halls clean, you see? And want the place to look nice, you know – public come in and all that." And the fellow has been hired just to clean the halls, you see? And there he is cleaning the halls, and – you think – and you come in one morning and you wade through the dust over your shoe soles, you see? And the next morning it's over your toes, and the next morning it's around your petticoats, and the next morning it's getting around the waist. You can hardly get into the joint, you see, for scrap paper. And you finally say, "What the hell is going on here? We have a fellow who is supposed to be cleaning halls. Well, what's he doing?"

And you ask him, "What are you doing?"

"Well, I can't do that. I haven't got time to do that."

"But that is your job."

"Yeah, but I haven't got time to do that."

"Well, what's happening?"

"Well, actually, I have to run all these errands and I have to mail, and I have to this and I have to that."

And you say, "Mail? What are you talking about? We have a man over in the mail room that's supposed to take care of mail."

"Yeah, I know, but he's so busy addressing and stamping."

"Now, look, we've got somebody over in the – in the – in the Address Department that's supposed to be addressing and stamping and ..."

"Well, yes."

And you go over to the Address Department and you say, "Why aren't you addressing and stamping?"

And they say, "Well, we just have to clean these halls, and we ..." [laughter]

You see? Data starts breaking down, you see? And it goes into a concatenation. And the first thing you know, nobody can do his job because he's too busy. And then you don't have any organization, you see? And it's pretty wild when you look at it that way.

So that's what happens when you try to relay or communicate data about life. Life is sort of like that, you know?

The government today is doing basically the work of charity organizations. Well, they are. That's what socialism is. Socialism is that perversion of government to a point where all
social activities and charity activities are undertaken by the government, you see? And they don't do any governing. Try to get a suit tried. It'll cost you ten thousand pounds, and it'll take you about two or three years, and so forth. But now, wait a minute. That's the business of government: justice.

You try to walk down Soho about three o'clock in the morning and come out of it unscathed right in the middle of London. That's a rather adventurous undertaking – not as bad as it was perhaps, but it's fairly adventurous even yet.

Well, what happens? Why? Well, the government is so busy being a social worker, you see? It hasn't any time to arrest anybody or take care of the law. Get the idea? Can't – can't round up criminals.

Well, why can't it round up criminals? Well, because they have to send them to jail. What has sending them to jail got to do with handling crime? "Well, we're not quite sure, but that's the way it's done. But of course, we can't send them to jail, because as soon as we try to send them to jail..." (This is Washington, DC which has the highest crime rate, I think, in the world, including Port Said, right now.)

You see, that's an interesting comment on a government, you know? I mean, that its capital city has the world's highest crime rate. That's really getting there, you know? Here's the center of law and order which has the world's highest crime rate. Fantastic! You can't get the cops over there to arrest anybody. They won't arrest anybody. And the reason they won't arrest anybody is the people "bug out." And "bug out" is a new cop piece of slang meaning: they go up, they get sentenced to St. Elizabeth by reason of insanity, you see? They parked overtime by reason of insanity, you see, and the judge – psychiatrist rushes in, rushes him over to St. Elizabeth's. They spend a few days in St. Elizabeth's and they're released without any punishment at all. And the cops have gotten to a point where they just won't do their job, that's all. Why? That's because the government is so deeply enmeshed in social work that it hasn't any time to govern, you see?

Now, it isn't that the government is accomplishing government with social work. Actually, it isn't. Because in a good government, production rises, the people are more prosperous. Various other things are always attendant to good government. And yet none of these things are occurring. That's because the government is so busy doing something else.

The government is attacking everybody who produces, which is an interesting thing for a government to do. Just get in business and you'll find the government setting up the Lewis machine guns on your doorstep, see? I don't care whether you're putting yourself into a business of fixin' shoes or fixin' skulls. Same thing.

All right. This is the off-postness of it. It's all off post. Get the idea? Well, where you're living in a world where nearly everything is off post, everything is trying to force you to wear its hat. You see? And if you didn't watch it, you'd simply inherit all the hats there were. And for instance, if we didn't watch it, in the course of the next two decades, we would be wearing the hat called government, particularly if I continue to keep overts going against it. [laughter] And that isn't my job. And it isn't anybody else's job around here, you see? But here's – here's the thing. I mean, everybody wants you to wear his hat. And you're wearing everybody else's hats, and so on.
All right. Now, let's see how we can short-circuit this so we didn't keep getting off the groove. And that is to say, in an HGC or an auditing team or any activity in Scientology, the person who is on the ground observes. A person who is on the ground observes. Don't ask other people who are off the ground to do your observation for you.

I love Herbie dearly, but to send me a telex... Yes, he's in trouble, but he didn't observe. He didn't go down and look. He couldn't have. He leaves me in a position where I have to surmise, you see, what he's doing. And because he hasn't looked, then I sort of interiorize into his hat. You see, he sort of – he yanks my anchor points out thirty-nine miles. Get the idea? And then I have to figure out. Well, I can by experience, fortunately for him. But I have to figure out what his auditor is doing. See? What are they doing that's taking two or three hours?

Well, in the first place, innumerable mistakes are being made. The first is that a person on Routine 1 is not supposed to respond particularly, or is not expected to respond particularly to think processes. And you're going to run two or three hours of think processes on somebody instead of doing a Security Check and the CCHs, you see? That's kind of silly in the first place.

Well, the basic mistake which they are making is a simple one. They're just running the rudiments with the sensitivity knob too high. See, they're not clearing the rudiments for a third-of-a-dial drop. They're clearing the rudiments for 16. And because they're doing Security Checks, then they think they should clear the rudiments for a Security Check at 16, but then they never get around to a Security Check.

You know, do the Security Check, by all means, with an abnormally high sensitivity, and check it all out with the sensitivity at 16, by all means. But that hasn't anything to do with the rudiments, see, of running the Model Session in which a Security Check is going to be done. And you set it for a third-of-a-dial drop, and this is about the way you would run rudiments on somebody who is going through CCHs – which will run rudiments faster, by the way, than any rudiments process you've got.

You say, "All right. Is it all right with you to begin the session now? Good. Is it all right to audit in this room? Fine. Is it all right if I audit you? All right, that's good. Have you got any ARC breaks? That's fine. Are you withholding anything? Good. Fine. That's good. Do you have any present time problems? Oh, yes, you do. All right. Well, thank you very much. Now, we're going to begin this Security Check." [laughter]

It's just practicality, that's all. You've gone through all the motions.

'Cause look, you're going to be back on the CCHs, and oddly enough, if you really want to try it sometime, you can run a present time problem with TR 10. That's right. Just say, "Notice that wall. Notice that ceiling. Notice that floor." The guy is very upset because his wife is going to kiss somebody else, and he hasn't been kissing her for years, and he's wondering why. And you say, "Notice that ceiling. Notice that floor. Notice that wall," and so on.

And the guy says – "Well, now how do you feel about your wife?"

"Well, it's all right. That's pretty bad."
"All right", you say, "Notice that door. Notice your auditor. Notice the chair. Notice the ceiling. Notice the floor. Notice the wall. Notice that picture over there. All right. How do you feel about your wife now?"

"Well, not so bad."

"All right. Good. Notice that ceiling. Now, notice the floor. Notice the wall."

That sounds like a funny way to run a PT problem, doesn't it? And yet it'll work. All right. You can run an ARC break the same way, unless the ARC break is so violent with you, the auditor, that he won't do the auditing command. You could get into something kind of like that. So you possibly, in doing the CCHs sometime or another – it's rare, very rare – but you might have to run some TR 5N or something like this while bridging over into a Security Check. You got so many ARC breaks with the pc that it's better if you run ten minutes worth of 5N, see – TR 5N. But it's just wasting time, you see?

I mean, basically, the CCHs for sure will run all the rudiments. The CCHs are senior as processes to all or any rudiments process. That's for sure.

So on that, all by yourself, well, you could see that this is the – that the thing would all shake out in the wash anyway. And then look at your – your Security Check. Don't you suppose that's a bit superior to rudiments?

Well, rudiments are just rudiments for heaven sakes. And when you're running a think process, you'd better have them awful straight. Third-of-a-dial drop. Does the rudiment register on the needle? No registry on the needle at a third-of-a-dial-drop sensitivity setting? Leave it alone. Do you understand? And clear it only back to a third-of-a-dial drop – and then you've got speed.

Now, I wasn't giving you a lecture on this particular subject. I'm giving you an example here, that observation should have been done on the ground, see? Then we could have figured out what they were doing instead of getting some extraordinary solution.

Here's the next one that's of considerable importance here. This idea of the analytical mind. We say the analytical mind is kind of a misnomer, because most people think it's some kind of a computing machine. And it's not. It's just the pc. It was a mistake made in early Dianetics in research. There was something there doing a lot of thinking and computing, and so I called it the analytical mind to differentiate this, because at that time we didn't know anything much about thetans. You got the idea?

All right. We mean the thetan. Now, when he directly, personally – what is conscious of a thetan and the attention units available there – are attacked by the auditor, you're going to get no auditing done. Your target is the reactive mind. It is auditor plus pc versus the reactive mind. And boy, now have you really got it plowing. This basically accounts for that five hour-twenty-five hour ratio that's been a kind of a bug to us. Works like this.

As a matter of fact, Julia was the one who made this observation. She was doing a bunch of tests out in Phoenix, and I was taking on pcs, and I was auditing pcs five-hour intensives, see? And I had a whole bunch of pcs one after the other at five-hour intensives, see? And the days and weeks went by and Julia got ahold of a whole bunch of profiles. And they
were the – what was not then the guidance center, but the staff auditor profiles, you see, for
the same period of time, you know? And here was the five hours and here was the twenty-five
hours. And they were the same results, you know?

And she got ahold of this and she pointed this out to me. And there they all sat in the
files. And this was rather fascinating. I was getting results in five hours and they were getting
results in twenty-five hours, but we were really running more or less the same thing.

Well, when you see a wild variable of this character, don't assign it, as most people
would in their overweening conceit, pomp and prejudice to how good they are, see? Any time
you say, "Well, the reason there's a big difference is I'm just good, and they're lousy, you
see?" That would be a wonderful way to block off any further information on the subject.

Well, truthfully speaking... [laughter] where you have all of your auditors working like
mad, putting in time, doing the same thing as anybody else, you're working like mad putting
in time; there must be something different. I didn't discover it actually till a couple or three
weeks ago what the dickens this was all about. Their reactive mind was apparently choosing
out the pc as the randomness. Got the idea?

In other words, they were auditing the analytical mind. They were auditing the pc, see. They were thinking of the pc as being aberrated, and the pc was this and the pc was that, don't
you see? Well, of course, this is true, but it isn't something you attack. See, don't attack the
pc; attack his bank. Get this vast difference. Your target is the reactive mind.

Now, I gave you a talk about this not too long ago. And here it comes up again. We
haven't got this point yet.

It is a big point. It is not a little tiny niggardly point. It's a big point. It was enough to
make this five-twenty-five hour difference.

All right. So therefore, it's probably enough to account for doing a Security Check in
75 hours or doing an SOP Goals in 225 hour assessment, see? See, that all by itself. It's just
that one little mechanic that stretches out, this tremendous... well, you might call it waste of
auditing time. Now, if you could just correct this one little thing and save four out of every
five hours of auditing, hey, that'd be pretty good, wouldn't it? That'd be quite a discovery to
discover something that was that much. And yet, I discovered this a few weeks ago, and I
evidently haven't communicated it, because you're still doing it. You see? To some degree,
you're still doing this thing.

What do I mean by this? What do I mean by this? (I know Mary Sue has covered this
with you, but I'm going to really slam it home here.) You take an E-Meter, and you look at the
E-Meter, and you say, "Have you ever stolen anything?" Now wait. This is the first time
you've asked the guy the question, see? You know? "Have you ever stolen anything? Oh, you
have, huh. Oh, well, what do you know about that? Well, hmm. All right." [laughter]

Pc possibly is saying, "Yes, I once stole eight apples and I robbed a store and so
forth." And he's saying this; you don't pay any attention to that. That's completely aside and
has nothing to do with you. [laughter]
You say – and you say, "Well, all right. I'll repeat the question again." Clause 16, Auditor's Code: Stay in two-way comm with the pc. Gong! But why?

You're suspecting the pc of having stolen something. You're not trying to find ways and means of getting him to recall, ventilate, air and get the dry rot out of the reactive bank. You're assuming that he knew all about it and has been walking up and down the streets all these years knowing very well that he has stolen everything, and he knows it, and he did it. You got the idea?

He knows it. He did it. He is the bird, and that his only crime is that he didn't tell anybody. Now, you've short-circuited it one step. Yes, he did and he not-ised it. And he's got it down in the reactive bank and he doesn't even know about it. And he keeps getting these fantastic impulses to steal things.

Now, when you do a Security Check, at the moment you ask it, because it's a specific question that nobody has ever asked him before, he remembers it. And he will tell you about it ordinarily. Now, having gotten that far, you've just gotten that far on your own steam. You've looked at the pc; you looked down here at your paper and find out the next question is "Have you stolen anything?"

All right. You look at this and you say, "All right. Have you stolen anything?"

And the pc says, "Oh, yes. Yes, as a matter of fact, I did. I stole three apples and two bananas and a cartwheel. And I once belonged to the army – enough said – [laughter] and so forth. Yes, I have. Yeah, that's right. I sure have. All right."

"Good. Thank you." He's answered the question, hasn't he? All right. You're going to ask him again. You say, "Well, have you stolen anything?" in any wording you care to put it.

And he says, "Well, yes. Yes, as a matter of fact, when I was a young kid we stole an automobile and went for a joy ride."

All right. And you say, "Well, all right. Thank you. Good. Now, have you stolen anything?"

And the guy says, "I told you all about it. That's ... No, there's nothing more."

And you say, "All right. Now, let's just be sure. Now, all right. I'm going to ask you on this now. All right. Have you stolen anything? Oh, I'm afraid there's still a knock there. What else is it? Come on. You can remember it. Come on, what is it now?"

"Well, blessed if I know one. I'm damned if I know. I can't remember anything else that I stole."

"Now, there must have been something There must have been something"

"I did nothing. There isn't anything else I've stolen."

You say, "All right. Well, let's just check it out and make sure we're straight here now. All right. Have you stolen anything in this lifetime?"

No knock.
"Okay. Well you – so you've been a ruddy thief in other lifetimes, but you haven't stolen in this lifetime. So that's fine. That's okay. All right. Now, here's the next question: 'Have you ever buttered any bread?' it says. All right. Now, have you ever buttered [laughter] – have you ever buttered any bread?"

And the guy says, "Buttered any bread. No. No. Hm-mm. Nope."

And you say, "All right. Let's make sure. Good. Have you ever buttered any – Oh, wait a minute. There's a hell of a knock on this thing. Now look, you can remember that. Come on now."

"Uh, buttered any bread?"

"Yes, that's right. I'll repeat it. Have you buttered any bread? Well, look at that, for God's sakes. Look at it." [knocks on something] [laughter]

So he breaks out a microscope and a telephoto exposure meter and so forth, and he looks around. "Buttered any bre – Oh, no. Oh, no. Well, yes, as a matter of fact, I was a ... God, you know I'd forgotten this. I was an attendant in a psychiatric ward when I was about twenty-two. I'd forgotten that completely. Yes, and we used to butter bread in there all the time for the insane patients. Yeah, yeah. What do you know?"

And you say, "Well, all right. Okay now. All right. Now, let's just check this one so we can leave it. Have you buttered any bread? All right. Have you buttered any bread? Yeah, well, that's flat. Okay. All right. Now, here's the next question. Have you ever been a student?" [laughter] You understand?

Now look. Look here. This is a different demeanor. This is a different demeanor than the way you're delivering a Security Check. You're busy Security Checking somebody's analytical mind. I'm sure of that, because it's taking you too long, you see?

First thing I found out about this Security Check. You were taking latent reads. The only time you ever say "I'll repeat the auditing question" in a Security Check is when he said "somebody else."

You said, "Have you ever buttered any bread?"

And he said, "Well, my Aunt Gafooseba used ..."

You say, "I'll repeat the auditing question." Don't even let him finish the sentence. The devil with it. You say, "I'll repeat the auditing question. Have you ever buttered any bread? You."

"Oh, oh, you ... Well, no. I ..."

"Well, all right. We'll check it. Good. That's all right. Fine. Here we go." Got the idea? It's between you and the pc until what signal? There is a signal.

Audience: "He says 'No'."

"No." That's right. You learned your lesson well. That is the signal. And you'll have nothing to do with an E-Meter until you get that signal.

Male voices: Thank you. Yes.
Nothing to do with it. Put it under your chair. Sit on it. Butter it. Who cares? But don't have anything to do with an E-Meter, because you're cutting comm with the pc. Now, why you got that E-Meter under your nose? I never security checked anybody in my life in this particular fashion, staring at the E-Meter and looking at it suspiciously. "Yes, you criminal. I have you sitting in the chair." I can security check the most unlikely people.

Now, why are you using any Model Session in the Security Check at all?

Well, it's just better. It keeps you from yickety-yaketing, and takes you too far off the line. It actually isn't really a Model Session action. It isn't a Model Session type of action. There's a lot of yickety-yak goes on, on the thing. You can close it and you can bridge and you can use those Model Session factors.

But I get people to talk by persuading them to talk, in an E-Meter. I'm liable to say to somebody, "Now look. You want to know... You're afraid to tell me something about this, or I see you're now remembering something about it, and you're apparently afraid to tell me. Why are you afraid to tell me?"

"Well", he'd say, "You might tell somebody else."

I said, "Right. That's right." I said, "I'm going to ... Soon as you tell me, I'll get an HCO Sec and they'll put it on a telex and they'll send it to all Central Organizations as an Urgent."

And the guy says, "That's silly, you know?"

"Yes, that's right. It's silly. Now, what have you done?" [laughter]

"Oh," the guy says, "Oh, well, put in that light, well, actually, I used to kiss goats." [laughter]

And you say, "All right. You used to kiss goats. Very good. All right. All right. Okay. Now, let's just check out and see if you've remembered everything there is to remember about that, see? All right. What animalism have you practiced with illicit diamond buying?" [laughter]

Then a guy gets another knock and you say, "Aw! come off of it, you know? Did you – have you remembered this? Do you know this right now? Do you know this all?" The attitude is "You couldn't possibly know this and not tell me. And I'm helping you fish it up. And here you are wasting time here by holding... It's silly, you know? This is foolish. Now, come on. You did remember this? You – you now ..."

"Well, yes, I was embarrassed to tell you."

"Oh, well, all right. So you're so bad off that it embarrasses you to tell an auditor something. All right, now I'm not gonna jump on you for that or anything, just give me this dope here. Let's get the show on the road," you see – you know, that kind of thing. That is, if I suspect that he is remembering it now, you see, and then sitting there holding onto it or afraid to tell me. You can ordinarily tell; they start to look hunted, you know?

Well, that's about as far as you ever go in attacking a pc. But just a direct assault on a pc: To pick up that E-Meter, the first time you ask that question, look fixedly at the E-Meter,
ask the question in a rather suspicious tone of voice, and so forth. You're being absolutely certain that he's not going to tell you. What are you doing? You're cutting comm with the pc. You are actually encouraging him to withhold.

You might as well say to him, "Now, I know you're going to withhold and you know you're going to withhold, so therefore everybody is going to withhold around here, and therefore we're going to take five times as long to do a Security Check." You see, when you sort it out with this kind of an idea? Of course, he's going to withhold. Even if he knew these things, he wouldn't tell me. I go at an entirely different assumption, because I'm attacking the reactive bank.

I assume that if he remembers it or knows about it, he will tell me at once. And I do everything I can do to promote that frame of mind. It's not just promoting that frame of mind. It's true. And by the time he's asked about the third question, you know, answered about the third question, well, he says, "Ah! This is pretty interesting, you know? I mean pretty, pretty wild. Yeah, you know, I can talk to this guy", and he starts going into session. And here he is. He's in-session.

I ask him the next question, "Have you buttered any bread?" Never occurs to him for a moment to withhold the thing.

He says, "Buttering bread, well, as a matter of fact when we were very young, I – I'd sure hate to have this known."

I say, "Well, it's going to be known. Now go ahead."

And "Ah, well, when we were little children, we used to butter bread, you know, and we'd butter it and butter it, and so forth, and hide it from our mother."

And I say, "All right. Good-o. How do you feel about that now?"

"Aaahh. Pretty grim."

"All right. Good enough. Well, have you buttered any bread?"

"No, I've just told you."

That's it. That's all of it. See, that's "no". You know? Then let's say, "All right, now, let's make sure we've got all of it."

And we check it on the meter. And we're already reading with an advanced sensitivity knob. We ask him with the sensitivity knob advanced, and then we ask him with the sensitivity knob totally increased. No further fall. That's it. We have checked it out. We can leave the question. And it's just a one-two-three-four.

But, it is your role as an auditor to persuade him that he can remember and that he can tell you. And every time you make suspicious actions in the direction of the E-Meter, you invalidate that a little bit. So the less those suspicious actions are, the better off you are.

You sit down. You put the E-Meter down, so forth. It's not an attitude of "Well, we're gonna find out all about it now, because there you are walking around knowing all about these things, and so forth. And that makes you a pretty bad criminal, doesn't it? Hah-ha-ha-ha. Ha-ha-ha-ha.'
Well, two-way communication goes up the chimney right there. How could it do otherwise? How could it do otherwise? No. You as the auditor can create an atmosphere, not of confidence, but create an atmosphere of communication. Don't create an atmosphere of no-communication.

You don't have to operate like a con man; you don't have to operate like a priest. As a matter of fact, I'm not above throwing all sorts of dunnage into a Security Check on the basis the fellow is looking very, pooh. You know, you've just asked him, "Well, have you ever raped a girl?" you know.

"O-o-o-o-oh, yeah."

"Well, all right now, you just remembered something there. Now, what was it?"

"Wah-wah-wah-what. I don't know what I did there. Ughrr-oh-oo-oo-oooo... That's..."

I say, "What the hell is all this about?" I'm not above saying something like this. I go, you know, "What the hell is this about. Do you think I'm a Catholic priest or something? I'm going to make you wear sackcloth and ashes for the rest of your life?"

The guy says, "Oh no. I guess – I guess you're not."

And I say, "This isn't 1620. This is AD 11." [laughter] "All right, now, let's hit this thing hard now. Now, "Have you ever raped a girl?"

"Well ..."

"Tell me all about it."

"Well, all right." And he tells you all about it. And not because you found it on the E-Meter, but because you just said, "Well, look at them sighs and groans, moans and writhing. And, man, there is something there. And you and me had better get this into view, all the way, and let the turbojet blowers go through the reactive bank, you know?"

Next thing you know, promoted, question after question after question, he is more and more confident and feels more and more confidence in his auditor and feels better and better. And the knowingness is going up in all directions. And the E-Meter is further and further away and is actually only used just to check out the last two checks. And you get so that you'd never find anything on the last two checks. You just never find an additional fall, that's all. He's given the whole thing to you before you ever went near the meter, see.

You, after all, are the auditor. And when you forget that you are the auditor ... And no matter how marvelous a mechanical contrivance is, when you forget that you yourself are doing the auditing and that you yourself are handling the pc, you get a slowdown right there. It starts to grind, you see?

Now, our next level of wasted motion was, of course, in this thing of latent read and letting the pc wander and so forth, exerting no control over his communication in the session.

You say to him, "Well, have you ever bitten any snakes?"

And he says, "Oh, well, yeah. Once upon a ti- . Yeah, as a matter of fact, my Aunt Grace, she used to bite snakes – used to buy snakes down in the market and she'd bite them.
She used to bring them home and bite them. And it horrified me as a small boy. And that's why you're getting a fall on the meter, or would get a fall on the meter, if you were looking at the meter."

And you say, "Whoa now. Whoa, whoa, whoa. Whoa, whoa. Whoa. I asked you if you had bitten any snakes?"

"Oh, oh, me? Yeah, well ..."

"That's what the meter would be falling on if I were looking at it."

"Oh, well. All right. Well, the hell with it. Yes, all right. I do it all the time. As a matter of fact, I did it last night. Bit one. Bit his head right off. I've got to bite 'em." [laughter]

And you'd say, "Okay. All right. Now, we'll check this one out. Is there anything more there? Nothing more?" You know? I mean, "Have you ever bitten any snakes?"

"No. That's the only one. That's the only one."

"All right. We'll just check it out on the E-Meter. Have you ever bitten any snakes? Ah, that's all right. Okay. Fine. All right, now let's get on with this thing now. Stop putting on the brakes."

And the guy gets in a frame of mind where he feels perfectly safe, and actually his anxieties in life were borne out of the fact that he doesn't feel so safe. So you bring about a tremendous change in the pc just by this attitude. The attitude alone can bring about a change in a pc. Use your E-Meter when he says no. Until he says no, leave it alone. Check it out for the advanced read you are already using, check out the question again for the most increased read you can get on the E-Meter and then, if you got nothing then, go on.

But, of course, on the advanced read, not the most extreme read, you check it out "Have you ever bitten any snakes?" And it goes pang! again. Oh, I tell you the amount of disappointment which I can get into my voice is histrionic. I say, "There's a fall here."

Well, he says, "I told you everything I'm ..."

"Oh, you did. You don't remember this one? Oh, all right. All right. All right. Well now, let's see if we can find it. All right. I'll help you out. Now, have you ever bitten any snakes?" Bang! "What's that falling on? This lifetime? All right. It's this lifetime. Okay. Come on. Spot it. You can do it. Come on, you can do it."

"Whew! Yes, yes, as a matter of fact, I used to bring snakes in and hide them in the teacher's drawer, and then when she was gone, I'd take them out and bite them. Yeah. all right." [laughter] "Wshooow."

Say, "Yeah, all right," you say. "Okay. Now, let's check it out. Have you ever bitten any snakes?" Fall. "All right, all right, what's the matter? Are you afraid of this subject or something of this sort?"

"Yes, as a matter of fact. It drives me nuts."

"Well, come on. Remember it. Now, you can do it."
"Oooh. I don't know. I don't remember any more of it."

"All right. I will agree with you. You don't remember any more. Let's see if we can find it. I'll help you out here one way or the other. Now, have you ever bitten any snakes?"

"Oh, it's a movie I saw once. It's a movie. It's a movie I saw once."

"All right. Now, I'm going to repeat the auditing question again. Have you ever bitten any snakes?"

"Yeah. Oh, yeah. There's one. I didn't mention that one."

"All right. Good enough. All right. Now, we're going to check it out." (He's told you what it is.) And you say, "Have you ever bitten any snakes? Ah, there's no fall on that. Good. Have you ever bitten any snakes?"

"Nope."

"All right. Okay. Good. All right. Let's get on with the next one." Get the idea?

It's only when he says no, you use the E-Meter. And then if you're using the E-Meter and he's still saying no, you assume – not that he's really withholding from you – but you merely assume that he hasn't overwhumped the reactive mind. This disappoints you, you see? That he doesn't just bang like this. And he gets the idea that he should be able to do it. It's most remarkable.

The point is that you can get him in a hopeful frame of mind. I'm maybe not putting this point across too good because I'm not giving you an actual demonstration of this thing. But the point is that his confidence comes up, and his ability to overwhump the bank comes up, and his ability to communicate comes up; therefore, his knowingness keeps coming up. And the Security Check will start showing up on your profiles like mad. And they happen rather rapidly. And after a little while, you'll be saying to him something on the order, "Well, have you ever stolen anything?"

And the fellow says, "Yes. So-and-so, and so-and-so, and so-and-so, name, rank and serial number, and sold it to the pawn shop. And that's it. Bang!"

And you say, "All right. Have you stolen anything else, now?"

"No."

You check it out. It'll be blank. His "noes" will be followed by a blank. His "noes" are not followed by a reaction.

Early in the game, yes, his "noes" will be followed by a reaction on the meter, and you'll have to turn around to him and say, "Remember it. Think about it." On the sort of an attitude of mind of "You can do this. It is possible for you to do this. I know that you can do this."

And he thinks, "I'm doing something. Well, yes, I am. I'm remembering something. What do you know! Yes, I am. And I can do it. What do you know!" I'm not putting any hypnotic charm on him, because what I'm putting on him is the fact that I've demonstrated conclusively to him that he could by just insisting that he did. It's like getting an auditing com-
mand followed. The auditing command you're kind of running is "Recall all your overts and
withholds. Thank you." And after a while, why, they just go off like a streak of light. And it'll
be very seldom that you ever find a knock on the meter after you've asked him to tell all. Then
you can resort to the meter. And you say, "Well, have you ever been a member in an armed
force?" you know.

And he says, "No. No."

And you get down to a point where you get much more rapid agreement amongst, the
auditor... And this is when you leave a question. When you have total agreement on "no". It's
an agreement. The auditor observes it; the E-Meter observes that it's no; the pc observes that
it's no, and the reactive bank doesn't churn anyone up, and so it agrees that it's no. See, and
everything is in agreement. There is a no. And you're promoting agreement like mad all over
the place, you see? Instead of the disagreement!

The disagreement which you're eliciting is when you sit down and look at the meter
and you say to the meter – you say exclusively, "Well, have you ever bitten any bread?"

And you know the pc knows this, but is only unwilling to tell you. And you're going to
sniff him out somehow. You're going to catch him off base. And the whole thing is being
conducted in a sort of a paranoid atmosphere of supersuspicion, you see? It does him good in
spite of all this, you see? It's just slow. That's all. It's just slow.

You can do Security Checks all backwards and do them all on the meter and stare at
nothing but the meter and never listen to what the pc says and go out of communication with
him. And you can still get away with it, probably, and you can still get the Security Check
system working. And you can still get an advance with the pc, but at what time ratio? Now,
we're just talking about time ratio. And that's all I'm trying to teach you these days.

All right. And you can build up something else that gives an entirely different time ra-
tio. And that is when you ask the pc, you ask him as a friend and with the encouragement that
he probably can remember it. If he has done it, he's certainly going to remember it, and then if
he has done that, he is certainly going to tell you. There is – no other thought ever enters your
mind than that this is going to happen. And you read him the question and only when he says
"no", in one time or another, do you check the thing out on the meter. And then when you
finally have checked it out on the meter, you got four things in agreement: the auditor, the pc,
the E-Meter and the reactive bank. They're all in agreement that it is "no". All right, then you
go on to the next question.

And you can do that with rather great rapidity because, as I say, he will keep remem-
bering them faster and faster. It isn't that you're – you see – it looks a different way. It looks
like his confidence in you is increasing, so therefore he can tell you. That is not what's hap-
pening. What's happening is he is able, better and better and better, to overwhump his reactive
bank and his withholds, and stare them right in the teeth and confront it and own right up to
them. And when he starts doing that more and more rapidly, he of course is taking more and
more responsibility, and you'll find these things are really blowing. He doesn't creep out of a
session and feel like a cur dog and so on. He feels good about it, you know?
And you get him back in the session again, and you get that confidence inspired once more. It's really rolling: It's just a question, he tells you all, you check it out; it's a question, he tells you all, you check it out; it's a question, he tells you all, you check it out. And actually, it's just more and more easy for him to do this. And therefore, it's easier and easier to conduct the Security Check.

And you'll find out that if it's conducted the way I'm trying to outline to you here, that you will get **forty or fifty times** the number of withholds off the case. Oh, you mean you get more off the case? You *said it*! You get *more*. Then he blows it *faster*, and it takes less time to get the more. Can you see that?

Well, what are you doing? Slowing it down, see? And the only way you can slow it down is be sure he won't tell you; be certain that it is the *pc* who is withholding it from you; be absolutely certain that it's only through the greatest of chicanery that you will eventually be able to trap him into a point where he has to run up a white flag and surrender with sword hilts reversed, you see? And say, "Well, all right, I've had a game with you and so forth and I give up now, and you've won the game." Now look. That isn't the attitude which you're trying to promote at all.

The other attitude is the one you're trying to promote, which is, "You *too* can remember your overts. You can do it. You can do it. And there they are and – uh-huh. All right. That was pretty good."

And you know, it is all in an understanding of exactly what's happening. Now, you got subjective reality on this, all of you. All of you right here at this particular instant undoubtedly have felt tortured at one time or another during a Security Check. You know? You were perfectly willing to tell, but the auditor didn't seem to be willing to listen. Or yourself couldn't quite put your finger on it, and you were trying hard, and the auditor seemed to blame you for not being able to put your finger on it, you know?

And the auditor was blaming you, but you were *trying* to remember, and you couldn't quite get it untangled, and the auditor gave you no help. Have you ever been in that situation in a Security Check? The auditor gave you no help to remember. That's because he's assuming. The auditor has assumed at that point that you remembered, but that you were just being mean.

So this is the assumption of a games condition in auditing, see? Don't ever assume a games condition in auditing. Never assume a games condition if you don't want one. You can materialize them left and right. You can materialize all kinds of games conditions. You can materialize more ARC breaks than you can shake a stick at.

Now, auditing is as workable as the rudiments are in. Well, what about this? Isn't this a better way to establish the rudiments during a Security Check than going over them with an advanced sensitivity reading and plucking them all to pieces; and particularly in Routine 1 when you're not supposed to be running verbal processes beyond a Security Check on somebody, trying to clear up his whole case by running rudiments and all this sort of thing. Don't you think that it's pretty apparent that these rudiments will just get ridden roughshod into the situation?
I have to confess to you that rudiments go out to the degree that auditing skill is out. And as auditing skill comes in, the rudiments come in. And you take a guy who has to have lots of havingness run on him, he generally is being audited by somebody who's audited him a bit roughly, you see? There's something going on here which isn't quite a good agreement, you see? So the rudiments are sort of perpetually out.

Well, if you can see that a profile can be held up and made absolutely static by a present time problem; if it can be reduced by an ARC break – if these two things are continuously present – naturally the case won't advance very well, will it? All right. So the best thing you can do is to create the operating atmosphere in which these things can't happen.

Now, if you are suspicious of the pc, continuously suspicious of the pc, they will happen because the pc isn't being bolstered by the auditor's confidence or the auditor's attack on the pc's reactive mind, you see? The pc isn't bolstered by it. The pc is just drifting.

Now, you see how you could really speed one of these things up? I'm sure you saw it earlier today, and I'm already going over ground which Mary Sue has already very, very well covered with you.

Perhaps it's a bit of an invalidation to go over it again, but I want you to see it in this operating atmosphere, not as a mechanical thing but as a created atmosphere that an auditor can create in a Security Check. And it's the basis of creation is simply: "Well, there you are and you've got a lot of these things occluded, and you can't remember them, and we're going to find them, and we're going to ventilate them, and you're going to feel a lot better. And after you've answered a few questions, then you too will be sure that you can remember the remainder very easily."

And the guy, you know – this kind of an operating atmosphere – he, "Oh, yeah. Yeah." Well, he's remembering faster and faster, and so forth. And he tells you once in a while, "I don't know if I want to go on with this. This is remembering too fast."

"You know. Well, come off of it. You can face up to these things. Have you ever faced up to 'em before?"

"Well, yes, yes. Yeah, I've faced up to 'em before. Must have faced up to them before. I did 'em."

"All right. Face up to them again! All right. Here's the next question."

"Did I face up to them? Hmm-mm. Heh! I can do that." You know, bang!

And he does.

Can you get some concept of the velocity involved? That is to say the speed of advance – of the increased speed of advance – that you can do with just this single factor. Hm? Do you see that that single factor injected into Security Checking could enormously increase your speed of advance, huh?

You set yourself up as somebody that people cannot help talking to; you set yourself up as somebody in whom people have confidence; you set yourself up as somebody who can be confided in, and you do a fantabulous Security Check.
You set up yourself as a cop who is going to sniff out the crime in spite of everybody preventing you from doing it – heh-heh-heh-heh! rrreh-heh-heh – and you'll have to sniff out the crime.

I'll tell you. It's a direct test of how good an auditor can do this, how many times he has to resort to the E-Meter to get it all. That's a direct test. The more often an auditor has to resort to an E-Meter to pull the teeth of withholds, the less he is using this. So you yourself have a good test that you can use while Security Checking. If you're finding you have to resort to the E-Meter, resort to the E-Meter, resort to the E-Meter, you know? And, "Did you do it?" And you get another fall. And you have to clear that. And you get another fall. And you have to clear that, and so on. You have to assume that you don't have the guy's confidence, that's all. You don't have this pc's confidence. That's what you have to assume. That's the first thing you should assume. That's the time for a heart-to-heart talk – time for one of these nice fireside chats.

You say, "Well, what'd be the liabilities of telling me about these things?"

"Woooh..."

You'll be told. You'll be told why you didn't – weren't easily able to bring about this atmosphere of confidence. Now having brought it about, get subjective reality on this, you know? Having brought about a better atmosphere of confidence, trust and communication with the pc, look at the speed with which the Security Check goes and how seldom you have to check against the E-Meter.

Well, what is this? It isn't the pc has become more willing to tell you those things which he himself was knowingly hiding. I'll tell you he doesn't know these things. You've given him enough horsepower now, see, that he just goes into the bank one way or the other, and the fur flies. He remembers this, and he remembers that, and he remembers something else, and there it is, and bang! bang! Oh, yes, he can attack that. Yeah, he can overcome that. After a while, he's saying sort of "Aah, bring on your reactive banks. Who cares? I can lick them!" Got the idea?

It's the way the first clearing was done, was in that operating atmosphere. Well worth remembering that there was an operating atmosphere that had to do with that. It was simply increasing somebody's confidence over his bank, and increasing his confidence over his bank and increasing his confidence over his bank, and they go Clear – not by running this or that or getting mechanical. They will go Clear, if you just increase their confidence enough over their ability to knock out the bank. Have I made my point?

All right. Well, I hope it's of some help to you.

Thank you.
TRAINING ON TRs,
TALK ON AUDITING

A lecture given on 30 June 1961

Okay. I think this is the 30th of June and 61, Briefing Course Saint Hill.

The first item that we should discuss today is the fact that I'm going to give you lectures after this on Tuesday, Wednesday and Thursday because you look so exhausted, you know. You look so exhausted come Friday that it's actually very – hard talking to you, you know. The CCHs are what are getting to you, I think, and – not so much receiving them, but doing them on people. The Security Checks, they're probably the most exhausting. They exhaust all sorts of charge on cases. Anyhow, all joking aside, I'll be lecturing on Tuesday, Wednesdays and Thursday afternoons.

Oh, yes, I have a news item. I have ceased to own two boats in the last twenty-four hours. Not having gotten my hands on them very solidly, and apparently have gotten hold of the – a Fairmile B., an old antisubmarine warfare vessel, 116 feet. They're good, solid weather boats – they were in their day. But the luck of the Irish, it's very interesting. I mean, it's the middle of the year, you see, it's way off season, and the most fantastic buys are just going begging, you see. So I couldn't resist one. We need one anyhow for this expedition. That's what I've been trying to find. So I finally connected with this boat, and you'll be hearing more about it.

Matter of fact, it has enough staterooms on it to set up an HGC. [laughter] Yeah. But don't worry. Of course, if you got audited under those circumstances, about the middle of the session you'd hear a howl coming through the loudspeaker system, you know, "Now hear this!" – I wouldn't be able to keep out of that valence, you see.

Well, anyway, I think you're making pretty good progress; by and large, making pretty good progress. I notice one or two of you are changing your minds about things anyway. Life should be looking a little easier, and if you're doing your Security Checks in this mood that I've been telling you about – of course, it's the technical precision, but there's a mood goes along with it. And that's practically the first time I've ever introduced, to amount to anything, for many years the subject of mood in auditing.

And you can classify it now precisely as a technical asset. The medicos never did that. They just said a doctor had a bedside manner or he didn't have a bedside manner, and he would be a good doctor or he wouldn't be a good doctor, and that was the end of the description, see. But you can say that an auditor who does not encourage the pc to overwhump his reactive bank and remember things and so forth has a poor auditing manner.

But what is it? It's just encourage the pc to overcome his aberrations and surmount them and get the show on the road, you see. I'm not talking about, now you tell him to invalidatively or something of that sort, but you audit him encouragingly. You know, "Come on,
you can do it" instead of "You schnook", you know. And that would be the difference between a good auditing manner and a bad auditing manner: was whether or not the element of hope, confidence and encouragement were entered into the session. Now you enter those three elements into the session, and it becomes comprehensible what we're talking about. And as soon as you enter those in, you'll find the pc runs faster, considerably—completely aside from anything else.

All right. Well, you now probably have a much deeper insight into the TRs. Do you have any insight into the TRs? [Audience: Oh, yes!] You think you can do these? I'll give you a note here in passing.

Time after time you're going to find somebody in organizations or something trying to teach the TRs this way: Go on to TR 0 and stick. And now it's—eight months from now, we'll still be doing TR 0. You got that?

You're going to find that consistently because the element of endure enters into it, see? Now, that is improper.

Here is the way you do the TRs, and that's probably—you'll find very valuable.

You do TR 0, flunking only TR 0.

You do TR 1. The guy didn't pass TR 0, see. He just got accustomed to it a little bit. TR 1: You do TR 1 flunking only TR 1. Don't flunk anything else.

TR 2: Flunk only TR 2.

TR 3: Flunk only TR 3.

TR 4: Flunk only TR 4. You got the idea?

Now come back to TR 0. Get the guy better at TR 0, and go on through it again, flunking only the TR they are on. You got it?

It's kind of like running the CCHs. You get a better idea of it, you know. They get a little bit of a win at it, and you go on to the next one. You got the idea?

Now you go back, and maybe the third, maybe the fifth run through, according to your judgment, you start TR 0 and you insist that it's pretty good. And there's another element I've just missed. About the third run through you should really start cuffing them around. Flunk only the one they're on, but start cuffing them around hard, see. Give them the business. Give them things they can't possibly confront, you know. Try to shake them up. Let them coast in on it easy. I better review that so that you don't get a double confusion.

TR 0, TR 1, 2, 3, 4, flunking only the TRs 0, 1, 2, 3, 4; flunking only the TRs, not giving the student much trouble. All right.

Now! Start in. TR 0 and give them the works.

TR 1 and give them the works; 2, 3, 4. Flunk only the TR that they're on, but give them the works. You understand? Don't give them a chance.
All right. Now, run through them that way a couple of times flunking only the TR that
they are on, giving them the works, pushing their buttons, you know. Give them something to
confront for sure.

And then start this business of TR 0 – mess them up.

TR 1 – mess them up and flunk TR 0s. Flunk TR 1 and TR 0.

TR 2 – mess them up. Flunk TR 2, TR 1, TR 0.

Get them on TR 3 – you're messing them up. And flunk TR 3, TR 2, TR 1, TR 0.

Get them on TR 4 – messing them up. And flunk TR 4, TR 3, TR 2, TR 1, TR 0.

And thereafter, running the TRs, always give them the works. Flunk everything in that
battery of TRs. You got it?

If you do that, you shorten the time it takes to learn the TRs considerably. You see
how this is?

In other words, you approach this with a gradient scale. We did learn about gradient
scales many years ago. Now we should continue to apply that knowledge. Let the guy get
used to it, and you'll find out they progress much faster if you do it that way.

Now, learning Model Session. Model Session actually can be learned concurrently
with learning the TRs, but for a while just let them learn Model Session. When you've got
somebody that's got all of his TRs pretty good, make them do Model Session, which they've
already learned and they can rattle it off and all that sort of thing They've got it letter perfect,
you understand.

Now there's another Model Session. And that's Model Session with all the TRs in.
They can do Model Session, you see. Is it all right if I don't bat this pc's ears off or something
of that sort? They can run this off, see, rapidly.

And then when they've got their TRs flat, your next gradient step on TRs is Model
Session. You run the TRs with Model Session. And you let them go through it with Model
Session, sitting back, not giving them a bad time but just letting them go through it but flunk-
ing all the TRs, 0 to 4. Just flunk those TRs. Let them go through the Model Session. You see,
they already learned the Model Session, probably while they were doing their TRs. And now
you put them over the jumps, flunking each TR from 0 to 4 inclusive that they flop on. Give
them the business, you see. Just flunk them on these things as you're doing the Model Session.

Now step it up. And give them a lot of trouble as they're doing the Model Sessions,
and flunk all TRs. You got the idea? Long since, you should have finished flunking Model
Session flubs. They should be – before you begin any of this, you see, they should be in a
position where they can go over the Model Session without laying eggs or flubbing, you see.

So now when you're giving them the business up along the line – you see, you just
flunked TRs while they were doing the Model Session. All right. Increase the tempo. That is
to say, give them a bad time while they're trying to do the Model Session and flunk all the
TRs that they flub, see. Because – but now they're going to start flunking on the Model Ses-
tion too, because it'll rattle them. Got the idea?
So you flunk the rattles and you flunk the TRs, and you flunk the lot, and eventually you get a guy up to a point, no matter what button you push, no matter what you do to him, his TRs don't go out and he can continue to do the Model Session. And boy, he's got it made. It gives an auditing presence that is utterly awesome.

But the steps I've just given you here are probably the steps which you should use in teaching staff auditors and people around, field auditors and so forth, to do it. And if you follow those steps and insist they work at it, why, you'll get there, but if you insist that they sit and grind on nothing but "Model Session" (quote), you see, or you sit -- they sit and grind on nothing but TR 0, or you know, you just stop the whole thing. Actually, you in effect stop their learning. They sit on to an endure. It's just like you wouldn't run a CCH after it was flat, see. It's what you're doing. See, you run TR 0 and the guy has gotten a couple of jolts out of it, and he's uuunh, and he's this way, and he's that way. And then all of a sudden, why, he can do it kind of, you know. Well, that's it. That's it, you know. Knock it off then, and go on to TR 1. Got the idea?

So you're running on a gradient scale of wins and you don't keep giving him loses all the time, and he'll eventually get up to where he has a professional presence which is awesome to regard, you know. The room blows up, and he says, "I'll repeat the auditing question", you know. And anything happens, why, he's competent to take care of it. He doesn't get thrown out of session himself, then, just because some extraordinary emergency occurs, you see. He's not so nervous about the way he's running a session that he can't handle a session, you see? Hm? There are no TRs for the -- as such, tailor-made so that the person will just sit there and give the auditing command in the CCHs. But remember that the balance of the TRs which are taught in Upper Indoc are there to back up the CCHs. And you can do those much the same way by gradient scale. Got it?

Of course, it really gets something. You get probably far too complicated when you start doing Upper Indoc TRs, you see, and flunking the lower TRs. That sounds a little bit complicated. You know what I mean, you know? A guy is wrestling around madly with you and so forth, and you all of a sudden flunk him on TR 0. As a matter of fact, it'd be a good gag to pull on somebody, you know. But it shouldn't have any part of the training program.

All right. That should -- that should get you over the hump in teaching large numbers of people to do the TRs. If you follow that type of gradient, why, you'll find that you'll be very successful with it. Okay?

Male voice: Routine 1, CCHs -- what is the guiding factor when you come off Routine 1?

When do you come off Routine 1?

Male voice: Yes.

This is the established criteria. You'd come off of Routine 1 when they were nominally flat. Nominally flat. You don't have to grind them to pieces to the ne plus ultra, but you don't
want a pc who is getting big changes on Routine 1 to be shifted off of them suddenly. That's your main criteria.

The time to take them off, and the only time you can take them off, is when you have gone over CCH 1, 2, 3, 4, and they are, all of them, temporarily flat. You could take the pc off at that time. You could. But the best time to take them off is when they're going through them, not at the beginning of the run when they're not getting any reaction and before you get into the reaction stage of the case.

You know, twenty minutes, no change. Twenty minutes, no change. Twenty minutes, no change. "Well, we've done the CCHs." Like hell we have. You've got to go over them a few times and run through that gamut a few times and all of a sudden gog! you know, and whew! and zoog! and so forth.

Now, when you've got that out of the road, you'll find out that the CCHs have bitten. That's the criteria, you know. Have the CCHs bitten on this pc at all?

All right. If they've bitten, then you'd run it up to a point where you are actually back to – this is the theoretical perfect end of the CCHs – where they were all running routinely twenty minutes apiece, without any change. And of course, it would be a break of the Auditor's Code to run them any longer. After you've gone through them maybe three times with no marked changes, man, the CCHs are flat – with the proviso that they have actually bitten, while being run. Okay? Does that answer the question?

Male voice: Yes, it does.

Good. Security Check, by the way, has nothing to do with it. It is not an influencing factor because it's carried on over into Routine 2 and Routine 3. Just the CCHs influence it. Okay. Any other questions? Yes, Ken?

Male voice: A run-through of Routine 2. I'd like a run-through of 2 – Routine 2.

You'd like a run through of it?

Male voice: Yeah.

In what respect, beyond what's in the bulletin?

Male voice: The scale itself, primary.

The what?

Male voice: The Primary Scale.

Yeah.

Male voice: How is that exactly run? I've heard two ways: run generally through it, just naming off the various different items, levels. And using the terminal.

What terminal?

Male voice: Hm?

What terminal have you got in Routine 2?

Male voice: we don't have any terminal.
That's right. How could you name a terminal? I see where his confusion is.

*Male voice: Ah, okay.*

He's got Routine 2 and Routine 3, and where he has come across the crossroads here is that he's heard that in Routine 2, you can run Prehav 13* which, of course, gives you a list of terminals over in the chronic PTP of the pc.

*Male voice: Ah.*

So, you see, that could slop over into Routine 2.

*Male voice: Okay.*

All right. So therefore, you would have a terminal in Routine 2. There's where that is, but you wouldn't name a terminal unless you were doing Prehav 13 or the fellow has always had trouble with his leg and he just has an awful time with his leg – You can, by the way, take anything like this. You do an assessment. Actually, Routine 2 general runs encroach on goals, but you shouldn't get them confused. They're distinctly different because you're only giving Routine 2 terminals a lick and a promise. You're not doing anything with them to amount to anything. Nothing serious.

So what do you get here? You say to this – you never run a terminal without doing a Terminal Assessment. Always a Terminal Assessment. This individual just keeps telling you, "Well, the reason I want to be audited is because I have this ringing sound all the time in my ears", see. He keeps telling you this, and this is his hidden standard and a bunch of other things, you know. And so you say, well, let's do something about this ringing sound in his ears. It's even coming up as a present time problem. It's getting in our road, something fierce. The corollary is, every time you come into session, they have a big problem, present time problem with the husband. And it takes forty-five minutes of the session to clean this up, session after session. Well, you say, "to hell with this", because "What part of that husband have you been responsible for?" is not about to clean up everything there is to clean up about husbands. You got the idea?

Similarly, by the way, the confusion area here is that sometimes a pc on a Goals Assessment assesses out to his present time problem, but you're still running SOP Goals, you see. I'm talking about this other thing.

This pc just keeps having this present time problem, present time problem, and it keeps getting in your hair. Or the pc has a hidden standard. Just these two conditions. The pc has a hidden standard, hidden standard, hidden standard. What auditing result do you expect? You know, he keeps crabbing, "No results, no results." What's he mean? Let's clarify it.

And he says, "Well, well, doesn't mean anything. I'm just not getting any results."

"Well, what would have to happen for you to know that Scientology worked?" That is the golden question.

And he says, "Well, the ringing would have to stop in my ears, of course. And I know whether auditing has worked, you see, as to whether the ringing in my ears gets louder or

---

* Editor's note: Prehav 13, see definition and description further down in the text.
softer. And sometimes it hits high C and I know I've had a good session", and so on. You can find all kinds of weird things like this going on, see.

All right. Now let's do an assessment on the ringing in his ears. What is it? Is it ears? Is it ringing? Is it heads? You know, what is this difficulty? And we just make him keep saying terminals, terminals, terminals, terminals, terminals. You get the idea?

We keep writing them down, writing them down, writing them down. We get a whole bunch of terminals for this ringing in the ears, you know. A whole gang of them. And if it hasn't disappeared in getting the terminals, which it very often does, then you turn around and you run an assessment on these terminals. Find one which falls the most. You don't have to do it by elimination, by the way. That's just getting just a little bit too purposeful. Just take the one that seems to be the most reactive in that list, gives the most change, you see.

We take that and we assess it on the Prehav Scale. It's a kind of a mockery, you know, of SOP Goals, and we assess it on the Prehav Scale, same way. We give it great seriousness. We run it. We run it, see, on the Prehav Scale, but you'll find out that very often you have to run it by the needle. The level doesn't last long enough. And sometimes it grinds out longer than you would think, and you'll be quite surprised, but keep it going. And get it a bit flat. Sometimes it might take you two or three sessions, or something like this to get this thing really flat. When it seems to flatten, by any criteria, assess it again on the Primary Scale. Don't bother with Secondary Scales. Not for something like this. And assess it again and run it again. And maybe you might have to assess it again and run it again. But that time's [it's] gone. Now you've gotten the chronic present time problem that you were handling session after session wasting time on, with a poor process, see, with a rudiments process, and it was a very weak process. Well, let's get in there and pitch. See.

All right. The Prehav Scale opens up. You can run this particular terminal. You can run it ragged. If it goes more than three or four sessions though, you'd better ask yourself if you're doing right, you know. Something wrong here. I'd do it all over again. Do a Terminals Assessment on it all over again or something. It's going too long. All right.

Now the other operation, that's the PT problem sort of thing. That's PT problem of long duration to be absolutely technical. A person's had this for a number of years but not more than one lifetime, see. You do the same thing with Prehav 13, which is pretty gorgeous, by the way. That's a pretty gorgeous one. You -- you just better get that in your working kit because it'll run on practically anybody under the sun. And it just is marvelous. So far, all the reports I've had on Prehav 13 were utterly rave reports. So it's got lots of velocity. And it's called 13 not because of the position on the Primary Scale, which is what you're liable to confuse it with, because it's a successor to Formula 13.

And what you do, the way it's been is very easy. All you do is make a long list of everybody the preclear knows, even faintly, but personally, in his whole lifetime, this whole lifetime. Just keep putting down names.

Now, as the pc runs along, he's also going to think of other names, and every time you do an assessment on this list, he's going to think of more names. Well, you add those to the end of the list. You don't assess them when they came up. You got the idea? Don't Q-and-A with it. Just keep putting these new names he thinks of on the end of the list.
In other words, there's just a stable datum there that every time he thinks of a new name after he's ended his list – you know, the list is over. "That's everybody I know." Now he thinks of twelve new names, see. You add those to the end of the list. You don't assess them at the time he gives them to you. You just assess them in turn. You got it?

All right. You take this list and it'll be a rather imposing, overwhelming affair, and you're liable to think the first time you ever do this, "Good heavens, we're going to spend the next 875 hours of auditing doing nothing, nothing, nothing, nothing, nothing, but go over this list, list, list, nothing. Kawow!"

Well, that isn't true. As you do the assessment and try to find out which person it is, and as you pick one of these names because of its greater reaction... By the way, you – you assess down the list – you could assess something on the order of taking twenty of the names as a block, and just assess that twenty, and find the person in that block of twenty that has the deepest fall, you see. You don't have to assess the whole list like you would in SOP Goals. It actually doesn't much matter how you do it, you got it? You're straining at gnats; you're the ensign out there on the bridge, looking through the sextant with chewing gum in the eyepiece and pointing it and taking a very fine meridian altitude on the truck light. And then he goes below and spends the next seven or eight hours, you see, figuring it all out to the ninety-fifth decimal point, you see?

So he figures out – the point he finally arrives at was – is actually far smaller than a pin punched in the ocean, you know. The accuracy of his action is, however, anything that would put him anywhere on this planet with a sextant. You got the idea? I mean, this is a standard one. It's one I joke about because frankly it's one I've seen many times. This tremendous – I've seen engineers do this, you know. I've had engineers – well, you've seen them, too. It's just horrifying.

And sometimes these guys will be horrified at what you're doing, you know. And you say, "Well, we're going to throw this bridge across this stream here. We've got to fix up this – this steel column here so it's going to support the roof", you know, and golly, you throw in all of these factors. You think it over, you know, and you say, "Well, let's see, there's going to be a lot of tonnage up there, and then there'd be tonnage moving in and out. And there'd be this and there'd be that. And the mass of the roof is so forth, and our factor of safety, let's call it 5, and so forth." And you say, "Well, let's make the thing so it'll hold up 192 tons."

And this fellow you're working with says, "Aren't you going to measure it?" you know.

And you say, "Measure it, why?"

"Well, well, I know, but good heavens, such inaccuracy you know?"

And you look at him and you say, "But there isn't any way to get a totally accurate down-to-the-last-ounce weight on any building. The wind blows, people move a machine upstairs. After you've built the building, why, they drag in another machine, and they overstress the area and they understress it, and during certain times of the day it has lots of foot traffic, and other times it has none. How are you going to stabilize the load on this beam? There is no such thing as a constant load on ..."
"Oh, well, yes, there is, you know." And they just believe this so implicitly, it's pathetic, you know. And half the time those guys will put up a beam, and you'll put one small electric motor or something up above this beam, and it crumples, you know, like a piece of taffy. But, boy, have they figured it. Man, they've got the last piece of gravel that is going to be on the roof, you know. They have figured out even the weight of the seeds of dandelions that are going to blow, you know, and touch the top of the building. [laughter] They got them all. And then they'll frankly go on by the hour, and they will take this figure — which is at best a very rough, rough guesstimate, see — and then they'll take this figure and with what agony will they reduce it to what accuracy. See? And golly, you watch this. But they watch you equally in horror, you see, as you're doing an inexact operation.

For instance, I happen to know that the stresses on a helicopter airfoil had never been measured. Nobody has ever measured one because we don't have men that endure enough to get out there on an actual helicopter blade, you see, and put spring balances on them this way and that. And a slow motion picture demonstrates that a helicopter wing, while spinning — they're wings really — they've got a twist in them as much as thirty-five to fifty degrees. And you'll see this — this blade going this way and this way under actual use. It's the most horrifying thing to watch. You say, "How can any piece of material ever do this", see? And as the helicopter wing swings forward, it's got one set of stresses, and then as it goes around past the nacelle and goes back, it's got another set of stresses entirely different. And somebody's going to calculate this? Man, that is just unimaginable. After they've calculated it, you see, what have they got to do? They've got to carve out a helicopter blade and swing it around to find out what it's going to do in actual service, and then make it a bit stronger, and they've got it. And that's the way it's normally done anyhow.

So I don't want in any respect to give you any idea that an exact formula, you see, exists in an area where the most wild, rough, slapdash is going to do some good, don't you see.

Now, it's quite one thing with what precision — because boy, it is precise if you do it right. And a lot of you have got reality on it, when you've run out all the guy's goals and you've got all of his terminals flat, man, the final one is just sitting there, and it's inevitable, and explains everything that's been going on and so on, and there it is.

In other words, you're up with a single answer because you're trying to achieve this single answer, you see. And there isn't any other answer. It isn't a dozen answers. It's just one.

Well now, that's quite a precise activity, and you then assess this particular one answer on the Prehav Scale and you're running for blood because you're running the fellow's whole track. Well, you have to do it pretty precisely. You have to make sure that it's the right level, after making very sure that it's the right terminal. Oh, yeah, a very precise activity. But looka-here: Prehav 13? Look, for heaven's sakes, there is no way to determine how fast these things are going to disappear. They may disappear on his mentioning having remembered them. They may disappear on charge on having them included in the list and read a couple of times as you're going over assessments.

They may disappear on the basis of you're — you've just got them, and you say, "All right. Now we're going to take Joe Jones, and we're going to run him on the Prehav Scale. Now, would Joe Jones be Cause?" You know, and here we go, you know, anything on the
Prehav Scale, and all of a sudden we're looking at the Prehav Scale, we're trying to assess Joe Jones, you know. Oh, we got a fall, you see, at Cause, and a tick at Faith. And we go back to those, and we can't get any reaction. No, you blew Joe Jones in the process of trying to get him on the Prehav Scale.

All right. Let's say we've got Minnie Gulch. And Minnie Gulch is over here, and we get her, see, on the Prehav Scale. And we actually find a level and it assesses out beautifully. And Minnie is sitting right there at Withheld Effect or something, and here she is. Man, we're all set, and we're forming the auditing command, and we're all set. There's no reaction on this thing, let's see now. She's gone.

And then you're suddenly startled out of your wits by having Mr. Zilch suddenly turn up on the case and not only hold good for a whole assessment, but hold good for the whole of the formation of an auditing command and hold good for about five hours of auditing Kawow! See? This throws you out of balance totally.

So every time you have to go through the same action. But don't expect that there's going to be anything very definite about how long that name is going to stay hot, because it isn't going to stay hot in some cases and it is in others, and it's very inexact. Well, in view of the fact that you've got this many vagaries of behavior of the list – yes, it is done precisely the same way every time, but it doesn't much matter whether you assess the whole list or assess part of the list or do what. It's all in what would be the most effective or efficient on how you handle this list – actually, how you assembled the list and so on. This is rough because you're doing a very inexact thing And I'll tell you why it's very inexact. Do you think there's a single person on that list that he's going over that had actually power enough to aberrate him the way he is?

So if you make the mistake of believing you were doing anything else but making the case happier or easier to run and getting all the present time problems out of the road, taking these people off as locks. You're just making things easier for yourself, you see. That's the only reason you're doing Prehav 13. In spite of the fact that it makes the preclear happy, it isn't going to do a great deal for his case at large. It's just going to make him easier to audit.

You haven't gotten any of his major aberrations out of the road. If you got one out of the road, don't get silly and believe that you've done something fabulous for this case because, let me tell you, you haven't. There isn't anybody on the list he'll give you for this lifetime that had power enough to aberrate him. Not a single soul. And this guy says all of a sudden, "Oh, I just had this wonderful result and thank heavens you finally found out the fact that my father used to beat me every evening, and I never forgave him for this. And isn't that fine, and isn't that nice?" Aw, pishtash! [laughter]

It'll last at best only about twenty-four hours, forty-eight hours, something like this. Now, if you could get all of his recall back on this lifetime, ah, that would be a big step forward. If you got all the not-knows off on this lifetime, that would be big. Because you'd be opening the track to his other lives. There's another Security Check that's coming up which is the whole track Security Check. You got it?

Audience: Yeah.
Of course, you wouldn't use that until the person had some kind of an idea that he'd had a past. I imagine it's quite something to struggle with, isn't it? Well, don't take it unless it falls. Unless you get an instant fall, don't pay any attention to it. A lot of these things are intriguing, you know. And you could wind the pc up just bragging. [laughter]

Here's this other Prehav 13 though. Well, you're just smoothing out the auditing and you're smoothing out his life, and you're keeping him from getting rudiments out while you're auditing him. Now, don't mistake it. This is very valuable. But that's all you're doing. So to lay you down any precise estimate of "For 3 minutes and 57 seconds point 9 if the tone arm is registering at 7.1, but preferably if it is registering at 7.199264", [laughter] "this you do and that you do and so forth. And then it's this way and it's that-a-way and so forth." No, it's just one of these crude, rough, kick it over, let's find out what's biting him. Let's get these PT problems all out of the road effectively on the Prehav Scale, you see (which is pretty powerful), instead of kicking them in to sessions and having to get rid of them in rudiments all the time.

That's actually the basic use of Prehav 13, is keep yourself from being messed up all the time by having the rudiments out, you see. That's its basic use. And its auditing value? The pc'll think it's marvelous – actually very slight.

Compared to a Security Check, it's nothing. Therefore, this type of action gives you all of the latitude in the world. How do you find all these people? Well, if you just took everybody you knew and took them one after the other, crudely, and assessed them on the Prehav Scale, most of them would blow out. Oh, you leave five hot. So what! They didn't do anything to him, anyhow. Got the idea?

See, its a very highly imprecise action. It's just something that you get out of the road. You can go over this list. You'd end it when you could go over the list without getting any kicks on the needle. That's all. Not even with a very high sensitivity, you know. You know, third-of-a-dial drop.

Oh, I got a joke on somebody on sensitivity. I told you Herbie was having trouble, and I put him back on the line, and I had it put up on the board here. But he says, "Sure enough." Only, it was – surprised me, the observer on the ground found something that I didn't necessarily predict, see. I thought that he'd find that they were setting the sensitivity knob too high while they were doing rudiments. This isn't what he found. Being right on the ground, he had an opportunity to observe it. No. None of them knew what a third-of-a-dial drop was. [laughter] You see?

Remember what I was telling you. It's just fantastic. It's just the unguessable. [laughter] Don't bother to guess it. Just look. We used to have a slogan: Look. Don't think. And it sure applies to this kind of thing, you know. Some guy is having an awful lot of trouble. Well, go look, man. Go look.

All right. The running of Prehav 13, the running a PT problems on a goals-type assessment, are done in Routine 2. And Routine 3 isn't clobbered up with this stuff at all. And there's where you got your crisscross.
Now, when you're just doing a general run as called for in Routine 2, you do your assessments just as you would assess for a terminal, but you certainly aren't mentioning any terminals. And you just go down the line. Same way. What I do is I take the list from the bottom and I run on up toward the top until the needle starts rising consistently. I do use a needle rise. And when it starts rising, I say, well, why go any higher, you know. And as I've gone up, I simply make a mark after the Prehav level that reacted. Every one that reacted. I didn't linger around on it.

You never repeat Prehav levels. You just say them, and it reacts, and you go on to the next one. And then pretty soon you'll find the needle starts climbing and climbing, and you say, "Well, we've hit the end of this fellow's reality."

All right. So we start back down again, and now we only take those points that we have a mark after. And we read those over once and find which one of those is still live. Any one of those that's still live, we make the same mark after it. Now you've got about two, three levels, or something like this you've got, with two marks after them.

Now, you read that second-mark level again to the pc, you see. You know, the one that got the reaction again, and you read those three over. And one of them falls out, and then you play the two against each other that remain. And one of those will fall out, and that is the level. And that is the fastest, most accurate way I know of, of doing a Prehav Assessment with a terminal, with a general level or anything else.

If you were to find that – while you were running SOP Goals – I'll make this comment because it – there were several checks here as to whether or not you're on the right track and you're doing all right as an auditor. I'd better mention them.

One of them is you do – this is about the third time – second or third time you've assessed this pc – preferably about the third time – on an SOP Goals run, and you're assessing this terminal which you have long since established on the Prehav Scale the third time, you see. You've already gotten rid of a couple of levels. You've run them. And all of a sudden you find twelve, fifteen levels of the Prehav Scale are alive. Uh-uh-uh, oh-oh, mm-mm, da-dadadat-dat. Wrong terminal. Wrong terminal. You goofed. And the thing to do is to end the assessment there. Right now.

Don't go on with it. You've got twelve, fifteen levels live. Something is awfully wrong. First find out what's been going on. Has the pc been selfauditing this thing? Has he been auditing some other terminal to himself? Has somebody else been running him, you know? Ask the obvious questions. No. None of these things.

So you sort of assume, well, I've goofed. So let's go back to the terminals list, and let's take the whole terminals list that we had, and let's read it all over again to the pc and find out what's wrong with it. And we may find that we have bought a cognition surge or something like this, and we selected that terminal too rapidly or something of the sort. Let's go back, because now we will find, possibly, that it wasn't quite the right terminal. Now we get the right terminal. Now just go on and run. Don't bother to go back to check your goal. That's certainly not going to be out. Your goal is kind of uncheckable anyhow, because the moment the pc's attention is put on terminals for the goal, the goal desensitises.
All right. So that's the – that's one test as to whether or not in Routine 3 you're on the right track. There is another test of similar validity. And when you're doing a level and, without being even questionably flat, the tone arm just goes up, particularly between sessions – the tone arm just goes up. This doesn't happen every time, but between sessions, you know. He left reading at 3.5 and he comes back in reading at 6.0. Or you're running him, and fantastically you've got a tone arm which goes – it's been running between 3.0 and 4.0, and all of a sudden it starts to run between 4.0 and 5.0, and then starts to run between 5.0 and 6.0. Well, that's another check. Your rudiments are out. That's all that means. Your rudiments have gone out somewhere along the line, see. The pc's got a withhold from you. The pc's got a present time problem. The pc's got something or other.

Now, this is a little bit confusing to read because toward the end of a line, just before the level gets flat on a terminal, this also happens – to a slighter degree, but it also happens. Your level is just about going to get flat, and the tone arm will go up half a point, and it kind of gets sticky and goes up and so forth. Well, so naturally, the best way to get around this is to check the rudiments before you reassess. If you think something is flat, your end rudiments should be very thorough. You think something is flat, you should end the session and hit those end rudiments very thoroughly, before you do your next assessment. And of course, you've got another crack at it in your beginning rudiments.

Now do your assessment, and if the level that you have been running is still alive and it was only an ARC break, it'll become obvious to you because the rudiments were badly out. You understand? And if the thing appeared flat, but then you went into the end rudiments, and the rudiments were very badly out, you would then assume that it really wasn't flat. And the – really the safe thing to do even before you reassess or test anything or anything else is, run another twenty minutes of it. See, after you've got the rudiments straightened up, run another twenty minutes before you finally get down to assessments. You see that?

That's the careful auditor. You won't make any goofs this way. A pc can go out of session, and the level you're running on SOP Goals appears to be flat. This is normally signalized by – when it's apparently flat, but reason is an ARC break or something, the tone arm is going to go pretty well up before it flattens. It's going to go pretty well up. So as I say, in – before you assess again, you should run those end rudiments, run some beginning rudiments, and if you found the rudiments were wildly out, just assume that thing wasn't flat and run another twenty minutes of it. Another test, in other words.

Now, this is – works exactly the same way in running Routine 2 on general runs. That general run is a highly precise action. And all of a sudden you're running Failed Leave on the pc, and you're running it and run it and running it and running it and running it and run it and run it and run it. And all of a sudden the tone arm goes up about two dial-divisions. And all of a sudden there's no motion. Well, one of two things could be the case.

Case 1: It's flat. And Case 2: He's gotten a violent ARC break or a violent PT problem or something else has happened, very harsh, very rough on the case. And in either case, whether running Routine 2 or Routine 3, you should make a very careful rudiments check. So therefore, you end the session. You don't say "Well, that process is flat. We're going to reassess for a new process." No, sir. That'd be a bum one to do. What you do is go over those end
rudiments. Now see if they were wildly out. You know, he had a PT problem. He had an ARC break. He had a withhold. I mean, you know, wow! See?

And you notice while you're doing this that the tone arm comes down. You'll see that happen, if this is the case, you see. And don't ever make the mistake of thinking the level you were running was flat because it isn't. And the safe thing to do is to, of course, give it another twenty minutes.

Now, if it *is* flat, of course, it'll remain flat. There isn't anything mysterious going to happen here. Nothing is going to unflatten it. There isn't any walking on the thin edge of anything. Go ahead. Test it again. So you might say, to absolutely guarantee the results you're going to get, the proper thing to do is, when a level is flat — whether Routine 2 or Routine 3 — the proper thing to do is to run end rudiments, beginning rudiments, and if these things markedly shifted the tone arm down, run it for another twenty minutes to find out if it was flat. Okay?

Of course, this even means an ARC break for the pc sometimes. But so what? I'll tell you this. I've never had it fail that when a preclear was ARC breaking on the basis of "You are running this level, and this level has long since been flat!" and so forth, and I have never seen it otherwise in the case that the level was just about as flat as the Tasmanian Sea, which everybody knows measures waves seventy feet between trough and crest. Not flat.

Just the fact that the pc is saying, "Yow, yow, yow, yow, yow, yow. And I know it's flat, and I'm tired of it, and I want to get off of this, and you just keep running it. And actually it's killing me because you're bringing in these other masses on me, you see. And it's all very ruinous and *yippety-yap, yippety-yap, yippety-yap.* I don't even look at an E-Meter. I just go on running it. Not to punish the pc, but I know the pc is just on the verge of a startling and horrendous gain, and sure enough you'll see it every time.

The pc will all of a sudden say, "Oh, well, what do you know. Gee. Wow, *uh-huh-huh! Hearh!"* They never tell you though, "Boy, it's lucky you kept on running that, man." They never say that. They never hear them say it anyhow. They only say, "Yow, yow, yow, and it's flat, and you know it's flat, and you're just running it to punish me. You're just running it because I said I didn't want to run it. That's why you're running it."

It's like the CCHs. When anybody says, "No. No. No. No. No. No. No. No! No! No CCHs. That's only for nuts, psychotics. That's for bums. My case isn't in that bad shape. Actually, I had the CCHs totally flattened in 1952." [laughter] And, oh boy, is that a good enough reason to run them. I mean, it's a perfect assessment. Something is overwhumping the pc here. Because a fellow, let me tell you, that has the CCHs flat will simply sit down and run the CCHs, bang! There's nothing to it, see. You just sit down, he'll run the CCHs. You got a reality on that now, I'm sure. They sit down, they run the CCHs. So what's that? That's nothing very drastic. The auditor will find out in exactly eighty minutes that they are flat.

All right. Good. Of course, if the pc asks you to put it in writing so that it won't happen again, [laughter] once more we have another test. The only place that the CCHs can really fool you is on the beginning of the run, and that's the only place a level can really fool an auditor. There is no telling at the beginning on many cases, whether the CCHs are flat or the level is flat. Because in one case the pc has no reaction; in the other case, the E-Meter has no
reaction. You don't get any reaction out of the pc in the CCHs. You don't get any reaction out of the meter on the level. And you go on. You run it and you run it and you run it, and you go through them once, and you go through them twice, and you go through them again. Aaaahhhhh. Nothing happening here, and all of a sudden the pc says, "Thuuuup!" Thud!

And then they get liver, and they get liver, and they get liver and liver, and then they're getting real hot, and the pc's going along just dandy, and everything is fine, and only after they've hit a peak of some kind, do they then cool off.

Similarly, with a level: you take some case, particularly that has to have a high sensitivity knob setting. And you start to run this level, and it's Failed Cause or something, you know. And here you go. "What have you done to the Confederacy? What has the Confederacy done to you?" Failed Cause, something of that sort. [laughter] And you get to run it along, and here you go. And you're getting an eighth-of-a-dial tone arm motion. Eighth-of-a-dial tone arm motion. Eighth-of-a-dial tone arm motion. Every twenty minutes it shifts a sixteenth of a division, you know, that kind of thing, you know.

And it'll shift an eighth of a division, and then it'll shift a quarter of a division. Then it'll shift half a division, and then it'll shift a division, then it'll shift two divisions, and it looks like it's doing a rock slam over on the tone arm read, see. And then it's hot, hot, hot, hot. And it runs hot. And it runs for a long time, and then it starts running cool, cooler, cooler, cooler, cooler, flat.

And you can expect this cycle of action to occur on the unflatness of any process in the three routines. That can happen anywhere in the three routines. The person is getting no reaction to something at all. And then the reaction suddenly increases. Okay?

All right. Is there – are there any other questions? I answered that one rather obliquely, but it's some data I thought you ought to have. Is there any other question? ...

Okay. Well then, you've had a successful week, have you?

Audience: Yes.

All right. Now, on this weekend, you're not going to have anything to do this weekend. Nothing for you to do this weekend except, well, do SOP Goals and run the Security Checks and routine things like this. [laughter]

I want you to check over with yourself – have a heart-to-heart talk with your thetan – [laughter] and check over yourself, "Now, are my TRs pretty good? Do my TRs stay in while I'm in a Model Session – doing Model Session? Do I really know everything there is to know about this here E-Meter? Or is there some things that I don't know about this E-Meter?"

Find out definitely if you really think you've got a good grasp on Security Checking, and find out if your idea of running the CCHs – if you're running those okay; if there's anything you need to know about those. And then look over very carefully, and find out if you got a good grip on general assessments and the Prehav Scale, and so forth, on doing an SOP Goals Assessment.

Sort of do a review on yourself on those seven points, and let's see whether or not you have anything else to learn on these points that you feel terribly stupid about. And if, while
you're checking these over, a horrible feeling of stupidity comes over you, while you're just checking these over, then ask your thetan what it is. [laughter] But don't let it stop there. Don't let it stop there. Let's tell your Instructors about it and see if you can get some point in it straightened out. Okay?

Don't hide from yourself a lack of knowledge along these lines. Don't kid yourself, because there's no point in it. You're not getting any grades. Nobody is giving you any grades at all. It's the world that's going to grade you. Why should I? Okay?

Thank you.
ROUTINE 1A-PROBLEMS

A lecture given on 3 July 1961

This is the 3rd of July, and I told you today that I was only going to talk to you three days a week, but I was sitting upstairs and I got lonesome. [laughter] Besides, you have – something **new** has been added.

Now, you go ahead and add things, you know. You're always adding things to processing – I see somebody was doing a Goals Assessment on some pc, somewhere along the line, is – was something on, "What success have you had? Thank you. What success have you had? Thank you. Oh, that was too bad. What success have you had? Thank you." you know? Weird.

So anyhow, if you want to add things, well, I might as well be able to add things, too, [laughter] and there is a place for another routine. Actually, there are places for many other routines, and it'll probably go up like the CCHs did, you know? Get all complicated, and then be cut back to simplicity.

This is Routine 1A is what I'm talking about. And I'll call to your attention that we did not change, differentiate or invalidate Routines 1, 2 and 3. They're pretty good as far as I'm concerned. They've stood the tests – all the crisscross tests of time.

But there is a case that should be run on CCHs that can't be run on CCHs. There is such a case.

Now, let's look this over. There are three things which can hold up cases: present time problem, a big withhold or an ARC break. ARC breaks normally stem from withholds.

There is a process on ARC breaks, which is "Recall an ARC break." It is not an unpoweful process. It is quite a process. If not flat, it becomes quite a process. That's just that one process. It's just one repetitive command. "Recall an ARC break." That exists.

And if ARC breaks are taken separately or under the heading of overts and withholds – to which they're intimately connected – it gives you either two or three things that could be wrong with a case that isn't progressing, you see?

It could be present time problem, withholds and ARC breaks. Or it could be present time problem and O/W. You see? They both amount, more or less, to the same thing.

So you'd say there are fundamentally two things, then, which are productive of three things. All of which mean case deterioration or no progress.

The two things, of course, are problems and withholds. And these are productive of problems, withholds and ARC breaks, you see? But by running just the two of them, you can cure three, ordinarily.
The person who ARC breaks badly, and so forth, is normally staggering along under lots of withholds and a lot of unkind thoughts and that sort of thing. ARC breaks should come under the heading of O/W, in any event, because that's the way you cure an ARC break with the pc. The pc is ARC breaky, you run O/W and that's it.

But there is nothing, via'd, that will cure a withhold except getting rid of the withhold. And there is nothing that cures a problem but getting rid of problem.

Do you see that? You're looking a little bit blankly at it. I wonder why? Because this is terribly, terribly, basically simple.

If a case isn't progressing in an HGC, you immediately assume that the case is either being audited on a PTP or the case is being audited with a tremendous withhold. See, these two things is what you immediately assume and that's what you should assume.

So how about the CCHs walking uphill against tremendous present time problems? There's no way to get rid of the present time problems, if you're running the CCHs, because there are no rudiments; and your rudiments processes probably wouldn't work on this pc anyway, quite interestingly. They don't work very well. So this leaves us room for Routine 1A.

Now, Routine 1A would take care of just these two factors: the problem and the withhold. Just these two factors would be cared for. That would be all. You wouldn't do anything else, then, but run a Problems Process and a Security Check. Problems Processes and Security Checks, and Problems Processes and Security Check. You got the idea?

Well, the only reason 1A could come to fruition so suddenly is that I had a nice blue flash. It was about from here to that oak tree down in the middle of there, and it turned the air a little bit ozonish for just a few minutes; and suddenly realized that all this work that has been done on problems – which began in earnest about 55 and saw the light of day in 56, and it's been heavily stressed ever since – had not been simplified to its lowest level of simplification. And that lowest level of simplification is the process "Recall a problem."

It runs all legs of the bracket. It'll run thirty-two legs of the bracket if you let it, see? It doesn't say whose problem you're supposed to recall.

Of course, the person usually recalls their own problems for a while, and then they realize that they're a problem to somebody else, and so forth. And this gets this thing of problems. Something – you do something about problems. Not necessarily a fast process.

But there are several things that I should tell you about problems in order to understand the handling of this particular thing. And I finally have found out what it is that makes a problem so deadly in processing.

Well, a problem is postulate-counter-postulate. A problem is ordinarily two ideas counter-opposed. It's an indecisional proposition. One cannot decide, because there are two things one could decide and when these things become even faintly in balance, one of course gets his attention on two data. This, of course, is almost impossible as a situation. So one doesn't see the amount of confusion on it. And the confusion tends to ball up and pile up, you see? And the confusion starts mounting around each one of these data. And you get two separate zones of confusion and the stable data.
I'll give you an idea:

Mary says, "Let us go to the movies."

And John says, "Let us play checkers."

Now, if these two things are of equal magnitude as to what we should do, we cannot look at the idea of movies and we cannot look at the idea of checkers. Because, you see, there's no deciding between these two things. Then, of course, movies start to ball up as a confusion. You see, because we're going to go to the movies, but we're not going to do it, you know? We're going to do it, but we're not going to do it. That's just an insane situation, you see? Now, we're going to play checkers, but we're not going to play checkers.

So we get two of these confusion and the stable datum. There are two of them there, not one. See, there isn't just the confusion and the stable datum, which is the ordinary spin that a person gets into and gets out of. There's two of them.

And you mustn't look at either postulate and you don't look at either confusion. So nothing gets as-ised. So a problem tends to persist and the common denominator of a problem is persistence. Of all things that endure, a problem is the endurigest. Problems endure longer.

So people become impatient with problems and they solve them. Now, a problem that is solved is a problem that is not-ised, not a problem which is as-ised, in the ordinary solution.

Now, people go along solving problems all the time.

Now, the solution of a problem, at the finest reductio ad absurdum, is of course, an overt against a problem. See? Problems can't just be problems; they have to be solved. And so much is so, that everything there is in this universe is a cure for something else, which is to say a solution to some other problem. And this is a basic factor in the persistence of the universe.

This isn't the only reason the universe persists. Mechanically, there is another reason. But as far as thinkingness is concerned, we get the oddity that everything is a cure for everything else and that all cures deteriorate and in their turn, become the new problem. All cures become the new problems.

Now, Jan and Dick, one time when I was discussing this in a lecture, they went home and figured out what time and space and matter and energy and so forth, were in time – in terms of cures. And they got it pretty good.

I had a big rack of cures of various things, in the lower order. So they pushed it over into the sixth dynamic to see what they were cures for and sure enough, they figured out that time was a cure for space and ... You get the idea. And energy was a cure for time. Everything was a cure for that.

I've never investigated this very thoroughly but it was quite interesting. Just the concept that these very elements with which we deal were cures for other things. But the basic thing is that nearly everything is a cure for something else.

All right. Let's look this over then. If that's the case, let's take a good notion here as to what this is all about and we find that alcohol, just about a century and a half ago, was curing
things. It was curing things. There is no doubt about it. I'll tell you that a naval vessel, like the USS Constitution, wouldn't carry three-quarters of its stores in potable beverages, unless it was good for something.

And somebody would get tired, you see? And they'd take a drink and they'd feel better – and life at sea was pretty miserable in those days – and they'd get cold and wet, or have a cold coming on or something, and they would take a drink and that would cure it. It really would cure it, you see? It was smooth. It really did work.

And nowadays, you take a drink and you get tired; and we have a disease called alcoholism. See, it itself is a disease.

Now, bacteria itself that causes disease at one time or another cured something and you can figure out most diseases on the basis of what they cured, which is quite amazing to figure out.

Well, you take an organization that is hammer and tongs on the subject of creativeness. The Roman Catholic Church is – no propaganda in this at all – it's just the fact that they do really have the hatchet out on the second dynamic, you know? I mean, they're real frothy on this subject. They don't think any creation ought to be done that can possibly be prevented. You realize that from their literature.

And they actively oppose any material being segregated which in any way, shape or form informs about cures or as-ises or has anything to do with the eradication of venereal disease. Because they think it's a good thing.

And VD programs in New York City in the recent decade or so ran into the heavy, heavy, heavy weather of anti... well, Catholic propaganda. They were just hot on this. They wouldn't let anything be shown to educate people into VD. Educate them as to what it was or how to take care of it or anything else. They spent enormous sums of money.

I see you're looking very blank about it. But this – I guess I'm telling you something that's news to you.

This is not news to anybody in the medical profession. They, as a matter of fact, are quite hot on the subject. That somebody would prevent the public from knowing actively how to take care of themselves on the subject of VD, of course, condemns the rest of the population to contagion – unwitting contagion and so forth.

It's just somebody is idiotically explaining how cancer is all right, you know? It's okay, you know? It's a good cure. Well of course, VD is a cure for sex. That's all it is.

Actually, there's terrifically heavy incidence of VD amongst military personnel. Why?

Well, I don't know. For some reason or other people get into armies and navies and so forth and they don't run into any women. I think it's very unenterprising of them; never had the trouble myself. But they do. They get into camps and things like this, and there are no women, you see? And they get on board ships and they're gone for some time at sea, and there's no women. I don't know who perpetuates this weird idea.

I know I wrote the Navy Department in 1942 and said we could use seven or eight girls on board. They didn't ... [laughter]
Actually, it would have been a good thing – having nothing to do with the second dynamic – because we couldn't get any sailors to man the guns, because we had to do all the cooking and yeoman work and so forth with fighting men, you see?

But I got interested in this one day, because we had innumerable – numerous cases of VD – a very unlovely subject. And of course, these cases would sort of wind up on my docket as something I had to do something about.

And when you're working in expeditions or corvettes, or something like this, you seldom have a doctor. Or the doctor is dead drunk or something. You sail out of a port and you've got seven out of a crew of a hundred men totally incapacitated. That can be very serious when you're already shorthanded, you see? VD. So of course, you break out the knockout drops and the sulfathiazole and the penicillin and so on and you let them have it.

Well, what was very interesting to me, a little Jewish boy – he was a terrific, terrific, terrific yeoman. He was marvelous. And he must have been all at about eighteen, something like this. He was quite a little guy. And, ah... name was Hymie. And Hymie came down with a roaring case of VD out on the Pacific coast. That's very interesting because all Hymie had to do was think of a girl, you see, and he'd practically go up through the funnel.

And we went out to rescue a careless pilot, who had mistaken the middle of the Pacific for his landing field and Hymie was hauled off the ship by the local medic. And Hymie, in tears, came by as they were dragging him away – literally dragging him away, you see – because here was his ship going to sea. My God, you know, and here he was being hauled over on the dock.

And he says to me, he says, "But Captain", he says, "I have never had anything to do with a woman, never in my whole life. How could I have venereal disease?" And they dragged him over on the dock. There was – doctors are a suspicious lot.

And we came back, having not found the aircraft. The army – I think they forgot to despatch it or something and everybody is educated by the movies, you know, into believing, you know that an aircraft goes up, and if it's unreported for fifteen and a half seconds that there are rescue squadrons all over the place, you know; and people talking efficiently on phones, and the Coast Guard talking to this and merchant ships at sea being alerted in all directions, you know. And you have very nice music backgrounding all this up, you know, [laughter] and so forth. And that isn't the way it's done at all.

All of a sudden, you'll hear a plaintive cry, someplace or another, and it sounds like a very faint Mayday and somebody's going down somewhere. And you take a radio fix on him and you instantly radio a base someplace, the nearest aircraft base. And you say, "Is one of your planes missing?"

And they say, "Well, we don't know."

"Oh, you don't know?"

"Well, no. We don't count planes taking off from here. You think we're crazy or something?"

And, "Well, is one of your aircraft missing?"
"Well, uh ... oh, I don't know. We'll find out in the next few days. Do you have to know?"

And you say, "Well, there's somebody out here yelling Mayday."

"Oh? Probably isn't from our base." [laughter]

That's an actual experience. I never did find any aircraft base that knew where any of its aircraft were, so that was pretty good. It's all propaganda, I'm afraid.

I don't suppose they abandon all of them. I suppose occasionally, when the press boys are around, they suddenly send out somebody to crash and get rescued or something.

Here we had ... That's a cynical attitude, but they're cynical people. I'm just Q-and-Aing with it.

So I pulled in alongside of the dock, and we're all disgusted, and there's nothing has happened. And we're all beat up and thoroughly dusted by the cruel, cruel sea. And we pull up alongside the same dock, and there's Hymie, see? And he's standing there with his kit bag, you know and he's looking very happy and very cheerful.

And he comes aboard and he says to me, he says, "Skipper", he says, "Heck, I didn't have it. I didn't have it. They told me it was something called a nonspecific." [laughter]

I talked to the medicos about this and they said, "Oh, yes, we get lots of those, lots of those." He said, "There's no bacteria present. There's nothing present and so forth. It's just a tremendous discharge." He says, "A lot of boys get very, very worried about this sort of thing."

I got to thinking about it later. I was going over this subject, here, a few years ago and it occurred to me that, obviously, venereal disease stops sex. So if sex is stopped, you get venereal disease. Got the idea? See, no sex equals venereal disease. Because venereal disease equals no sex.

And it goes both ways and you only get this high incidence of VD amongst very sex-starved people; and you get these nonspecific venereal diseases, you see, amongst groups of people who haven't anything to do with sex at all. Quite interesting, huh?

Of course, prostitution, and so forth, is about as close as you can get to no sex. You just ask men around London how close you can get to no sex at all, and they tell you prostitution. I actually conducted a campaign on this some time ago. That's also sort of a no-sex proposition, you see.

So this combines up in various ways, and we've got no sex, and we get over here a no-sex condition. So that's probably what VD is anyhow, because it very often doesn't even exist as bacteria. You got the idea? It's got all the symptoms, and somebody could be worried to death, but it isn't.

Well, there's a case of cures, suddenly emerging and arising, you see? Now, sex is a cure for no bodies. See? That's what sex is a cure for. And then, if you get no bodies, of course, why, you get a cure for sex. Get how weirdly and tortuously and involvedly all of this works out? Get the idea?
I mean, the cure becomes the cause becomes the cure becomes the cause. You know, the illness becomes the cure becomes the illness becomes the cure. You see how all this is?

Now, you haven't got a pc, whose ideas about horses sleeping in beds, who hasn't cured something with that idea. Quite factual. Every aberration he's got was a cure for something.

Let's take his motionlessness. This is why withholds work so well. His motionlessness is a cure for having killed so many people. See, that's a cure. If he doesn't move, he won't kill anybody. All right, so you pick up the withholds on killing, and all of a sudden he can move again. See, because he isn't under this tremendous compulsion.

But what was killing? Killing was a cure for something. Get the idea? Killing was a cure for hating people. If there weren't any people around, of course you didn't have to hate.

Well, what was hate? Well, that was a cure for associating with people to some way or another. Or that was to keep one from associating with people because one was liable to damage people. So we've come back to the same cure.

See? Hating people was a cure for liable to damage people. And then, of course, damaging people was a cure for people being people. And then, motionlessness was a cure for damaging people. You see how this works out on the withhold line? It's all this nonsense of one thing goes to another goes to another goes to another.

And guys will get some mighty weird, wild and wonderful ideas on what they're liable to do and how they should restrain it, or what's liable to happen and how they should solve it.

And as long as you see perfectly logical (to us) solutions, why, you think this is all right. It's only when you see these oddball solutions, you see, that you say, "Well, what is that a cure for?" And you don't understand it's a cure for anything and of course it isn't. So therefore, you say it's an aberration.

You might say an aberration is a cure that you don't understand or an aberration is a cure that doesn't cure anything or aberration is a cure that cures some craziness.

Now, you get all of this weird concatenation of illness is the cure, and the cure becomes the illness, and all these things get entwined and so on, and all these things go this way so irrationally because basically they are problems. It all goes back to the confusion and the stable datum, one kind or another.

Now, you get two confusions and two stable data and these are counter-opposed and you don't dare do one, and you don't dare do the other one; and therefore, you don't confront one, you don't confront the other one. You get an endurance because it is never as-ised.

And the endurance goes along the line on and on and on and on and on. Why? Because you never as-is the thing; it is always solved. You see? You do something else.

So these pcs, for instance, that have a via plus a via plus a via plus a via plus a via to run an auditing command inherit it simply on this basis of, they run into a problem, you see, and then they'll go up through the solutions, through a very serie – series of vias, and the basic thing wrong with them is the problem. That's basic. They've got a problem of some kind or
another. And this problem they have never frontally attacked. They have never looked at it as a problem; and not looking at it as a problem of course, gets them into some interesting states.

Now, when you say a problem of comparable magnitude, you've put the via of cure the problem – you've taken it off of automatic, you see? So you're getting the person to covertly look at the problem, look at the problem, look at the problem and you've seen it be quite effective. And all of a sudden the problem disappears. Well, why? Because you've made him look at the problem, look at the problem, look at the problem.

But basically, problems have terrific endurance. And they just run on the track forever. So therefore, certain conditions, which are designed to cure other conditions ...

A snake's venom is the thing which causes the snake to be antipathetic and it is a cure for the antipathetic character of people toward a snake. You see, you don't like snakes because they have venom. Well, they have venom, you see, because they – people don't like them. [laughter] You get how idiotic? This is always this idiotic – it all comes down to some idiocy, and we get the basic thing of Q-and-A is simply that the question's answer is always the question. The answer to a question is the question. You see?

You say to me, "Well, why don't you stand a pc on his head in the corner in order to process him?" and of course, the answer to it is, "Why don't you stand a pc on his head in the corner to process him?"

See, it's of course the perfect duplication. See? That is the answer to that question. You got the idea? That's the idiot's delight. That's the duplication.

But of course, that question is not prompted by that question. It is prompted by some other confusion.

So by simply replying to it, "Why don't you stand the pc on his head in the corner to process him?" and you say back, "Why don't you stand a pc on his head in the corner to process him?" This is very unsatisfactory. People don't like to have this happen to them.

Well, that's because they're trying to solve a basic confusion they have. But the confusion will be something very fundamental, about something very fundamental. There's a fundamental datum about Scientology or something awry they have a confusion on someplace else. And you haven't reached that.

And one of the ways of teaching – a very skilled method of teaching – is to try to arrive at where this guy is wound up. Don't give him an answer to why you – on a silly question like, "Why don't you stand pcs on their head in a corner to process them?" Don't give them – try to solve the thing for them. Just try to find out how – where he – where he got that lineup that would wind up with this, you see, as the satisfactory solution.

And you'll find out he's got some basic and fundamental confusion on Axioms 1 to 55. See? There's something going wrong here whenever you hear of one of these things and he's trying to cure a confusion and then when you answer him or give him a sensible solution, you very often are trying to cure his confusion. But as long as you try to cure confusions, the confusions continue.
That's why man drops back to threat of duress and punishment all the time. He is despaired of correcting this criminal's juvenile lifetime as the son of a millionaire or something, you see? His terrible period of childhood is something that's totally beyond anybody's reach and of course he got very fundamental confusions about human relationships in that childhood.

Oh, everybody recognizes that these days, but hardly anybody tries to do anything about that. Instead of that, they arrest the guy and put him in jail. Boy, that's sure a stable datum, isn't it? That is motionless, enclosed, it's a location that isn't going to change and that is a cure for what? A bunch of confusions about people.

Well, there are now no people there hardly at all. You can't be confused about people because there aren't any people there. Well, that seems to me to be terribly, terribly drastic. In other words, that's a heavy action, which is borne out of despair and it is only faintly a cure for criminality, because you find most criminals that are confirmed criminals or real bad criminals have been to jail several times.

In jail they get educated into hating people, you see. It's like the snake's venom. They get the idea people don't like them. So therefore it's perfectly all right for them to hate people, you see? And you've just moved them further and further out by "curing" this broad thing called criminality and I mean, advisedly, this offbeat idea of "curing" criminality. No, you'd have to get rid of somebody's basic confusions about life before he would cease to be criminal.

All right. Clarifications of one's own background knock out all of these confusions and there is a way of making a fundamental attack upon this. This is a frontal attack. These confusions very often stem from withholds. So you give something like a Joburg Security Check and you get the withholds off the case. All right. You get the withholds off.

In the process of getting the withholds off, have you ever noticed the pc appears confused at times? You know? Kind of spinny and confused and so forth? Well, actually, what you're doing is arising some of these fundamental confusions. He wonders, "Why the devil did I do that?" He's trying to find the problem that he solved with it.

Well, let's take a further look at this and we'll see, then, that the most fundamental confusion there could be would be two counter-opposed data, each surrounded by a confusion, and nobody could put his mind on either one of these two data and nobody could put his mind on either of these two confusions. Of course, those confusions would tend to persist all the more, wouldn't they? Because that's what you call a multiple confusion.

So a problem is a multiple confusion. It's more than one confusion. If you don't believe that, examine the anatomy of a problem someday.

Your pc has a problem, just find the two confusions. And you'll find out there are two confusions – not one confusion; there are two – and there are two solutions or two ideas involved in this, each one with its own confusion.

It's an encysted – *encysted* – confusion. Because there's a solution to it here, and there's a solution to it here. But of course you can't do solution A and do solution B. And you can't do solution B and do solution A, you see? And each one has its own confusion, so you...
just try to back off from this. And of course you can't back off from anything, actually. So as a result, it follows you. And you get this oddity of a problem moving in on somebody every time you get him to solve it and moving out on him every time you get him to look at it. You see, he's trying to escape an idea, and the idea is with him and the faster you try to back off of one of your ideas ... [laughs] You know?

Well, experimentally, get an idea that all lions are dangerous. Now, consider that as a very dangerous idea; consider you're a lion tamer or something. They like to be called lion trainers, I just remembered. And, "Consider that all lions are dangerous" would be a very dangerous idea for a lion trainer to have, see?

So, you shouldn't get that idea, should you? That would put an end, rather, to the aplomb with which you go in to the arena.

So get the idea of getting the idea "All lions are dangerous." Now do this, right now. Get the idea "All lions are dangerous." Now, decide that is a dangerous idea and decide you're going to back off from it. Don't forget it or anything. Just try to back off from that idea of "All lions are dangerous." ... Does an odd thing, doesn't it? Has a tendency to collapse.

Trying to escape your own ideas, you know, is very, very interesting. It's like trying to play checkers on your own coattail. And that is the mechanism on which problems move in on one, is one gets an idea he shouldn't have the idea, so he moves off from the idea. But of course the idea is his idea and where is there to go? Well, one thing one can't hide from is his own ideas, of course.

You get a sort of an idea of withholding though, as you try to back off from one of your own ideas because you're trying to get away from it, you see? So as you move back from these things, of course, they follow you in.

And therefore, you ask a pc – he tells you he has a problem. You say, "Where is it?"

He'll very mysteriously say, quite ordinarily, that it's out there about ten feet, see, or five feet, or it's right here in his head. And ask him to get a problem of comparable magnitude to it or just think of a problem of comparable magnitude to it, and then say, "Where is it now?" And he'll say, "Well, it's out there twenty feet", see? And, "Think of a problem of comparable magnitude." Moves out there forty feet, fifty feet, sixty feet – as long as you run that one.

Now you say, "Solve it, son. Thank you. Solve it. Thank you. Solve it. Think of a solution to it. Thank you. Where is the problem now?"

"It's right here."

You say, "All right. Think of another solution to it. Where is it now?"

He says, "It's right in the middle of my head."

And you say, "Okay. All right. Now, think of a problem of comparable magnitude to it. Good. Think of a problem of comparable magnitude to it. Good. Think of a problem of comparable magnitude to it. Good, good. Think of a problem of comp – . Where is it now?"

"It's out there about thirty feet."
Well, you keep that up and of course you say, "Well, where is it now?"

"Well, it's gone over the horizon and disappeared."

And you can actually get him to confront this sort of a problem long enough that this happens. Then you say, "All right. Get an idea that solves that problem. Get an idea that solves that problem. Get an idea that solves that problem. Where is the problem now?"

He says, "No place."

In other words, you haven't brought it back in. Well, why haven't you brought it back in? Because in the "Think of a problem of comparable magnitude", you have actually got him to as-is it. The confusions of it disappeared. Got the idea?

You got him on a via and so on. So he did confront it, on a via, and then he confronted it directly. And of course as soon as he did that, it disappeared.

So you can't say endlessly to somebody – . He tells you he has an awful problem with his wife, you see, or something like that and you say, "Where is the problem?"

This would sound at first statement like it's an idiotic question. Where is it? Well, she is home and he's here, so obviously, it is either home or here, but he never answers that. you don't get that answer. He says, "It's right there."

And you say, "Well, where's right there?"

He says, "Well, it's fifteen feet out in front of me", or something like this. That is his response, in actuality, if he's going to locate it for you and providing he's high enough up the line that he can see ridges. A lot of people are below being able to see ridges. They only see lines. Some people have lines going all over the room. Darnedest concatenation you ever saw. The old Reality Scale, way back – 17th ACC. Anyhow.

So you can't endlessly say, "All right. This problem with your wife. All right. Think of a solution to the problem. Think of a solution to the problem. Think of a solution to the problem. Think of a solution to the problem", have it arrive right here in his head, and then say, "Think of a problem of comparable magnitude. Thank you. Think of a problem of comparable magnitude. Thank you", and have it move out; and then say, "Think of a solution to that problem. Think of a solution to that problem. Think of a solution to that problem. Think of a solution to that problem", have it move in; and then say, "Think of a problem of comparable magnitude. Think of a problem of comparable magnitude. Think – ." What problem? This actually disposes of the confusion. It doesn't just endlessly yo-yo and last forever. You see that?

But problems have endurance. So you could say, on a thought level, that thought mass is basically problems. If thought mass is enduring, then it is basically composed of problems. If ridges are enduring, then they must be problems. Why would a problem endure? Unless the thing – the problem is the two confusions and the two stable data, counter-opposed. And one doesn't look at either of them or as-is either of them, so you get an endurance of energy masses in the mind.

Some pc complains to you that ridges are about to knock her 'ead off, or some pc says to you that they have a terrible pressure in their chest; or some pc coughs all the time. What's this? This must be a persistent mental mass, right? And mental mass is mass. There is no
doubt about that. It has weight. Very tiny, but it has weight. It actually has size and shape and so forth.

All right. This person tells you they have a persistent difficulty with their leg. Now, that isn't quite a mental mass because it's materialized in the physical universe and all of these conditions that I have just enumerated all add up to the fact that the person has problems.

Now, if you get this going enough, the person will be a problem, and of course, inevitably, will dramatize being a problem. And quite ordinarily, they say problems are unsolvable or these problems are much too much for them. So of course, the problem that they're sitting in is going to be much too much for you, too. Everybody sees to that. Got the idea?

So you start – you keep worrying about this pc, because this pc is a problem and then you keep trying to solve this problem. Then one day you got facsimiles of the pc. Do you see how that would work?

But the pc will actually get to a point where they dramatize being a problem. Now, if you ask around and ask people if the case has made any progress, the people that say no – even when their profile is changed – of course are doing what? They're simply dramatizing being a problem.

Well, what's wrong with them? Problems are persistent. They have terrific endurance and this person is sitting right in the middle of a problem, which is from Lord knows where, when or how or what, you see? But there it is and they've been so overwhelmed by this problem that when they're asked about problems, they are the problem. So they present themselves to you as a problem. And when somebody says he has no gain, he has said the same thing to you as, is "I'm a problem to you. Solve me." [laughter]

Now of course, your chances of solving it, on any oblique line, are quite poor. Why are they poor? Well, because problems are the one thing that have the heaviest endurance. They're the most enduring things there are. Because they're postulate-counter-postulate, each one with a separate confusion.

So one can make neither head nor tail out of a problem because he can't put his mind on confusion A without getting hit by confusion B. And he can't try to as-is or consider answer or stable datum B without having answer A strike him as the best thing, you see?

So he tries to put his attention on one, he gets the other one. He tries to put his attention on the other one, he gets the one and he finally says, "I will back off from this."

So he adds a curtain across this whole proposition called no-confront. Pcs which have consistently rising needles – you know, anything you ask them, why, the needle starts rising. At the drop of the hat, the needle starts rising, you got the idea? And it rises and rises and rises and rises and rises. It's no good for reading because you can't tell what they're not confronting.

But I can tell you what they're not confronting now. I didn't know a few weeks that I could, you know, say it, just bang! that would communicate well. But they're not confronting a problem.
So that's what a rising needle is all about. They're not confronting something, that's for sure. Well, we could never say what they weren't confronting. But we can say it in a generality, now: They're not confronting a problem.

And after you audit this person for a while, this person will find out that this person has problems. Only they didn't know they had these problems, see? But anytime you ticked anything that had anything to do with his problems you, of course, put them on a no-confront and you'd get some oddity like this: You'd be talking to the pc and you'd say, "Well, now, how's tricks and how's it going? And has anything happened between this last session I gave you and this one now?"

And the pc will say, "No." And all of a sudden the needle starts rising like a startled gazelle. And the tone arm starts going up.

And you say, "Well, what is this?" and "Something did happen?"

And they say, "Oh, no, no. Nothing happened."

And you check it down and you're finally forced to do something you really shouldn't do, but you can't take somebody who has got a very, wildly different tone arm read – between sessions this was acquired – and go on and process him if you expect to get anyplace, because something has happened!

But they will quite normally – it's like fishing for fish in a sea where there are none! It's like these resorts that get you down there that promise to sell you bait and boats, and you're going to catch all the fish in the world and the only thing you get is a sunburn, you know? You just – apparently just can't find what this is, you know, for a long time. It's like drilling for oil in barren rock.

Then all of a sudden, "Well, there's nothing happened, except I had an automobile accident last night. That's all. I mean, couldn't possibly be anything. Oh yes, it was. Yes, as a matter of fact, I was guilty. As a matter of fact, I – I just remembered, I have the ticket from the police in my pocket now. I'm supposed to appear as a summons and lose my license at two o'clock." You know? I mean, it could get this nutty.

But factually, you see, it was a problem, and they backed off and they didn't confront it. And then, now, they can't tell you about it. why can't they tell you about it? Because they can't confront it, that's why.

But I can tell you the common denominator of all no-confronts is problem. No-confront? Problem. Persistence? Problem. All these things add up.

Now, the CCHs can cut and saw through this remarkably well, considering. But this is where you get your slow gain. This is your slow-gain case. This is the case that doesn't take off like a startled gazelle and run to Clear in a hurry. This case is mired in problems and this is probably the answer to slow clearing. This is why slow clearing occurs. Okay?

Now, you need the answer to that. Why is slow goals? Why does it take forever to get somebody's goals? Well, he's sitting in a problem.
Now, you'll notice that a case that is slow in gain is heavy on comm lag. Or if they are talking, aren't talking quite on the line of what we should be talking about. Got the idea? Either the confusion is withheld or inverted.

In other words, the communication is withheld or inverted. The comm lag stems from the no confront. And then this can get so bad that they don't even confront what you're asking them but disassociate slightly and talk about something else every time you ask them a question. You got that?

In other words, you can back off from a problem to such a degree that there's no place to go. And then you have to go on a complete disassociated via because everything is associated with this problem.

Well, now, what caused the pc to react, dumbly? The pc sat down. They were apparently okay. The tone arm wasn't too high and you said to them, "Has anything happened since the last session?" And of course this clicked it. But they went on a no-confront, so they can't tell you. It clicked and put them on a no-confront.

They were all right, right up to the point when you asked them if they had a problem and this is the phenomenon that you've run into consistently, of somebody being very upset with you because you asked them if they have a problem. You've asked them to confront something they can't confront.

And they're liable to get a fall, so they know they can't run it, because they know they can't do anything about a problem, don't you see? And they'd rather get on with the auditing. Haven't you ever noticed this one?

Well, this is their confession, when they have this type of reaction to a problem, that they're sitting in the middle of some God-awful problems, none of which they're confronting. See?

Well, you might say the clue to slow gain or odd behavior in a pc is a problem; and not one, but a multiple series of problems which compose themselves into a ridged bank. So you get your invisible field, your black field, your field with small rockets. And then, of course, on an inverted basis, a field with little trains that run by and give you the dope, see? This is a way to communicate without looking at anything. You put them all on little toy trains, see?

And this explains these various field mechanisms. And I've never given you a good explanation for them before. I couldn't put it well. But there it is.

It's basically a problem. They start to confront; they get no confront. That's because it's an indecisional situation, wholly indecisional.

Now, all this is a prelude to a very, very simple process. It is so idiotically simple that you will begin to wonder when it half-kills your pc. Because it will. It'll turn on somatics that are fabulous. It'll turn on aches and pains and sore throats and bad ears that you never heard of before, you know? But every one of these things is what's keeping the pc from going up the line.
So you could make a direct, frontal attack on the no-change case, not with change but with problems. I've known for years that that stuck profile was the fact that the pc had a problem while he was being audited, see?

Well now, let's reduce this to a point where the pc is a pc where all problems are life and life is a problem. That they're being audited is a problem. That they're alive is a problem. That they're going to die is a problem. That they have a car is a problem. That they don't have a car is a problem. Do you see? It's all a problem now and no apparent solution to anything. And reactively, it becomes very dangerous to them to solve anything; and they don't solve anything. They have an awful time, terrible time.

Problems. Sniper on the right, sniper on the left. If you duck to the left side of the tree, you get hit by one sniper, if you duck to the right side of the tree, you get hit by the other sniper. Well, what you going to do? If you do either one, you're wrong.

So you take up religion. [laughter] See? It's just, thud! Just like that, you know? You'll find that it is in the fields of stress and duress of life where religious cults make their finest harvest.

Here's skid-row George, you know, stumbling down and he knows if he doesn't drink wood alcohol that he's going to get the DTs; and that's terrible, see, because he'll start coming out of it. And if he does, it'll kill him and it's that much further to come out of it, see? What's his answer? Salvation Army standing there on the corner; he all of a sudden helps them beat the drum. [laughter]

He's arrived at exactly nowhere. See? He's gone into a think. He's gone out of a confront into a figure, see? And you'll find -- you'll find afterwards, the thing to do is to beat the drum, you know?

And you say, "Didn't you used to be an alcoholic?"

Has nothing to do with what the case is. He won't say anything about his life as an alcoholic.

It'll cut in on some kind of a level, "... and then I took up religion, and I was no longer a liability to myself or others." Got the idea?

He'll hang in the middle. Just ask him sometime. You can hang him right in the middle. If he doesn't say, "Yes" -- except as it sort of comes out as propaganda -- "Yes, I was an alcoholic. I remember well, lying around in a barroom, and there was this bartender there. And he gave me a job sweeping out. And I was lying there on the barroom floor and he picked up the bar broom and he swept me out instead. And I was lying there in the gutter in the rain, and this cop came by and took me over to the hospital and I had a devil of a time in the hospital. I had DTs and everything else."

No, none of -- the story never goes that far, because there's not that much confront in the man. It will go something like this:

"And the bartender picked up the broom." He'll get that far. "And I realized, then, I was on the wrong course and I've been beating the drum ever since." See, he does a depart. He never finishes the engram.
Only, next time that you ask him about when he took up religion, or you say to him something on the order of having been an alcoholic, he tells you an entirely different tale about the moment he decided. He was up this mast, in a ninety-mile-an-hour gale, and he realized there wasn't much to life and that it was all very perilous and all there was, was really God, see? And it was at that moment that he suddenly did.

And the next time you ask him about anything about his being an alcoholic, he'll give you another story which is entirely different; and of course, all of these things are fictitious nonconfronts of one character or another. Because he cannot confront the problem of having been an alcoholic. Because he's now solved it. Which is a matter of he's sitting right in the middle of being an alcoholic, being the solution to being an alcoholic, see? That's why Alcoholics Anonymous do what they do.

I always thought this was a pretty good organization. One of their members convinced me otherwise, down in South Africa. He told me what their texts were all about. Their first tenet is "There is no cure for drunkenness. There's absolutely no cure for alcoholism. One must make up his mind to it."

I didn't believe the guy, but since that time I've read some of their literature. They sell a person absolutely, hypnotically, hundred percent, with a sledgehammer on the idea that he can never be anything but an alcoholic. That is his first line.

What he must learn to do is to overcome it in some fashion or another. Realizing all the time that he is an alcoholic. I mean, you talk about finding a guy in the mud and then using his head for a stepping stone, that's it. It's not so good.

See, I thought they were doing something about alcoholism. No, they're not. They're saying nothing can be done about alcoholism. That's why they never cooperate with us. I never understood why before, but they never do. It's always a little token cooperation, and then they find out that we say that you can do something about alcoholism and they're off us like a shot. That's because they've got an opposed datum, is there's nothing you can do about alcoholism.

All right. Alcoholism is a problem. And to them it is a problem of tremendous endurance and enormous magnitude; and they're saying you can't confront any part of it. See? So therefore you've got to walk around being a solution to it. So join Alcoholics Anonymous. A nice mechanism, isn't it?

"Man is evil. He is a terrible problem. There's nothing you can do about it. Become a monk." see this? These are the concatenative thoughts that all wind up in the same order.

Now, you're in there; somebody's come into Scientology saying, "Well, there's nothing you can do about life. I'll sit here and not confront anything", and their case doesn't make any gain. They aren't many. Don't think you're one of them. Because they're only people who get no case gains to amount to anything. Got the idea?

Then their withholds and their problems... Their problems actually come about through their withholds, and then their withholds come about through their problems, you see? And then the more they withhold, the more problems they've got. And then the more problems they've got, the more they withhold. You see? And the less confront there is in
them. So they get foggier and foggier and mistier and mistier about the whole thing. And what are they doing? They're flinching from themselves. They're there. Where else is there to go? There isn't anyplace else to go.

The atomic bomb, you say there's no place to hide. That's a lie. I know of a lot of satellites, asteroids, the moon, various planets, even Jupiter — if you like to swim in seas of liquefied air. These are places to go and I don't mean getting out on the broomstick that they send off at Cape Canaveral.

I — I'm talking about the fact, so, they knock you off, you go someplace. Or before the atomic bombing comes, why, you die of something and go to Jupiter or something, you know? What's the difference? There is someplace to go.

But there is one thing that you never can get away from, and that of course is yourself. Because you're there and as long as you're there, you're there.

And as soon as you start getting away from yourself, of course you try to pretend you are not where you are and you get some kind of a dispersed locational situation. You get a "buttered all over the universe." See? The guy is everywhere at the same time, you see? He permeates everything without being anywhere.

Well, he's just somebody who's trying to escape himself Why? Because he himself has problems and these problems all carry, as a common denominator, no-confront.

So just as you get the idea that lion taming is dangerous — thinking of yourself as a lion tamer — try to back up from the idea. Of course, where are you going to go? You've put motion and action into a thought process. And as soon as you do that, of course, the two become inextricably entangled. Only inextricably short of Scientology.

All right. These ridges and all that sort of thing that people run into and that they're having difficulties with and so forth, actually surrender on this one command. They do.

But I am not telling you a lie when I say it's actually hell to run. It is. It is rough, because it turns on some nice, horrendous somatics and from session to session, in the early stages of it, it does not move rapidly. Do you see why it does not move rapidly?

It appears to be very gluey, and the pc's liable to tell you they're getting all gummed up in the glue of it all, you know? And that it's all stacking up and it's getting worse and worse, and so on. Well, the CCHs are moving this same thing through.

But you ask somebody to recall a problem, you've said what? You've said, "Confront something you're not confronting" so you have to be very careful to get the auditing command answered. So a secondary question very often should be interjected.

You said, "Recall a problem."

And he says, "Mm-hm."

And you say, "What problem was that?"

And you'll very often catch him out. He just has a generality of life. He's just thought of a generality called life. Yes, he's recalled a problem. It's a generality, you see? And this great generality has sort of spread all over the place and he hasn't told you a problem.
And when he says, "Well, um, yes. Well, um – ha – I didn't – I just uh, didn't – didn't really think of one. I thought of a ..."

And you say, "Well, I'll repeat the auditing question. Recall a problem."

You have to make sure that he does recall a specific problem. Because on this particular process, more questions go unanswered than in any other known process. More questions can be dogged than any other one. So you have to be quite sharp on that. What was that one? You know?

"Recall a problem."
"Mm-hm!"

That's great. Yeah. *Mm-hm.* What does this *Mm-hm* mean? It's probably agreeing with your auditing command. It isn't that he did it, till you say, "What problem was that?"

And you very often get the immediate confession that it was just a generality. It didn't have anything to do with any particular problem anyplace, anywhere, at any time.

Now, a man goes through, or a girl goes through, nonconfront like this like mad. And these various ridges that are hounding them and making them cough and pushing their noses into the back of their heads and all that sort of thing, are simply problem ridges, and that's all there are. They're confusions which have centered around counter-opposed data, between which nobody could make up his mind, except to confront them. And they haven't confronted them; they have backed up from being – "lions are dangerous." They backed up, and of course, they – there is no place to back to. So there they are.

So they begin to have the sensation, then, of being pushed or being pressed upon or being infiltrated or being entered or having terror stomachs or facial somatics or sinusitis or bad eyes or pains in the head or migraine headaches or something like this.

And of course they – it feels, to them, like some exterior pressure is at operation on them. See, there's some kind of an exterior, pressing, demanding thing that is evidently being levered against them from some other quarter.

Well, the other quarter, of course, is not another quarter. They're trying to back up from where they are, you see, but every time they back up, they carry what they have with them, naturally.

It's like a fellow with an armload of kindling and he keeps backing up to get away from the kindling, but he never looks at the kindling or lets go of it. And of course, he'll get the sensation after a while that something is busting his ribs. What is it? It is very mysterious. Well, it is not very mysterious. It is a problem.

But don't think of it in terms that if you could just find the one problem of the man's life, you'd have his whole case solved. You could find the basic-basic problem that started all of his confusions on the track. You could find various vintages of problems, which would then start a concatenation and a rip-up of problems. You could find a lot of considerations that move problems into a tough category, and so forth. But it is just this one consideration, really, that there's an unconfrontability between two counter-postulates.
It's like – it's like you belong to the Greek army and you were having a lot of fun knocking off Persians and you got exteriorized in a battle, and so on – getting your mock-up knocked off. So you picked yourself up a Persian, see?

I say you picked up a Persian; you kind of marched off with the Persian hordes, you know, and you picked up somebody in Persia. And then they all of a sudden say, "Well, those damn Greeks are coming over the line. And we – and you're conscripted. And you're part of His Majesty's Darius's cavalry or something." And there you are, you see, and you're looking at all these Greeks.

This gets to be an interesting problem. You should be on the Greek forces, but you're not. The confusion to the Greek forces is the Persian forces, you see? But you're in the Persian forces, and confusion to the Persian forces is the Greek forces.

There's only one answer to that. Go take up a lecture circuit on the subject of peace. Because you will land halfway in the middle of the battleground. See? You can't be a Greek and fight the Persians, and you can't be a Persian and fight the Greeks. Unconfrontable. Both of them are wrong.

Well, you run a pc who's in this situation, and you find out he was a Persian before he became a Greek. It wasn't the other way to, see? He was a Persian before he became a Greek and then he again became a Persian; and you've got that all solved. And you say, "Well, that was the answer and that was the problem." And then you find out, actually he was an Egyptian, you see, fighting the Persians and then exteriorised into the Persians. That's how he got there.

And you say, "Well, we've got that one, now. We've finally sorted that out." And the pc will tell you he's got that all sorted now and then you find out he was a Persian before he was an Egyptian.

You see? And they keep running this way on the track. And a pc, as he runs this, actually will tend to come up with some interesting solutions. You find him sitting there, and all of a sudden he'll have a very interesting solution. It's a solution to what? Well, he won't be quite sure, but it's an awfully interesting solution.

And he's no more than thought of it, and it becomes a terrible problem to him. "Well, it'd be awful to put that into effect", you know?

"Well, I've just decided to go to the movies", he says. "I've just decided to go to the movies. And the finest thing I could do is go to the movies. And we're all set, and so forth. Get your hat and coat, here we go to the movies – oh, to hell with it. I've seen the picture before. Where are you going? What are you doing with your hat and coat?" See?

You say, "This guy is nuts." No, this guy isn't nuts. This guy had a solution.

He was feeling bored that evening, and so he solved being bored that evening by [snaps his fingers] going to the movies. And then, on a little, three-minute, four-minute, five-minute comm lag, why, he of course does the other flip; and solving it was dangerous, so going to the movies is a boring proposition.
See, he was bored. So he solved boredom by doing something interesting. But then the interesting thing he decided to do, all of a sudden, Qed-and-Aed and flashed back on him and he's bored with it.

You get a lot of people that go out and buy a Mercedes or something, you see, and they no more than stick the keys in the ignition than they instantly are bored with the Mercedes, you see? Just do that, bang! just like that.

And they say, "I don't know what's wrong with me. I don't know what's the matter with me. What is the matter? Something fantastic is wrong. I – it's not ..."

No. They got the Mercedes because they were bored. See? The Mercedes is a solution to boredom. Well, the Mercedes is not a solution to the boredom. The Mercedes is a Mercedes. Look one over if you don't believe me. [laughter] And that's it, you see?

But if they haven't examined this, and they don't even look at the Mercedes, and have-n't even looked at the Mercedes at all, and they were bored so they bought a Mercedes; they step into the Mercedes, put the keys in the lock, and they're bored.

See, the problem is the solution, you see. And the cure becomes the – and then they don't know which they are. And naturally, you can do fantastic things by getting them out and having them touch the Mercedes, you know? Touch the fenders and the wheel, and so forth. And they say, "What do you know, it's a Mercedes. It isn't a solution to boredom." And then they become interested in the fact that they have a Mercedes. And you would do this by touch. Otherwise, they will never confront the Mercedes, because they can't confront the boredom. Now you see why Touch Assists and familiarity and that sort of thing work out so easily.

So you have 1A. As I say, it's got a lot of rationale behind it and it looks very innocent, and it looks very simple, and so forth. The things you must do in it, don't overrun the thing, beyond the Security Check point.

When I say hour for hour, I don't mean one hour on this process and one hour on the Security Check. I mean if you happen to run 12 ½ hours of "Recall a Problem" or CCHs, then it looks to me like you've got to put in about 12 ½ hours on Security Checks. You got the idea?

We don't care when it's done. You flatten the CCHs. You bring them up to a flat point. And you say, "Well, we can let that rest for a little while."

Now you do a Security Check for a while. And when the person seems to be kind of wound up on the Security Check, whether it was one page or ten, you say, "Well, we can leave that alone for a while, and we'll do some CCHs." You see, you kind of run them flat.

Well, similarly, you'd run the motion out of the tone arm on "Recall a Problem". And the motion is momentarily flat, and so we at once move over into doing a Security Check. And the person seems to be cooled off. And the needle seems to be doing better now and life seems to be a little bit easier on the thing; go back to this problem. Because the problems will kick withholds into views, and the withholds will kick problems into view, see? The things operate one against the other very well.
And that's Routine 1A; and I advocate Routine on – 1A on people that aren't making any very rapid progress on a CCH. The progress is rather slow on CCHs, and we say, "Well, what we're doing is trying to solve the problem with control, communication and havingness. And we probably could get there, all right, but let's make this person directly as-is some problems before we go on", you see?

You'd run Routine 1A until things looked a bit better and the pc was making changes and gains and you were getting more and better tone arm action and a looser needle. I don't care whether that's an intensive or two intensives or what, or five hours. It doesn't matter. It's just as long as you attain some kind of a goal, looks like the pc can change better, why, you could go back to Routine 1 or you could go to Routine 2. Okay?

But Routine 1A is a culmination of many years of investigation of this particular goofy factor called a problem.

And it's well worth noting that the solution to a problem is a problem. That is the solution to the problem; and when a pc is being a problem, then you'd better get him to look at and as-is some problems. Some problems, because it isn't ever one problem. A case never has one problem. A case does have one goal, a case does have one terminal, but a case never has one problem.

So you try to run a PT problem flat, and you're going to find yourself with another problem. Haven't you ever noticed that? And then you run that problem flat, and you'll find yourself with another problem. They can just go on this way, ad nauseam, endlessly.

Now, also Routine 1A would be something you would resort to if the pc keeps coming into session with present time problems. By the time you've run three or four – no matter what else you're doing with this pc, by the time you've run three or four sessions on the pc, and every one has got tremendous, fantastic and overwhelming present time problems and they take up an awful lot of a session – it just seems like we just have an unlimited supply of present time problems to view – you've got Routine 1A as the best, fastest method of getting this case on the road. Okay?

All right. I wish you good luck with that one.

Thank you.
Thank you.

Well, I'm very glad to see that you're all still alive. I personally didn't think this was going to happen. And I'm sorry for it. It's an accident. We have a great many processes, though, that we still could use. [laughter] And furthermore, we could let them be used by somebody that read the bulletin and thought it was written in Chinese. That's about the only way.

We've just heard, from your part of the world, that Routine 1, on two cases, is showing absolutely no change or gain of any kind whatsoever. And this means what?

This means some gross error. I mean, a Security Check is being run backwards or – it'll be a gross error, believe me, you know. I mean, it'll be big. And it is so unimaginably big that the Instructor, in this case, doesn't imagine that it could be that big, so doesn't look for anything like it, you see.

Like Herbie, the other day – he's telling us, well, he's having a terrible time. And can't he omit all the rudiments from a Security Check because his auditors just are spending nothing – getting nothing done but the rudiments in a Security Check.

And I tell him a third-of-a-dial drop – thinking it's something else. And then he, of course, on the ground and able to observe it, finds out what? His auditors don't know what a third-of-a-dial drop is.

So they've been setting it for anything, you see? But he never imagined this. See, he thought there was something basically wrong with the process or something of the sort.

Now, you're going to find out – you're going to find out that the mistake which causes Routine 1 not to operate is something like a Security Check is not being done. Be no Security Check that you would call a Security Check, see?

The auditor, you know, doing something weird, you know? And it isn't happening as a Security Check. And then you'll find that Routine 1 is probably operating with the CCHs all out.

You know, they got the idea that the CCHs actually must bite – this was a mistake they were making – making a week or two ago – the CCHs must – each one must be made to bite before you leave it. And that doesn't matter if it takes an intensive to get CCH 1 to bite,
you go on running CCH 1 until it bites. And you're only entitled to leave the thing if it has bitten. You see?

Totally missing out the idea that if a thing is flat, it's flat. And twenty minutes worth of it, it's flat, and that's it. So they never – nobody ever got any CCHs run.

So you'll find out, somehow or another, the CCHs aren't being run. And somehow or another, a Security Check isn't being done, and then Routine 1 doesn't work.

Female voice: Hmm. Maybe they don't know what a CCH is.

Hm?

Female voice: Maybe they don't know what a CCH is.

Well, I understand that just a couple of weeks ago there was a terrific yickle-yackle on the subject of all the HGC had to go over to the Academy, if they found out the Academy was teaching and running them entirely different. And then somebody else had an entirely different idea of how they were run. And they were all trying to straighten out and get some agreement. Well, I understand they did come to an agreement. But are these the CCHs?

Female voice: Sure. [laughter]

You see, that would be – you see, that's the gross error that you come up against with something like this.

Somebody tells you suddenly that some process doesn't work on a pc. "All right", you say. "That's fine. That's fine." But the first thing we do is to find out if it was that process? Was it in any way being used? That's the first thing we ask for.

Rather than, "Ah, what process is going to run on this pc?" That could be an interesting thing. Okay. Enough of that.

We've got Routine 1A operative here, haven't we?

Female voice: Yes.

Hm?

Female voice: Yes.

Is it working on anybody?

Female voice: Yes.

Female voice: Jolly good.

Male voice: Sure is.

You like that?

Male voice: oh, yes.

You like that. Well, of course, who would think in the midst of – only I would be able to get a simplicity on the subject of problems. [laughs] Because, of course, I just realized that any time anybody has looked at the idea of auditing problems, of course it has been a problem – how you did it.
I actually worked for a very long time with problems to get some kind of an anatomy of them. And we have a fantastic array of technology, as I gave you yesterday. That's why I wanted to give you that lecture yesterday, so that you had the gen on – on problems.

And it's an interesting thing that anything could be as much of a problem to man as the problems of man, you see, had an anatomy. That's what's interesting. Or it was undoable or had any understandingness about it.

It's the way we first entered the game on psychosis. We had to assume that the main thing about a psychotic was that it was all incomprehensible. Everything was incomprehensible. And then if you had everything incomprehensible, of course, why, that was it. And everybody was trying desperately to understand psychosis. And that's the only mistake the psychiatrist has made.

He hasn't actually done anything about psychiatry – "psychiatrosis." [laughter] He has labeled it, he's identified various types and forms, and then he has applied an extraordinary emergency remedy. Extraordinary! Just fantastic!

I mean, it's something on the order of, well, this fellow's – this fellow – his leg keeps itching. His leg keeps itching. And, well, he has to scratch it.

And this is the order of remedy of psychiatry, you know: "We'll cut it off!"

So they cut his leg off, see? Keeps itching. Now they have no remedy. They're done, you see, right there. That's the way they're treating insanity.

When you use these heroic measures which are all out of proportion to the condition, of course that's what you always wind up with. There's never a second trench. There's never a second ditch. There's nothing to go into. After you've electric shocked somebody, what can you do? And after you've given somebody a prefrontal lobotomy, well, he can go pick up another body. That's about it. you know, that kind of action.

But oddly enough, in Scientology now, we have actually been able to do something about this. We've been doing things about these, if anybody wanted to sail in and do something about them.

The common denominator of the psychotic, of course, is problems.

The understandingness of problems winds up, eventually, to an understandingness of insanity. When all the solutions become the problems, and all the problems become the solutions, of course you have your ne plus ultra A=A=A=A.

All right. Now, there's an additional condition. There's a further reach of this. When the problems can't be the solutions – you know, the problems are the solutions, that's one level; now let's go down a stage and let's invert it – and the solutions and the problems no longer can be matched or associated, then we get a tremendous number of solutions which themselves are the problems but which are not matched up to any problem.

And this I think, if you look it over, describes psychosis. The person is being a whole bunch of solutions to nonextant problems. Think it over.
You see a psychotic in an institution; he always carries a roll of toilet paper with him. And that's to wrap it around door knobs so that he won't have to touch any of the door knobs. You'll see them doing this quite – it's quite an ordinary mechanism.

Freud observed a lot of things like this. He added quite an enormous amount of observation to the field. He's now busily – he was taken over, you know, by psychiatry. And now he's being repudiated by psychiatry. And now, the next thing we're going to find out – according to Marilyn who just wrote me something on it – we're going to find out that the only psychiatry there is, really, is Pavlovian.

That could happen to us one day, you know. I mean, somebody takes over Scientology, you see – tries to take over Scientology; somebody tries to take it over and then, when they've got full control of it, invalidate it, see? And then knock it out, and then say there's nothing left but brainwashing.

Well, the hope is there that they could do that, because they continually are trying to come around and say that we do brainwashing. See the – so the hope must be extant. It's a psychotic forecast of what their future – they would like to have their future be.

There's always something you must know about these things, though, before you consider or give them tremendous dangerousness. Don't assign dangerousness to these things. The psychosis is a solution to a nonexistent problem. The problem doesn't exist for the person who is solving it. The person is living the solution to a nonexistent problem. I see I'm not reaching you too well here, you know. And when you see a psychosis, after it's all described – after this (quote) "psychosis" (unquote) is all described – there's a missing datum in the description, so of course it's incomprehensible. See, it's been objectively described. They haven't described what problem it is that this behavior is a solution to. So of course the main part of the data is gone. See, you haven't got the problem, so it's gone. You got it?

Male voice: Mm-mmh.

See? So therefore, you couldn't understand psychosis by observing behavior. It's incomprehensible because it's 50 percent missing. It's like trying to understand an electric motor, you see, that has no guts – has no leads, terminals or guts.

Now you walk along, and you say, "What is this thing?" Well, maybe somebody did a futuristic shell, you see? You see. See, it's just the observed thing, but there's – the rest of it is not there. So of course you couldn't – .

Frankly, the cure of a psychosis, by addressing the psychosis, is – listen carefully now – not possible. You cannot cure a psychosis by addressing the psychosis. Now, you cannot cure an aberration by addressing the aberration. Why?

Because you're running the still in the middle of the motion. You're running the solution in the middle of the confusion. The stable datum and the confusion. You're trying to cure the stable datum. And it is held in place by an existing confusion.

And you're not looking at the confusion. You're looking at the cure. You're looking at the stable datum. You're looking at the motionless fact. But of course, it won't move out unless you get the motion off of it.
Now, you get an idea of a whirlpool with the center of the whirlpool motionless. But without that center, the pool wouldn't whirl, you see? But for some reason or other the center of the whirlpool is motionless but all else is moving. And that motionlessness continues to be motionless only because it has motion around it.

So you get the idea that, yes, if we could pluck out this motionless piece, the whirlpool would cease to exist. We get this idea.

But I'll tell you something. Practice, empirical practice, in my efforts to do various things and combinations over a very, very long period of time, have demonstrated that it is not possible to take the motionless piece out of the whirlpool. You can take the whirlpool off the motionless piece, but you cannot take the motionless piece off the whirlpool. Because the thing is being motionless only because the whirlpool isn't being confronted, to put it into mental terms.

So here you have confusion and the stable datum. Here you have motion and no motion. Here you have sound and silence. Here you have absolute location and change – change surrounding a location which is motionless. Here you have all these things.

Now, the solution is analogous to the motionless point in the middle of the whirlpool. That's the solution. And you can't pull the solution out and have the whirlpool disappear – that's mentally. It just – just take my word for it; it can't be done. Because if you leave the whirlpool there, all that's going to happen is, is a new motionless point will arise, and you can pick off an endless – an infinity of motionless points off this motionlessness. You could just go on forever picking up no-motion. Just forever.

But to pick the motion off of it, ah-ha!

It's a very funny thing that everything that is wrong with a thetan is what is right with a thetan. Anything that is on the way upper Tone Scale that is right with a thetan, in a fixed, aberrated state at the bottom of the Tone Scale becomes what is wrong with the thetan.

At the highest upper level, a thetan can be motionless. And at the lowest level, he has to be.

It's a matter of determinism. On the higher levels of the Tone Scale, he can determine motionlessness. But at the low level of the Tone Scale, motionlessness is being determined for him. And when this gets into the field of mechanics, of course motionless is not being determined by another postulate; it is being determined by the mechanics of motion.

If you want to see somebody stiffen and go still – and actually, this test, by the way, this is – will amuse you, but it doesn't work as a test. It's the perfect lecture room test. Theoretically, you see, this thing is perfect. I'll tell you why it won't work in a moment. As a demonstration, people don't get it. Because I'm – so I'm not going to do it. I'm just going to tell you about it.

You stand a fellow up and you shake your hands in front of his face. You're going to demonstrate confusion and the stable datum, you see? You're making him the stable datum and you shake your hands violently in front of his face. Not threatening him, particularly, but just a lot of motion, you know – fingers shaking, and so forth, in front of his face.
And you say, "Now" – you say, "Now, there you are, and there was the motion." And point out to the rest of the class and the observers that he stood still.

And you'll see it every time. He actually freezes. You know, the person will sort of tend to freeze. You know? He goes still on you. You show him the motion. He goes still.

And now – you say, "Now, isn't this a wonderful demonstration?" And nobody gets it. They've all gone still. [laughter]

And this stillness is a stupidity. So the person you have demonstrated it on doesn't get it at all. It's the most marvelous thing you ever tried to demonstrate.

I tried it up here at London HASI several years ago. And I just couldn't get it across to the staff auditors, you know. I kept showing them, you know, one after the other. I kept – and they just kept getting stupider and stupider and stupider. [laughs]

Because then, of course, you're dealing with the absolute basic woof and warp of what happens to people: that they withdraw from this motion, and they get into a fixed stillness, you see? Well, they won't confront the motion, and yet they can't not confront the motion, so they put up a barrier against the motion, which is stillness. And they think that if they become still enough, the motion will duplicate them or something and become still. That's the last resort.

And then after that they just butter themselves all over the universe because they're trying to move out of a stillness and be a stillness without, of course, actually confronting the motion. And eventually, they go into violent motion. They eventually have no place to even butter themselves anymore. So they themselves become motion.

You'll find out in Goals Assessment that it is the commonest thing in the world to have a preclear come up with a whole string of goals of "get in motion." They come up with this whole long string of goals. It doesn't matter whether it's in space opera or any other field they come up with – race driving or something like that. They come up with this long string of goals: get in motion, get in motion, get in motion, see?

What they're actually trying to do is avoid the motion. And they go back into the motion. Kabibliu-boom! See?

Now, after they're audited for a while and so forth, they'll go on a reverse course. They're liable to go into an obsessive stillness for a while. You know, not want to go out or something like that, when they're out. And then all of a sudden they will go into motion. Only this time they're in control of the motion. See, they become cause over the motion.

But at the time they give you this, usually, as a whole string of goals, they're sure being the effect of motion to such a degree that they're the effect of stillness. You see? They're driven out of a stillness. They can't be still, and they themselves become the motion. They're the particle on the line, the leaf in the breeze, the pilot in the cockpit of the fighter plane. He's got to go, man, go. That's his motto: "Go, man, go."

Yet you look at this fellow's life in general and he hasn't been going. You say, "If you like speed that much, well, why aren't you – why aren't you doing any race driving?"
You see, in actual fact, they've moved out of the motionless spot into the motion and are being the motion. But factually, the step upgrade is motionless from that spot. So they do an awful lot of motionlessness, which is very hard to understand, hard for everybody to understand.

The person who can't leave the house – well, there are certain motions around that are just too motion, see? And they mustn't go out and confront this motion. And they're doing a no-confront of the motion which, of course, fixes them with stillness, and so they don't leave the house.

That is all this odd aberration is called, you see, of motionlessness. This odd aberration of not leaving the house all it could be called is, you see, is a no-confront of motion.

And we have a case up in London who's been a guinea pig. I've done my best for this case, and so forth. I've given auditors direction on the case, and so on. But this case's motionlessness has now been audited for very close to eight years with the very best processes and the very best auditors. And the case still stays in the house. Now, you get what I mean?

Now, the practice on the line demonstrates that every time. I haven't any other reverse cases. Whenever motionlessness is audited and motionlessness is audited and motionlessness is audited, and you audit nothing but the motionless – "All right. What silence would you be willing to be?" See? Any process of that character. All you do is stack up a bunch of motionless points, and the bank looks like it's jamming.

Now, you can slightly differentiate the difference between motions, but you cannot easily differentiate the difference amongst stillnesses. So stillnesses identify more rapidly than motions.

Now, let's look again at psychosis. The person is being one of these stills, even while they're being driven out into the agitation. See, they're being a still, of some kind or another. Well, what kind of a still is it?

Well, the worst kind of insanity there is, is catatonia, not an agitated insanity. It's the insanity of total motionlessness. Catatonic state. Now, that's deemed to be incurable. Why, it isn't incurable at all. I'm sure there are many things that you could do.

But you recognize that the fellow who's sitting there writing checks without a checkbook, without a pen, in his cell in the institution – he's sitting there writing checks. And he gives these invisible checks to the jailer, and he gives invisible checks to this one and invisible checks to that one. And he's always mailing them off in invisible envelopes. It's quite an interesting activity. Well, when people try to cure him, they try to find out all about these checks, you see. Well, factually, he probably was simply a business executive that's been driven mad by Internal Revenue, you see. [laughter] And the thing that's wrong with him hasn't anything to do, really, with sitting still writing checks. What's wrong with him, is this was a level of stillness to him, at some time or another, which became a fixed solution to some other very motionful problem.

Now look – just try to throw your imagination across this, and you could see easily that there could be a thousand problems to which sitting still and writing invisible checks would be a solution to.
Some writers, when they finally, finally go around the bend – it's right – immediately after they – they usually wind up, as their last ditch, is writing for *The Saturday Evening Post* and *Reader's Digest*. And they take off from there, and they want to watch out from that point there on, because that's just one step, you see, close to no writing at all. They almost wiggle in the chair and they move over into no writing at all.

Well, that fellow had better watch it because he's liable to be out in the park one day and all of a sudden pick up an invisible pen, you see, or invisible typewriter and start typing an invisible story. And there he is, you see?

And matter of fact, there are many cases of this. That's very common. Very common. A fellow sitting still writing an invisible story on invisible paper. Very common.

Well, that's what the fellow gets for writing for the *Saturday Evening Post* and *Reader's Digest*. That's all I say. It's good enough for him.

Now, those are the great organs of mediocrity. The great organs of mediocrity. I absolutely despise a publication that intends to achieve nothing but mediocrity.

It's like, I respect a skid row bum if he has set out to be the bumbiest skid row bum that anybody has ever heard of, you see, he's really willing to work at it. I'll respect him. I'll respect him.

But if he's just trying to be a mediocre skid row bum, why, I'm afraid I don't have much respect for him. But if he starts to *work* at being a mediocre skid row bum, I'm afraid my contempt knows no bounds. I wouldn't even confront him in Steinbeck.

Now, the substance of this is, the fellow has added up all skid row bums, see? So he's got an average skid row bum. So he's not trying to be *one* skid row bum, you see? He's trying to be *all* skid row bums.

Now, that's a very interesting state to be in. And it's like this magazine, *The Saturday Evening Post*, which doesn't even come out on Saturday evening and wasn't founded by Benjamin Franklin. [laughter]

And it's sort of trying to be all magazines at the same time, you see? And there it is, working *hard* to be all magazines. And never publishing anything brilliant, really, you see? Never publishing anything bad. And never publishing anything good.

It has a stated editorial policy, if you please, that it has stated – and released statements on – that it wishes never to publish a brilliant writer or a bad writer, but just a mediocre, medium writer, because that's what really appeals to everybody. And that's their editorial policy.

Well, when somebody is going out to be average, he isn't really being himself at all. He's being everybody. So of course you've got one of these buttered-all-over-the-universe cases. See, he's promptly being everybody. He wants to be an average. What the hell is this?

There are individuals. There can't be an average individual. There could be an individual who has the same IQs or characteristics as other individuals, but there can't be an average individual. I'm not quibbling with the thing.
There can be, however, a fellow who is trying to be an awful lot of other individuals and therefore is buttered all over in terms of beingness. Now, that fellow will be obsessively in a still. That's for sure. The stills which you will run off of that case are fabulous. And he's right next door to going around the bend. Don't kid yourself.

The operations which this universe uses to make a person assume the average and try to convince him to be the average are so numerous that they appear not odd to you, you see — or nothing reprehensible about this. They've been completely dulled down on this particular subject, because the operations are so innumerable.

You know, "You mustn't really stick your head above the crowd." You know? "And you mustn't get down underneath the crowd's feet, either. You must just be the crowd."

Now, how the hell can you just be the crowd? I'd like — wish somebody would tell me something. And this thetan is going to occupy all of these bodies, called a crowd, simultaneously, huh? Well, that means, of course, he isn't occupying his own body. And that's the first thing you'd find out about in processing. The one thing he isn't occupying is his own body.

So what can he do? If he thinks of himself as being everybody else, then every time he breathes wrong, he will have qualms. Because of course he's made everybody else breathe wrong. You got the idea?

So if he thinks an abstruse or an abtuse — obtuse thought, in any way at all, this is liable to have terrible consequences because some child going to school in China might be thinking — might have to think this thought, you see? And that would be terrible, because — not because of anything else but that he'd be thinking the thought, but he'd be thinking the thought in China. You get the idea?

It's not that he — you find out, in the final analysis, that he has specialized in murdering children in China, see? But he, actually, is not worried about the child in China. He's worried about the fact that he is in China, you see? See, he's actually the most self-centered person in the world, while being buttered all over the universe.

All right. Insanity is right next door to that.

So a person is never himself, and therefore, by addressing the solution which he is being — and let's put a definition in right here: Insanity is a solution. It's the adaption of a solution. The obsessive adaption of a solution, to the exclusion of all other solutions, in the absence of a problem. Got that? There's no problem there, but the fellow sure got a solution. And he can't be any other solution.

Now, the one thing you can't do to this insane person is say, "Well, now, why don't you put these three rocks that you must put on your window sill every evening before you go to bed — why don't you put these three rocks on the chair?" You say, "Now, I'll help you out, because they keep falling off the window sill and waking you up, you see?" The person keeps brushing them off, "We'll put them on the chair."

And the person will go along with this, merely because he can't do anything to you. And you put them over on the chair. And then you leave the room and you come back and the rocks are on the window sill, see? You'll explain to him that "This is what is waking you up
and why you can't sleep, you see", and so forth. And you'll always find the rocks on the window sill.

Now, this looks pretty daffy. But what problem is he solving? And that's the question you must always ask of insanity. What problem is this fellow solving?

Because he's obsessively being a solution to a problem which he doesn't know about and cannot confront. To the exclusion of ever changing, to the exclusion of ever really looking at any problem. Because if you'll notice, the number of problems which they create are just innumerable.

If they would just go on through life being this solution to the problem, we shouldn't argue about it or worry about it very much. But they're not content with this. Because they're the one solution to a nonexistent problem, all problems with this person are on automatic. And the number of problems which occur in their vicinity, practically can't be counted.

Well, they – all they have to do is get into an automobile, and the motor doesn't start, and all of a sudden the battery goes down and two tires go flat.

And you say, "What on earth is this all about?" It looks absolutely telepathically, teleportationally mysterious beyond all mystery. You'll find there's probably, a very logical connection between this, or something. But that's the truth with them. They're just surrounded all the time by problems.

You sign them – one of the things Registrars should know, in Central Organizations, is when they hand the person a writing pen to sign a contract, and the pen doesn't write, take the pen back and take the contract back. [laughter]

This is not your average condition. These are pretty extreme. And they're very recognizable.

You'll find out that when you put one of these in an HGC, for instance, that all of a sudden, clear up on the third floor of the building next door, you've got problems. You've got problems, man! You've got problems out on the front walk and you've got problems in the basement and you've got problems every place. Problems you never dreamed existed around there.

And not only that, they've got most of the people in their family on full automatic on problems. And you'll have all those on your neck giving them – giving their versions of all these problems, you see?

You'll find out you cannot even mail them a letter. Try and do it. They've given you the address and everything. And you stamp it carefully and so forth, but my golly, by the time you get through, this letter will have gone to Tanganyika. And just nothing can – nothing can permit – this letter just won't ever arrive, that's all.

But in the process of not arriving, man, does it sure carom off a lot of places! Don't be surprised if you have the whole postal department down there on your neck, you know, trying to find out why this letter, see? Why, you see?

And yet you look at it, and apparently it's just an operation of you wrote a simple letter. And you put it in an envelope, with the proper address, and put a stamp on it and put it in
the postbox. And it looks to you like it ought to be, then, picked up by the Post Office Department and eventually delivered to this person. But that is not what is going to happen, I can assure you. That is not.

And you can look through the files of Central Organizations, where they have come into collision with a person who should have been institutionalized long since, and you will see some of the weirdest, oddball communication curves you ever have cared, read. It is very funny.

You see, the person confronts no problems of any kind. So in the final analysis, of course, all problems are on automatic and they just happen. The person takes no responsibility for any action of any character except being a solution. And the person goes on being this solution. It's just one solution. That's all. And it'll be at the bottom of everything.

Now, there can be a million problems. There can be a million problems, but there's only one solution. See that?

Now, when you're doing a Goals Assessment, you're actually covertly getting a person to look at problems. That's why they go null. So it's a pretty good reach.

Furthermore, you're getting them to look at what they haven't been doing. Which is to say, while being A they were trying to be B and so never as-ised anything about A. So you keep dropping them back and around, and moving them on the track, to all those areas where they weren't being what they were being but were being something they weren't being; so we got no as-is. And that's what happens in a Goals Assessment.

Now, the lower harmonic or even, perhaps, the more direct approach is in Routine 1A.

Now, if you wanted to see somebody go through the roof or out the window or down the spout, run Routine 1A on a spinner. I haven't advocated that you do that. We don't have very many people that are edgy. And we certainly don't have any psychos.

You lack experience with psychos, I can tell you that. They – when I say "psycho" – the word "you're crazy" is used so carelessly in English language that – so careless that people lose sight of the fact that there are these conditions, that they do exist, and that in the United States something like one out of every fifteen people – including Menninger – have been in an institution at one time or another. And before they take them to an institution, they have to be pretty bad off, or mixed up in politics, one or the other.

And factually, a tour through an institution sometime – . Put your collar on backward sometime, or hang a cross on your chest and take over your ministerial rating or something, and go down to console the poor dead screamers that are inhabiting the local or some private sanitarium.

They usually won't let you into a private sanitarium. They're holding down Grandma, and so on, so they can collect the family fortune in there. Usually the people are in there for usual economic reasons.

For instance, we have a professional pc who caroms around in Scientology like this. And her brother – every time he needs some money, he gets her pronounced temporarily insane. And then, according to somebody's will, he has the family fortune at his beck and call.
And this girl simply gets put in institutions and electric shocked. And then the family is no longer interested, since they've got what they wanted for the moment, or something of the sort. And then she gets out of the institution. She's allowed to drift around for a little while. And then there's some economic bind comes along, and they put her back into the institution.

This has been going on for years. She's been breaking auditors' hearts. She even showed up one time in England, here. And promptly, of course, from various quarters and so on, pressure was put on authorities, and she was promptly put into an institution here in England. And she walked out the front gate of it and turned around twice, and so help me Pete, was back into it. I don't even know where she is now. I've gotten – I've lost track of this particular character.

We've rescued her out of too many gray walls, you see. But the gate there – there seems to be a strong wind blowing from outside and through that gate. But it's economics.

And – but you go to a public institution – and the best thing to do – to go near is a public institution. And – like Menninger's fills up all the time. And – well, Menninger has his own clinic on one side of the river, and after they all run out of money, then he ferries them across the river to the state institution on the other side. I'm not kidding you. That is his modus operandi.

And practically nobody ever walked out of Menninger's front gate. They go down and go across the river, and they get put into the state institution where they don't cost anybody anything. [laughter]

But state institutions are great – are the great neglected – state institutions. And you'll find lots of people in there that – they're real psychotics. And it is actually something to look at a real psychotic. It is something to look at. Wow! Wow! Very impressive.

Years ago I used to worry about them. Long time ago, I thought this was something remarkable. The only thing remarkable about it is the psychiatrist with his solution. And of course, your psychiatrist is not Q-and-Aing with any problems. So therefore, he never tries to solve insanity. He Qs-and-As with what this psychotic is being – a solution. And when the psychiatrist Qs-and-As with the psychotic, the psychiatrist comes up with an obsessive solution.

You wouldn't even stand a chance getting electric shock relieved in the United States. You couldn't even legislate against it. Everybody would be pouring in there, telling you, "This is the solution."

And you say at the same time, "Has this ever cured anybody?"

And they say, "No, it has never cured anybody."

And you say, "Well, why are you doing it?"

"Well, it's what you're supposed to do."

"Who said you're supposed to do it?"

"Well, it's what you do!"
"Yeah. All right. Has it ever cured anybody?"

"No. As a matter of fact, if we didn't electric shock anybody, they'd get out of here weeks before."

"Well, now look. Then therefore, that's costing the taxpayer money, isn't it?"

And they say, "Well, yes, but it's the solution!" you see?

And if you wanted any greater proof than this – I wouldn't think you would want any greater proof than this, that what is the psychiatrist going to Q-and-A with? He's going to Q-and-A with a psychotic, that's for sure. Because he has no answers to amount to anything. So you just – now examine the psychiatrist's fixation on the idea of a solution. You give him an unworkable solution and he's very happy. And he'll never change his mind. That is the solution, and that is it.

And you talk to a psychiatrist and you try to tell him all about Scientology, see? And you say it'll do this and do that. Oh, yes, he agrees with you. He probably thinks it does. He doesn't think that it doesn't work.

What you're going up against is the fact that he is himself being an obsessive solution. See? He is a solution. What kind of a solution is he being? Well, he's a psychiatrist.

You say, "Yeah, well, all right."

This is what gets on your nerves all the time. The guy can't cure insanity. He can't do anything about psychosomatic illnesses. And yet, continually, everybody is referring to him, "But he is a psychiatrist!"

And you say, "Very good. Now, what has this got to do with it?" The person who handles the mind should be able to handle the mind. And everybody in the state and psychiatrists and the medical profession – they all look at you and they give you this complete non sequitur.

They'll say, "Yes, but he's a psychiatrist."

You say, "All right. Let's go over this again, slowly." Do you no good at all.

No, the man – that is the society's solution. And of course it's just held in place – rirrrr, crunch! See? And the psychiatrist cures are just held in place – rirrrr, crunch! See?

And when you come along and you say, "Why don't you do something practical?" you're asking a fixated solution to change, which isn't aware of any problem. And that's the mystery of psychiatry. They don't recognize that psychosis is a problem in the society. Psychosis is not a problem.

And therefore you would have some very odd conversations with the psychiatrists of this institution you visited. These conversations would sound very odd to you. You'd say, "This guy is nuts." Well, that's right. But you're talking to a fellow who is being an obsessive solution. And that is all he is being. He isn't being anything else. He doesn't have a chance to be anything else. Why? Because he's handling only people who are obsessive solutions.
Now, they're being obsessive solutions because they have no view of any problems of any kind whatsoever, and not a slightest idea of a problem ever existing! They have no idea that they are problems to anybody.

You can say to a psychotic, "Do you realize…" – after they've splattered a pitcher of milk all over the room – you can say to him, "Do you realize somebody's going to have to clean up this pitcher of milk splattered all over the room?"

No. You have not reached them. That does not communicate. That somebody else has a problem or that any problem exists does not communicate. There's no communication on the subject of problems. You can talk in vain. You see what I'm talking about?

So if psychiatry, in its various studies, has pursued a course of research, it has been a research of solutions. But what would you think of a group who continued to solve a problem they didn't know existed?

You say, "Why are you institutionalizing these people?"

And they'll give you the most oddball answers. But they will never give you the obvious answer. "They're a menace to their family and society, and therefore should be locked up" – that is not the straight answer. But you know that's the answer you'd get if you asked them. You know that because that's a sensible answer. But that's not the answer you'd get. You get all sorts of odd answers.

And they speak about cure. They're continuously speaking about cure. Either they hate anybody who says they can cure anything…

So while being the solution, they hate solutions. So you can get a whole series of solutions set up, and you can examine these solutions forever. And you say, "Well, where are we? What are we at? What are we looking at here?" Well, we're looking at solutions.

Well, please, in research, and please, in working with the mind, never make the mistake that man has now made all the time he's been on the track. Look, if there's a solution, there must have been a problem.

Look at the Ten Commandments, which are 162. You know, I'm beginning to believe the ministry can't count. I looked that up the other day, how many commandments there really were. You know, there's pages of them. And everybody keeps talking about the Ten Commandments.

And some versions of the Bible have Qed-and-Aed with the fact that there are supposed to be Ten Commandments, and they dragged in Ten Commandments. And they got Ten Commandments in them.

But a full Bible has just got commandments, commandments, commandments, commandments, commandments. Man, you don't know whether you're coming or going, when you finally get to the end of all these commandments – because you take any group of five, and at least two contradict. Confusing, man.

These are all solutions. The only thing they've listed is solutions. And that's why you don't like moral codes. Because moral codes are solutions to problems which aren't announced. And you can therefore define a moral code, technically. A moral code is a series of
solutions to problems which have not been confronted or analyzed. And you get upset about moral codes. "Thou shalt not drink pitchers of milk after three P.M. before thy parents"; or something like this. [laughter]

Do you realize that almost all of those commandments which are in the Bible at this particular time, that we call the Ten Commandments, are prompted by some obsessive crimes that existed at that state of the game, and that several of these commandments are solutions to venereal disease? Isn't that interesting? I think it's fascinating.

I see those archbishops now, standing up there with the little choirboys all singing and the harps drumming or whatever they do, and swinging incense burners around their head like slingshots, and going through it all, and everybody dropping nickels on the drums and so forth because they're solving venereal disease. I think that's terribly interesting. [laughter]

Why didn't they invent penicillin? Look what we would have been spared, man.

I've actually managed to shock even you a little bit. Look them over. Look them over. You think I'm kidding you. The next time you run into a copy of this thing, read them over and find out how many of them are solutions to venereal disease.

You see, that was a problem that descended on them that they could know nothing about. That was a problem that descended on them from various quarters of the world, and finally descended upon them from the New World. And they didn't know what the devil cooked here. But they got a lot of solutions. But they never looked at the problem.

And the problem, of course, was inherent in the basis that there were some (quote) "no sexual practices." They had enormous numbers of practices whereby, there was supposed to be no sex. They were already preventing sex, don't you see? So they turn around on the other side of the picture, and they say, "We'll leave all those in place, and now we will solve this other thing. While leaving all of the things that are causing the problem, you see, in place, we will now get some new solutions." That's the one thing they didn't need, man. Yeah.

They already had about forty too many solutions. They had actually prevented morality, at an ethical level, see, and then invented an immorality with a whole bunch of new morals.

I'm telling you this, not because I'm yip-yapping about the Christian church.

But solutions. Solutions. The more you have to do with solutions in straightening out human conduct the less gain you're going to make. And that's all there is to that. That's all I'm trying to tell you. The more you have to do with solutions for the third dynamic, the less third dynamic you're going to have. Because solution, by definition, is a nonconfront of the problem. And you get a fixed confront of the solution.

Well, if everybody is facing inboard while the enemy is attacking the gates, all hell is going to break loose, I promise you. Everybody faces the courtyard, you know, the inner keep. All the soldiers on the walls do nothing but look at the inner keep. And there it stands, stony, silent, massive, impressive. And they say, "Well, that will take care of us. That will take care of us." With their backs, you see, to the wall; and the walls are being stormed.
Now, what do you suppose is going to happen to all these soldiers? They're going to get a solution. That's for sure. They're going to get somebody else's solution in a hurry, aren't they?

So later on, this is proven so unworkable – this becomes so unworkable, at length – they try various means of this. They face inward, and eventually they take the keep, you see, and they make it have face, and they have arms, and you have stone idols. And if you just look at this enough, you see, you're all set. And don't go look that way, look at the stillness, you see, and that's good.

Now, the next one that happens after this sort of thing, of course, is that even though there isn't a war on, everybody's looking at the muezzin in the minaret. And he's saying, "Aly-al-Allah", or something of the sort. What does that mean? Father of evil?

Anyhow, they pray to this minaret, see? And everybody has to face in certain directions at certain times. And of course, this is a good solution. It's a good solution. Particularly for thieves in the market.

And you see, we get more and more of these "Face the motionlessness", "Contemplate the motionlessness, contemplate the motionlessness, contemplate..." "Look at the stillness. Look at the stillness." "Face inward; don't look outward."

Does that sound like any religions you ever heard of? "Meditate." "Now, if you just contemplate stillness enough, you've got it made, son."

It's an operation. It's the basic operation of the track. I don't – I'm not anti-Christian. I'm just anti-operation.

I believe it's perfectly all right to do anything you want to to people. I believe this is perfectly all right. I run on a very odd code. It's very peculiar for this universe. It's all right to do anything you want to, as long as you don't say it's something else, or try to convince people you're doing something else. That's where the crime comes in. The entrance of the not-know.

Or say you're doing something for some very wonderful purpose, you see, when as a matter of fact, you're doing it for quite another purpose, which is not wonderful at all. This, you might say, is evil. And this is practically the only evil there is that drifts on down the line.

And I don't – there's a qualification to that: is as long as – you can do anything you want to, as long as other people aren't being completely plowed under by it. Greatest good for the greatest number of dynamics. But that allows you an awful lot of latitude, believe me. There's an awful lot of latitude in there.

But fighting in the dark, up in a black alley with a poniard – nah, nah, nah. That's no way to live, man. That's no way to live. They pick you out of the burning ghat. And – you don't go to hell, you have to live with yourself – which is about the only hell there is.

Now, where you have solution, solution, solution, solution, solution, and nothing but solution, and nothing but solution, and nothing but solution; and you never have problem, problem, problem, problem, problem – you never see any of these problems; these
problems are never disclosed; you never see any part of them; nobody's ever asked to confront any of them, and so forth – of course, the person winds up eventually just bthaaa solution, you know? He's a walking solution. But he doesn't even know what he's a solution to. That's what's grim. It's the not-know.

Now, when that stage is reached, that's the definition of an obsessive solution. It is reaching the stage when one does not know what one is a solution to. And those are obsessive solutions, or being an obsessive solution.

Or when one is being terribly still, he doesn't know what he is being still to counteract the motion of – what. See? He doesn't know what motion he's trying to counteract by being still. Then – only then does obsessive stillness enter.

So you've got not-know, you see, running through all of these things. That is the bug factor.

Now, where you have an individual solving problems, you don't have an evil. There is nothing wrong with solving problems. Quite the contrary.

But an individual who has put all problems on automatic, now can't solve problems. If he does solve them, it'll be with some fantastic liability. Fabulous liability to the solution of a problem. He's liable to cave in, terror stomach turn on. Oh, my God, all the things that'll happen to him if he solves a problem.

So he's galumphing down the street, you see. And he doesn't know where to go for the night. And he doesn't know what to do, and so forth.

And you say, "Well, why don't you go down to the YMCA?"

The first thing you get back is, "Oh, no."

Well, it never occurs to you to ask him, "Do you have another solution?" But it should, because he hasn't. He doesn't know what he's trying to solve a problem. He just doesn't dare. They're not crazy, you know. That's not insane. It's just they don't dare solve a problem.

When you have somebody around who's a workman or something who is in this particular state, everything sort of goes into a fabulous decline of some character or another. And you can't quite figure out what is happening here. You'll find every job in the place gets half done. Everything is half done. And eventually, the whole place is just torn to pieces, and it's in complete ribbons.

He isn't being evil. He knows he's supposed to be working. So he's trying to work without solving any problems. Because the terrible consequences of solving a problem weigh down upon him mightily.

Now, you go up another stage, and you get a fellow who can solve problems of a minor nature but can't solve problems of a major nature. And we very often hire them as executives. Not in Scientology, but we very often see these people around in organizations trying to be executives, you know? And all they can do is swell themselves up and practice pomposity or be mean to their juniors or something like this. Because they for sure don't dare really solve a big problem.
The little problems about the ink wells, yeah, all right. But the contract with Blitz & Company, do we accept it or do we reject it? Brrrr, no, no, no, no. "Let's have a board meeting" is the usual answer, isn't it? Let's hang everybody else with the responsibility for this thing.

Now, they know this is so dangerous that they will very often try to protect you by preventing you from solving a problem. And they'll keep feeding you all sorts of extraneous data to the problem that has nothing to do with the problem at all. But they're merely trying to protect you; they're not trying to confuse you. Because they know what's going to happen to you if you solve a problem. Because they know what would happen to them, if they solved a major problem. The consequences of it are fantastic.

Now, we move up the line; we find a fellow who can relax on this particular subject.

Now, the level of aberration of a problem, the level of aberration – what it takes to be an aberrated solution, you see – we mustn't get the idea that all of it is very mild, you see, and this all runs at a very low level. We only see that when they're accumulating as locks.

Actually, the problems they have tried to solve and the problems they have failed on and the problems they have proposed and the things which they couldn't confront that they did solve are pretty magnitudinous. Such as "Shall we wipe out this planet?" You see, the problem was "The planet is getting overpopulated and people are having a rough time. Now, the solution is, "Shall we wipe out this planet or shall we practice immigration or what shall we do?" – see, to this problem of it's all overpopulated and things aren't going very well, and nobody's very happy. And this person took their finger off their number with magnitude, see? Big magnitude.

And they said, "Well, the thing to do, I guess, is to wipe out the planet. I know it's a bad thing, but it's the only thing we can do." And they did. And there they are now, down in the spinbin, see?

This kind of thing, you see? They make this – they didn't confront the problem. Either through laziness or stupidity or irresponsibility or something, they didn't confront this problem, and it influenced more dynamics than just themselves, and influenced them very heavily. And they did some great wrong by not confronting the problem. And they did some great wrong.

And after that the idea of "Problem? Ha, ha, ha, ha, ha. No, there are no problems around here. Everything is going along just fine." you know, the machinery is all busted down and the papers are all over the floor, and they're using the account books out there for a doormat. But "Everything is going fine. Yes, everything is fine."

And that's why you sit – see these guys – see these guys sitting in the middle of absolute – well, you wouldn't call it an office, you'd call it a catastrophe, see? And you'll see a guy sitting there, and there's just stuff running out of the walls, practically, you know? Man, they wouldn't dare touch any part of it. See? That itself would be a – they'd have to face this confusion. They'd have to see the condition they're in.

And when you see somebody living like that or somebody working like that, one of two things are true. Either the stuff is avalanching in faster than they can cope with it – but in
that particular case they're coping with it; they're getting something done, so they can then
straighten it out – or you've got somebody that doesn't even know it is there, doesn't even
know it's cascading in on him. And you'll go into this person's quarters or office or some-
ting, and you look at him and you say, "Why don't you straighten this place up?"

And the person says, "What?"

Well, that's the essence of what I've been trying to show you. They don't even see the
papers cascading all over the floor and the account books being used as a ledger. See? Which
happens to be, strangely enough, a doormat. It's not – it's not there. It's something – they just
got it all not-ised.

And if you can get the idea of this fellow sitting in this terribly untidy, completely
twisted-up office without even knowing he has a confused office space, without even know-
ing he has the papers scattered all over the place, without even knowing that he's got the floor
dirty, see, and without even noticing that the lights don't go on and off anymore, you've got
an idea of a thetan sitting in his bank.

And he says, "It's all orderly and it's all straight and there's nothing here and there's
nothing confused." You get the idea? And there he is. "It's all right. So it must be wrong with
them over there. Couldn't have anything here. Because I've got it all straight."

And you look at it, and you say, "You do? You do? How very interesting."

But of course because you can't see the clu tter that he is not taking any exception to,
why, you just put it down to an odd behavior pattern. And you say, "Well, he's behaving
oddly." [laughter]

Well, no. He's not behaving oddly. He's confronting no-ly. He's got a big
not-is going on it all.

Now, when you're running anything, you run it in an orderly fashion. And you will at
once get something done. In the first place, you're giving the person an orderliness to con-
front. And he confronts this orderliness, and he finds out that there is some motion that can
be confronted.

And then he'll confront a little disorderliness, and you'll get a somatic going through.
And then he confronts your orderliness of your process, and then he confronts the disorderli-
ness. Got the idea? And he'll confront a little bit more and a little bit more and a little bit
more.

Now, where you have individuals who are totally insane, you have, of course, got no
confront of problems. So don't expect 1A to work. It won't. 1A does not, anywhere near, go
as far south as the CCHs.

But it'll work on most people. But some of the phenomena it brings up is going to
startle you. It's going to startle you. This fellow's got it all tame. He's making it just fine.

Of course, he's ghnh sick whuu-whuh-whooh gat-an-sau, an-sooo and so forth. But
he's doing all right. And therefore he doesn't need any auditing.
I always feel like taking a violin out of my pocket and playing, "it maybe so, I really don't know, your story sounds so queer". [laughter]

All right. You start running problems on this guy, see? And you say, "Recall a problem. Recall a problem", or "Think of a problem", or "Confront a problem", or anything you want to say. "Recall a problem" is the one you're running, and the best one.

And the individual says, "Suuuuuh. I'm not sure about this." And this'll happen to almost anybody who's a member of the human race, right now, if you ran this particular process on them, see?

"What has Ron been talking about all these years? He's been talking about these things called ridges. Ridges. Oh, well, really! Ridges. People have ridges."

It's an interesting indictment of psychology that they don't believe there are any masses in the mind. "Ridges? Ridges? There are no ridges?"

And you run them on "Recall a problem. Recall a problem."

... [laughter] "Where the hell did this come from?", you see? And the bank starts going solid. And little avalanches occur. And little things occur. And somatics.

Well, you're just calling to his attention the fact that there were some problems around that were confusions, and they were in motion. And therefore the problem motion, of course, in counterpositions – oppositions of confusion, naturally, add up to ridges and masses and so on. So these things really start showing up.

This is the first time, I can tell you truly, that we have a good cure for this type of mass, and so forth, that we run into in the mind. It's good. It's really good. It bypasses the liability of curing it.

We're doing the darnedest things, here in Scientology. I mean, the things we're doing are absolutely incredible, see?

I can tell you absolutely, straight to your faces, that you mustn't solve anything, don't you see – I mean, that's what somebody would add this lecture up to, see – all the while, telling you you can solve it. And then you run it and you find out you can get away with it. That's pretty weird, you know. That's pretty weird, if you think it over.

In other words, we're enough on top of the mechanisms of existence and so on that we can pull the overt-motivator sequence without its consequences. Well, what the hell, you know? I mean, the guy that dreamed up that operation in the first place, that – that's defeated, you see. The problem-solution sequence, you see? And we say, all right, you can sit there, as an auditor, and solve all this pc's problems.

By the way, there's another index in psychiatry. They do sit there and solve all the patients' problems for them. Aaaah. Yep, this is right about craziness. That's for sure.

And the individual – we tell him, "All right. Solutions? Man, the only thing that's wrong, the only reason people go crazy, is solutions. Now go ahead and solve the pc."

But the fellow says, "But how? How could you possibly do that, you know? I mean, if you go crazy solving – gosh! Uh, hm. Must be something very evil about this."
Yeah. Yeah. Only the road out, of course, has no barriers. You see? That's the one thing that nobody ever looks at particularly, you know?

You go out through all the gates of a park and you go through the gates of the park. And other people trying to leave the park keep walking over shrubs and getting branches in their faces and coming up against barbed wire and stone walls. So that proves to them conclusively that you'd better never go out of the park.

And we come walking along, and we're walking along this gravel path and admiring the view. And we see the gate up ahead that we're going through, you know. Walking along and we're moving out the gate.

We look at these people floundering over here in the brush, and we say, "What the hell is the matter with them?" We said, "Hey! Hey! There's a walk over here. Why don't you come over here and walk out the gate?"

And they know – they know the truth. There is neither any walk nor any gate. Don't you get in that frame of mind.

Okay.
QUESTION AND ANSWER PERIOD: 
PROCEDURE IN AUDITING

A lecture given on 5 July 1961

Okay. What is this, the fifth of July? Do you realize yesterday – yesterday was the anniversary of George III's considerable upset. [laughter]

Female voice: That's sacrilegious.

I did a terribly sacrilegious and irreverent thing, though. I found a guinea, a golden guinea with George III's head on it. Had it made up in a tie pin and took his head back to America. [laughter] Terrible thing. What makes it doubly funny – what makes it doubly funny is I was, of course, on the other side of that war. I was an observer on Howe's staff during the Battle of Bunker Hill. Wasn't even British, but I was there. Yeah.

Well, anyway, I haven't given you a chance to ask any questions for some time, so how about a question? ... Gee, I'm glad you know this stuff. Why, I'm really glad you know it. Yes?

Female voice: Well, I think it's stupid asking this question, but when you're doing Goals Assessment ...

When you're what?

Female voice: When you're doing a Goals Assessment ...

Yes? When you're doing ...

Female voice: ... do you cancel out that there is no more question at that time. I mean really go after it hard ...

Hm.

Female voice: ... before you begin nulling them ...

Hm.

Female voice: ... or is it all right just to take the list the preclear hands you and then start in on that?

Is it all right to do what?

Female voice: or just to take the list the preclear hands you or the list you already have ...

Hm.

Female voice: ... and start in on that.

No.
Female voice: ... I mean you can say to him, "Well, do you have any more goals?" and if he says, "No", not search for them or you can actually search for them.

No, if you're not – you don't have an option. Now, the question is, is "When doing Goals Assessment and you come to the end of your list, should you ask for more goals or not?" Isn't that what it'd boil down to? Or, "Can you get away with just going over your list and not asking for more goals", does that add up your question?

Female voice: Not quite, no. I mean should you actively search for more goals? Actively search?

Should you actually search for more goals? Yes. Well, it's – I think this is the same thing. Should you ask for more goals? Should you search for more goals? Yes. This is mandatory. In doing an SOP Goals Assessment, when you have gone down and finished off the list, you must always search for more goals in all categories. Not just more goals, but goals by categories. Antisocial goals, secret goals, hidden goals, goals that you would like to hide. Any kind of goal that you can think of or goals about health. Any kind of a goal that you might think this pc still has, you ask for this and add those to the goals list. And of course, every time the pc gives you a new goal spontaneously, you also add that to the goals list.

The goals list is a continuing action and it must always be continued. And as a matter of fact, when you think you finally have the pc's goals, you don't, unless you get a null on, "Do you have any more goals?" – You say well, I've got the pc's goal, and it continues to fall, but the checkout might demonstrate that the pc still had more goals. Now, if the pc still has more goals, the one which you found with such ardure is liable to go null.

But what is adding auditing time... And I'm awfully glad you asked this question. It's not a stupid question at all. It's something I should take up. Here I'm neglecting the piece de resistance and talking about the hors d'oeuvres all the time in not talking to you more about SOP Goals. Because it's a pretty precise activity, and if you're going to get anybody Clear, you're for sure going to get them Clear by running SOP Goals and not by doing anything else. Therefore, any question with regard to SOP Goals is very germane. And this is probably the only place in the world right now you could learn the straight dope on SOP Goals. So it's very far from a bad question, Evelyn.

All right. Now, let me give you a rundown on this. Should I? Just let me give you a very squared, cubed, triangular rundown on it that all buttons up very nicely. You are making a mistake in running SOP Goals Assessments, which winds up in getting fantastic numbers of goals. And the mistake is this, and in view of the fact you haven't been told to do it precisely, therefore, it can't be added up as a mistake. But it's one of these things you wouldn't think you'd have to tell somebody.

When you get to the end of a goals list ... I have a feeling maybe you've got some part of your question I'm not answering.

Female voice: Yes, but maybe you'll get there. [laughter]

All right. But what is the part – what is the part of the question I'm not talking about?

Another female voice: What she's – what she's trying to ask is, is that when you get the – you have a preclear and then you ask him for his goals list and he turns you in a list of
goals, should you at that time (before you begin eliminating them) ask him for further goals according to the E-Meter, or could you just begin assessing them?

I see. The question got lost back in the beginning here. Yes. You don't assess the list he gave you. Not until you've got a complete list. That is the precise answer to it. Now I see the tension go off. [laughter]

Preclear comes in, hands you a list of goals; yes, you add to that list, you add all categories to that list. You do not look on his having handed you a list of goals as having anything much to do with it. You're just richer by having a few more goals that you didn't have to sweat for. It is simply an assist. And you would – he'd take his list of goals, and then you start in on SOP Goals search just as you would in any case.

You want goals in all shapes, varieties and categories. And you just go on and on and on listing goals, goals, goals, goals, goals, and you list goals until you've got a null needle.

Now, here's the mistake you're making. You are making a mistake. You're asking for more goals, having nulled a lot of goals without running any rudiments in between. And therefore, you are getting falls, falls, falls that have nothing to do with more goals.

You are getting falls on "Oh, my God! Not any more goals. You mean, I have to give him some more goals. Ohhhh." And you get a fall.

And then you immediately got the fall, and you say "Well, then obviously, obviously the person has more goals, because he has a fall here." Oh, that's not true.

Havingness. There are several things run the same way. You ask this individual, "Do you have a present time problem?" It very often occurs this way. You ask the person ... This is true of meter. This is E-Metering. This is a part of E-Metering.

You ask the person, "Do you have a present time problem?" and you get a fall. Do you know that that can fall on having been asked for a present time problem? He doesn't have a present time problem, but he's upset because he thinks maybe he's going to have to spend the next two hours in auditing, running one, and you already ran one yesterday fruitlessly, and it didn't get anywhere. Or somebody has done something to him, and the present time problem didn't get handled, so he thinks auditing will handle it, and you're getting a fall, you see.

And here you are. You're getting a meter reaction on a present time problem. The meter is never wrong. The meter is never, never, never, never wrong, but you can sometimes ask the wrong question. See, you can ask the wrong question, get a fall, and then get the wrong idea of why it's falling. It's like this silly drill on, "Have you ever been a victim of pain-drug-hypnosis?", you see. And of course, you get a fall, and so you search it down and you find out that the cat PDHed him on the twelfth of July at midnight, you see. And it all is idiotic. Well, the meter isn't wrong. The meter isn't wrong. You just have asked a dull question.

The pc has a charge on "victim", has a charge on the word "pain", has a charge on the word "drug", has a charge on the word "hypnosis" and drowned a cat at twelve midnight – twelve July, midnight, see. Well, obviously, the whole thing adds up all wrong and backwards. So you have to take your questions apart, and you have to know what you're asking,
and you have to ask what you're asking to find – in such a way as to find out whether or not you're – get a reaction on the sensibility of it or some odd side effect.

So you say to this person, "Have you got any more goals?"

And the person says to himself, "Oh, no!", you know. And you get a fall.

And you say, "Oh, well, he's got more goals." – "Well, what is this more goals?"

And the person says, "Oh, no. I've thought of every goal I've ever had. I've thought of a lot of goals I haven't ever had." [laughter] "I've tried to please this auditor. I've tried and tried and tried to please this auditor and there's just no pleasing this auditor at all. And he hits me, so I'd better create." [laughter] "The auditor hits me, so I'd better create some. So all right. Well, let's see. Let's see, goals ... What the hell is a goal?", you know.

And this is how your lists get so extended. It's because you're not clearing what the meter is falling on.

So I'll give you a remedy for this. Run a rudiment before you ask for more goals. Now that, of course, applies to your question, too. Because, you see, the person comes in; he's got a goals list. He thinks this is all the goals he's ever had in his life. He hands you this list, and you promptly don't go down the list and say, "Oh, well, that's it. That's it. Let's get the show on the road." Instead of that, you ask him for more goals. Well, this in itself is rather odd sometimes. It's not always invalidating, but occasionally even that could be slightly invalidative to the pc, don't you see, in some rather sensitive pc.

So here's what – here's what you should do. And here's what you would do anyhow. You put him into Model Session in order to get more goals. You don't just take off: He hands you the list; you start asking him questions. That isn't the way you do it. You put him in Model Session. So you're in effect running all the beginning rudiments between his having written the goals list, you see, and your asking for more goals.

So, you get an opportunity to sort of clear this subject up because you've got the rudiments, don't you see. And you can ask some burning questions about goals while you're doing the rudiments. "How do you feel about goals? How do you feel about people searching for goals on you? How do you feel about giving up all these goals?" You can ask anything you want to like this. And you start to get a fall on this sort of thing, clean it up. See?

You say, "Well, now how do you feel about – you did all these goals and you've given them to me and so forth, and all right, and you realize I'm going to ask you for even more goals than this. How would you feel about that?"

You watch it. You'll see – sometimes you'll see a fall. And you'll say, "Well now, what's the matter with that?" Well, you immediately believe that he's got some goals he doesn't want to tell you about. No, he may be falling from just the idea of exhaustion. See? So get this cleared up.

"Now, what's that fall? What's that fall for? What does that fall fall on? More goals. What is that?"

"Oh, I don't know. Ah, yes. It's my father. He used to bang at me all the time about what I was going to do in life." Or some poor girl – I've seen a lot of girls practically spinning...
on this, trying to measure up to the ambitions of their parents. Girls seem to get this more heavily than boys. Boys get bored with it and run away. But the girl, she's sort of pinned down, you see. And people come along and, "What are you going to do with your life? What are you going to do with your life? What are you going to be? What are you going to be, little boy? What are you going to be, little girl? Are you going to be a fireman? Are you going to be this? Are you going to be that? What are you going to be?" Of course – the schnucklehead – he's being a little boy. He's perfectly all right. [laughter]

I've seen parents do this on babies and absolutely drive babies halfway around the bend. The kid is only six or seven months old, and yet he is being hammered and pounded. Nothing he can do is pleasing. He's always got to be able to do something else and something more. And they get it hot and heavy, these little kids do. You know?

The kid actually learns to pick up a milk cup, you know? He thinks that's pretty good. He's pretty smart, you know. And right away his parents want him to pick it up with one hand, you know. So he learns to pick it up with one hand, and so he learns to pick it up with one hand and drink it without spilling any milk at all which is rather terrific, you know. Or even actually be able to pick it up with one hand and splash it all over the room, which is equally terrific. [laughter]

And do the parents say anything at all about this? They say, "No, dear, you must learn how to drink milk without or with splashing it all over the room", you see. "You must learn to drink milk differently. You must learn to drink milk differently." So he learns how to drink milk, and now he's got to learn how to drink milk differently. See, here he is busy being a little boy and they say, "Well, you better be a grown man", see. But he's being a little boy, and nobody ever notices that he's being anything. All they notice about him is an alter-is.

Well, this adds up on some pcs particularly to be an allergy, to get – sometimes will get practically allergic to being asked for goals. "What are you going to do in life, little boy", adds up to the auditor's, "Do you have any more goals?" See, it's reactive.

So the smart thing for you to do before you ask for more goals is to run end rudiments or something of that sort. Give him a little break there. Run some end rudiments. Run some beginning rudiments. And now, before you actually ask for the goals as actually part of the rudiments, you clear up this subject of goals. "How do you feel about goals? Anybody ever pester you about goals very much?" so forth.

And the person, "Ooooh, yeah." All right.

You get no reaction on the idea of the word "goals", see – no reaction on this. Dandy. Dandy. Now let's say, "Have you got any more goals to add to this list?"

And the pc will say, "No."

And you won't get a fall on the needle either. But the way you can continue to get long, long lists and add to them forever, you see, is by mistaking what your meter is reading. Your meter is reading on an allergy to giving you any more goals, so you're reading it as though you've got now to get more goals. You get the misinterpretation?

But this isn't as bad as it looks, this isn't as bad as it looks, because a person who is having a rather hard time in life will give you five, six, seven, eight, nine hundred, a thousand
goals. But this at least saves you from getting in the additional two hundred you wouldn't have gotten, you see. I mean they just made up a couple of hundred there just to fill in time or something like this. Something went wrong.

So before you ask for more goals, whether the pc just gave you the list and you're just beginning or if you've just finished working over a whole column of goals, for heaven's sakes, clear the subject of goals, asking for goals and rudiments. And if you do that, you'll find your Goals Assessment goes more rapidly. Okay? Sound wise to you? It is.

Well, that's more question than you asked, but I have had it on the back of my mind for some time to speak to you about this. That okay?

Female voice: That's okay. Thank you.

All right. Wasn't any other part of that, was there?

Female voice: No. I've got it now.

You're sure?

Female voice: Yeah.

You're sure? All right. Any other question? Yes.

Another female voice: This follows right along and is equally – mine's being – quite dumber. When you have been nulling them, you still have not completed your list, do you keep on nulling at the beginning of the next session or do you ever ask for more goals before you continue? Do you ...

No. You just keep on nulling. And when you've totally run out of goals to null – that is to say, you've just completed the list.

Female voice: Yes.

When you've gone through the list once, even though many goals remained live, you ask for more goals. But the smart thing to do is to clear up goals and run rudiments before you ask for more goals. Got it?

Okay. Any other questions? Yes?

Male voice: With Routine 1A, would you run one for one with the Security Check?

Yeah. In Routine 1A would you run one for one with the Security Check? Yeah. But what do we mean by one for one? We simply mean if you're going to spend six hours running Recall a Problem, then you're going to spend six hours security checking and so on. You always bring a process up to a flat point before you do something else, because you're in collision with the Auditor's Code.

And you're going to find out this is pretty hard to do with Recall a Problem, Routine 1A. Pretty hard to do, because you're not going to flatten that very soon. And the guy can practically go on forever with a wobbling tone arm and so forth.

The best way to run Routine 1A in an HGC, would be to take Routine 1A's Problem Process and get that audited in formal session. And then take another auditor or take another period of the day as an entire separate activity and do a Security Check. And this supposes a
unique problem. You actually should flatten a process before doing something else or going on to another thing or changing, you see.

Routine 1A – in its infancy right now – yet shows no great promise of flattening rapidly. Certainly not flattening rapidly enough to do a Security Check. And to follow the rule, well, flatten the process and then do your Security Check, which you should do on the other routines ... You know, you shouldn't do the CCHs. You should bring CCH 4 up to a flat point and then do a Security Check or something like that, you see. Or even CCH 2 up to a flat point and do your Security Check.

Well, you're dealing with one now in Routine 1A that doesn't have such flat points – liable to go on forever. So you could get around this by setting up an entirely different session, see, or atmosphere or period or something. And just break it down so that we're running the pc at one time of the day on problems, and running him another time of the day on Security Checks.

You're going to find out Security Checks go more rapidly with Routine 1A than they have been doing on CCHs. Routine 1A can be terribly slowed down if the Security Check is omitted. And I would never go more than five hours of Routine 1A's Problems Process without doing a Security Check. I know that sounds like a rather involved answer, but I'm having to answer it on my feet. This is a new routine. Okay? Right.

*Female voice:* on this point, you said in an HGC you could do this by having two different auditors ...

Yeah.

*Female voice:* ... doing the job. Well, as a private auditor, could you, by agreement with the preclear beforehand, set aside the morning for...

Uh-huh.

*Female voice:* ... auditing problems and the afternoon ... Right.

*Female voice:* ... for auditing checks.

Yeah. As a private auditor – HGC, you could give them a couple of different auditors. A private auditor could probably most easily set aside a morning session, just as you've said, and say we're going to run problems in the morning and going to security check in the afternoon. Or we're going to run Security Checks in the late afternoon; we're going to run problems in the evening, or however we want to do. Or on alternate sessions, or something like this, we're going to run one or the other.

This does pose a slight difficulty because Routine 1A can get awfully hot. It can get awfully hot. And the pc will feel like you're tearing up the whole universe around him. And havingness gets badly shot in Routine 1A, apparently. And the appearance of the havingness shoot, of course, is the fact that by taking off the confusions, you're knocking out the stable datum which are havingness to the pc.
If the pc is looking on all these stable data as havingness, and these havingnesses are disappearing because you're knocking the confusions off of them, you've got the agitation and confusion of the problem agitating the pc, and all problems are a "can't-have" anyhow. And then you've got the stable data disappearing, and it looks rather – rather messy. And you've got TR 10, which you can always run as part of Routine 1A. I personally don't believe it is necessary, as long as your auditing is pretty smooth. Auditing has to be pretty smooth to run 1A. You can't fool with a beefy process like this with rough auditing

But if an individual is apparently getting very agitated and running down and that sort of thing, be assured that you are running the process which also runs it out. You've got the pc up against all of his "can't-haves", almost simultaneously. So of course, he looks like a "can't-have", you see. It's not really running down his havingness. But he has the feeling that it is. And it makes him nervous and agitated and misemotional and so forth. You'll run a lot of ... This process runs pretty hot.

Now, if, however, this seemed to be too bad or something of the sort, you always could find the pc's havingness process. Or you could use TR 10. I mean, good auditing is good auditing. And as far as cutting off suddenly, running problems – you know, the pc's got this terrible somatic. His head is just half off, and it moved over to just here, see. And now you say, "Well, that is the end of that process." Then you say, "Now we're going to do a Security Check." I'm afraid you'd get a backfire.

So that's why this different sessions or different auditors running the problem and the Security Check or a preagreed idea that at certain periods we're going to security check and at certain periods we're going to run problems. And you don't create the ARC breaks, you see. A pc isn't given the sudden feeling like he's going to be left in what he has just been plunged into, don't you see. He knows he'll have to face that up again tomorrow, so it's all right. And he becomes content to do that.

You say, well, can't we do this in one session and give him understanding in one session? Well, I personally doubt it. I personally doubt it because you're – you're now violating, in the session... One session, you've got a preunderstood situation going here, and the pc is not liable to examine his contract while he's in session. So you better let him go out of session and have him remember his contract, which his contract is, we're going to do alternate sessions on problems and Security Checks. And he knows this. This is easy to remember because it's two different parts of the day or it's two different people. You've – I think you'll find on the whole, it's a much happier situation.

Otherwise, you've got a big problem here. You got a big problem here with problems. It is a problem with running it, and that is that it isn't going to flatten fast. It's not a fast-flattening process.

I was very amused on an auditor's report last night to see somebody said – they said, "Well, tomorrow or the next day when we get this flat, can we go back to something or other?" and I thought, what hope. What hope. It – it isn't going to happen that way, see. He's going to run this on here for quite a little while, and it's just going to go and go and go and go and go and go and go and go. It's a marvelous way to get all of the problems out of the road that the pc's got so he isn't always coming up with PT problems. Your future sessions are going to go
rather easily. But to give this thing a lick and a promise and leave it while it's in high restim would be a dangerous thing to do, and in addition to that to hope that it's going to flatten in the next session or so is not optimistic; it's foolish. It's not going to.

It's just like the guy who'll sit there forever. You say, "Now, how does that problem seem to you?" you know.

And the fellow says, "All right."

And you say, "All right. Now describe the problem to me." And the guy will give you a different problem. Every time you'll get a different problem. When you're running this, "How does it seem to you?" and "Describe the problem." Well, it's, you know, the old – one of the earliest versions of problems: "Describe the problem. How does it seem to you? All right. Good. Describe the problem. How does it seem to you? Describe the problem. How does it seem to you?" And if you've ever had any experience running that, you know, he always gives you a different problem. He never gives you the same problem.

And he comes into session and he says, "Well", he says, "my wife and I have just had a quarrel, and she has just thrown the silver coffeepot down into the areaway. And it was a gift from my grandmother who is about to die at any moment. And this – our total future of economics is dependent on her remembering us in the estate, and she's going to call this evening", you see. It's a very involved problem.

And you say, "All right. Well, now that you described it, how does it seem to you?"

"Oh", he says, "it's pretty grim."

You say, "Describe the problem to me."

"Well, the problem's not being able to work, you see, because I expect my grandmother at all times, you see, to leave this estate."

You say what the hell happened to this coffeepot? [laughter] You know, you've got a coffeepot down in the middle of the areaway. Well, as far as that's concerned, it'll stay in the middle of the areaway for the rest of the session.

That's why we don't use, oddly enough, that is why we don't use any fancy problems processes in rudiments. We don't give them any opportunity in rudiments to do anything but run that problem they came up with. Now, the – Change as a level in the Prehav Scale was developed to cure alter-is. And it turns out that was a stopgap. Good as it was, it was a stopgap. What cures alter-is is problems. And your pc that's obsessively alter-ising anything, he'll run problems like a shot rocket. And problems is alter-is. Because, of course – look at it – the guy has a problem, so he solves it. Well, the solution to the problem is an alter-is of the problem, isn't it. So you get this as being the modus operandi of alter-is. I've made this discovery recently is why I suddenly am stressing and moved over onto 1A. I've been trying to cure alter-is.

Here was the factor that stood in our road from time immemorial The factor that stood in our road was a very simple one. We gave the pc an auditing command, and then he chewed it up and converted it into cellophane and exported it to China, received Chinese taels for it, converted these into rubles, went on an exploration to the North Pole and answered you with
blubber. [laughter] And it might have sounded reasonable to the auditor most of the time, but this tremendous chain of vias was going on. So you couldn't say this process doesn't work on this pc, because the process had never been administered to the pc. You know?

Now, there's ways to counteract that. You sit on top of a pc, practically on his lap and breathing down his larynx, and you say to him every time, "Now, exactly what did you do then?" or "What did you do with that auditing command?" It's very good practice every now and then to ask a pc, "How did you do that one?" You know? And he'll give you... And you will sometimes get the wildest concatenation of transferring tael to blubber, transferring it this way and that way. And then it goes out to a little spot that is eight feet off of the head, and then this spot plays a small tune. And then he knows because his toe is getting warm that the proper answer is... And it'll be some wild via-via-via-via-via, you see.

Well, now, you're running into this so strongly, so strongly, continuously, in running problems that you have to check up on this often, only it isn't "How did you do it?" that you check up on; it's "Did you do it?" You ask him for the problem he just recalled. Now you're going to be amazed if you haven't been already, the number of times the person really hasn't recalled a problem. Have you noticed that? Have you? They haven't really recalled a problem. They've just gotten the foggy notion of all of the confusion, see.

All right. So here's this fellow in a foggy confusion of some kind or another with about three somatics, and you all of a sudden say, "We're going to security check you." Now, I tell you, that's wonderful productive of ARC breaks. I don't care what understanding you've got, what contract you've got written and how many witnesses you had when you signed it with the pc, it isn't going to hold. Not even if you took it to court would it hold on some pc. Say, "Oh! No wait! What do you mean – what do you mean Security Check? What? Are you kidding? My head's – oh! and so on. It's a terrible pain here, and so on. And there's something going on – and you want to security check me. Oh, you're not taking care of me, auditor", see. So he goes right out of session. So you'd have to do it on different sessions or with different people if you're going to run Security Checks before Problems shows any signs of flattening.

I sight trouble up the line with this, that's why I'm stressing it so hard. Okay? All right. I overanswered that one, but I hope that's all right. Okay?

All right. Yes?

Male voice: What's the matter with overcoming the problem of the preclear not actually getting out an answer by having him verbally answer each command?

Yeah. Well, of course, that's time-consuming. Spot-checking was an early auditor mechanism to keep the pc in communication without wasting all of the time. Now, as you know, you've run a lot of pcs who are extremely verbose.

Male voice: Yeah, including me.

Yeah. Well, you give them – you give them an auditing command and you ask them to answer it aloud. You, by the way, would never give an understanding you were going to answer all these auditing commands aloud. There isn't anything like that. You'd have to tell him every time to tell you what it was all about, and by the time you've wasted four or five
session hours out of an intensive just because he was stumbling around on this you'll say, well, this pc would have gotten further if he'd simply recalled it.

So that you're doing a police check really. You're doing a spot check, and that's all you want. That's all you want. You don't want every question policed, you see. But you want it random enough so that it takes them by surprise and keeps them disciplined. Every few commands, particularly if the pc looks a little bit wuuhh, you know, it's a very good thing to say, "Now what was that problem?"

"Oh, oh, what was the problem! I don't uh – what problem?" so on.

And it's about time you said, "I'll repeat the auditing command. Recall a problem."

"I'll repeat the auditing command. Recall ..."

Say, by the way, I wonder if I've mentioned to you, every time the pc says anything or repeats the auditing command after you, or makes any comment of any kind on the auditing command – not cognition – you say, "I'll repeat the auditing command", and do so. Do you do that routinely?

_Audience: Yes._

Well, don't drop that one out of your works, because the pc very often feels he has answered the auditing command.

You say, "Recall a problem", and he says, "Cheesecake." And, you know? Chee – hm – you know. He'll nod. "Recall a problem" – nod, you know. What's happened? He's said to himself "Cheesecake", you know. And well, that's all right. He'll look vague, and then you could check up on it. That's one part of this.

But the other part of this is more important. You say "Recall a problem."

And the person says, "I never knew oak trees grew that large."

You say, "I'll repeat the auditing command", see. "Recall a problem."

"Oh, oh, oh, oh, yes, yes. Ah-ha, yeah. Yeah. I missed that for a minute."

You say, "Good. I'll repeat the auditing command. Recall a problem."

And the pc says, "Yes." He did, see. He gets a feeling that he's answered the auditing command. You can actually get into a silly situation where you think the pc is comm lagging, when as an actual fact, he thinks he's answered the auditing command. And when a pc repeats the auditing command after you, you've got a circuit in bloom. And if you don't repeat the auditing command, he is being audited by his circuit.

So the rule is, when the pc says anything after you've said the auditing command, which isn't an answer to the auditing command, you say "I'll repeat the auditing command", and do so. But there are two versions here of this.

_Cognition (which is an internal comment of some kind or another or a realization; a cognition is a realization): If the words repeating – "I'll repeat the auditing command" –
would tend or look like they were an invalidation of his cognition, you don't use them. You just repeat the auditing command. You got the idea?

If you're very good at this and your intentions are very good at this, there's no confusion in his mind that it is a different auditing command. He knows it's the same auditing command. You see how that works? But don't take a chance. There's two sides of this: (1) You can be so pedantically insistent on repeating the auditing command, the pc feels he can't communicate with you. And there's Clause 16, Auditor's Code, out. You can very easily shut off a pc's communication with this "I'll repeat the auditing command." Let's take the other side of this picture, however, and have the pc saying things and commenting on things and then have him sink back. Well, he must have kept that in some circuitry or some sort to keep the auditing command alive, don't you see. So you have to say the auditing command again. So you have to be clever enough to acknowledge what he said – acknowledge what he said – without ending the cycle of action. It's a semi-acknowledgment, by the way. These are half acknowledgments, and you acknowledge what he said without ending the cycle of the auditing command, and then you say the auditing command, see.

You say, "Mm-hm. All right. Recall a problem." See? You say to him, "Recall a problem."

And he says, "Gee! I haven't – haven't thought of that – I haven't thought of that for a long, long, long, long time", and so forth.

Well, in that case, you're not quite sure so you'd say, "Did you recall a problem?"

"Oh", the person says, "No. No. As a matter of fact, I – I didn't."

"All right. Recall a problem." See?

If you put a little insistence on your auditing command, it doesn't sound like a new auditing command. It sounds like a repeat.

You get how this is? It's an interestingly narrow border. Now you say, "Recall a problem." New command. "Recall a problem."

And the pc says, "Gee, it's getting late, isn't it?"

And you say, "Mm-hm. Recall a problem."

"Oh, oh-ho, oh, you want me to recall a problem, yeah."

"Recall a problem."

"Well, I – I don't know. I'm all confused about it", and so forth.

And you say, "I'll repeat the auditing command. Recall a problem."

He isn't under any illusion but that is the same auditing command that you are repeating over and over, don't you see? If you get good at this, you can actually drop out a lot of this "I'll repeat the auditing commands." If you're good at this.

There is such a thing as half acknowledgment, and there is such a thing as actually repeating the auditing command in such a way that there is no margin of doubt anywhere. He knows it's a repeat of the same command that you just gave him. Okay?
Audience: Yes. Mm-hm.

Right. Always get the auditing command you asked answered, by the way. Always get that answered, otherwise your pc goes out of session. Yes.

Male voice: Ron, could you ask the pc, "Do you still have the auditing command ?"

Yeah, you can. But you would ordinarily ask that while he was comm lagging and drifting around. It'd be almost an emergency situation. Its use would be very rare. Very rare. It's usually a very bad thing to interrupt a comm lag of the pc. The pc is, you know, looking for this. He's looking for it, he's looking for it, he's looking for it, looking for it. And all of a sudden, the auditor distracts him.

The most basic source of ARC breaks with auditors which are legitimate ARC breaks, is the auditor taking attention – the pc's attention off of his own case and putting it on the auditor. You'll find out that statement right there is the common denominator of ARC breaks. In other words, the pc is – got his attention on his case, and the auditor does something to pull his attention off. And that just about will practically finish some pcs. What happens is you get a sudden change of attention. And change of attention is associated in all minds with accidents, pain, casualties and so forth, you see. The fellow was standing there minding his own business, and all of a sudden this sixteen-inch shell hit him in the back, see.

Well, that's a sudden change of attention. And if the auditor yanks the pc's attention off his bank and puts it on the auditor, what the auditor's trying to do or say, then – in the case of an auditor flub, or in the case of an auditor intruding during a comm lag, or in some other case of – analogous – then the pc gets the sensation of having been hurt or struck.

And you have to be kind of careful about this, so that if the pc is sitting there, and you're saying by this time, "Well, good God! Eight, nine, ten minutes have gone by. He sure can't still be thinking of the auditing command", you know. I'd wait till he sort of looked up for a moment dazedly in my direction. I would say to him – not very specific or not very intrusive – "You still got that?"

He'd say, "What?"

You say, "All right. I'll repeat the auditing command."

"Oh, well, yeah. I was drifting off..." And you don't get an ARC break. But the pc is deeply interiorized, and he's thinking, he's thinking. He's running through his mind and through his mind. He hasn't said a thing. He's still got the auditing command. He's doing what he's supposed to be doing. He is the soul of purity and goodness. He's doing everything you said. He is in control. He's interested in his own case. He'll give you the answer as soon as he's got one.

And you stick your number 10's in and you say, "Have you still got the auditing command?"

And he says to himself, "My God, I give up. Here I am doing everything I'm supposed to be doing", you got the idea, "and here you have given me a sudden shift of attention." And then you'll get the blowups and there's your fruitful source of ARC breaks. Okay?

Male voice: Yes, thank you.
All right. You bet.

Female voice: Um, should the preclear ask you to repeat the auditing command or say he's lost the auditing command, is it necessary to say, "I will repeat the auditing command" before you repeat it to him? – should he ask you for it.

Oh, I very often omit it. If you say – the pc thinks he's lost the auditing command and he asks the auditor to repeat the auditing command, does the auditor then say, "I will now repeat the auditing command", and do so? Yes, this is formally, exactly, absolutely correct. That's absolutely correct. It can, however, be omitted as a preliminary statement to repeating it. The pc says, "I haven't got that command. What did you say?" And just simply say, "Well, recall a problem." He won't take it amiss. You bet.

Female voice: Is there any way that you can tell on the E-Meter what the pc is doing, if he still has the command or if he doesn't?

Yeah. Yeah. It'll wander around. Needle – needle will wander around. Tone arm will move. If these things all of a sudden become still and there's nothing happening on the meter at all, it's almost legitimate to assume that he has lost the auditing command or is thinking about something else or is doing something else. You can tell on a meter if you watch the meter whether the pc still has the auditing command and is still doing it.

If the pc is still doing the auditing command, of course, he's plowing through energy masses of one character or another, and this is the first thing that the E-Meter registers. So of course, it does register whether or not he still has the auditing command. I would not say it was totally vital, because I think a pc could give himself an auditing command and give himself some other auditing command, and you'd still get a meter reaction. This isn't a foolproof answer, but it is an answer. Okay?

Female voice: Thank you.

All right.

Another female voice: You mentioned that in running Routine 1A, the preclear may need havingness or he may look as though he needs it, but not really need it.

Mm-hm.

Female voice: Well, you can... Could you just check that up with a hand-squeeze test? I assume you can.

The pc may look like he needs havingness or may actually need havingness. It goes like this: It's how gaunt and wan does this pc start looking. It's a question of degree. You will find in running Recall a Problem, that the havingness will drop and then resurge. You know, goes down and then he comes up and he's all right.

All right. Supposing it just kept going down, and he just kept getting hollow-eyed and he's deeper and deeper and further and further gone over a period of a half an hour or something like this, and the bottom had practically dropped out. Well, I'd bring it up to a point that wasn't disturbing anything, you know, where he had a couple or three answers that were fairly close together, and I'd run some havingness on him. It's a question of degree. It's a
question of how bad off does this pc look. But he can look pretty bad, by the way, without going by the boards. He can look pretty bad without going by the boards.

Female voice: Would the hand-squeeze test not be valid in that situation?

Perfectly valid. Hand-squeeze test would be perfectly valid. But you start running in and out of problems, you're going to get stuck needles, loose needles, stuck needles, loose needles, stuck needles, loose needles. And the fact that a needle is stuck up for a moment or two would not be a criterion that he needed havingness.

You'd run havingness the same way as you always ran it. We could run the Havingness and Confront Process over into Routine 1A as far as that's concerned. I mean, you don't have to worry about that. May do so. Perfectly legitimate. Havingness and Confront Process are not an integral part of Routine 2. They've just been stuck in Routine 2 because we didn't have any other stowage for them. Okay?

All right. Yes.

Male voice: Would Routine 1A flatten a hidden standard?

Would Routine 1A flatten a hidden standard? It sure would. That's a very good thing you asked that, Robin, because frankly that's what it's looking for. The alter-is and the hidden standards – if you can get these things out of the way, man, you can clear them with a swish. And if you – if they've still got hidden standards, even while you're doing Goals Assessments, their hidden standards can remain a little too effective. It certainly gets the hidden standard out of the road. And if you've got the alter-is out of the road, the obsessive change of the auditing command so that you can give him auditing commands (which is what the CCHs are for) – and if you can get the hidden standards out of the road, voilà! You really got it made. Answer your question?

Male voice: Thank you.

All right. Yes.

Female voice: What if you – in running 1A, you have a preclear who volunteers oral answers? Do you tell him to shut up?

In running Routine 1A, what if you have a preclear that volunteers oral answers. Such as what? Now, give me an example.

Female voice: Well, such as for me – it is being run on me – and I have – each time the command has been asked, I have given the preclear a verbal answer. I mean, the – the auditor a verbal answer.

Ah, yeah. Go on.

Female voice: Well, this has been going on for several sessions. Should I quit doing it?

Oh, no ...

Female voice: You know, it's the natural way of doing it.

... no, no, no, no, no.
Female voice: And I was wondering, if – when I was an auditor, if it should be prohibited.

No, no, no, no, no. You see, let's get back to the definition of an auditing command. It goes back to this fundamental: An auditing command when executed has had performed exactly what it said, and nothing else. An auditing command has no understoods about it. There's no prearrangement about an auditing command except maybe learning the language.

So if you have said "Tell me – Recall and tell me about a problem", then, of course, you would expect him to do it always. If you have said "Recall but don't tell me about a problem", you would expect him to recall one but not say a word to you – neither one of which are workable commands. I'm just giving you – they'd have to be that. And that is the only way you would be able, by the Auditor's Code and all standards of auditing, to regulate whether the pc talked or not. It'd have to be inherent in the auditing command.

Now, when you've said, "Recall a problem", you haven't told him to do anything but recall a problem. Now, he has recalled a problem, and if he then elects to tell you about it, all right. If he elects not to tell you about it, all right. That is not part of the auditing command. So you can't have a prearranged agreement with the pc in any event as to anything he was going to do. You got the idea?

Female voice: Yes.

If you understand that very carefully, you never get in trouble with a pc. Remember that it's very difficult to get into trouble as a pc being audited by any auditor if you only do what the auditor says. This is quite interesting. Never do anything else than what the auditor says. Only do what the auditor says. This is an interesting index. It's very difficult for you to get into trouble.

I had an auditor finally get past that one one time by simply changing the command before it could be answered, several times. And that you couldn't do anything about, see. Gave you one process then gave you another process and another process, and each time waited for no answer and said, "Oh, no", or something like this, and then gave you another one. And then finally says, "Well, answer the auditing command." And I had to say, "Which auditing command?" And the auditor practically blew up.

Well, I had to know. I mean, I didn't even have any understanding about whether – whether you answered the first command first or the last command first or what command did you ask first. And I had four auditing commands, and they had all been asked, but no answer had been waited for on any of the auditing commands. Coo! Where did we go? What did we do? So that point of confusion can – could happen, but... or the auditor who just won't give any auditing commands, who just sits there silent. Best cure for that, of course, is go in the other room and get a gun and shoot them, put them out of their misery. [laughter]

But that is – those are the two wild tricks that can be played by a person who is pretending to audit. It'd only be a pretense of auditing, but those are the two wild tricks, is not give any commands – just remain silent – or give a whole series of different commands without wanting any answer to any of the commands. And between those two things, you'd have about all that you really could do wrong in auditing.
Give auditing commands that can't be answered. Don't let them be answered. Don't wait for them to be answered. Give other commands before those commands can be answered, preferably different commands on a different process; or say nothing. That is the most maddening thing to a pc, is the pc gets a horrible somatic and waits for the next auditing command, and there is none. Fifteen minutes go by, and there is no next auditing command. The auditor is just sitting there. Can you imagine that condition occurring? Well, I have seen the condition occur a few times. Quite amazing.

What happened to the auditor? Where is the auditor? Why – and wha – . It's a question of the auditor went totally out of session. You know, he's not supposed to be in session, so he's gone out of session, what do you do about it, you see? There isn't anything you can do about it.

Beyond those two things, you're always perfectly safe to do exactly what the auditor says. And oddly enough, you sometimes make a monkey out of some auditors when you do exactly what the auditor says, when you do nothing but what the auditor says. The oddities of some auditing commands suddenly come to view. I can't think of an example readily on the thing, but you will run into them from time to time. You do exactly what the auditor said, and he didn't tell you to do that. Oh, yes, he did. He said – distinctly, he said, "Think of a time when you weren't answering an auditing command."

And he says, "Well? Well?"

And you say, "I am."

"Well", he says, "when, when?"

"Well, right now. I'm not answering an auditing command."

And he'll say, "By golly, that's right. Well, let's see, I'd better phrase this auditing command so that it can be done."

That little game I used to play. I always used to do the exact auditing command that I was given. They're pretty wild. You listen sometime when you've seen somebody, particularly making up commands of some kind or another.

If a command is unanswerable when I'm being audited, I just simply say so. But this is not even an advice or a discipline to a pc. You cannot give advice to a pc. That's an evaluation. That's telling the pc how to act. You mustn't ever tell the pc how to do the auditing command in addition to the auditing command. It was – all must be inherent in the auditing command you expect to be answered. And that's the only direction the pc has.

If the pc is doing something else, well, you better rephrase the auditing command if you don't want him to do it. Because if by the standards of the auditing command he could do this thing, that would be very incorrect in auditing to censure him for doing it. You got it? That comes under the shuns. I'm covering that rather heavily because it's one of the great fundamentals of auditing. It was thoroughly disregarded in most psychotherapy that has ever been practiced. It just has never been a factor that has ever come up.
They talk about all sorts of things. They evaluate and they invalidate, and they never let the patient give an answer. They don't ever expect the patient to answer all these various things. I hope that answered your question.

*Female voice:* Yes.

You should just go on answering. Your specific answer is whatever the auditor asks, you do it if it can be done. And if it can't be done, tell him so.

*Female voice:* You do it the way – as a preclear, then, you do it the way you would do it.

Yes. You just always do it the way you do it.

*Female voice:* And as an auditor, you don't ask him to do it any different than he would do it.

That's for sure. If you want him to do it some other different way than what he's doing it, you'd better add it to the auditing command.

*Female voice:* Now I understand.

Yeah. So you'd have no understanding going on it. It would simply be a statement. You know, it wouldn't be from – we clear at the beginning of session that each time he answers the auditing question, he's going to put both feet flat on the floor. All right. That's valid for one answer – just one answer – because it's sort of part of the first auditing command, you see.

You say, "Well, now every time I ask you an auditing command – every time I ask you an auditing command, which is going to be one – you put both feet flat on the floor. All right. Now, here is the auditing command. When was George born?"

And you put both feet flat on the floor, and you say, "October the 2nd, 1716, or something."

And you cross your legs. And he says, "All right. When was George born?"

And you say, "October the 2nd, 17 – ."

He says, "Wait a minute. You didn't put both your feet on the leg – on the floor."

And you say, "Well, you didn't tell me to either."

"Let's see. Let's see. That's right. I didn't", you know.

There are no understoods. No carry-overs.

You'll sometimes see one of these things in as a sleeper. You won't notice it, but it's a sleeper. It's a sleeper in a session. And it's actually interrupting the session. You've got some understanding that you're going to quit at 4:15. That's an integral part of every auditing command. See? You can very often introduce these weird things. The auditor makes a contract with the pc, or the pc makes a contract with the auditor that it's going to be so and so and so and so. Well, of course, that's good for the first auditing command. That's all.
There is no contract between the auditor and the pc from the pc's viewpoint. There is a contract from the auditor's viewpoint. The auditor is there to give him some auditing for a certain period of time, but even the period of time disappears as far as the pc is concerned. There isn't anything else. There is nothing but the auditing command. That is all. And then there's this acknowledgment and the various guidance that he gets from the auditor. That's it. When it is given, see, each in each unit of time. Otherwise, auditing scrambles, becomes bunched up, the pc doesn't know what he's doing and is not in-session.

So that you can hang a pc in the first auditing command of the session by having an understanding. You can hang him on the first auditing command, and the rest of the session, he will be on the first auditing command.

And during this seven-hour session, you have asked and got answered just one auditing command. That's all. That's the first command. I don't care how many times you repeated it, you asked the first command. That was the only thing that you asked. Got it?

One of the great fundamentals of auditing: Get an answer to every auditing command, and the pc only has to answer the exact auditing command which he is given at that time. There are no other understandings. There is no understanding that he's in-session. There is no understanding that he hasn't got to have a present time problem. There is no understanding, you see, that at 5:13 he can walk out of the room. There is no understanding for anything. You got it? It's just the auditing command at the moment when given.

There is no way to be a pc. There is no way to be a pc at all. No modus operandi. This is violated in Book One, by the way, with great enthusiasm. Old Joe Winter, and John W. Campbell, Jr., and several other guys around, wrote a pc's code. And they wrote up this pc's code, so I think we shoved it in the book. I don't think I've even ever read it. What trust and confidence I have in some ways.

Actually an HGC contract to obtain auditing is in violation of these principles, but in view of the fact that it's an administrative matter, there it is. But that it applies to auditing, the staff auditor is not bound by it. Couldn't be. The questions in the session are not monitored by it. It couldn't be. The HGC administrative contract has to do with the conduct of the pc when he's not being audited, and therefore that's all right, but cannot regulate the conduct of the pc while he is being audited in any way, shape or form. And no auditor can, beyond exerting control for one question at a time. That is the control he exerts.

Now, you can only get in trouble with this when a pc, out of session, comes up to anger or something of the sort and goes screaming at somebody out of session. And in New York City, they had a pc one time, years and years ago, that would come up to anger and go out and bust up a hotel room or something and would be upbraided by all of his relatives and knocked back into apathy. So the auditor would get ahold of this pc again, and they'd audit the pc, and they'd bring the pc up through 1.5. And the pc would get close to 1.5, go bust up a hotel room or a relative or something of the sort, and all the powers of creation would all come together to smash him back into apathy again.

And you know that this kept up for the better part of a year I think it was. It was a fantastic performance. There wasn't anybody going to let that pc get well, and the auditor audit-
ing the pc had no facilities for restraining the pc in an auditing room for the duration of the twenty-four hours, you see.

What he needed to have been done was auditing in a padded cell; of course, the pc was a psycho. But – that would have worked all right. But that was the most piteous example of the society being totally against anybody getting back on his feet that I have ever witnessed. It really went on, I think, for the better part of a year. Yes?

Female voice: But if you had a case, and let's say that they did answer the problem. They said, well, the problem was how to get along with Joe. And – but then they went on, and then they began to tell you how they first met Joe and how – the reasons why they had this particular problem. Well then, you wouldn't – you wouldn't – that isn't answering the part of the answer to the auditing command. You would try to use your acknowledgments to ...

Yeah. Well, this comes under the skills and tools of the auditor. I was talking about the jurisprudence back of it. Now, far as the skills and tools of the auditor are concerned, he has asked the pc an auditing command. He expects that auditing command to be answered. And that is all he expects.

Now, you get into the control factor of the auditor. This goes over into another field entirely different, and your question, for instance, was, "Well, do you tell them to shut up?" Yes, an auditor can tell a pc to shut up. I have done so. I have said very elegantly in my best possible formal auditing fashion, "Shut up and answer the auditing command." And the pc looks at me blankly for a moment and then answers the auditing command. I never have an ARC break for some reason or other, any more than "Now, sit back in the chair there and answer the auditing command." Pc is going to leave. They're through. They're finished. Anybody ask an outrageous question like "What criminalities have your father ever engaged in?" or something like this. It's insulting. It impinges upon the family honor, you know. "Sit down and answer the auditing command."

And so they sit down; "Yes, he spent seven years in prison." And – some reason or other there's never any ARC break.

This comes under the heading of control. You can control pcs. The mistake is not to control pcs. The mistake is to be kind. I gave you a lecture on that the other day. That's the mistake, man. Or to be social while you're auditing. [laughter] God! Social auditing, kind auditing – boy, they kill more pcs. Pcs get all off the rails. It – in the final analysis, it is much better to say to a pc that is burning up all of his auditing time, "Shut up!"

The pc says, "Aw, I'm talking too much?"

"Yes. Yes. You're covering things I haven't asked you. Now, come on now. Let's answer that one auditing question, now: Recall a problem."

"Oh, oh. That's what you want. Why didn't you say so?"

"I have. Recall a problem." [laughter]

And you'll find your pcs like you better. That's for sure.

Now, there's a polite way of telling a pc to shut up. You say, "Recall a problem."
And the pc says, "Mmm, with Joe. Well, yes. Oh, with Joe. Yeah. Oh, yeah. I had that problem for years. Yes, my mother also had that problem, and my cousin Joanne, she had that problem. And sister Betsy, she had the problem, too. The problem originally originated back in the back hills..." Well, if you've let them go that far, man, you've had it, see.

No, the proper way, actually, to handle it if you can do it, is to say, "Thank you.", you know, plant it right in their skull. "Thank you." They shut up if you're good at it. Look at you kind of blankly. They agree with you, too. They were running off to the hills. Valence is running away with the session. They know a valence is running away with the session. If it can run away with you, too, they go out of session.

Aw, I remember this – one guy, he's had a bad history in Scientology because he keeps falling off the marijuana wagon. And he goes out and gets jobs with bands and so forth. And then he gets to smoking the tea or get – "hitting the tea", I think they call it, or "having the tea pad" or something. And – he goes to ramming around and then all of a sudden, why, he realizes he isn't doing right, and he'll turn up again. He has a bad time, this boy.

He – nobody is sufficiently interested in him. The main difficulty is, is none of his fellow Scientologists are sufficiently interested in – with him to make him sit down and get some auditing, see. He keeps getting away with it. But this guy pulled an interesting, proper trick one time. A very proper trick.

He was auditing an HGC pc. This fellow had a wife. And this wife sounded like one of these tape recorders when Peter is copying tapes, you know, at high speed. [laughter] And he was going over to this fellow's apartment to audit him, and this wife would tear off and tear into Scientology and so forth, and tear into this, and then intrude her own problems, and difficulties this fellow has, and this fellow had always been silly about his mind. And oh, my God, you know. Just run on and on and on, miles a minute and disassociatively, too. You know, start talking about the China teapots and all this kind of thing. So this guy – this guy pulled a Tone 40 "Thank you" on her. He got his face right up against her face, [laughter] you see, bending over sideways as she was talking, you know, and put a Tone 40 "Thank you" right in the middle of her thetan. Bang! You see? And she didn't say a word for two days. [laughter]

And that pc was absolutely fascinated. He might or might not have gotten anything too much out of that intensive, but he went home perfectly satisfied. There must be something to Scientology because it's the first time in his life he'd ever heard his wife quiet for twenty-four hours. [laughter] I remember that silly case. You remember that one?

Female voice: Yeah, I remember that.

Yeah, man. He really planted one. Rest of that day, man, she didn't have a thing to say. [laughs] she had no – no ARC break of any kind with the organization or with that auditor. After that, she thought we were all right. Fascinating, isn't it, huh?

The mistake is not to control the pc. That's the mistake. And your – all of your social training and all of the other trainings which you have, go against that point. And you think a pc is talking too much, you can give them an acknowledgment, just before they – in full flight. But watch it, because you've announced yourself at that moment as a control unit, see.
You've announced yourself as a person who is controlling the pc. And the next few seconds are very crucial. Will you continue to control the pc or won't you?

And if you will continue to control the pc, you're all right. But if you really didn't mean it, and you're going to back out on it and you're going to apologize for having controlled the pc, you're going to be in trouble because the pc will make a test of it. Rather, the valence will make a test of it right at that moment. The valence is running on and on and on and on and on, and very non sequitur, and hasn't anything to do with the session. And you say, "Thank you."

And they're liable to get a little something sometimes, you know: "Well, you couldn't quite have said that. You interrupted me, you know", kind of fishing "Is he going to keep on controlling me?"

And you say, "Well, I'm sorry I interrupted you, really", and chicken out on it, see. You got an ARC break.

They say, "Well, I hadn't finished what I was saying. You know." If you don't chicken out, you get away with it right straight across the boards.

You say, "Yes, I know. Here's the next auditing command."

And they say, "I've met a tiger. Hmm! I've met a tiger with red stripes. I will now do the next auditing command and stop this nonsense."

ARC breaks proceed from lack of control. They actually always proceed from lack of auditing. You don't give auditing to the pc, you don't give control, you don't give auditing commands to the pc or you don't let the pc do the auditing command, you've got an ARC break. That's where your ARC breaks come from.

But as far as creating ARC breaks by being rough with the pc, positive with the pc, definite with the pc, and so forth – no, you do not get ARC breaks. The pc sort of says, "Wheew. I've been sitting here for the last three sessions wondering if this person was ever going to get on the ball and really, really, really get this thing in – into its proper pocket. And he did. Huh-huh! Good! That's really some auditor", they'll think, you know.

I remember one pc didn't make any progress. Didn't make any progress of any kind whatsoever under one auditor who was being very, very kind, very understanding, very sympathetic. Pc would spend about two-and-a-half-hours answering one auditing question, just running off at the mouth, and the auditor would sit there and let her do it. Just burning time, burning time, burning time, burning time.

Basically, what you can get away with is the degree that you can impinge upon the pc. Impingement has a lot to do with this, a lot to do with it. If you haven't made any impingement on the pc at all, the pc isn't going to do the auditing commands easily and isn't going to gain very fast. But if you do make an impingement on the pc, why, fine.

You start making a misemotional impingement on the pc, however, and you have bolstered up the valence which is always – a valence always is, by the way, a misemotional entity, and you've bucked up the valence, and you've permitted the valence now to overwhelm the pc, you see. Valences are usually in a misemotional state and – down under the surface,
and so on. They're low grade. And you've supported the anger that's about to cave in the pc and the pc will cave in. That is the wrong way to go about it.

If you're going to exert control, you exert it just as Tone 40 control. That's all. If you're going to exert fast, hard control, you simply say, "Well, that's it." And you say, "Do it." If you don't like what the pc is saying and you engage in a misemotional debate with the pc on what the pc is saying, oh, you've had it because you have now bolstered the valence which has already got the pc overwhelmed. So you have overwhelmed the pc, not controlled the pc. And there's a considerable difference between these two points.

So if you're going to do any of these things, if you're going to tell the pc to shut up and sit down, don't say, "Shut up! Sit down!" Oh, no. Nice Tone 40, "Shut up. Sit down. That's it. Thank you. Thank you very much. All right. Now, let's get on with this session, shall we? Here's the next auditing command." Bang!

Pc says, "I've met a tiger. Well, I guess these aberrations of mine have finally met their match."

But you can actually drive a pc off his hinges by becoming angry with him or using an angry tone of voice in trying to monitor or control. And if you don't shoot misemotion at a pc, you can say anything to a pc – if you don't shoot misemotion at him.

It's a bum thing to comment on a pc. It's a bum thing to make any comment of any kind whatsoever, on anything the pc has done. The pcs is – practically looks like they're pleading for a comment. They say, "Well, I burned down this church, you see. And I guess that was pretty bad – wasn't it?" And you, you knucklehead, say, "yes". Hmm, you've had it. You evaluated for the pc.

He asked for it. And you evaluated for him. And you say, "Well, then why in the name of common sense have I created an ARC break, and why is this pc out of session, and so forth?" You've made a comment. It is not up to the auditor to comment.

The pc says, "I've been sick for eighteen years, and I've had lumbosis in my zorch. And I have just been caved in all over the place, and that's pretty bad, and the doctors have really done me in, and everybody has done me in, and that sort of thing."

To say "Yes, you're in pretty bad shape", is a lousy thing to do. That's a bum thing to do. Just acknowledge it. Well if you're going to get him in auditing, you're going to get him to be audited, don't run a sales talk that is based upon an agreement with this sort of thing. Just say, "Yes, I am sure you need auditing. Now, the next auditing session begins at 7:30. Now, why aren't you there?" You see, that's the end of it. That's control. That's control.

But agreement about how bad off he is, agreement of how badly he's been treated or anything like that or agree that some auditor has bunged him up, or, you know, make – this is evaluation. Whether you like it or not, it's evaluation. The individual says, "Well, I feel pretty bad about having done that to that girl!", and the auditor says, "Well, I guess you should." You just watch him hit the toboggan. You can – you can – you can drop him two, three points on the Tone Scale tus-ku-whish, like a bang, you see.

Why? Because you are able to control. So therefore your opinion doesn't become an opinion to the pc; it becomes a stable datum. Now, God 'elp you if you are now faced with
the necessity of auditing out all of your stable data. You've made a lot of comments to the pc. You've agreed with the pc on a heck of a lot of how bad it all was and so forth. Now you're liable to get up against the situation where you actually are auditing out your own agreements with the pc on this subject, because you'll come up against them sooner or later. The pc will come out from underneath them.

Don't make comments to the pc. Don't comment on his data. Don't evaluate in any way. A comment is an evaluation even though it's apparently a kind of a null evaluation. I just don't pay any attention to it. I acknowledge it. I do this habitually enough that sometimes people think I've agreed with them when I've only acknowledged them. They want me to agree with them so hard that about the only trouble I ever get into is they think I've agreed with them.

They say, "It'd be a marvelous thing if we took the roof and moved it down on the lake, and so forth." And I've acknowledged that I heard them talking. See? And I'll say unfortunately or something like that, "Good. Good." And they say, "Well, he said we could take the roof down." [laughter]

Well, that's how hard – that's how hard a pc will work to get you to agree with them. You're not out of agreement with them. You're not in agreement with them. That isn't your role. Your role is the role of administering auditing and control, don't you see. That's the way it is.

Well, I've kept you terribly overdue.

Thank you very, very much.

Audience: Thank you.
ROUTINE 1A – PROBLEMS AND CONFRONT

A lecture given on 6 July 1961

Well, this is the what?

_Audience_: Sixth of July.

It's the 6th of July. No kidding! I just read an HCOB upstairs, said it was the 7th of July. [laughter] All right. It's the 6th of July, AD 11.

And I kept you very late. I've been keeping you very late these evenings. Do you object to this, or is this ...?

_Audience_: No.

It's all right? All right. Thank you.

Now you've just had a shift over from the process commands of Routine 1A. That's probably not the last one on 1A, because 1A by definition is simply Problems and a Security Check. And you can't help but run problems and see them run on a great many people, without finding odd factors of one character or another, and refining auditing commands.

The first thing I discovered is when you ran "Recall a problem", the person went first-dynamicy and actually just as-ised his own problems and his own problems and his own problems and plowed around on the valence.

In view of the fact you're running this on people who are very thoroughly fixed in valences, then the obvious thing to do is to boot them out of it. And that's – new command is a six-way bracket. Best way to phrase it is "can" and "wouldn't confront" on self, another and others. Actually the wording of it is not as important as that.

Now you've just had a shift over from the process commands of Routine 1A. That's probably not the last one on 1A, because 1A by definition is simply Problems and a Security Check. And you can't help but run problems and see them run on a great many people, without finding odd factors of one character or another, and refining auditing commands.

The first thing I discovered is when you ran "Recall a problem", the person went first-dynamicy and actually just as-ised his own problems and his own problems and his own problems and plowed around on the valence.

In view of the fact you're running this on people who are very thoroughly fixed in valences, then the obvious thing to do is to boot them out of it. And that's – new command is a six-way bracket. Best way to phrase it is "can" and "wouldn't confront" on self, another and others. Actually the wording of it is not as important as that.

Now, you got an oddity: Whenever you combine an "invent" process – a person isn't inventing, but it's an open invitation to invent, to the pc, to say something on the order of "What could you confront?" see? Well, oddly enough, the cure for the Step 6 phenomena is, of course, Confront. I don't know if you knew that that was the cure for the Step 6 phenomena – you ask somebody to invent something and the bank all goes solid. That's why we don't use Step 6. There were quite a few people that they'd start to invent something and the bank would go solid, you see? The whole bank would start living up.

Well, Confront is the antidote, and a five-, six-way bracket on Confront – plus and minus confront, you see ("What would you like to confront?" "What would you rather not confront?" you know, that – any such wording) – is a cure for this phenomenon that if you ask somebody to create, his bank goes solid. All you got to do is ask him to do some confronting
after that and the bank goes back to size. Do you understand that? So this was why I wasn't much concerned with everybody letting out – not everybody, but a few people letting out pale screams about Step 6.

It was very, very easy to remedy. There are two ways to take the edge off the bank after it has all been (quote) "beefed up."

You're looking at me awful blank. Don't you know this? Don't you know that if you run – that if you run old Step 6, the whole bank goes solid on some people?

_Audience: Yes. Yes._

You know that.

_Audience: Yes. We do._

All right. Did you know there was a remedy for it?

_Audience: No._

Oh, I see what we're falling into. [laughter] You thought it was incurable! [laughter] Well, actually – well, frankly, frankly, there's nothing in the world easier to cure than this particular one. You just say to the fellow who's had this happen to him – you've asked him to mock up, mock ... You could actually run Creative Processes if you kept this in mind. The guy doesn't like men with wooden legs, so you say to him, "Well, all right. Mock up a man with a wooden leg."

He says, "Well, I can't do it."

You see, give him a failure right away. And you say, "Well, mock up the shadow of Treasure Island."

"Oh, I can do that all right."

"All right. Now put a person on Treasure Island."

"All right, I can do that all right."

"Good. Now mock up a pirate ship."

"Well, I can do that all right."

"Now mock up a cook."

"All right. I can do that all right."

"All right. Now mock up a parrot."

"Okay. I can do that all right."

"Now put the parrot on the shoulder of a man."

"All right. I can do that all right."

"Now mock up Long John Silver."

"Oh. Yeah, I can do that!"
You say, "That's okay." He'll never have any further reaction from there on out to a man with a wooden leg. I mean, I'm not joking. That is what you could do.

Creative Processes were wonderful. There's no kidding about it. Because what's it do? It takes over the automaticity of the fellow creating these things in his own bank, you see? And you just take over the automaticity on a gradient scale, and you got it made.

Fellow is an alcoholic. You say, "Mock up a table."

"I can do that."

"All right. Mock up a table. Thank you." "Mock up a table. Thank you." "That's real good. Now, all right. Now, mock up a table with an empty glass on it."

"Uurhh, I can't do that. It gets full of whiskey."

Actually, that's what an alcoholic is trying to do, is as idiotic as that. He is trying to get back to where he was before he took the drink, so the glass has always got to be full. That's why they can't stop drinking. I mean, it's as stupidly idiotic as that. You act like you don't believe me. I mean, it's just as goofy as this – this alcoholism. The fellow sits there and he wishes he hadn't drunk the whiskey and the only way he can get the picture back of not having drunk whiskey is to have a full glass of whiskey in front of him, see? So, you fill up his glass of whiskey and then he's very happy for a split instant, you see?

But then, of course, it's got to be an empty glass of whiskey because you got to make nothing of whiskey. So he doesn't throw it in a spittoon, he throws it down his throat, see?

But the second he's thrown it down his throat, he's got an empty glass, so he has to fill the glass up again in order to be back where he started again. Because, of course, when he started, he had a full glass of whiskey. You think I'm kidding you, but they're this loopy. And that is alcoholism in full parade.

All right. You ask this alcoholic, you say, "All right. Mock up an empty glass."

"Can't do it."

"Well, all right. Now look, mock up the shadow of an empty glass."

"No. I can't do that."

"Mock up a ring on the table where an empty glass has been."

"All right, I can do that."

"Okay. Do that. All right. Now mock up the shadow of the empty glass."

"Okay, I can do that."

"All right. Now mock up an empty glass."

"Huhhh, all right. I can do it. It's all right – tduuhh! It keeps trying to fill up. No, it's going down. No-ow it's going – filling up – oh...." [laughter]

And with a terrible series – experience of relief, he says, "Huh! I can do it! Yeah, I can mock up an empty glass."
You say, "That's real good. Now, fill it up full of whiskey."

"Ulp!"

And you say, "No, no, now. Now, just let it sit on the table and fill it up full of whiskey."

You say, "Well, all right. Just keep putting it back there. Now, just put it on the table and get it full of whiskey. All right. You're all set now. Now you can kind of hold it there on the table. Can you hold it there on the table?"

Sometimes you're not that lucky. It keeps pouring down their throat, pouring down their throat. But any gradient that you could possibly figure out, see? Eventually he can sit there with a whiskey bottle, he can sit there with a glass, he can sit there with a full glass of whiskey. He can sit there with any of these combinations. And when he can do that, he's no longer an alcoholic. Just like that.

You know, the test of an alcoholic is, can he ever take a drink? The test of an alcoholic is, can he take a drink? That's the cork test. And Alcoholics Anonymous say it is impossible to cure alcoholism or do anything about alcoholism, so therefore they must not ever take a drink, because they know this is true: that an alcoholic is no longer – not an alcoholic as long as he doesn't take a drink. But he becomes an alcoholic at once if he takes a drink, so I guess that makes him an alcoholic all the time, doesn't it? That's why Alcoholics Anonymous is – all it's doing is running a terrific "can't-have" on alcohol. Now, where do you think that's going to get, huh?

All right. You can cure all that with Creative Processing. Well, all right. But because you've done this, because you've made the guy mock it up, mock it up, the bank has gotten solid. You know, he feels these ridges. He feels these masses. It is not so good. It's not so good. His chest is caving in and all sorts of bad things are happening to him, see? And he doesn't think this is so good. So you-ou-ou-ou ...

Two things – two things that'll do it. One: "What could you confront?" "What would you rather not confront?" "What could you confront?" "What would you rather not confront?" "What could you confront?" "What would you rather not confront?" Run that for a while. The bank goes thuum.

Now, to make sure that it stays down and make sure the process doesn't get stuck on flows or imbalanced, you run "What could you confront?" "What would you rather not confront?" "What could another confront?" "What would another rather not confront?" "What could others confront?" "What would others rather not confront?"

This is carrying it out so the guy doesn't get stuck on a stuck flow, see? And the old confront process, when it was run on self dynamic only, eventually got stuck and became inoperable, see? So we've – you haven't kind of seen the old Confront Process for so long. And therefore it's just used these days for touch-up, various types of Confront. And you'll find
these things are all operative, but they're merely used for touch-ups on a case. But if you go for broke on this and you really start auditing Confront, you better audit with a six-way bracket: plus, minus, and self, another, others – see, plus and minus for each. And you can run Confront forever that way.

Now, a person who is stuck on another confronting, but not stuck on himself confronting, actually will not get anywhere running Confront. That is why Confront ran on some people, didn't run on other people. In other words, people have different kinds of stuck flows. And Mr. A has a stuck flow because another won't confront it. See, he's trying to make another confront, another confront, another confront, see?

Miss B is totally mixed up on confront because she's trying to get others not to confront, "Please, others not to confront." So she's got a stuck flow right on that leg of the bracket.

All right. You try to run "What could you confront?" "What would you rather not confront?" on that person just as those two commands. But Mr. A over here, he's stuck on "another", see? And Miss B. she's stuck on "others", see? So you won't get those two cases; you only get the fellow who is stuck on himself confronting.

So, if you run this six-way bracket, plus and minus on self, another, others, you take in all cases on confront. You can turn on any pictures you want to using confront in this particular way, you see? And this beefs – the beefed-up character of Step 6 disappears when you do this. It goes right down. It disappears right now. There are no consequences to it. It takes a half an hour or so, something like that and it's gone.

And the other one is Responsibility. "What could you be responsible for? Thank you." "What could you be responsible for? Thank you." I mean, something on that order will also take the edge off of one of these banks gone solid. You see that?

You got two remedies: any version of Responsibility on pictures and any version of Confront on pictures, preferably the six-way bracket. These two things cure the Step 6 phenomena and therefore it's not very serious, because even though you do it, you can undo it.

You do too much create on a person and they have a hard time. If you said to a person, "Tell a lie. Thank you." "Tell a lie. Thank you." "Tell a lie. Thank you." "Tell a lie. Thank you", there'd be a certain number of people, all of a sudden, things start to get awfully solid inside their head and solid out in front of their faces and solid back of their backbones. And it gets painful and it gets more and more solid and more and more solid. And you just keep on saying, "Tell a lie. Thank you." "Tell a lie. Thank you." "Tell a lie..." And it gets more and more solid, and it's getting very painful. Why? These people have an automaticity that if you create anything, everything they're creating gets created.

Now, the bank is an individual creation. The bank is created by the individual. This is actually the series of proofs by which this is done: You improve picture A and then go back and look at picture B. All right. Now come up and improve picture A again – you know, turn on the sonic and visio in something in picture A – and then go back and look at picture B again. You'll find out it's improved in picture B, too. And this is quite curious.
Pick out a picture B as a six-years-old birthday party – pleasure moment, see? All right. Now we're not going to permit any confronting to amount to anything of picture B, this six-year-old birthday party. All we're going to do is improve their confronting of an automobile accident when they were nineteen – has nothing to do with the birthday party. All right. So we improve their ability to confront this automobile accident and we get all the perceptics in the automobile accident up – really, what we're trying to do rather than improve its confronting – get all the perceptics up, sharpen them all up, making them sharper, make them clearer, open that view up of that automobile accident. Let's hear the blood drip, you know? And then take them back and show them this birthday party. You say, "How's the birthday party now?"

"Well, I didn't know there were that many children there. And I can now see the front doorstep. And it's all getting 3-D."

You say, "Thank you very much. Very good. Now let's get it back to this automobile accident. All right. Now take a look at the automobile accident. Now do you hear anything in that automobile accident? Do you feel anything?"

"Yeah."

"Well, what lies over in front of the car?"

See? Just beef it up, beef it up, beef it up, beef it up. It's getting 3-D, you know. I mean, it's getting 3-D, and it'll – eventually, even the person who has a black field, you can talk them into doing this.

You eventually get this picture which is a totality. If they're stuck someplace on the track at some other picture, of course, that is the black field. The field is a picture, you see?

There isn't such a thing as a person who has no pictures. There is a person who has an invisible picture or a person who has a black-field picture, you see? It's not whether pictures have disintegrated and so forth. It's just a picture. And you move them to some other part of the track, or get them to take responsibility for the part of the track they're in, and that black field, invisible field, moving field, something like that, these things disintegrate – if they do the auditing command.

All right. Making allowances for these other various case mechanics, you improve this automobile accident like mad, you keep making him look at this six-year-old birthday party and eventually, my God, they can taste the cake, they can get the heat of the candles, they've got the whole lot, you see? But, what were you doing? You were improving an automobile accident when they were nineteen. Curious, isn't it?

Well, that means you improve up one part of the bank, you're improving up another part of the bank. That's what it means. Who are you working on? You're working on a pc, aren't you? And what are you doing with the pc? You're improving his ability to perceive. Well, to improve his ability to perceive, you're improving his ability to create.

Now, the same phenomenon takes place if you say, "Mock up the park. Thank you." "Mock up the park. Thank you." "All right. Now we want you to do it just a little bit better this time, and get some more leaves on the oak trees, and that
sort of thing. Mock up the park. Thank you." "All right. Now, we want you to do just a little bit – let's get some more water down there in the lake and get a little more space in this thing. Now, all right. Mock up the park. Thank you."

And they say, "It's getting awfully solid out there."

And you say, "That's good. Let's take a look at this six-year-old birthday party."

Holy suffering catfish! You see? The kids are all in 3-D and their screams are coming through their eardrums. You get the idea? So that any time you improve creative action, any time you improve creative ability on one part of the bank, it improves on another part of the bank. It's quite interesting, isn't it?

It tends to indicate, as we have discovered long since, that the only reason you can make a pc well is because he's doing it all himself. He isn't getting any help from anywhere.

All right. If he isn't getting any help from anywhere and he's doing it himself, naturally you can clear him. Otherwise, you'd have to go back and find all the people who aberrated him and get them to apologize to him or something of the sort, to clear him. [laughter]

Now, just the fact that you can change a pc's case shows the – is the prima facie evidence: It shows that you are, actually, working with somebody who is doing it all himself. You know, he's mocking up his own aberrations. He's mocking up his own bank. There is no other automaticity. He's mocking up his own machinery, his own circuits, everything.

All right. So therefore, you improve his ability to do any part of that and then you look over the track as far as he's concerned and you find out it's improved everywhere.

All right. If this is the case, then you have the situation where if you improved the pc's ability to create without improving his ability to confront, you've done him in.

Art school. Art school. Technical schools. Show people how to build better electric motors – build more electric motors, build more electric motors, build more electric motors, build more electric motors, build more electric motors, build ... more ... electric ... mo-

Eventually, they'll do nothing but break electric motors, see? Something They'll start feeling bad. Their study will upset them. Study will upset them. Why? Because you're asking them to create, create, create, create, create, create, see? And the whole bank starts beefing up. But make sure that your school is so arranged that it has no electric motors in it. It just has diagrams – has diagrams and mathematics and slide rules, but there are no electric motors to teach anybody on. Just make sure you do that.

And, of course, you spin in every electrician in the society, every potential electrician. Even though the guy was a good electrician in his last life, by the time you've gotten through with him, why, he's no good now. That's why you can't get any washing machines repaired in this society.

Nobody – it never occurs to anybody, "Oh, you want to work for us as an electrician? Good. All right. Let's see. Have you ever been an electrician?"

"Yeah. Oh, yeah."

"When was that?"
"So on and so on."

"Oh, good. At certain, certain dates. All right. Okay. Killed in World War II. All right. Chief Electrician's Mate. Oh, that's good. All right. Now, that was the US Navy? British Navy? What? What navy?"

"German Navy! All right. That's good. Okay. Now, what part of that life would you be willing to confront? Thank you."

"What part would another person be willing to confront? Thank you."

"What part would others be willing to confront? Thank you."

Bang, bang, bang, bang, bang.

"Now we'll put you to work at $125 a week and there you go. There's the shop." You would have educated him.

No, but you use this other system:

"All right. Now, we're going to teach you to make electric motors and fix up electric motors – particularly make electric motors and create electric motors. And we're going to fix you up. Now, all we have here are diagrams. There are lots of diagrams of electric motors, but not many diagrams actually. It's mostly text."

This sound like modern education? [Audience murmurs in an agreeing way] And the guy never has a prayer, don't you see? He never has a prayer to knock out the creation. So everything he doesn't like about electric motors or engineering or artwork or architecture, or anything else he's studying, will eventually come to the fore, because you're running a "can't-have" on him.

It isn't an educational system, it's a games condition. See, you fix it up so the fellow can't have what he's being educated in. There's only one way to learn how to be an engineer or an aviator or anything else, is go find yourself a bridge or an airplane. That's it, see?

Look at the number of hours you spend – as a student in Scientology – look at the number of hours you spend auditing, being audited, getting subjective reality, objective realities. Look at the number of hours compared to the number of hours you spend on theory. It's different, isn't it?

Audience: Mm. Yeah.

It's a different system.

I say, all right. Look at people's brains. Look at people's behavior. Look at what you're looking at. Look! You know? Get an idea on it.

All right. You take somebody who's been floating along. He'd been drifting along; he hadn't done much auditing. He actually didn't do much studying. He hadn't confronted anything very much. You find all of a sudden – not having done any auditing to amount to anything and not having studied very much in the first place and not having done much observation but has just read some books, and you'll find out he has a very hazy idea of whether auditing works or not. He doesn't have much reality on it. He doesn't really think it works. And the funny part of it is, the more evidence you present to him and the less work he does with the mind, the less he will believe that auditing works. Isn't that interesting?
You could present him with tons of proof, you see, in terms of graphs and testimonials, and all that sort ... You wonder why I don't ever specialize in graphs or testimonies? Why aren't these plastered all over the walls and being shoved under the noses of presidents and tramps and all kinds of people, hm? Well, there's no point in it. There's just no point in it. The guys can't look at problems anyhow. They don't even know there's a problem about the human mind. They'll tell you – parrot-like, they'll say, "Well, out of every fifteen people, there are nineteen of them are psychotic. Yes, we have the figures of the American Psychiatric Association. Yeah, I know. Yes, yes. Big problem. Big problem, big problem, big problem, yes, yes, yes, yes." Hell, he'll never see any part of that problem!

Their own wife and eighteen children might be in the insane asylum and they wouldn't recognize that insanity had anything to do with them or was any problem in legislative action, or the world of operation, or anything else. See? They just won't confront the problem of it. They can't confront the problem of it. It doesn't exist, because they have no subjective reality on it.

Now, actually, the more theory which you present them with, unaccompanied by an ability to confront or an opportunity to confront the substance of minds and the substance of thinkingness, and the substance of beingness in life, the less reality they're going to have on the subject of the mind, so you better leave them alone. You better let them drift in this uncomfortable miasma that they are now in, rather than deteriorate it, until you can get around to getting them audited. You get the idea? It's a different look when you look this thing over.

You say there's no reason to go around the legislative halls, or the armed services, or something like this, showing a bunch of things. I do some token work in this direction. But the more they hear about it without observing any of it, the less reality they've got on it. And that's the hideous way this thing operates.

All training must be accompanied by confronting and all training in the arts or productivity certainly must be accompanied by confronting. Kow! man, you'd better really operate now if you're going into the field of the arts, where it's produce, produce, produce, produce, you see?

Oh, I'd better – guy had better spend one hour a day painting and five hours a day looking at pictures, see? You better let him spend a little while figuring it all out and then actually doing it in the mass, and looking at it being done in the mass. In other words, you got to get the confront up.

Where you have a create, you've got to raise the confront. The cure for obsessive create is confront. This gives you some idea of the value of confrontingness.

All right. Now, let's trace back – I'm not just mad-dogging the subject of education, except we've got to get to them before they do. But here's the thing: If the guy is mocking up his own bank and if the fellow is creating his own aberration, it must be – it must be, perforce – that the road out would be a confront. Isn't that right?

I mean, if obsessive creation or consequences (bad consequences by a reason of creation) – if these are curable by confront or some version of confront (which is to say, familiarity with the subject; let's not just say confront), then, of course, the road out lies in, on the one
hand taking over the automaticity of that obsessive creation, and on the other hand giving him
great familiarity with that obsessive creation. And as soon as he gets these two things, he goes
Clear.

If there's any secret to clearing, that would be the secret. But, of course, you must have
been missing a few links here. The reason I've given you a short talk on this is because if you
didn't know that Step 6 was curable, then, at the same time, you hadn't thought the thought all
the way through that a mind is curable. You see, because all a mind is, is an obsessive crea-
tion. It's an unknowing, obsessive creation on the part of the individual.

There are many factors which enter into it, of course. There are infinite factors, but
there are only a few important factors: create, confront, responsibility, problems, change and
not-know. And these things kind of added up, when you juggle them this way and that, why,
you've sort of got it.

Now goals, of course, prevent the individual from looking at anything. You see, he's
always looking at tomorrow. He's never looking at what he is looking at.

We've got a girl right now who is very interested in going down to the seashore and
she's very interested in having a long vacation and so forth. And she's sitting in the middle
of the swimming pool with lots of help, and so forth. She's got a big goal to have a vacation,
see? And her goal to have a vacation is so tremendously strong that it absolutely prohibits any
observation of where she is. There's nothing wrong with her having a goal to have a vacation,
but you begin to laugh when you look at it. It's silly. She's having a vacation, only she's got
such a goal to have a vacation, you see, that she hasn't noticed.

Now, there's nothing wrong with having goals, but what you're looking for is the ob-
 sessive goal of the case and there's only one of those and of course that prevents them from
confronting anything in that chain. There's nothing in that chain confronted. Why? Because
the goal is so overwhelmingly obsessive that it removes their attention away from anything
that is in that chain to something that isn't yet in the chain. So of course they get no confront-
ing of any kind on that particular chain where they have the most obsessive goal.

And when you've knocked it down to a totally obsessive goal and then you have found
the terminal that represents this totally obsessive goal, you will now have found the terminal
that they have neither ever looked at, inspected, but had then been. It's pretty grim when you
take a look at it.

Get an idea – I see that you're looking a little bit drifty, here, about this thing – get an
idea of looking at this table up here. All right. Just look at the table now. Now you're in the
process of looking at the table, aren't you?

All right. Now look at the ceiling above the table. All right. Now, as you look at the
ceiling above the table, get the idea that it isn't there, and the only thing that is around is this
table. Now, isn't that a kind of an odd sensation?

All right. That's a goal. That's a goal, you see? The person isn't where they are, they're
at an imagined future point. So of course they aren't confronting where they are.
And there's nothing wrong with having goals, but one of these super-plowed-in, obsessive goals leads to the person who most obsessively had this goal, which is the valence, and of course, this is the total no-confront of the bank, is all bunched in that one spot, see, with that whole track around it. Now, naturally, you get all kinds of changes when you start running goals out of people. And the more goals a person has, the less confronting he's done of his immediacy.

Life is now. Life is now. It isn't tomorrow. Life is now. It is right this minute, you see? So if you only looked at tomorrow while living right this minute, along one particular line – if you did this always, forever, and you never observed the immediacy of the situation, but only observed the tomorrow of it – you would eventually have as-ised any future of it at all. Couldn't have any future, so therefore it hangs in time a hundred percent. Doesn't move, it can't.

And at the same time, you've never as-ised any immediacy of the situation. So all the immediacy of the situation is there on that chain and all its future is as-ised. Its future is gone. And there you get your obsessive goal, and there, of course, you get your most solid chain in the bank. And, of course, this is represented by a terminal.

There's why Goals Processing works like mad. But Goals Processing undoes these little mechanisms of no confront – SOP Goals. The assessment itself starts off at a high roar and starts doing this left and right, center, in all directions. And the pc feels groggy and he feels this way and he feels that way and he feels some other way. And you sometimes despair of it. You say, "Well, good heavens, you know, this fellow is just going to go hours and hours, thousands and thousands of hours, it's obvious, before we find any sort of a goal."

Well, it's not true. He'll fall in someday.

But all the time you're finding a goal, of course you're taking off all of the futures and restoring the immediacies. And if you were to do Goals Processing somewhat crudely and slant it in another particular way, you could get an odd phenomenon: You could get an individual totally regressed, so that some back point of the track becomes the total reality. See, there's no present point, there's only this back point.

If you kind of ARC broke it and didn't keep him moving on the track and kind of messed him up in all directions and so forth, he'd find himself sitting in the middle of the Battle of Bunker Hill or some stupid thing, you see? And everything would all be 3-D, too – 3-D in color. And it would be right now, right now.

Running into this right-nowness at points on the track is sometimes very startling. And where they lurk is on the goals chain. You see, they're a moment when the fellow wished to God he were somewhere else. He's got to be somewhere else, but he can't be anywhere else, so he's got a future.

And this thing he's looking at, this totally solid scene, no part of it is observed in any way whatsoever – it's just a total overwhelm – and he's got a future of it. He's got a future, see? He's going to make a future postulate there. And it's that "I don't want to be here! I want nothing to do with this." And it just leaves it on the track as a total solidity. And one day you're running him back down the track, and he now hasn't got the total strain of future, so for
a flicked instant he'll get all the redcoats standing there in 3-D, you see, and smell the powder smoke, and all the rest of it. And he has been tricked, you see, he feels, into being at this spot again. And it won't last long; he will be at that spot and he'll go zoom into the future. He does a bounce.

So you don't see these regressed spots very long. But that doesn't mean the regressed spot is as-ised; that means the pc has gone into the future of it.

Now, as you're auditing it on SOP Goals, it's so rigged that this won't particularly chew up your pc, and you're also going to run some Havingness and Confront. But early in an SOP Goals run, you might very easily find a preclear hitting these 3-D regression points. You know, every time he turns around, why, "What? The place is on fire!", you know? "Oh, well, uh, no, that's – that's an instant of track. Yeah! Pheew!" "Yeah, that's pretty good, yeah. No, it is on fire! By George!" [laughter]

This is the sensation he's getting, you see, because he's never as-ised where he is, he's never inspected that, so he has no familiarity on that at all. He only has a familiarity on elsewhere. Now, naturally, the more familiarity he has on elsewhere, the more elsewhere – with regard to that moment – he does as-is.

So the "elsewheres" tend to disappear and he begins to be more and more fixed in that incident where he isn't, but where he is. This is one of the basic mechanisms of existence.

So these points – when you start to run Creative Processing of one kind or another, these points tend to come up rather easily, because of course he's obsessively creating them all the time. And you find all sorts of 3-D stuff on the track if you're doing this.

But your "confronts" are very good.

Now let's take this thing called a problem, which is the least confrontable thing there is, because it's in motion and because it fixes one with a stable data, and all that sort of thing. And you look over problems, and if we run confront in on top of problems, we're doing a double job, don't you see? Also making it easier on the pc to run it with "other people confronting", and so forth.

He starts out, usually, with the most interesting ideas as to what other people can confront. Takes him a long time sometimes to find out that they haven't confronted any part of what he thought they could confront. He has the idea of, well, his mother, she could sure confront problems. "Man, Mother could certainly confront problems. Boy, that's dead easy. She never did anything about any of them, ever." So obviously she could confront problems, because she never did anything. And then it kind of turns up, as he goes along the line and he looks at this again, and he'll say, "Well, actually, most of these were problems Mother created. Ah, well, that's a funny thing. Well, she could certainly confront problems, I guess. Uh – or could she?"

Then he gets up to the point of, "You know, I don't think she ever confronted a problem in her life. I don't think she even knew they existed. Must have been! Must have been, because she never did anything about any problem. And she certainly created all the problems that she – I can't find anything in the family – anybody creating anything in the family like
problems but my mother. Now, what is this all about? She – no, she couldn't confront problems. She didn't know they were there."

You get the mysterious viewpoints a person takes. One gets a totally false idea, by the way, of what other people are able to confront by what they don't do anything about.

For instance, you see the United States right now and England and NATO at large: they're – communism's perfectly all right. Atomic bomb – "Well, we'll have a deterrent: You hit us, we'll hit you. Yeah, that's the answer to it."

Running problems for a little while, it suddenly dawns on you with a dull crash that these people don't even know where the wall is with regard to this particular problem, see? They're facing an annihilation, a total attrition and they say, "Well, what wall? No problem there. Couldn't be anything going on."

Now, some of these nations, well, they jump on some country or another – the Congo or something – for not conducting its parliamentary debates right. Congo kept trying to conduct them, I think, with machine guns and rape, and that isn't done anymore. And the Congo hadn't realized that it had gone out of style with Empress Eugenie hats. It was quite the style around here a century ago, but it's gone out of style.

And so they were just – they kept saying to the Congo, "Well now, you fellows are out of style, that's all, you know? I mean, it's not done anymore, you know?" Raising hell about it. "And you shouldn't throw people in jail and do all this kind of thing." And whole United Nations comes crashing down on the Congo and everybody starts monkeying around with the Congo, and...

Well, let's look it over. This is about the most pint-size, postage-stamp problem that exists on Earth today. And it has, as its personnel, a lot of people who are rather easily handled. So of course the United Nations can confront the problem called the Congo – not do anything about it; create more problems in the Congo. But nevertheless can almost be familiar with the Congo. Don't you see?

At the same time, two-thirds of the world population are behind an iron curtain, totally denied liberty, justice, fraternity and equality and all the things that the United Nations says it stands for and it doesn't do a cotton-picking thing about it.

Look at that. What an interesting view of the order of magnitude. Here's two-thirds of the world's population: They have to have permission to eat and to sleep and to starve, and permission to not wear shoes, and they are permitted to wear a toothbrush, and I think their – their total possessions, by the way, I think, are a spoon, a comb, and a toothbrush; I think that's about what you can own now in China, by law.

United Nations doing anything about this? Does it ever call anybody to account? Does it ever whistle anybody up and say, "Hey, you know, you blokes are not conducting yourselves with liberty, fraternity and igualidad?" You know? They never say a word about it. They just have conferences on these fellows down in the Congo, which is about one one-hundred-thousandth of the world population.
Well, now, these things become very clear to you when you get a subjective reality on problems and people's reaction to problems. See? I mean, all of a sudden a lot of this stuff becomes explained.

Now, similarly, a preclear's life all of a sudden starts looking much more comprehensible to you. And it looks much more comprehensible to him.

Some pc will run a total irresponsibility about problems of any kind, shape, form, anything else. Yet they see nothing incompatible with having trouble in their life and not confronting any problems in their life, and they think this is okay. And they're liable to think you as the auditor are being mean to ask them to confront any problems. They see no connection. All of a sudden they see a connection, which is a very rapid way, of course, of going about the situation.

Now look-at-here: If a person can't confront any problems, they of course are not going to confront any problems that they've got. Ahh, and we have the clue to slow clearing. See, there's the clue. I'm quite convinced of this now, because I've watched an awful lot of people getting Clear. And the percentage is rather slight and apparently those that get Clear rather easily are able, at the time they get Clear, to confront problems. They just happen to be able to confront problems; this is a fluke, you see?

Well, this is adjudicated by this: Profiles don't change when present time problems exist. You can prove this. You can take a person with a present time problem; he says he's got a present time problem in rudiments, you know? And you say, "All right. Well ..." See, attend to that. "And now, let's see, have you got any ARC breaks with me? Oh, good, that's good. All right. Got any withholds fro-? All right, that's fine. All right, now we'll begin this process. When weren't you successful while thinking you should be in Oshkosh? Yeah, all right. When weren't you successful while thinking you were in Oshkosh?"

And you run this for twenty-five hours or something like this, or any fool process, or TR 10, or any effective process – it doesn't matter what you run. Just neglect, every time you do the rudiments, to take up his present time problem. Just neglect it.

It helps if you know for sure the pc you're using for this test has a screaming one. You know, he has a terrific present time problem, see, of some kind or another. Well, it helps enormously with this test if you know that's the case. Then you neglect it in the rudiments. Audit him on anything you want to audit him on for twenty-five hours and get him tested again.

No change. No change of profile. No change anything. Got the idea? That's the one, see, that can't be bugged out.

Now, if you want to reduce a profile, keep doing bad auditing which is ARC breaking the pc all the time, ARC breaking the pc, and his graph will deteriorate. But the problem one – that's healed, of course, just by good technical auditing. But the problem one – tsk! – that's a hangfire.

Invariably, you see a case that after twenty-five hours has had no profile change whatsoever, you can say instantly this one thing, with great certainty, and always be found right; everybody'd think you're a wizard or something. You say, "Well, preclear had a present time
problem", you say wisely, "Bring the preclear in." You put him on the meter, you say to the preclear now, "All right, now", (you turn your sensitivity up here a bit) "do you have a present time problem?" Bang! You say, "How long have you had this present time problem?"

"Oh, years!" And he says, "Oh, yes, yes. Oh, yes, yes", you know?

You say very wisely to the auditor, "You see?" It's inevitable.

All right. If that happens in day-to-day routine auditing, let's take it on the wider magnitude of people going to Clear. They must have a tremendous number of present time problems if they don't get any more shift toward Clear than that, see, with heavy, powerful processes booting them along.

The wise thing to do about something like this, of course, is just handle all their present time problems. How do you handle all their present time problems? Routine 1A.

All right. Now, if you've handled all their present time problems – let's get practical for a moment here – if you've handled all their present time problems with Routine 1A, you've handled all problems with Routine 1A, you straightened it all up: while running problems in Model Session, would you take up present time problems? You wouldn't take up that rudiment to which the whole auditing session is devoted, because you're going to run a hot problem process – you're going to run a hot problem process – in the body of the session, so why run a weak one in the rudiments? See?

So you ask the fellow if he has a present time problem. He says, "Yes." It falls.

You say, "Good, what is it?"

And he tells you. And you say, "All right. Very good. Thank you", and go on to the next one. You wouldn't run a thing.

Because, man, you're going to slam straight into this present time problem situation, of course, in the body of the session. Right?

Now, you'll find all kinds of hidden standards coming up. Why should you have to labor so hard? Now, I'll tell you another reason why we got Routine 1A, is "yous guys" were having to work far, far, far, far, far too hard to find hidden standards. And you weren't finding them well. In other words, a pc on SOP Goals Assessment had all sorts of hidden standards he wasn't coming up with. And you were having to work too hard to get those hidden standards, and every one of those hidden standards is categorized under one heading: problems.

So, of course, the wise thing to do is to put them on a routine that gets all the problems out of the road and then your assessment should go off like a hot rocket. See, it isn't going to cure the whole case, but it's certainly going to get it there. Okay?

Do you see how this is? All right.

We are always refining in the direction of more effective auditing per unit time, see? All right, if it's going to take you seventy-five hours to run a Goals Assessment, this is only going to be true, really, because the preclear has too many hidden standards. They're difficulties of one kind or another. They are difficulties, difficulties, difficulties. In other words, the preclear categorizes these things as problems.
Now, they can't confront problems. All right. If they're taking a long time, they can't
confront problems easily. All right, if they can't confront problems easily, how are you going
to get the hidden standards?

In other words, this is a bug in assessment; a bug in SOP Goals Assessment is why
you've got Routine 1A.

You go on asking this pc, for seventy-five hours, for goals. And you ask them for
goals, and you ask them for goals, and you ask them for goals, and you ask them for goals,
and they never tell you the hidden standards. Even though sometimes you ask for them, they
don't tell them to you. Why? They don't know they got them. Well, why don't they know they
got them? Because they can't confront a problem. If they can't confront a problem, how can
they say it to you?

It's quite common to audit a preclear for twenty-five hours and then he finds out he has
a screaming present time problem with his mother-in-law and he never knew it before. You've
probably had that happen.

Well, now apply this same observation to Goals Assessment, see? In other words, you
got a slow freight; there is a bug in goals assessing The pc is not confronting his problems. So
you're running a pc who has a legion of problems. These will keep coming up and the other
test of it is this: In running SOP Goals, when you've found the terminal and when you've
found the level, as much as three-quarters of every session gets taken up with present time
problems.

Now that the data is coming in I can tell you some of these things, see? That's fantas-
tic! The number of present time problems these people suddenly come up with. Look, look,
are we going to run goals or are we going to run present time problems?

Now, this has been the reason for slow freight in running SOP Goals and this is the
reason for slow clearing, and I've now put several engram wranglers on it, and I've got all the
reasons rounded up in the south pasture, and I tell you, I group them all up as just "problems,
inability to confront."

Now, "Recall a problem" is the most elementary of these processes, but it has this dif-
ficulty: It as-is the problems the case has. It as-is problems, as-is problems, as-is problems,
as-is problems, as-is problems. That's perfectly all right, although kind of miserable. That's per-
fectly all right – I mean, you could go on doing that – but it's sort of like Dianetics (I've had
the observation, you see): you erased all the engrams in the bank.

Well, Scientologically, there is another approach, which is to improve the ability of
the preclear to confront problems. This is why this – you've got an auditing command change;
I wanted to see you look at it in its raw state first. And I've now seen that the new series of six
commands produces practically the same tone arm reaction as the first command, "Recall a
problem." See, I get almost the same reaction there.

But you'll get a shorter run, that's the main thing And you won't have the bug of the pc
stuck on the first dynamic, stuck on the first dynamic, stuck on the first dynamic, stuck on the
first dynamic, you see? Because this pc was – basically began to worry about problems be-
cause of another dynamic. See, his basic concern about problems was usually an other dy-
namic. He became concerned about somebody's inability to confront problems and then Qed-
and-Aed with it, tried to force the other person to confront problems and wound up valencing.
See, that's the mechanisms back of this thing.

The mechanisms of clearing somebody up are actually not very complex. But it – only
thing that is difficult about it is try to isolate which mechanism it is which is most in the road.
Because you can overcome most anything else, you see?

So I think Routine 1A, if assiduously run before you do an assessment, will give you
Clears rather easily. I'm sure of this. We have not done it, but I'm just showing you this.

And notice that reaction on problems. Have you noticed the pc getting any reaction on
running problems this way? You have noticed some reaction, huh? Hm? Have you noticed
any improvement on the pc today, however in running this? You haven't noticed that?

Have you had any pc just set his heels and practically refuse to run any part of the
thing? Did a pc look like he was going to? Well, all you were running into there was the irre-
 sponsibility for problems. Now you got a pc, of course, who wouldn't blow Clear if he had
this many problems, because you wouldn't be able to clean up this many PT problems. The PT
problems would keep coming up in the SOP Goals. See, it's the time. [You could] probably do
it. You could undoubtedly do it on SOP Goals, but let's look at the time factor, see?

All right, you got a long assessment, seventy-five hours. Why? Why you got such a
long assessment? Well, the person can't confront any of his problems, so therefore he can't
confront any of his goals, you see? By not confronting his problems, of course, he doesn't
know what goals he's had to get out of these problems.

All right, let's take in the actual run, the actual run; and this is true of report after re-
port after report after report that I get back. Five hours auditing, two hours on rudiments; five
hours auditing, three and a half hours on rudiments. You look over and say, "Rudiments!
What the devil is happening here? Rudiments, rudiments – PT problem. Person had PT prob-
lems, person has PT problems, person has PT problems, that person has PT problems, PT
problems. And it's marvelous how fast these present time problems come up while we're run-
ning SOP Goals."

Yes, it is marvelous. It is so marvelous, that SOP Goals, in view of the fact that it
doesn't devote itself to running present time problems, naturally, you're taking a weak process
and you're having to clear up all of the side panels of the case on the subject of problems as
you go, and you've blown, now, another hundred percent of auditing, see? I mean, pardon me,
you've blown the fifty percent. In other words, what you could do formerly in fifty hours with
SOP Goals running you should be able to do in twenty-five hours. So that is quite a saving,
isn't it?

And all these improvements are mainly in the direction of saving time – saving audit-
ing time and making it easier and giving him a faster win. Okay?

Now, I'd say a person who is having a bad reaction to running problems, I'm afraid
their clearing time probably would have been up around two thousand hours. Why? Well,
they're not Clear because they've got problems. It's hanging the fire, see, but they begin to
recognize these problems as they're being audited. And then the auditor has to take up these
problems with a weak process, see, and it's a dispersion all the time that's coming on. But the case is hanging fire because it has problems. And it's one of these cat-chasing-his-own-tail propositions, you see, and the cat just never gets anyplace. You ask Sambo; he's done it up here a lot of times. He never gets anyplace.

Okay. Now, what questions do you have on this particular activity of Routine 1A?

**Yes.**

**Male voice:** Can you mix this Routine 1A with running SOP Goals? In other words, when you run a level flat on SOP Goals, can you take the person and put him on Routine 1A?

Oh, I suppose you could. I suppose you could mix these routines. These routines all mix, by the way. About the only thing that doesn't mix very easily is the CCHs. I wouldn't run the CCHs while running levels.

**Male voice:** Mm.

That's about the only thing I wouldn't do in combining things here.

**Male voice:** Hm-hm.

I'd run Havingness and Confront, as far as that's concerned, on Routine 1A, if I had to. I mean, it doesn't matter much.

Your packages are quite neat and very applicable and you don't have to do anything really much more than the package. But now you'd find out that it'd be unnecessary while running SOP Goals to devote any time to running problems, probably, if problem was totally flat to begin with. But then, at the same time, you might open up a completely new section of the bank. And the test of this – I can just give you this one off the bat; I just know this was the way it'd be – the test would be, is your pc suddenly developing present time problems?

See, you flattened Routine 1A, you've done an SOP Goals, you've run two or three, four levels of SOP Goals and all of a sudden – everything has just been going fine up to this time – and you suddenly ask, and the pc has a present time problem. Oh, I'd let that one go by, I'd handle it, see? And next day, you find your pc has a present time problem. "Oh", you'd say, "come off of it here", and I'd go back to Routine 1A, and then come back to running SOP Goals. I wouldn't change the terminal or anything.

**Male voice:** Mm.

But I'd get their confront up on problems.

That's a well-taken point, Bob, very well taken. You could do that. But I sure wouldn't spend too much time in SOP Goals – the way they have been doing – I wouldn't spend too much time fooling around with the pc's tremendous present time problems. I'd do something much more effective than to run the standard routine, see?

I mean, it's a chronic state. Oh, yeah, a pc will have a present time problem on Tuesday and then you don't hear any more about present time problems. Well, that's all right. But if he hit a present time problem on Tuesday – and he hadn't had any before – and he's got a present time problem Tuesday, and he's got one Wednesday, and he's got one Thursday, and he takes up most of Friday – well, oh no, you don't want to go in for that sort of thing Clear-
ing is very rapid. Shouldn't get held up like this. So it's faster to take up the exact thing which they are hanging on, which is problems. And they're hanging on problems.

We have never really made a frontal assault on problems before. You'll notice we've been working with problems for many years, as a factor, as one of the primary factors of auditing, or it wouldn't be in the rudiments. But we have never really attempted a frontal assault to clean all this up on the pc before we audit him. Sort of like reducing a part of the rudiments and cleaning them all up before we go on auditing the pc. That's kind of where 1A sits. Okay?

*Audience:* Hm-hm. Yes.

*Yes, Robin.*

*Male voice:* Wouldn't a hidden standard be blown open by asking the Joburg question "What would have to happen to prove that Scientology works?"

All right. Now, I didn't quite get the question, Robin, now.

*Male voice:* Wouldn't a hidden standard be blown open ...

Oh, wouldn't a hidden standard be blown open by asking the question "What ..."

*Male voice:* "... would have to happen ...

... would have to happen for you to know that Scientology works?" Yes. Yes. But you won't – you've got a reality factor. Your E-Meter only registers what is real to the pc. And the pc might have a hidden standard that wouldn't register. He's got some other reality involved and it's certainly a way-outback-of-Arcturus sort of a thing. All right, that's fine. You will get that on the E-Meter. You will clear up the immediately-known hidden standards. And then we advance the case, and he's got a new set of hidden standards.

As soon as his reality improves and his confront goes up, we are liable to find ourselves sitting with a new set of hidden standards. That's why we're tackling Routine 1A frontally, head-on. Okay?

*Male voice:* Mm, thank you.

All right.

Any other questions? Yes.

*Female voice:* I wondered about the order of magnitude of a problem. In SOP Goals, for instance, would they be different, not a broken cup, or something like that. Would it be a more – a bigger problem, something with more magnificence and ... ?

Oh, I see. You wonder about the order of magnitude of problems, and while running SOP Goals, if they wouldn't come up as bigger problems ...

*Female voice:* Yes ...

... the magnitude.

*Female voice:* ... as more weighty problems.

Oh, yeah, yeah. More fundamental ...

*Female voice:* Yes.
... more fundamental problems. That's true. And they will come up that way.

Female voice: Yes.

Now, if you have, however, a person geared in to being able to observe or confront problems very well under 1A, your magnitude of problem will be even greater when it does come up. It has to be greater for the person to do so, because he already can confront the lesser ones, you see?

Female voice: Uh-huh.

So that's why Bob's point is very good. When this starts to happen and these problems just come in, in staggering magnitude, and so forth, you might have to return to Routine 1A for a little while and get this leveled out as a new activity. Yes, they are. They're much more magnitudinous. What will register as a present time problem – this is actually a clue to cases, you know; it's a very important point. What registers as a present time problem on three different people is a total index of case level.

A hair ribbon has been dropped, see? And person A just absolutely has a fit, man. This is a fit. I mean, they all but get down and bite the asphalt, you know? It's just the most God-awful thing that has ever happened, see?

And person B will go tsk, tsk, tsk, tsk, tsk, tsk.

And person C, on exactly the same problem of a dropped hair ribbon, would simply pick it up and shove it back in the kid's hair, see, and doesn't even think that anything horrible has occurred.

I imagine you've had nurses or mothers or nannies, or something like that, that had different values for different problems. [amused and agreeing noises from the audience] If there's anything drives a kid mad, you know, it is somebody – the order of magnitude of problems. And it makes your parents sometimes completely incomprehensible, because, their order of magni – not yours, but their order of magnitude of problems was out, definitely was out. And you just couldn't see what the hell the problem was, because it didn't look like any problem to you, see? And my heavens, it's going on and on and on, far into the night, and into the next day, and so forth, and ... [laughter]

Order of magnitude of problems. It is that factor which caused me to shift it over to the broad brackets on the thing.

But you can see some people practically faint. And I know I, one time – a very dear friend of mine, an old man when I was a kid; he was a dear friend of mine. He was going along all right. He was a very sunny, cheerful sort of fellow. And I got back to this part of the world and dropped in on him one day and good heavens, he was a shattered wreck – an absolute wreck! He was a gone dog. And actually, within a few years, had gradually gone downhill to a point where he was totally paralyzed and a couple of years after that died; and it was all because of one problem.

He had been working in a bank and he was a shareholder in the bank, but he also had a job in the bank. And when Frankie the Limper took over, he made sure that all the little banks went crash, see? And all the banks went boom! see? And so he gave it all to the big banks
because he thought things ought to be in chains or something. That's right. This is the actual history of it, although I'm speaking about it rather sarcastically. And this poor guy watched one of these chain banks come in and pull the routine modus operandi.

And because there was a bank moratorium, then the bank wasn't permitted, you see, to pay out any of the accounts. If you had a checking account or a savings account, that was seized. But if you had a mortgage and the bank had a mortgage on you, you had to pay it – every penny of the mortgage, see? They got all the cash. It was the biggest raid known in financial history. I don't know, in a few decades somebody will wake up to the fact of what that was all about – "the great friend of the people." [laughter] But it was just that. They then were given the opportunity to seize all the cash in the bank, and then make everybody make good their paper, too.

Well, of course, they pronounced all the little banks insolvent by government order and then they, of course, were grabbed by all the bank chains. So little guys such as this, with a little job and some shares in the bank, and so forth, were just wiped out. Bang!

But this appeared to be a problem of such gross magnitude to him that it pract – it did! It killed him! It killed him. And I remember definitely – (Used to call him Uncle Jimmy.) I looked at him and I said, "But, Uncle Jimmy", I said, "you're still a young man. I mean, all you've got to do is – well, I don't care what: start another bank or get a job or start a feed business, or something. But this doesn't seem to be very great to me."

"Oh", he says, "Ronald", he said, "they just wiped us out. They just stole everything from us. They just ruined everybody", and he just went on about it, and so on and on and on. And that's all he would talk about. That's all he could talk about. That's all he could think about, and so forth. And he just went down, down, down, down, down; overnight, practically thirty years was put on the man's age, you see?

Now, that was a problem he couldn't confront, which was terrific thievery on the part of a government. Well, what else could he expect? It's a government. [laughter] Of course, at that time of life that I was in there, and my general modus operandi, and the way I look at things anyway, this didn't have any agreement at all. I mean, I remember it as one of the wildest points of disagreement I think I ever had on the whole track. I just couldn't get the man's point. I just couldn't get his point, that this was a problem of such magnitude that it would just stop all life right there in its tracks, period. And that's what it did.

Now, his ability to confront problems was poor to begin with, don't you see? And he got one from an unexpected quarter, which gave him a betrayed help, or something of the sort, you see?

He probably was a member of the American Legion, and all of this kind of thing; was up there singing "The star-spangled Banner" with everybody. And he always expected, you know, the whole works to be all good, you know, and kind and sweet and patriotic, and he never realized that politicians were crooked. That's the basic problem that he was into.

So, not having looked at any part of this, you see, it came as a tremendous shock to him. It was just borne home with such velocity that it'd have been kinder to have shot the man with a bullet, you see?
All right. Now you see fellows failing because of business, failing because of nervous breakdowns. These are comprehensible, but there's one that you don't find as comprehensible as that, even. You will actually see somebody dibbling with some pieces of paper, or something of the sort, and he will announce to you that he has just hit the end of track, man. This is it, you know?

And you will just look in vain to find out how this is the end of track, you know? And you'll have – there are fifteen ways of handling this thing. There are fifteen ways of resolving it. There are dozens of ways of as-is-ing it. I've seen fellows, for instance, getting just in deeper and deeper and deeper in some criminal proceeding, you know, that they'd become involved in. And you'd tell them, "Well, why don't you go tell the man?" you see? When you're auditing people, you run into all kinds of weird things, as you only know too well.

"Well", I said, "why don't you go tell the man that you took ten thousand dollars, and why don't you take what's left of the ten thousand dollars and give it to him and straighten it up and say, 'Well, go ahead. Put me in jail', or something like that, and spend your six months, or something like that, or get off whole-hog."

"Oh, no!" you see? "Nothing! Oh, no!" You know, they, "Oh, God, no!" you know? Well, all right, that's comprehensible. But how about something like this: The fellow has to quit his job. He just has to quit his job because the pots and pans aren't the right size. Oh, brother, you look at this, you know, and you say, "What is going on here?"

Or you look at some fellow and he's got a perfectly good berth on a ship, and he says, well, he'll have to leave her at the end of the cruise, and he ...

You say, "Why?"
"Well, just have to, you know?"
"Well, why?"
"Well, I don't think the mate likes me."
"You don't think the mate likes you. How do you know the mate doesn't like you?"
"Well, I've never – I – really, I just know."
"Well, has the mate ever said anything to you?"
"No."
"Have you ever done your work all right?" or so on.
"Oh, yes."
"Well, what is the matter? Basically, what's the matter here?"
"Well, I just don't think the mate likes me and I'll have to leave the ship at the end of the cruise."

And you say, "Now look. Why don't you speak to the man? Why don't you straighten it out with him, and so forth?"
And he says, "I will have to leave the ship at the end of the cruise, because I don't think the mate likes me."

And you say, "Well now, why don't you take this up with the captain? Why don't you speak to the captain about this sort of thing and get this thing straightened out, or talk to the owners, or something like ..."

"No. At the end of the cruise I will have to leave the ship."

You begin to believe after a while that there must be something else here, that that couldn't possibly be the problem he's stuck on – that's the suspicion that you get – and you yourself are guilty of a no-confront. No. That's the problem he's stuck on. That's it. There isn't anything more than that. Only this person's ability to confront a problem is so tiny, and the problem is so microscopic that he can't confront, or the problem is so microscopic that he can confront – you see, these two things meet down toward the bottom; this is maybe the only problem in the world that he could confront, is this one, and so he's got a problem, you see?

You won't be able to fathom it. You say, "What the devil is going on here?" Life becomes very baffling along about this point. But if you remember that the ability to confront a problem is a gradient case index... And you'll see somebody sitting in the midst of ruin, disaster, sudden death and so forth; the columns of the house falling, and the children's bodies flung about, you know, or something like this, you know, something – maybe not so dramatic, maybe it's more just the magazines are flung about and the beds are unmade, you see, and there hasn't been a fire in the furnace for three weeks, and you know, life has just sort of gone to pieces, man. And you see this person just sitting there worrying like mad because the lady next door has bought a new hat. [laughter]

Well, that's the level of problem that that person can confront. And these other things don't exist, and they are not problems. They're not only not problems, they aren't there. And it's just a total vanishment of everything. And you say, "My, that certain – certainly that person sure can confront problems." No, they can't. How can you confront something you don't even know about?

And the magazines flung around the floor, and the dead fire in the furnace, and the cold house, and the dirty sheets of the unmade beds, and everything else, and these things don't exist. And then, here's what's odd: Somebody can walk up to her and say, "Look, why don't you straighten this all out?" and the person thinks the person who just said that is crazy. That's the oddity about this sort of thing. They go around with a very interesting opinion of that other person's sanity.

They think they should do something about it, or they think that the person should look at these things.

And you press it a little bit further and they will give you the most interestingly involved explanations of how it is not possible to look at any of these things. And even if you did look at these things, you would find out they didn't exist anyway. And if you did find out that they existed, there couldn't be anything you could do about it, so how could you even say that they existed? It would be some wild rationale of that character. And you're hitting a person right where he lives when you're getting this one.
You could probably do an intelligence test and not only that but a sanity test and ability test. You could probably just make a gradient list of problems in various spheres, categories and dynamics, you see — could divide it all up here so you got problems per dynamics, and then you got problems per zones of action in life, and then you got problems in gradient order of magnitude. And you just ask him the silly question, which would be silly perhaps to you. You just ask him one question; that is, "In each one of these groups, check the problem." There'll only be one or two problems in each one of these groups for him, although every one of them is a problem. He'll only be able to conceive as certain of these problems as being that. And where he checks that level, there he lives, which is an interesting order of magnitude.

Okay. Well, enough of all this; kept you overtime again. Hope you make a lot of success on this. Probably won't give you a talk tomorrow. One, one last word: Is there anything you feel you should know in running your pc right this minute that you have not asked, or you have come up against, or something has occurred about?

You feel you got it taped? Feel you got it taped?

All right. Confront it. Thank you very much. [laughter]
A lecture given on 11 July 1961

Okay. What is this? This is the 11th of July AD 11. Okay. Eleven, eleven. Okay. Now, are there any ARC breaks? Any ARC breaks? Well, is it all right if I talk to you? [laughter]

All right. Do you have any withholds? And more importantly, do you have a present time problem?

All right. Bringing us up by gradient scale to talking to you a little bit about present time problems and talking about problems in general.

Routine 1A. Routine 1A, definition of: *any combination of processes which combines problems and Security Checks*. And that is all. That is the total embrace. You don't have to say, "Routine 1A is revised", because you are running a different Problem command or it isn't Routine 1A Revised because you are running a different HCO WW Form Security Check. You understand?

So it could be any Problems Process and any Security Check. And when you are combining those two items alone, that is Routine 1A.

Now, this would presuppose that there would be other combinations which included other parts of the rudiments. And I remember an Australian auditor – you call them Australian auditors, but down there they're Australian* auditors and doing very well I may say so.

I've been thinking of sending the whole Joburg staff over to Australia there for a while – and it's horrible, horrible thing to do – and sending the Washington staff to Joburg, and the Los Angeles staff to Washington, and HASI London to Los Angeles. [laughter] I've just been thinking of this, you see. But that's the kind of thing you do when you're overwhelmed by problems, you see.

Problem equals change. Change equals problem. We could presuppose that any rudiment, then, will eventually have some routine number and letter; any rudiment. So that you get ARC breaks and Security Checks. You get the idea? You get various combinations of these items.

Well, right now the most fruitful in production of any known process is Routine 1A as far as it comes to plumbing the Stygian depths of the reactive mind, because it takes care of those two items which are most prone to give the auditor trouble. Constant and continuous PT

* Editor's note: Ron is pronouncing the word with the second "a" like in "father"
problems on the part of the preclear will prevent any gain of profile whatsoever. He's got present
time problems? Powee! No gain. Just add it up. Look, I've been looking at this now since
about 1956. You better look at it.

It just adds up to this: present time problem – no change of profile, no gain of case. I
don't care what you run! I don't care what magic button would suddenly arise in our midst; we
would still not make any gain at all on a case that was being run that had a present time
problem. You might as well just make up your mind to it. And when you see the graphs of HGC
auditors or you see the graphs of a field auditor, and he wants to know why "Recall a ruddy
rod", or something, didn't work on the pc, and you said it would work, but he's proven that it
didn't work because there's no change of profile...

Now, look. You're auditing mechanics all by themselves, just sitting there and going
into Model Session and giving a repetitive command "Do fish swim?" to the preclear for
hours will produce a change on a profile, providing one of three things or all three things
aren't present: first, major present time problem – there's no present time problem (which
could be a present time problem of long duration or present time problem of short duration);
if there's no ARC break; and if there is no major withhold – and if these three things are ab-
sent, "Do fish swim?" will produce a change of profile. You got it?

Now, make up your mind to it. I mean I'm not giving you any datum there that's light.
I mean I want to give that a few neon lights and underscores. And when you end it off, put an
exclamation point after it and a number of rockets going up. And don't add any false stories
about Russian sputniks after it. Put real ones. Something exclamatory.

This is one of the hardest things to teach auditors. Obviously it must be, because from
1956 when problems first made – pardon me, 55 they first made their emergence; but 56, 57,
when they were really being used hard and problems were being pushed – from then on up to
now I have said this many times. I remember that in 1955 telling the HGC, then located on
15th Street in Washington, DC – and Julia was running a mighty good HGC – but I remember
telling those auditors on a telephone auditors' conference (we used to have speaker phones,
and we had our auditors' conference every day on speaker phones) that if there was no change
of the profile, a present time problem was present. No profile. And if an ARC break was pre-
sent, you would get a down drop of the profile.

There has been no reason at all to amend that statement. And the only thing that's been
added to it is, in the presence of a withhold you don't have a preclear even in-session. The pc
is not even in-session. You can't even say he had a present time problem because the fellow
sort of has to – in an auditing session, if a fellow has a present time problem – you've already
said in an auditing session, and the withhold avoids that. You don't even get a session, much
less no gain, see.

The guy will be audited for a little while and he'll blow or, you know, he's in, out,
bang! Gone. And he doesn't know, and so on, and all of a sudden oddball effects to – our
processes don't work. Things all du-hen-di-woa-pu-dawha-boap, and there's just no session.
And you're spending all of the time trying to get your big paws on the pc and hold him still
long enough to keep him from getting ARC breaks and present time problems and everything.
And you just spend all of your time doing this, doing this, doing – you haven't got a session
going yet. See? That's all that – that's what a withhold amounts to. So that's the only thing added to these other two things.

So what are the major barriers to auditing?

The major barriers to auditing are a present time problem, ARC break and a withhold. Those are the major barriers to auditing. Major barriers. And boy, they rear up like the Atlas. They're big.

All right. If that is the case – some Australian once said to me, "Well, from what you've just said then, it becomes fairly apparent that someday we will be auditing only the rudiments." [laughs] Well, you – that is not true. What you could say, however, is for some time after his entrance into auditing, probably the only thing that should be run on somebody is rudiments in some version. Not the rudiments themselves, but the elements of the rudiments, you see. Which consists of what? Present time problem, ARC breaks and withholds. So as I say, you can then expect to get some numbers and letters which will combine these three, one way or the other as the data emerges, and I get bright ideas, and some research material and so forth, you will see some more of these things.

Well, right now you're actually having very good luck with running problems in a most outrageous sort of way. So I had better tell you about problems; and this, therefore, is a lecture on Routine 1A, and I'll also talk about some Security Checks.

You're all using problems at this time, so maybe if I told you a little bit more about them, you would be more prepared to deal with the situation. Okay? Because there are some things to know about problems.

In the first place, there's the definition of a problem. A problem is postulate-counter-postulate resulting in indecision. That is the first manifestation of problems. The first thing. Postulate-counter-postulate. And the first consequence of a problem is indecision.

Now, our next observation is that any time you have a postulate which is a fixed and stable postulate, it accumulates thereunto or came about because of a confusion. So a problem actually is a multiple confusion. And you are looking at two stable data and a confusion phenomena when you are looking at a problem. There are at least two – at least two stable data. That's a postulate that is counter the postulate. See, two postulates in opposition. And these two postulates in opposition are surrounded, each one of them independently, by a certain amount of confusion. So therefore, a problem at the lower stages looks like a confusion-counter-confusion. That's war. When it gets that mesty, it's confusion-counter-confusion; and there aren't any postulates.

You take a fight between a psychiatrist and his patient. I don't think you could ever dignify it by calling it a session or anything like that. But if you take a fight between these two, and you've got what? You've got a confusion versus a confusion. The psychiatrist doesn't know what he's doing For sure the patient doesn't know what he's doing. And yet, boy, are they busy. [laughs] This looks of course idiotic to anybody.

Now, you take a war – I've heard a lot of things called Mein Kempf – Mein Kempf. I don't even know what Mein Kempf meant. I know about Garbage and Herring and the other fellows, but not Kempf. And you know, I heard an awful lot of shouting coming through the
ether. (I think there still must be ether there. The old physicists believed there's ether, so there must be ether. Something's putting people to sleep. That's for sure.)

Anyway, I ran into this head-on, on Riverside Drive. Way back before the war, years before the war; and I was up on Riverside Drive minding my own business. Had a very lovely apartment. And I was doing nothing but writing and getting into trouble and amusing myself. And one fine day there was a horrendous knock on the door and it like to have caved in, and a couple of gents walk in, and they've got the funniest looking space opera gadget you ever saw. And it's actually a radio direction finder, and they have located the insidious fact that my electric typewriter is generating static. [laughter] And I wondered why anybody was so interested in my electric typewriter generating such a tiny amount of static. And they told me that I would have to muffle it all by myself, at my own expense. And so I got a suppressor and hooked it through. And after that my electric typewriter did not generate static. And the electric light company was very, very happy and so were the people next door.

And unbeknownst to me, during my writing time, they had not been able to follow out their favorite vocation which was listening to Hitler, from whom they had escaped with their lives. [laughter] And that's all they did morning, noon and night with a high-power, high-velocity transatlantic radio receiver, you see.

They were listening to Garbage and Herring and Kempf and [laughs] – and the second the static was missing in the apartment building, which was my poor little electric typewriter, they could turn it up full volume. And while I was trying to write about this and that, I was entertained with Garbage and Herring and Kempf. And the superemotionalism, the shaking emotional tones of that voice and so forth were really marvelous. Absolutely marvelous. One didn't have to understand a single word; and it's a good thing because there weren't any there. There wasn't a postulate in the lot.

You take his speeches apart, and you find out the German people should have been going north because they should have been going south, you know – except for the times they should be going east and west. And it's all for the best, in this best of all possible youth Sportplatz groups providing they had free love – the Germans must be pure and virtuous. Everybody is being an inferior race. Everybody is inferior, but the Germans are superior. And the Germans are a superior race, but the only slight difficulty with the Germans being a superior race is a lot of the Germans are inferior. [laughter]

And by the time this had entered into Chapter One, Chapter Two, Chapter Three, I'd decided that these refugees had tortured themselves enough. And I would go and get my electric shaver [laughter] which put out good static – high-velocity static – and I would keep it there alongside of my typewriter, and I'd turn it on, and that would be the end of Hitler. [laughter] I would turn it off again and they would become very interested after another hour or two to see if the static was gone. And they would turn it on, come on full blast, he'd get right up to his freund Garbage and on would go the electric shaver and off would go Hitler.

I probably saved those people from numerous anxieties. But they sure must have been in a confusion. They escape at Lord knows what cost and travail with their lives clear across the Atlantic, and then they sit on Riverside Drive in a perfectly decent apartment in a free country and can't do anything but listen to Hitler. They were in a confusion, weren't they?
Well, Hitler was sure in a confusion. The man didn't know whether he was going north, south, east or west, fighting Roman legions or cat fur. He was a madman, but a very intelligent madman. He sounded so real, you know. But he was a confusion.

Now, very probably, there is a problem. And a problem is something like this: "Young centurions of Roman legions should not lead punitive expeditions through villages which have not offended against the Roman frontier." That's probably the problem or something and that's probably been the problem ever since; and there's probably no problem in Germany but this one. Only of course there are no centurions; there are no legions.

So the original postulate, lacking its own confusion, has accumulated confusions ever since. And this thing has rolled along up the track madly. And here we've got it amongst us – still today. I'm sure they are still expelling the legions. I'm sure of it. Or preventing themselves from being expelled by the Russians, or something. But there's some basic and fundamental postulate in there. There's some basic and fundamental appositive – or a positive postulate that is against something, see.

And then this adds to its confusion and then it's completely lost in the shuffle. Only it attacks things and makes confusions, but these originally have a postulate like "We must repel the German hordes." See, we must repel that. Well, that postulate all went to pieces because nobody could do it. Then that added to itself a great deal of confusion. So we have – that original idea is totally wound up with some resistive effect against Germany. Only it gets lost in the shuffle and nobody can find it in the confusion anymore.

So we have a confusion of Germany's "warlike spirit" (quote) (unquote), and the confusion of something else's unwarlike spirit or something of the sort. And these two confusions are absolutely pressed tight together, and they keep bursting forth at the drop of a hat. And they've been doing it now for about two thousand years. It goes back almost that far. It's way, way back. And if anybody can tell me what these wars are all about, I'd like to know.

I at one time had a good solution to the thing. I went down over all the terrain, the common invasion terrain that goes from Germany into France, you see. And you've probably heard some tape or another with a dissertation on it, because I did solve it. I did figure out what the wars were all about, is that the Germans are basically at heart cattle rustlers. And they every once in a while go on cattle rustling forays, because that's all there is down in the part of France that they ever attack are a few cattle, do you see? And there's a lot of things that you can work out with this. It's an interesting premise if you start going along this line. You eventually get all wound up in various aspects, but you do come up with this one fact, is that's probably the only possible reason they would ever go across the border.

There's nothing in that country, by the way. They've overrun it so often that you could drive the length and breadth of it, and there are just – I've noticed the villages along the route, for instance, are built out of stones unmortared. They're all set to be blown apart again. [laughter] And after they're blown apart, well, there's no difficulty in putting them back together again. You just pick up the stones and pile them up one on top of another, you see, and you've got a village again. You mark it the next time you go through there. That's the way those towns are built now. In other words, they're all ready to have another confusion, see. And their own structure has gone into a confusion, and so on. Well, these are the problems.
Now, when you see it on the order of magnitude of some great psychotic force in the world, like Hitler, and opposing forces and postulates which gather to themselves confusion, and now we look at it twenty years later, and what do we find? We find there's still innumerable signs of these confusions still around, sewn into our industry, sewn into our various political principles. For instance – I don't know, American troops aren't goose-stepping yet, but almost, almost. And you get various aspects of this. It's all over the place. It's all over the place.

Economics expresses itself in these talks about common markets. And you see this. It just keeps echoing these waves of this tremendous force of opposition – of two or more great forces which were in opposition – and the confusions still continue, you see. They go on and on, and they roll down through the years. And all of a sudden – these confusions – somebody gets ahold of this, and he makes a big deal out of one of these confusions, you see. Adds a new spark to the thing, gathers new confusion to it and *boombo!* And goes off up in some new direction, you see. Finding some other force to oppose, you see.

Well, it's a good picture of a reactive bank – the only reason I'm bringing it up – good picture of a reactive bank. This fellow set up or iginally some idea that he should oppose some other idea, you see – probably quite logically, you see – only this idea that he should oppose, in committing overt acts of confusion or which confused the other idea, you see, got back in turn confusion. And the other idea, of course, counterattacked this idea. And you had eventually two confusions, one going against the other. And then you got more confusions. And then these confusions go rolling down the ages, and nobody can identify them. See how this is?

Now, you try to take apart a reactive mind. What are you taking apart? From a standpoint of problems, at least this one aspect of the reactive mind and a very powerful aspect it is, because it has endurance; *it continues* – you've got a continuance of these old problems. So that you have a problem, and then a solution, but the solution becomes a problem in itself. There's that mechanism. There are other mechanisms, you see, aside from this, all of which add up to what? Duration.

Now, the one thing you could say about the reactive mind: that it is right here right now, performing right here right now as it should have been performing at some other period or time.

All right. How do you take it apart? You should understand it from the standpoint of problems. Problems are in the reactive mind. Problems do exist in the reactive mind. How many ways could you take that situation which I've been describing here – trying to put it on the third dynamic so you could easily see it in the first dynamic – how many ways could you take that apart?

Well, you could take it apart in the form of motion. You could take it apart in the form of looking at two things at once. You could take it apart in the form of getting confusions of comparable magnitude. You could do all kinds of different things to resolve this particular situation *without*, remember, adding a new solution. Ah, that's the one thing that has never happened on the track.

That is why Scientology in this particular department is doing something which has *never* been done before. Scientology at large is doing something that's never been done be-
fore. But here, vis-a-vis, you've got something that just was never done before. Solving problems without finding yourself with a new solution. Incredible. Incredible. You don't lay a new solution in to get the old problem solved.

Now, let's compare that with psychoanalysis. Do you see that psychoanalysis lays in a new solution? See, there's a new solution for the old confusion. Which will only add to what? Which will only add to a new confusion with a new solution, which of course gathers to itself a new confusion, and then you've got to have a new solution. And then it adds to itself a new confusion, and then you've got to have a new solution, haven't you? So you get interminable branches of psychoanalysis – all different, all solving what? All solving the original confusion which gathered around the original postulates of psychoanalysis.

Well, the thing starts to look like a field full of black puffballs, all of them rolling against each other. And you wonder, "Well, there could be no end to this. There is no end to this. It'll just go on and on forever." Yes, as long as you add new solutions to get and gather to themselves new confusions. And you start adding new confusion solutions and new confusions, you'll all have – always have new confusions and therefore always have a reactive mind. And that's one of the reasons it has continuance.

Now let's look at it from the standpoint of confrontingness. You realize if somebody has to have a solution, they didn't confront and therefore as-is. You see a solution, then, is always a no-confront. So you can put that down as a stable datum: solution equals no-confront. And confronting equals vanishment of problem.

Now, there's the equation on which all of these operate. Everything along this line operates that way. If you look at it, factually it vanishes. But if you solve it, it persists.

Now, if you're ever having any trouble with getting something to persist, one of the best ways of handling it is don't confront it. I mean you can use this in reverse, see. It's not necessarily a destructive or an as-ising mechanism. You can use it as a persistent mechanism. Look at it, you see, and you'll see that if you wanted something to persist, absolutely to persist, then you prevent – let me phrase it better – you prevent all confrontingness. You wanted something to persist, you'd prevent all confrontingness and we get back to the original mechanism. The original mechanism of structure in this universe happens to be preventing the solution of the problems of the universe to guarantee the persistence of the universe. So that anybody who solved problems with regard to the universe was non persona grata with anybody who was trying to get a total persistence of the universe. You got that?

Audience: No.

You don't get that.

Female voice: Say it again.

Well, this is an interesting problem in itself. How would you guarantee the persistence of something? Well, if you prevent confrontingness, you will guarantee its persistence. Let's be extreme. We have a monument and we fix it up so that you can't run into it, the wind can't hit it, nothing can touch it, nobody can look at it, nobody can come near it. And to do all these things, of course, we have to hide it, say it doesn't exist, we have to deny it in every possible
way we can, prevent confrontingness. And sure enough, nobody will ever touch that monu-
ment. You got the idea? If you did all this. All right.

Now, let's take and blow that mechanism up to universe size, and say, "All right, we've
got some space and we've got some time and we've got some plants and dirt and various things,
and some myths and legends." [laughter] Now, let's – let's take this thing here, and now, be-
cause it's so very hard – very, very difficult – you see, this is the problem that this other thing
solves. It is impossible to create and say that something will persist. You see? That's the idea
of the problem.

Now, this problem thing that I'm talking to you about is the solution to this "impossi-
ble to create." See, we can't create, so therefore we've got to preserve what's been created.
Well, the way you preserve that is to get this exact mechanism that you're trying to undo in
the reactive bank, because it's a preservative mechanism. "Anybody who solves problems is a
dead duck. Horrible things will occur to anybody who solves problems. And we will prove
it." And everybody agrees 100 percent and everybody does it to everybody, and you get a
physical universe fact which enters the mental field. And here is where structure and mind
take their first divergence. This is the first time these two things start separating.

And we say, "Anybody who solves any problems is going to get the problem in his
face like a custard pie. He's going to really get messed up. Now, you solve any problems and
boy you've had it."

Now, what is this? This is a protective mechanism. If you've got a universe which is
persisting – you've got a universe that's persisting somewhat, limply – and you want that uni-
verse to persist solidly, completely and forevermore, you've got to prevent the solution of its
mysteries. You've got to prevent it from being confronted.

So how do you prevent it from being confronted? You say, "Anybody who tries to
solve this thing is going to get it, man." And you're going to get a total persistence of the uni-
verse. And this goes over into pcs trying to solve their problems from day to day. The terrors
of solution then bring about all of these other mechanisms I have been talking about. I'm just
giving you the exact bedrock genus of the problem. So eventually it becomes absolutely, fantas-
tically impossible to solve problems. You must not solve problems!

It's all borne out of this one fact: The universe must persist! See, we mustn't let any-ody go around and take a look at these pillars and rocks, planets, space, time and find out
anything about them at all because they pose a problem, don't they. Why is it here? That's the
first problem they propose. Why does time go clickety-clickety-clickety-click? Why?
Big problem posed, isn't it?

Well, we right away have to rush around to somebody who's taking a look at this, and
just as they did in the Middle Ages, we'd have to say to him, "Tsk! tsk! tsk! No, no, no, no, no,
no, no. We'll have to burn you at the stake." [laughter]

"Oh, you're researching into why time is here. You realize that's sacrilege? Uh-huh-
huh-huh-huh-huh-huh." Even in ancient Greek times, it was sacrilege against Cronus to investi-
gate time. The Greek broke free, but everybody was being prevented from solving problems,
then you got a total persistence. And then in a more self-centered sort of a way, the fellow
who could be a tremendous mystery, of course, thought he could guarantee to himself a tremendous amount of persistence. Obviously, it would follow.

So the way to live was to be mysterious. And if you were totally unknown and if everything remained totally unknown and you confronted nothing, why of course, you would just live on and on and on and on. This was obvious – except what were all these funny black masses and this – so on – that's gathering up? And "Why are we unhappy?" and so on.

So we developed a whole genus of thetan, developed not to solve anything. If you solved anything, it was dangerous. And this is proven by the fact that if you just simply ask a pc to solve something, solve something, solve something, solve something, masses close in on him. He goes through the exact I'm-supposed-to. He dramatizes the cure of the impersistence of universes.

Do you follow that now?

Audience: Mm-hm.

Do you see what that is? And that is exactly how he got that way. Basically and fundamentally, there's nothing wrong with solving problems. But when you've got tremendous overts on people who were trying to, of course it becomes impossible.

So we find this dear old lady who never did anything in her whole life. I remember the history of one of these as a pc one time. And we couldn't get her going as a pc until we had solved innumerable second dynamic affaires de coeur. All of them in direct violation of the basic principles of matrimony. We get this dear, sweet old lady standing on the corner, innocent, you know, silver hair, as a halo about her head.

She's standing there and she can't make up her mind whether to cross the street or not to cross the street. You can label her. She's no victim. She's somebody who has forbidden, forbidden, forbidden, forbidden the solution of any problems or the knocking out of any mass or the vanishment of any universes. Which arrives at what? Total indecision. Because you've got problems, problems, problems, problems, problems. And you don't dare solve any problems, problems, problems, problems, problems. And you mustn't look at any problems, problems, problems. So what's going to happen? And you get a dwindling spiral. And in terms of problems, that is the dwindling spiral. You can't solve them. You mustn't confront them.

Now where are we? We stand one-half a block north of the southeast corner of nowhere. You see where this is? And you see somebody saying, "Well, I just don't know. I should have – ooooh, no – now – no. I think I – ooooh – well, I – ooooh . . . Mmmm- mmmmmmm."  

You say, "What are you trying to do?"

They say, "Well, I'm just trying to make up my – well, as a matter of fact – well, the truth ..." [laughter]

They can't even tell you what their problem is. And when they can't tell you what their problem is, of course, hammer and tongs along with this, hand in glove, is they don't dare solve it either. They can't look at it. They don't dare solve it. Boom!
How did they get that way? Well, it's overts against people trying to solve problems. That's all. So solving problems had a consequence connected with it and the consequences was you got packed in black mass or something or the other happened to you, and "Everything collapsed on me." You'd have no universe left. You'd have no space left. All of these various consequences, consequences, consequences, you see. And they keep piling them up. "You mustn't solve problems, you mustn't solve problems, you mustn't solve problems." And the fellow finally just says, "What are you talking about, problems?"

They say, "Well, you know all those things you can't see and you don't know about? Huh-huh. You know, all those things you can't see and don't know about – well, those are problems." Well, isn't that the way it's normally defined?

So we look over this pattern – we look over this pattern – and we find out that it can be used two ways. You can make something persist with it, and you can get somebody real loused up with it. Therefore the persistence of the reactive mind is Q-and-Aing with the persistence of the physical universe. Therefore you find most of the physical universe principles which affect the mind are in the zone and area of problems. There are other things, you see, which affect the mind besides what I'm talking to you about. You see this? It's physical-universe things, you see – gravity, motion, energy, being still, being fixedly located or trapped.

Being trapped is a direct result of solving problems. "If you're going to solve this problem, we're going to put you in jail." They did it a few hundred years ago. I don't know how long they kept poor old Galileo – they let it out now that he had a rather not unenjoyable captivity. He was merely kept away from his instruments and things of this character, but that sounds like to me like captivity.

"You solve a problem, we'll put you in jail." So the fellow has a problem. He doesn't solve the problem. He doesn't confront the problem. Therefore it doesn't create any space between himself and the problem – which is the real closure of the mass, you see – and of course he gets embedded in a sort of a black basalt of energy of some kind or another, you see. He solves the problem and jails himself. You see, he knows what he's supposed to do: "If you solve problems, you jail yourself: That's the way it is; and if you confront a problem, you're going to get confused. That's for sure."

See, these are all fundamental, pattern arrangements which have been laid out in order to protect various monuments, planets, thingamabobs and whatnots, all of which are based on an upper-strata failure, and the upper-strata failure is a create failure.

Now, the consequences of creating are something we've been told all about since we got into Step 6. I didn't know there were any consequences to it, but there obviously are. Amongst a lot of people there are tremendous consequences to creation.

So after the universe was all figured out on the basis that: If you create one, there are terrible consequences. Therefore, it is impossible to create another one, see. So therefore, your havingness would all be shot to pieces if you knocked out the one you've got because you can't create another one.
You see you've already had earlier on the track these tremendous problems on the subject of creation, you know. It isn't enough just to create something and say, "That's it." Everybody had to decide, well, it's very valuable, and nobody can ever create another one like it.

You go around art museums sometimes, and here's some horrible daub, you know. Some painter has been by there carrying a bucket of paint on the end of his ladder, you know. And in some of these museums, particularly down in Greenwich Village or places like this, this is what happens, you know. The interior decorators and people like that got careless and just slopped up the canvasses that were there, and eventually this is what you've got, you know. That's the only way you could explain these things; and here – I'm talking about – [not] necessarily about classical cubism or immersionism, but I don't think they're talking about art.

Anyway, here is a – here's this idea of "It's very valuable. It can never be replaced. There is only one like it. There was only one Van Gogh or Van Went or something, and here he is, see. And therefore this is terribly valuable, and we're going to prove it. Now we're going to have an auction and the highest bidder gets this totally invaluable thing which he can then hide away in a private study which will never be confronted, you see. And he gets to pay 8,765,000 quid or something like that for this painting." Aw, this is nonsense. It's nonsense, man, but that's protecting the valuable, you see.

You make it valuable by protecting it. You make it valuable also by never being able to replace it. And these are all mechanisms of value. These are all mechanisms by which people try to get you to lay off most, see. These are the mechanisms of "don't touch it." These are the mechanisms of "preserve it", but fundamentally the mechanisms of "no create" – the penalties of creation. And when these things have been exercised to their full and everyone is totally convinced that creation now carries such fantastic penalties with it, that nobody else is ever going to be given a show of any kind, then you get this problem sequence. Why? Well, you have to protect the things that are created because they're liable to get as-ised.

You see, you unfortunately possess the ability to look at something and have it disappear. Unless you look at it cross-eyed or upside down or something like that, something is liable to happen to it. And of course, this gets very upsetting to somebody who is already convinced that it's impossible to create or make anything.

So he will tell you at once the solution to the problem is going to get you in plenty of trouble. The confronting of this thing is going to get you in plenty of trouble. Medusa's head – the old legend that dramatizes this and so forth. You looked at it, you turned into a stone or warriors turned into snakes or cat's fur or something. I've forgotten. I'll run into the preclear someday that made that up. Pandora's box – her curiosity, you see, and when she finally opened the lid, then all the evils of mankind came out. And they scattered all over everything, and man has been in trouble ever since. Now, isn't that smug. [laughter]

These are the kind of legends which they generate on the basis – they say, "Don't look, don't look, don't look, don't look, don't look. Don't investigate. Don't go anywhere near it. Get ah-da-da-ah-ah-ah, you're too close to that, man. And do you realize that if you solved the problem of time, all time would cease. All the temples in the world would no longer chime their bells, and Big Ben would no longer strike, and everybody would be totally motionless where they as ..." You know, the most fantastic nonsense you ever heard of.
If you solved the problem of time, the consequence to you would be, you would have to put it there again. Mass without time, of course probably could not entrap anybody. So nobody would be held motionless.

I was running a process one day "Look around here and find something you can have" and stopped all the clocks in the house. This was rather upsetting to the auditor. Well, I looked at my watch, and I said, "Well, I could have the time", and at that moment my watch stopped and all of the clocks in the house stopped. And there was a kind of a – an odd white streak appeared on the consecutive time track, you see. You know, there was a zero, a zero. And the watch stopped and it wouldn't go on running and the watch stopped elsewhere. You get the idea?

Well, this was terrible, wasn't it? But the only reason the auditor got the least bit upset about it is I – it actually encroached in the direction of time. And that's something we mustn't create. That's something we can't create, so therefore we mustn't confront. And you get how creation and confront and problems and solutions and these sort of things proceeded in their evolution. Now, if you understand some part of that – if you understand some part of that – you can see what's happening to your preclear.

Now if you said, "Face a solution. Thank you. Face a solution. Thank you. Face a solution. Thank you. Face a solution. Thank you", he would be very disturbed. In the first place, solutions are the easiest things that a thetan does and the easiest things to create. And so he'd get his head practically knocked off by the confusion which was around these solutions and you didn't have him looking at the confusions, you only had him looking at the solutions. So of course things apparently get more and more confused.

Well, undoubtedly somebody could go through the door like this, but it would be terribly uncomfortable. It would be very, very, very uncomfortable. That's the least I would say about it. Because you're bound and determined to overlook and not confront any part of the confusion which surrounds any of the solutions. So you then never have any reason why any of the solutions ever occurred. This is strictly problems now I'm talking about.

So if we say to them, "Look at the confusion. Look at the confusion. Look at the confusion", why, they haven't got much of an inkling of where the confusion is but these two things packaged together are rather communicable to man, and that is "problem".

We're asking him to look at the confusion or the difficulty. We're not asking him to look to the solution of the difficulty; we're asking him to look to the confusion or the difficulty and in view of the fact that the difficulty also contains other postulates, he's also looking at the further solutions, isn't he? He's looking at the solutions then which cause the confusions to some slight degree. So you get an as-isment of problems when you have him look at problems.

Now, the basic thing you're trying to do is get the fellow, not to solve problems, not to erase problems, but to become habituated and accustomed to and get over his stupid nonsense about the terrible liabilities of solving things and the horrors of problems.

You're trying to get him to recover from these things which were set up on the earliest, earliest, earliest part of the track. These are very early track. You're asking him to get – re-
cover from his inability, apparent inability, to examine confusions, apparent inability to re-
solve them.

A person who can't confront problems, of course, does not ever exhibit very much judgment and we have the cue to judgment in this. This is judgment. Judgment – so-called "sound judgment" – can only take place in the presence of observation. Now, we can observe synthetically, but it is nevertheless observation. Well, you observe synthetically when you observe with mathematics, when you mock something up, you say, "Well..." – or think it over or try to approximate the various conditions which exist and then you can come to a judgment about it. You can come and – to a conclusion. So judgment is completely absent in a person who would be completely unable to confront a problem. That would be the total missingness of judgment. You'd get zero judgment.

Now, if you want to choose an executive, just test him on the subject of problems. A few of the briefest questions on the subject of problems which establish immediately his index on judgment. Just instant, almost instant coordination on these points. If he can't confront problems, he won't have any judgment.

Now, similarly in auditing, the auditor who cannot confront the problems of the pc, of course will pay no attention to these things because they won't seem to him to be problems. Therefore he will not handle these problems and therefore the pc will make no progress.

So, completely aside from the fact that it resolves cases, it also resolves auditing. The more confrontingness that the individual has, the greater his ability to confront, the sounder his judgment will be with regard to anything; and of course, an auditor with good judgment is a very valuable auditor.

Now, let's see how you would get there. Now, I've given you the various ramifications and the discursives, theoretical this-is-where-it-came-from. How would you get there? Well, you'd get somebody to basically not really confront, not really do this, not really do that. We don't have to be very specific beyond this one thing: we'd have to get him familiar with prob-

Now, we take this fellow out. He can't drive a car. Every time he comes near a car, the door falls off, you know. He doesn't even have to come near it – very close to it. He brushes against the rear fender, and the whole radiator goes splat. You've run into such people, I'm sure. And here's this bloke, and we want him to get to pass his driver's test and be able to drive a car so he isn't a menace to his license plates or something. And all we do is get him out there patting fenders, you know. Just let him reach and withdraw from fenders and the bonnet and the radiator cap and the hood and the top, and – mix up some American and Eng-

The first thing you know, this individual can pass a driving test like a breeze. Why? It's familiarity. You don't have to say it's confronting. You don't have to say it's reach and withdraw, because there are probably tremendous numbers of ways to gain a familiarity; lots of ways to become familiar with something. Lots of ways, in other words, to know something better and these are mechanisms by which you can know something better.
So when we say "the process for problems is", and then follow it with some auditing command, we have actually fallen short of a complete statement, so this is what you're up against right this minute in your auditing and handling of pcs. You're up against only this one fact, is I said "Recall a problem", and then gave you a five-way – six-way bracket about problems and so forth, and several of you at once started writing "1A Revised." So let's put this one right.

1A is simply familiarization with problems and getting off the fellow's withholds with Security Check. That increases his knowingness by getting off the not-knows he's running on the rest of the world – see, the Security Check decreasing not-knows. Now you're increasing his knowingness by getting him to be familiar with problems. Not necessarily get the solution out of the problems in order to know it.

People will do that, too. It's quite interesting They take all the problems and they take the solutions off of them. They put the solutions in their pockets so they'll know something and then let this problem just go adrift, you see.

They never face any of their problems. They just get – they're like stamp collectors or something of the sort – they just get an innumerable library of solutions, you see. One of the best books on the subject of survival that was ever issued was issued for United States and Allied pilots during World War II on the subject of survival in the jungle, and there was another one issued which was survival at sea. And it was quite fascinating – if you were down in a dinghy or something of the sort or off a torpedoed ship. This little booklet of survival at sea was a whole method of navigation. And what they had done is just take the ancient method of navigation used by the Polynesians, researched the thing completely and turned it out in a booklet form and gave you all the hot dope, you see.

Now, those were fairly practical books. But now let's get up to An Encyclopedia of Camping Lore. Coo, you know. Talk about people making something out of practically nothing, look over sometime A Complete Encyclopedia of Knots – you know, knots that you tie. It's fabulous, you know. How many ways are there to make a piece of rope hold itself by binding against itself? That's all a knot is – all a knot is. It simply is something you do with a piece of line to make it hold itself with itself And there are various complicated methods of doing this. And they get more and more complicated, and they finally go off into art [laughter] as they naturally would, you see, having no in – no practical value of any kind whatsoever. But this is a Turk's-head, and this is a double, superplated Turk's-head with the twelve inner strand type of Turk's-head, you see, that is used to make mats for admirals' barges, you know. And I imagine down here in the – in the nautical books available in the Admiralty and so on, there's all kinds of this stuff. It is just innumerable. It's just so fantastic. There are about eighty-nine hundred ways of making one type of lace out of rope called Spanish lace and there are just innumerable methods of doing this, you see. And this is what you would call the collection of useless solutions.

Because man and boy, I've been going to sea quite a while. I never found use for more than about three-four knots. [laughs] Yeah! It's fantastic, you know. It's just fantastic. I look around. Decorative purposes? Yes. Yes, you can make everything look very pretty, you can put walls and crowns and Matthew Walkers. And if you haven't got anything to do some sun-
shiny day, and you want to make everybody believe you're busy, why, start preparing heaving lines and things like this, tying various complicated knots of various kinds. It gets an awful lot of admiration – but of no value – of no value at all.

The collection of solutions. Science now includes in its ranks innumerable subjects which are merely the frantic collection of solutions. They haven't anything to do with any problem known to man or beast. But boy, can they collect solutions that might someday be of use to somebody, possibly.

Botany. Botany is a most interesting subject. You probably never collided with botany – not head-on, not head-on. But it's a classification science. Botany. After you've classified all the herbs and flowers of a district and area, you'd think that would be plenty. But no, they've got to correlate the confounded things. [laughter]

And I was reading the other day on fauna – not allied to botany – on the island of the Azores. Finally a great mystery had been solved by examining the inner ear of a shrew. And they found that it was really, actually related to the subgenus clasamatus. It was not actually related at all to the subgenus clasamotus. [laughter]

Now, I sometimes start giving this kind of thing the ha-ha by calling it "the little facts we cannot possibly live without."

You walk through the place – I've often wondered what would happen in some universities if I simply moved up a moving van and started moving the library out, moving the prexy's office out and that sort of thing. I walked into the president of a university's office one time and took all the famous, ancient prints down from the wall, took them down to the photolithographer's, had them all photolithographed for a school edition of the paper and took them all back. Nobody noticed they were gone. By their terminology, there must have been a hundred thousand pounds worth of prints on that wall, those walls, in those offices. They were absolutely invaluable, see. They had ceased to confront anything, but boy, they sure had an awful lot of answers, you know?

Now, get that extremity with the fellow who will have nothing to do with the solution, but must live in problems. Now, he's just got to live in problems. You find him normally down in skid row. Brother, he is really a gone dog. Of course, he's just totally caved-in all the time about everything and you would be utterly fascinated to find the number of things which are to him a problem.

And you start examining this, and you absolutely fail to be able to classify them because they don't seem like problems to you. Because he'll give you facts as problems and his problems are always facts. He never announces them as problems. He never announces them as "how to." He never announces as to "what is" or any question mark. There's no question
marks connected with these problems at all. They're all problems, but they are announced as facts. You say, "Tell me a problem", and he'll say, "the sidewalk." [laughter]

Now, any time you enter a problem chain on a preclear you will find either one or the other of these two conditions existing. If it is a type of problem that has – the preclear has never been able to handle, he will either be in an obsessive automaticity of solution or he will be totally immersed into the confusion of the problem as a fact. One side or the other, he will be on both sides of this, but he'll never be in the center line of "these are problems."

So you have a preclear all of a sudden waking up to the fact that he has problems, which startles the life out of him. Well, you could have told him that. The fellow has never been able to eat lunch in his life. He gets violently sick at his stomach at exactly 12:02. And one day you've got this fellow in session. You're auditing him and so forth and he announces to you as one of the most classical statements of all time that he has a problem at noon every day. He can't eat lunch because he gets sick at his stomach; and that is quite a problem to him. Only he announces it as a fact.

He doesn't announce it as a problem. He doesn't announce it as "Why do I get sick at my stomach?" see, or something of that sort. He announces it as fact. Or he will say, "I wonder – I wonder if there's any connection between my taking Tums – I have to start to eat Tums, let's see, at 11:50. Yes, I always eat Tums at 11 – I wonder if there's any connection with that and the fact that I get sick at my stomach at noon?"

And you look at this and you'll say, "For heaven's sakes, what is happening here? What is this? You mean the guy doesn't connect these things?" Well, it's worse than that. He never thought there was anything significant about his eating Tums at 11:50 and he didn't think it had anything whatsoever to do with anything because he never eats any lunch.

There's no problem there, don't you see. It's just this vast vista and he's got the total solution: You eat Tums and that's the solution, but there's no problem. And you're auditing him, and all of a sudden he relates this solution to some extant condition, and he says these two are related. Well, you could have told him that. Only that's his reactive mind at work, not yours, you see? You see how this is?

So they go in one of two different directions and you can always tell when you run a problems chain of one kind or another, because the fellow starts coming up with solutions, and then on a gradient will start to relate them to facts, which turn out to be unpalatable facts, which turn out to be problems. Or he just goes into it head-on on the subject of facts, facts, facts, facts. Only every fact he announces is actually a problem. It's not a solution to anything. It's just a problem. Each one is an isolated, distinct and different problem. So you don't think you're listening to problems.

You say, "Tell me a problem."

He says, "The sidewalk."

And you say, "Whaaa – wha – what?"

"Well, yeah."
He thinks you're stupid, man. You can't see that a sidewalk is a problem? Why, of course a sidewalk is a problem; and you start to think of ways and means by which a sidewalk could be a problem. That isn't what he means at all. He means a sidewalk is a problem.

There is no further ramification. There isn't any puzzlement about it. There is no mystery about it. There is no relationship of the sidewalk to anything else. The sidewalk doesn't give him any difficulty that he could enunciate or talk about. It's just the sidewalk is a problem. And that is the behavior of a chain and you'll see it yourself as you're running them.

These cannonballs fly overhead and of course we all agree that a cannonball is a problem. But then we have done the mental gymnastics of dressing up the cannonball with all the ramifications which make a cannonball a problem: (1) It is fired usually in anger, (2) it has a target, (3) if it hits anybody it's going to blow them to smithereens; and naturally you have to avoid them, spot them, and not be in the place that they are hitting. You can think of all kinds of problems, but the pc isn't doing this, you see.

So you say "problem", he says "toothbrush." Now, you go ahead with an automaticity, trying to make a problem out of a toothbrush to see what he's looking at. Well, that isn't what he's doing He just says "problem – toothbrush." That's it. There's no further ramification then.

Then off of this toothbrush peels the first onionskin of a problem and he starts telling you "Toothbrush, toothbrush. Yes, I've recalled a problem – toothbrush. I've recalled a problem. Toothbrush. Toothbrush? Yes, that's it." And he'll go on about toothbrushes and glasses – glasses that you put toothbrushes in and all of a sudden will recall that he has been severely beaten at some time or another for having not washed his teeth.

We're getting somewhere now, you see? And then we'll get a little bit further, and all of a sudden, "I wonder why I always had to wash my teeth. I wonder if it's true that teeth are preserved if you wash them."

Now you'll start to see problems coming off, you see. The skin is coming off of the onion and eventually you'll get down to the fact that this is a hard fact which has now disintegrated or deteriorated in something by observation and familiarity. And you ask him if he's worried about it. No, he isn't worried about it now. Well, what has exactly happened to this toothbrush that was the problem? Well, it's gone through all the stages of all the problems a toothbrush has ever been to him, down to a point where he decided to get even with his mother, you see, by doing something like dipping the toothbrush or dipping her toothbrush every morning in a bottle of vinegar or something of the sort.

We get an overt around it, and it's a solution to something or other, and then it got to be a problem, and that all blows. And that whole thing has been confronted and it's gone. You get the evolution of that? Or he will tell you overt, overts, overts, or solution, solution, solution, solution, solution, solution, solution, solution. Problem, problem, little bit of problem, little bit more problem. Little bit more problem, more problem, more problem, more problem, more problem, less problem, less problem, some kind of a solution. And all these solutions go. See, you can enter this thing from both sides. Actually, they're both the same mechanism. It's just the stage you enter the mechanism.
How do you take these apart? Well, you simply get the pc more familiar with them. Well, how do you get the pc more familiar with them? You get the pc to look at them. How do you get the pc to look at them?

All right. Now, right where you sit, you can develop, undoubtedly, ten or fifteen different ways of getting a pc to examine problems; and all of them probably would be perfectly legitimate running Routine 1A. The first and original command on it is "Recall a problem." The next command combines Confront with Problems, which is the most logical way of getting somebody to confront something. But not the most logical way of plowing up his bank. So you could combine these two.

You could run "Recall a problem" for a session, and you could run Confront on Problems for a session, and you'd find out it was something like mining, and then getting all of the ore up out of the mine on the mine dump, and then going over the mine dump, do you see, to find out if there was anything of value in it, don't you see. And that would be the Confront Process, is pulling apart the mine dump after you've mined it and the Recall Process would be mining it. And you could keep doing this one after the other.

Well, there's a liability in this. If you have run "Recall a problem" on a pc and have not followed through the cycle back to PT with his problem, you have probably hung the pc, so Confront will not operate on him. You see that? Confront won't operate on the pc unless he's been cycled back to PT. So any Problems Process that is combined with "Recall" must be run with Model Session cyclic endings.

In other words, you've got to bridge it with getting him back to PT and ending it. Not two more commands and ending it. You got it? That is a must. If you don't do that, you can actually hang your pc up in some old, powerful problem and now you're going to start to run Confront, but that hasn't anything to do with it because he's back down the track, and he isn't in present time, and he hasn't handled that problem. The Problems Process isn't flat to his sense and you have transferred the process, and he is hims – you have become a problem to him; and he's liable to fix on the problem of the session rather than on other problems. You got it?

So any recall Problems Process must carry with it the absolute rule that it has to go through a cycle and back up to present time. You've got to make sure it is and if the person is very unstably in present time, run the cycle through again till he's nice and stable in PT. Got it?

All right. There are various ways, then, of handling this. There are various auditing commands you could use, but these auditing commands must all contain the word problem. That is the simple thing. No matter what you're going to do with these problems, you're going to get him familiar with them.

Well, what auditing commands can you use? You could sort it out on an E-Meter what the pc would best respond to, if you were being very expert and very able with your E-Meter, and you would actually get some version of Problems that would fall, and that is what you would run on him. He might not fall on "confront problems" at all. He might fall very nicely on "recall problems." You see, you get a meter reaction on "recall problems". You don't get any reaction on "confront problems". So you could sort out any version of a Problems com-
mand until you got the most active meter on it. Then you could follow through this type of cycle of mining it and then overhauling it.

Now, there is another Recall Process which is a killer. This is even worse than "Recall a problem" which tears pcs into small strips and this is much worse. Infinitely worse.

And the auditing command is "Recall a present time problem". This situates of course, the pc in the immediate instant of time as to when he had the problem. So you're running him through a whole bunch of consecutive moments of time when he is right there and of course you're not doing any alter-is of time while you're running it. It's sort of a head-on sort of process like you turn the freight train loose and let it run into the station, you know. Head-on! Crash! Boom!

Now, if you were going to run anything as violent as that particular process, you sure should follow it through with some kind of a bracket to compare and get him to confront problems for a while. In other words, you really ought to alternate that with something else. That's awful strong mead. It's something like feeding the cannibal on nothing but human flesh day and night and expecting him to remain docile and gentle.

Give him a chance to confront it. But of course, you're actually confronting it all the time you're running "Recall a present time problem." So I would only bother to shift this when it apparently was sort of flat and had died out. Now, in view of the fact that a problem was originally originated in its aberration – the aberration about problems and solutions were originated to protect the universe or various works or mechanitions – you of course find the early end of a problems run – appearing to run forever. Because the basic aberration about problems was planted there to secure persistence.

So Problems in running has a peculiar behavior pattern and that is early on in it, it looks like it's just going to slog and plow forever. It looks like you're never going to get rid of any part of a tone arm motion. The pc isn't having any cognitions. There is nothing happening, except it's just slog, slog, slog. And you've seen that happen with lots of pcs. Well, that's what actually they're floundering in when it happens. They're floundering in the middle of a problem. Only they've got a present time problem and you're not auditing it, so they don't come out of it.

But you run through this exact mechanism when you're doing problems. You say, "Recall a present time problem" and then you go on like this; and honest, he gets no cognitions, no new problems turn up. The tone arm is very active. He knows it isn't getting him anywhere; it doesn't seem to be doing any good. Nothing is happening. He is doing the auditing command, and this is going to go on forever. And this is sort of the atmosphere that seems to surround the thing early on in the run, you see. And this gradually starts disintegrating and the onionskin starts coming off, you know, and all of a sudden he's liable to pass then to either side. These are facts and he starts announcing these facts, you see. And they're very didactic facts. You know?

"Recall a present time problem." "The sidewalk." You go on, wait for him to say something else. Well, I'll tell you right now it'd be an error for you to coax him to say anything else because he's answered your auditing command to his best ability. A sidewalk is a
problem. You see, you don't have to say, "How is it a problem?" "Why is it a problem?" Don't get him to elucidate. I would call that bad auditing.

We did it one time back about 56. We were asking them to do all sorts of things with problems and we found it inevitably knocked the people out of session when we were doing this. So the best way to approach it is accept the pc's answer. And that's an auditing maxim anyhow, which is a long-duration auditing maxim. He thinks he's told you a problem. Okay. Don't disillusion him. The problem is – the problem was a sidewalk. Okay. It was a sidewalk.

The pc, then, in the basic part of the first grind run is liable to move off to either side of this and all of a sudden starts to give you solutions, solutions, solutions, solutions, solutions or is apt to get 8 thousand, 762 million cognitions per square inch. Pandora's box indeed, you see. Or on the other side of the thing just starts telling you a fact, a fact, a fact, a fact, a fact, a fact, a fact, a fact. And then he will be in a far goggier state of mind than he would be if he were telling you solutions. But he can alternate between these two extremes.

You ask him for a problem; he gives you a solution. All right. Buy it. So what?

You say, "Tell me a problem."

And he says, "Airplanes. The velocity of flight of airplanes. The velocity of flight of airplanes which suspends them and permits heavier than air flight – the, ah, the wind passing underneath and creating a vacuum above the edges." [laughter]

Seems like a problem to him, so that's a problem. Got the idea?

Now, in handling the Security Check, which very briefly should be mentioned before we wind up – very, very briefly – the Security Check will vary more in its character and quality while running problems than most anything else. It'll move all over the place because you're moving him to different spheres of the mind and area and so forth. But the type of Security Check which you should run while you're starting a pc off and using Routine 1A to start him off with – the type of Security Check, the best one is of course the most general Security Check – that is the Joburg Form 3 – unless you have a specific Security Check that fits his exact case.

Let's say he's been an old-timer. He's been an old-time auditor and that sort of thing. Well, give him that old-time auditor Security Check, you see. Work that one over until it's clean as a wolf's tooth. Then go on to something else, don't you see?

If you haven't got a Security Check that exactly matches the pc's case or that comes close to it or characterizes it well, you would do best just using the Joburg Form 3. But in any event, you would not consider that he had gone through Routine 1A until you'd worked through any and all Security Checks you had that fitted his case or not, as the case may be, and had completed successfully, so that he could do easily and not forever, Form 3.

In other words, it'd finally have to come down to Form 3, no matter what else you did and he'd have to do it easily. Not thirty-six hours for one pass through the Security Check, you understand? He's got to be able to go through this Security Check zippety-bop, like a flat rock skipping across water, see. Bangety-bangety-bangety-bang! He's got to be able to really go through that Security Check.
Now, if you ran these two things one against the other and ran them in that, you have set up a case so that it won't have any PT problems and it won't have actually any major withholds for quite a while in auditing.

But now, does problems – do problems appear again anywhere else in auditing? Yes, they appear in rudiments. You handle them ordinarily as they come up in rudiments. But if you're running a process on problems, for heaven's sakes, don't waste any auditing time taking care of the guy's PT problem, because he's just about to run it anyhow with a better auditing command, you see?

Now, how about running SOP Goals on somebody and he comes up against the fact that he's starting to develop PT problems of some kind or another or "problem" starts falling? Well, it would not do any harm to revert the case to some Problems – to run some Problems until that factor seemed to be kind of cared with and go on with your SOP Goals run.

As long as you can keep rudiments in easily on either Routine 2 or Routine 3, you would not do anything extraordinary. You just let them run. As long as you can keep routines in easily. But the moment routines – the routine seems to be having a hard time because it's running up against a lot of work on rudiments – every time you run rudiments – then you certainly had better handle the thing with Problems – Problems and Security Checks. Got it? It's a kind of a return to Routine 1A to get this thing out of the road although these things will later on have different names. Okay?

There – you will find that most cases going for goals now – going for Clear on SOP Goals Processing – most cases are halted or slow gain simply for one reason only: They've got problems and problems have got them stopped or... we assume that their withholds have been pretty well cleaned up or are kept cleaned up. But between these two the problems and the withholds, I don't care what goal you try to run or what terminal – if you found the goal, if you found the terminal, if you tried to run these things, you're going to stack up just hundreds of hours of auditing.

So you had better get rid of Routine 1A, and you had better get rid of it and straighten it up and finish that up with the pc no matter how many – how long you've got your goal or how well you've got the thing pegged, because he's not going to make much gain.

Nothing in SOP Goals has occurred to alter any consideration concerning the value of a problem or a withhold in stopping a case from making progress. These things still stop cases from making progress whether on SOP Goals or not. Okay?

Now you've got all kinds of Security Checks. There'll be more Security Checks. In running SOP Goals, about halfway through the run, going up that direction, you've got a Whole Track Security Check. Person's memories are opening up and so forth, and you actually are getting a case there that is being held up by the reason that he can't get off his withholds on the whole track. There's no way he can do so, you see. But you've got a Whole Track Security Check. But you for sure would never use a Whole Track Security Check over here in 1A, you see. You wouldn't monkey with that over here in 1A. Okay?

Now, I hope I've squared around most of the problems that you have or will be having about problems and I thought I'd better give you a good look at this. And I want to say I want
to thank you for buckling in and making the fur fly. Sitting over in my office over there, you see little bits of paper flying out every once in a while and you see little tufts of fur going out every once in a while out of the auditing windows and so forth. It's a very, very satisfactory state of affairs.

So thank you very much.
QUESTION AND ANSWER PERIOD: ANATOMY OF MAYBE, SOLUTIONS

A lecture given on 12 July 1961

Thank you.
Well, I didn't mean to interrupt Suzie's talk. What is it? The 12th of July?

Audience: The 12th of July.

All right. What she can tell you is far more practical. And she can tell it with a lot more bayonets probably.

Well, you haven't had a chance to ask any questions, and I've been informed by Mary Sue that you are now getting into a shape that you know what you don't know. [laughter] So, what question would you like to ask today? ... [laughter] Great, isn't it?

Female voice: Don't disappoint me.

All right.

Female voice: I was wondering when you decide and how when to put the ten-way bracket from a five-way bracket. When you decide?

When you decide to go from a ten-way bracket to, pardon me, a five-way bracket to a ten-way bracket?

Female voice: Yes.

Ah, well, you're dealing with a problem which has actually no basis in mechanics beyond this: The reason you go to a – from a five-way to a ten-way bracket is the plus-minus proposition. It's covered in the anatomy of maybe and I think that is covered in what? That's Scientology 8-80, isn't it?

Female voice: Yes.

And that's the anatomy of maybe. And a continued uncertainty on the part of a pc – a continuous no-cognition, the pc who says – never says, "What do you know?" is hanging so hard in maybes. And his maybes are so fantastic that as you look this thing over you'll see from the anatomy of maybe that the way to take it apart is take it on the plus side, take it on the minus side. "How have you done it? How have you not done it?" "How have you coughed? How have you not coughed?" You get the idea? And his idea of "Maybe I will cough" disappears.
"Maybe" does not have in itself, you see, any faintest reality in fact. It is simply a manifestation of a positive and a negative; and your positive and negative manifestation add up to maybe.

Now, problem one consists of postulate A versus postulate B and between these two postulates you get an indecision, don't you see? But usually postulate A is "do it", and postulate B is "don't do it." That is the commonest variety of a problem.

And if you ask somebody that you're trying to take problems apart by solutions – which can be done; I'll tell you how to do that in a moment – you would say some version of "do it", "don't do it", and then the decision can emerge. But as long as he's hanging on "I've got to do it. I mustn't do it", then no decision can emerge. And "maybe" is simply a counterbalanced insistence on "must" and "must not", or "it is" and "it is not". And these things equally insistent, addest up into the indecision of maybe, but the indecision of maybe is not itself a fact. Have you got the idea?

Female voice: Yes.

All right. If that's not a fact, then you've got to take apart the thing by taking apart its two sides. And then the indecisional character or the maybe character, the uncertainty – and this is quite important in psychotherapy because we're not handling the whole subject of anxiety. The whole subject of anxiety is resident in this anatomy of maybe.

Well, anxiety simply is – consists of "must" and "must not", "is" or "is not." And these things are so counterbalanced that of course, the person can't make up his mind, and anxiety is simply a heightened or frantic state of maybe, you see.

So, all right. Let's – supposing you have a terribly, terribly, terribly anxious or nervous pc who is very indecisional and doesn't know whether to come to session and doesn't know whether not to come to session and thinks there might be great consequences in coming to session or not coming to session, and wonders whether or not they should do it this way or should do it that way and they are just dramatizing indecision all the time, all the time, all the time. Actually, you should know that it is a mistake to run a five-way or six-way bracket on them. You would have to run – pardon me, a five-way bracket – you'd have to run one of these ten-way brackets on them. Got the idea?

Female voice: Yes.

Because they're – they cannot land. They're incapable of landing on plus and incapable of landing on minus, so the longer you run anything in the middle that is avoiding this tremendous condition in which they find themselves, why, the longer they're going to be in processing.

And this is the case that never says, "What do you know?" You've run this case, you've run this case. This case gets no cognitions. This case doesn't ever say, "Well, I'm getting better." This case never says, "Well, there's some way out of the hole." Or the case never even says, "I'm getting much worse." You know? It just goes on grind, grind, grind, grind. Well, you've run into the anatomy of maybe. And the total absence of cognition winds us up into the total presence of uncertainty and anxiety.
"I don't know whether I should be processed or not, you see, because if I am processed, da-da-da – you never know. And if I – I – I don't know. I – you know. I – isn't there ter – some terrible consequence? Are you very sure that it doesn't hurt the mind?" And so on and you'll run into all of this.

The person is saying to you "maybe." The person is saying to you, "indecision", "anxiety", all that sort of thing. Well, practically every process you do on them, you ought to somehow or another bend it around so there's plus and minus, plus and minus, plus and minus, plus and minus, see.

Never run a plus, plus, plus, plus, because you'll get a stuck flow promptly; and never run a minus, minus, minus, minus, because you'll get a stuck flow promptly. And that is what decides it. The condition of the pc is what decides it.

Now, about one pc, maybe, out of every – this is an inaccurate figure, but it's just somewhat of idea of order of magnitude. Maybe one out of twenty never says, "What do you know."

All right. Well, that particular pc – when you're sizing them up, you run them for a little while – just make up your mind, everything on this pc has got to be run plus and minus. Everything.

So, this would make the rudiments sound like this: "Do you have a present time problem? Is there a present time problem you don't have?" [laughter] Got it?

Female voice: Yes.

"Do you have an ARC break? All right. Is there an ARC break you don't have? Thank you very much."

"Are you withholding anything? All right. Very good. Very good. Is there anything you're not withholding? Fine. All right."

You could even go to the reductio ad absurdum of asking such a pc, "Is it all right if I begin this session now? What would happen if I didn't?" [laughter] And you'll find that your noncogniting pc will all of a sudden be saying, "What do you know?" you know. And this long grind, grind, grind will tend to disappear and go into limbo.

So, that is when you decide this. The greater the anxiety, the greater the indecision, the greater the uncertainty of the pc, the more you must run both sides of an auditing command; and it just depends on that. And most pcs – the large majority of your pcs – this just falls into place and you can do it most any way you want to do it. And it'll go along. And you would do a Prehav Assessment and it's Failed Leave, well, you don't have to run Leave. They may dramatize Leave a little bit immediately after you've run Failed Leave, but doesn't matter. You can get away with it, don't you see.

But if this person is one of these "can't change", "don't go anyplace", so forth, you assess them on Failed Leave, you know instantly if they're going to blow straight across the scenery, they're going to disappear on you if you say "Failed Leave" about twice without saying "leave." Got the idea?
You should recognize this as that particular case, because I think that case is the bane of your existence. The case actually will change, but never seems to notice it. Yeah. Well, that's how you handle that case. You can take that case apart like you can count pennies on a table. Okay?

Female voice: Just something more to add here. Would it also depend on terminals — running terminals? SOP Goal on the terminal or on the pre ...

No, ma'am. Doesn't ...

Female voice: — only on the precl ...

... doesn't determine. Terminal has nothing to do with it. On most SOP Goals cases, you just run the level ...

Female voice: Right, thank you.

... and that's fine. But if you've got a superanxious pc who is being very doubtful about everything ...

Well, this kind of a manifestation — you're running — you're running a terminal — you're running a terminal "whizzlestick." And this pc just doesn't know if that's the level or not. You've assessed Cause. "Whizzlestick, Cause. Well, I don't know whether that's the level or not. I wouldn't be sure that's the level. Are you sure that's the level? That couldn't have fallen on that, could it have? That isn't the level then, really, is it?" Well, the auditing command you put together had better be Cause-Not Cause. Okay?

Female voice: Yes.

All right. You bet.

Male voice: Ron, on Routine 1A, when you're running "Recall a PTP" or one of the processes, can you change during a session, and when?

All right. In running Routine 1A, and you're running "Recall a PTP", or whatever you're running, can you change within the session? The mildness would be the determination. The answer is "yes". Not ordinarily, but it could be done. And it would be determined by the mildness of reaction, not the violence of reaction.

If you're getting tremendous tone arm reaction, and you're getting tremendous pc reaction as a result of running such a process as "Recall a PTP", it would be an Auditor Code break to shift it not only in the session but in the intensive. Because it's running too hot and it's running too heavy, and it would be too painful a shift to suddenly alter the auditing command.

But the other side of it, you can. The thing doesn't seem to be doing very much. You're — you know, you're getting some tone arm action. You're getting a division of the Tone Scale or something like this, and the pc seems to be doing it rather easily. And they were having a little difficulty a short time before doing it, but they all of a sudden start doing it easily or something, and it looks like it's getting a little too easy with the pc or something like this. You could shift. You could shift to Confront.
This is something like I was saying, you dig up the ore from the bottom of the mine and put it out on the dump. Well, you could shift over onto Confront. And all of a sudden watch that tone arm fly again, see? You can do an adjustment like this. You can always do an adjustment on processing when the process you are running is no longer producing marked results. But, if you change a process before the rule of change has occurred – the twenty-minute test has occurred – you have committed a serious blunder not to go back sometime and complete that process. You got the idea?

*Male voice:* Yeah.

It basically would mean that you probably made a mistake. It comes under the heading of rectifying an error. A person would – would run all right on Confront, but won't run at all well on Recall, and you ran Recall; and Confront won't get a heavy needle reaction, and so forth, but then, a heavy tone arm reaction. But you don't get much on Recall, see.

Well, it's actually the correction of a blunder. What you do would bring him, by cycle, up to PT whether running Confront or Recall or anything else. You get him solidly in PT and shift.

And that would be the main thing that would determine whether you could shift or not, is can you get him into PT? See? If he's out of PT and the tone arm is moving like mad, well, you wouldn't shift. You'd carry on, that's all.

Any auditing command, of course, can be modified. If you weren't able to modify an auditing command or change a phrasing of a process or a different approach on the same subject, of course you'd be hung with your own mistakes; and you'd also be hung with the diminishing change.

This pc, you've run him for – you ran him all day yesterday, and you run him on "Recall a Problem", just as simple as this, you see. And that tone arm was just whizzing, man. That was going over and jumping on – hitting the needle on the head, and turning the sensitivity knob up all by itself, you know. And just really whizzing.

When you bring him into session, and all of a sudden it isn't whizzing. Check your rudiments. Your rudiments are all in. Just not getting any reaction on that process today. Well, don't waste auditing. Don't waste auditing. Shift it over. See if you can assess another command here that does get a big heavy needle reaction, and run that one, and that would be your basic criteria. I'm not trying to give you anything complicated.

By the way, if you ran "Recall a Problem" during the whole of that session and the next session, it'd probably come back to doing its business all over again, you see. It's just what's faster.

As long as you're running Problems, run them any confounded way you want to, or in any fashion you want to; but there are certain rules that have to be followed if you're going to do a good job of auditing and one of those rules is you don't change a process which is producing marked change on the case. If your process is damped out and isn't producing very much change, why, shift it in its type or wording, making a big loud note in the middle of a – in caps on the middle of your Auditor's Report – that "this process was changed when not
flat” or something of that sort, see. At least let somebody in on the secret. That answer your question?

Male voice: *It does, thank you.*

All right.

I'd like to say something more about problems and types of processes that could be used on problems here, and here's a good time as any to say them. Here's an interesting point about problems and solutions.

I may have given you too much of an impression that it is impossible to run a solution. Now, no, that is not factual. You can run solutions. There are many ways of running solutions and getting away with it. But I'm talking about running something like this, preventing the person from examining the problem and always insisting that he run a solution. Yes, that is impossible. But you run solutions on cases all the time. SOP Goals. What is a goal? A goal is a solution to some problem. You've learned that already. You've seen that.

All right. Another comment I'd like to make here is it seems to be tentatively true – from observation of reports and from what Mary Sue says – that those people who are being run on Problems and being given Security Checks and being assessed on SOP Goals are getting rather rapid trouble-free assessments on SOP Goals. Does that confirm your understanding of it? And those people who aren't being run on any preparatory processes and Security Checks at the same time are making poor, long-term, scramble progress. Is that the way it looks like? Hm? Well, tentatively, we make the observation that a case runs faster in a Goals Assessment if run on Problems and Security Checks at the same time – at different periods of the day.

All right. Now, let me say some more about this solution thing. There is a whole problems process, a very old one – at least three years old, two – two, three years old. It's probably older than that. I'm always finding something new had a precursor, or some two or three years before that it's already occurs in the notebooks. And that is, you take the condition of the pc, off your own bat, you *assume* that it's a solution to a problem. Of course, you'll be right. But you *assume* that it's a solution to a problem. This is the way of doing this, you see.

And then you ask the person, "What problem could that be a solution to?" Now, this fellow's got a headache. Got a continuous headache. All right. So you say, "All right. Now, what problem would a continuous headache be a solution to?" Now, obviously, they're looking at a solution without examining the problem, right? Now, this brings us forward to a method of nulling goals which would be too insidious for words and it is not usable. I underscore that. *This is not usable.*

This could however be done: We've assessed this person for a cadet. This is the final terminal that emerged, and so on. We could say, without using the Prehav Scale, if we didn't have a copy of one or something – this is not recommended, see; this is not a doable action – "What problem would a cadet be a solution to?" That's the pc's terminal.

You're going to produce action. That's for sure! [laughter] That's for sure, because you're going to run him into every problem he's ever had for the last two hundred trillion, or
ever since he's adopted this particular terminal. You're going to run him into every one of them. So, clang! clang! clang! Expect action.

It is a thing that could be done which you might get away with. It is not a recommended thing to do. You got it?

All right. Now, I'm just giving you examples here of what you can do with this. You take the – the stable datum and you ask him, "What confusion was that a stable datum to?" you see. You're saying the same thing as, "All right, what problem would a continuous headache be a solution to?" See? You're asking – you've taken the stable datum, which is a headache and you've asked him for the problem. Because he never confronted that or he wouldn't have the headache, you see.

To get him to confront this, however – this is not always successful. This is successful enough to be very useful to you. This is a good way of getting rid of a chronic PTP or something like that. It's not always successful because you may have put him up above the level of his confront, like crazy.

Well, he can't even confront the headache, because he's complaining about it and yet you're asking him to step back into the further never-never land of unreality and confront the problem that that's a solution to. And on some cases, you're going to lay a complete ostrich egg on this, you see. Their confront just is not up to this. That is all. But it is a useful mechanism and is something to know about and it is usable. You can do this.

Now, you can take a goal. Here's something you can't do. You can take a goal and you'd say, "Tell me a problem that goal would be a solution to." We've assessed the fellow, and the pc "to be unencumbered." All right. This was the goal.

All right, and we say, "Well, what problem would being unencumbered be a solution to?" And of course, this is something like picking somebody up and throwing them into the tar pit and say, "Swim, you –." But the – these are heroic things, so heroic that they will exceed the level of the preclear's reality quite ordinarily and easily.

You could, however, take a present time problem and try to run this with it and you would very often succeed with great rapidity. It would be quite astonishing to you how often you would succeed in taking this difficulty the pc has and assuming, just whole hog – it's just assuming that it must be a solution to a problem and just telling the fellow to look at the problem and it would blow up with great rapidity.

You take some fellow who's worried about – well, let's take a very common one. Impotence. This is very common. And you say, "Well, what problem would impotence be a solution to?" You know, you keep talking about this.

Or the fellow keeps giving you this hidden standard, and this hidden standard apparently has absolutely nothing to do with his Goals Assessment. You know, the Goals Assessment is here and the hidden standard is over there in the corner, but he tries to find out if the Goals Assessment is working all the time to find out whether or not it turns off the burning in his right ear. We want to get rid of this hidden standard? This is a good way to do it. You see?
It has lighter usages than Goals Assessments, according to my experience, at least, this far. It has lighter usages. You can get rid of PTPs, of short or long duration this way. You can get rid of a chronic somatic or something of this sort rather easily.

And the auditing command that would go along with this is a very pat one. It's just: "What problem would a (whatever it is) be a solution to?" Quite useful. A useful gimmick. You'll get an awful lot of chronic somatics and things like that off your pc with no consequence. We're doing the oddity, you see, of solving problems without the consequences of problems and solutions, which is the greatest oddity in the world.

Scientology is full of these oddities. It's the oddity of getting away with it. We're doing the impossible, living in a universe that is tailor-made never to get out of, you see. Tailor-made. Tailor-made for you never to let anybody else out of it either. And we're in situations which are all tailor-made to stay in. And hitherto getting out of them has been attended by all the consequences of a jailbreak, you know. Complete with sirens and police dogs! [laughter] It's all booby-trapped.

You solve problems, solve problems, solve problems, you've had it, you see. That's booby-trapped down the line. All right. So all of a sudden we solve problems with no sirens. The front gates of the prison disappear, the prison disappears. We get out of the prison by dropping the prison, not by busting out through the front gates and making some ironmonger a lot of work.

And we've got a lot of these – a lot of these in the works, and we do this quite a bit. It's the only way it could be done, don't you see. You can't cure, as man has been doing it, without consequence because it's rigged the other way.

So here is a universe – well, I'll give you an example of the rigging of the universe. You know, ministers can marry, but they cannot divorce; and you look around you and you'll find everywhere in this universe there's mechanisms of that character. No prohibition about getting in; every prohibition about getting out. [laughter]

Take the, take the armed services. You walk up there. My golly! The recruiting sergeant is nice, man. [laughter] Next day they've fed you cold beans, and you say, "Well, the devil with this." You've run into a subaltern or something and you turn around and you go back to the same recruiting sergeant, and you say, "Give me my papers back", and by golly, he won't do it. [laughter]

And then you've got a universe that – and a civilization, and all of its customs are more or less tailor-made in this particular direction.

Well, we even do it ourselves to some slight degree. We have some Book Auditor out someplace, and he's just found out that music processing is the various thing that's in now. In North Fernando Valley or something, why, he has eight pcs sit down, and they all raise their shirts and contemplate their navels, and they play Bach. And he says, "If you've done this now for 289 hours, why, you will be Clear as near beer. And you're all set." you know? And he's just a Book Auditor. And we say, "Oh, well, for God's sakes", you know. And that's the limit of action.
But the guy is a professional auditor. Oh, hell, man, the sirens go, and the police cars start wheeling, see. "What the hell are you doing?" See? It's all on the basis of "You know better than that." This is always quite astonishing, you see.

Because the universe is so thoroughly rigged this way, why, it happens to be the only method by which you could ever make any progress out of it is to approximate some of the progresses in and that happens to be one of them.

If you're a professional auditor – if you're a professional auditor and you know better, well then, don't do it. And if you're a Book Auditor and you don't know any better, well, so what? You got the idea?

I mean, some professional auditor is expected to go over and say, you know, "If you – instead of having them raise their shirts, have them sit in chairs like this, facing each other and then run TR 0 on them for a while." [laughter]

But that, you see, is even present to that degree in the administrative lines of Scientology, much to my shame. But there's other mechanisms that are survivals of this sort of thing.

Apparantly all resistance is to prevent oneself from going any further down. The resistance is to go down. It's quite amazing the difficulty you have, actually, in worsening somebody's mental state. It's fantastic what you would have to do to worsen somebody's mental state. Really. And how anybody would achieve this, actually, it's to the utter shame of psychology and psychiatry that they're really not able to. They temporarily do it, one lifetime or something like this. I suppose if they gave the guy enough motivators, why maybe it would even run out some of his overts. You could look at it in some kind of a reverse mechanism. I think that's the mechanism on which they must operate.

But most of the resistance is to getting worse and you stop pressing against the resistance to getting worse or if you resolve the resistance toward getting worse, just that, the guy will get better which is one of the goofier things. You see? That's goofy.

You don't try to make the fellow well. You just stop him resisting getting worse. He has terrific resistance to getting any lower down than he is, and there's practically no resistance to getting any better, which make one look at an auditor who isn't getting results wondering what on earth he must be doing, you see, because it actually is a very easy one to reverse this because there's practically springs back of it. The fellow's mainly concentrated on keeping himself from getting any worse. That's how his mind is rigged.

He's preventing deterioration or something like this. And he could get it all – all sorts of complications where his prevention of deterioration looks like he's trying to deteriorate. And that's really true, too, but it's nevertheless rigged as a resistance toward degradation. And all an auditor has to – has to do is convince a pc that he is not trying to degrade him, is not trying to make him any worse, is actually not trying to cure him – because he might have resistance to being cured, too, because he knows how much worse you can get when you're cured. The cures for broken arms which they rebreak two or three times you know, can be quite heroic.

And all you'd have to do actually is to convince a pc that you weren't trying to push him further down on the thing and just had a heart-to-heart talk with him about whether you
were or weren't and all of a sudden, he'd get better. Because the fact that he's resisting getting worse is pinning him into getting worse. See, that what he – which he resists he becomes, see. There's a lot of goofy little mechanisms here that operate on the side of the auditor. You really have to get pretty wild to violate all of them and not get a case to improve at all. Okay?

I want you to remember that particular process though as a – as a good patch-up process. You're just sick and tired of hearing about this burning right ear. He knows he will get better because his ear will stop burning.

"Well, did you make any goals during this session?"

And a moment of comm lag ensues and then he says very brightly, "Well, no, not really."

And if you don't follow through immediately afterwards and say, "Well, what didn't happen?" You sometimes will miss the hidden standard. "Well, what didn't happen?"

"Well", the fellow says, "of course, my gall bladder isn't burning. When I get better, my gall bladder always burns, so I know I haven't gotten any better." We haven't run out that particular somatic. Ha, ha, ha. Here we've got it, see? We've got a hidden standard here.

There are ways and means of smoking these hidden standards into view. Of course, they're idiotic. You didn't have anything to do with a gall bladder. You weren't – you weren't even processing him on anything that would have helped his gall bladder, and yet his whole test of whether or not he met his goals in the session is whether or not his gall bladder had altered. Or got worse. Gall bladder didn't get worse, so he didn't improve. You got a fellow in an interesting condition of being in a games condition with his own gall bladder or something. See? You can! You can have a fellow in an interesting games condition with his stomach. You know, he's trying to get even with his stomach. Auditing isn't working – his stomach didn't get worse.

All kinds of crisscrosses here. The reactive mind – the reactive mind, of course, is not sensible, so you get all kinds of unsensible responses where it comes down home close. Okay?

All right. Any other questions? ...Oh, I'm glad the rest of you are caught up to it. I'm glad the rest of you are right up there on the ball. Yep. Yes?

Female voice: we were working on the third-of-a-dial drop for two days with a good squeeze and we noticed an improvement. That's a good thing When you have a sensitivity that's very easy and then a reading that's not easy, where – where you don't get drops, you're just sort of diagnosing on change of characteristic ...

Uh-huh.

Female voice: ... as the sensitivity is very free and – and practically hits the pin ...

Yeah ...

Female voice: ... the actual needle action on the ...

Is very slight.
Female voice: ... assessment is – is very stuck.

All right. Here it is, Bobby. You'll run into this rather constantly. Its – your needle – using a sensitivity knob for diagnosis, and your sensitivity knob has a low setting for a third-of-a-dial drop, and yet you're not getting much needle action. Well, that is why an E-Meter can never have its sensitivity knob adjusted to read low. There – a sensitivity knob can only be set as it is set on the Mark IV. That's about as good as you can do. Because if you start setting the sensitivity knob lower for less drops, then the drop that would be observed will drop out. Do you understand what I'm talking about? You will no longer be able to see any drop. You got it?

So the person that you're discussing is actually getting up into – well or in – they're a Release and haven't found it out yet and they're getting a tremendous drop on zero setting practically of the sensitivity knob – terrific action – and then when you try to assess something, why, horror of horrors, that needle doesn't move very much. Here's a very loose can-squeeze test and not much of a motion in the needle.

All right. Now, let's look over the characteristic of an E-Meter. An E-Meter is registering amount of charge or disagreement. Charge and disagreement could be said to be synonymous and to make charge more understandable, use the word disagreement. If you're getting a bad fall, you can always get your fastest cognition on the part of your pc by asking, "What are you in disagreement with?" This doesn't fit in well for most of your questions, and so on, but you could always bend it around so that you can use it.

This pc, "Do you have an ARC break? Do you have – do you have this or that or anything of the sort?" You finally say to this person, "Well, do you have a disagreement with anything?"

And all of a sudden you'll observe this fall that you have observed so fleetingly, because it is the fundamental reaction is caused by disagreement.

Now, as a person gets up toward Clear – they're getting closer and closer in this particular direction – of course, their wild disagreements, aberrational disagreements with existence, are much less so there's actually much less charge on the case. And the needle will only register to the degree of the charge remaining on the case. And so you have the oddity of the closer a person gets toward Clear, the looser is the needle and the less is the actual reaction on questions. And you will get to a point – . It's a good thing for you to bring up because it's a good diagnostic point.

You're eventually going to have to raise the sensitivity knob up for a person who gets toward Clear just as you had to for somebody who's way down at the bottom so that you could read the needle at all; and this becomes very difficult. The can squeeze test makes the needle go over, bang! And it hits one pin and comes back and hits the other pin. And it's crash! You see? And you say, "Well. All right. Now, do you have a present time problem?" The fellow looks like he has a present time problem or something like this, you know. To get a read, you have to actually increase that sensitivity knob, in spite of the wildness and violence of that can drop.
So your can-squeeze test ceases to be valid from Release on up. When you can no longer retard the sensitivity knob on a Mark IV British Meter to get a third-of-a-dial drop, from there on – this is something that is not in the text – you had better be suspicious that you are going to miss falls. And you'd better start advancing the sensitivity knob. Do you see that? It's – there's something to know there. Now, that's quite – quite amazing. You'd say, well – but you see all aberration is a mockery of Clear and you've got down into the lower scale mockeries of Clear. Of course, you'd have to keep a highly advanced sensitivity knob to get any reading at all. The case is actually below having charge on it.

Now, as the case gets better, you get a third-of-a-dial drop, which is somewhat the average case. Now you've got a pretty good charge, see. Your charge is quite heavy. And you get nice readings and everything is fine; and one day you're auditing the fellow and you say, "All right, now, squeeze the cans", and it goes over and hits the pin at the other side. And you retreat with that sensitivity knob reading. You say, "Give the cans a squeeze", and it goes over and hits the pin. And you've got the sensitivity knob down, and you just can't turn it down any further. And you say, "Well I ought to fix this meter." And I actually fell for this myself some time ago – ought to get these meters fixed, you understand, so that they can be turned down to a third-of-a-dial drop.

No, when that condition begins to exist, then you, to find charge, had better start advancing the sensitivity knob. And you'd better start advancing the sensitivity knob to magnify these little remaining disagreements that don't amount to a hill of beans. Well, the difference is that when the fellow originally, to get a third-of-a-dial drop, had to have his sensitivity knob well advanced, well, he was below disagreeing.

Now, he comes up to a point where he can disagree with things fundamentally, and you of course are getting terrific reads with the thing down here at the sensitivity knob reading at its lowest set. You get big reads and everything is fine. And then you process the fellow a little bit further along the line, you're going to see a change of characteristic here. At zero set, you're going to get more than a third-of-a-dial drop. Well, from that time on, you had better start advancing the sensitivity knob to get your reads. Not for the rudiments, but for Security Checks and goals. You can do it with Goals Assessments, too. Actually, rudiments and Goals Assessments are a cousin in the way they're read.

Security Check – you'd better start really revving that thing up because you're not going to find much on it. The fellow just isn't reacting. He isn't as reactive anymore, so the needle isn't reacting. But that is your fundamental test of whether or not the case is going Clear. And when you see this first start to occur – of your third-of-a-dial drop squeeze – that's – that's a gone dog as a test. That's no good as a test anymore. You got Release – that's good enough to just check out a Release right there.

And after you get up to a point where you just cannot retard it and it just hits pins and caroms back and forth and flies all over the place, and you have to – in order to get a read – have to advance it up to 3 or 4 on the sensitivity knob setting. You know, "You got a present time problem?" The fellow says, "No", nothing happens. So you advance it to 3 or 4. "Have you got a present time problem?" you know. Bang! You get a terrific read of about two divisions, you know. [laughter]
Now, the test – cross-test is that it blows that fast. Guy's got a present time problem, he tells you about it. Now, you can't find it again. Gone. See, the thing's blowing. When this condition completely disappears and advances to a point where you just can't – well, the can-squeeze test is just all over the place and 16, you can't get anything falling. You can't even do an assessment anymore, something like that. You'd better bring yourself up with a – with a sharp halt. You've probably been looking at a Clear for the last few hours and haven't noticed it. That is the gradient scale of Clear test. It's unmistakable when it happens to you. Unmistakable.

If a case is not changing in characteristic of can squeeze as it goes along, it isn't making any advance – and that would be checked out, by the way, by giving them continuous profile tests. It's not making any advance. The can squeeze test is not varying from one session to the next, see.

They still have to be here at sensitivity knob setting 2 to get a third-of-a-dial drop. Next session, sensitivity knob setting 2, to get a third-of-a-dial drop. Next session, sensitivity knob setting is on 2. You say, what's going on here? PTP, ARC break, withhold. There's a rudiment out, man. See, the rudiments are out.

The speed with which you can detect this, is sufficiently good that if your processing is advancing with all of your rudiments in – this is an important thing to know – if your processing is advancing with all rudiments squared away, see, rudiments all in, everything's all straight, you should be able actually to detect, from session to session, a difference in the can-squeeze test. Gives you some index of how far rudiments are probably out on most cases that are being processed.

Now, as the case goes to Release and from that point on, your mid-session break ought to find a difference. See, the difference between your – your first part of the session and your second part of the session when you start the session again, you ought to see a difference in the can squeeze test.

Minute, but detectable. And they should advance that rapidly.

You can tell, very quickly and very immediately, that a case is not advancing because this phenomenon that you've just brought up is not taking place; and if that phenomenon does not come into being on a case in some finite period of time and – you just can't set the sensitivity knob back, you see, far enough, you still get too much drop no matter what you do with the sensitivity knob; and then your detection of Security Check questions becomes very difficult because you're not getting much needle action.

Well, if that doesn't take place, you just better take a case practically apart, you know. What's wrong with these rudiments? What's the hidden standard? What's missing here? What's holding up the show? What are you doing out of session? You know? What's going on here? Got the idea? Just really chew into the ground on it. Your processing will advance as fast as that happens. Thank you for bringing it up. It's a point which happens to be missing. Okay? Does that answer your question?

Female voice: Yes.

All right. Any other question? Yes.
Female voice: Would you tell me the commands on CCH 4?
What did you say now?

Female voice: Would you tell me the commands on CCH 4?

Commands on CCH 4. Oh, I don't think I have to tell you those. In the first place, your verbalization is not your process, and you may be getting much too precise. I'm not going to tell you those. I think they're in your bulletins and that sort of thing. No point in it. Okay?

Female voice: That's just the ...
Hm?

Female voice: ... that's just the book motion process.
That's just the book motion process.
Female voice: I couldn't find a bulletin that did have the commands in it, so ...
Male voice: Never was one. Never was a separate one ...

Never was one.

Female voice: Okay.

All right. Issue one, Suzie.

Female voice: All right.

All right. Okay, Virginia, it's actually – if you want to know the commands of any of the CCHs, get your minimum effective statements to get the motion done.

Female voice: Mm-mm.

That answers the question. Command verbalization is tremendously important in every other routine than the CCHs. That's why I'm not going to give you a set of auditing commands right here and nail them down in brass, because there have been, I think, a dozen versions.

Anything you want to say to the pc, more or less repetitively, which shows him that you're going to do this and you expect him to do it just like it right afterwards, and then that demonstrates that you are interested in knowing whether or not that he's satisfied that he did it, would be the commands of CCH 4. Got it?

Female voice: Yes.

All right. Any other questions? Yes.

Female voice: In a longish sentence on Form 6 ...
In the ...

Female voice: In a long sentence on forms – Security check Form 6, a long sentence ...
Mm-hm.

Female voice: ... and check on sensitivity 16, and that needle wiggles while the sentence is still spoken – should it stand quite – quite null during the whole sentence?

Yes, ma'am.
Female voice: Yes.
Yes, ma'am. Quite null during the whole ...
Female voice: ... whole sentence.
... sentence. On a Security Check question or any question you're asking a pc on an E-
Meter, you have this liability. That there are sections of the question ...
Female voice: Yes.
... and each section may fall ...
Female voice: Yes.
... so if you've got a long section, you have no option but to clear every part of the
question.
Female voice: Yes. Thank you.

This is so poorly understood at large that it has actually let Scientology in for some
brickbats. Because you can ask almost anybody anything. You can ask a girl, "Are you a vir-
gin?" If she's a virgin, the needle falls, see. And, "Are you a virgin?" And the girl, "Oh." There's just charge on this word "virgin." Hasn't anything to do with whether she's a virgin or
not. It's "virgin" that's falling. It's not "Are you a virgin?"

And you can get led very far astray with this with an E-Meter if you don't take them
apart. So the basic rule is that you would ordinarily, to begin with, take that long question to
pieces, so eventually having taken it to pieces and gotten it all straightened out with the pc, you eventually would be able to read the whole question from beginning to end without any
reaction.
Female voice: Good. Thank you.

All right. Okay.
Female voice: On that particular thing, you wouldn't suddenly – you're reading it to
him for the first time, you wouldn't suddenly stop.
No, no, no, no, no...
Female voice: You'd read it to him.
... no, no, no. You just read it to him. Don't even look at your E-Meter. Find out what
they said. And they said, "No." All right. Read it to them again, looking at your E-Meter. And
they say, "No." So you read it by sections to them again looking at your E-Meter, questioning
each section. And get all sections clear. It's sort of like clearing the auditing command. And
then read the whole thing again now that you've got all sections clear and you get a fall and
they say, "No." I guess your work's cut out along about that time. Okay. Any other questions?
...

All right. You seem to be well genned in today. Well genned in. As a matter of fact,
you're changing... I'll pull a California gag on you – your auras are changing color. [laughter]
It's only stated in two places in the world: in Chelsea and Los Angeles.
Anyway, we've stepped up the velocity. Have you noticed this? Oh, you've noticed this? [laughter] And there's something goes along with this which I had better remark to you about since I haven't put a bulletin out on it.

It's expected that at the end of thirty days you will have completed your checksheet. I just thought in view of the fact that you were still taking it easy I had better add that. At the end of thirty days, you should have completed your checksheet. That's pretty grim, isn't it?

_Female voice:_ Yes.

Mmmm. But I will say this. We won't instantly and immediately hire skywriters in your home town to fly overhead and paint a sign in the sky that you have not gotten a course completion at Saint Hill. That is, within thirty days we won't do that. [laughter]

Yes?

_Male voice:_ Ron, I came up against something recently on CCH 4 which might be useful. I found that auditors were using sort of – sort of a standard command on "I want you to make a – I'm going to make a motion with this book, and I want you to copy it mirror-image wise." And then they were using this check question, 'Are you satisfied with that duplication", or something of that nature after every command.

_Hm._

_Male voice:_ And I found that this was causing an invalidation on the preclear when the auditor wasn't satisfied with it and then went on with the same command.

_Oh, yes. It will. It will. You have to be very smooth._

_Male voice:_ So I told them they should only use that satisfied check question when they themselves as auditor were satisfied and were prepared to leave it.

Well, this – this can cause quite a bit of randomness. The original reason "Are you satisfied – ?" was used has to be researched. And that was because invalidation was occurring – here you've got – er, occurring. Here you've got the cure-problem phenomenon, you see. And the cure is now causing difficulty. But the tendency of the auditor to critically do the command again caused tremendous ARC breaks and would actually cause the process to be totally inoperative. So, "Are you satisfied with the auditing command – that you did that?" rather, was introduced in order to cure this particular situation.

Now, it is not necessary for the auditor to duplicate the exact command they just did. It is not necessary that they do this. After all, they're not trying to duplicate, duplicate, duplicate because it's not particularly duplicative. It's duplicative enough that the auditor does it and then the pc does it. So what they do is they find the pc is very weak on a circular motion. So they just go on making varieties of circular motions. And they just put him over the jumps on circular motions. But they're not always the same circular motion, don't you see, and this prevents the thing. Now, that's another cure, and that undoubtedly will produce its own problem in the future. Your point's well taken, Vic. Right.

Okay. Any other questions?
Have you been doing anything in your processing lately that you didn't think you really ought to be doing but were only doing it because you had been told? Come on, let's see if anybody's brave enough to say anything to this. Yes, Virginia.

Female voice: Well, for a while, when I was doing the one about – I can't even remember the command, but anyway it was a five or six-way bracket on –. Well, my goodness, I sure did lose it. [laughter] I didn't like doing it because it was – oh, 'where you wouldn't, or somebody wouldn't do it", and "you shouldn't do it" or something like that. Well – oh Confront! That's the one it was. [laughter]

Female voice: Well, I – I could think of the – that they might not do it or when I could see that they wouldn't do it, well, I wouldn't be so sure about that because if I could say, "Well, you wouldn't polish my shoes. But, if I ask you to do it and you were confronted with the problem, you might at least confront it."

Well, you were running a command that you hadn't any agreement with as an auditor. You thought the command could have been ...

Female voice: I was the preclear.

You were the preclear

Female voice: Yes. I didn't like it. Well, I just kept on doing it because I was the preclear, and that's what we had been told by ...

Yeah. All right.

Female voice: ... but I didn't like it at all.

All right.

Female voice: Because I kept running up against that same sort of thing. Well, practically everybody I know when asked ... If I asked them specifically, or they knew about it, I think that they would be willing to confront it. They probably wouldn't be willing to do something about it, but they'd be willing to take a look. Be interested.

All right. Did you clear it with your auditor?

Female voice: Well, I told her about it, and now I'm not running that process anymore, so...

All right. Okay. Okay. All right.

Now, is – anything you've been auditing that you felt you were – shouldn't really have been auditing. Anything you've been auditing you felt you shouldn't have been auditing. Why, it'd take a brave auditor to answer that question. You look back on most of the processes you're auditing are laid down by me very specifically.

All right. Yes?

Male voice: I have one question, Ron. In answer to your last question about doing something you didn't particularly want to do. I felt that, giving withholds up on a Security Check as an auditor, writing each withhold down was irrelevant. I thought the nature of the withhold was irrelevant and it took up time.
Mm-hm.

Male voice: *I feel that also it rather tends to cut down in two-way comm with the pc.*

How would it do that? Because he feels that his withhold will be further exposed or something like that?

Male voice: *No. I think it rather – it sort of takes time writing the thing down ...*

I see. All right.

Now, let me – let me clarify this. Let me clarify this. Your point's very well taken there. And it's never intended that everybody should write down every withhold that the pc ran across because you would run into the – you'd run into the British Museum Library [laughter] every time. But something that was very difficult to clear – something that literally took you an hour or more to clear or something of this odd nature. It took you a half an hour to finally get down to it – what was it? Now, that appearing on a Security Check as what the nature of withhold would be – that would be this rough to try to clear – would be of value, only to me on research.

And eventually I'd be able to go over a tremendous pack of written Security Checks, don't you see and be able to establish the type of withhold which was most closely pressed to the bosom, and perhaps adjudicate something out of this that would get us along a little bit further. So your resistance toward that is quite proper because writing down every line of the pc – every withhold he had, writing it down on a Security Check – that would be a poor show. But those that are very resistive would be of great interest to me. Not as a character index on the person but just as a general run.

"The human race most closely withholds the following: ..." And then you just make some great long column of the types of withholds. You get the common denominators in these withholds, you'd probably find a hidden button that we didn't know much about before. Okay? That's the only – only thing I want, and if you'd write that sort of thing down. You really had to struggle for this one, you know. You got in there and you ask him, "Well, have you ever raped a cat?" you know, or whatever the security question is, and you go on and on and on and on and on; and you just cannot get any clearance on the thing at all, and then you find out that it's something – some odd shading of the command or something like this, or of the question, that was really holding it up. Well, for heaven's sake, write it down.

Female voice: Oh, he's complaining about that because I asked them to write it down. And the reason I do is because we have different auditors giving Sec Checks from the different auditors who were processing them and the auditor wants to know whether hisPreclear's case is improving, whether apart from running, more withholds are coming off.

Well, you mark the fact that you've got ...

Female voice: They also want to check to see if his withholds – if the Preclear's withholding anything from him, the auditor, that he's told another – the Sec Check auditor, but hasn't told the auditor. You see what I mean? His real auditor. So, I mean for all purposes of this course is that I think they should jot down – they don't have to write down every word the
preclear said, but they can at least note it, you know, "stole apple", they just write down "apple", you know.

Hm-mm.

Female voice: so ...

All right. I've given you my requirements – what I'd like to see on a Security Check. That applies very broadly whether you're doing them in Northumbria or any other unlikely place, and so on. Now, Mary Sue, to facilitate running the course – which would probably then apply to facilitate running an HGC – wants a shorthanded notation of the withhold that was there and was given up, like "stole apple" and she puts down "apple" and somebody then checking back across this thing – he's looking through this on rudiments or that sort of thing, he finds out that he's got a whole chain of withholds that doesn't – that hasn't been given up to Security Check or something of that sort. Don't you see? Nobody expects you to make any stenographic heroics or become very heroic stenographically along this line. Okay? Does that answer it, Robin?

Male voice: Yes, thank you.

All right. Yes?

Male voice: In the bulletin instruction about sending all Sec Checks – forwarding them in to you ...

This applies ...

Male voice: Does this apply to all auditors?

No, this applies – this applies to Sec Checks on Scientologists, and is an old regulation and has been thrown pretty much adrift whether or not Sec checks when completed should be sent in to me. This has gone adrift. That was the old security program of getting up a policy of Scientology and clean hands, don't you see.

Male voice: Yes.

And this was actually a preventer. It wasn't that I wanted to know these things. It was that there was some feeling about, when this was first begun, that such data might be used for blackmail or something like this. And of course, if the actual Security Check is sent through and it's already resident in a safe someplace in the world, it's – couldn't so operate, ever. You got the idea?

Male voice: Yeah.

So that was its basic thing. Now, there is another check, purely organizational in character which is just now being worked up. We got the Joburg, and the Joburg passed immediately over into processing. Now, it had left a need for an actual Security Check which some HCO Area Sec or a D of T or somebody like that could give rapidly, or the Assoc Sec Sec could give for employment or for a course admission that didn't take seventeen hours of auditing or something like that to deliver. And it must be at the absolute outside, about thirty questions. That would be the absolute limit that the thing could possibly tolerate. You see? Preferably less.
All right, so let us say that a person has been accepted for employment in a Central Organization, then I would expect to see their employment check sent on through with the record and fact that they had been employed. You got the idea?

Male voice: Yes.

Now, that would also then keep Central Organizations from bypassing this particular step because you would notice that there was a lot of personnel there that you had no employment application form for of any kind and that would mean the security had dropped in some particular area; and if you want trouble in an area, drop its security, I can guarantee you'll get trouble in the area.

All right. Now, if a field auditor wished to do this, and the field auditor were giving this Short Form Security Check to people that were operating in some area or something like that, and they wanted to send it in to me, why, they should do so. It isn't a required proposition, however.

A Clean Hands Check has now become so difficult to do, because the Security Check so rapidly changes its character under processing and so many security factors emerge which were totally unreal before, that a Clean Hands Certificate or seal on a certificate is now only going to be issued as a result of being audited on these routines which have repetitive Security Checks mixed up in them.

Now, therefore, it – you could not do what was originally intended which is you simply drop in on an HCO and get a Security Check and they give you a Clean Hands stamp, and that's that. That's not possible. But you could forward the evidence of having been audited all the way up the line on a routine, you see, with consequent Security Check, with copies of the Security Checks either in an HGC or in the field. Hand those over to HCO and a Clean Hands seal could be then administered. But it would now be as a result of auditing – auditing on the routines. It would not be as a result of simply a Security Check in an HCO.

Male voice: How much auditing on the routine?

How much?

Male voice: Yes, Sir.

Well, I don't see that there's much reason to drop below the level of Release.

Male voice: Thank you.

I'd say auditing to Release and that's about the only thing that'd make it safe and secure. Washington's all excited right now. They're going around in small circles and being very proud and that sort of thing. They just committed an administrative blunder. They left the D of P on a pc and that mustn't happen. Ds of Ps, even acting Ds of Ps must not be given a pc, you see.

That's an old piece of policy because it skimps, then, auditing on all the rest of the pcs in the place. But they've got somebody going through to Clear. And this fellow was appointed acting D of P who was auditing somebody, and this person is just – just flicking the edges of Clear, see. And Washington went into a panic because all of a sudden the Assoc Sec was transferred over on to a course, temporarily, and the D of P was transferred over on to a
course and somebody in – just as he went off post thought, "Well, this is a good auditor. He's had lots of good results, and so forth. We'll just make him acting D of P.", without finding out how many weeks he had left on a pc or what state the pc was in.

Everybody takes a look at this and finds the pc busy – almost Clear, you see, and going to Clear. And it just caused a fantastic amount of randomness, let me tell you. Because it was in effect, because of this erroneous appointment – in effect, they had almost been told not to clear somebody. Got the idea? And boy, that put everybody in a sweat. That certainly couldn't work that way, but this is the first Clear of recent times they've made in the HGC. So that this activity was being stepped in the road of, of course had rockets going up in all directions, you know – white lights, burning tar barrels, and flags flown upside down. Don't do this to us, you know! Of course, the fellow who did it to them is probably safely over on course now. [laughter] Very interesting.

Australia and Washington are starting to boom and they are going at great guns. Their Academies are getting fuller and fuller, and their HGCs are fuller and fuller. London right now is getting in a desperate state. Some of its leading lights are here, and all of a sudden had – didn't have to, but did bust policy and take List One and Two, which is the Staff Staff Auditors, off staff and put them on outside pcs. Oh, oh. But when it had been found out that this had happened, it was already a day or so's auditing deep into the outside pcs, you see. All that means is, is that the Acting D of P denied sources for Staff Auditors, and so forth. Just was straight up against the wall, see. In view of the fact the temporary D of P London is down here right this minute, why of course this is all up in the air with a screaming Chunk.

There's two things that happen: you just mustn't have the Director of Processing auditing a pc and running all the pcs, too. That just doesn't work. You get no results anywhere.

And the other thing that mustn't happen these days is the staff mustn't lose its list auditors. It just mustn't. Because I think staffs of, say, all of Central Organizations and the HCOs have a right to be Clear. And they're all getting real on it, you know. They've gone along for years without having very much reality on clearing.

And we've been wading into them with seven-league boots as far as – as doing it right and squaring it up. And their willingness is terrifically high, and they've been getting up to a high level of duplication, and so on. And all of a sudden their results are coming up, coming up, getting better and better. And they're moving up, and they're moving people easily now up into brackets of Release. And they're looking right ahead. And suddenly Clear is getting real to an awful lot of people in Scientology it was never real to before. I never thought it would take me eleven years.

But, give you an idea right now. The only reasons why clearing is not being done are scandalously huge. They are never minor errors. They're errors of such magnitude they would just stagger you, you know. Tremendous errors. The two people in Joburg who were hanging up on whom rout – I posted the notice on your board in here. Did you read it? The two people there in Joburg who were hanging up, and cables were flying back and forth – Routine 1 was not working on these people. All of a sudden they – the Course Instructor waded in with all flags flying, and grabbed ahold of the pcs and put them on a meter. And they had screaming present time problems of long duration that should have been caught in the Security Check
Model Sessions – every session – but had never had any attention paid to them. And she found the present time problems on these two people and they instantly broke into tears, both of them, you know. Just cracked right up, and so on. Boom!

And all of a sudden Routine 1 started to work like mad. That is what is called an error of magnitude: is running somebody with the rudiments out; and these things certainly must have been showing up on some rudiments.

No, it takes an error of magnitude, something like the auditor didn't come to the session for three weeks, and the fellow didn't get Clear, you know.

And this should start to be getting real to you. You've noticed when you came here you were probably pulling a lot of wild blunders of one character or another. Okay?

And you've noticed these things smoothing out? Right? All right.

And you've noticed that there was something to smooth out, didn't you? Understatement of today. [laughter]

Your next lecture is Friday afternoon. Okay?

Thank you.
CHECKING RUDS AND WITHHOLDS

A lecture given on 14 July 1961

Thank you.

Okay, what is this? This is the…

Audience: 14th.

…14th of July, AD 11. Okay. I can at least remember the year. All right. It's a very difficult subject that I have to touch on. Very, very difficult subject: is you're dragging your heels. You've been out-passed. You've been out-passed. They just made three Clears in South Africa, on the course there. Clearing goes by contagion. It's contagious. You make a Clear, now look what happens. Went down to South Africa and on course made a Clear, see?

All right, a big reality was established right at that point. Promptly and immediately Peter Williams goes back over to Australia and makes two Clears. See? Boom. This Clear, now teaching a course down in South Africa, has cleared some fantastic percentage like – I don't know what it is – three out of four, three out of seven, or something like this, that was on this unit.

Interesting, isn't it? Who's going to be the first Clear here tomorrow? Tomorrow. All right. Let's get on the ball. You've got to create a new reality and set a good example and stop setting this aberrated example to people. Now, let's set a good example to people.

Now, you're doing all right. What we've been doing – I'll tell you what the difference was, what the difference is. All these Clears have been made very close to assessment only. You understand? It's practically nothing but Routine 3 that is clearing them. Got it? But let me point out something very drastic here. A very small percentage is making it on Routine 3. Yeah, it's making it, but a small percentage is making it. Now why?

Rudiments are so far out on the vast majority of people that putting in the rudiments becomes a fantastically arduous proposition – not necessarily difficult. But a whole activity has to be devoted to this thing called rudiments. Hence you have the first part of a session – if you've ever cared to notice – is getting the pc under control. You at least have to get him to sit down in a chair before you can establish rudiments, you understand? Routine 1.

All right. Now, out and above that comes Routine 1A. That takes care of the alter-is characteristics of the pc and takes care of present time problems as a bugaboo from there on,
because the only people she didn't clear were people who had screaming present time problems that nobody'd located. See that? It's a common denominator.

All right. So our next part of the program, of course, is to get these present time problems swept right straight off the slate – just set this up and set up this wide percentage, you see? And get all of these withholds that are slowing it down to a walk, off. Hence your Routine 1 and your Routine 1A. These are preparatory.

We're not looking for an occasional Clear; we are looking for very broad clearing, you understand? Any time, for years, I could have made a Clear. Well, I did and have done it. So what? See? Where has this gone? Well, I could probably sit down and do nothing but audit twenty-eight hours a day and I could probably turn out a few dozen Clears in my lifetime, and that would be dandy. And then I go out and get mixed up in an altercation called life, or something like that, or the body decays, or something like that and nobody else makes any Clears. And then you've got Buddhism. That's pretty good. That would be nice. That's just what this planet needs – just exactly what it needs. Just needs a bunch of brass idols. That's just what it needs. Because that's all anybody has ever understood out of Buddhism.

All right. So that obviously has been tried. And I wouldn't advocate that particular route. It has already been tried. And it's actually strewn with the whitened bones of busted psyches. That whole route looks like a chart of Death Valley.

There are so many routes been tried – so many routes – that one of the most difficult things is not getting curious when you cross some of their old ruts. And you know, you say, "Oh, isn't it interesting. Look at the Oregon pioneers and they went up that way. Well, all right. Let's walk through that woods. That was very interesting. And look at that water hole all surrounded by bones and busted wagon wheels and let's go a little bit further, maybe somebody found something out there. And there's a range of mountains over there. Yeah, well, maybe somebody can cross that." And the next thing you know, why, somebody's sitting and there is no way out, see? They can't even find the trail back, man!

So frankly, the piloting of Dianetics and Scientology is not so much through a wilderness or an untrodden desert waste, you see, that nobody has ever been in; the trouble with plotting Dianetics and Scientology is, it is nothing but solid trails. Something on the idea of tracking five hundred horses which have gone in all directions, you know, and you're trying to find – you're trying to find a new trail in the middle of all these horse marks. And that's all they are, too, horse marks.

Okay. Now, as we go forward here, we find that it'd be very easy to trip up and to take some old cockeyed route that has never led anywhere and never will.

And this is pretty darn good that somebody else is clearing. This is pretty darn good. And we're clearing close-up and then they're clearing at a distance. And now they're clearing at a bit of a remote distance in time. This looks very promising, see? Looks very good.

But the only flaw in all this is broad clearing. You want to be able to take Joe Aloysius Q. Doakes – that was not his father's name but we'll let it pass – and by getting – without getting fancy and without having to become screamingly brilliant in all directions as an auditor
and without having to sit up half of the night figuring out the star-plot of George Q. Aloysius Doakes, why, clear him.

All right. Now, we're on to that right now. We're on to that right now with Routine 1, Routine 1A. And I have not said very much about Routine 2. There's only one addition that has Routine 2. This has been hanging fire for some time.

I better give you the changes which have taken place in the Prehav Scale. Change number one is drop "No Motion." Drop the line "No Motion." Just leave it blank, leave the number blank. Now salt through the lot – beginning up around one and so forth, salt through the lot of it – which way they go and where they belong isn't very important – every basic emotion you have ever seen on a Tone Scale, as part of your routine and ordinary assessment. You know, "serene", and all the rest of it on that line. In other words, put all those emotions into the Prehav Scale. There is several ways you could do it. You could put them all in their proper place on the scale (well, leave that up to me, I'll do that, sooner or later), or you could just take those emotions and just read them off every time, after you've read the Prehav Scale. See, there's not – I don't think there's thirty of them. There are a very few number.

Now, people that get stuck in a chronic tone – and you can get rid of that chronic tone. You can get rid of it. It's a good thing to do. And you'll find your pc will fall on that chronic tone. You just run it Routine 2, see? Or if it falls while you're running Routine 3, why, you run it on the terminal. You know, "Would a god be angry?" You know? "How would a god make you angry?" Thank you. How would a god make you angry? Thank you. How would a god – how would another make a god angry? Thank you. Or -- no, "How would a god make another angry?" Thank you. How – would another make a god angry? Thank you. How would a god make a god angry?" Or "How would a god make himself angry?" That would be your bracket, you see, if you ran across this Tone Scale.

Now, it would follow and fall right along with the Prehav Scale, you understand? It follows the same characteristic; it has no special activity, read, diagnosis, anything; it's just – it's more levels of the scale. And you assess it by elimination, and so forth, and you just go over those things, too, every time. Those things have been with us since the earliest days of Dianetics, and there is no sense in neglecting them now that we got it on the run. All right.

Now, we're looking for very broad clearing – very, very broad clearing. And we want to take somebody that's lying unconscious up in the hospital, non compos mentis, and haven't known anybody for eighteen years, and run them through to Clear. Get the idea? I mean that – that is the reductio ad absurdum on the thing.

I wouldn't say, and I am not on the track of, some things that would work this way: You find a thetan after he's just dropped a body and you audit him through to Clear. See, now, we haven't got any summated data that leads on that track – that's not an examined road. One of the requisites of Clear right now is the odd limitation that the thetan must be in a body. So that's as far south as we happen to be going at the present moment, see?

In the first place, you'd have to be something on the order of OT before you could pick up this character and audit him. See, so that requires a different skill and a different lineup and a different location of the pc and a different version of CCHs, and the lot, you see? "Give me that – give me that beam. Thank you!" [laughter]
But there is about where we are.

Now, we are doing this, and with your Sec Checks you're taking care of withholds, and with your various problem factors you're taking care of problems, and those are the primary hang-ups. I am perfectly prepared, as I have said before, to suddenly find out that ARC breaks might constitute some specialized activity. They basically, however, fall under O/W, do you see? And they are junior to withholds by considerable.

But you still might find some pc who did nothing but ARC break, and if he did nothing but ARC break, I imagine the oldest remedy we have on that is "Recall an ARC break." And that's quite a slippery one, man. That's quite a process. Any process ever calculated to turn on track and tie double carrick bends in the preclear that was it! "Recall an ARC break." They all do. Because, you see, they run themselves backwards on it all the time, you know? They call it motivator, motivator, motivator, motivator: George did this to me, and Bill did that to me, and Mamma did that to me, and somebody else did that to me, did that to me, did that to me, did ... that ... to ... me umm, boomm, boomm... They go down scale in a hurry.

But if you kept on pushing it, they eventually come up and find out they did something, too. It's a workable process, the process is perfectly workable. I would say offhand, if I were auditing somebody who was consistently and continually ARC breaking and I just couldn't get them into session because they were ARC breaking and all that kind of thing, I'm afraid I would be more inclined to "Recall an ARC break" than I would be to go out on the CCHs. Person is perfectly capable of running a communication process, you know, of one kind or another. So we say communication process, "Recall an ARC break." He will do that. He is ARC breaking. You are paralleling what the mind is doing, and I'd say it was perfectly legitimate as an activity, if you ran into this factor of somebody did nothing but ARC break.

And then you've pretty well covered the rudiments, because you've got "Find – " the Have process, you see, and that gives them the room. And you've got lots of rudiments processes, which are the best ones, to find the auditor. The best way to find an auditor is, of course, the CCHs, and the processes which already exist on Model Session. The old "Look at me. Who am I?" is kind of a weird, lethal killer.

When columns A, B, C, D consistently and continually register as low on repetitive examination of profile – that is profile, every intensive, and you find A, B, C, D, that area in there, low – you can make an adjudication out of that. The pc has not found the auditor.

Now, there are two causes for this. The auditor is incapable of making an impingement on the pc, see? The auditor thinks he'd better audit, sort of in the back of his head, you know… And nobody ever quite finds out whether he's auditing or not. That could happen, you understand? That could happen. Or, the commoner cause of the pc just cannot register an effect – cannot stand or tolerate an effect of any kind, cannot stand or tolerate control of any kind. And on a pc whose profile continues consistently and forever low on A, B, C, D, and you are trying to run problems or you're trying to run some other remedy on this pc – formulas, problems, something, just anything to get him off the bottom there – you're wasting time. You're just wasting time.

Now, let's say we audited somebody just fine on problems for twenty-five hours, and when we examine their profile the following Monday for their next twenty-five hours, we find
out he didn't get off the register on A, B, C and D. See, they're all low, and they didn't move, and nothing happened. Well, don't come on down on the auditor with a thud, and so on. That's an entirely different activity, training auditors, and setting them right, and so on. The auditor probably was not effective in some fashion, or he didn't get the PTP, or he didn't get the withhold or he didn't get something.

But there's a very easy way to short-circuit this. You already must credit the fact that the auditor was undoubtedly trying to do something for those first twenty-five hours, you see? He was trying to do something, and you could go in and check it over and you'd find the PTP. You would, you'd find a PTP if you looked for it hard enough, and so forth. The easier thing to do, however, is just say "1A. Run 1A." That's a good, broad remedy for an HGC – a D of P, Assoc Sec, HCO Sec sort of remedy.

They just see this character is hanging up, and then without going and inquiring and running a congressional investiga –. Oh, well I'd hardly say we'd ever run a congressional investigation. We're not trying for publicity. That's all a congressional investigation does. You should hear those guys, by the way. "Let's see, how can I get some publicity so I can be re-elected? Well, I think I'll investigate Scientology. Yes, that's it. That's a good idea." You'll hear that someday. But remember that if you ever do hear it, to immediately convene an investigation of Congress! But the upshot of a hung profile at levels A, B, C, D – those levels are down there about minus seventy or more – your standard remedy is Routine 1A.

All right. Now, if Routine 1A does not budge this in twenty-five hours… I'm getting – talking about awful difficult cases here. I'm giving you a good way out, see? You tried Routine 1A the first week, and the case didn't move. Let me – let me review this. Just scrub what I said.

Routine 1A didn't move the pc, see? When we assume, then, that while doing the Security Check and everything else, certainly there was every opportunity to find withholds, there was every opportunity to get the case started, and instead of just being critical and coming down on the auditor and batting our brains out and that sort of thing, shift them over to Routine 1, got it? Run Routine 1 for twenty-five hours.

Now, quite amazingly, it will now be possible for you to check over the case if it still didn't move much. You see, but that would be at the beginning oaf the third twenty-five hours. Now, what do you do at the beginning of the third twenty-five hours? This case didn't move for two consecutive intensives at columns A, B, C, D of the graph. What do you do? Well, certainly don't let it go any further than the beginning of the third twenty-five hours before you act, but don't much bother to act until then. That would be the rule you should follow when you're monitoring cases audited by other people.

You should saw in now with your E-Meter and get clever, with the sensivity up to 32. Funny thing about it is, at twenty-five hours of problems, if they wouldn't show on the profile, has still done something. And twenty-five hours of the CCHs, although it didn't show on the profiles, have still done something. But all they have done is arm the firing mechanism. This is why it's really fruitless for you to have tried anything before this time, or have scolded auditors or jumped up and down, because all they've done is arm the firing mechanism.
Now, you're going to ask this case, you're going to talk to this case, you're going to talk to this person personally on a girl-to-girl basis or a man-to-man basis or a man-to-girl basis or versawise. And you're going to say, "Now, put all your hairpins on the table, because here we go." And just check those rudiments until they just about fry the atmosphere, see?

"Are you withholding anything from the auditor?" We've got the sensitivity all the way up; we can hardly read it, you see, because the thing is – the needle is so drifty. Sensitivity all the way up. And we say, "All right, are you withholding anything from your auditor?" See? And you don't get a reaction.

"Have you thought of withholding anything from your auditor" "Have you ever discussed it with yourself whether or not you should tell your auditor this?" "Have you ever decided that it was no good to have told your auditor this?" "Have you ever decided that it wouldn't do your case any benefit," really, because 'a little thing like that' – which you haven't mentioned, and you don't know – 'a little thing like that, certainly, wouldn't hold up a case.' Have you ever thought that?" You get the idea? It's awfully, awfully, right-down-to-rock drilling, see?

And on questions of this character, which are all cross-leading and which are rather unsettling, you know what the person has done. Sometime during that period of time they have undoubtedly come up and said, "Well, I probably ought to confess to the fact that I did rob my piggy bank when I was three", you know? And have said, "Well, that couldn't possibly have suppressed my case." And so they have not-is-ed it. And for a moment, it was on registry, but immediately afterwards wasn't. Well, you've got to kick it back on a nonregistry – off of nonregistry and back onto registry.

The way you do this is run a not-is type of questioning. On all of your rudiments. Now, what do I mean by a not-is type of questioning? Well, I just gave you an example. "Have you ever thought that it really wouldn't hold up your case any if you didn't tell your auditor something? There it is. What was that?" And of course you're sitting right on it. What have you done? You've done the not-is, see? You've picked up these moments of not-is. Because you're going on the assumption that this case has been thinking about something, or this case has been stewing about something, or this case is reacting about something during that whole fifty hours of auditing, have you got it? The ease must have sooner or later come through something, and factually it'd be impossible if the case hasn't.

But remember that a case that hangs fire has this wrong with it: It has an automatic not-is. And when you've got an automatic not-is, it can wipe out the needle read. Thing comes up to reality, the person pushes it back. See? Not-is. For a split instant, when it came up to reality, it registered, and then the person said, "It doesn't exist." See, and the not-is machinery took over and said "Nu-unh." And it went right back out of sight again and didn't register on the needle after that.

In other words, there's just a fringe level. Now, this is a case that could go out and murder half a dozen babies and have an opportunity to shoot a policeman and didn't. This is a case that could have all sorts of oddball things in its background and tell them to you in just a steady stream on a Security Check without your ever getting a reaction. Got the idea? You just never get a reaction on the Security Check.
You say, "Why on earth isn't this reacting on the needle?" Well, it isn't reacting on the needle because it isn't real to him, he doesn't think it's bad, and he is actually running on about the second inversion of the not-is. See, he knows about it but it's all not-ised. You won't get any registry. You won't get any case advance either. Those cases are hang-fire cases.

So you get very expert in taking them apart. Don't, however, get into a state of outrage when you do this with the auditor who has done the auditing, or even with yourself if you've done the auditing, for that first fifty hours. Don't get in a state of outrage and say, "Well, he missed it! And I had to dig it up!" That is not a correct statement. "I had to dig it up" is a correct statement, but "he missed it" is incorrect, because it normally wasn't there. In the first place, he was busy running "Give me that hand" when it came up. He didn't even have the person on an E-Meter. It registered for a moment; it got awfully real for a moment. And the person said, "Oh, my God, I – uhhzzzzzzz" – not-is. [laughter] Out she went, you know?

Now, your line of questioning can actually dig it up out of the auditing. You're not trying to dig it up out of his life, you're trying to dig it up out of his auditing. The lock at the most is – even if they're being run fragmentarily, is only a few weeks old. Dig it up out of their auditing. And you talk about auditing all the time you're checking this person over who has had no gain for two consecutive intensives, see? Just dig it up out of his auditing. You'll find it's there. You'll find it's there. You'll find an amazing number of things that come up during the auditing they just had not mentioned to the auditor. You get the type of questioning this would amount to, you see? The type of questioning would be a very simple type of questioning which is about him and the auditor – him and his auditing.

"Now, at any time during your auditing have you felt that it was improper to audit in that particular auditing room?" All right, now you've put it on a via, so therefore it's safe. See, the question is on a wide via. If you say to him, "Is it all right if I Security Check you in this room?" or "If I run these rudiments, or do a scout of rudiments on you in this room?" that's not real. Unreality is the common denominator of this case that doesn't make the advance, you see? That's unreal.

But asking him about being audited in another room that you are not now in – that's safe. See, that could be real. And all of a sudden comes up with this remarkable series of complaints. "Well, I just never mentioned it to the auditor, but there's a lavender picture on the wall, and I've always detested lavender ever since I broke a bottle of it over my grandmother's head, do you see? And I've always detested it, and..." They don't remark the idea that the smell of lavender and the picture – color lavender have nothing in common except some letters in the English alphabet. You pick things up that way – pick them up on a via.

That isn't the only trick in doing a research of this character on rudiments – that isn't the only trick. But it is a very good trick. You should ask any way you possibly can, "Is there any time in your life you ever felt that you were completely beyond help? Ah, what was that?"

"Oh, well, that was when I was eighteen, and, uh – goodness, I'd forgotten all about this, but this was when I was eighteen, and such-and-so happened, and I didn't dare tell my parents and uh..." Uh-huh-huh-huh-huh.

"Well, have you told your auditor?"
"Oh, well, no. You see that was a long time ago and that was when I was eighteen, see?"

You get the tricky way of going about this? In other words, you release the not-ises. "Have you ever felt that you were beyond help?" Well, obviously the guy had just done something and the person must have been withholding something even if it was just his body during such a period, don't you see?

So you can indulge in a tremendous amount of very tricky questioning. I could probably write down a series of thirty or forty rules or types of questions – they'd probably be very handy to have – but I haven't developed them. You usually look at the pc and you size him up and you find out about which way this thing is going. And you count on the fact, then, that during a period of CCHs, during 1A, something has come to the surface and has possibly disappeared. And it isn't registering now but it came to the surface during auditing and anything that happened during auditing, you can make it reregister on an E-Meter. So you get the registry of the registry. See, it's too direct to get a registry for this pc, but you can get a registry of a registry – get a via. You get how you might go about this type of questioning?

Well, you should study to get clever about this. You should study how to get clever about it. It's just cleverness, that's all. You sit there and the person says, "Now, have you failed to tell your auditor anything" and you don't even get a disturbed needle. It just sits there, calm. "No, no. I've told my auditor everything." Well, technically in a childlike way, this is true. But the reverse question is quite interesting, you see? "Have you ever thought of telling your auditor anything and then didn't do so?"

"Ohhh! Oh, well…" and you get a needle read. You see, this is an equivocation. The person really has told his auditor everything. "That he thought he should tell his auditor" is the qualifying statement which he doesn't add on to it. And the not-is machinery is, of course, why it's sitting there. And you could study to get very clever with this and it requires a bit of cleverness. The bit of cleverness will save you any quantity of auditing time. You get clever right about this point.

But I wouldn't bother to get clever at the beginning. In the first place, nothing's been plowed up. It's like trying to plant seeds or reap grain off of unplowed, unsowed ground. He's been going along like this all of his life and he knows it's all right. He knows it's all right to live like this, you know – constant migraine headache and sick stomach and hating everybody. He knows it's okay. That's normal, isn't it? That's what a psychologist would tell you. Normal state of man? Just read what his opinion of man is and, of course, you get what he thinks the normal state of man is. And it's pretty wild!

So this is all right, you see? Well, of course, people rob banks and rape billy goats, and so forth. So it's all right. See, everything is all right. And you get out a meter – well, of course, you're asking for a disagreement. The only thing a meter ever registers on is disagreement. I pulled one right straight on the groove not very long ago and I just chucked all silly questioning and I said "Well, have there been any disagreements in the last few weeks with anything, anywhere?" You know? Of course, I got a registry. I got tired of talking into
the blue, you know, and I just got a registry, bang! "All right, now what were you disagreeing
with there?" See?

"Oh, well! At wholly…" You know, I mean a whole bunch of stuff comes off on this.

"Now, have you got any – have you had – ever had any disagreements with me about
what's going on here?" and so forth. Clang! You see? And immediately before this, "Do you
have an ARC break? Do you have a present time problem? Have you got any withholdss?" All
blank, blank, blank, blank, blank. But now, a sudden dissertation on the subject of disagree-
ments. "Do you have any disagreement with what's been happening to you in the last couple
of weeks?"

"Oh, well. Comes to that, that's another proposition!", you see?

You say, "Well, have you had any unkind thoughts about your auditor?"

"Oh, no!" No registry, see?

"Do you have any disagreements with what's been happening to you in the last couple
of weeks?" Clang! "Well, now, what was that?" And we get this on a via-via-via. We have
gotten – hit the jackpot. They sit there all the time thinking unkind thoughts about their audi-
tor, see? Pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa!
Only, you see, this is ordinary. And it's what everybody does.

I refer you to Dianetics: Evolution of a Science, the "everybody knows."

Because what you're running into is the "everybody knows" when you're trying to
cross-check rudiments. See, this is normal. You know, horses sleep in beds. Bang! Normal.
Everything is normal! Everything is normal to this pc.

Of course, nothing is normal in actual fact. The pc has migrosis and his zorch is out of
place. And all this is pretty goofy, see? And he really knows that it is not normal. The pc
knows, but the valence that he is being considers it all normal. You sometimes, just for fun
and just for exercise, should just lay aside your knowingness hat of you know what is going
on and start asking somebody just right off the bat, "What is life really like?" You know,
some raw meat someplace, and just ask this character, you know, "What is life really like?
What are people really like? What are things really like?" and so forth. And just get treated to
a ball. It's pretty wild!

Now, you go to a jail and start asking this question and you get some of the wildest
answers. Actually, it's better than a comic book, practically. They just stagger you all over the
jail aisles. You just ask prisoner after prisoner. Each one of them knows what normalcy is –
each one of them. They know it perfectly. And they're the wildest divergencies of anything
you ever heard of. And they have some of the wildest opinions on things you ever heard of
They couldn't possibly be further off of the line, you know? You could take a tractor or a
tank, and drive all day and all night at right angles to any known highway and you still
wouldn't get as far off the line as they've managed! And then they say, "Well, life just doesn't
run right for me", you see? Well, this universe in which they have gone up the pole, of course,
hasn't anything to do with it.
So you start asking anybody about the rightness or wrongness of their deeds or actions, or the rightness or wrongness of their opinions, or the differences of their conduct when all of their conduct is aberrated, and of course you get no falls on an E-Meter. See? I mean, that's all usual. So there can't be any disagreement because they're in total agreement with themselves while being in total disagreement with everything, and you don't get a fall on the E-Meters. Do you understand how this is?

We described this in various ways. We say, "Well, it's below the fellow's level of reality." Well, what do we mean by that statement, exactly? Well, we mean something very precise by that. We mean that he has some specialized, compartmented values of existence which have nothing to do with existence. It's below his level of reality. Well, his level of reality is the clue. What is his level of reality? Well, it's up some fireman's pole someplace, that hasn't anything to do with the sun, moon or stars or another human being anyplace or anything, you see? It is a total unreality. But of course this is reality so, of course, it doesn't register when you ask him for a difference. You say, "Have you had an unkind thought about anybody lately?"

"No."

And it would even be too much insight for them to say, "Not any more than usual!" But that's what they mean. "Have you had an unkind thought about anybody lately?" Well, they'll give you all kinds of qualifications about this sort of thing. But, of course, it doesn't register on the meter because it's totally rationalized.

You know, just going around nattering about everybody and how bad everybody is and how everybody ought to be shot. And somebody hands you a sandwich in a restaurant, and right away there is a long stream about how their thumb shouldn't have been on top of the plate and the plate should have been set down in a more geographical position in the middle of the table, and all of this sort of thing, or let –. The fellow says, "Well, this is life!" It never occurs to him that he could sit in a chair and have somebody simply bring a sandwich and put it on the table and that he sits there and eats the sandwich. That just is not life, you see? Reality is natter, natter, natter, natter, and there's always something wrong with the sandwich. See? It's all awry.

But the very complexity of the disagreement with everything adds up to a no-registry because, of course, the disagreement is in total agreement with the way things should be. And when a disagreement is in total agreement, why, of course, you get no registry.

So that's the kind of a person you're trying to run rudiments on and check rudiments and do a rudiment scout with, after, let us say, something like a week of 1A didn't move anything – like a profile. A week of CCHs – didn't move anything, see? Aw, hell, man! That is something – that is something on the order of putting somebody in a flour barrel and then bringing them out and there is not a speck of flour on them. Believe me, it's impossible! It just couldn't happen.

Something has happened, but the automatic not-is will be of such magnitude, the automatic disagreeer that is in such disagreement with everything that you are in perfect agreement with it, this thing has been disturbed by that auditing. Fifty hours of this and that didn't get disturbed in any way? Well, at least you'll find the periods of disturbance. All of a
sudden you will find these periods of disturbance, and that's what you're trying to find. And these things will kick. These things will go bang! And follow them down, follow them down, follow them down, follow them down. "No, I don't have any present time problem. No. No, I haven't had any present time problems during auditing. No. No, I haven't been worried about anything." No registry on the meter either.

"Well, is there anything you should have been thinking about, other than auditing?"

"Oh, well yes, of course." Registry on the meter.

"What's that?"

"Well, it's my divorce." [laughter] "Yes, I should have been thinking about my divorce." You got the idea?

You say, "What divorce!"

"Oh, well, didn't you know?"

That's always part of the response on such an interrogation. It always has a lot to do with "Well, didn't you know?" or "I told you all about it", "Don't you remember that six or eight months ago you met me on the corner of the street and you said to me – you said 'How are you?' And I said, 'I think I will get divorced.' Don't you remember my doing this?" You see, it probably never happened, either. [laughter] "Oh, I told you all about that!" You know? "I've told my auditor about this whole thing in full." You'll get that kind of a response. And if you don't follow it through with, "Exactly what did you tell your auditor about this divorce?" you're going to be fooled again. "Well, what did you tell your auditor about this divorce?"

"Well, I said I was a little – little worried at the beginning of one session."

"Did you tell your auditor about what you were worried?"

"Oh, well, no."

"Yeah, I told the auditor all about it", he's saying, you see? "All about it." This is a qualified, broad, carelessly used, interpretation. "Yes, I said to the auditor I was a little bit worried."

"Did the auditor ask what you were worried about?"

"Well, yes, as a matter of fact. The auditor said, 'What are you worried about?'"

"What did you say you were worried about?"

"I said, 'life.'" [laughter] And you go back in the auditing reports and you will actually find it. And you'll find there was a needle registry, and when they said "life" it cleared, and that was it. The not-is went bang, see, and there it all went.

You'll find people straining to get Clear, something on the order of submariners try to get out of a submarine that is immovably fixed on the bottom and will never come to the surface anymore. For God's sakes, find out what submarine, you know? What's her name, rank and serial number, you know? On the bottom of what sea? "Oh, well, I've told everybody about that! Everybody knows all about this submarine I'm trying to escape from. Yes, I'm being evicted next month."
You say, "From where?"
"Well, from my sister's."
"Oh? Well, what about this? What about this eviction? How come?" and so forth.
"Well, it's because of what the police did last month." [laughter]
You say, "Whoa, boy! Where we goin' here?" see?

It's like taking a billiard ball and throwing it on a billiard table, you know, and it caroms off all sides and bounces and falls on the floor. Then – you don't even find a billiard ball there anymore, so you expect it's okay. Nevertheless, they become vaguely aware of a billiard ball during the auditing, you see, and you can track it back.

You get some goofy ones. Well, why are they goofy? Well, that's because life is totally identified with everything, so nothing makes any sense anyhow, so there's no sense in disagreeing with him. You're looking at some kind of a superapathy of one character or another. "This is life", you know, is kind of its motto. And you've got to do some smart checking back, that's all. And if you're smart enough, you can really start unveiling the statues, man. The place will look like an art gallery before you get through, you know?

"Well, have you ever consulted anything – during your last two weeks of auditing, have you ever consulted anything to find out whether or not you were improving?" And you get a fall. That's the first anybody ever heard of the hidden standard. See? "Have you ever asked anybody if you were getting better during the last two weeks of auditing?" See, that kind of a dissertation.

"Oh, well, yes, of course. I asked my wife!"
"Well, what did she say?"
"She said she didn't think I'd ever get better." [laughter]

And in that way, you can drift in sideways on something. The pc is actually not being willfully mean, the pc is not trying to obscure anything, the pc is not trying to withhold or anything else. The pc's opinions of life are just sufficiently abstruse that they don't add up to a disagreement, you see, because "that is life." They've gone up some gully someplace and it's way off the mainstream, and there they are, you know? And they worried a little bit; they kind of know they're up a gully. And they'll tell you, "Well, I don't feel emotional anymore about things, you see? I don't get a kick out of life anymore. Just things don't seem good to me. And I just seem to be a little anxious all the time and so on." They make these general statements of some kind or another.

Well, all they are telling you is "the mainstream of life went that-a-way, and somewhere along the line I considered it was just too much, so I went up this little gully. And I've been lying here in the midst of the dead leaves ever since. And if you dig me out of here, of course, you'll put me back in the mainstream of life again. And that's no good, because that's too horrible, you see, and that's impossible. And if I just lie here and not feel anything and not see anything and not hear anything, I'll be all right. So just go away quietly and let the robins cover me one leaf at a time!" [laughter] That is the supergeneralized solution that people take.
They find the back bayous of the muddy river, you know? And they go in there and after that they don't even catch any catfish.

But they are worried about the fact that they know they shouldn't be there and they know they shouldn't be doing that. And they know that that's no good to do that.

Now, pcs who apparently have never had anything happen to them, have led perfectly calm, orderly lives, and yet still don't improve in any fashion whatsoever… Oh-oh! No. Their tale of the calm, orderly life and that sort of thing, you could sing a little song about "It may be so. But I really don't know. Your story sounds so queer." The truth of the matter is that you've got a case on the back bayous. You see, the case is up this little gully lying there in the black mud, and they hope they have no past. Their quite usual reaction is to say they don't have any – they hope they have no past.

Now, how would you get a person's past? How would you get a person back into the mainstream of things? The cruelest thing you can do is just ask this burning question: "Have you ever left any place?"

And they say thoughtfully, "Well, yes, when I was a small boy, I uh – well, as a matter of fact, no. In uh – uh – well, I left school. I left school."

Now, that isn't all of the meanness you're going to indulge in here. You're going to ask one more worse question. You're going to say, "Why?"

Now, you're asking for the points of departure from the main highway. "Did you ever leave any place?" "Why?"

He says, "Yes, oh yes. Well, of course, I left a place. People always leave places. As a matter of fact in 19 – 1948 – 1948 – I left San Francisco in 1948. Anybody is liable to leave San Francisco." [laughter] "If you can find your way out. Fog, you know?"

And you say, "Good! You left San Francisco. Why?"

"Hm-hm-hm!" You shouldn't have asked that, see. Because what have you done to him? At that precise and exact moment you have said, "What didn't you confront that you should have confronted? What did" – not necessarily should have confronted – "you feel you should have confronted? What did you not confront that you feel you should have confronted?"

"Oh, well, that's a different story." And you've all of a sudden got an active meter. Now your meter gets active. Up to that time it was all okay, but this wasn't okay. Now, that particular – the not-is is what you run into as a more general mechanism. But if you want to connect somebody up with the mainstream of life, the exact mechanism I just gave you will just pick them up by the collar and throw them into the mad and raging torrent. It's very easy to do; don't think this requires very much cleverness.

It can be summed up this way: Did you ever have a little child want you to look at something? Put your attention on something? Did you ever have anybody –? All right, did you ever have anybody ever demand that you put your attention on something? [affirmative murmurs from the audience] Now, have you ever had anybody tell you you were wrong for not having had your attention on something? [Audience: Yes.] All right. That's the basic trick.
See, and you'll run into that on problems. One of your basic tricks of life – "making people confront" is the overt, and "having to confront" is the motivator.

All deaths and the whole mechanism of death derives from unwillingness to confront – that is the mechanism of death. So when people leave and yet feel they shouldn't have left, it is because there was something there which was too threatening. And it keyed in death. And that's why they went up the bud – the bayou and covered themselves with the dead leaves. Because it's just a straight Q and A on death. Departing from situations you feel you should have confronted is just the same as truck runs into body, pc goes out of head. If he was good enough at confronting probably the truck would have disappeared before it hit the body, but certainly he probably would not have been hurt. The fact that he knew he could be hurt caused him to bring about his hurtingness.

It's interesting. You will notice that people have repetitive accidents to the same part of the body. Now, there's a curious one, until you know that their motivator line must be that because their overt line is that. Well, similarly, they were running a no-confront on people. They were giving people things that couldn't be confronted. Now, if you ran a bunch of no-confronts on people, then you get to the idea that you can't confront. And after you get the idea that you can't confront, you can only leave. And when you cannot even leave anymore, you can still go nuts. I'm speaking very factually; that is the cycle of sanity. All right.

So, the person – you ask him this question. You say, "Well, have you ever left anyplace?"

And he'll say, "No, no." And "No", rudiments all in, everything is all fine, no disturbance here, everything is going… Now, you've got evidence that there must be something wrong, because you have two powerful processes, here, run one after the other without any change of profile. You know something is here. That tells you something is here. That's one of the most vivid tests that you can get is an unchanging profile, an unreality on the auditor. Case remains either very, very high or very, very low. No change. You got the idea? Just all floating along. Well, there are many ways to clear this up, and you can't clear it up with ordinary cleverness, you can go back and actually trip the trigger on it. "Have you ever left anyplace?"

"Oh, well, one time, I – yeah, yes, yes, yes." Of course, when you're part of the military services, you very often get answers like this, "Well, we were ordered out of Tobruk." That's not very fruitful ground. They say, "Well, yes, I left – I left London. Left London in 1948. Yes, I left London in 1948. Hm-hm, hm-hm." And if you were watching close, you got a disturbance right there. [knocks on the meter]

"Oh", you say. "You left London. Why?"

"Uuhp" Clang! Big withhold. It's liable to fall right out of that hamper. And maybe if it wasn't London, maybe you had to ask him for five places they left, and ask them why five times before the fifth one suddenly dropped it out in your lap. And all of a sudden you got a big withhold off the case.

Now, there's another way to follow this down. And you say, "Well, has that sort of thing ever been a problem to you at any other time?" Cow!
"Well, yes, of course, right now!" There's his present time problem. Got the idea? Get the withhold, work it to the present time problem, bring it down the line, you see?

Now, this works out this way: "Have you ever thought of blowing session?" is part of your technique. See? "Why?" You know he has no ARC break with the auditor. The pc has no ARC break. He has no – no nothing; everything is all fine, and so forth. "Well, have you ever thought of leaving session?" "What had you just done?" "Good. Well, what had you said about your auditor?"

"Uuhh!" Shouldn't have asked that one. Falls off the pin!

And you see, what you've done is walk around using cleverly the actual buttons which you know in Scientology. You have actually walked around all the defenses, "If I keep it all not-ised and unreal, everybody will go away quietly and leave my decaying body here in the leaves." You can just walk through this because you know the buttons to walk through it on, see?

Now, it's a funny thing that a lot of the parts of the original Prehav Scale can be discussed in exactly the same way. You almost do a Prehav Assessment, only it's in the line of rudiments. Do you see how that would be?

For instance, Prevent – just taking one off the bat. Prevent is to a large degree an anatomy of problems. So you say to him, "Well, during your sessions have you been trying to prevent anything?"

"Uuhh!" You're liable to get one fall off the pin there. "Well, no. I really haven't been trying to prevent anything. I just don't want to get any worse, you see? And the auditor is very unskilled, and…"

All of a sudden, "Well, have you told the auditor this?"

"Well, of course, no. But, uh – It'd hurt his feelings."

And you get a whole basket of stuff comes out, see? You can take almost any part of the Prehav Scale and go at it this way, see, and compare it to various parts of the rudiments. You don't need any system.

Now, the funny part of it is, is surprise has a certain amount of element in this. So therefore, if you take a pat system, you see, which is everything, everything, everything, and then you put in the eggs, and then you whip them all up, you see, and then you put the frying pan on, and you put exactly one sixteenth of an ounce of butter in there, you know? Well, the recipe becomes familiar, and this, too, can become a not-is. See, then the person can not-is that. No, it's got to be you – it's got to be you who does the questioning.

Now, there's another part of the element, completely aside from a system – a system defeats itself to this degree – is the person realizes he's being interrogated by an intelligence. And it's necessary for the person to realize that. And the person says, "Ooooh, well, last fifteen hundred years been very comfortable in these here dead leaves."

And part of his fall may actually be reaction against you – some misemotional reaction against you – for having actually disturbed the corpse. Dead bodies – any good, clean, honest
thinking auditor would know better than to disturb half-decayed bodies lying in piles of dead leaves.

But you can get to a pc from all corners and quarters. But to try to get to the pc before anything has happened to disturb the beautiful, smooth, not-ised complexion of the bank is quite a trick.

Therefore, things like Presession 37 run at the beginning of auditing turn up very little. The same technique run after ten hours of auditing turn up quite a bit. Now you take two tremendously powerful processes, like the CCHs or Problems, and look, if they're not going to move this case... It has never happened yet. All it will do, however, is just shove the case far enough that you can save the next five hundred hours of grind on "Give me that hand" by getting some withholds off and finding out what the present time problems is [are] and finding out why this case can't get easily into session. You see how you could do that?

So right there, you could save an awful lot of auditing with a little bit of cleverness. Interrogation of this character is very, very valuable on a case – very valuable – criss-crossed questioning of one kind or other. Well, you ask the straight question at first. "Well, have you had any – during your auditing have you had any present time problems?"

"No." No registry on the meter. "Except one. I told the auditor about that, and the auditor handled it."

He had no other present time problems. Now, what's calling this pc a fibber? Two profiles. Now, man, that's not possible, see? It's just not possible to get no change of profile and be free of present time problems. That's not possible.

So you say, well, all right, and go in on it on some other quarter – some level of the Prehav Scale. Something – anything you want to do. But try to find this present time problem. It's probably there. It's not there because your meter says so, it's there because your graph says so. It's there because graph and unworkable auditing says it's there.

Now, somebody tells you, after they've had quite a bit of auditing, that they haven't gotten any results from the auditing, this once more is as good as the graphs. So you just wind up your E-Meter with the handy attached made-in-Britain spring on it and let it fly. And you start interrogation of one kind or another. You don't just run rudiments. You just shake this thing to pieces. You just go at it from every quarter.

Now, one of the things that restrains you from doing this is you think the pc is going to get ARC broke if they're this knocked around. I'll tell you what ARC breaks the pc about something like this. The ARC break that comes about is because of some dumb repetitive question that has no cleverness in it. And the pc gets ARC broken because he feels he is not being confronted by an intelligence. And that'll cause more ARC breaks than you can easily count. You see? You can only cause ARC breaks by auditing stupidly or just going on knuckleheadedly. Just completely off beam.

You say, "Do you have a present time problem?"

And the pc says to you, "No."

And you say, "Well, all right, do you have a present time problem?"
And the pc says, "No."

And then you say, "Do you have a present time problem?" and the pc picks up the chair and hits you over the head with it.

And I almost don't blame him. Because this line of questioning is going to lead no place. In the first place, he's fairly well aware of the fact that you're not even getting a reaction on the meter, don't you see? That's the wrong way to go about this sort of thing: "Do you have a present time problem?"

He says "No."

And you say, "Well, what would be a problem to you?"

"Oh, well, that's a different question. Let's see, what would be a problem to me? Well, like having my car parked outside like it is right now with the meter running – I – is – uh – na – heh-heh-heh! Yes, I have a present time problem." He'll say "Aha! You're a pretty clever auditor! You velly smart!" And he goes out and puts the nickel in the meter and goes into session like a rabbit disappearing in a burrow. Kabango! You got the difference?

Cleverness is very well associated with intelligence. Good reason, of course. It's also associated, for some reason or other, with control to such a degree that amongst working men who work all the time with their hands – you wonder what causes strikes and all this kind of thing, and upsets and so on.

By the way, I just read in the paper last night the first proof I have actually seen that psychiatrists do take their orders from Moscow. One of the great brain and nerve specialists of England, actually turns out to have been working under an assumed name as the head of an organization backed by the communists to knock out all management in England. He was the brains behind it all and he was working under an assumed name and he was known as something else, and so forth, and here he was.

This is the first one I've ever seen exposed. You know, they all go running down to Vienna every year to get their orders. You know? They all go down to get their orders, you know? And then they go spreading out and they say, "Well, the party line is 'Freud is no good' this year." You ought to hear them, man! And they get up there and they're always giving advice, that's superpolitical advice, that's going to bust somebody's back sooner or later. It's quite interesting. That was in the papers. That was headlines last night if you didn't see it. Did you see it last night? It was headlines. They got him! Rrrufff!

Anyway, labor-management situation is a suspicion of cleverness. And when people are very, very unclever, they are very easily overwhelmed by cleverness – very easily. So much so, as I say, somebody who is plodding around all the time just learning that somebody is very intelligent or something, or something of the sort, they have one of two reactions: either they admire this, or they don't quite like this, or they immediately decide to strike. That is the basis of labor-management relations.

Now you often wonder – I used to wonder, how in the name of common sense is a – is an engineer walking around men building sluiceways and digging with their hands – all of them with weapons in their hands, you might say, who would fight amongst each other. Every
morning, why, they're dragging themselves to work with black eyes and split lips, you know? Violent boys! And why is it that they never turned on you? It used to be a little bit of a problem to me. You know? They'd fight amongst themselves, but they just wouldn't fight in the direction of somebody who was more intelligent than they were. That was what I finally boiled it down to.

It's curious, you know? Real curious! And yet you put somebody more intelligent than they are at their level, or below them, and boy, they eat him up like a terrier will eat meat! Slurp. Gllumm! Yeah, they will! They just go out of their road to make life hell for him. But the second that he has even a quasi-position which is slightly in charge of something, he's really in charge. Bang! You know? It's quite fantastic. You've seen this kind of thing or samples of it. I tried to understand it over a number of years exactly what this mechanism was all about.

The basic yap of labor is against an intelligent function called management. And management is never bright enough, however, as bright as it is, to turn around and use the same weapon on labor. And the weapon on labor is, of course, just a display of intelligence, not conservatism. You get a display of conservatism and that's a sort of a defensive action, you see, of one character or another. And you just ask him to get overwhelmed by the FCTU Communist Dedicated Antipeople's Local Union Number 49. See, Kabango! It's not that I'm against unions; far from it. But they sure can be used! And you'll find that they have a revolt factor toward this other. And it's not management; it's intelligence. It's not so much control. The only way you can err in management is not control. And you can also err by being insufficiently intelligent.

But you get this intelligence factor. I'm only trying to say here that the intelligence factor is part of being looked up to. It's an altitude factor, let me put it more precisely that way. If you're clever, or if you show you're clever, or you are smart about something or other, you will have an immediate altitude with your pc. And going on and asking the pc stupid question after stupid question – preferably repetitively – all of which have been negated, is, of course, a prima facie demonstration of stupidity.

You ask this question: "Well, have you ever raped anyone?", it says on the Security Check. And the pc – you get a small fall, and instead of saying, "What was that?" or something like that, you say "Good! Have you ever raped anyone?" And the pc says "No." And you say "Good. Have you ever raped anyone?" Actually, anything is better than that line of procedure, just anything is better than that line of proceeding when you're trying to find out one datum from the pc, because he hasn't answered the auditing question. And yet by repeating the auditing question you appear to have agreed that he has in some peculiar way answered the auditing question, don't you see? Because you're obviously asking another one. Even though you say "I'll repeat it", or something, the fact is it's coming out again, you see?

And if you cease to demonstrate that you want that one question that you have asked, answered, and that you're going to find some answer to it regardless of what he does, and going in on it from all sides – you start doing that kind of thing, and he instantly feels sort of surrounded and he says, "There must be something here," and he tries to look and all of a
sudden he's got it. And the whole thing rolls along with considerable speed if you do something like this. But you sit there and say, "Well, have you ever raped anyone?"

"No," he says.
You say, "Well, have you ever raped anyone?"
"No."
"Have you ever raped anyone?"
"No."
"Well, have you ever raped anyone?"
"No."

I'll tell you, *anything* is better than that! Histrionics are better! [laughter] If you – if you even turned the E-Meter – this is extreme, but if you even turned the E-Meter around facing him, and said "Now look! I'm going to say those words again, and you look what happens here! Have you ever raped anyone?" *Bang!* "You see that? Well, that's what I want to know about! Now tell me." Honest, that's superior to a repetitive question. It sounds rough; it sounds rugged! But it'll get results! It shows that you're interested. It shows an active intelligence is confronting him, not a machine. See, he won't obey a machine.

And intelligence is very often variety or versatility, or other factors mean intelligence to people. So you say, "Have you ever raped anyone?" And you get a fall. And you say, "Who was that?" Well, it at least tells him there was an observer. You say, "Who was that?"

"Who?" He says, "Well, I've never raped anyone. It couldn't be any 'Who'!"
"Well, 'her' then!" [laughter]
"There couldn't be any 'her' because I've never raped anyone, I tell you!"
" 'Him' then!" [laughter]
"Well, there can't be a 'him' because..." and so on. "I've never raped anyone. I'm trying to tell you! I'm trying to tell you!"

"Well, I hear what you're saying. But so does the meter – look! All right. Animal, maybe? All right. Who could it be? Now, put your mind to it a little bit, this thing isn't falling on the window shade – now, come on! What is it? Rape, rape, rape, rape, rape."

"Oh!" he says, "You're talking about, uh, you're talking about my sister Bet..."

"No, no, you!"

"Oh, I was just trying to tell you, you're talking about my sister Bessie. She got raped and it was a great upset to the family, and that's undoubtedly what the..."

"No, look. We're talking about you. Have you – you – ever raped anyone? That was what the question was. And it's still registering and I want to know what it is. That's all. Let's get it up very plain. Let's get an understanding going here. I'm not trying to pick a fight with you or anything. I just want a piece of information that's very easy for you to tell me, it's very simple, and the second you tell me I will have heard it."
And he says, "All-right-it-was-a-sixteen-year-old-girl-and-I-was-there-at-the-side-of-road! Uhhh uhp! There!" [laughter]

You say, "That's better. I knew you could do it!" "I knew you could do it! Good! Now, let's just check here to make sure this thing is clean and clear. Have you ever raped anyone? Ah, that's calm now, all right, fine. Let's go to the next one."

Well, I tell you, that's Security Checking, see? Kabango-bango-bango! You're getting right on down the line. That's because the person feels he's being confronted by an active intelligence. Somebody is interested. Something is happening here. Something is going on. The whole situation is under control. There's something occurring. And that's the way to do it. And just never go at it on the basis of set yourself up as a nice ritual, a nice machine. Like I'm telling you, check the rudiments on this character that isn't advancing. You're not satisfied this case's advanced, check those rudiments.

But don't check them, "Do you have a present time problem? Thank you. Any ARC breaks? Yeah. Yeah. Any withholds? See? You getting along all right with the auditor. Yeah. Well, your rudiments are okay. The rudiments aren't out. Didn't fall on any of those questions."

If you add it all up to yourself this way, it'll make much more sense: Only a dead body would fail to respond to the processes. There must be something else wrong. You got it? And that something else is contained in the rudiments. And as soon as you pick up a high level of certainty on this, then you go at this with a lot more willingness and a lot more verve, see? And that a dead body doesn't talk well and doesn't respond well – so that if you're not getting instant and immediate responses, you've just got somebody who is lying up in that gully somewhere and it's way out of the mainstream of life. And you're going to have to get him back into it, that's all.

In the first place, he's never going to be happy up there. In the second place, he's going to go on complaining because he's living up there. Maybe if he'd just lay there quietly and never said anything anymore for the next two hundred trillion years, it would be all right. But he doesn't. He thinks he's lying there quietly, you know? And he's firing off guns and throwing leaves into the river and putting this dreadful stench up through the trees, and so forth.

And you just got to show him somebody is alive around here. That's all. And you do that by being clever. And you'll be surprised, you'll be surprised how much faster a Security Check goes, the second that the pc gets the idea that you might be smart. You know, that you just might have something on the ball; that you might be alive, and you might be smart. And all of a sudden he said to himself, "Oooh ooh, somebody has moved some leaves! Somebody has moved some leaves! And I never noticed it before! But there it is, there it is!"

Well, you can watch it, because you're liable to be put on test right at that moment. Next one that's hot, and you can say, "Well, did you ever spend any money that wasn't yours?"

He knows of one. And he says nothing, "No."

You say "All-l-l-I right. When was it?"
"When was it? But I told you no."

"But I want to know when!"

"Heh-heh! Well, yeah. I haven't even told you that I did!"

"Yeah, but I know – I want to know when!" "Why do you want to know when?"

"Well, I just think it might be a good thing if you told me. Peculiar idea of mine. When and how much?" [laughter] "From whom?" Now, it's getting tougher, see, and he gets the illusion, you see, that this is going to get horrible if he doesn't burst forth with it.

"All right", so he says, "Okay, it was seven dollars and nineteen cents, and I – hunh-hunh. Twenty-one years old, and so forth, and it was from Uncle Sabuchi."

"Very good. All right. Now, have you ever stolen any money from anyone? All right. That's clear. Good."

And you don't get these hang-ups – you just don't get these hang-ups that way. They sort of become a thing of the past. And you're over your primary hump of the guy wondering and hemming and hawing. Then you can go the other way, too. You can get so helpful that he depends on you utterly to find them, and he never bothers to remember any. [laughter] So that you can steer around that, too.

All right. Well, I didn't mean to keep you so long today, but I thought you might be interested in this whole subject of criss-cross checking rudiments, and hang-up cases, and so forth. Thought you might be very interested in that. Okay?

All right. Have a good weekend, and don't loaf because you probably have only got – oh, you've only got a fraction of what you should have gotten filled out on your checksheets.

Thank you.

Female voice: Thank you.
A lecture given on 18 July 1961

Well, you're very lucky to be here listening to this lecture today. That's all I got to say. What's the date?

Audience: 18th.

Thank you very much. Eighteenth, AD 11, July, probably. Saint Hill Briefing Course.

Understand something happened to you people today.

Audience: Yes.

Oh, I'm sorry. [laughter] I'm very sorry. It's a very, very difficult, trying world, isn't it.

Now, we're going to turn back the clock to 1952. Philadelphia Lecture Series and Scientology 8-8008 are the basic texts on havingness. That's basic and fundamental on havingness.

Havingness is a very dominant situation. It's a very dominant thing. I have worked from time to time down through the ages here and put together Be, Do and Have as the primary activities. Now, you are probably more acquainted with Scientology: Fundamentals of Thought and the discussions of games conditions.

Games conditions. A very, very important point. And all of a sudden it emerges as far, far more important than it ever has been, because now we're back to games conditions and its relationship to havingness. And in this book Scientology 8-8008, along with other things – theta-MEST theory, differentiation, association, and so forth – we get in here some general discussions of havingness. And this is the first written text on the subject of havingness.

And it says the goal of processing is to remedy scarcity and abundance in all things. Well, that's what's important about this. Remedy scarcity and abundance of all things.

And on the 17th of July – this book, remember, was written in the winter of 52-53 – and on the 17th of July in 1961, why, I suddenly undid... I've been thinking about this, by the way, for just weeks – I've been working with this for weeks, but I suddenly found out a simple modus operandi by which you put this into effect.

I call to your attention that all we had previously was Creative Processing. That was the key of how you remedied scarcity and abundance in all things, and a lot of people couldn't run it. And they got into bad trouble trying to create things, and so forth. Now, the next da-
tum, just a few weeks ago, that fell out of the hamper, was just this. And this is a very important datum because you will be using it in processing undoubtedly from here on out.

The status of affairs right now is that I could set somebody down, put them on an E-Meter, and probably in five or six hours, at the outside, have them Clear as beer. Now, that's about the step we have just got through taking. And that step derives immediately from having resolved how you remedy the scarcity and abundance in all things. And that's what I'm going to talk to you about today.

Now, let's look at this very, very important datum concerning havingness. I have finally gotten the interrelationship between havingness and creativeness. And when you've got the interrelationship between having and create, you pretty well got it sewed up because these things look a little bit separate. They look different, one to the other. Creating things – well, obviously, after you've created something, you may have it and you may not have it. That's the way we've looked at it. It may be taken away from you. It may as-is. A lot of things might happen. So that just the fact of creating something doesn't mean that we have something.

I'd like to make a discursion right at this point. I see we have some nice new students, some very fresh-looking students. The wife of one of our students was on the phone last night saying if her husband didn't come home instantly and at once that she was going to take a gun to him and meet him with divorce papers at the airport. I don't know whether anybody's communicated this to this student or not at the present moment. Well, I see they have. All right.

That's fine. [laughter]

But almost precisely at the moment she was calling, I was writing this same student a note telling him he had to be here another week. Now, my postulate goes on something like that.

Now, aside from welcoming you new students, you'll notice some notices on the board. I invite you to read the board. And they tell you that you have to learn the whole course in the first week. [laughter] That's right. Because we've got to have time to digest it after we learn it. So, I want you to pay good attention to those things and get those wheeling and dealing in a hurry because nobody has arrived at this course yet knowing how to do any of those things, which is quite interesting.

There are only seven things you have to know about auditing, and these seven can be just brrrrrrrrrrp off just like that. There's nothing to it. And we haven't had anybody arrive here yet that knew how to do one of them, much less seven. And how Scientology has been done through the world, I'm sure I don't know.

They're little things like the TRs and reading an E-Meter, and things like that. And we actually have never had anybody coming here yet that knew how to do one of them well. And the students who have been here for a while, I congratulate you because you now know how to do these things pretty good.

Now, that's just getting it out of the road, and anything I have to say about theory or what you audit depends first and foremost on the ability to audit. And the ability to audit is – consists of these seven things, not a theory. You see that? These stand totally independent of any theory. Now, these things are nailed in brass, and if you know how to do them, you can
audit. And if you don't know how to do them, I could give you the pearls of Ophir and you'd feed them to psychiatrists. [laughter] You understand?

All right. It's all very well to know the new theory and the new thing, to get all excited about that – because I was pretty excited about this myself – but those of you who are new or haven't been here very long just pay attention to that board in there, because none of this is going to work for you, not for five minutes, on anybody or on yourself unless you know these seven principles of auditing which have to do with E-Meters and TRs and that sort of thing. Okay?

All right. So, I give you that dire warning in the middle of this, not only to you but the fact that if you take this material, which I'm about to give you, and "psychiatrize" it and "squirrelicate" it, you're going to have somebody in the soup, man, because you have got both red hot pokers straight into where the thetan lives. And if you can't audit, you're not going to be able to handle this, boy. That's all. We already had one student today screaming. It's easy. It's easy. But to bring him all the way through it and make him feel better afterwards, that depends on your knowing the seven things. Okay?

So, a major breakthrough doesn't immediately change the seven fundamentals of how to do it. Okay? These fundamentals, these tools, Pre-havingness Scale, and the rest of these things, are all part and parcel to what we're doing here.

Now, havingness went into a revival – I'll get off of this cross professorial note here – and this revival of havingness came about at the Johannesburg Congress, practically the night before the Congress. I got some kind of a chart to draw, to show people so they'd understand some of these facts, and that was the birth of the Prehav Scale. But you'll notice it got called the Prehav Scale. And that's all of auditing. Pre-havingness. I don't care whether it's done by that particular scale or not. It is pre-havingness. Pre-havingness.

Now, the relationship between creativeness and havingness – I have just licked that. Now, that relationship is this, and this has to do with the fundamental formation of the reactive bank. And this is very important.

When a person can't have, he creates. That's the law on which man operates. Now, you'd just never dream it under the sun that that went together that way, but that's the way the crossword puzzle fits. That is the way this big French roll of bread crumbles.

When you can't have it, you create it. And that is the formation of the reactive bank. And that is the most fundamental law of the reactive bank now discovered. We have now gone down in diving suits well below the surface of the bottom of the ocean. That's the bank. That's the story of the bank: If you couldn't have it, you created it.

This tells us all sorts of things. All this last winter and summer, I have been collecting little odd data that looked like something strange and didn't look like it was quite part of the puzzle.

It began with an observation that Italy routinely goes into a renaissance every time it is licked. Obviously, the best thing possible for Italian civilization is to get whipped. That's quite an odd, random factor, isn't it? If they get licked, they have a renaissance. You'd think it would be quite the reverse. You'd think they'd go into a decline. But they don't. They have a
All you have to do is lick the Italian, and, boy, does he produce.

It goes into such things as the roses which you see out here on the terrace. I have long known, as most gardeners have known, that all you had to do was cut a rose routinely and it bloomed. Only they put it down to this. That the roses have to be appreciated. And if you don't cut them, they aren't appreciated, so they don't produce roses. Now, that's the *modus operandi* that most gardeners think occurs or halfway think occurs with regard to roses. And that isn't true at all. The abuse of a rose causes it to produce roses.

All right. Now, let's look a little bit further here. All these observations, one after the other, plus a long story which I myself went through ... It does you a lot of good for me to get out into the real universe every once in a while and get out that rope ladder and get off the Ivory Tower, you know, and go out and rub elbows with the sweating humanity, you know.

And I have been fooling around with ships for a long time, and this was another correlative factor. I found out I couldn't get a ship from South Africa, so right away I started to buy ships. And I've been trying to buy ships ever since. And then I found out I was now creating ships, and I was beginning to build ships, and this wasn't totally a waste of time because I've done a rather fantastic thing – design a ship hull – Earth apparently hasn't had one because they have very calm seas here on Earth compared to most planets. And resulted in designing a motor. And apparently they don't have a motor on this planet. I heard people say this an awful lot of times. But all this directly derives from the fact that I couldn't have a ship. So I had a bit of subjective on the thing.

That wasn't where we got the main part of it, but that all kinds of little observations of this character have gone on and on and try – these are funny bits of the crossword puzzle. What are all these things?

And all these things add up to this fact: that if a rose bush can't have a rose, it creates roses. It also adds up to this interesting fact. That if a shipyard is building ships, it is because they can't have ships, and that's why they build ships that only last for seventeen or twenty years. That's why the great *Empress of Canada*, which was just launched up here, has an aluminium – boy, is that British – superstructure. Its whole superstructure is aluminium.

Isn't that interesting, because in something on the order of about thirty-five years it's going to be a mound of gray powder. I know now aluminium doesn't work in shipbuilding because I have been in receipt of tremendous catalogues which are very beautifully put together and pamphlets beyond count, released by Kaiser and the Aluminium Company of Canada, and all of them are so insistent that aluminium can be used, and they are so hysterical on the whole subject that I began to look up the data. And looking up their own data, you find out that, at the most, a few decades and the aluminium is a pile of gray powder.

Also, you can't weld it. You have to solder it, and if you use zinc, why, that won't hold under the sea water conditions. And there's all these reasons. But you must use aluminium to build ships.

I think they just put out about two million pounds in money to build the whole superstructure of the *Empress of Canada* out of aluminium, and it'd seem to me like that many tens
of millions of pounds invested in a ship should last longer than about thirty years. It'd just seem to me because you start adding it and dividing it and subtracting it, and you find out that it just – the ship just sitting there is going to cost a half a million quid a year before you do anything to it at all because it's all going to disappear in about thirty-five years. And you ask yourself odd questions like this, and you come up with this odd observation. If somebody is creating ships, it's because he can't have ships.

Ah, but let's take one further look at this. He's going to make sure that you don't have a ship. If he's reactively building ships, it must be because he can't have ships. So, he's for sure going to Q-and-A with you, and you're going to wind up with no ship. Oh-ho. So, of course the ships on this planet, with all the materials available out of which you could make ships that would last – well, teak and cypress last practically forever.

There is an old ship I was trying to get my hands on down in Las Palmas; she was built in 1885. She is much sounder than the dollar. She is in beautiful condition. 1885! And she's built out of teak, and the teak lasts forever. But has man enthusiastically been building teak forests all over the place so he could have lots of teak to build ships with? Oh, no, nothing like that. Do you see cypress growing everyplace in the swamps so that you could have wood to build ships? Oh, no, you see Oregon pine. [laughter]

Well, you say, well, it grows fast and there are lots of reasons for it, but even Lloyd's tells you that Oregon pine lasts. And I've never seen an Oregon pine hull after it's been in the water twenty years but what you can't see daylight through the dry rot. Now, a lot of surveyors will argue with me, and so forth. But they argue, and I can still find examples whereby the ships which they build have no endurance, and they go to pieces, and it costs a lot of money. Well, now there's an interesting field, one that I happen to know something about. And out of this we get this interesting series of observations, and suddenly a total explanation of what this is all about.

If they – they really don't want to build ships and they certainly don't want you to have ships. Shipyard worker goes in and he works for something on the order of five pounds a day, but when you get the bill his wages were fifteen pounds a day. Why, that's fascinating. That's just a method of not getting ships for anybody. It's very interesting.

I think the reason the US government punishes all the producers of the United States is simply to get them to produce on some reactive basis. But the government is a no-production body, so it's going to make sure that nobody else produces, but the immediate result of not permitting anybody to have anything is to make everybody create something. So the stupider the government gets with regard to handling production, the more is going to get created. And the more passive a government is and the less interested a government is on the subject, the less is going to be created in the country. Isn't that an interesting fact?

There's all sorts of cross observations under all of this that make life much more comprehensible. That isn't what's important to us. I'm just giving you background music – the various things I've looked at that were close to me, and so on.

I've been rubbing elbows on the subject of ships and I've monkeyed with a lot of other things in the last few months. And looking at life in general it has seemed very interesting to
me that there's evidently some cross relationship that goes further than the overt-withhold mechanism. There is something more than the overt-withhold mechanism.

Well, actually, it was described, in theory – it's a marvelous thing to eventually understand your own work. But I find myself in that interesting position every once in a while, and I'm of two minds with regard to my own past work. And one mind says, "Boy, that was sure stupid", and the other mind is "Boy, that was sure smart", you see. I mean it's two minds definitely.

But this havingness situation compounded with the games conditions of Scientology: *Fundamental of Thought* actually give us the answer to any case. Games condition. What do we mean by a games condition? Says in *Scientology: Fundamentals of Thought*, it's preventing people from having things. But how far can we go on this basis, and what is this all about, and what do we mean by things?

Well, anything you can name is a thing. You name it – it's havingness. You can name it – if you can name it, it's havingness. And if you can guess at it, it's havingness. And a thetan is only unhappy when he can't have. And his idea of quality ... Well, amongst us, I think personally it could be reformed.

But if you deny him any given thing, his instant and immediate reaction is to try to obtain it – so that prohibition in America makes drunkards out of the whole country.

Now, I know how to make a successful civilization now that would just go like a hot bomb just using this principle. I would find everything I wanted the civilization to have in it, and then hire nothing but police and agents in all directions with bureaus and departments to prevent each one of these things from existing. And then I'd make sure that I had real knuckleheads in charge of these bureaus [laughter] so that they would not be in the least effective or efficient. Well, just name the number of things you want in the society or the civilization and then form bureaus to prevent each one of them, and you'll immediately get a demand. That's the way you create demand. You don't create demand by supply, and that's what's wrong with economics. You create demand by prohibition.

Now, how do you create creation? By just running a broad can't-have. That's all. That's all you have to do. And everybody will create it. Now, if you were to run a million-pound advertising campaign in England stating categorically, giving fines – particularly in England; England works on this like a gorgeous thing. I mean it's marvelous. You get instant reaction on a games condition. And if you made it absolutely against the law, completely and utterly to have a cat, *cawow!* You know you wouldn't be able to see the pavement anyplace? Well, think about it for a minute, you see.

Everybody'd kind of get even with you. They'd immediately start breeding cats, man. Well, I can see it now. The Secret Cloak and Dagger Society for the Breeding of Angora Cats, or whatever. Having clandestine meetings, you know, and everybody wrapped in cloaks and meeting behind back doors, and so forth. A whole secret fishing industry springs up so they can smuggle fish in. The government passing regulations "No fish for cat consumption will be imported into England." I can see it now, man. That's the way it'd go, too. That's the way it'd go.
Now, oddly enough, the games conditions situation can get so bad that if you insist on people having something, they also don't want it. So if you insisted on England having nothing but slums, you would immediately improve the standard of living. But unfortunately, by insisting that they have nothing but council houses with very, very nice appointed apartments for one and all, you're going to get slums. They're going to uphold the standard of living. If you're going to uphold this standard of living with great violence, you see, people are going to listen to everything else. I think the total birth of rock and roll in England is the attitude of BBC toward culture. I think so.

After all, old BBC sits up there, and they – they just figure day and night how they're going to make everybody cultured. And the net result is, the only thing they – they haven't got Bach and Brahms being played on the streets. Man, all they've got is rock and roll and the Whiffy Tiffy Five, you know. [laughter]

Unless you knew these rules, man's activities would look totally incomprehensible, and as – once you know these rules, his activities look very comprehensible.

All right. Let's say that we want three-sixteenths-inch size bolts produced in enormous quantity in Manchester. Well, the first thing we do is put a heavy tax on such bolts. And we prohibit their being sold in any of the stores. Everybody's going to produce three-sixteenths-inch bolts. That's for sure. They're going to make them, left and right. I can see it now. They take quarter-inch bolts and swell them up and half-inch bolts and shrink them down, see. [laughter] Everything's got to be three-sixteenths, man. It's right there. Bang! Nothing else will do. So this all looks totally irrational.

You'll go into a community, you'll arrive here on Earth, it's a new area to you, and you start looking around, and you see this happening and that happening, and the other happening, and it doesn't make any sense to you at all. Well, you don't know what the law has been. So therefore, you can't read the opposites because your games condition is going to bring into existence the reverse. If you run a can't-have on people, they're going to create it. It's very interesting.

You take a district, and you utterly prohibit, one hundred percent, crime, and everybody goes just a little bit bugs or crime starts to occur around and about the place, or something like that. It is totally police action that creates crime. Everybody knows this sort of instinctively, but they never quite look it over. I've operated down in parts of Los Angeles, South Alvarado and Main and that sort of thing. It's as much as your life's worth to go down there on a weekend. Hang around those bars and gin mills and marijuana joints. They just stack up the bodies like cord wood.

It's nothing. You pick up some guy on the corner, and he's cut from ear to ear and bleeding gore all over the pavement. Nobody's paying a bit of attention to him. That is too usual.

Well, it was very odd in operating in that particular area to look what man was actually doing or what he would accept or what he was trying to do. And it was very peculiar that the police were trying in some measure throughout that area to squash all of this kind of activity. And they were particularly hot in those particular activities. There is more police per square inch on Main and South Alvarado, and so forth, in Los Angeles than any other place
on earth. It's totally populated by police. And it is the seamiest, lousiest, scummiest skid row in the world. Well, isn't this fascinating?

Look. Well, you see, reasonability throws you astray. You say the place is rough, therefore they have to have police there. No. You have police there to forbid roughness, so you get roughness. Now, I have actually seen police create roughness. It goes this far.

Here's a guy minding his own business. A cop walks up to him, turns him around and tells him to get out. Well, what is the fellow doing? He's doing nothing. Well, that was why he was told to get out. It's all too calm here for the cops, man. And the next thing you know – I have actually seen a man beaten till every tooth was knocked out of his head and stamped on and everything else. And there wasn't going to be a single thing going on. I mean, the fellow didn't do anything or otherwise. The cops just had to have some trouble.

It was very interesting. One of the cops, after that foray was all done, was all beat up. He was just black and blue, and he was in terrible condition and all this. And this other fellow got away, by the way. And I was standing there explaining to this police officer how I had helped him all I could. I did, too. And he was trying to create trouble; I helped him create trouble – for himself. I was helping him beat the guy up, you see. I was operating as a special police officer myself, you know. Just somehow or other, every time he'd raise his hand to strike, you see, his wrist would hit my arm or something like this. He kept getting in my road. That's what I kept telling him. It was a very confusing brawl.

He explained to me afterwards over a glass of whiskey, and so forth, he'd never been in quite as confusing a brawl. He'd never ... [laughter]

But that it was possible to keep law and order in these places was very, very easy to observe. Because in those areas where I was, they didn't have any trouble. Now, that wasn't some special monkey business I was pulling off. In fact, I wasn't looking for any trouble either way. I wasn't either trying to make people be good or be bad or try to start fights or otherwise.

Actually there was law and order in that immediate area because nobody was running a 'can't-have' on anybody. There were no 'can't-haves' being run.

I'd talk to all the guys that came in, and so on.

People kept trying to hire me, by the way, because it was bad for business to have these brawls, and so forth, occur. And I've been offered some very fancy sums to keep on with this job. It was very, very amusing and entertaining to me. They took me as the real McCoy, you know. I must have been the real thing. I thought, that – boy, that's the biggest fraudulence I ever pulled in my life.

Anyway, there where you didn't run a super 'can't-have' and a super no-have enforcement of some kind or another, nothing would happen. I'm talking about a rough area of the world.

I've had ships, I've had places of this character, and as long as you yourselves weren't in a games condition with the people present and you had some control in the area, nothing happened. Things just went on and everybody was happy and cheerful, and so on.
And so we get this oddity. We get a Captain Bligh, who was an awfully good officer, but he did have a mutiny. Bligh did have a mutiny. Good officer. I wonder why he had a mutiny?

Well, he had a fellow by the name of Mr. Christian. And Mr. Christian was running a can't-have on the captain. The captain ran can't-have on the crew. And I'll tell you, running a can't-have on a bunch of sailors where a bunch of beautiful Polynesian women are concerned is a mighty hard thing – an adventurous thing to do, if I may say so. I myself never tried it personally. I never tried it personally.

Myself not wearing any halos in this particular department, I've followed quite an opposite course. I remember running the Golden Gate Bridge one time with radar only, with a Golden Gate pilot – San Francisco Bay pilot – standing there getting grayer by the instant, with nothing but cotton-packed fog. You couldn't even see the bow. Running down a fairway full of ships at frank speed. He'd never heard of radar before, and it was brand-new in the war, you see.

And of course, I could see Alcatraz at the other end of the entrance, and I could see every ship in the fairway. And down the line we went, crash, bang; turned on our tails, snap, boom, underneath the Oakland Bridge, bang onto our mooring spot. Down went the anchor, shook the pilot by the hand. He didn't have to apply any motion to his hand, it was already shaking. [laughter] And boats away! And if he had examined the situation very carefully, he would have seen this was perfectly reasonable, sensible activity.

I myself had innumerable dates on the "Top of the Mark" which I would be late for. And all of my petty officers undoubtedly had numerous dates along the waterfront that they would be late for, and all of the crew undoubtedly had numerous dates ... elsewhere. [laughter] Well, it's very fantastic, but nobody was running a can't-have on these characters. You get the idea? Quite the reverse, but not any enforcement on it either.

The reasonable, sensible thing to do from this crew's point of view, of course, was to get ashore as fast as possible after a long cruise and get their liberty boats away by four-thirty on the button. That was the reasonable thing to do because, man, that beach was just crammed with dames, man. Crammed. See, that's a reasonable thing to do. Bligh didn't do that.

He says, "You see all those beautiful women?" He said, "Nope. Hgh! No." Games condition. Now, we read in the annals how he didn't create the mutiny. Isn't that an interesting thing to read? He didn't create the mutiny. Well, he – you see, there is nothing against running a can't-have. It's supposed to be a good thing on this planet. So when you sailed in here from wherever you came from and took a look at this scrambled hamburger, you were probably amazed because the one thing that is bound and determined to produce a complete upset throughout the whole civilization is allowed on this planet, condoned a hundred percent.

You are only a sterling, upright, pat-him-on-the-back citizen if you run a good, solid can't-have in all directions on everybody. Now you're a good man. Let's put him in charge of the National Provincial Bank or something. See, let's put him in charge – he's a good, safe man, you see. That's a good, safe admiral. Um-hmm. Um-hmm. Runs can't-have on all the sailors, all the officers, the Navy Department, everybody. Okay. Good. Let's appoint him, see.
Well, this must be an excellent army because the sergeants and captains and generals in it won't let anybody have anything. Must be a fine army. Look it over. Must be. That's the test. Are they strict? What do you mean by strict? You see?

You have governments that don't govern. Well now, how can you possibly add this up in any other fashion than the government is running a can't-have on the people with government. But they don't take these odd, decisive steps. They don't take odd, peculiar, sensible decisions. They don't act when they're supposed to act, you see, so they're good fellows. Got the idea?

The best thing you can do, of course, create as many problems as possible. And the way you create problems is – and we're right back to the common fundamental – is run a can't-have. And as soon as you run enough can't-haves, you're going to create problems.

We had one here in the last two weeks. We had somebody in Accounts turn me in an accounts record on which some four or five thousand pounds were not shown. Well, that's interesting. When you're very interested in getting the show on the road and keeping everything together, and so forth, you all of a sudden read your bank statements, and there are four or five thousand pounds less. But I had told this person not to reconcile these bank statements anymore, but it looked like the bank statements had all been reconciled. This accountant was running a can't-have. The immediate result of this has been caroms in all directions. A can't-have suddenly appeared in the organization, and there's all sorts of discussion and offbeat activities, and everything you could possibly think of just as a result of this.

Rumor lines going around left and right, and so forth. This is all tempests in teapots or in tea saucers. But it all came from one little can't-have. Got the idea? And this thing went zoom zoom zoom zoom!

So "can't-have", in addition to being the fundamental of the reactive bank, is also the fundamental of all problems. If you want to create a problem, run a can't-have. That's the best way to create a problem. Your problems normally look as though they're don't-haves. You can look at your problems as mainly don't-haves. You have a problem of what to do with the weekend because you don't have a – you see, a car or something or other. You get the idea?

So they look like don't-haves. Well, how did you get into a don't-have? That's the fascinating question. How did you get into a don't-have? How come you haven't got this thing that you need? That's the question to ask. And all of a sudden you can materialize it. Here's exactly what you do. You say, "Well, got a weekend coming up, and I don't have a car, so there I have problems of what to do with the weekend." That's a very mild version of a problem, see.

Look out in front of your face. What have you done at that moment? You're liable to spend the rest of the weekend trying to build a car or something. In some various via, you will have something to do with the scarcity of cars because you ran into the fact that you don't have one. You may have one where you normally live, but right at this particular area you just don't have one.

Well, how did you get into a position where you can't say presto digitanto pretlosis or something and have this car materialize. How are you in a position in life where you can have
a don't-have run on you? Because that's sort of the last ditch of "can't-have", isn't it? The don't-haves. That's way downstairs. Well, how did you get in that position? Well, it's the overt-motivator sequence.

You see, you run enough can't-haves until you create a situation of don't-have. And then all of a sudden you can look around and not-have yourself. See, you've opened the gates on the motivator. By running a can't-have, you've opened the gates of the motivator, and you will eventually wind up, not with just can't-have, but you'll run up with a don't-have. It's very, very simple. It's one of the idiotic, Simple Simon mechanisms, but that's the O/W sequence as applied to the games condition. And that's where we arrive at now with the practicalities of auditing. I'll stop reminiscing to you about this and that and get down to some "practicalitis."

And it just adds up to simply this: that if your pc doesn't have anything, it must be because he has denied it. As elementary as this. He must have denied it. If he has a low quality of something as his favored quality, it must be that he is operating on this kind of an activity mentally. He can't have a good one, but nobody wants a bad one, so he's got a bad one.

Now, you've seen that guy around. You'll find them in the electronics world. They've got the whole backyard full of impossibly decayed machinery, electronics, junk, and so forth. There's always a spool of wire, you know. The wire itself is broken in fifty places and nothing you can do with it or about it, and yet that's it. And nobody wants this wire. And you run into this and you puzzle yourselves with this problem. You say, "Well, why does he have the wire if nobody wants the wire?" And of course, you've answered your own question. He has it because nobody wants it. And if nobody wants it, then he can have it. And that is his first test of havingness with regard to wire. He can only have it if nobody wants it.

Have you ever realized that there might – I know it sounds incredible to you – but there might be, there just might be an explanation for the old ladies' hats you see in London. [laughter] They're too incredible to be believed. Well, that's the only hat they can have. And they can only have it because nobody wants it, obviously. You get it? You get that kind of an answer.

Now, the total absence of something does not mean the thetan is without it. This is the other interesting fact. The total absence of something doesn't mean the thetan is without it. You're going to find it in his reactive bank being obsessively created. Haw-haw-haw. And the further it is out of sight and the further it is out of his sight or anybody else's sight, of course, the more covertly he thinks he has to create it. So the covert creativeness which goes on, called a reactive bank, is a remedy of havingness. And that's all a reactive bank is.

Now, you run a can't-have on somebody on sex. And then one fine day you find people are running a can't-have on you on the subject of sex. And you're very puzzled because these two facts don't necessarily or easily associate. Well, now if you go on that far, you will find out that second dynamic activities are impossible, see. You can't have these second dynamic activities. So therefore, they're liable to take some kind of a flip. They'll go off in some different direction, and you start building up various types of second dynamic activities that you could have. You got the idea? And when these, too, fail, of course, you wind up with these even hidden from yourself but still being created in the bank. You get how this is? So they don't only pass out of somebody else's sight, they pass out of your sight, too.
So we get the degrade of quality. We get the downgrading quality, you see. A fellow can't have a Cadillac. So, he thinks he might have a Buick. But he actually can't have a Buick, so he settles for a Ford. But he can't quite have the Ford, so he settles for a 1928 Austin, Baby Austin. Now, he's all set to buy this, and then he finds out that he can't have that because it can't be licensed anymore or something of the sort, don't you see?

So, we're auditing him – we find a car wreck. Hey! What's this? You know? This guy is stuck in a car wreck. No, he's not stuck in a car wreck. He's stuck in having a wrecked car. [laughter] You get the reinterpretation of the thing? That's something nobody wants. Life sort of ran a can't-have on him in cars, so his cars downgraded, downgraded, downgraded, and then disappeared. There wasn't anything lower, I don't think, than a 1928 Austin. Unless it's a vintage Stutz Bearcat 1912. Vintage model. Mint condition. I'm familiar with the car. It was never in mint condition.

All right. So you get the degrades, you see. And the degrade is only what a person can have.

Now, what emotion or feeling can a pc have? Now, let's just depart from the nature of things of just solid havingnesses, and let's move over into what feeling can the pc have? And do you know the common denominator complaint of most people who are around the bend is that they can't feel anything anymore or they can't emote, and they have no more sensation. That is a common denominator way downstairs, and then you get a little bit upstairs and you find everybody has something that they wish they could feel more about. They can't feel about certain things anymore, and they – this upsets them.

That is what? That is nothing more nor less than a can't-have on a feeling. So the feelings degrade. The beautiful, exhilarated, superserenity of Tone 40, you see. Well, that's impossible, you know. You have to gaze at your navel for forty years on the tops of Everest, and every time you climb Everest, you know, you get wiped out and all kinds of things. That's impossible to obtain. So we will settle for a little enthusiasm, but of course, that's really an overt-act to be enthusiastic to people, so it's best to be conservative. Except bank managers set us such a terrible example in that that nobody wants us to be conservative, so the best thing to be is sort of bored, the best thing to do is angry but you can't – nobody'll let you be bored. You won't let anybody else be bored either. And so the best thing to do, well, let's start crying. But you don't want people to cry and people don't want you to cry, so you can't have that one either. So you at least could be good and degradedly apathetic. Oh, but nobody wants you to be apathetic, and you don't want anybody else to be apathetic, so you wind up with no feelings. But you can mock 'em up way at the back of the bank.

Now, at the first Saint Hill ACC, I talked about two routes. Experience, and another route that we were using at that particular time, you see. These two things we've now combined, because the experiential factor is havingness. All of a sudden it all can be lumped under one heading. Experience is havingness. If you regard all experience as havingness, then all experience can be restored.

In other words, take these doingness and beingness factors and add them all under havingness. In other words, make beingness and doingness junior to havingness.
All right, we get a beingness. Now, we can't obviously be some of these scarce and rare beingnesses which are way up to the top of the list of social stratas, and so forth. So we settle for lesser beingnesses and lesser beingnesses and lesser beingnesses. And we get into this sort of state where we're not being anything right where we are particularly, or we maybe are being a bit of something which is not too acceptable to us, and we mock up some kind of a beingness – reactive mock-up of a beingness. And of course, the first grade of beingness that we're liable to mock up is something terrifically desirable and then pretend to be it. But we're not it. You got the idea?

Now, little kids do this all the time. I want to call to your attention that children are not allowed to fly airplanes in this society. This is an omission. Undoubtedly, it is done to deny people airplane crashes. But the truth of the matter is that a little kid is not permitted to fly airplanes. He is not permitted to be an aircraft pilot – nor train as one. They say, "Go to kindergarten and learn your ABCs", and he's only interested in learning how to read bank-and-turn indicators, and engine temperature gauges, and so forth. This is all he's interested in. But they say, "Go to kindergarten and play with those blocks." And we find this little kid buzzing around, buzzing around, buzzing around, buzzing around, buzzing around. He's creating being an aviator all the time. Why is he creating being an aviator? Well, nobody's let him be an aviator. See, there's the explanation. You got the idea?

This is reactivity we're talking about. By running the can't-have, we get the creation. This is reactive. What confuses everybody is all of this can take place on an analytical level, a totally analytical level. And we say to somebody, analytically, "Well, you really shouldn't drink so much alcohol because it makes you drunk, and you've got a class in the morning or something." And they say, "Yes, that's right." And they don't drink. See, that throws all of our computations out that the way you get people to do something ...

But oddly enough, if we did this to them very often and if we did this to them in some unacceptable way so it's a can't-have, so the communication is a can't-have, they can't have the communication. And they can't have the liquor. They'll all of a sudden start feeling a little dizzy all the time. What they're doing is rekindling their past drunkennesses. You've run a can't-have on drink, and they've started rekindling their drunkennesses, and they start going "Thuuh-thuth, now, see what you've done to me", you see. And they use it for some new purpose. But the truth of the matter is that by running a can't-have, not by as a friend of theirs helping them out or something like this – you see, that level can exist – but we run a can't-have, a good games condition – our motives are as impure as a politician's, see. They're really impure.

Now, we say, "Well, you really shouldn't drink anything this evening, you know." We've sort of privately, reactively got our eye on the bottle, and we see there's only three drinks left. [laughter] All of these mechanisms take place below the level of ARC, of course. So that absence of ARC is almost a direct requisite for a reactive creation by reason of can't-have. It must be a can't-have run without ARC or some portion of ARC or mis-ARC. You got the idea? The can't-have really has to be run, man. It really has to be run.

Now, people all over the place are working day and night on this. Saw Sergeant Bilco on television last night and I never saw quite so much can't-have on the army in my life. But
that was a gorgeous program whereby these recruits come in under a military school graduate who is some military prep school graduate, and they've all been drilled up already. And they want Bilco to take them out on the rifle range and teach them how to shoot. And Bilco's trying to beg off. And all he's doing is run a can't-have on them on training, you see. And he thinks of fifty dozen different ways to insist that they not be trained. Real gorgeous.

But do you know the condition of peace which avails every place is simply a can't-have on army activities. They just run a can't-have on all these soldiers. Soldiers like to come back and tell you how beat up they are after a war. As a matter of fact, they don't, you know. It's only lying around shore bases and things like this and waiting forever and not doing anything that really upsets them. They're denied the experience of war.

Generals, of course, are the people who will run can't-haves hardest. You get more peace and more war along with the peace and more explosive peaces which develop instantly into war under generals than any other single class of person. Man, you can have yourself some nasty international situations if you get somebody who is totally insistent on peace. Why? He's reactively running a can't-have on war.

See, it isn't that war is good or bad. He's just running a can't-have on war. That's what he's totally devoted and dedicated to. And he runs one hard enough, he'll get one. Somebody'll create one. why will they create one? Let's look back at the first rule. He's run a can't-have on the subject. Well, man, don't run a can't-have on the Germans on the subject of war because they react on it too easily. They mock it up at once. The best way to handle the Germans is, you can see immediately, is to get into good ARC with them and explain to them how they must get ready to fight. We don't care what, but just ready them up to fight in all directions. Explain that there's alien races on Arcturus or something, you know.

No, keeping the peace does not consist of running a can't-have about war and getting out with a bunch of propaganda about, "I hate war, and Eleanor hates war. And James hates war. We all hate war. And that is why we are going instantly and immediately into one that we should have entered five years ago." See? That was a real mess. But it's all on, "you mustn't have war, you mustn't have war."

Now, if you don't think that wasn't reactive, it went this far. There were no bulletins about the war. There was a can't-have on war run by the US Information Services on the American public. And it was the wildest can't-have on the war I ever heard of. You could read newspaper accounts about what was going on in the part of the world which you were in, and they bore no slightest relationship to reality. Now, I don't know that it was doing the enemy any harm or any good. But I know now that it had nothing to do with the enemy. It was just a big can't-have on war. Everybody was involved in fighting a war, but simultaneously everybody was running a can't-have on the subject of war.

Man, the trouble you got into in World War II for going and attacking the enemy. That was something that just wasn't done. You think I'm kidding, but it's true. That's the most trouble you could get into. You couldn't get in any trouble sitting still. You couldn't get in the slightest trouble saying, "Well, the engines are broken down, and I haven't got a full crew. And nobody's serviced with provisions and the refrigerators won't cool the meat."
Everybody'd say, "Oh, well, good boy, good boy", you know, and pass on down the line. They'd just leave you alone. But if you ever said, "Say, you know, there's a whole bunch of Japs or something just landed on that island over there, and I'd like permission to go over and run a harassing patrol." Man, they're liable to put you in the booby hatch or something, you know. You were non persona grata at that moment. You had broken the prevailing mores which is "there mustn't be a war." But somebody should have called it to their attention: there was one in progress.

After a whole United States fleet had sacrificed itself holding the Japs back and buying three or four month's worth of time, they then said some old, obsolete ships have disappeared in the Pacific. It's the most fantastic story I've ever read. I read it the day I stepped off of a boat from that exact area, how these old, obsolete ships which didn't mean anything anyway had kind of sunk at their moorings or something. Well, you get somebody who can't walk, he'll run no-motion on everybody. Right?

All right. Now, there is the interlocking complications of existence. People are running can't-haves on things that exist. Let's move it up now to that state. Let's run a can't-have on something that exists. Let's say it doesn't exist. We get a total delusory state.

There's a whole religion devoted to this called Christian Science. I'm not mad at Christian Science. We are indebted to Christian Science. But unfortunately for the Christian Scientist, their can't-have runs to the degree that the physical universe isn't here. You try running 8-C sometime on a Christian Scientist. Cawow! Cawow! Cawow! You're going directly against their most basic can't-have, which is they mustn't have a physical universe. What does it amount to but you mustn't have a physical universe when you tell somebody there is none here; there is no physical universe. Nobody asks the intelligent question: "Then where the hell are we?" [laughter] No, everybody says, "Oh, I see. I got that. Yeah. Ooohh." Let's look over and see where these things come.

What do you suppose this Christian Scientist is then going to do? What's his bank going to look like after a while. Cawow! What would be the basic mass of a bank of a person in Christian Science? To have a can't-have on the whole physical universe, now, what's their bank going to look like?

Audience: Solid. Solid.

Well, they're going to have a whole solid bank, aren't they? That's real good, huh?

And just for kicks sometime, you ought to get somebody that's been in Christian Science and ask them to swing around Arcturus and other places because it's all in their minds. It's all present. Everything is all present. It's all inside. All being obsessively created internally because it can't exist externally. The insistence on a thetan on the somethingness of existence and on the first Axioms is utterly fantastic.

Now, how are you going to use this?

Do you realize there's a – let's get into some very practical practicalities here in ending this thing up. You've got a bunch of people, for instance, in England who can't think. Try to run a think process on them. A bunch of people down in South Africa – they can't think. You say, think of a time.
Kabow wow! "No. Can't, can't think of a time." Oh, this is "fascinating." Have you ever run into anybody and you try to run a think process on them, and you had to change it over to "Get the idea?" Did you ever do that? You had to change it over, actually. You could – well, we had ways and means for a while of not-is-ing – of running the not-is off of thinking. It was back about the 4th London ACC. Ah, but there is something very much worse than this, as a process, that is absolutely deadly. Utterly deadly.

Look, if they can't think, they must have O/W games condition on thought. Ha-ha! There must be something there whereby they have preventing people from thinking. So if they can't have a thought, then they have added it up to a can't-have on a thought. Oh, this is very fascinating. A can't-have on a thought. Therefore, people are going to run can't-have on them on a thought, aren't they? And that is going to be very interesting, and with that one observation we can antiquate every Security Check we have. Aren't these people withholding all of these various things so as to deny other people from thinking things about them? [laughter]

So there is one two-command process which knocks out a Security Check necessity. Now, we're still going to do Security Checks, we're still going to have them, but recognize what they are. If the individual is withholding a thought, he is doing what? He is running a games condition on you on the subject of "you can't have it." And this is going to render him in a condition where he's going to have less of it. And if you can make him get off his withholds, which is to say give you the thought, you have then stopped him from playing this particular games condition, and he feels much better.

But why does he have all these discreditable things anyway? Well, they don't exist. They haven't existed. For instance, why is this fellow nursing to his bosom having robbed a candy store of a bar of candy at the age of five? Why? Why has he got this thing pulled into his bosom. Why won't he tell you? Completely in addition to the fact that he doesn't want you to have that thought, that thought is scarce. If a person is withholding, the thought is scarce. And if the thought is scarce, we must assume then that there's damn little robbery and theft in candy stores. He's got it cut down, see. It is not in abundance. It's in scarcity. And so the individual is taking these immoral actions, criminal actions, actions of – against the mores of the society – well, the reason he withholds them is because they're against the mores of the society and therefore scarce.

They are scarce because they are against the mores of the society. So if he can get hold of one of them, he has a little jewel there in that little plush box tucked away, you see, under the left oblongata. It's a scarcity.

But then he holds on to it for this other mechanism. He doesn't want you to have bad thoughts about him. And of course that's totally recognizable, but it's in the same category as games condition. He's running a can't-have of bad thoughts on you. You're not supposed to have bad thoughts, so therefore you mustn't think these bad thoughts in any direction, much less against him. Got the idea?

So this is a basic process, this "What thought –" well any – I don't care how you phrase it – you don't have to write it down as a command because it's just a theoretical process – it's "What thought haven't you permitted another to have?" and "What thought hasn't another permitted you to have?"
Well, that immediately starts doing all kinds of weird things with the Security Checks we've got. Because it's the – one of the basic modus operandi of why the Security Check exists. The person is running can't-have on thoughts. He doesn't want you to have bad thoughts. So if you ran any such auditing command, you – well, if you said, "When haven't you wanted another person to have a thought?" or "What thought haven't you wanted another person to have?" Accompanied – to get your flow in properly – "What thought haven't people wanted you to have?" You've immediately jumped over the top of all Security Checks. Get the idea?

Now, another mechanism about this is, you tell somebody, you say, "Think of a woman. Thank you. Think of a woman. Thank you. Think of a woman. Thank you." And then just keep tags on what kind of women he thinks of. It's quite therapeutic, by the way, but you're making him create women. All right.

"Think of a woman. Thank you. Think of a woman. Thank you. What kind of women?" First, he gets nothing, perhaps. It's probably quite invisible. He probably gets some generality. He probably thinks of the general idea of women. He probably doesn't have any broad concept of it at all except just "women", you know. And then he starts thinking of specific, departed women. You know, they're specific, but they're departed. Therefore, he hasn't got any picture of them. And then as you run this process, you eventually come back up to a basis where he can get dead women. So he gets dead women and dead women and dead women. And then he gets sick women. By the way, if this is running perfectly, it runs through all the sequence of the funerals.

You have certain strata of funerals, you see. So you have women's graves, and then you have women being buried, and then you eventually get women dead in state or something of this sort. And then you get women dying, you see. And then you get women sick and about to die. You got the idea? And it goes back up this line.

What exactly is happening here? You're making him examine the scarcity of women, that is all. And it runs backwards, and eventually the process would be flat if at length he was able to think of a present time woman with the greatest of ease and actually get a perfect 3D picture of her. You see that? Well, actually, just "Think of a woman" would do this. You're getting him to exercise the automaticity of the downgrade of women. You see that? Not a recommended process. That's not a recommended process. That's a test process. And a very simple test process and a very valuable one. Australia of autumn 1959 – spring Australian time.

Now, what is this? What's the next process? What is a valuable process? How would you work these theories around into a process now?

All right. We find this fellow's deficient on the subject of women. One of the things he's probably deficient – we detect that he's deficient on women – is because perhaps he has peculiar ideas about sex with men. You don't condemn this. You just – it's just indicative that he obviously can't think about women. If he's a man and he can't think about women, he can only think about men, well, there's something weird going on here. So therefore, he must have a hell of a scarcity on women. Well, here's the gag and here's the formula by which you put together the games-condition process.

Whatever it is that you find him inverted or nonexistent on, you develop a process by which you can discharge his using that item in a games condition on others, and others using
that as a games condition on him. And because you're running out stable data all the way on this, you add a confusion, a problem or emotion along with it.

In other words, you take whatever the item is that you find him inverted on or nonexistent on, and you run a games-condition process.

Here's an example. Your confusion and stable datum is what accounts for the last command. The guy – if he doesn't as-is some of the confusions and problems and motions in connection with this, he will be content to just sit there and run the stable data of the games condition out from the middle of it and wind up in a confusion. So you've got to throw something else in there to make him as-is the conf – the motion. Got the idea? Whatever it is. Or the problems with regard to it. You've got to bring up his confront on the problem of it. Otherwise, you're just taking apart a game for him.

So the last part of the command, or the third part of the command, is to rehabilitate the games condition. And when that is missing, the games condition doesn't necessarily rehabilitate easily and the process takes a lot longer to run, and he's going to feel like you're taking a game away from him. So you run this last one.

He's short of games, too, merely because he can't ... The way you deny people of games really, is to give them things they can't confront. And, of course, that's a marvelous way to deny everybody havingness.

So the fellow can no longer confront problems, so he can't have new games. You got the idea? Because new games require havingness. So the confront of problems is necessary to the rehabilitation of all new games. Right? All right.

Now, here's a sample of this. Here's women. "When have you denied another a woman?" "When has another denied you a woman?" "What problem about women is not present now?" Now, those three commands would take any of these oddball sexual difficulties and just knock 'em out brrrrrrr.

Now, let's take a woman, and she has a lot of trouble with men – having lots of trouble with men of one kind or another. Of course, you give them the same command, only it is addressed to men. "When have you denied a man to another?" "When has another denied a man to you?" And "What problem about a man is not present now?" Now, why that form "not present now"? Well, you remember my lecture on not-ises. Well, that's the not-is version of problem confront. And that's a murderous process, man, because it un-not-ises everything involved. Got it?

Well now, that basically is the road out as far as games conditions are concerned. And it started back there with Scientology 8-8008, and went through the vicissitudes of problems and Creative Processes earlier than that, and then problems, and came up more recently into the Prehav Scale, and has moved out into a highly workable, functional activity. All you have to do is establish the nonexistence or the downgraded form of something in the pc, run a games type process on the pc, and the pc's going to snap out of it.

Now, how does the Prehav Scale fit in with this? Well, you could actually assess on the Prehav Scale and find out the person was very short on something or other. Well, it's – he's got something; he reacts badly on something so you simply consider he's short on it. And
let us say it was leaving. It's as indefinite as this, don't you see. This would be your Routine 2 application of this sort of thing. You assess it on the Prehav Scale just as you normally would. And you find that he is short on leaving. When I say you find he's short on leaving, it simply means you've assessed and found out that the hot button was leaving. So you run a games-condition type of process on this and you would find that the person would recover in maybe a tenth of the time or something like that than he would on a general run. And the games-condition process would be something made up out of leaving. But make sure that it makes sense. Just make sure it makes sense. That's the main thing.

You have to work it over. And then make sure that the commands react on the meter before you start running them, because they might be totally unreal to the pc. In other words, it would be, "When have you prevented another's leaving." "When has another prevented your leaving?" and "What problem about leaving isn't present now?" And that would be the way you'd put a games-condition process together on a basis of Routine 2.

Now, you'll get some of these levels, and they don't make sense, so you wouldn't say to somebody, "What fail leave isn't" and "What fail leave is" or something of the sort. And it's all up in the air, and he can't quite wrap his wits around it. Well, you have to work around it until you get an answerable command and one that reacts on the E-Meter.

Now, the basic thing that this has resolved and the basic target at which all this work has been leveled, is the problem run into by Peter Williams and the problem run into by us on endless assessment for goals, since a proper assessment for goals obviously is taking much too much time. Well, now why? Because it is not everybody who takes this amount of time in an assessment for goals. What is this all about? It is simply a games condition on the subject of goals. And you're sitting there asking somebody for goals who is in a games condition about goals, and goals are very scarce, and they're not going to let you have one, man. So of course, they're never going to give you their goal. And you can easily get a thousand goals out of them – none of which are their goal.

So, you can use a games condition process on goals which is preparatory to a Goals Assessment which shortens the Goals Assessment right on down, boom! Which is what? Is "What goal haven't you let another have?" or "What goal don't you want another to have?" or any way you want that thing, and "What goal doesn't another want you to have?" or " – hasn't wanted you to have?" or any way you want to phrase it, you see. And "What goal would be a problem?" or some such a command. All of a sudden they come off of games condition with you, the auditor, on the subject of goals, they begin to level, and reactively, they are incapable up to this time of digging up a goal and giving you one.

Now, all of a sudden, they actually stretch their goals out. You can find their goal. You can find their terminal rather easily. That defeated that game.

But anyway, a games condition is an unnatural situation since in a games condition a person becomes convinced that only this game exists. And that game always consists of a singleness in that field and a can't-have. And all games consist of a can't-have. And the person gets into the opinion that there is only that game, so they can only run this can't-have. And the more they continue to run the can't-have, of course, the less they have of it. So the thing dis-
appears from view after a while and they've gotten worse, if anything, not better. So there is the long and short of games.

You understand, of course, that originally when you started to clear people, way back, they wouldn't clear because they thought they were losing their games. And when you did get them, by some hook or crook, Clear, then they were left with only one game and became impatient with the idea of being Clear, and so promptly got themselves aberrated up again so that they could have a game, and they expressed it this way: "Well, I wanted to be like other people or have some fun in life, and I felt like I was totally detached from existence, and I didn't want to be this detached."

Well, what was pinning it all down was games. Scarcity of games. And their scarcity of games was so terrific that they felt if they left this game of being aberrated they would never find any new game. And SOP goals, of course, walked them out of this but was walking them out of it, for some people, much too slowly. We were being successful, but at what slowness in many cases.

All right. So a remedy of havingness of games consists basically of broadening their view on the subject of games. And if you can broaden their view on the subject of games, you can of course clear people rather easily. So therefore, all you would have to do is find out all of the basically aberrated games that the fellow was playing, knock them out one right after the other. And getting his fixation off of these things, he'd be able to look around and find out there was more games, and would practically blow Clear almost at once, because he would now be willing to.

But every person going for Clear has become totally convinced that if he audited just one more auditing command, if he said just one more answer, he would no longer have his game. And he will tell you occasionally that he really doesn't want to be Clear and yip yap yip yap. And he's just talking about one thing: He said "Well, if you run out this game, there are no other games, and I've had it."

So my attention has been very much on that thing, and I am very happy to tell you that I have gotten that wrapped up.

Thank you very much.
QUESTION AND ANSWER PERIOD: AUDITOR EFFECT ON METER

A lecture given on 19 July 1961

Thank you. This is the what?

*Audience voices: July 18th. 19th.*

Eighteenth?

*Audience: 19th.*

I thought you were wrong! I just got one of my motorcycles back out in the garage out there and so I didn't know the date. That's sufficiently non sequitur. Nineteen July 1961, AD 11. All right.

Now, I've been giving you a lot of information but I haven't given you any opportunity to ask any questions. We always assume at times like these, that you've gotten up to a point where you've found out you don't know something. This is, of course, a rare and strange occasion when this occurs. But is there anything that I could help you out with? Any questions? Yes?

*Female voice: Why does a stage four needle do what ...*

What is a stage four needle?

*Female voice: No, not what is it. Why does it do that particular thing instead of just sitting at Clear, or doing something else?*

Instead of just sitting at Clear?

*Female voice: Yes, or doing just so long. Why is it, that in every case with a person in that condition has exactly the same sort of movement?*

Why does he always have this stage four needle? Is that right?

*Female voice: No. Why is the – why is the movement constant?*

Yeah. Why is that movement constant? That's what I meant, yeah.

Well, now, of course, you're asking me for a surmise. Now, I can only give you a surmise. A stage four needle, of course, is one which is unmistakable. The tone arm setting has nothing to do with it. Usually, however, a stage four needle will sit around Clear read and therefore you should beware, beware, beware, beware, beware because the person is below Clear. It's something like, if he got a long ladder and climbed for a long time, he'd reach bot-
The stage four needle is something that when you encounter it, sometime or other, will plague the living daylights out of you. You don't see them too often, but when you do run into them they are marvelous.

Now, the standard stage four needle that I have observed has about a two-and-a-half inch swing and it goes from – well, if you've got the tone arm set right, it'll sweep up from, as you're looking at it, the right side of the dial on the needle and it'll sweep up here, and it will stick. There is a stick. That's what makes this quite different than a free needle. It sweeps up here and it sticks and then it drops back, falling again to your right as you look at the thing. And it just keeps doing that. At just about this speed. And that's all it ever does. It just goes through that repetitive swing. U-u-up, stick, fall. U-u-up, stick, fall.

And that is the darndest thing you ever want to see. Because no matter what you ask this pc, no matter if you hit him over the head with a brickbat, he'll still have a stage four needle. In old times, he comes under the heading of an unsolvable case. You have so many things now that will resolve his case that it's not particularly a worrisome thing. It's just something that you shouldn't ever be in any illusion about.

You put somebody on an E-Meter – here's where you'll get into trouble: you put him on an E-Meter and start to security check him. Ha-ha! "Have you ever raped your mother?" You know? Bang! No action. "Have you ever put slugs in a parking meter?" No action. "Have you ever breathed?" No action. It's just that stage four needle. Just that stage four needle. It just seems like it will go on forever.

It's an electronic transfer – what it is – of energy in the mind and it is a repetitive cycle and what you might call a machine reaction. And – it is – this person is not himself, but is being a machine – always, always. They are not themselves at all. That is to say, they're totally backed out of being human. They distrust themselves to such a degree that it is much safer to be a machine.

Now, the oddity is, is they're so far down on this that the machine has an individual read, not a 2.5 tone arm read; it's liable to have any kind of a read. But as a result machines are run by energy and what you're looking at is some kind of a fancy doodad like an AC motor and it's feeding its current on a surge and then it's reversing its flow; and it's feeding its current on a surge, and it's reversing its flow, and there's nothing going to disturb that except auditing. Anything in life could happen to this person and this machine will still go on, on this charge line.

Now, that is a surmise as – that its current is running that way and reversing. I myself have not observed this closely, but I would say it's a very safe surmise because you can also get an alternating current read on a pc. If you ran Black and White Processing fast enough on a pc, you'd get sixty-cycle AC. And – you would. Over here in England – fifty cycle. [laugh-

But this is – is just a machine read, a machine facing. It's just – the person isn't there. He has no responsibility for being there. No responsibility for his case. Doesn't have any re-
sponsibility for answering the auditing questions and whatever he thinks produces no reaction at all upon his bank. That he thinks a thought has nothing to do with his bank. He knows he can have no effect on anything.

Well, there are too many ways to take this apart, nowadays. But the CCHs if – will always undercut it to some degree or another. You can run one of these stage four cases on the CCHs and get further than any other activity if in doubt.

But remember the common denominator of all cases as they worsen is less and less effect upon the bank and the bank has more and more effect upon them. So, getting them to think a thought, you see, by an auditing command – you say, "Do this" or "Do that" – well, they think a thought. This then produces no reaction upon the bank and they drive you sparky, you know. It doesn't matter how many auditing commands you think up. You are not going to get any action, even if the pc complies with them because, of course, the pc has no effect upon his bank. His thinkingness does not effect his bank.

The common denominator of all cases is the amount of effect the thetan has on his bank; and that is a gradient scale which runs from "no slightest effect" all the way up to "total, easy effect" on the bank. And what you see at the bottom of the scale – the reason you have a Clear read, of course, is the thetan has no effect of any kind on the bank. Nothing disturbs anything. There it sits. Of course, you're just reading a dead body. And as you go up the scale by gradient, he has more and more effect on the bank. Well now, sooner or later he's going – as you audit him, he's going to start changing around the bank by the reason of what he's thinking.

And about this time you'll see energy lines, you will see ridges. Those generally show up before pictures and then they kind of pass out, and he has lots of pictures. And then you run into more energy masses and energy lines and the tone arm starts acting up like mad. Well, what you're watching there is he has more effect on his bank now, don't you see. And eventually he's got enough effect on his bank that he can as-is it. And it gets up to a point of no bank and no disturbing bank – which is what you mean by Clear.

All right. Now, the stage four needle is a retreat from bottom and when encountered, your safest bet is always the CCHs run exactly the way you're supposed to run them and so forth – not a thinkingness thing, but an action thing.

However, there are many other ways to take this apart. And you will find that there are some buttons which are still open and the modern processes which you are doing in these three routines – you always find some hole in the fence. It's problems. It's confusions. It's motion. It's leaving. It's something other, you know. There's something going to be open there someplace and you could keep tickling this spot in the fence and all of a sudden you've got an entrance. And that's about all it is.

You know, on a low case, all you have to do is trigger an automaticity and then, of course, the case is undone because the automaticity is being run off by the auditor; and the automaticity is what prevents the pc from having an effect on his own bank. You as the auditor, through triggering the automaticity, are not ever actually asking the pc to do anything, you see. Except not retreat; that's the only thing you want him to do. You want him to come to sessions and so forth.
And stage four is no exception to these particular lines. But if you were to open up on a case and do a case assessment on somebody and notice there was nothing on the meter whatsoever but this odd phenomenon of it rises, the needle... Down here from where you'd see on this old meter dial about 3.5, it goes back on up toward set, sticks somewhere in there vicinity, falls on down to 3.5, comes up, sticks around set, just about at the speed I'm talking.

Now, there is another spook stage four needle that I probably have never made any remarks about at all. But that is turned on by the auditor's statement, and sometimes it's very small and sometimes it's large, but it only occurs when the auditor says something. Actually, you're turning it on and turning it off, see, by saying something or not saying something and it just doesn't matter what you say. And you see this all the time. This is very common. This is a third of the pcs that sits down in front of you have this ghost of a stage four needle.

You say to him butter and you get a little rise or a little fall and a rise and a stick and a fall, or some combination of this sort. You've got – every time you speak, you vivify the needle. Well, that's you energizing the bank. Remember you're an electric eel. And you can actually have on pcs more effect on the bank than the pc can. Something you have never learned, something I have never been able to teach anybody. They are always so sold on the idea the pc's totally responsible for it all that they don't realize that the auditor can just sit there and just actually push that bank around anywhere, you know.

Say, "Be in the Roman arena. Thank you. Now, don't be in the Roman arena, be in the twentieth century. Thank you very much." And the bank will just move.

Because they can't see it, they don't believe it. See, they're not there then sitting, looking at the picture of the Roman arena which results. And then maybe the pc is so occluded he doesn't see the picture of the Roman arena that results. But you – an auditor can say something like that. "A spear is now entering your right side", and the pc gets a somatic – because it's a cinch someplace on the track a spear has entered his right side and you say, "The somatic strip will now move to that part of the track where a spear entered your right side", and you get a somatic. You're very much in control of the situation.

And this other phenomenon will baffle you sometimes when you're doing a Security Check. And you open up the paper and do your Security Check and everything is fine, and you start right in and you say to the person, "Now, are you on the moon?" something like that, and you get a boomp, boomp, tink And just for fun throw a total non sequitur into the situation, you see. "Are bananas hot?" you see. You get pzoomp, tink – get the same kind of a reaction. You say, "Is the sky blue?" Hmm, tink. "Is your name George?" Hmm, tink.

It's you, you see, you are actually turning the reaction on. It is the impact of your thinkingness and speakingness against the pc. The pc isn't doing anything, it's just the fact that you are energizing the bank and then the E-Meter will read that energizing.

Now, I better clear up something here that hasn't been cleared up for quite a while, and that is: What about these null questions to find out if there's a needle reaction? Do you use these null questions today and do you pay any attention to them at all? And the answer is no. You don't even have to ask them. It's always nice to know that the pc actually does respond and have a lie reaction because it's a good case index.
You set some pcs down, and when they say – you say, "Are you sitting in that chair?"
And they say no, you get a lie reaction. Well, you know this pc's in pretty good shape. Well,
you say, "You're on the moon – are you on the moon?" He says, "No", and you get a lie reac-
tion. Oh, oh, oh, oh, oh, oh. It's a way of indexing a case, don't you see. It's whether the case
has any reaction or has a reverse reaction or has a proper lie reaction.

Now, of these the lowest reaction is when the pc is energized every time the auditor
speaks and if you're seeing a needle that every time you say something goes whirr-plunk, you
know, or does something, don't get an idea the pc's getting a fall on it. You just say, "Are ba-
nanas hot?" and the needle does whirr, clunk. And you say, "Are you on the moon?" and the
pc says, "No", and so on. But that has nothing to do with what the pc's saying has nothing
whatsoever to do with it. You just say, "Well now, you shut up for a moment, and I'm just
going to ask you a few questions just to read it out on the meter." And then you say, "Well,
are bananas hot? Are you on the moon? Do automobiles have motors? Cheesecake." Each
time you've said something, you get the whirr, clink, clink. It's nothing he's thinking. In other
words, you're not reading the pc's reaction.

Now, if the pc is in a Security Check, the moment that you start to security check a pc,
his level of interest rises and creates an emergency level and thereafter, your needle rides
straight. So don't avoid a reaction on an E-Meter needle just because the pc has one of these
automatic response things on the needle at first because the second you're asking him meaty
questions that he feels he might be caught out on, he no longer has that reaction. He's right
there pitching, I don't care how low toned he is, you see?

"Te-thu-ooh, ooh."

"Have you ever stolen any money?"

"Wah, well, let's see, I – mm-mm!"

And you've got him in session and so that any reaction on a security question that
might be meaningful is always taken by the auditor as factual. And you will never go wrong,
providing it's an instant read.

So your null questions are just some kind of a goofball case index and that's all they
serve as anymore. But any time you start asking a whole series of questions that are non se-
quitur, and have nothing to do with the case, of course, you're liable to get some kind of a –
well, you're liable to get an impulse reaction. Because, you see, the pc knows it has nothing to
do with the case. It seems silly to him and he's not taking any responsibility for the answer.
And if he's at a level where the moment he just thinks of irresponsibility or it has nothing to
do with me – the moment this is triggered – why then, after that you are moving the E-Meter
around. You got the idea? But the second you're on something that's meaningful, that might
have something to do with him, why, it will behave just like any other E-Meter.

Now, I'm not sure that a stage four needle, at this time, will behave that way or not.
But I tell you that it's a high probability that it will behave any time you hit the button because
they've got withholds by the avalanche. Got it?

So any reaction on an E-Meter – Mary Sue has had a little bit of a hard time pushing
this across occasionally, so I'll help her out here – any reaction on an E-Meter when a mean-
A meaningful question is asked and that's any question on a Security Check that might have (might have) something to do with the pc, not just null nonsense questions – is taken by the auditor as factual, providing it is an instant read. And an instant read is immediately, factually, instantly followed up by the auditor; and a latent read or a latent reaction is totally ignored.

The only thing you're interested in is "Did the meter react instantly when I asked the question?" In spite of this other oddball phenomena, you'll find out that you won't go wrong if you'll always investigate that instant read.

An instant read must occur within one-tenth of a second of asking the question. Anything that occurs later than that is neglected by the auditor.

Now, is there any judgment involved there? Well, yes, there is. Yes, there is. Because I cannot guarantee the meter on which you are working, unless it's a British Mark IV or an American. I can't guarantee the meter. And a lot of these meters – squirrel meters and so forth – have a lag. I'm not trying to sell meters or run down meters or anything. I'm just warning you that they do have a lag.

Some of the early organization meters, circa 1954-55, had a lag built into them which made me think that battery meters were no good and then I found out everybody had been working day and night to build this lag into the meter. And the meter did not respond for from one-half to one second after the question was asked. And if you're foolish enough to audit on some old decrepit affair that was made by the buggy-whip companies or something, you had better establish whether or not it has a lag in its read. And of course, that would throw out this instant-read law at once because the lag is in the meter, not in the pc. All right.

Now, what about three quarters of a second? Well, let's not get picky about this, shall we? Three quarters of a second. Well, that's an instant read, see. Because the lag is introduced by the length of the question. You got the idea? The length of the question and the difficulty in digesting the sense of the question. And the sense of the question sometimes doesn't come home for a half a second after you've stopped talking. Got the idea? That's got to come home before it can be even acted on in the bank. But it's just about as close to instant as you can get, don't you see?

Now, definitely, from a second on and up, let it drop, man! Skip it! Get away from that horse because it has nothing to do with the question, and so forth.

You can do a great deal for the pc. You can clear up enormous sections of his life. You can clear up all of his relatives. You can give a Security Check to all the teachers he's ever had. You can do all sorts of oddball things, but you're not giving this pc a Security Check. That's what the main criteria is. Do you understand?

So by latent read we mean anything – we don't mean anything after a tenth of a second. By latent read we mean from one second, plus. That's one second plus and that would even apply to an old buggy-whip meter. If there's – takes a second or more for that needle to react in response to your question, ho-hum, brother, ho-hum.

And I think you've been using that rather consistently, most of you here and you've been getting along just dandy with it, haven't you?
Audience: Mm-hm. Yes.

And before, when you were using latent reads, you were just having one awful time. Right?

Audience: Mm-hm. Yes.

It took 139 hours to clear question 18, you know. Every time you ask, "Have you stolen anything?", you would get a long silence on the part of the pc and then a little motion with the needle and you say, "What was that?"

And he says, "Well, let me see. What could that have been? Well, I thought actually of my Aunt Grace. My Aunt Grace once kept rats and I think once she stole a rat. I am not sure."

So you say, "Well, all right. That's fine. All right. Have you ever stolen anything?" Three, four seconds go by and then – fall. "What was that?"

"Well, it actually wasn't stealing, I guess. But I was on a bus one time and the conductor gave me too much change and there were a lot of people and so I gave him the change back and corrected the change and gave him the right change, even though he'd given me..." oh, what the hell are we doing? See. [laughs] What is all this about, man? Well, it's not situate in the reactive mind and the basic characteristic of the reactive mind is instantaneousness.

The reactive mind has no time in it. And as a result, if you ask a question that is going to be real to the pc – that is to say, if he can see that deep into his reactive mind and so that response can be energized – you will get it instantly; and that's the difference between an instant and a latent read and not knowing this difference can louse you up on doing a Security Check just from here on out. You'll have a hundred-hour Security Check every time you turn around. You just don't ever get any security checking done. It's got to be an instant read.

Well, I've told you an awful lot about meters there, extraneous to a stage four needle, but there it is. Okay.

Yes?

Male voice: Ron, what has the velocity of fall got to do with it? In other words, the needle just rides ...

Nothing

Male voice: ... slowly?

Nothing.

Male voice: Oh, okay.

Velocity of fall has nothing to do with nothing. Don't worry about velocities of falls or recoveries or the square root of the God – of the God Ohm. I'm not making fun of your question, Bob.

Male voice: No. No.

It has nothing to do with it. I'm glad you brought it up, because this rumor is always brooding about. And we're always hearing this – that something about velocities of fall, or repetitiveness of fall or "thises" of falls or that of reaction, and so on and they don't have any-
thing to do with it. A pc who is situated and has been living in glue for the last hundred tril-
lennia is for sure going to get a slow fall. But velocity of fall can't be watched – I'll tell you
more precisely why it can't have anything to do with it – is because it can be altered by
the setting of the meter. So the second you can alter something by the setting of the meter, then
you can't calibrate anything against it, so the devil with it. Okay?

Male voice: Right. Thank you.

All right. Yes?

Male voice: What's the purpose of the "What represents" and "How could you help"
questions in the Joburg, and do you have to null them? You know, "What represents your-
self?" "How could you help your family?" Questions like that.

Is that still in Form 3?
Female voice: That's still in Form 3.

Well, now, what's the question?

Male voice: Well, what's the purpose of them in a Security Check?

What's the purpose of them in the Security Check? Nothing.

Male voice: Do you have to null them?

It's something like – there are a lot of people have nerves that go back underneath their
lungs. I'll tell you where this comes from. And this nerve channel passes actually underneath
the lung and according to Darwin, this is all a hangover. Got it? I'm not making fun of your
question. I'm telling you – this is fact, this is fact.

And you'll find a lot of bric-a-brac of structure ... Well, like boats. I was quite inter-
ested to recognize the other day on the subject of boats that the first boat was a log and I'll be
a son of a gun if the Queen Mary isn't still dragging a log. It's now the keelson. They have
never moved off of this log. The first boat was a log, of course, with this caveman straddling
the thing and paddling it. And so help me, Pete, it's still in the Queen Mary. Another thing is a
raft is three logs at least and so help me, Pete, they've still got three logs in them. They're chi-
nes and the keelson. There are eight-thousand million ways of hanging a boat together that
have nothing to do with these logs, but they're still there. I was – I was quite interested in it.
That's Darwin, too; he talks about these things.

And this check originally was an employm ent check. And it was one of these things
that was going to do everything and all in one package. One of the things it was going to do
was select out executives.

Male voice: Well, I know how it got ther e, I put it in there but I was wondering ... [laughter]

I wondered how long it would take him to realize that! Well now, why did you build
the Queen Mary out of a log? Thank you, Jack. You can strike them, you don't have to null
them. They have nothing to do with the price of fish or apples. But that is basically, remember
now, Jack, a Security Check. That is still a Security Check, even though it is used for process-
ing. It still serves organizations for various purposes and until there's a proper organizational
check and until purely processing checks are written, that one will have to do. But it's just a stopgap. Okay?

_Male voice: Yes, thank you._

All right. That's a good Security Check, by the way. Yes?

_Male voice: Yesterday, you said that – you told us that a person can't have, he creates. Then now, is that a prerequisite of creation?_

No. That's the reactivity of creation.

_Male voice: I understand._

Now, we're only talking about unknowing creation and most of our discussions here concern the reactive mind and the unknowingness of it all. This is some of the laws which have gotten submerged and which are out of ken. And those are the only laws we're interested in digging up.

Nearly everybody who has studied the mind has studied analytical reactions only and I sometimes err in not telling you, "Well, this is not an analytical reaction", or something of the sort. That's not an analytical reaction. It is totally a reactive action and the statement here that a can't-have is a prerequisite to creativeness is only a reactive response. Of course, at one time it was an analytical response and all reactive responses were at one time analytical, but this is now no longer analytical and so is a hidden law.

Right now, let's get an idea out here. We've got some very, very terrific workmen here at Saint Hill. I mean they're marvelous people. There's Mr. Weller and Mr. Jenner. These guys are really marvelous. And those birds aren't under any such delusion. They can really build in concrete, and wood, and do various things. They're quite good, you know. But they just go on the simple postulate of "Well, I think I will build up this stone wall out here and we'll make a curb around the thing and that's all there is to it." And it doesn't fit with Weller because everybody was giving him a workshop. He could have all the workshops he wanted, but when he got around to moving his workshop, well, he built himself one. Well, there he could have a workshop and he did build a workshop. All right, that's a totally analytical response. A fellow decides he's going to fix up a wall, he decides to build a wall.

You – you're walking down the beach one day and you say, "Well, I would certainly – dearly love to have a house on the beach." You very likely would simply call up a couple of your friends and tell them to build a house on the beach. See, nobody has even inferred that you couldn't have one. And you up and built one. But then you're doing it knowingly. See, you know what you're doing. You know you want a house on the beach.

Now, this other law comes up along this wise: One day you have a picture of a rhinoceros in front of you. Where the hell did that come from? Well if – you know that somebody somewhere along the line has forbidden you to have rhinoceroses. I mean it's as stupid as that and of course, that's getting real stupid to have a picture of a rhinoceros because you don't even want a rhinoceros! You got the idea? You're not aware of ever having wanted one – at no time.
The truth of the matter is it could get keyed in very well and very easily because of an interest in wildlife back along the track somewhere and regulating life on planets – something of this sort – and you've read in the paper how there are only 250 rhinoceroses left in the world or something like this and a couple of days later – you've forgotten that, see – couple of days later, why, you got a picture of a rhinoceros. Now, where the devil did this picture of a rhinoceros come from? And you trace it back. You see now, this is the reaction of the unexplained appearance of a mental image picture.

Now, we go back in the history of Dianetics and Scientology, we didn't even know we were making them at first, see. This is how far we've progressed. All right. If you sort it back carefully, knowing this law, somewhere fairly recently, some part of rhinocerodom has been run as a can't-have on you. Just like that. And you get this automatic response. But it's totally an unknowing response which is what makes it utterly incredible. But just creating, oh well, pooey.

You can always trace back a desire to create something. You can always find and link up some period when somebody told you not to have one. You can always cross these things up, but then actually you're the one that's crossing them up. They're not crossed up already, see.

The Freudians moved all sorts of rationale on the backtrack to explain what was happening in the present time. You see, they'd even invent backtrack rationale to explain what was happening in present time. But the mysterious appearance of a creation somewhere in your vicinity or a wild and incredible impulse of something you don't even really want – and for some reason or other, you've just got to make up this tune. You've got to make up this tune. Just got to, you know. "I got to write this piece. But I don't know how to write music. But I got to write this – no, I don't know how to ..." and so on. That kind of a bling-blong - well, somebody's run a can't-have on you on music. And you've gotten the immediate back response from it, see.

I know Mary Sue used to get the ideas all the time that she had to write a book. All right. In spite of past track, which she could have added up very easily into something like that, it was true that a member of her family used to run a can't-have on her on books. But it wasn't a can't-have that was that easily explained. It was another type of can't-have entirely, because people didn't want her to read. See? So somebody didn't want her to read wound her up in the necessity to create a book which had nothing to do with the price of fish. Got the idea? So this is how you can track one back.

It's a reactive law, not a knowing law. All creativeness, fortunately, was not a necessity-driven affair. As a matter of fact, a great deal of the creativeness that goes on is totally spontaneous. It has no connective action. But a spontaneous creativeness, of course, is usually an able creativeness and a reactive creativeness is usually for the birds. It is terrible. Have you seen any cubist paintings lately, man? That answered?

_Male voice: Thank you, Ron._

Good enough. Okay?

_Male voice: What's the purpose, and when do you run a negative Sec Check ?_
What's the purpose and when do you run a negative Sec Check? Ah, I'm glad you brought up that point. I've been meaning to tell you about them. I neglected to issue a bulletin. Nobody's run can't-haves on me lately on bulletins, so I'm not writing them anymore. Last time...

Negative Sec Check – may I just cover the whole subject?

*Male voice:* Yes.

What is the reason why your pc advances in auditing and gets new answers on the Sec Check? He's gone over them before, he hasn't remembered that he did anything on these Sec Checks. You see, he hasn't remembered stealing anything and now he gets some advance in his responsibility in auditing and you can tell whether or not he's had any advance because now you ask him if he's stolen anything, he suddenly remembers something and it's rough to clear the question. Don't think that you missed the question before. You have raised his responsibility level so that he does remember.

Well, by raising his responsibility level, you have also made him braver and he doesn't hold everything as not-ised as before. Now, on negative Sec Checking, I refer you to the lecture of a few days ago on the subject of not-isness. You should know how to do this trick. It's a brand-new trick. I just whipped it up to speed up the withhold situation. It's just speedup. If you'll notice, that's about all we're working on right now. We're working on speedup. We're working on more cases reached and reached faster.

All right. Now, this is part of it. Why sit around and wait for this withhold to come up? Why not just knock it into existence? Well, how would you knock it into existence? Well, you'd as-is the not-is. You ask him the not – a couple of not-is questions.

See, this is processing check. This isn't a Security Check, but I suppose you could use it as a Security Check for employment or something of the sort and it would be much more reliable. But this is plain murder. You say to the fellow "When haven't you stolen something?" Well, he has to spot something on the time track, you see, and he has to spot another one on the time track and if you've got any needle response, I certainly wouldn't bother to clear it with that question. But I might run the question longer. Got the idea?

If I were getting needle response, that would only tell me to ask the question a couple of more times. It's a little auditing process that you run in there with the question, don't you see. "When haven't you stolen something? Very good."

Now, you pop the question to him, "Have you ever stolen anything?" "Uh-hiuckieogkiyeougluh." You've practically got it all answered. In other words, you scraped the not-is off the top of the question and of course you got to the meat under it almost at once. And although it is – there are more questions and more processes and more statements involved, you will find this will speed a Security Check.

Now, your question of "When should you use this?" is quite important. You should use this on any Security Check which promises to have a long duration. Do you know we've had some forty-three hour and thirty-six hour Security Checks around here? One time through Joburg HCO WW Security Form 3. Thirty-six, forty-three. *Ka-wow,* man, I mean that's a long time through a Security Check.
Well now, why? Why did it take this long? Well, actually the poor pc was just being tortured to death, because they didn't remember and yet the needle was falling. Now, everything was trembling right on the verge of memory. But not sufficiently on the verge of memory that the pc could find out about any part of it.

All right. If you're going to get a fall, it must be a terribly thin crust you see, that you have to penetrate. So, if you're going to get a fall, you say, "Well, have you stolen anything" you get a read. And you say, "What was that?"

And the pc says, "I haven't got the faintest notion. Let me see. Could it be this? Could it be something or other?"

And you say, "Well, have you ever stolen ... Good. Have you ever stolen anything?"

"Let's see, it might be this, it might be that."

And, "Have you ever stolen anything?"

"Oh, could – oh, I can't ..." Just comm lag. They don't remember.

When you run into that kind of a phenomenon, just treat every question with a negative check. Just take the crust off of it and let it explode.

What you're doing is "Not-is stealing. Not-is stealing. Not-is stealing. Okay. Thank you very much. Now, have you ever stolen anything?" Bowwww! If the answer is there, he's going to know about it. Got it? And that's why you would use it, and that's on what you would use it and actually that is how to use it.

Now, there's one little question there I haven't answered completely and that is how many times do you ask this question? Well, this would be a gradient scale of how rough is it to get a withhold off this pc. If your pc is running easily on a Security Check, you don't use it at all. If the pc is having a little trouble, use it once or twice. If the pc is having a lot of trouble, use it five or six times. And that's why you would establish it and it is unfortunately a matter of judgment. That answer your question?

Male voice: Yes, very much so. Thank you.

Okay. You bet.

Female voice: So one point on that – it's make a point of "When." They ask "When haven't you stolen anything? When haven't you looked at pornography?"

Yeah. You mustn't ask this question: "Have you never?" That's for the birds, man.

Male voice: Thank you.

Kawow, kawow, kawow, because the guy's telling a lie, of course, if he's got a reaction on it, isn't he? You must always ask an auditing question that can be answered. That's one of the laws of commands. It must be answered.

Another law of command is: that you mustn't ask a question which if answered would be a lie. And "Have you never" is a lie. You see. Because right away you've invalidated the pc, so you've disobeyed the Auditor's Code. You say, "Have you never stolen anything" and the pc says – well, he doesn't know whether to answer yes or no or right or wrong, and he
finally in desperation says no. And then you say, "Well, have you ever stolen anything?" If you said that right afterwards, and so forth and he said yes, this would make him look like a liar.

It's one of these legal questions, something on the basis of "Now, answer the following question yes or no", the prosecuting attorney says, "Do you still beat your wife?" Of course, you can't answer that yes or no and you're hung, you see! And that's another. So it must be "When haven't you?" and then make them recall an actual time. And it'll seem to the fellow like ... on some of these cases where the question is real live, it looks real funny, by the way. It just looks like they must have been doing it day and night all of their lives, because they can't find a moment on the track when they weren't doing it! [laughter]

It has several side effects too. It knocks into reality the fact that the guy does have charge on it. We're, of course, adapting the negative processes of old SOP 8-C in its fullest sense, in some of these respects. The moment we move into games condition, we're right back to SOP 8-C, 1953-54.

Okay. Any other question? Yes?

Female voice: Since Routine 1A has come out, does this mean that now 1 is not good for half the Scientologists in the world?

Oh, that doesn't mean so. It does mean this: that it's a speedup.

Female voice: Mm-hm.

1A is a speedup, and I – you want to know if Routine 1A, since Routine 1A comes out – does that say that Routine – cancels the statement that Routine 1 is necessary on about half the Scientologists in the world. Yes, I'd say it modified this statement, because it's showing itself up as being a very beefy process.

Running – you see now it's further refined. We're getting it into real dynamite now. You have – you've got any Problems Process, you've got any Games Condition Process addressed to problems, confusions or motions – that all comes under the same routine. You've got a negative Security Check plus your positive Security Check and this is something on the order of this poor little suffering pc was doing all right and we were making good headway with him and then we started bringing up shotguns and rifles, decided that wasn't good enough and brought up a little bit of antitank armor [laughter] and you know, here it went. So that actually, the processes are so beefed up along this line that a tremendous number of these cases now that would have been included in that one-half are reachable, without running Routine 1. Okay?

Female voice: Okay.

Thank you for asking. Any other questions?...

Well, I'm glad you all know it! I'm glad you all know it.

Now, the new students are, of course ... Let's see, what day is this? This is Wednesday, isn't it?
This is Wednesday and a couple of students got here Tuesday. They've been here now twenty-four hours or forty-eight hours. They've been here really forty-eight hours and they've passed all of their examinations.

Female voice: Yeah.

Ah, that's pretty slow! [laughter] We're dead serious about that though, dead serious.

Actually, the beginning of learning is a discovery that there is zones of not-knowingness. Up to that time you're liable to go along like the old-time pilot that was – he was never taught to fly, he just got into an "airplane" and he just flew it, you know and the wings kept brushing the trees and he always flew with the left wing low and a few things like that, but he never paid much attention to that because he was still alive and it was still flying, wasn't it? Well, that's enough answer to him, you see.

Now, you take a hold of this guy and you try to correct any of his errors or retrain him on any of his mistakes and he doesn't pay a cotton-picking bit of attention to you because he doesn't think there's anything that he doesn't know. And of course, right now you're in a position where you can catch the tips of your wings in more bushes and trees; you're flying lower and slower and – higher and faster than you've ever flown before. Actually, it's marvelous how few upsets occur.

Now, of course, this is invalidative of training and one's past training and all of that sort of thing to insist so suddenly on it. But let me point out this horrible thing: If your past training was real good, why worry about taking an examination? E-Meter for instance – E-Meter has just been codified for the first time. That's why that becomes very important – with E-Meter Essentials. And I swear, I don't think there was anybody in the whole world could run an E-Meter. It is completely fantastic, but I don't think anybody was. E-Meters were telling lies to people and so forth.

I'm certain that none of these poor people in the States that were getting all swamped up in PDHs and that sort of thing – I am sure that there wasn't a single one of them knew the top of a meter from the bottom of a meter, you know. And you didn't even have to know the refinements of compartmenting questions. I don't know, I think they thought the tone arm wobbled when you asked a question, you know? Tone arm never wobbled, the E-Meter didn't work. Say "Do fish swim?" No motion on the tone arm. One time, no motion. You point out to them, "Look, you have to reach over and take hold of the tone arm and move it before the tone arm moves." And they say, "Oh, is that right?" [laughter] I'm sure being snide today.

Okay. All right. Are there any other questions?

Female voice: Would you just say a word about these obsessive people who talk about how they must, you know, react on the E-Meter and how, when they think about something, well, then it doesn't react, but other times they think about something, and it does, and you know, they're in real competition with the E-Meter.

Well, that's a dodge of withholds, when you see that worry. Now, you don't mistake me. I will not tell you a lie. You're talking about people who say they can push around E-Meters and so forth. Well, I will not kid you. An E-Meter can be pushed around.
But I'll tell you frankly, I can't counterfeit a reaction when I push around an E-Meter. It does not look like any reaction I ever saw come off of a pc. I'm just not smooth enough. My touch isn't sufficiently delicate. But I can move a needle back and forth by just putting a beam on it and moving it back and forth. You know, I hit it, knock it on the side and it looks like body motion. I know I can't make one read. I can make a Beep Meter play "Yankee Doodle", or push that thing around, but I can't make one read in any kind of a read that is sensible. It's jerky. It'd look like a body motion. If you did see it read, you wouldn't even mistake it for a reading because it would be zz-zz, you know? And you'd say well, the pc shifted his head or something, you know, moved his hands on the cans.

And the first thing you'd say about a pc who was worried about pushing around the meter is that he was not in-session. That would be the first thing you'd say, if he was worried about the meter. The second thing you'd say is that he's got withholds and he's afraid of the meter or the meter disturbs him or the meter is showing him up in some fashion or he's afraid it might show him up. Or you would say, well, he's trying to put up some sort of a pretense of some kind or another that is making – he's trying to impress the auditor, and the effort to impress the auditor gets into the road of the session because he's not there to impress the auditor; he is there to get audited. So that tells you he's not in-session. So I'd say the common denominator of all this is the pc had never been put in-session.

And I could say a lot about this, but I don't mean to condemn anybody because I've heard an awful lot of people talk about this meter and how they could do this and that. But the point I'm making is it doesn't look like anything an auditor would ever mistake for a read. You'd say, well the battery has hit a rut or something of the sort. It would come over and it would go clank, one way or the other, and it would just be too jerky to pay any attention to. Yo?

Male voice: Well, Ron, I may have contributed to a little bit of that confusion. A couple of weeks ago while I was being audited, I was getting great big twangs on the body that weren't showing on the meter and then all of a sudden something would happen on the meter that I had absolutely no idea about it. It's gone now apparently.

All right. But that would be ordinary that you wouldn't know what was happening on the meter. I know I find a great deal of trouble predicting whether the thing fell or not. Because what it's falling on is the unknown. It's what the pc doesn't know about that causes the meter to react. No, I wouldn't worry about that, Wing, whether you did or didn't contribute to it. I'd just like to put the facts straight.

I'm certainly not going to tell anybody that they cannot move an E-Meter needle. I'm not going to tell anybody that. I'm not going to say that a person who is Clear couldn't mock up a mass and read the tone arm high, make the tone arm go high. I couldn't say that either because I could undoubtedly myself sit and think about some juicy organizational problems and then be very careful not to look at any of them. You know, think of a problem and then very carefully not confront it. Think of a problem, not confront it. Think of a problem, not confront it. Think of a problem, not confront it and start to get this tone arm going up. You see, there are various dodges that you could resort to, but this wouldn't have anything to do
with auditing. That's the point I'm making. It doesn't have a thing to do with auditing and it rather tells a person that the person is not in-session or is upset in some fashion.

Now, all of the things that keep a pc out of session are being handled pretty well these days. Those are present time problems, withholds and ARC breaks. Talking to the auditor and interested in their own case: That is being in-session. Now, obviously, part of that is violated when the pc is more interested in the E-Meter reaction than his own case. Or interested in what the E-Meter is saying about his case rather than what his case is all about. His attention is already too extended to fit this thing of "in-session." And I would say offhand – for the benefit of pcs, not their condemnation in any way – that if a pc starts talking about moving the meter or starts worrying about the meter, that the pc has gone out of session and one of the rudiments is out.

And my first action, as a practical action, would simply be to close off the process I was running, smoothly, with my Model Session and do end rudiments and just knock the spots off of those end rudiments; and I would every time find something was wrong. Well, this is not, then, the pc's fault if the rudiments are out. It's the auditor's fault.

All right. So therefore – that's enough about this particular phenomena.

I've got an O-Meter we're busy developing these days. Reg loaned me a couple of great big, powerful scopes. One was streamlined. It was powered with Cadillac engine, I think, and it was extremely easy to push a beam around. It registered mass more easily than it registered thinking. And it was so easy to push a beam around that it was utterly fantastic. I was sitting there with Mary Sue and Dick Halpern, and so forth; I don't think they were even noticing this thing. But I gave up on the thing at once. I found all you had to do was put a beam on the electrodes and it instantly got a different read. It jumped. Well, that is too darned critical. It's almost as if all you do is look at the electrode and the E-Meter reads. So you see, I can't say that it doesn't happen. I can only say that when a pc's doing it, he's not in-session. And the rudiments are out. Okay? All right.

I've spoken about this O-Meter. There is one. It does exist. It could be put into production now. But the top zones of this thing have not been exhausted by most people and we needn't worry about that. We would right now only have a couple of dozen people on Earth that could be audited on it, so skip it. Any other questions? Yes?

Female voice: I'm so vague about this, I don't know really how to say it. Perhaps you'll help me. I read someplace or heard someplace that at sometime Havingness plus Confront Processes were used in rudiments. Is there anything ...

You say you heard someplace that Havingness plus Confront Processes were used in rudiments. No, this would not be true.

Female voice: At the beginning of the session.

Ah, yes. This is where the confusion has arisen. After you've done the rudiments and when you begin to audit the pc ...

Female voice: Mm-mh.
When you begin to audit the pc, this is not, "Is it all right to audit in this room?" You've actually started a session. You can run the Havingness and Confront Process to get the pc even more thoroughly in-session, but it's not a rudiment. It's not a rudiment because its purposes are different. The rudiments' purposes have totally to do with the outer environment. You're trying to reorient a pc in his bank when you're running Havingness and Confront Processes and it's totally attached to processing. And just before you finish, it is a very kind thing to straighten out the pc's bank. It's like, you leave an auditing room, it's a very nice thing to put the chairs back in the proper place and empty the ashtray or something like that, you know. Well, similarly, a pc will get along and actually go right on through to Clear, but you can actually leave him parked in the middle of what you were just running and Havingness and Confront Processes move him into PT.

Another thing. You can be running a terminal which it doesn't exist in this life. It just doesn't exist. There hasn't been any. And, all right.

So therefore, all of your Prehav processes on an SOP Goals Routine 3 run would be addressed to past lives – every single command! How is the pc ever going to get up through and scan up to this present life? How's he ever going to get back up to this life, unless you run some Confront? This has strictly to do with a subjective phenomena. Rudiments are basically objective, having to do with the environment, to break it down in an effort to get the pc's main things that keep him out of session off, so that he will get into session.

Now, you set up the bank for auditing and you can set up the bank for auditing with the Havingness and Confront Processes. It's a very nice point and one can be much too picky about the thing. But they couldn't possibly be part of rudiments because if they were part of rudiments, then you would only run them at beginning and end of a session and this is not what you do with them. You can run them at the end of every process.

Let's say you are going to shift processes in the middle of the session without going through a whole bunch of rudiments or something of the sort. Well, a beautiful way to shift processes is to end this process, run some Havingness and Confront and reassess. That's a preliminary to a reassessment. The pc isn't answering the auditing commands too well, seems to be struggling and bungling and flobbling along. You don't seem to be getting anywhere and the tone arm action sort of died out. Well, there's two things you can do. One is go back and cover the rudiments and end the session; which is a rather time-consuming activity if, usually, a very beneficial one. Or you can simply give him a kick with Havingness and Confront and continue on with the process and the thing now gets active. You understand their purpose and use a little better?

*Female voice*: Yes.

All right. Okay.

*Female voice*: I think where I heard it, it was not stated that it was in the rudiments. I think in my confusion I put it there. It was in the beginning of the process, so instead of in the process I put it in the rudiments, in my thoughts. That's why I asked you about it.

*Second female voice*: Mm-mm. She just was explaining why she was confused. Mentally she made a mistake, is all I'm saying.
All right. Okay. Good enough. Good enough. All right. Any other questions? Yes?

Female voice: I would like to ask what vitamins or what composition of vitamins would be taken in an intensive and if they were allowed vitamin B1 and C and iron and nicotinic acid.

Oh, well, you're talking about an interesting subject. You want to know what vitamins could be taken to what? What is your exact question?

Female voice: It is usually advice to take in a longer intensive or how do you ...

Good advice to take these things in a longer intensive and so on. All this is perfectly true. You're talking about GuK is its oldest phrase. More politely, latterly, Dianazene and other such mixtures. All of them, however, directed at different targets.

The target of the atomic bomb is what gave us Dianazene and that is the one which has the iron and everything else in it. Now, let's see, what is the formula for a Dianazene? I think it's 100 milligrams of B1 – something on the order of this; this would be a workable formula anyhow – 15 grains of dicalcium phosphate (or calcium), 250 milligrams of ascorbic acid (vitamin C). Now, that all by itself is GuK. That isn't the original GuK, but that's the component parts of the original GuK that worked. Folic acid and several other items – iron and so on – had nothing to do with the original GuK and its performance. So those three items were the original GuK. And that is vitamin B1, 100 milligrams, 15 grains of dicalcium phosphate and 250 milligrams of vitamin C (ascorbic acid). Now, that was GuK.

And to this, if you add iron and 100 milligrams of nicotinic acid – not niacinamide (that has no reaction at all). It's nicotinic acid; it's that vitamin which goes under that heading. And if you add a 100 milligrams of that and a few grains of iron – it doesn't much matter how many grains of iron – you'll start running off all of the sunburns, all atomic blast flushes. You'll have a ball, man. You'll be on fire one moment and getting cold the next and it's hotter than a pistol. It feels like bathing in mustard.

And in addition to that, its basics have something to do with skin cancer because once in a while some brave soul taking this stuff has turned on – or this has happened now and then – has turned on skin cancer per se – itself – in person. And it has run right straight on through and turned off again, providing he persisted. So we can assume that radiation and so forth has something to do with cancer. We can probably expect more cancer in the world now with atomic bombs around or something of the sort.

All right. The reason why this rationale came about is very simple; is nicotinic acid is listed in the "pharmacopoeia" – I'll bet you can't say that [laughter] – anyway, is listed as a – a drug which produces a drug rash and this doesn't happen to be correct.

But I have also – I've been informed – informed by the powers that be; who of course know all – that if it isn't in the "pharmacopoeia," it isn't true. And that it's the "pharmacopoeia" that sets up the standards of chemistry throughout the world and if they made a misprint in Mendel's chart or something like that, why, Mendel's chart would have had it, you see. And iron would no longer weld or something, so they had to be awfully careful with their typographical errors. So it is listed as a dangerous drug because it turns on a flush.
Well, the observation was originally – I was trying to find some drug mechanism when they were having such a time exploding atomic bombs. Oh, they were enjoying themselves. Boy, were they enjoying themselves. And every time it rained, you could take a Geiger counter and you could point it down at a gutter and it'd go brrrrrrrrrrr. Fallout was falling all over the world, and so forth.

I was walking down the street in Washington one day and said there must be something here and then I suddenly remembered that – the tremendous amount of research we did on this earlier, that sunburn was turned on and run out by nicotinic acid. Sunburn. Very interesting. Now, the odd factor which totally disagrees with the pharmacopeia is simply this: It produces a body flush, but why always in the shape of a bathing suit? [laughter]

You know, that's an interesting one. That's – I suppose the medicos would explain that by the fact that the various nerve centers as they go through the body end at those points. But it's very remarkable. You can take some of this stuff and if you've been out this summer sun-bathing in a swimming suit, the flush occurs exactly where the swimming suit wasn't. It's remarkable. Leads to better clinical research. Very interesting.

Anyway, this point is coupled with the fact that there was something which turned on a radiation burn. There was something that did, because sunlight is radiation. I know in – just a few short years ago they were teaching in all the public schools that the sun was a burning ball of hydrogen, which was regulated by the Thames Water Board or something [laughter] and it doesn't happen to be true. The sun is a ball of incandescent atomic fire. And that's what the sun is and sunburn is nothing more nor less but radiation burn. That's all.

Okay. Let's take a look at this, and sure enough, those people who'd been unlucky enough to be around the sites where they were testing – and we had some of these available – boy, they would turn on a nicotinic acid flush the likes of which you never heard of and it was no longer relegated to the shape of a bathing suit, but was relegated to the shape of work clothes. Interesting. Guy working down in the desert with a low necked shirt, you know and it would just be exactly these areas on the backs of his hands and it would be the very places he would get it.

And we did quite a few tricks with this, but we were experimenting around. It was simply a stopgap proposition. There's a serum – I think they've developed a serum and if you shoot somebody with a horse needle with this serum; I think if you shoot him every ten minutes – you shoot a quart of serum into him every ten minutes, in event of atomic fission, he will get sick. I think that's the limits and workabilities of the existing atomic energy serum. It's just grim. In other words, they've done nothing.

Now, as far as the problems of civil defense are concerned, the amount of equipment necessary to handle one atomic burn victim is something to the value of three to five thousand pounds and requires something of the order of a large hospital room to house. I think this is very interesting because there's enough to treat several hundred people, for instance, in the British isles. You could treat several hundred, but the last time I looked at the population count it wasn't several hundred.

So I thought that it might be a good thing to know in event of atomic war that we would get – we might have some chemical assist so that maybe the people who were only
slightly frazzled and so forth, could – could come out of it. And it would have to be very simple. It would have to be some common drug, some common pill.

Well, there are societies in England that are having an awfully good time fighting the cigarette. They can't do anything else, so they fight cigarettes. And they say that the cigarette causes lung cancer. And they've – you've been hearing something of this, I'm sure. Yeah. Not smoking enough will cause lung cancer. Not smoking enough will cause lung cancer! If anybody is getting a cancerous activity in the lung, the probabilities are that it's radiation dosage coupled with the fact that he smokes. And what it does is start to run out the radiation dosage, don't you see. But I'd say that would be better than not running out any of the radiation dosage at all and the number of lung cancer cases which exist, of course, that don't smoke are just forgotten about by these societies, but they are very numerous.

Anyway, there's nicotinic acid in that cigarette. Inevitably, on inhalation of tobacco, you will get some of this phenomena of face flush, but in view of the fact that a cigarette isn't pushing its smoke over the outside of the body but on the inside, of course, you run it out internally.
