And so we look over the attributes of the Clear as he goes up the line and we find out, crash! He discovers the fourth dynamic. Only, now the aberration is not in his bank. The aberration is right out here right now. And you take a bunch of people who aren't Clear and try to persuade them up, that they ought to do something on the fourth dynamic and you lay ostrich eggs, robin's eggs, very frail eggs, very tough eggs, but they're all eggs. And you don't get – even get an omelet out of it because nobody pays any attention to this at all.

But nevertheless a Clear has an ability to lead. You'll find most of them are, well – are – they will lead. And they can infect people with considerable enthusiasm along a – certain lines like the fourth dynamic and that sort of thing. So you'll have here and there throughout Scientology, I can absolutely assure you whether it's South Africa, Australia, the United States and so on – South Africa has right now got one of these things going – very laudable to its degree, but it's impractical to this extent: is the Clear in this particular case is talking completely beyond the reality of other people and they're not going to know what the hell this person's talking about. That's all.
Now, the best way to do something for the fourth dynamic is, of course, get people into the PE Course and have an HGC that clears people. Now if you can get those two things, you're doing the most for the fourth dynamic that you could possibly do. To do much more than that at this particular stage of the game exceeds reality. You'll only cause a tremendous cross-commotion of some kind or another and it'll only wind up in the soup.

But this particular aspect of the Clear is that he has found mankind. And he has found them out here now. And he finds them a present time problem now. It's not a case of his bank. It's not a case of the bank condition whereby he has got to do something because it hurts him so on his little toe every time he sees a woman, see. That's his motivation before that. His motivation right now is this fourth dynamic as we look around this particular, rather small planet on a twelfth-rate sun seems to be in one God-awful mess and it seems to be causing it a number of problems. And these are very observable to the Clear. [laughter]

And it's – they enter into it in the same enthusiasm that you'll find in a pc when you eventually uncover the problem he's really worrying about. Have you ever had this happen with a pc? The pc's going on and on and on. He's talking about nattering problems this way, nattering problems. And all of a sudden he finds a problem he's really worrying about in life. He takes off with enthusiasm. Well, that's it, you know. Bang!

Well, a Clear, casewise, does this. And sooner or later, you can expect that phenomenon to occur. Well, of course they're on the road up and they will eventually blow that and go on to the fifth and the seventh and the eighth and come back to the sixth. And by the time they've got these more or less whipped, you will find that they're upwards toward Theta Clear. And then if they thought there was something to be done about mankind, they would probably do something about mankind. For instance, I can tell you a very practical way of stopping a war.

You mock up a small herald and he walks up the steps of the White House and he's got a tabard on, you see. And of course, the G-men of course all shoot him and the bullets go through him and don't make any impression which upsets the G-men. And he goes on in and he pulls out – he blows a blast on this trumpet and he pulls out this long scroll and he reads to the president, "People of Earth, we come in peace. We bring a plowshare not a sword," you see, that sort of thing "And unless a conference is held amongst all nations with – whereby they are sincerely going to operate along peaceful lines," something like this, you see, "in a fortnight, why, we're going to have to put the president and the other heads of nations under close arrest." And then, of course, just disappears in a small cloud of smoke. [laughter] Now, that's very effective.

Of course, they don't do anything but natter for a fortnight. And then you mock up some very tough space opera characters standing around the gates of the White House, standing around the Kremlin, standing around here and there, you see and so on. And they don't let anybody leave or enter.

This is upsetting because the G-men and the NKVD and other such nonsense peoples can't shoot them, you see and it's all very upsetting. And so they finally do hold a conference of some kind or another, you see and they come to some agreement to scrap bombs or turn them into the running of merchant ships or something else practical.
See, now there is a method of doing this, but you'll find somebody as he goes up scale will collide with this as a solution. Actually, this is not much of a solution. But it's a pretty good stopgap and it's much better than going to Trafalgar Square and sitting down in the rain. [laughter] Because the pavement is so damp!

Ah, dear. These things, of course, are problems of politics, governments, civilizations and a person starts colliding with these things. Then eventually, as you go along, why, a lot of people are Clear, they'll eventually realize "Mores? What mores? People aren't operating with any mores. They're operating with a bunch of prejudices which they themselves do while enforcing them on others and we don't have a civilization. We have a games condition."

Well, they start straightening out this, you see and that keeps them busy for quite a while. That's about the way it goes. You don't necessarily have a quiet peace when you wind up, by the way. They eventually get up to the point where they recognize the imposition of inaction on everybody is a fine method of making everybody ill. All you've got to do is make everybody be quiet enough and they all get sick.

You notice, the medical doctor is always making himself enormous future fees. Always. He tells you – you must be quiet and you must go to bed for a week or so and you must do this. He must – you must – you must be quiet – that is the main thing. Whereas truthfully speaking, the best advice, as you could get a good reality on, is tell somebody who is coughing and wheezing and having a terrible time. You tell him, "Well, walk around the block for an hour and note everything you see carefully." In other words, get a little bit active. Get a little more active than they are. Now of course, there's a finite point where this becomes impossible. And that is when a person can't move his legs or his arms or his head, you tell him to get up and walk around the block, you've given him a lose.

But I don't think at that stage you should tell him to be quiet. And the medical doctor can never resist. You couldn't get him out of bed practically with a derrick, you see. And the medical doctor can always be counted on, in the patient's hearing, to tell somebody else particularly, "Well, you have to keep him in bed for a few days." You know?

Can't you – don't you recognize this is a very familiar – has a familiar ring to it? Well, they just never can resist telling everybody to be inactive, which is a marvelous piece of nonsense because it's going to make everybody sick, but of course that increases their fees. They're practical men, at least. Even if rather shortsighted on the dynamics. I don't think a medical doctor even gets to the first.

But your best system of doing anything for a society – the most practical system of doing something for a society is rehabilitate knowingness. If you rehabilitate knowingness and ability, people will work things out. If you pull the rug out from underneath everybody and tell them to be utter slaves and that sort of thing, you don't work things out. It becomes a no-solution of magnitude.

Common solutions on the track which many of you have a reality on. You – well, you do such things as set up a huge electronic computer that figures out everybody's lives for them and they all go by the ticker tape. And go in for their inoculations and truth serum or something like this. Or you have a thought tower prominent in the middle of town. Everybody any-
time thinks a hostile thought, why, he immediately reports himself to the police because he realizes it's been picked up by the thought tower and so on.

We're skating awfully close to that, you know, with Security Checks. And the only thing that a Security Check has to excuse itself is that it makes people free. And the thought tower mechanism never did anything but make slaves because if somebody reported in that he's thought a hostile thought against the administration, of course, they immediately put him in the electric box and that was that.

Anyway, those are your various states. Well, I've overanswered the question but given you some various views on things which you've probably been thinking about. Whither are we drifting? I imagine a Scientologist every once in a while looks up and says, "Whither are we drifting" Well, the only way I'd modify the statement is, should we ask, "Whither are we gegangen at such a helluva rate of speed?" Because we're on our way. We're not drifting anyplace.

Now, the basic modus operandi on which I operate politically or administratively is that the only solutions are technological solutions which restore comprehension and self-determinism. And those are valid solutions because at the same time comprehension is restored, people can understand what is going on. And when you reestablish self-determinism, then you have made a person capable of responsibility for his own actions. And you'll find out that when somebody is responsible for his actions across a number of the dynamics, that he does not commit crimes. He is not evil. And you don't necessarily put him into motionlessness, you see. And so on.

And you'll find out the more people that can know the difference between right and wrong, the more people who can understand, the more people who can reach decisions, the more people who can act to straighten out any given situation, the better things will be. That is all. It's a very simple solution. It's too simple that one could very often be accused of some subterfugens, deviative, offbeat pitch of some kind or another. He could be accused of all kinds of odd things. Because there is an old mystical law though that a fellow has as much power as he can be trusted with. It's not quite right. That's theosophy. There's normally a little pitch connected with those things. The proper statement is "A person has as much power as he will trust himself to have." That is the proper statement. That is the real basic law of that. He will have as much power as he can trust himself to have.

And when he can no longer entrust himself to have any power, he then starts running on some kind of wild automaticity that has nothing to do with self-trust or self-distrust or anything else. It's just – it's just motion. And the more you have to do with criminals, the more this fact is impressed on you that a criminal is not any longer dealing in right and wrong; a criminal is simply dealing in forms of action and inaction insentient. A criminal does not make sense. After he steals something, he never does anything with it. He's quite amazing. But, of course, any confusion is amazing.

He s as – he s like MEST, in that MEST turned loose on MEST simply collides with MEST. You pour a bunch of liquids into the same bowl. There's no decision on whether they associate or don't associate; they simply do. And you separate them out in test tubes and
there's no question on the subject of – the MEST doesn't think that it's being separated out or not being separated out. It simply separates out.

Any exterior force, any exterior stimuli brings about some type of response. But response in the individual only occurs by reason of exterior stimuli. And you have packaged the criminal in a very tight package right there. All things occur by exterior stimuli. Only exterior stimuli is responsible for anything.

You talk to him. He is the most amazing fellow. A confirmed criminal is the most amazing fellow to talk to you ever heard of. Cawooo! He just leaves you utterly baffled. The way to get unbaffled about it all is disabuse yourself of the fact that you're talking to sentients. You're not talking to anyone or anything that is sentient. You are talking about a mechanism which activates on exterior stimuli. The bottle is on the counter and because the bottle is on the counter, it makes him put it in his pocket. Because the whisky is on the table, it makes him drink the whisky. You got the idea?

See, he has nothing to do with anything that is going on anywhere. And if you understand him at all, you had just better put it in the phraseology of MEST. You don't think of an ashtray deciding whether or not it is going to be moved. Well, don't think of a criminal as deciding whether or not he is going to do a criminal act. There is no understanding there, so of course it's incomprehensible. His actions are then incomprehensible. Well, incomprehensible is because he has no understanding. It's as simple as that.

Now, when you get a large section of the populace down to certain low levels of irresponsibility and all things start operating on a stimulus-response basis, there is no sentence left to furnish any direction and there is nothing going to happen but indirection and collision of some kind. There's nothing going to occur but confusion and randomness. That is about all that occurs and you see a society which is disintegrated. It has many interesting dramatizations and aspects and oddball activities and mores and all these things and eventually they're just merely a confusion. Because they're none of them sentient, none of them directional and all of them occurring because of exterior stimuli.

Why did he kill the girl? He killed the girl because the room was hot. You'll find out that's where it's gone and that's it. And of course, the poor police, they sit around and they grant this fellow beingness, you know. They're always granting the criminal beingness. And they're granting the – he had some motive for killing the girl. They're – if they're any – sure of anything, you see, they're hung with that security, see.

They think well, he had a motive for killing the girl. "Why did he kill the girl?" You see? Well, they put him under the hot lights. "Why did you kill this girl?" You see? And he says, "Well, the room was hot and that's why." And they say, "Well, he won't answer the question," and question him for another twenty-four hours, you see. And then decide that he's crazy and then put him in a mental home where he stays for five days and is then released. I mean, some weird things are going on in the society at this time.

It's basically on the basis that the society is rigged for people to be responsible in. And then you have vast numbers of people who are being irresponsible in it, you see, so it becomes incomprehensible how it is running. Somebody, Mr. Jubba-Jubba Pangawonga, is suddenly elected as president of the Algerian secret consuls of the upper hinterland or something,
you see. Why, hell, he hasn't any responsibility for it. He has no administrative training. He has nothing of the sort. He has no tradition, no background of anything else but throwing spears at gazelles, maybe.

And there he is. But everybody says, "Well, he is president of the upper Abyssinian hinterland, so therefore he is a responsible authority. So therefore, the things which he is doing make sense." See?

You see? That's what doesn't make sense, is the assumption that what he's doing makes sense. You see where it breaks down? The stupidity is interjected by the interjecting of a pretended knowingness. It's a false knowingness. They know he knows what he's doing.

But of course, this country might, two thousand, three thousand years ago, when it had an administrative, political tradition, when things were running in the country, when it was set up at one time – for instance, Abyssinia was the conquering entity of Egypt and actually ran Egypt for God knows how long, you see. They weren't always stupid. And there they are and at that time, if you'd elected Mr. Jubba-Jubba Pongawonga as president of the upper Abyssinian hinterland and so forth, you would have had an administrator in the place and you wouldn't have had to ask all these odd questions, you see.

But now the society decays, goes to pieces, is conquered by this one, conquered by that one, overrun by somebody else, everybody carefully shoots anybody in that society who has any political leanings. Naturally, if they want to control the thing, they've got to kill everybody that has any political leanings. And they gradually weeded out ...

The Japanese in Formosa were quite interesting. They made everybody who had any political aptitude or was demonstrating any, they made him into an opium addict. What's more simple? That was their basic government policy in Formosa. Well, for Lord knows how many, many, many, many decades, you see, they carefully made sure that there are no leaders and nobody to take responsibility for Formosa. And all of a sudden the Japanese pull out and we elect one of these people as in charge of Formosa. And their first action – I think their first action – was to shoot fifteen thousand students. That seemed to be a good political action. The proper action to take. Well, the students were around and they had some banners and they were in motion, so of course, you had to stop the motion and they did. Total responsibility – the stimulus-response. You get the idea?

So you get any kind of a – if you want a chaos, all you have to do is remove all responsibility from the chaos. And if you want to disestablish a chaos, all you have to do is return responsibility into the area. And that's it. Very simple. Except it's such a simplicity that it has apparently escaped man for a very long time.

I didn't mean to get off onto a harangue like this, but whither are we drifting, I think, probably should need a comment here and there.

You see, we might very well be part and parcel to the Fifth Invaders conquering Earth, you see. We might be a secret adjunct of the space command which is really interrupting everything. We might be this and we might be that. There's every reason why we might well have been part of the Marcab Confederacy, don't you see, as an extensional arm of invasion on
Earth. There's every reason. Because this is a timetable on which Earth is operating right at the present moment.

But the truth of the matter is, it's too simple to observe, you see. It rather escapes the eye. We are just us. You see, that's the most we could be – could be said about us because we are definitely more and more us. And we are more us than any other us's. [laughter]

On the simple rationale that the more effective we become individually, why, the greater effectiveness we will have as a group and the greater sentience and responsibility zones will occur and of course, we can't help but win, because it's not very complex. And the complex structures break down.

But every once in a while, somebody looks into Scientology for some vast, complicated complexity of some kind or another. There's every reason in the world why we might be one. But you just – it evades people's thirst for complexity, you see, that we aren't. And what we're doing is very, very simple.

It's just the more the individual is self-determined, the greater his zone of influence, the greater capability there is there, the more potential that is built up in that particular area and this is – I'm only talking now third dynamic on Scientology. Why, naturally, you build up a tremendous potential, there isn't anything that'd stand up to it. There's not much doubt about that.

Reversewise, there is another one that goes on simultaneously and that is the simple action of setting men free. And that's a perfectly simple, laudable, understandable action.

You're going to find sooner or later there's going to be some Scientologist stood up against the wall because he was overthrowing Earth. Let me tell you, man. We're getting up to a point where authority could here and there shake in its boots. But actually, more than shake in their boots, they succumb. Because remember that the world is basically running on the basis of exterior stimuli today. And the most stimulating stimuli there is around in the field of human relations is us. So we couldn't help but win.

I think we could try to go backwards at this particular time. I don't think we'd make it. I think our forward impetus is too great. I'm not even talking hopefully. Australia is unbearably cocky at this particular instant, see. Probably, you – none of you would find it capable of living with any of them, you see.

They're making Clears. They're doing this and doing that. All you – all they do is put something on the grapevine and the government does it. That's right. I mean, it's that positive.

I had a big discussion one night with a bunch of Scientologists in Australia. I said, "Well, the currency is inflating because you don't have enough goods in the country to absorb the money. And the country is doing something very stupid in that it has a very high tariff wall. Now, what we need to do is organize a resistance against the tariff wall and keep you from being cut off from the Commonwealth utterly." And we discussed it all over. And we even had demonstrations that we were going to organize. And we were going to have all the workmen in the country refuse to work with tools on which a tariff had been paid. All the housewives to refuse to serve food or use utensils on which anything had been paid. You know, make a bit of a demonstration and so forth.
We never had a chance. Went straight to Canberra. Ten days later they lifted all tariffs – all tariffs to the United States. I think they left 10 percent of them on some goods being established, were left on, but the rest of them were all lifted.

That was quite interesting, wasn't it. It made me do a double take. I said, "What is going on here?" Well, what was going on is very simple. Our lines of influence were much stronger than we realized. And amongst the people I was talking to, of course, they had lots of friends and the friends had friends. And what we were talking about and what I was talking about was very acceptable and they thought this was a very fine idea. And it went straight to Canberra and it got done instantly.

There are other such instances of that down there. They're not having much trouble now. Doctors – we made the doctors get rid of their secretary of their association because he was objectionable to us. Goofball things like this, but they're – the Australian Scientologist now is pretty cocky.

The South African Scientologist is getting very cocky – and should be. And the atmosphere is changing one way or the other. And you won't notice the degree of the influences. You will sometimes make a mistake. You'll say, "Well, they're copying us." They're not copying you; they're obeying you! There's a big difference. And they will change off to more practical aspects of it as fast you get Clear. That's all there is to it.

Well, I want two by tomorrow. So you better get to work. And right now, good night.
Grades Of Auditors

A lecture given on 28 September 1961

Thank you. And this is what?

_Audience: September 28th._

It's the 28th. What month?

_Audience: September._

28 September 61. Well, you better ask some questions today. What question do you have? Yes.

_Female voice: I have a question. I would like to know, earlier you said in a lecture that to be sure that the terminal is flat, you would check it on the Prehav Scale at sensitivity 16. Is that correct?_

Hm! It's an exaggerated check, but it's all right.

_Female voice: Okay._

The best way to check to find out whether or not a terminal is flat is clean up your rudiments. The more practical way is clean up your rudiments and then check it with a high sensitivity.

Some people apparently have the idea, by the way, on flattening rudiments – I've noticed one in passing – apparently have the idea that a rudiment is – all levels on the whole Prehav Scale have to have been run on a terminal before it can be considered flat. I just wanted to get that one very straight. You only flatten those levels on the Prehav Scale on a terminal which react. No levels react and the terminal is being audited with all rudiments in … The terminal's being assessed with all rudiments in and no level reacts, of course, it is flat.

But when you check a terminal on the Prehav Scale for a level, you ought to get all of your rudiments in and then check your _past_ level which you have been running to find out whether or not it still quivers or merely do an assessment. It doesn't matter what, you see. Your old level that you were running is still on the Prehav Scale. But before you do any changes with regard to the Prehav Scale on what you have been running and what you should be running – before you do any changes at all – get your rudiments in and then check.

Now, before you bring a terminal or a goal to somebody else to be checked, you yourself should check it out, find out if that is the goal (in checking a goal that somebody else is going to recheck) and then get all the rudiments in and then check it yourself and find out if it's active. Otherwise, you're – just a bunch of useless checking and appointments and that sort of thing. But you see, there's another way of going about this.
Instead of having the person throwing the responsibility for checking it off on the person who is going to do the checking – well take the responsibility yourself for the rudiment factor and then recheck it yourself. Then when you take the terminal over to somebody else to be checked – or the goal, whatever it is you're going to get checked – you'll know for sure that it's going to continue to react or not as the case may be.

In other words, you've actually checked it yourself before you had it checked. Because what does a terminal check consist of? It consists … a goals check. It consists of first checking the rudiments, you see and then checking the goal. Or first checking the rudiments, then checking the terminal; first checking the rudiments, then checking the level.

And when you're doing checking on somebody else's goals or terminals, when you're doing this, that is the first thing you should do – the first and foremost thing you should do properly and at once. The person comes in to be checked, you check out the rudiments. If the rudiments are out, you don't check the goal or terminal or a level. You don't go that far. It just gives the pc another invalidation, don't you see. See, because you're actually now checking him with the rudiments out.

Now, you as checker do not put the rudiments in. You merely find out whether or not they are out. And then you give the pc back to the auditor to have the rudiments put in. Otherwise, you are violating the Auditor's Code – too many auditors.

Now, you should know – in this unit particularly – you should know how to check a terminal, check a goal and check a level and how to patch them up if they're out. You should know this definitely because an HCO Policy Letter has just come out which grades auditors. It puts auditors into four classes in HGCs and the whole system depends on their having somebody that has had the Saint Hill Briefing Course. That's part of the rundown.

In other words, you could never have a Class III – grading on up the line, Class I being the lowest class – you could never have a Class III Auditor unless you had had somebody in the organization on the Saint Hill Briefing Course because the requirement of it is that they be trained by somebody who has been trained at the Saint Hill Briefing Course or of course, had been trained on the Saint Hill Briefing Course.

This classifies – reclassifies auditors. Classifies them in four grades. This is for purposes of staff use in organizations, which you'll find this gets very widely reflected. Part of that bulletin is your lecture of September 26, 1961. That's part of the bulletin. The lecture I gave you about how to train up auditors in the field.

So your first grade is … uses the old wise?? I'll explain this bulletin to you a little bit because it'll be in your hands shortly.

Auditor comes in. You say, "What have you had success with?"
He says, "Well, I've had success with Rising Scale Processing."
You say, "All right. That's all you can run on pcs."
And you'll get better – you get better pc gains. That's all.

Now until this person is ready for and can be checked out as and classified as Class II as an auditor, that's all he does. He takes a process that he himself has had some success with,
all right? Whatever process that is as long as it's Scientology and that is all he is permitted to run on pcs.

You'll find out it's ordinarily 8-C or it's Havingness of some kind or it's SCS and Connectedness or it's something like this. See, he'll have had some spectacular wins in his own line. So what are you doing? You're making sure that your staff auditor gets some wins and that your HGC pc gets some wins.

You're making absolutely sure of this right at the in – at the onset.

Now, to get an auditor to audit something with which he is not familiar, on a pc and in which he has no confidence, of course asks for the auditor to get a lose. And it asks for the pc then to get a lose because he's being audited with an auditor who has absolutely no confidence. Right?

Now, a Class II Auditor is one who has been checked out on the fundamental bulletins which you have to be checked out on with a perfect score. He's got to have had perfect scores on all of these bulletins and on the tape of the 26 of September 1961. He's got – in other words, to know Security Checking cold. And if he can pass all those things with a perfect score, he becomes a Class II Auditor and all he is permitted to do on anyone is security check them. That's all he does. He doesn't do anything else.

And then we have a Class III Auditor. And a Class III Auditor is one who has had some success in Security Checking and has done a good job of it and who has checked out everything necessary to the handling of Routine 3. Knows how to assess, in other words and knows all this cold. And when that person knows all these things cold – we don't let him audit these things on pcs while he is learning them, you see – after he's got them all cold with a perfect score, we call him a Class III Auditor.

All right. Now, he can run, then, SOP Goals on pcs, but part of that requisite to become a Class III Auditor is to have been trained at Saint Hill and have had a course completion – of course, that's understood and I don't think it's even mentioned in the bulletin – or to have been trained, which is mentioned in the bulletin, by somebody who has graduated from the Saint Hill Briefing Course. So a Central Organization couldn't make a Class III Auditor unless they had somebody present who had been here that was training them.

All right. Now, that goal and terminal has to be checked out by the Saint Hill Briefing Course person. We permit none to be run that aren't checked out by the Saint Hill Briefing Course person. In other words, a goal and terminal that has not been checked out by a Saint Hill graduate cannot be run on a – on a Central Organization pc. That's it, bang.

It's no nonsense about this because it's far, far too dangerous, it's too touchy and you will find that they will run the wildest hobbies you ever heard in doing assessments.

For instance, a guy just can't stand the idea of being a ship captain. So if the pc's goal is to go to sea and the terminal is a ship captain, he isn't going to let him have it. That's it. He's always had an ambition, you see, to be a – himself, he's always had an ambition to be an accountant. So he gives him the terminal "accountant." Of course, every time you mention accountant, it ARC breaks the pc so you get reactions, so it is obviously the terminal, isn't it?
If you don't think this isn't prevalent in the human race, look at the conduct of so many fathers. Wherever you've had a father or a mother failing in her goals line, she insisted on the child doing a life continuum of that and there it is.

So now that's a Class III Auditor and once more the requisite is a perfect score on examinations. And these examinations – same type of examination as you're taking here. You get constantly examined on these things. Possibly they won't be constantly examined on these things. They will be asked to study these things very hard and pass their examination on them, but must be a perfect score and the examination must be a minute examination. You know, the niggling, the exact word. You get down to the exact word.

That gets pretty grim, but it's the niggling type of examination of you found some obscure fact, way down in the corner of the bulletin that nobody ever noticed before and you ask him that and he fails it and then he's had it, see.

It's that type of examination. Very niggling, you know. Very, very nasty. "How many lines are there on bulletin of … ?" [laughter]

He says, "I never counted them, you see."

"Well, that's it. You flunk." I mean, that's – that's going pretty extreme. But if they failed to answer perfectly any question you ask them, they have flunked it. They have flunked the whole examination. It's very easy to examine this way. Let me point out to you. Maybe you've been examined this way consistently and continually, but you may not have noticed the mechanism. You maybe have been so involved with getting examined that you didn't notice how the examination was being done.

The proper way to examine on these things is the person goes over all of the material as a unit. That is to say, he takes the HCOB on which he's being examined. He studies this HCOB and then he takes his copy of it in to the Examiner and gives his copy of it to the Examiner. That's the way he should do it. Or in a case of a tape, the Examiner has the examination. And the Examiner asks questions until the student flunks. And that flunks the whole examination. He doesn't ask any further questions after the flunk.

Well, this makes for very rapid examination. Now, we've all been supereducated into the idea that it was all right to get 70 percent. Well, I'll tell you: you can't get 70 percent of a question on a Security Check clear. You can't have 70 percent of a goal right. So there goes the old traditional 70 percent, you see. It has to be perfect.

The Security Check has to be perfect. And the goal has to be perfect. And the terminal has to be perfect. And the level has to be perfect. And the auditing command has to be perfect. And there's no compromising with it. So, of course, you can't compromise with examinations. So anyway, that's a Class III.

And then you get up to a Class IV Auditor. And a Class IV Auditor can do all these other things and can run engrams on assessments and runs SOP Goals on pcs, plus engrams.

Now, the rest of this is not discussed in this particular policy letter, but I might as well say a word or two about it since you will probably – all of you, sooner or later, will receive the full brunt of this thing because we have just launched the campaign which makes Clears
in HGCs. This is the first shot actually. The first official, noncompromising, no-more-pep-talk, this-is-what-we're-going-to-do, see.

I think you will agree that that is a very, very practical method of going about it because it permits HGC pcs to come in and get results. And it permits auditors to get wins and it inhibits flubs.

Now, we have grooved training in to a point where it isn't changing. There isn't anything changing about training. Hasn't been for quite some time. There have been some round-ups, horse wrangler-type activities. You'll get the full brunt of this when you get back into an area where you are having to train up people and so forth, you will do a lot of horse wrangling. Just make sure you don't Q-and-A with the escaping pony.

Extraordinary solutions: All of you will err sooner or later – all of you will err sooner or later – in dreaming up the extraordinary solution to fit the extraordinary case that exceeds all rules. You'll all err in this direction sooner or later. The only thing I ask of you is catch yourself when you find yourself doing it. Because of course, you always get a flub with the pc. Extraordinary solutions are only required when the basics of auditing are violated and that is an extraordinary solution, definition of. That activity which somebody thinks he ought to do because all the basics of auditing have been flubbed. The extraordinary solution.

In other words, we have to do an extraordinary type of process on this particular pc. why do we have to do an extraordinary process? Well, that's because we didn't do the basic process.

This is horse wrangling. And you got this crowd of ponies. And it's out on the wide, wide-open prairie and there's no fence in any direction. And you're trying to tell them there's a road here. And they know better than that, see, and they all say, "Well, there's no road here. Look there's just wide-open prairie; there is no track. And nobody knows how to do any of it. And there isn't any right way. And besides there are eight thousand hundred million other ways to do all of these things." And they just invent them all the time, consistently and continually and you have to keep saying, "Well, there's a road."

Actually, there is a road. It's four lanes, it's concrete, marked with sodium-vapor lights the whole distance, you see. But they're odd ponies and they're blind to this phenomenon. They're blind to the roadway and they say, "Well, it's just open prairie." And you have to keep pointing out the road, you know.

And you point out the road until they themselves have a reality on the fact that there's a road there. You don't make them follow the road because they're afraid you will hit them. That's the naval, military-governmental method of doing it. You take all the revolt out of people by beating them down.

No, there's quite another way of handling the whole situation, but only bright people can do it and that is you take the randomness out of the situation by pointing out to people that there is a fact. There is something there. There is a reality to be gained and you educate them until they gain that reality. And you go ahead and work at it and you'll eventually find that they're able to stand up to this and say, "Well, what the heck. There is a reality here. Well, what do you know? What do you know?" There's something to be found out.
"Oh, well, you know, I never pay any attention to those TRs. I mean, I just audit, you see. I'm just natural. And that's why I have my feet over the back of a chair and …", you know. And finally, in horror, one fine day, finally in horror, they suddenly discover that the reason they don't audit with the TRs is because they can't. That's the first – about the first great discovery that they make, you see: that they never have gotten an acknowledgment across to a pc as long as they've ever been auditing. There's something there to be done.

Up to this time they didn't think there was anything there, you see. It was just a number. And this type of thing:

Well, there is no trick to Goals Assessment. You just ask the fellow, "What do you like to do in life?"

The fellow says, "Well, I don't know. I'd like to have a Pepsi Cola."

And the fellow says, "All right. Well, let's see, who would have a Pepsi Cola?"

Well, the fellow says, "I would."

And "Good. 'I.' All right. That's good enough. Now, let's assess it on the Prehav Scale, that's fine. All right. Now I don't happen to have a copy of the Prehav Scale right now. Think of doing something."

"Oh, I don't know. Going. Going to have a Pepsi Cola."

"All right. That's fine. That's the level we'll run. Where are you – where are 'I' going?"

[laughter]

Yeah, they will do a thing like that if they didn't realize that a person has just one goal and they just have one terminal and they just have one level. They realize that and as soon as they realize that, they say, "Oh, but wait a minute. How the hell do you find these things?"

And then, will ensue, possibly, the same cycle that has ensued since February.

Unless you had a reality on the fact that it could be found, wouldn't find it. I mean, that's why they weren't found. I mean, there's nothing more esoteric to it than that.

They didn't think they could be found, you know. And it was just all a good idea. But there wasn't any reason to really do anything very serious about it, because, you know? And you'll find right here in this unit, is – occasionally, where somebody's terminal has been messed up. You know, somebody wouldn't let him have his terminal, auditor will turn right around and won't let the other fellow have his terminal. You have people auditing, finding terminals – . I beg your pardon. There was one other condition to Class III Auditors. Class III Auditors had to have found their goal and terminal.

There's a clause in Class II Auditors that isn't there but probably should be. They have to have passed a full Security Check. That would be a very good one to add in. Probably will get added in.

Anyway, it's a part of Class IV. The Class IV Auditor, of course has to have had an engram run on his goals-terminal line successfully. He has to have had a subjective reality on this here action.
So all of these things are based on subjective realities. And your job in instructing, and your job in handling such people, of course, is to keep them steered and sooner or later, they will collide with one of these realities. You know, up to that time, it's doubt, doubt, doubt, doubt, doubt, doubt, doubt, doubt, doubt, doubt, doubt, doubt, doubt, doubt, doubt, doubt, pretended know, pretended know, pretended know, doubt, doubt, doubt, doubt, pretended know, pretended know, doubt, doubt, doubt, doubt, doubt, doubt, doubt, doubt.

Well, that's just a bunch of ponies wandering all over the prairie and they don't think there's any road to travel on and nothing of the sort and any bunch of grass is a bunch of grass and – no criteria, in other words. It's – no sensibility. And you just have to keep it rounded up.

And sooner or later one of these here ponies will start walking on the concrete and he will say, [knocks on the table] "Wa – whoa, what do you know. Wait a minute. Wait a minute. Wait a minute. I got a hoof on something here." And they put it over here on the prairie. "That's different. That's different. Ah, haaaaa! Hey! Hey!" Turn around and tell you, you know. "Hey, you know there's a road here?"

And you – you generally, being of kind heart, you ordinarily respond – if he hasn't been an exceptionally dumb pony – and you'll respond and you'll say, "Well, yes, that's right. That's right. I'm awfully glad you find it – you'll – you'll be very happy with – found it."

But every once in a while, he's been a particularly obtuse pony. And has been – kept falling into arroyos and doing other things, you see. Anything but trying to find the road. You almost can't restrain yourself from saying, you know, "That's what I've been trying to tell you. What did you think that was?" See? Kind of make him guilty for being so stupid.

But the truth of the matter is until they find out this one phenomenon, you know, that there is something there to walk on and there is something there, why they – you'll just – you just can't round them up, that's all. I mean they have an awful time. They're all over the place.

And that's what normally happens in HGCs. Auditors come in. They pay lip service to all these things that are supposed to exist. And they hope they exist. And they got a fair reality that they do exist. And they think they do exist, I hope. And then there's no reason to do any of them. See? No real reason to do any of them. Because nobody would ever know whether they had done them or not because actually "There are no factors. Are there? Maybe?" You get the idea? It's just all sort of mush.

So this IV-scale is based on certainty and a common denominator of it is how certain is the fellow of his mind. And you let him walk on certainties the whole line.

Well, somebody who has been educated HPA/HCA level has some kind of a certainty. He winds up with some kind of a certainty, if he wants to audit at all. He's got some kind of a certainty. Something. Doesn't matter how dim. He ran "Something you wouldn't mind forgetting" on somebody and it turned on a somatic. And so he said, "That's unusual. That's very odd." And so he goes home and he gets ahold of his elder brother or something and he says, "Hey!" he says, "What's something you wouldn't mind forgetting? Sit down in the chair. Yeah. What's something you wouldn't mind forgetting? What's something you wouldn't mind forgetting? Yeah. Good. What's something you wouldn't mind forgetting?" Turns on a somatic in him, you know. "Yeah. Well, there's something here." And all of Scientology be-
comes "Something you wouldn't mind forgetting." That's the whole lot. There isn't anything else in Scientology but just that one process.

Now, you, as the DofP, take this person, you put him on staff and you say to him, "All right. Now what we want you to do is take this E-Meter. I want you to security check this pc and get this thing all straightened out. And I want you to do that, I want you to do the other thing. And make sure that you get all the rudiments in and so on. That's enough for you. Now, let's see. Now, Joe, how about you?"

Person walks off, stands in the hall a minute and says, "You want me to do this? Well …" He knows what he ought to be doing. See. He ought to be going – running this pc on "Something you wouldn't mind forgetting," you see.

So he does a very – he tries. He tries hard. And it's all to his credit that he does try hard. And that he goes in and he actually tries. He tries to follow these instructions and he tries to do these things. And that's fine. He tries. Nothing much ever happens either here. But he tries. Where as a matter of fact, he'd be cocky as a grenadier, if he – after the winning battle, if he were just told, "Well, all right. Now, you see that pc over there? Well, you just take him up to that room there. And what process do you have a great deal of reality on? What have you got some wins with?"

"Well, it's 'Something you wouldn't mind forgetting'. "

And you say, "That's fine. That's what you run on that pc. You just take him right up there in the room."

Happy as a clam, man. Of course, he'll get some results. He evidently can run it. And most – most pcs could benefit from it, so what have you got to lose? Nothing.

Same way with Security Check. A person who has had no Security Check run on them – doing a Security Check? Hah!

You'll find people will give you all kinds of reasons why they can't give Security Checks or they don't want to give Security Checks or what they don't think Security Checks are. All their doubt, doubt, doubt, doubt, pretended know and uncertainties and so forth, all come up in a horrendous black tornado, right about the time you say, "Do a Security Check." What's basically wrong is that the individual doesn't have any reality on a Security Check ever doing anything for anybody – and of course, has withholds.

You get a person with a lot of withholds doing a Security Check and they do a fantastically oddball job. Very peculiar. A very peculiar job. Let me tell you. They're going to make all kinds of flubs. Well, they're all natural. The flubs are just natural and they will usually leave questions unflat on which they themselves have withholds. All kinds of oddball things occur.

So a person has to know Security Checking cold and also, as should be in the policy letter, should have complete clean hands on Security Checks, before you turn them loose on Class II things. And now you'll find out that they get their best results on pcs by Security Checking. And they can Security Check this way. By the time they're all groomed up on Security Checking and they know – they've had lots of experience with Security Checking, and
that sort of thing, why, they get very fancy with it indeed. And you can do some very fancy things with Security Checking.

Oddly enough, because we haven't pushed Security Checks very hard. Not even you have – have the – a total reality on what fantastic things you can do with a Security Check. You've got a reverse reality. You know what weird things can happen to a case who does gather up a whole bunch of withholds he hasn't let go of. See? You've got that reality.

Well, there's another reality there to be found and that is what you can actually do with a person with a Security Check on the positive side of the ledger. And that's pretty, pretty wide. And now that I've pointed this up to you, I'm sure you're slugging ahead and doing something with it and all of a sudden the stars will be dawning in all directions.

And as far as Routine 3 is concerned – well, what the hell. It's too wild to even contemplate until you've found a pc's goal and terminal. Skip it, man. Till a person really knows his business and has found a goal and terminal on the pc, they will do all sorts of wild things. And the first wild thing they will do is take forever to assess.

Why do they take forever to assess? Well, they know it isn't there. They don't think it's there. They don't really realize it's there. They haven't any reality that they will be able to do it. They get very disheartened. These "forever assessments" are hinged on the rudiments being out. That is the mechanical fact. But the background music to it actually is that they don't think it's possible. Otherwise, they would be in there pitching.

They're wandering all over the prairie, you see and there's no road. And when they get a reality on the fact the pc has one goal, the pc has one terminal, the pc has one level and no other – doesn't have two – and when they suddenly get that as a reality, why you'll have people who can do some Routine 3 work.

As far as engrams are concerned, it's absolutely catastrophic to take somebody who has never had an engram run and ask him to run an engram. That is wild. If you want randomness, just set that going. Once you've had an engram run, why, you can run engrams.

Well, I just wanted to give you this particular rundown. I know this will be put into effect by Central Organizations particularly because the first Association Secretary that heard about it at once added something to it and said, "Well, that is an opportunity to – to change the pay scale of staff auditors." Very highly practical consideration and that's a sufficiently practical consideration that will back up the – the sensibilities of it and there we go.

This is our first elephant-solid step in the direction of full HGC clearing.

Now, I'd better say something about the workability of this in running any kind of a clinic or a group of auditors because all of you, whether you like it or not, will wind up somewhere in that direction, whether in Central Organizations or otherwise.

And that is that the auditors, you would say, then, naturally, that the auditor who have gone through Class I and Class II and Class III and is now a Class III, you would say then that auditor – all that auditor did, you see, was do the full of Routine 3. Well, that's not necessarily true, you see. This auditor could do the assessment. Could do the assessment and could handle the assessment factors and handle some of the basic runs, but wouldn't have to handle the
Security Checks, because you got auditors around that can handle the Security Checks, don't you see. So a pc could then be audited by two auditors – one who is a Class II and one who is a Class III.

And then supposing you had one Class IV in the whole shop. Well, when engrams got ready to be run, he'd run them. You see how that could work out? Now, that's apparently at first glance a violation of the Auditor's Code, but it isn't. Because you're not changing the pc's auditing on what the pc is auditing. You are not changing the auditor on what the pc is auditing. This is an interesting point.

In other words, if you change the pc's auditor on what the pc is being audited on, you will have trouble. But you can always have somebody else running something else and that happens very often. It's only when that becomes a withhold that it becomes very disastrous – being audited every night by one auditor and aren't telling the other auditor in the daytime that they're being audited on the same thing and this really gets to be quite a mishmash. And that is upsetting.

But you can do this other one. You can push a pc into the HGC and you would let him be run for a while, until you had somebody who could do something else about it, by a Class I Auditor. And then you get a Class II Auditor devoted to it on something on the order of two-and-a-half hours a day or something like that, you see. And you can give him a general run on SCS and Connectedness or something in the morning and in the afternoon they'd be getting security checked by a Class II Auditor, you see. You could split it up this way.

And then that could move over to where a Class III Auditor was doing the morning, you see and a Class II Auditor doing the afternoon and that way you could handle more pcs with more advantage.

In other words, you could mix up the auditors on a pc and you could straighten this thing out and you keep the pcs moving. And you'd find out this was quite successful and the fact glares now that HGCs must start clearing. And this is a very firm, forward motion in that particular direction and it hinges on this Saint Hill Briefing Course.

Well, if there's anything you don't know about checking terminals or anything you don't know about this particular thing before you get out of here, you certainly better find out because you'll find yourself in a lot of embarrassment someplace or another. Because you're supposed to know.

And of course, I'll help you out. I'll say, "Well, when they leave here, they know all about it. Yes, yes. Well, I know. Yes, Bob was here for quite a while. He was here all summer. Yes, he certainly knows all about that. Yes, well, you just ask him."

And the only esoteric thing that you're going to run into is you're going to run into the imponderables – the pc who doesn't move, the pc who doesn't respond, the pc who just nothing happens with and your temptation – because that is what is being urged on you all the time by a Class I Auditor – your temptation is consistently to dream up an extraordinary solution. There is your first temptation.

I know. I did it for years, and so on. Finally recognized what I was doing and your only fault is not recognizing what you're doing. Go ahead and dream one or two up and lay a
gorgeous egg, but recognize what you're doing. You're avoiding the fundamentals and cutting it in someplace else with some extraordinary solution of some kind or another. It is always a *gross* auditing error. I don't care what the staff auditor said he was doing. I don't care what the field auditor said he was doing. That had nothing to do with it.

If that case isn't moving, there is a *gross* error. It is always a *gross* error and when you think up an extraordinary solution, you just perpetuate the gross error. And that's why the extraordinary solution is wrong. You haven't actually found out what was going on. Gross error.

I'll give you an idea. A Clear down in South Africa. Two cases not moving on CCHs. Absolutely not moving. Not moving, not moving, not moving, not moving, not moving, any way, shape or form. Nothing happening, that sort of thing. And this couldn't be called, at first glance, a gross error because the CCHs – you're just supposed to run the case, don't you see. Well, actually, the gross error was the CCHs were being run wrong or they would have done it. It was simple, wasn't it? See? We – so we got a datum in our laps to the effect the CCHs aren't working on two cases. Well, our first impulse is to say, "Well, let's do something else that is new and marvelous and strange because the CCHs aren't working."

Your first job in rounding up ponies is to find out what they're doing. Never take what the pony said he was doing. Find out what he *was* doing. And that is very often, somebody who has a low reality on his tools, will often tell you with good faith, that he has done all that and you have to have a closer checkup on it.

Now that, by the way, was solved – down in South Africa, it was actually solved not by doing the CCHs right. It happens to have been solved by the Instructor going in and just asking these people if they had present time problems and just cleaning up the rudiments and asking them with real pressure and going really at it and discovering that they both did have and blowing grief charges off both of them on their present time problems and after that, even these misrun CCHs worked.

Well, that was an extraordinary solution, but didn't necessarily get CCHs working, did it? So, there's a datum sitting there that the CCHs wouldn't work on cases with present time problems. Yes, the CCHs would work, if run right, on people with present time problems. But the easiest way to have done it in this particular instance, of course, would have been to have put the rudiments in, even though you were running the CCHs. If anybody had ever done that, they would have found out something. But that is not a particularly gross error. That's just a mishmash, see.

The gross error, of course, CCHs weren't run right. Of course, you can always do something for a case by putting the rudiments in. So these two things go together. And – but we have a misunderstanding when we come out at the other end of it. And that is to say, the misunderstanding is the CCHs don't work on some cases. Well, that's the misunderstanding. Yes, the CCHs run wrong, don't work on most cases.

You sit somebody down and pump his hand for seventy-five hours and nothing happens. [laughter] You're violating the Auditor's Code in all directions. You're running a process that is flat. You're running a process that isn't producing change. Well, there you are.

All right. Let me tell you some more extraordinary solutions.
An extraordinary solution: The pc – we just can't clue what this pc is doing. We just haven't got an idea what this pc is doing. The pc – God knows! Well, we just keep running this and – and it – just don't know exactly. Actually, we found the pc's goal and we found the pc's terminal and it all seems to be all right, but nothing has happened.

Well, I don't know. There must be some other level to the Prehav Scale that we're not running. Let's see. Let's – pc responds to "indignity." All right. We'll run the level of the Prehav Scale "indignity." That must be about the way it is. Yes. Well, we'll try that and after we've wasted a dozen auditing hours, well, we try something else and after we've wasted twenty-five more, we try something else. And after we've wasted fifty more, we try something else. What was wrong in the first place? Gross auditing error.

Since finding the pc's terminal, from there on, the pc had never done the auditing command. Now, that is the most gross auditing error there is. There is no more gross auditing error than that: to give a pc a command which the pc does not then execute. Isn't that simple?

So, how do you think dreaming up new levels to the Prehav Scale is going to do anything for this pc who has never done any level of the Prehav Scale even after it was assessed, huh? Now, where is this going to come out? How is this going to make things right? By adding new errors onto old errors, we're going to wind up with what? New errors. So, there is no more gross error than an auditor auditing a pc who is not doing the auditing command.

Now, let's define what is "not doing the auditing command." All right. Not doing the auditing command is defined as: simply not executing it or doing something else – or executing the auditing command indifferently and then doing something else. You know, they say, "Well, have you ever – have you ever shot a duck?" You know? And the pc says – thinks to himself dimly, "Well, yes. I've shot a duck," and then applies it to his lumbosis, which is hurting him today and says, "Well, let's see. I wonder if there could be any shot in the lumbosis. I get the idea of mocking up some shot in the lumbosis. Yeah, all right. That didn't work. Okay."

See? The pc is not being audited. The pc is – is answering the commands and self-auditing. He's doing two things. You could say not executing the auditing command, technically, could be expressed is: not doing it and not just doing it – not just doing it.

Now, when a pc has a present time problem of long duration, the pc will have a hidden standard and every auditing command which is given to the pc – the pc then audits something else in order to affect the hidden standard and they'll do it every time.

The pc had a headache, so you give the pc an auditing command and then the pc has figured out that if he audits the mass against his stomach, that this will affect his head. So the pc then does the auditing command against the mass of the stomach, only, and then sits back to find out if it has done anything for his head and no matter what you say to the pc, no matter what command you give to the pc, the pc does these things. He receives the auditing command, thinks about it for a moment, gives you some kind of a response, then applies it to the ridge in his stomach and then checks to find out whether or not it has affected his head. So, he hasn't just done the auditing command. See, he's done a lot of things.
The first time Mary Sue ran into this down in South Africa – as a very fine example of this and really punched it into view – was auditing somebody who was – had been audited for just – oh Lord! You know, just tremendous numbers of hours. And everybody had been thinking up extraordinary solutions for this fellow. Extraordinary! Absolutely extraordinary. I mean, the most marvelous solutions had been thought of for this fellow's case. A catalog of them would have filled the wall, you know. And just shelf after shelf of books to all these beautiful solutions.

There was only one difficulty. The case had never done anything but audit an electronic incident in an effort to change his sex. No matter what was said to the pc, the pc then audited to the electronic incident because he knew that if he got rid of the electronic incident, then his sex would change. And for literally hundreds of hours, actually, the pc had never done anything else. The pc then had a present time problem of long duration. He did not want to be a man. It was a terrible problem to this pc to be a man, so this was all the pc ever did.

Now, that is more broadly understood by the fact that any pc who has a present time problem, particularly a present time problem of long duration, will use the auditing command to resolve the problem, no matter what the auditing command is. How do you like that? And that's why you can't audit up against a present time problem. And that's why you can't leave present time problems of long duration just floating. Because the pc will never do the auditing command, they always do something else. So that's the most fundamental error that could exist. And you could go on thinking up solutions until your hair was down to your knees and you wouldn't ever have the pc doing anything but just sitting there unchanged. Interesting, hm?

You must be inquisitive. You must find out what the pc is doing. Now, if you have to find out too often and too much what the pc is doing, you obviously have no confidence that your rudiments are in. Well, doesn't that follow? Because if the rudiments were all in, the person wouldn't have a present time problem of long duration or short duration. Awfully simple, isn't it?

Now, the pc who applies the auditing command to a specific target may or may not ever apply the auditing command to the terminal you just got through assessing. Isn't that fascinating? That is very disheartening. The pc with a present time problem of long duration will apply an auditing command, not to their own terminal, but to the terminal which is troubling them. And this may be the wrong terminal. So you think you are auditing "a ghost" and you are busily auditing "a sixteen-inch gun". I mean, that's as stupidly simple as that, see. You're not running the pc's terminal. That's all. And that's the gross auditing error.

Every time the pc answers the auditing question, you eventually find out from the pc, realizing the pc is stalled in some fashion and has been for some time ... You see, you got a great apparency that you can get going these days, marvelous apparency. You see, the Security Check the pc is getting can give him a case advance. So, you look at the case advance the pc is getting from a Security Check and you attribute it to the auditing you're giving the pc – because the pc isn't receiving any auditing from you. You see how that could work out?

The pc is receiving auditing from a Security Check, whether you're giving it or not, but you think by running his terminal the pc is getting an advance. Well, the pc isn't getting an
advance if he's not doing the auditing command. He might not be running a terminal. He might not have any idea of the terminal. Always a good thing to ask the pc if they can get an idea of this terminal and what is their idea of this terminal as they run it, and so forth. And you'll find out very rapidly that the terminal they are running is not the terminal you have just got through assessing. Isn't that fascinating? Well, we get some kind of a case going where this fellow is auditing – being audited on a – on "a skin diver", and that's dandy. He's having a marvelous time on a skin diver, but every time he answers the auditing command, he actually applies it to Mary Ann. Well, he's in a state of non compos mentis. He isn't thinking in this zone. It's not his fault, because he is frozen in this particular zone. He is irrational on this particular point of course, or it wouldn't be his terminal.

So, you ask him one day, you – you notice he's not making any progress. And you decide it's his Security Checks that are giving him the progress, not the running of the terminal and you get very bright. You have a long, blue streak of lightning, you see. You get this marvelous idea. And you say, "It just may be there's a gross auditing error here." Now, that is the first idea you ought to get with regard to the pc who is not making progress. Whether you're auditing on a via, through some other auditor or whether you're supervising auditing very casually or whether you're doing it yourself If you're not getting progress, you should think to yourself there's a gross auditing error here of some kind or another and the first and foremost one is that the pc isn't doing the auditing command. That's the first thing you should search out. And you get this long, bright blue spark and you say to the pc, you say, "Who do you think of when I say, 'Have you ever destroyed a skin diver?'" And the pc thinks for a long time. There's quite a comm lag.

And says, "Well, I think of Mary Ann."

And you'd say, "Well, is Mary Ann a skin diver?"

And you get another long comm lag and the pc then says, "No, come to think about it. Mary Ann is not a skin diver. Mary Ann has never had anything to do with skin diving."

Now, I know that sounds completely idiotic, but then you're handling a zone and sphere of idiocy. Everyone is very bright until he gets on the subject of his exact goal and terminal. And then he's a complete idiot. So, there you go.

So having asked this burning question, don't say then, snarlingly, "Well, after this, after this, when I ask you the auditing command, apply it to a skin diver!" You know, that would be the wrong way to go about it because obviously the pc is incapable of doing so and you just asked him to spring up to the top of the Empire State Building in a swan dive from the pavement. He can't do this. So you give him a kind of a lose.

Now, you say, "Well, what cooks with this Mary Ann?"

"Oh, I don't know if I've ever told you, but she and I had a lot of trouble."

All right. That – that would be the way to go. You're auditing somebody with a present time problem of long duration. You're not auditing somebody's terminal. Your rudiments are out even though they're not registering as out. They don't register as out, because the thing is totally submerged. The thing is completely out of sight. So therefore you have to supplement rudiments with interrogation and what kind of interrogation do you have to do? You have to
ask the pc, "Well, what would have to happen to you in order to find out if Scientology worked?" you know. It comes right back to that thing.

"Oh, well, I have to get over this trouble with Mary Ann."

There it is. Present time problem of long duration. This can give you a lot of trouble – present time problem of long duration – and could have given you much more trouble a few weeks ago than it would now. Because now with your Security Check aspect of the broad tool – Security Check is a very broad tool – you have the rule of the prior confusion and that is one you must remember because he is not fixated on Mary Ann at all. Mary Ann is the solution to a problem of which Mary Ann had no part. And you can audit Mary Ann till hell freezes over and you won't free the pc from Mary Ann. Why? Mary Ann is the one piece of paper that was motionless while all other pieces of paper moved.

It's the rule of the prior confusion. The broken leg – the broken leg is the solution to the confusion. Believe it or not, it is. And that is hooked and it violates the rule of auditing the stillness. Don't audit stillnesses. Audit motion.

Well, what is there motionful about a broken leg? There it lies pointing the wrong way. It's awfully still and it's sure been still ever since, hasn't it? It's gone on for some years being still. Guy's got a psychosomatic now called a broken leg. Only it's not called a broken leg. It's called an articulo metalosis of the tibia.

Female voice: of the what?

That's very interesting. The one you didn't get is a proper word for a leg. [laughter]

Anyway, here we go. Chronic somatic, then, from – viewed from a Security Check basis, is a solution to a prior confusion – always. It's never considered otherwise. Now how do you get rid of one? I can tell you how to get rid of one today as I told you the other day, but I can repeat it.

It's a very simple activity. What do you do? You find the prior confusion by assessment. What confusion reacts the most on the meter just prior to Mary Ann, the broken leg or anything else the pc is using in running? What is the prior confusion?

You assess it. And you find out that just before Mary Ann turned up, God help us, it looked like the Battle of Gettysburg at high speed. Yeah, man, it really was motionful. And whatever it was – whatever it was that assessed out, you take that series of personnel and run Security Checks on them and you never run any Security Check at all on Mary Ann or the broken leg.

Now earlier, we were making very slow but positive progress by running Security Checks on Mary Ann, or pardon, not Security Checks, but running O/W on Mary Ann, running O/W on legs and we were getting someplace. We were getting someplace. That was no doubt about that. Very slow, but very positive.

We could run O/Ws against a fellow's bad ear. You know, "What's he done to an ear? What has he withheld from an ear?" and so forth, we would have gotten someplace. But now, this new data has turned up that the ear ... Well, the new data that turned up is I had to find out for ever and aye, whether you ever audited stillnesses and I find out you don't. And of
course, this is the stillest stillness you ever heard of. This ear's been floating through time, it isn't even moving on the time track. It's awfully still, isn't it?

So obviously you've got to find the confusion for which the ear is a stable datum and our tools are now adequate and our sessioning is now adequate, with rudiments in, to actually audit confusions. You can hold the pc in-session, which you might not have been able to do some little time ago.

So, what do you do? You find the prior confusion and the personnel and objects involved in the prior confusion and you security check them. You find out what the pc did to them and how the pc tried to make them guilty and you find out all about it. And now when you've done that Security Check, you will find out Mary Ann has blown and the broken leg is now moving on the track, which is quite an interesting thing.

Now, look at what this pc is doing. It's not ever as flagrant as this. A pc who's doing this is having a hell of a time. "Let's see now. If my ear got well, then I would know that the auditing which is being done on me is working."

Every time he does an auditing command, he looks over to see if his ear gets well. He does an auditing command, see if his ear gets well. Then he thinks he'll audit something else in order to see if his ear got well. Then he'll audit something else and he'll have something else as a target – which he doesn't tell you anything about – and then he looks back to see if his ear got well. Hell, he's not in-session. He's running a self-audit. Also, he must be running some kind of a weird oddball mechanism called "doubt." He must be doubting everything that is happening. He must be in – a hell of a lot of doubt going on of one kind or another for this sort of thing to be going on. He has no positiveness and he has no assurance. Therefore, he has no confidence. Therefore, there's no boost to anything that is happening, so therefore, it's all slow freight through Arkansas. I mean, he's not going to have anything happen.

So you got now the rule of the prior confusion. Now, that's his present time problem of long duration. Find the present time problem, confusion. The confusion that went before the present time problem of the long duration and you've got it.

Now, this even might apply to engrams. It might be that the person is stuck in some portion of an engram as a solution to the confusion which went before and maybe it forecasts a new way to run engrams – which is to say, you don't run the engram, you find out where the fellow is stuck and then you assess the prior confusion. And having assessed the prior confusion, why you could run a Security Check type action on that and the engram would blow. That's – that forecasts it for engrams, but I'm – I don't have any experimental data on it. It's just theoretical.

This other is not theoretical. This other is quite factual, that it is the prior confusion which sticks a person into a present time problem of long duration. Now, he cannot confront that prior confusion and so he has his attention stuck, you see, on something he can confront. And you'd be surprised, but thetans can confront busted heads, bad legs, hopeless love affairs.

The Japanese – oh, the Japanese ever … Show you what a thetan will do (the Japanese are, too, you know) and I would love to see you – I would – I would just love to – to see your reactions to a real honest-to-goodness, not faked-up for export, but a real honest-to-
goodness Japanese movie – a real, sound movie from Japan, for home consumption. I would love to see your reaction to it, because – in the first place, I could tell you about it, but you still wouldn't believe it. It's not something on which anybody could have a reality. Because I myself, the first time I ever saw one, I said this is impossible. And I sat all the way through the thing and I hadn't seen it at all because it was all impossible. And it was mostly for practice in understanding Japanese customs and frame of mind and also practice, obliquely, in speaking Japanese.

But the next one I saw – I'd already seen it happen once, so there was a probability that it could happen again – and I realized that when I had heard and read of things like this when I was a kid around the Pacific, that I had just not-ised them. They were just total not-is. I didn't believe anybody ever considered this drama and yet there it was.

Well, their fairy tales are very easy to get hold of – very easy to read. But they don't exaggerate it to the degree that the Japanese has got it exaggerated now in the later days of his civilization.

Oh, I'll give – I'll give you a plot of a movie in Japan. I mean it runs like this. The soldier comes home from the wars and greets his girl and then he goes off to the wars and is killed. You are now at about ten feet deep in the film. You may not even have seen him. This we are suddenly collided with – we suddenly collide with this immediately after the titles. We're – we're acquainted with this almost immediately after we find out that it was directed by Kobi Mitsuyu. This is totally incidental. And now, my God, we have five reels where she does nothing but wander across scenes and areas where she has seen him before he died – and that's the movie. [laughter]

And of course, the Western mind is educated to a bunch of action. And then finally, why, she receives the news that her lover is dead and she lies down on the bed and cries and that is the end of the film and that's very modern and very something or other. That's – that's really something marvelous. You know, that's a very tragic picture to us, you see. Very dramatic. Not to Japan. The whole picture now takes place. Now it takes place, see. You have a hell of a time sorting out who this fellow was. [laughter] All this is incidental. The action is entirely missing. There is no action.

Beautiful photography. Have these circular bridges and so forth and cherry blossoms. And the cherry blossoms are falling, blossom by blossom, you know and the circular bridge. And she is reflected in the water. And then she's standing on the bank, you see and she looks into the water, and she doesn't see her own reflection, she sees his face. [laughter] And then she walks on … [laughter] and this goes on for about five reels. Coo, man! [laughter] You read about these things, of course, they'll give you a Westernized version of the plot and they'll say, "Well, her lover was an aviator and he got killed bombing the Saratoga and so on. And this broke her heart and she became a geisha girl." That's the plot. And you say, well, there must be … You know, and you get the idea of rahahahahah, a-a-a-a, [imitates the sound of an aircraft and a machine gun] and all this kind of thing. Well, it has nothing to do with the picture. [laughter] We don't even find out the guy's name, you know.
Well, that's a grief engram stuck after the fact of action and you can run it till hell freezes over, of course and there's no action in it, you're running the still. There's the still.

So, of course, if there isn't any action in it, what's – keeps holding it in place? It must be the confusion which occurred before the action. Actually it wouldn't have occurred if there hadn't been all that action. Well, the Japanese can no longer face any kind of action. Not even in war could they face action. They went out and did the most suicidal things. They could face death and they could face that very well, because it was good and still.

I know I spent about four years making myself numbers of enemies amongst naval officers in the West by trying to tell them something about Japan and I don't think they've even grasped it yet.

But the Japanese, of course, he's already in a still, and he obsessively duplicates and so forth. They're not a bad people, long way to, but they – they very easily slide into this particular band. They shudder off of the motion. They shudder off of the confusion and they will pick up some fabulous stable datum and they will carry on with it. And their attitude toward war is "What is war for? Well, war is to get killed in." That's some kind of a wild stable datum, isn't it, for a war? So they lose.

And if the Japanese cannot succeed with their first pound, why, they've pretty well had it and they almost did succeed with their first pound at Pearl Harbor. They almost did. And after that you kept wondering why the hell don't they push the attack home? Because they really never did. They never – never really pushed the attack home.

And American marines were absolutely fascinated with the conduct of Japanese marines. Japanese marines would line up in a company front formation and march down an open beach against machine guns – at routine marching pace. What can you do about something like this? Well, you can kill them, that's all. And the Japs go and hole up in caves. And then they just had to go on killing Japs in caves and killing Japs in caves and killing Japs in caves. Very tenacious. Very tenacious while holed up in a cave and that sort of thing. Because it was still.

I'm just taking up this one particular racial side just to give you an objective view of what a – what a person is doing with a psychosomatic.

He couldn't confront any part of the motion which proceeded this. And it was all too confusing for him and he had absolutely no datum of any kind whatsoever. So, he holds on to a twisted leg.

Or domestically – domestically, he says, "Well, my – my first wife did me in." He says, "She did me in." That was it. And he's got stuck pictures of her and so on, and it's just all stuck. And he's stuck in the first home they lived in. And it's all miserable and it's all stuck. Ah, come off of it. To free it – Why did he get married? See the kind of question you have to ask? It's not "What did your first wife do and what did you do?" Because you're Qing-and-Aing with him to that degree. You are interrogating the stuck. "Well, why'd you get married?" Well, of course, this sounds to him perhaps flippant. You know, like, "That'll show you," you know. So you have to ask the thing rather diplomatically.

"What was going on before you were married?"
"Oh, well, I didn't know her very well. I knew her for some little time."

"No, no. I mean with other people," and so forth.

"Oh, well, that. Oh, well, no, no. Nothing there."

The E-Meter goes mad.

"What was happening before you were married?"

"Oh, well, uh – th – that's, uh – well, actually, that has nothing to do whatsoever with the marriage."

"Well, okay, but …" Your meter will be going mad. And you say, "What was that confusion? What was that confused area of life? What was going on during that area of life? What were you trying to do?" And you get some wild tales, man. There's the drama. There's the action. There's the confusion.

"Ah, oh, well, there were five – there were five girls. And they were all cross-suing something or other, but it was all kind of involved and it got me in a lot of trouble with my parents." You get the idea? "And I was this and I was that, and so on. And it was all very rough. And we really shouldn't go into that."

And that will be his immediate reaction, is "We really shouldn't go into that." And you'll get that constantly. Why? Because he wouldn't be stuck on what he's stuck on if he could face what had happened and you're asking to face what's happened. So I could see that if you weren't alerted to this other thing, you might Q-and-A with the fact that it's nonconfrontable, which it isn't at all. It's perfectly confrontable. But he will keep telling you – and down through the years, if you run this trick, you will accumulate enough people telling you that it is impossible to confront it, that you'll eventually start running the stuck again, unless I warn you.

So what do you do? You take the personnel – the rule of the prior confusion – is you take the personnel involved with the confusion and you security check on this basis. Now, you could run broad O/W on these people. You could do a lot of things about this and maybe shake it all out. But it's a longer route than a direct Security Check.

So he had trouble with this girl. She was down in New Orleans and actually, he had to pay for an abortion and so forth. And actually she didn't really have a child. And he found out about it later, but the same time she was blackmailing him. This is not his wife, you see. This is somebody else! And unless you tailor up some kind of a Security Check to find out what this person did do to them, they're liable not to own up and it's liable not to come up on an automaticity, you see. You're not checking against specific questions. You're just letting him wander and he won't face it because he can't. But security questions – yeah, he'll face it. Just by getting it off, why, it'll free up. That's the anatomy of a stuck point on the track and we've searched for it for eleven years and there it is.

What is a stuck on the time track? What is a chronic somatic? What is a stuck engram? What is any of these things?

Now, this also predicts – and don't bother, don't – don't take this very seriously – it also predicts (and I'm sure you're not going to reach it by this technique) that a hell of a lot of
confusion went on in the case before the person picked up the valence which is his terminal. See? I've already given you some lectures on that last summer sometime. To reach that is possible, maybe it's not possible. It's not been tried.

The reason why it hasn't been tried is we have other routes that are successful. But you possibly could blow that valence. You possibly could blow that goal. There's a possibility of doing so. So I'm – would be dishonest if I didn't tell you there's another prediction. Just like you could blow an engram – a piece of an engram – you might blow the last hundred trillion years by finding out what was so confusing before them.

But my experience with cases has been that all gets very unreal and bucking them into it is asking too much. And the earlier they go on the track, the beefier they were as thetans and the messier the ridges are and the more velocity things have. And boy, for the last hundred trillion years they haven't been able to confront an electronic machine gun, you see. And the type of machine gun – if you turned it loose in Trafalgar Square, it'd knock down all the buildings for a quarter of a mile in all directions with one swing. You see? And that is an awful lot of motion. That is an awful lot of action.

The idea of a hand grenade in those periods, you see, was something that flattened a city. Be a lot of motion. When a thetan stared you in the eye, you lost your eyeballs. You know, this kind of thing. And you get going on early track stuff, the fellow has no acquaintance with his bank. He's not worked up on it and there's plenty of motion surrounding this terminal. So my feeling about it is, is you ought to be satisfied with that. [laughter]

If the terminal isn't blowing a gross auditing error exists. Gross auditing errors – I gave you one gross auditing error which the pc is not doing the command. Other gross auditing errors is the rudiments are out, way out. Another gross auditing error is the auditor's attitude toward the pc is such as to drive the pc out through the bottom. This is a very gross auditing error. It's almost too gross to even be admitted, but you must discuss it and you must realize that it can exist. Fortunately, not in any majority. It's very rare, but it – it can be a very gross auditing error. The auditor just hates the living guts out of the pc. He just hates the pc like poison. He's just not going to see that pc get anywhere. And all he does is make the pc guilty and try to trip the pc up and all of this kind of thing. Gross auditing error.

Another gross auditing error would be to try to audit a Scientologist who has been around for quite a while without getting the auditing Security Checks like 6 in hand – the last two pages of Form 3 and the Sec Check 6. And if you haven't got those a bit in hand, why, you shouldn't expect anything to be happening, because they can be quite wildly out. And if they're out, just because they are overts against the exact activity which the person is performing – not – you might get the idea that those are – the reason why those have to be free is the worst thing you could possibly do under the sun would be to have an overt or withhold on the subject of Scientology, see. Or the worst thing that you possibly could do anywhere from horizon to horizon would be to injure Scientology or some of its personnel, or something like that. You get an idea that that has an order of magnitude.

Well, the only order of magnitude it has is to stop a fellow's case advance. Because it's an overt act against the exact thing that they're expecting benefit from. That is why it is a rough one.
Now, of course, that incidentally does work out to be the most horrible overt act that they can pull. Because it's against themselves, because it stalls their case, but it's only an overt act to the degree that they now don't recover. You see how – how this thing all works out?

You find all kinds of weird attitudes. You find all manner of weird attitudes amongst field auditors. Here, there, they've been gone out of perimeter, out of touch for a long time. They've been nattering around and – and so forth.

Of course, they haven't had – made very much – such a person hasn't made any progress because his overts would stop him from making any progress in auditing. The fact that he doesn't make any progress in auditing then makes him hostile toward auditing, you see. And then because he's hostile to auditing, you see, he has more overts against auditing. So, of course, he makes even less progress. And eventually he stalls down and then all of his fake ridges key in, you see. All the times he's infraudulated people – key in. And all his doubts key in and he goes kind of spinnny.

All right. Well, this person finally – he hears that somebody has gotten some results and you find yourself auditing him. This is an extreme case of this sort of thing. Why, he isn't going to make any progress – not until you get the last couple of pages of a – of a Form 3 flat and not until you get a 6 pretty flat. You're actually wasting time doing very much with him until you do those things.

Oddly enough, you can, if you're very good, find his goal and terminal while this is being done – if you're very good. But it makes it very rough. It makes it harder to do.

It's quite interesting. You look at mail coming in from such people, and so forth. And they – they look down the line, and it's quite – kind of horrifying, you know. You say, "Boy, this poor guy. He's got himself stalled in a box," huh. There he is. There he is. Sitting there in upper Kokokomo and he's having himself a ball.

And as I told Robin today, I said – somebody had said, "Well, we've just – just got through having our sessions." And I read the rest of the letter, you see. And the rest of the letter is rather insouciant and insolent and – and so on. We know the past history of this particular couple, and it's not good, and – see, why are they getting audited?

Because I'm sure the last thing that they would do in the area that they are in would have anything to do whatsoever with a Form 6. It would be immediate tacit consent. See, they – they both would have so many overts along these particular lines, you see, that there wouldn't ever seem like there was any overt to it, don't you see. So therefore, they would say, "Well, there's no sense in running that because … You know, well, you can't do anything with that." And, well, why are they getting processed? See. Why are they – why are they fooling with it? Because they have overts against what they are expecting benefit from.

And I suppose you can have overts against castor oil and still get medical benefits from it, but unfortunately Scientology doesn't work that way. [laughs] Ah, me.

Well, all right. I said I was going – you were to ask questions, but you had one proclaimed here which I thought I had better cover and then I had that news about this policy letter I thought I'd better give you and give you some rundown because it does have an effect
upon you. It does have a rather broad effect because you run into it more than once. Even if you aren't even near a Central Organization, you're going to run into it.

Well, what do you have to do … I just brought up this hypothetical case and how desperate it all was about this couple who were way off some place or another and with nattering overts and yippety-yaps of one kind or another.

Just today I – we received some interesting news about another Clear, and, all checked out by one and all. Oddly enough, the person was (quote) cleared (unquote) and then took an HCA Course, but no engrams had been run and ran into a mishmash of engrams that took twenty hours to get rid of. And then checked out Clear as a bell.

In other words, engrams – completely outside anybody with any advice that they had to run them – they had to be run, that was it. This has happened twice now on Clears. They get cleared and then nobody has cleaned up any of the engrams on the chain. And these engrams key in and they have to be run out and then they eventually straighten up and that's it. So the stabilization – what's in the road of stabilization is the engram.

So, anyhow, discussing the couple as I've just discussed there, what do you have to have in order to – to handle a situation like that? Well, in this particular case we had a couple that weren't on the line by a long way and I got a hold of one of them and put him in an ACC. And I rode that right straight down and taught that ACC hard, myself. And I made sure that that person got straightened up.

And I devised … we were at that time running O/Ws and I made sure that this person got off his O/Ws on the subject. He went home. His wife came in. And his wife got Clear. She went home and they started clearing people. They're living a wonderful life. Everything's going along fine. Everything's just gorgeous in all directions.

So what do you have to have to straighten anything like that out? You have to have a positive assurance that in a Central Organization or in centers around the world, when you tell such a couple – to one or the other of them, to go on in and get straightened out, that they go in and they get straightened out. And their engrams are neglected until their Security Checks are square. And their Security Checks are handled and all that's flat. And then they get some results, and they get a subjective reality on what they're doing and they go home and they can do something. And this has a great deal to do with the future dissemination of Scientology.

There is a modus operandi. We have to have Central Organizations in which we can base a total security that this will happen. And we can tell such – such people to go in and – one or the other of them – and get run through the mill. And when they have been – to ourselves have a total security that all of their overts, their Security Checking has been done, has been done well, has been very effective and what has been run on them has given them a good subjective reality on what they are doing – they go home and they sail. They have done it every time. And we have – do – this – these are not isolated cases.

Now, up to this time, I myself have had to do it. So you just better be getting geared up on the subject of being able to do it. When you get some of these people and they've been nattering around and they've been having a hell of a time on the fringes and so forth and they've been trying to get audited this way and that way and they're auditing each other, but
they don't like that "Well, that Hubbard and that Central Organization – they're pretty terrible people and everything’s all bad, you see. But we're going on with it," you know, this kind of a thing. Well, they're got – getting no place. What do you have to do?

You have to furnish the areas of the world, you see, where you can pick up such people, straighten out one or the other of them. Give them good, sound Security Checking. Make sure that's all in the groove. Make sure they got good subjective reality on what they're doing. Then turn them loose and then all of a sudden you will see action.

So we do have the formula more or less worked out. Our task is to make sure that there's a total security – that when we tell these people to go in and get straightened out, that where they arrive and where they go into, does straighten them out and straightens them out very expertly and well. And when we've done that, you're going to see dissemination take place by the cube over what it is doing now. You'll see that with great rapidity.

Okay. Well, I've given you a lot of odds and ends. I hope it is of some value to you.

*Audience: Thank you.*
The Prior Confusion

A lecture given on 3 October 1961

Thank you.

[part missing]

Okay. This is one of those days. What's the date? Third of October?

Audience: That's right. Yes.

And my watch stopped last night. How would I know? And 1961. Special Briefing Course, Saint Hill.

[part missing]

Now, Suzie's been giving you an explanation up here as to the prior confusion. And I'd better give you some material on this and some other things. I could give you a lecture on a brand-new series of discoveries, but you haven't caught up with these. [laughter] I'll mention these in passing just to get them as a matter of record, however. There is a great deal to be known about mutual motion. Mutual motion is a terribly interesting subject. It's the motion of two generating sources. This has something to do with problems. And mutual motion runs with great rapidity, and so on. There's a lot more about that, but I just wanted to get this little slight note on record.

You're interested in the prior confusion, the hidden standard, because this puts into your hands what the hakim, the witch doctor, the bone rattler, the medical doctor, and all such ilk have been trying to do something with here, now, for a good many thousands of years. This puts something into your hands. And if you grasp this, you've grasped something. And if you haven't grasped it, you're stuck in one. [laughter]

Chronic somatic is a stuck moment on a time track which is the stable datum of a prior confusion. A hidden standard is the stable datum of a prior confusion. Prior confusion. Now, in trying to explain this to you, you take a look at a chronic somatic, you try to look at the prior confusion and you swing back up into the chronic somatic again, and you don't even know that you looked at the prior confusion. This is a very, very easy one to forget. It's a very easy one to slip on because it is, actually, the basic anatomy of how pictures and illnesses and concepts of one kind or another get very, very stuck.

Now, the way they get stuck is the confusion and the stable datum. Now, that confusion and the stable datum has been known to us for many, many years. And what we've done to it is add time to the span. The confusion is in one place and the stable datum at a later place. So in all time track plotting, you get the confusion, and then you get, after that, the stable datum. So actually, they're linear in time. In other words, you don't have the stable datum
and the confusion occurring necessarily – and certainly not very aberratedly – you don't have these two things occurring simultaneously in time. In other words, the stable datum and the confusion do not occur in time, if they're going to become aberrative, which is the same time – you don't have the stable datum and the confusion in the same instant of time.

Now, by that we mean twelve o'clock, second of October 1961: There's a confusion while a person is sitting at a table. Well, the confusion doesn't make the person necessarily sit more solidly at the table. That's not the kind of stuck that we're mixed up with. This is the way we get the person if the person is going to be stuck at the table: At eleven o'clock there was a hell of a confusion, and the person had an upset and had an upset stomach and so on at twelve o'clock, and sat down in the table – at the table to ease their upset stomach, and somehow or another it didn't ease.

Well, there was no confusion at twelve o'clock. The confusion was at eleven o'clock, just an hour before. Do you see this now?

In other words, the confusion is at an earlier instant of time than the stable datum that the person adopted afterwards. But we find that the stable datum which is adopted afterwards is the sticker. Of course, you can always adopt a stable datum in the middle of a confusion. This is, er... it. But that isn't the one that sticks. The one that sticks is where you have a stable datum adopted after the fact of the confusion.

The United States goes to war with Japan; nothing much occurs as a result of the war – perhaps. And then we all of a sudden have President Eisenhower talking about loss of face. Well, it's very interesting to have an American president use a Japanese term. [laughter] We give the Wehrmacht a hell of a shellacking, and during the war nobody is being the Wehrmacht, that's for sure. The 88s are going on one side and the 22s are going on the other side, and we have a good, solid, flat-out, knockdown-drag-out war. And nothing happens during this period of time that is at all upsetting, except people getting killed and buildings blown down, and so forth. But everybody is too interested to have any stable data to amount to anything.

And then after the war, there's a discussion about "should American troops goose-step?" There was, you know? Now, we add in World War I to it and we find American troops wearing German helmets. It's fascinating. This gets more and more fascinating.

Now, we can understand the Confederacy all wearing Federal uniforms during the Civil War, because they didn't have any, but there were lots of Federal dead to take them off of. That wasn't much of a stable datum. But today we find the Confederacy is very stuck in the Confederacy.

Now, we think that something happened, like the assassination of Lincoln or something, and all of this. Well, we certainly know all about Lincoln's assassination. Well, how about a lot of the other people who got assassinated by bullets in that war? You see, we're not worried about them. That stable datum isn't sticking, but something that happened after the action is sticking like mad.
This is a peculiarity, and it's not necessarily sensible. It doesn't necessarily follow any logic; this is an empirical fact. By empirical fact I mean one that is established by observation, not established by theory or reason. This is true only because it's observed to be true.

Now, you can develop a lot of theories about why water doesn't flow uphill. There could be lots of theories developed about it, but you stand alongside of a river, and then you go find another river, and then you go find another river, and then you go find another river, and you observe all of these rivers, and you find out finally that the common denominator of all rivers was that water was flowing downhill. The points downstream are at less altitude than the points upstream. And we establish the fact, then, that water flows downhill. We don't have to have the theory of gravity; we don't have to have any other theory connected with it at all. All we have to have is the observation that all rivers we are able to contact are flowing downhill. That's an empirical datum.

All right. Now, this "prior confusion" is an empirical datum, and that is all it is. It's empirical. It's just observed that this is the case: that the person is not stuck in the marriage that they are complaining about but are stuck in the marriage because of the confusion that existed before the marriage; they're not stuck in the marriage because of the confusion of the marriage.

Now, you've always been assuming that the marriage got stuck because of the confusion of the marriage. All right. Now let's get down to workability – solid, sound workability. How many marriages have you squared up by knocking all the confusion out of the marriage? Well, it's sort of a lot of little failed lines on that. We've straightened up a lot about marriages, and so forth, by knocking out their confusion. We've done a lot about marriages by knocking out the confusion of the marriage. But the reason we couldn't do it rapidly, and the reason we got bored stiff trying to do something about it, is if a person is stuck on the subject of a marriage, the reason they are stuck has nothing to do with that period of time but has to do with the prior period of time that predated the marriage. And if you free up that prior period of time to the marriage, the difficulties of the marriage blow. Now, this is an empirical oddity, an oddity of magnitude.

We've got somebody who has got to have their liver operated on, something wrong with their liver. We find them stuck in an operation on a liver. They've got to have another operation on a liver. They know it's their liver. Their attention is stuck solidly on the liver, and so we go ahead and process the liver, but we never find the basic-basic on the chain of when their attention got stuck on the liver.

When did their attention get stuck on the liver? Actually, it got stuck on the liver immediately after a confusion. Immediately after a confusion. So the way to blow this operation on the liver is to blow the confusion which preceded the difficulty with the liver. It's so peculiar. It's sufficiently peculiar that this occurs when you try to learn it: You immediately think of your own chronic somatic. You try to swing your attention before you had the chronic somatic, and you wind up with the chronic somatic. And you say, "Well, there is the chronic somatic, and of course, that is all there is to it."

And then one tells you again right away, "Now look. Let's look before you had that chronic somatic."
And you say, "Yes. Chronic somatic." It's just as though we're trying to put your attention on top of a spring. And as you put your attention on the spring, it rebounds, and blows you back into the chronic somatic, do you see? And your attention just doesn't go on to the prior confusion. It's quite remarkable.

You say to somebody, "All right" – you'll do this as an auditor, now, many times. You'll say, "Put your attention now on the period" – or "What happened" – you say in some other fashion – "What happened just before you got all upset with this marriage?"

And they say, "Well, I got all upset with the marriage."

And you say, "Well, what happened just before you met this person and so forth?"

"Oh, well, just before I met this person, um… uh… yeah, well, we certainly had a hell of a time in that marriage."

And you say, "Well now, look-a-here. We're talking about just before you met the person. What was the date before you met the person?"

Well, they're liable to do something like "Well, I had an awful lot of trouble when I was a little child."

And you say, "Yeah. But just before this marriage. Just before the marriage."

And they say, "Yeah. Well, I had an awful lot of trouble in that marriage."

What's happening is, is the pc's attention bounces to later periods of time. Chronic somatics are always the result and solution of an unconfrontable disturbance which occurred immediately before them. Hidden standards and present time problems are always the result of a confusion which immediately preceded the difficulty. And when you get the pc to put his attention on the confusion, you are asking him to do what he couldn't do, and why he pinned his attention just after the confusion. You see? He looks at the confusion, and then his attention, without his recognizing anything, bounces straight into the stable datum.

Man has a broken leg. And this broken leg has just been going on and on and on for years and years and years. He doesn't recognize it as a broken leg. The medicos say it's a "tibiosis of the filamoriation," and that he's suffering from a decay of the tendon.

Well, he busted his leg sometime or another. Let's get it down to simple language us folks can understand, and – you see, if you don't know anything about a subject, you can get awfully fancy. As a matter of fact, the more fanciness and the more oddball opinion and crosscurrent of opinion you find in a subject, you can assume that that is in direct relation to the amount known about the subject.

The more confusion in the subject, the more crisscross, the more learnedness, the more pretended knowingness there is in the subject, the less is actually known about it. You can get a terribly complicated idea about life and the mind from fields where it isn't known. You understand? There's a lot of invented, pretended knowingness on the thing. For instance, I don't know how many medical terms there are for a leg, and yet this leg won't heal, and they can't make it heal fast, but they can sure call it by lots of names and have lots of opinions on it, don't you see?
Well, they're sort of bouncing off the confusion. All right. So the person's got a busted leg. Well, the leg should have healed up in five or six weeks and that should have been all there was to it, and that's it – finished. But it isn't. Seven years later, like the children's doctor, the fellow is still limping – I think two years ago. He kids me every time he sees me. You know, he comes in limp, limp, masking the limp very consciously as soon as he's on the premises, trying very hard not to limp. He was in a skiing accident a couple of years ago, and I told him I was going to process him, and it scared him within an inch of his life. And so he always has some kidding remark to make to me when he comes in to look at the children's tongues, about whether or not I'm going to process him. But look, it's been two years and he's still limping. Ah, well, then this isn't just a skiing accident, because there's nothing really in bad shape about the bones. They were all put together by the very best orthopedic surgeons. He had the best of care; he's a doctor.

So what must have happened? Well, he busted his leg in a skiing accident. And two years later it has yet to heal, really. Oh, well, the bones are grown together and it isn't bleeding anymore, but it isn't operating. All right. Now let's take a look at that.

Was it the instant of the accident? Ah, well, we know more about the mind than they do. We know very well that before some fellow does a practiced action, if he's in a smooth frame of mind – he's used to doing this action – he goes down the slope and slaloms like mad, and everything is just dandy, and he winds up at the bottom upright and saying "Whee!"

But if a fellow is in a disturbed frame of mind, and his attention is on many other things – he just received a letter from his wife or his girl saying, "Well, I've just gone out again with Pete," don't you see? And there's nothing he can do anything to but himself. He can't do anything to anybody but himself. There's nobody else around or he's powerless or something like that. Then this practiced skier starts at the top of the slope, and he goes halfway down and he says, "This is a good place," and wraps himself around a tree.

Then they put him pathetically in the hospital and bring him home by ambulance plane and so on, and it goes on for years, don't you see?

So the high probability is that the accident had nothing to do with the motions of skiing. Skiing probably has nothing to do with the confusion which resulted in a broken leg, mentally. Because we have to ask the question, how did he get himself bunged up, and why?

Now, a fellow doesn't get himself bunged up by accident. See, it's not by accident. That's the first thing you have to recognize. That there's some kind of a postulate in there to bung himself up. And he'll manage it every time.

All right. So this medico, all right, we ask him, "Now, what happened just before you broke your leg?"

And he'll say, "Well, the snow was flying all around, and the wind was going whee, and so forth. And then there was this condemned Switzerland pine tree, and it pulled itself up by the roots and moved over in the middle of the ski track."

And you say, "Good."
And we keep on running this. And at the end of many hours, we actually do get the thing to remove to a marked degree. We get an abatement of the chronic somatic. Yes, we can do that. We have done that many times.

Well, how would you like to see that chronic somatic vanish? Well, that would be a much better procedure and much faster than that. Ah, well, we'd have to find out what went on before he went skiing that day.

Well, he was on vacation, we know, and we know that he felt he needed a vacation. Why did he feel he needed a vacation? An odd thing to need – me particularly, I never get one so I don't dare need one. [laughter] He needed a vacation. Well, what was the randomness that preceded that? What was his mail like while he was on vacation? Let's search in this area. Let's find out anywhere in the last six months what had been going on. And all of a sudden we wind up with the damnedest, knock-down, drag-out confusion. If it was enough to make him break his leg, it will be sufficient to bar out his inspection of it. And at first he won't be able to inspect the prior confusion.

It takes an auditor sitting across from him to chunk his attention into that period and do an assessment of it. And all of a sudden he finds out that he thought the broken leg happened last year, when it happened two years ago. And he's completely forgotten that he broke the same leg when he was five; and all kinds of oddball forgettingnesses turn up.

Now, what causes forgettingness? It's the inability to confront a motion. The inability to confront a motion brings about an occlusion of that area of time. Now, you've got postulate – the first-, second-, third-, fourth-postulate theory. The first postulate is not-know. The second postulate is know.

All right. So you've got a big not-know, you see? He had a big lot of mysteries and a lot of confusions he couldn't confront, and nothing he could do anything about of any kind whatsoever, and he got himself a know which immediately succeeded it in time. In other words, this not-know area, this confusion area, is followed by a know area later in time. Now, this is quite interesting because he follows a not-know by a know, and the know might be quite stupid, and it might be quite painful, and it might be quite destructive, but nevertheless it's a knowingness. Some fellow who is gimping around with a bad leg certainly knows something: He knows he's got a bad leg.

You might say all psychosomatics and hidden standards are cures for mystery. They give themselves a knowingness, following a period of not-knowingness.

Now, people can get stuck in relief, and very often when your pc feels better, he will feel better momentarily and quite artificially and not feel better at all. Now, for instance, supposing we were all sitting here and we heard a high whine and a dull thud out in the park, and an airplane full of screaming passengers had apparently just crashed, you know, and we could hear the whole works, sitting here. And so we in a big flurry crowd out the door and rush outside to see this airplane that's crashed, and so on. And it's just Peter left one of his record players on. [laughter]

See? Quite a feeling of relief, but the relief followed a period of confusion. Now, I'm not saying this is very aberrative. This would be so light that it's very easy to face indeed.
Then, you see, we'd have a little period of relief, and it actually would stick slightly on the track. See, it's a period of relief. It's a period of know. Now, you see, at the moment we heard it crash, we didn't know what was happening, so we've got a not-know. And then we go out and we find out what happened, we find out nothing happened and that it's all all right, so we know. You get this. This is just in vignette. What I'm talking about is not at all aberrative. It takes much greater volume of magnitude to make one of these things.

All right. Now, let's go into what Mary Sue was showing you here just before I came in. And we have ourselves a period there, which we see as a big, white chalk mark up at the top, and then there's a little chalk mark down the line and we've got a vertical time track here; and it's got a big blob of white chalk at the up part, and a little blob, and then below that a big blob, and then below that a little blob, and some more little blobs. All right. [laughter] Now, I'm not making fun of her cartooning here. But anyway, taking a look at this now, we see the time track plots linearly. Now, she's got herself plotted from a zero at the top to 1961 at the bottom. Well, all right. We'll take it that way because time tracks don't run in any direction. All right.

Now, we take that little tiny, last, bottom white blob, and that's a chronic somatic. The person has a chest wheeze, and every time you process them, they look at their chest to find out if they're still wheezing. And they know the auditing command worked because the wheeze is less, or they think the auditing command didn't work because the wheeze is more. This is how they know, you see? This is how they know. Well, isn't it interesting that this know would occur in connection with a chronic somatic?

Now, a person must have a hell of an avidity for knowingness if they have to find out if their back's still broke or their chest is still caved in or if their rib cage is squashed. What kind of knowingness is this? Well, it must have followed one God-awful confusion, man! If that's the acceptable level of knowingness, wow! What must have happened before that? So we take this pc, and we say to this pc, pointing to that last white blob there, "Well, what was going on in your life immediately before you noticed this difficulty with your chest?"

And your first, usual, immediate response, if this is a hot subject, is "Well, my chest has always hurt me." It'll be something intelligible like this.

They haven't answered the question at all. You say, "No, no, no. Just before you noticed this – before you noticed this – what happened in your life?"

And they say, "Well, um... I don't know."

That's right. There you got it hot. That's hot and heavy. And, boy, they never, they never spake more sooth than that. They were spaking sooth with all front teeth. They didn't know, that's for sure, or they wouldn't have this chest difficulty. All right. So we punch it a little harder – you see, it's the auditor compelling the pc's attention into that area – and we say, "Well, when did it turn on? What period of time was it when it turned on?"

"Well," he said, "well, it must have been – must have been the summer of '59 or something like that. I know I had it then."
You see, they haven't said anything "before" yet, you see? They know they had it in the summer of '59. You say, "Now, that's good. Now, just what happened just before the summer of '59?"

"Well, I had it in the spring of '59, too."

See, they haven't answered your question yet, you know? All right. But you see what's happening here? You're plowing their attention back toward an unconfrontable area. So you say, "Well, all right. What happened before that? Well, what was going on before you noticed this chest somatic and so forth?"

And they say, "Well. Oh, well, uh – yeah, well, it uh..." (And we notice this little upper white blob here, see?) They say, "Yeah, well, it turned off for a long time." Haven't answered your question yet. See, it's off from the first white blob to the second white blob, see? Well, it's off.

"Yeah. Well, I wasn't troubled with it then, and uh... I remember – oh, yes! Yes, that's right. I recall in '56, I had medical treatment for this." See, they've told you nothing about "before" yet. But they've got it stretched back in time. And then all of a sudden they'll come up and say, "Well, let's see, '56." (And we'll call that earlier blob there 1956.) They'll say, "Well, let's see."

You say, "What were you doing in '55?"

"Well, I... '55. That was when I was down at camp in Cornwall. No. No, no, no. Come to think about it, that was '52." And they're liable to come up with the adjudication that they don't know what happened from 1952 to 1956. This is a curious blank period. And they figure it all out, and they say, well, it must have been this and it must have been that, and it might have been this and might have been that. And then all of a sudden they say, "Well, the truth of the matter is, I was... Well, I'm not sure. I'm not sure. But do you know, I had this when I was a child?"

See, way back now. Way, way back. Boom!

"Yes, I had this when I was a child. They thought that I had consumption and so forth, and I... actually I hadn't remembered that, but I had a lot of consumption, and I remember I was living with my grandmother, and so forth. And they – they had me to the doctor a lot of times, and that sort of thing. And I just had overlooked this fact."

Now we're up at the first white blob up there, see?

You say, "Well, what happened just before you were living with your grandmother?"

"Well, I wouldn't know. I was awfully young. I was eleven."

"Well, yeah. Well... where were your parents at that time?"

"Well, let's see."

And brother, we've got another blank spot, and we've got a nice, big, juicy blank spot. Now, we keep plowing into this blank spot, and we finally find out that Mother and Father had agreed to separate just before this, and there had been a lot of domestic difficulties, and we think we've got it now, and we're trying to really pin it down – we think we've got it. And
they were trying to separate, and this was happening, and that was happening; it was all very clouded up, and it was all very this and that. And we're just about to get a touching short story about this whole thing, when suddenly the pc remembers that he burned down the house. [laughter]

And that will be the end of that chronic somatic. Just by assessment only. See? That's just by assessment. But your assessment is, doggedly, to find out what happened before they noticed this.

Now, perhaps it's a bad thing to say "for the first time" because this is always a lie. One of the stable data of auditing is always make your auditing question as truthful and as factual as possible. Don't make auditing questions that are nonfactual. So you say, "Well, what is the first time you remembered this?" or "What is the first time you noticed this?" Of course the pc cannot answer this because he's going to give you fifty more first times after he's given you the first time. So it's much cleverer to say, "What is a time that you noticed this? When did you notice this? What happened before you noticed this?" And then just keep chugging it in.

Now, it's not a repetitive command, and this is actually getting rid of chronic somatics by assessment. If you are very clever at assessing, you can just go on and assess and assess and assess, and you finally find out the confusion; and you pin the confusion down to such a degree that you've made the pc confront the confusion, the confusion will as-is. Right there. Bang! And everything else will blow after it, and that is it. You can do it by assessment only with an E-Meter. That requires a rather clever auditor to do the whole job by assessment only.

Now, here's an easier way to do it. We finally spot the area of confusion by assessment, and then we put together Security Checks to fit that area. We find out that this person had this when they were eleven: Well, it's some kind of childhood activity that is all messed up. Well, you can actually take the child's Security Check, and bend it around one way or the other, question by question, and add your own questions to it, and so on; and you're going to get yourself some interesting data that this pc has never seen before.

And you're going to blow out those zones of confusion, and you're going to find the dissipation of the hidden standard of the chronic somatic. That is a more standardized method of going about one of these things.

All right. Let's take another example. This girl finds that she has headaches. She finds she has lots of headaches. And in auditing, she's always sort of aware of this headache, and she knows the auditing process is working because the headache turns on or turns off, and if nothing affects the headache, she of course doesn't think the auditing process is working. That's her hidden standard. That's by which she finds out whether or not auditing is working. That is the definition of a hidden standard.

Well, naturally, your rudiments are out as long as the pc has this condition. Why? Well, the pc is viaing the auditing command.

Now, in all cases where a pc is not making progress on Routine 3, you can bet your bottom peseta that the pc has not and is not doing the auditing command. They might be doing the auditing command plus, plus, plus, see, or they might not be doing it at all.
I do remember back in Wichita, long, long ago, a pc coming around to me after a twenty-five hour intensive and bragging to me that they had succeeded in not answering an auditing command once, and they thought this was awfully clever of them. Yes sir, the pc was really bragging about it. What was the matter with the auditor that he didn't find it out?

Now, here is the more usual thing: The pc does the auditing command and applies it to a certain area of the mind or body in order to find out if it has affected something else. And they do the auditing command by applying the auditing command to something in the mind, and then they look over here to see what is going on and if anything happened. And they do this continually. They're not just doing the auditing command. They are doing something else. Now, they know they did the auditing command right or they know they did it wrong, or they know the command is right or wrong, in direct comparison to how much happens to alleviate this difficulty.

You are auditing a pc who has an attention fixed, not on the bank in general but on some particular, peculiar activity. And they're doing something peculiar with every auditing command. You feed them the auditing command, they do something peculiar with it. Even though they verbally answer it and so on, and apparently have executed it, they do something else with it.

And when a pc is not making progress, you can say his attention is stuck someplace. Well, that's a shortened form of saying the rudiments are out. One of the rudiments are out. The pc is not really in-session. The pc is on auto. The pc is not under the auditing control, the pc is under his own control. He's under his own control to this degree: You say something, then the pc takes over as auditor and executes the auditing command, and then gives the session back to you. And you ask the next question, and when you ask the question, then the pc takes the auditing command, goes on auto, audits the auditing command on himself and then gives the auditing session back to you. Have you got the idea? And the pc, during the entire period of execution of the auditing command, is not in-session. Any pc who hasn't gone Clear in 150 hours is doing it. Pc has got a hidden standard.

What is this hidden standard? Maybe he's got six hidden standards. Well, every one of those hidden standards is totally this stable datum stuck after the fact of the confusion. They all have the same anatomy. Pc takes the session away from you, does the auditing command, finds out whether or not it moves this electronic, then sees whether or not the electronic is affecting whether or not he's a boy or a girl. That's right. That was how we moved into this, with just that action on the part of a pc. We knew about this for a long time, but we've never really seen it in action to this flagrant degree.

This pc had been audited for about a thousand hours, and had applied every single auditing command ever given to the pc to the resolution of an electronic incident which the pc was convinced, if it were run out, he would turn from a man to a woman. Thousand hours – no progress. Well, why? The pc was never in-session.

So the rudiments are out. The basic rudiment that is out is present time problem of long duration, where you have a hidden standard.

All right. Very good. Now if we take ourselves a pc, and we audit along with Routine 3, we can find the pc's goal, we can find the pc's terminal; oh, yes, with some difficulty, but
we can find them in relatively short order, certainly under twenty-five hours of auditing, if we're really in there. We'll keep the most flagrant rudiments in, don't you see? But we haven't noticed this hidden standard yet. And then we assess the pc on the Prehav Scale, and we run the pc on the Prehav Scale, and we run the pc and we run the pc and we run the pc and nothing happens. Well, there's where it'll show up.

See, we can do the action of finding a goal, because the pc's attentions are very, very solidly on goals. We can certainly find the action of a terminal, we can find this terminal, because we actually haven't really asked the pc to do an auditing command. It's all between you and the meter, see? We can find the assessed level of the Prehav Scale very easily, but now we go into the repetitive auditing command and the pc goes on auto.

Why does the pc go on auto? Well, the pc's got a hidden standard. The pc is auditing himself on making his nose well. Pc is not running – *not at all* running the terminal of a railroad engineer. He's running a nose. And so he doesn't go Clear.

Now, very often, in worse cases, the pc will be very resistive toward an auditor's inquiring questions. The auditor says, "What are you doing? What did you do with that auditing command?" You've all of a sudden got a knock-down, drag-out fight on your hands. Pc does not like you inquiring into it. The first time you ever notice anything like that, you say to yourself, "This pc has a hidden standard. Let's find out what it is."

Now, although you can find the person's goal, terminal and level, you actually can't *run* the pc on that in the presence of hidden standards. It is a waste of time.

Now, there's one earlier action that can be taken with the pc, that the pc *will* do and that will produce results. But there is only one earlier action can be taken before a Routine 3 assessment, and that is a Security Check. This can be done without knowing the pc's terminal and will produce lasting, excellent results. There is no other process – now we have all the facts in over the years – will produce easy and lasting gains on a pc. No other process will produce easy, good, solid, lasting, positive gains on a pc. You have a Security Check and you've got the assessment and you've got the running of the assessment.

So, this leaves us with a Security Check as a very powerful auditing weapon, because it will operate whether you're running the goals terminal or not. The Security Check will operate, and those gains you make with a Security Check will be lasting gains.

Hence, we divide up auditors into: Class I – run any process on which they have a certainty. This will probably be some kind of a control process, by the way. It'll be some cousin to the CCHs, if the auditor is wise, because that at least works out the control factors of the pc, and you do make a sort of gain. You're running in order, and something is going to happen with this pc, and it doesn't come under the heading, however, of a fast, easy gain. It is not a fast, easy gain. It is a lasting gain, but it is a hard, long gain, and that's all you can say for it. That's the CCHs, SCS – all these various things. They are long, hard, arduous things to handle, and they do produce a lasting gain, but at what cost! So it doesn't come under the heading of a nice, easy, stable gain achieved by the auditor at all.

But Class I Auditors had better be employed, even though it is very hard to achieve a long, lasting proposition. No matter how arduously, they had better be put to work doing
some auditing, because any auditing is better than no auditing, and this type of gain will be quite beneficial in the long run, and so forth. And this argues that a Class I Auditor is doing something, as long as he's doing one of these types of processes.

All right. We move up to Class II Auditor, and a Class II Auditor can security check. All right. Security Checking produces a lasting gain, and it is very easy. It is very easy to do. It is very nice. It is very – very fast, and it is a lasting result. So we have the Class II Auditor doing Security Checks. And actually when we're talking about the hidden standard, and that sort of thing, we can envision that a Class II Auditor would have set up a pc on the basis of having gotten rid of all of his hidden standards. And that's what we look to a Class II Auditor to do – not just to sit there and prate off a Sec Check 3.

We're asking him to do something else. We're asking him to sec check in the direction of getting rid of all of the stuck points in this lifetime. We're asking him to get rid of the confusions of the first, second, third, fourth, fifth and sixth marriages. We're asking all of the… We're asking him to get rid of that crooked neck. We're asking him to get rid of the odd habit he has that every time you say something to him he goes drrvvvkh! It seems rather odd this person would do that, you know? Because you haven't asked him to smell a thing. In other words, these things all surrender to Security Checking. All of them, now, the lot. But what kind of Security Checking does it take? Well, it takes a standard Security Check. That is always a good thing to bang into a case. The first and foremost thing you do. That's a good thing – just go on and pick out the probable Security Check.

Let's take an old-time auditor, he's been knocking around and into God knows what. Well, the first Security Check we want to shove into him is the last two pages of a Sec 3, plus Sec Check 6. There's no reason to do the first many, many pages of 3 or do anything very fancy, because he's not going to get any benefit of something that he has overt on, and so on. So let's get that out of the road.

And now having done this, let us get clever and apply this data about the stable datum and the prior confusion. Now, this is different than the stable datum and the confusion – the idea that we get all of the stable… we get all the confusions off the case and we will of course knock out at once all of the person's activities, and so forth. No, isn't quite true. We have to knock them out selectively – has to be very selective.

So after you got the last two pages of a Form 3 and all of a 6 done, you should roll up your sleeves at about that point, and let's go for the hidden standards. Let's find out if there's anything by which this person measures gain or no gain.

"What would have to happen for you to know that Scientology works?" That's the clue question.

And you get these things, and sometimes these things are detached things. Sometime these things are "Well, my mother would have to get well." Well, he doesn't really mean – perhaps he does, but he really, probably, doesn't mean – that his mother would have to be sold on Scientology and brought to an auditor. No. The auditing command which he is doing, if applied to himself, would have to cure his mother. You see, he often means that, too. So this idea, this… he says, "Well, my mother would have to get well." Well, this is marvelous. It means his mother is a stuck – a stuck chronic somatic. [laughter]
Now, the way you would have handled this in the past – the way you would have handled this in the past is not the fastest way to handle it. You could have handled it in the past, and it would have worked out all right in the past, but that is not the fastest way to handle it. I'm just giving you a much faster method.

When did this occur that Mother became a stable datum? And what confusion preceded it? Ahhh. In other words, we don't run O/W on Mama, and we don't security check Mama, and we don't have very much to do with Mama. We want to find out what happened before Mama became a chronic somatic. Because Mama is a stable datum for a confusion before the fact of accepting Mama as a stable datum. There's some confusion prior. Remember, it's always prior.

Let's reorient your thinking on this. Now, the fellow says, "Well, uhhh... I just have to get over hating my father. That's what would have to happen. Yes, sir. To know Scientology worked, I'd have to get over hating my father."

"Well," you say, "that's good." So obviously you can do something about that. You do a Security Check about his father. That's obvious, isn't it? This is past thinking on it. And you get all of his overts against his father, and all of his withholds from his father, and you clean up Father. And what do you know? You could do it, too – I mean, you could have gotten a long way in this direction.

Ah-ha, there's a much faster method. Let's find out what happened before "hating Father" became his stable data in life. "Hating Father" must be an activity he can confront, as a retreat from earlier activities he can't confront. And they probably have nothing to do with his father. Hatred of Father was much more acceptable to him than the tremendous confusion he had with, who knows? Probably not Father. Who knows who it is? Lord knows.

So, what do you do? You assess. And you find the area of prior confusion to the hatred of Father. Now, at first the pc is going to tell you it's something that Father did, and it's something that had to do with Father. But remember, it can't have anything to do with Father if Father is the stuck somatic. Can't have anything to do with Father, you see, if Father is the stuck personnel. If Father is the broken leg on this case, it hasn't anything to do with Father, because he can confront Father. Well, if he can confront Father and he's spent all these years confronting Father and so forth – it hasn't got him well – why do you, in an auditing session, put in more hours confronting Father? Waste of time, see?

No, let's find out what happened before this occurred. So you'd want to know, "When did you notice that you hated your father, and what happened before that?"

First answer, well, inevitably, "My father did this, my father did that."

And you say, "Good, fine." Give him a cheery old acknowledgment and then find out what happened before that with other people. Oh, you find out his old man hasn't been anybody – man, his old man has been nobody in this fellow's life. There is some kind of a person on a broomstick that has been flying around in this person's belfry.

You know, as a child, why, this person would see – well, maybe it was his father's mother or something, you know? And the child would see her sitting there quietly knitting and rocking in the rocking chair or something, and he absolutely just couldn't resist, you see,
spilling the cat on her, or you know, or pulling up the ball of yarn, or somehow or another stealing all of the bread dough, or putting salt in the plum pudding – just anything, see, anything. And you'll find that these are overt, but they won't come through that way at all.

He will finally recover the character on the broomstick, see? Total occlusion. Recover this character on the broomstick, and you will try to do a Security Check on this, and "She beat me and she socked me and she used to hold me over the well and say she was going to drop me..." And he'll just go motivator, motivator, motivator, motivator, motivator, see? Of course. Why? Because he can observe the inflow, but he can't observe his outflow.

Yeah, but what did he do? That's what's getting interesting here. What did he do? Did he steal her broom? [laughter] Because you'll find inevitably that this is what happened. So you make up some kind of a roster of the personnel involved prior to the stuck personnel. And you make a roster of the "missing persons bureau." And your little list is a "missing persons bureau." And boy, you're really going to find missing people. Pc doesn't even know they exist. There's going to be sections out of his life he don't know are gone.

And you're going to find those sections and find out who is in them and then write up a Security Check – any old kind of a Security Check – to find out what he did to them; these other people, not Father. Skip Father; he was a confrontable character. Why bother with Father? Just a waste of time. That's what the pc is complaining about.

Now, whatever the pc complains about, do something earlier. There is your stable datum. Whatever the pc complains about, you do something earlier. And don't pay any attention to handling the object about which he is complaining. You pay attention to his complaint. But if you continue to handle the object about which he's complaining, such as his big ears, why, you're not going to get anywhere. He's complaining about big ears. "Well, I'm seeing... Every time I..." You find out every time he answers an auditing command that he finds out if his ears shrunk.

"Oh, well, I have had big ears for some time," you see? That's your inevitable reply.

Now, if you get a reply of this character which is a non sequitur, you know you are on to a hot area of disturbance, because the pc's attention went onto it, and then flik! – came right up the track to the big ears. Your effort to put his attention on the area of confusion results in putting his area on the object. Whenever you try to put his area on the confusion, and then you only succeed in putting his area – attention on the object, you know you've got it made. You know you're looking at one God-awful area of occlusion.

You say to him, "When did you first notice that you had big ears? When did you notice that you had big ears? When did you notice this?"

"Oh, well, I have had big ears for some time," you see? That's your inevitable reply.

Now, if you get a reply of this character which is a non sequitur, you know you are on to a hot area of disturbance, because the pc's attention went onto it, and then flik! – came right up the track to the big ears. Your effort to put his attention on the area of confusion results in putting his area on the object. Whenever you try to put his area on the confusion, and then you only succeed in putting his area – attention on the object, you know you've got it made. You know you're looking at one God-awful area of occlusion.

You say to him, "When did you first notice that you had big ears? Now, what happened before you first noticed you had big ears?" Any such question.

And he says, "Well, I've just worried about it for years – my big ears."

Well, now, you see the mechanism at work? You asked him about a time before "big ears," and he answered "big ears." So it's obvious that his attention deflected from the area
you tried to put his attention on. You have located a hidden springboard. He doesn't know it's there, but you now do. He coasts right up the track to it. Every time you put that hull in the water it goes straight to that particular dock with a crash. It won't head out to sea. It won't go anyplace, you see? You just put it in the water, and it hits this dock. "Father" or "ears" or something, see? Bang! And there it is.

You say, "Well, now in your – in your early life, what went on there? What went on in your early life?"

Now, this would be just asking for a whole bunch of balderdash. Now, it'd take an awful lot of millions of words for the pc to tell you every single, horrible thing that's been done to him in his early life. There's no sense in having much of a synopsis on it. It's up to the auditor to continue to direct the pc's attention where he wants the pc's attention directed, not to listen to a recount – a blow-by-blow recount – of all the beatings the dock gave him. See, that's silly, because that's all he's going to tell you.

He hates his father – this is his hidden standard – he doesn't feel better yet about his father, so not feeling better yet about his father, he knows the auditing isn't working. And you say, "Well, tell me about your early life."

So he says, "Well, my father… and he used to take me out in the woodshed, and then he did this to me and he did that to me. And he did this and he did that, and my father this and my father that." Well, are you doing anything for this pc? No! No, you're not doing anything for him at all, because you're leaving his attention stuck on a refuge.

Any chronic somatic, any stuck personnel, anything of that nature is a refuge on which the pc can put his attention. And you are not doing your job as an auditor unless you get his attention eased over onto what makes him stick his attention on it. And you do that by a gradient scale, and the pc can get very restive if you jump your gradient too hard.

So you say, "All right. Big ears. Now let's see. What happened just before you noticed that, or when did you notice that you had big ears? Tell me a time you noticed you had big ears. What's some early period when you noticed that?"

And the pc says, "Well… uh, well… uh, well… uh, well – well, I was working in London for an attorney's firm. I used to notice it."

"Good." You say, "Is there any earlier time than that?"

"Oh, well… no. In the attorney's firm…"

Oh, well, hell, you got his attention stuck there. And you say, "No, earlier – earlier than the attorney's firm. What'd you do earlier than that?"

"Oh. Oh, well, what did I do earlier than that? Uh… I don't know! What did I do? Let's see now. I went to prep school, and then I went to college, and then – so on, and that was 1952. And I got out of there, and then '52 and then 1955… 1955, and I went to work. Yes, it must have been '55 I went to work – I remember that, yes. It was '55. Went to work for the attorney's firm in 1955. And I got out of college in 1952."

"Oh, good," you say, "well, what did you do between '52 and '55?"
"I just don't know. Now let's see, what did I do? No, I – I met a girl. Ah, yes, I remember now. I met a girl, and she… uh… yeah, I met this girl and she had a boyfriend. And we had an awful… No, that was '58. Let me see, No, no. I – I'll get it in a minute. It's 1952, 1955. Now, there's a period of three years. Now, let's see. After I got out of college, I must have gone home for a little while. And then I must have done this, and then I must have done that, and I must have done something or other – probably. Yeah, I'm sure I must have done something like this, because, you see, you just wouldn't ordinarily just go from college to an attorney's firm.

"Now, let me see. Oh, I know. I had an awful fight with a fellow. Yeah. Oh, that was pretty terrible. We met down in this bar, and he had some kind of a criticism of me one way or the other, and we had this hor – . No, that was '57. No, no. That wasn't '55, that was '57."

And that's the way he'll go on. You understand? And you say, "Well, what happened in this period of – anything that might have occurred between 1952 and 1955?"

"Oh, uhh-uh, ruh, ruh, ruh, ruh-ruh, ruh, ruh-r."

"Well, did you ever think about big ears before 1952?"

"No, no, no, no, no, I didn't think about that before 1952," and so forth.

"Well, did you – you think about big ears after 1955?"

"Well, yes. Oh, yes, oh, yes, all the time. Used to sit there at my desk with ink all over me, and I used to sometimes get it on my ears, and they used to call me 'ink ears' sometimes, and so on… That was probably it. Actually, the firm really hated me. And the senior partners…" this and that.

You say, "That's good. Thanks! Good! Good! Good! Fine! Thank you! Thanks. Good. All right, now. Good. Now, we want '52 to '55. Now, who did you know in that period?"

"Well, I must have known my father and mother." [laughter]

"All right. Well, who introduced you to get work at the attorney's firm?"

"Ah… must have been some connection with my father."

And you know, you're liable to find some damn-fool thing like a marriage? [laughter] You're liable to, man. You're liable to find anything. But you will find something, and it'll be a period there of total occlusion.

What you're trying to do is not necessarily solve the big mystery of it all. If you were very clever, you could do the whole thing by assessment. On the meter, one of the ways you do it by assessment is "Well, '54. Did you have a long vacation there after you left college? Was it two years? One year? Six months?"

"Oh, I went to work, something of the sort. I was doing something. I'm sure I was doing something. I must have been doing something. Over a period of three years a young man doesn't do anything, you see? And I went up… I'm sure. Yes. Yeah. I'm absolutely sure. No."

You finally dredge up a name, Agnes. Ohhhh, Agnes. Ahhhh. All right. Now, in essence, as much as you can find out about Agnes, you just do it on an interrogation basis and
assess "The worst confusion you ever had with Agnes. When is the worst time you ever had with Agnes?" and so forth. And this finally peters out and you find Agnes is just a red herring. She's hardly a girl at all, and in actual fact it was Isabel.

Isabel turns up along about this time, and now we have got a honey by the ear. And we find out that she used to stand there constantly, and say what she said, and she used to do this and do that, and she was the one who got him arrested. Arrested? [laughs, laughter] Where – where – where the hell did this come from? Don't you see? We don't find out, usually, anything about big ears. Agnes never said anything about big ears, nothing of this sort, but she went off with a boy who had big ears. And Isabel – Isabel, she went off with a boy who had big ears. Something stupid like this. So big ears got to be something in here. And in some of the wild, devious way that all of a sudden works out and becomes completely sensible, we find out how he wound up with a stable datum of big ears.

This person says, "Well, I have a ball of light and it is just back of my eyeballs, and when the ball of light glows, then I know the auditing question worked. And when it doesn't glow, it didn't work." You want to find out, "When did you notice this?"

And then you want to find out what happened before that. "Now, what happened before that?"

And the person said, "I… well, I haven't got the faintest idea. I'm… Let's see, now. What happened before that?"

And we run into some kind of a blank period. Then all of a sudden, marvel of marvels, we find out that between 1945 and 1948 the person was deeply immersed in the Temple of Black Magic, someplace or another, and all this seems to have dropped out of sight. And what they did, really, there, was "see the light." And he's been seeing the light ever since, but it was one awful confusion. Because after the police raided the joint, you see… It wasn't so much that, it was being sued for being the father of the child. That was what got him.

But all of this has been fantastically occluded, you see? And all of these stable data that the person has lead back to a prior unknown, and it's just the not-know followed by the know. It's the confusion followed by the stillness. The confusion, then the stillness.

All right. Now I'll give you something I've got some kind of a reality on. It works like this: You find the bird… This works out on a broader track basis. You find this pc standing on a rock in the middle of the sea waiting for somebody to pick him up. And he has this pain in his stomach, and he had that pain in his stomach for many lifetimes. Many, many lifetimes he's had the pain in his stomach.

And you say, "All right. Let's run this out." So we run him standing on the rock in the middle of the sea. And we – I guarantee you – we can run it and we can run it and we can run it and we can run it and we can run it, and he will still have a pain in his stomach and still be standing on a rock in the middle of the sea. And this is the old engram that wouldn't resolve.

And this is why finding the earlier on the chain resolved the later engrams – the engrams that wouldn't erase: Because, of course, in finding the earlier engram you accidentally went across the confusion, and you got the confusion knocked out. Well, there's nothing precedes that incident that's hardly worth recounting, except mutiny, shipwreck, sudden disaster,
halfdrowning seven times, and there's something kind of strange and spooky about the whole thing. And then we finally find out that he's standing on the rock without a body and hasn't noticed he's dead. And this finally resolves the whole thing.

Up to that time he knew all about it. But trying to get his attention immediately before the incident when this occurred will be one of the tougher jobs, because you say, "All right. How did you get on the rock?"

And he says, "I was just standing there. Well, I must have gotten there some way. Uh… oh, I get a picture now of the surf. I must have come to the rock through the surf."

Well, any fool could tell that, man. He didn't land there by helicopter, that's for sure. But he'll make these suppositional actions.

Now, a person trying to do this, all by himself, begins after a while to appreciate an auditor, because his attention is pinned in a certain category. And as it tries to go back to areas that are unknown to him, it of course deflects onto the chronic somatics. So he tries to put his attention back on this and then comes up into the chronic somatic, and then he's stuck with the chronic somatic; his attention is on it, so he starts auditing the chronic somatic, and he never does put his attention back on the earlier incident, see? So he leaves himself stuck with chronic somatics.

See, his attention goes back up, and he needs an auditor sitting there to tell him to put his attention back again. You know? "What happened before that? What's the worst kind of motion you possibly could experience on a ship?"

"Well, it wouldn't be a ship. It'd be a submarine. I don't know why I said that."

"Well, what's the worse kind of motion you could experience on a ship?"

"Well, being torpedoed by a submarine. Let's see. Or torpedoing a ship by submarine? Being torpedoed by a submarine. Let's see, torpedoing a ship or a ship torpedoing you? No, a ship wouldn't torpedo you, you see? And the ship… It's the worst kind of motion… worst kind of motion… Be standing on a rock waiting for a ship to come in."

That's exactly where the attention goes. Then he'll get all interested in the thing. "Worst kind of motion. Let's see. Well, what might have preceded that? Must be some kind of bad motion."

"What kind of a bad action could a person perform that that would pay for?" You know, asking him for a direct overt – just suppositional.

"Oh, oh, oh, well, you've really asked one now, you know? I get a picture of a foredeck of a galley. And all the galley slaves are there. And they're all chained and their blood is running down underneath the fetters. And the overseers walk up and down the ramp, and the whips go wham! you see, and so forth. And in a battle, in a battle, when they start throwing Greek fire in amongst the galley slaves… No, that was much earlier. That isn't the same period at all. I got that." [laughs] "That was much earlier. Much earlier."

And you say, "Well, how much earlier was that?"
"Well, that was another lifetime. That's a completely different lifetime. I don't know what I was doing in this thing. It just seems kind of blank, the whole thing seems sort of blank. There's this sailing ship, you see? And it's sailing along, and I think I actually stood on the rock, and I managed to coerce a ship to come in and wreck itself on the rocks. Or maybe… or maybe…"

And we finally find out that it wasn't very dramatic. He just got dead drunk as a Captain of a ship and ran it square aground on the rocks and killed off all the crew, and they all died in the jagged reef, and they were all screaming around him and so forth. But it wasn't so much that. He had stolen the ship and was guilty of barratry.

Oh, we're getting someplace now, yes. Actually, he had murdered the owner's agent the second day out of port. Now we're getting someplace. And the next thing you know, he isn't standing on the rock anymore. See what happens? You get the overt and that sort of thing off on the prior confusion and it blows. And that is the end of standing on the rock.

But the more you Q-and-A with the pc and let him stand there on the rock, the less you're going to get done. It get pretty obvious? The less you're going to get done.

Now, you can keep chasing a pc's attention back, back, back, back, back, back, back, and wind him up at the beginning of track, probably. Of course, that's a kind of a Q and A, too, because that's a method of not confronting. He puts his attention on an incident much earlier that he can confront, rather than confront the incident immediately before. We're much more interested in that span of time just before, that seems so mysterious, and that keeps landing him back on the rock. That's the period we're interested in. We're not necessarily interested in his whole career as a space commander. We're not interested in that period, because space commanders very seldom take ships to sea. All right. So what we're interested in is the period which we have encountered.

Now, you're going to find this technique very interesting in the handling of engrams, just to branch off on to something else. You're going to find this very, very interesting.

When you've got a person's hidden standards and he's been running well, and he's running his goals terminal on the Prehav Scale, and you get up to Class IV-type auditing and you're going to run some engrams, you find these are usually very easy engrams and you haven't got to resort to very much trickery to run them. Because the pc, with the rudiments in, he's in valence, he's already contacted these pictures many times as he runs up and down the track; and you find out they kind of run like hot butter. Take about a half an hour to run one of the things, an hour and a half. Three hours is the longest I've had so far. And they run very easily.

But let's suppose in some peculiar way that we didn't really get this thing wheeling, and the person seems to be stuck in it, and there's a hell of a "burp" someplace in this engram we're running, you see? And the person goes… every time they go through this area, they go "burp." And every time they go through the area, they go "burp." And we're having trouble running the engram, we should assume that something confusing happened just before that, and try to get that up rather than try to knock the burp out. Get the incident just before, and he will blow whatever is hanging.
Now, of course, the whole engram is hanging up, isn't it?

Now, how does a person get stuck on the track in the first place? Oh, let's ask a much more important question than that: How does a person get on a time track in the first place, and what are you doing on the time track in this universe? That's an interesting question. Why are you plodding along the time track with such orderliness? Could it be that there's a confusion at the beginning of track that you can't face? I find that a very fascinating question. I won't bother to give you any answers to that particularly. But what is time? Time very possibly could be retreat from a confusion we cared not to confront. So we retreated en masse and have been going ever since.

But that gives you, now, a basic rundown on the prior confusion – trying to find the prior confusion to find the stuck datum. A person's ability to confront confusions, improved, of course will blow a lot of chronic somatics. But I wouldn't count on it. I wouldn't count on just improving their ability to confront and then having it all work out magically. I would much rather that you just sawed into it from the word go and picked up these things and blew them selectively, one by one and very intelligently. Because a goals terminal run on the Prehav Scale will give them lots of confrontingness and it'll give them lots of changes and that sort of thing, and you're much more interested in that.

Trying to run a person, though, with a present time problem of long duration – one special kind of which is a hidden standard – trying to run a person on the Prehav Scale with five-, six-way brackets and that sort of thing is highly profitless, because the pc never does the auditing command.

When analyzing whether or not a case is running, look to find out whether or not the pc is materially advancing, the sensitivity is coming down and the needle is getting progressively looser.

All right. That all betokens advance of the case. Now, we go just a little bit further than that and we say, if the case has not gone Clear in 150 hours of Routine 3, which includes, of course, Security Checks and assessment and runs, we'd better say to ourselves right about there, this case has never done an auditing command. This case has done something else, too, or has done something else, or has not done it at all; and before that time – that would be the ne plus ultra of being kind of stupid to wait that long, now that we know this.

But if it did reach that time, then we would say, well, there's hidden standards here, and we would determine what they are. And determining what they are, we would get rid of them on this basis of a prior confusion or any refinement thereof. We'd blow these hidden standards. We'd straighten out these things. We return to a goals run. If the case still hung up, we would suspect another hidden standard. We would blow that and go on. So it might be a very good idea to blow all the hidden standards that you could blow on a case before you do very much worrying about the case getting on the way with a goals run.

In other words, by all means get their goal. By all means, get their terminal. By all means, assess a level on the Prehav Scale. By all means, give them some running on this sort of thing.
But on a Security Check angle, first, let's get off those last two pages of Form 3, and let's get off all of Form 6 on an old auditor. On new people, let's straighten up Security Check in general, let's get this pretty well ironed out, and then let's find out if the person has any hidden standards. And then let's undercut those by finding the prior confusions; let's fill in these blank spots, at least in this lifetime. Let's get them sailing so that they can actually do a straight auditing command. And then, doing that, you'll find you make very rapid progress with clearing.

All summer and all last spring, I've just been working on speed of clearing. That is all I've been working on. And this is another seven-league-boot stride in that particular direction.

Thank you.
MORAL CODES:
WHAT IS A WITHHOLD?

A lecture given on 4 October 1961

Okay. And this is the 4th – 4th of October.

By the way, Special Briefing Course, Saint Hill.

If I can remember all this, I'll give you the whole rundown on overt-withhold and how it got that way and then you will be much smarter cookies. [part missing] I mean that. If I can remember all the put-together, how it goes together. Because, let me tell you, it's complicated – very, very complicated.

Told you some time ago, this is very apropos to a Class II Auditor; this is part of Class II Auditor skills. This should be known and known very well. This should be understood. And if you're ever going to make anything out of a Security Check, if you're ever going to get any advances with a Security Check, you'll have to know this sort of thing.

It is not enough to be able to sit there and say, "Well, have you ever raped anybody? No? Well, have you ever raped anybody? You haven't... Have you ever raped anybody? Good. Have you ever raped anybody? Good." Keeping TR 0 in, of course. [laughter]

That has very little to do with Security Checking. Security Checking is not a repetitive command. You ask the question, you get the answer and you get off the withhold.

But what's a withhold? What is a withhold? Well, you just about to find out. And it's a good thing, too, because I'm saving your bacon in the nick of time. I come in here, I find Mary Sue tearing your scalps off on the subject of it, and what have you been up to? Of course, she must have found somebody auditing on this basis: "Well, have you ever done anything to a fellow staff member?"

"Well, yes. I heard that Joe went out with Bessie."

Oh, no! Now, your first order of business as an auditor is to get an answer to the auditing command. And will you tell me how that is an answer to an auditing command? "What have you done?" "I heard that..." He hasn't done anything! How can it possibly be a withhold?

I'd put another question: "Have you ever ruined people maliciously by gossip?"

*Clang, clang, clang!* "Yes." Correct, they have.

SHSBC TAPES 001-100

1364

04.02.15
Do you know people will make up withholds just to get other people in trouble? And you're going to sit there and let them do it? And you're going to hear people saying things—people that have heard things about people who heard things and they understood that something and they knew that so-and-so—and you let them get this off as a withhold?

Well, what auditing time are you wasting. Well, you're wasting your own time and you're wasting the pc's time. And basically you have demonstrated that you don't know what a withhold is, but that is excusable up to this moment. One hour and a half from now it begins to be a crime. See, it's not a crime for the next hour and a half, but an hour and a half from now, the cat will be out of the bag. Only in this particular instance, it is a rather big cat, about leopard size, that is leaping out of a rather big bag, because this is one of these jackpots that we hit every once in a while in Scientology.

You know, you pull the lever expecting to get out a couple of quarters, and florins, shillings, sixpences, so forth, cascade out on the floor for a half an hour. I mean, that's the sort of a thing which has just occurred here. And those of you who haven't been to Las Vegas can ask those who have what I meant.

What's a withhold? What's an overt act? It's important to know these things.

Mr. Doakes sits down in the auditing chair—because you, of course, being a pc, don't pay much attention to auditing—he sits there and he says to you, he says, "Well, I have robbed banks—uh—murdered women—uh—strangled babies—uh—embezzled it, yes. I—uh—ruined marriages, I did this and I did that," and you don't get a single knock on the needle.

Oh, you say, this person is not security checkable. Aha! But from this moment on you're going to see that there is no such thing as a non security checkable person. Because you're going to say that this pc you had is not capable of registering on the meter, because obviously these are tremendous things. They're social transgressions against your code of sociality to a point where, God almighty, he should be shot, put in a straitjacket, given a pill by a medical doctor—most horrible things happen to him. Why? Because, look, he's robbed banks and murdered women and so forth and you don't get a single knock on the E-Meter.

You say, "Well, the man is conscienceless. Therefore he has no withholds." Aha, and that's right—against your moral code, he has no withholds, because they were not transgressions to him.

Now, your task in doing a Security Check is to get off withholds. But what is a withhold? What is a withhold? Now, you could say grandly, "It is what the preclear is withholding." You could say, as we have been saying about an overt act, "What is an overt act? An overt act is what the thetan thinks is an overt act. Therefore, if I do not think I have committed an overt act as I strangle this person or that," you see, "then I have not committed an overt act," you see?

No, those are not adequate replies, and those are not adequate definitions, and those are not adequate answers, and they do not add up to useful, workable definitions in the field of auditing I think you will agree with me that you, yourself, have been puzzled about this.
How is it that one person gives you some kind of a stuff and it's not a withhold, and yet says, "Well, I – I looked down the road." you know, it's clang! You know, you got clang!

And you say, "What did you do? What is that?"

"Well, I looked down the road," and it cleared.

And you say, "Well, what kind of a withhold could this be?" you know? "There must be more to it." And of course you immediately exceed your function as an auditor, which is to clear the meter. If "looking down the road" cleared the meter, that was a withhold.

Now, what puzzles you is that you're fixed on a moral code, or lack of one, which is yours, circa now. And you consider that the pc that you are security checking only has withholds if they are transgressions against the moral code which you consider a moral code – now. And therefore you just make fantastic numbers of mistakes. See what I'm talking about?

All right. Now, let's take this criminal. Aha, this criminal. And we've got him on the meter, you know, and we say, "Well, have you ever –?" You know what a criminal should be security checked at: "Have you ever robbed a bank?" Clang! You see, you would think, boy, that's going to go clang! You know, because we know he's robbed a bank. He's actually been in Joliet, and Columbia University and other prisons [laughter]– obviously he has. And you get not even a twitch of the needle. And he looks at you blandly and says, "Yes, I have robbed banks."

Well, you see, what is astounding you at that point? There's only one thing that is making you astonished: is that he has said something that is a transgression against what you think is his moral code, you see? And therefore you go on security checking him against your moral code, and that isn't the code he lives by. And he is not free of withholds. He has tremendous numbers of withholds, but only against the moral code he lives by. Did you ever hear the moral code of a criminal? "Thou must not squeal to the cops." "Thou must not peach." You could write up a long one all about how "after you've robbed the bank you must equally share, except if somebody didn't help you rob the bank very much, and then you should cut his throat." "Not to kill a cop," could be against that moral code in some societies.

So that you ask the question from the bearing of your current moral code, and you say, "Have you ever killed a policeman?" And there's no fall. You're checking on the wrong moral code. You're checking a pc who has a different moral code.

The question should be, "Have you ever had an opportunity to kill a policeman and failed to do so?" Clang! See, it's against his moral code not to kill a cop. Other criminals wouldn't speak to him. Do you follow this?

In a prison, you'd have to security check along these lines: "Have you ever failed to keep a guard in the dark as to what was going on?" See? "Have you ever cooperated with prison authorities?" "Have you ever told the truth to any official?" "Have you ever spoken to a screw kindly?" [laughter] Because it's against the moral code of the prisoners and they have their own moral code.

You can say, "all PCs have withholds," but these withholds are not necessarily against your moral code. So we add to it: "all PCs have had moral codes against which they have
transgressed." And when you locate the moral code against which they have transgressed, you will then get off the withholds of the case and only then will you get off the withholds of the case – only then.

A withhold, then, is an unspoken, unannounced transgression against a moral code by which the person was bound.

Now, how many moral codes are there? How many moral codes have there been? I'd say circa right now, there is probably a different moral code for every group, each one, large or small, in every city, county, country, continent of Earth. There's probably five hundred of them for every language there is on this planet and there are fifty thousand languages on this planet.

I'll give you a moral code question to a Zulu: "Has anything ever been lying around loose that you didn't steal?" Clang! "Who didn't you tell that to?"

"I didn't tell my father. I wouldn't dare. He would beat me." Because it's moral for a Zulu to steal. Interesting, isn't it? So not stealing is his withhold, and you think his stealing would be his withhold. So you ask for a stealing withhold and you don't get any response and you should have been asking for a not-stealing withhold.

Therefore it is incumbent upon the auditor to have some idea of moral codes. What's a moral code? We'll get into that in a moment. But how many more moral codes do you think there have been? Now look, if circa right now there are possibly a hundred or five hundred of them for every language on Earth – let's be moderate about it – and there are fifty thousand languages on Earth, that gives you quite a few right here in present time, right? All right, let's go back on the track. How many moral codes do you think there have been on the whole track in the last two-hundred trillion years? How many moral codes do you think there have been? It is some unimaginable number. You could start up in the corner of this wall and start writing – after you put down one, then just start writing zeros in tiny microscopic writing clear from that side of the wall, clear to the other side of the wall; go back to the beginning, write it all the way across again and then when you've filled the whole wall down to the bottom, then you put it twenty-first power. That would be quite a number. That would be quite a number. Now, that is an awful lot of moral codes.

So, what's the anatomy of this? What is a moral code? It is that series of agreements to which a person has subscribed to guarantee the survival of a group. And that is what a moral code is. It's that series of agreements to which a person has subscribed to guarantee the survival of a group. That's what it is.

All right, I'll tell you an old short story. This is the most vignette sort of a thing. There was a couple of fellows and they heard there was a buried treasure. A galleon had gone up on a reef down in the South Pacific or down in the Caribbean. And they heard this galleon had gone up on a reef and that there were – just before it sank they threw a tremendous amount of gold into its bronze guns, hoping they could come back for it later and put the tampions on the guns. And the galleon sank and these great, belled cannon were still down there filled with gold. So a couple of men got together and they picked up a native boy and they – as a crew – and they sailed away and they dived and dived and dived and dived for this old galleon's cannon.
They had agreed a hundred percent what they would do with the gold. They had agreed completely what they would do with the gold. They would split it equally and the shares would remain on board the ship until they were taken to a certain point and at that point a banker and trucks would come down to pick it up and it would be transported properly to Switzerland. And they had agreed utterly and completely; they knew exactly what to do. And they had agreed also not to squander it and not go getting drunk and not go doing this and not go doing that, until it was all safely cared for and they were back in their own country. They'd agreed what to do about the bills of their trip. They had it all taped.

Well, they found a couple of cannon, but they reached their arms down the muzzles of the cannon and they couldn't find any tampion. And they went ashore after many days – their supplies were running out, everything was going to hell. And the supplies were running out and what were they going to do? They hadn't found any gold.

Well, they had an agreement for everything except failure. They had no agreement as to what they were going to do if they failed, so they began to wrangle about it after the fact. And they got more and more wrangling and more and more wrangling and finally one of them picked up a dirk and sank it in the other one and the other one simultaneously lopped off the other fellow's arm with a sword. And they had an awful time because they didn't have any agreement at all what to do in case of failure.

And about that time, as one of the fellows was dying, he looked back at the boat and these guns that they had already hauled up on deck, the backs had evidently fallen out of them, being rolled around by the native boy and the native boy was throwing handfuls of gold into the sea.

But they had no agreement on failure. And you'll find out that man has learned down the track, in weird ways, that where he has not agreed upon codes of conduct or what is proper in eventualities – he has agreed – where he has agreed, he survives, and where he has not agreed, he doesn't survive. And so, people, when they get together, always draw up a long, large series of agreements on what is moral (that is, what will be contributive to survival) and what is immoral (what will be destructive of survival).

Now, moral, by these definitions, are those things which are considered to be, at any given time, survival characteristics. A survival action is a moral action. And those things are considered immoral which are considered contrasurvival.

But remember, this is for any group in any special circumstance. And here you have a group of two men going out to find gold or a whole nation being formed after the conquest of the land from some other race. It doesn't matter what the size of the group is: They enter into certain agreements. Now, the longevity of the agreement doesn't have much to do with it. It could be an agreement for a day, an agreement for a month or an agreement for the next five hundred years.

There's a Constitution in the United States that is an agreement. It was an agreement made by thirteen states as to how they would conduct their affairs. Wherever that Constitution has been breached, the country is now in trouble. There mustn't be any income tax, the first one said. Well, they managed to muck that up and they managed to muck up another one and
another point and another point and another point. And each time they have busted up the agreement, why, they're in trouble.

Well, why are they in trouble? Well, that's because there aren't any other agreements than the basic agreement. You don't have modified agreements. If the agreement didn't exist in the first place, you can't keep patching it up and expect any great, lasting success. But what I have just said is to some degree a matter of opinion, because moral codes either leap full-armed from the brass tablets of Moses as he walks down from the rain and the mist saying, "Thou shalt not sell pork to thy neighbor. Sell it to a stranger if it is tainted."

You didn't know that was one of the Commandments, did you? But I've mentioned it before that it happens to be there. There are about 162 of the Ten Commandments. And they contain all sorts of interesting bric-a-brac. But that is just a moral code.

Now, perhaps that was fine, and everybody got along fine with these first 162 precepts or principles and so forth and then somebody came along with a pitch and put a big curve into the line and altered the agreements and redefined it all, you see? And after a while nobody knew what was moral, so it got to be a confusion. And then everybody tried to enforce what was moral and what wasn't moral, but nobody could make up his mind. And the confusion got greater and greater, and then people departed from the group and dispersed. And these people, dispersing, entered into other moral groups and new moral codes were formed, which they then followed, more or less.

And eventually those moral codes, of course, got diluted and messed up. And time marched on and what did we then find? All kinds of confusion would then enter in to what was moral and what wasn't moral. And the next thing you know, somebody would jump up and a group would get together and they would agree on a brand-new moral code, you see? And then that moral code would get all messed up somehow or another, and people would offend against it somehow and then that group would disintegrate – because, of course, its moral agreement disintegrates, why, it – the group disintegrates. And then that confusion is succeeded a little later on the track by these various group members, now members of other groups, forming up new moral codes which go into disintegration. You see?

So you've got a cycle there. And the cycle of action of civilizations is simply this cycle of action: It is an agreement on optimum conduct; a disintegration of agreement and optimum conduct; a disbanding of the group; a formation of a new group with the agreement on – new agreement on – optimum conduct; a disintegration of that agreement; the dispersal of the group; the formation of a new group. Do you see the cycle? Now, that's the cycle of civilization. And that's the cycle of action.

The create-survive-destroy, in this particular instance, is, of course, they create a series of agreements and conducts of what is right and what is wrong. They establish what is right and what is wrong, what is moral, what is immoral, what is survival, what is non-survival. They establish this thing. That is what is created. And then this disintegrates by transgressions. And these transgressions – unspoken, but nevertheless transgressions – by each group member gradually mount up to a disintegration.

And the person who transgresses the most, quite commonly can be the person who is up there screaming the loudest that the others must follow the moral code. You look at the
various Calvinist preachers and things of this character. Man, those fellows had a ball. Ten million withholds per preacher, you see, and they were screaming to the rooftops how everybody must follow the code. Of course, you get a disintegration after a point like that.

You see how this thing goes? So your "survive," of course, is as long as the codes or agreements continue in action. And then your "destroy" or your destructive confusion, of course, is what occurs when everybody has withholds, when everybody is going the other way to, token payment to the code but actually no adherence to it; everybody has withholds from everybody else concerning it. The group, of course, disintegrates on the basis that when you have overts, you have separation, individuation.

So the group disintegrates and you go into a new cycle now. It stays – sometimes they stay disintegrated for a year, sometimes for hundreds of years.

There are countries on this planet right now whose moral codes have disintegrated, who haven't yet formed a new one. Several Mediterranean countries have done this right this minute. They really don't have a new moral code; their old one is pretty doggone shot.

The white man, with "life, liberty and equality" as spread by Tom Jefferson and so forth, now, down in Africa, is experiencing the agony of having his moral codes, as natives, totally destroyed, completely. And everybody says, "Isn't this wonderful! Isn't this marvelous! Look, all we're doing for these natives," you see, and the natives are getting sicker and sicker and falling apart and they can't handle themselves or anything else. And everybody says, "Isn't it wonderful what we're doing. Look, we're giving them washing machines. Of course, they don't have any electric power in their house, but we're giving them washing machines! And look at the marvelous things we're doing here."

Well, the marvelous thing they're doing, of course, is disintegrating the moral code of the tribe or the tribal unit and bringing about a total disintegration of the individuals concerned with it.

Now, there is your general hue; there is the general state of affairs with regard to a cycle of action of civilization. Do you see how that went? You see how it goes?

All right. You in Scientology are involved right this minute in a certain mores. There is a certain moral code of one kind or another. Actually, it isn't completely formed yet. It is still in a state of formation. But one of the reasons why you find it difficult to process another Scientologist is not that his case is worse, but because you, when you flub, transgress against the moral code of "Thou shalt be a good auditor." That's it.

And because you are subscribing to a code of conduct that is survival, therefore, when you have overts against that code of conduct, it is the code of conduct by which you are auditing and progressing in life. So naturally, these things, then, take paramount importance in Security Checks. The last two pages of the Form 3, all of Form 6, when straightened out, will do more for a long-term Scientologist than anything else. Why? It's not that he's – why, he's been doing all these things in the name of helping people. "Well, yes," you say. "Well, he has a perfect right to go nattering around about, 'Well, Ron has changed his mind again!'" You know? You think he has a perfect right to.
Well, I personally believe he has a perfect right to, don't you see? I'm not upset by this in any way. I've been shellacked by experts, you know? And I can stand up to a lot more hurricane than somebody sitting back in a corner nattering slightly about something or other. "Oh, well, these bulletins aren't in order, you know? And Ron should have gotten these bulletins in order," you know?

All right. But it just so happens, by the principles of the thing, that the very fact that he is thinking them is a transgression against something he apparently has agreed to. All right, the transgression is such that it holds his case up.

It is the *current* moral code, then, which is the most important to the case. It is the code by which the person is now living which has dominance over all other codes. So we get a practicing Scientologist and so on and the first thing that we've got to do with him is straighten out his transgressions against the group agreement: "Thou shalt be a good auditor." "Thou shalt not flub." "Thou shalt pronounce thy commands properly." [laughter] Get the idea? And "Thou shan't get Scientology in trouble." You know? This kind of thing. Whatever these codes add up to, they are what they are, don't you see? They aren't so much what I say they are, they just are what they are. They're what you're forming up.

All right. Transgressions against those things, then, tend to make you feel like an outsider from the group of Scientologists, and to that degree you can receive no benefit from Scientology, don't you see? It's very simple.

It is not that the action is monstrous; it is the degree that the action removes the person from his group.

So that is the definition of a transgression. This has very little to do with our own moral code, only that we just, oddly enough, are suddenly – suddenly look and see what we're doing, you know? I mean, here we are, we're forming up a new series of agreements. They're not all completely formed yet, not by a long ways. But there they are. They're a new series of agreements. They're a way of life. There's "this is survival" and "that isn't survival." The fact that these things are – resolve life and take dominance and command over so many other moral codes and can actually run out now and change all other moral codes, of course makes this a fantastically powerful code by which we're operating.

I'm not now talking about the written Code of a Scientologist. I am talking about what you think a Scientologist should do and should not do – what you think he should do or not do, see? Not what I think he should do or not do. That is basically the moral code which is being formed up here.

Well, it's a very strong one because it has dominance over all other moral codes. You think it should be this way and it should be that way or it shouldn't be this way and it shouldn't be that way. And it all is added up to you and adjudicated on what you consider survival and what's not considered survival. And of course we're in a position where we're dominant other [over] all other activities. But let's not worry about that for a moment. That has very small bearing on this particular lecture.
What I'm talking about is, what is a moral code? Well, a moral code is a series of agreements to which members of the group have subscribed to promote their survival. Now, that is a moral code.

And their transgressions are the degree that they have separated themselves from free communication with the remainder of the group. That is a transgression: the degree that a person has separated himself from free communication with a group. And that's all a transgression is.

Now, you say, "Well, a transgression – after all, he murders a member of the group. That's certainly a wilder transgression than this…” Well, I don't know. He murders a member of the group and so they burn him at the stake or something of the sort or assign him to being skewered with E-Meter cans in the public square. Something goes on. It actually is not much of a transgression.

That is sort of a livingness and groups do get enturbulated one way or the other.

But get this one: Murdering a member of the group and hiding his body and never mentioning it to the rest of the group – oh, oh, oh, oh, oh. Now he is pretending to be part of the group while no longer being part of the group and it is out of that sort of thing that you get the disintegration.

So, he murdered a member of the group and everybody found out about it and they all knew him. They saw him do it, and they skewered him with E-Meter cans in the middle of the square and told him, "Go thou and never get audited again, you dog" And so he went out and picked up another body. And one day an auditor runs into it in session and runs it out, see?

But he actually has not been separated from the group. The only person who can separate one from a group is himself, and the only mechanism he can do it by is withholding. He withholds transgressions against the moral code of the group from the other members of the group and therefore he individuates from the group and the group therefore disintegrates. This should be very simple; this is very well taped.

Now, how does this all come about in the first place? What are – are there any other mechanisms back of this? Yes, there is the mechanism of co-action, the mechanism of co-action. The last time you were dancing with somebody you were indulging in a co-action. They were moving and you were moving and so forth. The last time you had a fight with somebody, you were in a co-action; yes, you were in violent disagreement with their actions and they were in violent disagreement with your action, but unfortunately, underneath all this, you were both fighting.

Now, I'll give you an example of a co-action of magnitude, if you will forgive the slight excursion into maritime affairs. I'll tell you anecdotes about the Phoenician navy pretty soon, but right now I can only tell you anecdotes about current ones that you would be interested in.

A ship is no good until it has braved some tremendous danger or indulged in combat. The crew is no good and the ship just isn't integrated. There's nothing to it.
You take these harbor launches that everybody goes home to the wife every night, and they come aboard, and so forth. Well, they fall apart. There is no group there to amount to anything.

But a ship, in essence, is a fairly isolated group and therefore gives us a good example.

And you recruit everybody up and you've got all the proper number of ratings and men and they're all at their proper stations and they're all in the proper slots and they've all been trained for their duties – and nothing works. It's so interesting. Nothing works. There is no more nightmarish nightmare than putting a ship in commission with a new crew. For the first month or two or three months even, you are in a position where you don't know whether the guns are going to fall off or the keel is going to suddenly wind up down the stack. You just don't know.

The supplies never seem to get aboard and the fuel never seems to flow freely to the engines or burners. Nothing seems to ever happen in the ship. It just – nothing happens! Except a sort of a confusion. Some kind of a weird confusion goes on.

And then one fine day this ship is out and it meets a great storm. And this storm is battering away at force 8, 9, 10 and huge, raging seas are racing on every side of it and every man is braced, and down in the engine room they're trying to keep the screws turning over somehow or another, and the water in the bilges are sloshing all around and somebody forgot to close a seacock. And the next thing you know, they're all being punished for their omissions.

And somehow or another they hold the ship together. Somehow or another they hold the ship together. And then the storm abates. And for some peculiar reason we now have a ship. This is a noticed fact. I mean, a lot of people who have gone to sea, and so forth, could tell you this fact.

It is true of a flight group. It is true of a military company. You never really see any organization hang together at all until it has been bruised, heavily and hard, and then you will see an organization hang together.

The reason business organizations is so hard to hold together as groups, and there are so many transgressions against their codes of operation, is centered totally upon the fact that they never get mauled. The boss gets mauled and the accountant gets mauled and somebody else gets mauled, but nobody ever takes the whole building and mauls it. There is no mutual danger to amount to anything.

One could be created. Instead of the manager taking it all on his back every time somebody writes him a nasty letter, if he got the staff together and read it to them and they had a chance to find out what was going on and discover what was under attack here or what wasn't under attack here, you might get a cohesed group and organization. Otherwise, no.

What is this? They have experienced the necessity to survive, and that is the whole summation of it. A group becomes a group when it has experienced mutually the necessity to survive. And that then makes a very strong group.
A ship going into action for the first time goes into it as a disintegrated series of agreements. It has no moral code, it has nothing. Why? Because nobody sees any necessity at all to survive. And then they take a rare shellacking. They've left a seacock open and they forgot to test out the ammunition hoist and a lot of other things weren't done on this ship. And all those sins start to catch them out. And they suddenly say, "We've got to survive around here and we had better put it into high gear." And when they come out the other end, they're all friends, oddly enough. They've gone through a mutual experience of some magnitude and they're friends. And their friendship for one another expresses it in itself – of a knitted group which has its own mores.

You'll find out that every ship which has been long together with itself under any kind of – well, just mediocre, the most mediocre – it isn't leadership that makes a ship, it's lack of interference by leadership that makes a ship. And you'll find out that these boys will have developed a whole civilization of their own. They have their own jokes. You'll be walking down the deck of a strange ship that is lying in some harbor someplace and somebody will say, all of a sudden – turn around and he'll say (he'll look at another little boat in the water or something like that) and he'll say, "Ten feet tall." And everybody – every member of the ship's company that is near him – will laugh like mad, you see?

"What – ten?" You're an outsider. You don't know what he was talking about.

Well, something has happened on the ship or somebody got razzledazzled into some peculiar way and it somehow or another centers around this joke, "ten feet tall," and everybody knows this joke, but the outsider doesn't. Well, that's as much a part of their civilization as: all the ship's members know that when you go down a certain companionway and open a certain watertight door, you'd better for sure get your fingers the hell out of the road because it inevitably slams back. They all know that, but you're a stranger and you don't know that, so you get your fingers caught. [laughter] But they have a whole technology, and it's just a group of men running one piece of machinery.

An oil rig, running out in the middle of Texas someplace or standing out on a Texas tower in the Gulf, something like this – the crews attached to that thing, after they've gone through certain experiences and so forth, cohere and become a group. And they have certain morals that are different. It runs different, place to place. But there's a certain pattern runs through it all. And the basic thing is you mustn't injure the survival of a fellow group member – common denominator of a transgression. And that's also, by the way, the common denominator of the code in the first place: You mustn't injure the survival of a certain group member.

Therefore, a manager has a tendency to be far more isolated from a group, or the leader of a group has a tendency to be far more isolated from the group, than group members. Why? Because he every now and then does injure the survival characteristics of a group member. No matter if he does it reluctantly, every now and then, on every side of him, he will find members of the group are absolutely insisting that Member X be expelled. Member X's transgressions, in the cumulative sense, have gotten so antipathetic to other group members that they find that it is impossible to survive with Member X around. And who do they turn it over to?
Well, now, the leader of the group is not particularly aware of the transgressions of Member X because he doesn't live the same life as the rest of the group. He's a little bit isolated, don't you see? So he does an independent overt without a motivator. He dismisses the group member. He says, "Thou shalt be shot. Thou shalt be turned out to starve," or something.

So he tends to get all manner of overts against group members. And then he seldom tells anybody else in the group what exactly happened to Member X, because he thinks it'd be too enturbulative. He never posts it on the bulletin board or something like this. "For the seventh consecutive time, Member X was found eating crackers in somebody else's bed and therefore is no longer amongst us, by popular demand." [laughter] He never does anything like this, you see? He operates sort of on a constant withhold. And he can actually drive himself straight out of his own group. It's quite interesting. Ah, you get this in the isolation of command and so forth.

Now, this is so true that man has at length accepted the idea of isolation of command as a normal course of human events. It's not necessarily normal at all. But you see, there is one of your breakdowns.

Now, leadership is one of the frailties of a group, while at the same time being one of its greatest strengths. So that you change the leadership of a group, you can change, to a marked degree, some of the characteristics of the group. But if you change the group over to a leader who then violates or changes all the mores of the group, ah, well, we've got lots of trouble now. We've got lots of trouble.

I have a case in point: There was a very successful company. You heard of Nick Carter and Diamond Dick and all the rest of these old pocketbooks – in their day, the comic books of the 1890s. Well, those were all published by a company known as Street & Smith. And it had become very, very wealthy over a long period of time, and it had its mores. Boy, did that place have mores.

It owned a whole square block – imagine it – in the middle of New York City, where a square foot is worth about a hundred thousand dollars. And it owned a whole, huge square-block building about four stories high that was the clammiest, most fallen-apart old building you ever heard of, and it had printing presses in it. And the building was so shaky that when these enormous presses started to roar, the whole building shook. You could hardly hold the inkwell on the desk, you know, up in the executive offices, and so forth.

And they had – they had just gone on for years. They had unpublished manuscripts of O. Henry. They had all kinds of things. I went into their vaults one day, and there were the originals of Ned Buntline, you know, and Annie Oakley and all of this kind of stuff. Fantastic.

And there were certain codes by which you couldn't speak to people and could speak to people and certain precedences by which you went to lunch and did this and did that. And there were promotion precedences in every place and it was a very hidebound old outfit. Well, after all, it had been in existence for the better part of a half a century.
And all of a sudden young Mr. Smith inherited it on the basis of death dues, you see? And he had a wife. And his wife believed that it was a nasty thing to publish things like that. Her friends wouldn't like it. But they would like such things as fancy women's magazines.

And so Mr. Smith Americanized himself to the degree of saluting the wife and saying, "Yes, sir." And at the time he took over – at the time he took over – there was a seven-million-dollar sinking fund in that company. Just – just the sinking fund! There were no strings attached to it. There were nothing. It just sat there and made money. Everything made money in all directions.

He took their high-power presses, which could spit out more dime novels and magazines than any other high-power press in America and sold it to his nearest competitor. And then they could spit out more magazines than Street & Smith. And when he got through, he owned Mademoiselle, all on the cuff. [laughter]

And the company was gone and the building was gone and everything was gone. And that is – it's things like that, you see, which give rise and credence and get loyalty devoted to such things as socialism, communism, things of this character. Because they recognize that the leader of a group is the most capable of destroying the group.

The group might survive all sorts of storms and financial crises and crashes, but all one – well, just one thing has to happen, you see? The leader of the group goes bad, marries the wrong girl, who decides that her friends won't speak to her quite well enough if she is connected with printing blood-and-thunder magazines, don't you see?

I don't know what happened to all of that, but the staff dispersed all over the place. And you would see these people afterwards, and they'd be sitting around in a sort of a degraded fashion, you know? They were old Street & Smith people. They were never anything else. They were not new popular-publications people, you see? They were old Street & Smith people, because it was one of the oldest publication groups in America.

Now, you can answer the question, "Why is it that the old soldier is always degraded?" Just hire an old soldier someday to mow the front lawn. You usually will have had it. They have a very bad employment reputation, old soldiers. Now, I'm talking about old soldiers: the sixteen-year man, the twenty-year man, the thirty-year man.

And you say at once, "Well, the army must have done something horrible to this fellow to bring about a total disintegration of his personality and therefore the army is very bad training and therefore the army is degrading and therefore the military is very bad." And you can get a whole nation believing the military is very bad because every product of the military which they see, after the fellow has spent ten, sixteen, twenty, thirty years in the military, is the guy is walking around in a fog, you know? He's walking around in a daze of some kind or another or he takes to drink or he's unreliable and he won't do his job. And they see this sort of thing, so they say the military must be very bad.

No, they're looking at another phenomenon. It is the phenomenon of a group member who is no longer part of the group. That's the phenomenon they're looking at. He's a perfectly good soldier, but he has no group. How can he go on being a perfectly good soldier? There's no mores. Any mores that he has – "Thou shalt not tell the sergeant," you know? "Thou shalt
sneak in after hours when thou dost not have a pass." "Thou shalt raise hell with the mess
sergeant." "Thou shalt scrounge anything that isn't nailed down, providing [laughter] – pro-
viding it doth not belong to thine own company." Tremendous mores, various kinds, you
know? "Thou shalt raise hell with second lieutenants but be respectful to captains." All these
kinds of things.

Well, this is the moral code by which he is living. And of course he's living by a moral
code and he has no group connected with it anymore; he is degraded.

Is he degraded, actually, because he had overts against the army and his moral code?
No. No. He is merely degraded because of this interesting phenomenon, which you must pay
some attention to: If a person is no longer a member of the group, he feels automatically that
he must have had overts against it and was driven out of it. Through no fault of his own, this
group has ceased to exist or he is no longer a member of it. Just the fact that he is no longer a
member of the group makes him automatically – flick – believe that he must have had overts
against the group.

You see, this is the reverse phenomenon. Now, you run into this every once in a while.
As a matter of fact, you run into it rather constantly. Because the punishment or the result
exists, people then believe the crime must have existed. Got the idea?

You'll see every once in a while some fellow whose wife has left him. And he will
then believe that he must have been mean to her or that he is not a good family man. Maybe it
had nothing to do with it whatsoever. Maybe there was a typhoid epidemic in the area and
then she died. But he gets this other sensation, you know? The other sensation is he's no
longer a part of the group, therefore he must have offended. And you'll find people nattering
and chattering about this.

One notable example, there was one girl I knew that – whose father died in an auto-
mobile accident exactly two thousand miles away and she sat around all the time trying to
figure out how she killed her father. How had she killed her father? Well, was it because she
didn't answer his telephone call when he put a telephone call through to her? Was it because
she didn't phone at the time of this? Was it because of this? Was it because of that? Was it
because she had gone to this other city in the first place? Now, if she hadn't gone to the other
city – and so forth.

Well, all of this nattering, and that whole thing which the psychiatrist – ooh, this just
drives the psychiatrist mad. He worries about this more than anything else. He sits up all night
sometimes worrying about this one. He will – if he finds this in a patient, he sits there and the
perspiration just drips all over his white, somewhat smudged-edged weskit. The person thinks
he killed his father. And he'll just do everything he can possibly do, you see, to try to con-
vince this patient that he didn't kill his father. And he doesn't know the mechanism connected
with it, and actually we didn't either until just now, in the last few days here.

Well, his father's gone, so therefore he must have offended against a group called
"son-father" or "daughter-father." See, that is a group. Daughter-father: must have offended
against it because he's no longer a member of the group. And you might say this is the com-
mon denominator of people's degraded feelings. They are no longer a member of the group.
So you will very often be processing somebody who feels that he had tremendous overts – this is not in the majority – but you'll feel this is somebody who had tremendous overts against a group, and you won't be able to find them. And you won't even be able to locate them on the meter, which is what I mean. No, the group is gone and he – it's not any longer there, and he's no longer with the group, so he figures it out, you see, that having suffered the final punishment for transgressing against the group, then he must have transgressed against the group. And what's worrying him is to try to figure out how he transgressed against the group rather than simply face the fact that he's no longer a member of the group. You got the idea?

An awful lot of people finished up World War II, or the Korean War, feeling degraded because they were separated from their military units. Well, they were separated from their military units. Well, if they'd gone through a lot of cosurvival motion, see – if they'd gone through a lot of motion with other fellows in an effort to survive – then it cohesed the group. And of course, how did they leave the group? Well, they just left the group by being demobbed, that's all. (Naval terminology: they were "separated from service.")

Well, that was some action of some character in some personnel division someplace. And the fellow afterwards wonders if he shouldn't have been nicer to the squadron, you know, and he shouldn't have been nicer to the company or if he shouldn't have been better to those people and what did he do? And he'll sit around and grieve, actually, about the horrible things that he did do to these fellows. Well, he's integrating the whole thing against the fact that because he's no longer a member of the group, then he must have transgressed against the group. You see?

In other words, he does an identification of the punishment with the action. See, it's – only the action is necessary.

Now, what actions are actually necessary to cohere a group? Co-action in the direction of survival. If you have co-action in the direction of survival, with two or more people, you inevitably have a mores. It's tiny and it's not very explicit, but it's a mores. And it has to do with two people who went against many survival, ah... antisurvival forces. They coacted against antipathetic forces, so therefore they are a group.

And now one of the people dies or departs and we have the other person then believing he must have transgressed against the other person. And sure enough, he does have transgressions and you'll find out he's very, very happy to find out and get off his withholds and transgressions against the other thing and it will blow at that time. But it's blowing for another reason. The reason you think it is blowing is because you've gotten off these little, petty, two-bit withholds, you know? No, no, he was very happy to have found he really did merit no longer being a member of the group. You got the difference?

See, he figures, "Well, it was justified. They were right, throwing me out, because look, I did have some withholds, see? I did have some of these withheld transgressions. So therefore, obviously, there it is." See, happy as a clam, you know?

So he's willing to be separated from the group. Up to that time it's unknown, it's unexplained. Did he have transgressions against the group or didn't he have transgressions against the group? And the only evidence he has – he's no longer a member of the group, so he must
have transgressed against the group. That's what the equation is. If the fellow is no longer a member of the group then he must have had action against the group.

You'll find out that the fellow who has a dogfight over France with a German pilot, let's say, and they go round and round and round and round and they have this hell of a dogfight and so forth, and they finally break it off and go home – do you know, there's always a little bit of an oddity between the two of them, so on. You know, they – every once in a while after a war, a couple of pilots who have had aerial duels and so forth, will meet. And they meet like old pals, man. That is the group. But you see, just to that degree, they formed a group.

Well, what kind of a group was it? It was a group of tremendous co-action – contra-survival. But each one is trying so forcefully to survive that their action is in agreement. It's an agreed-upon action: a dance of death in the sky. They're both firing at each other, aren't they? They're both flying airplanes, aren't they? They're both trying to survive, aren't they? They're both in the same sky, aren't they? They're both in the same time period, aren't they?

Well, they know they aren't a group. Each one knows the other is an enemy and they know this positively and violently, that they are not a group. And so they can never explain why the dogfight hangs up. Of course, there are withholds against their own groups in there. If one didn't shoot the other one down, it's actually a sort of a transgression against his own group, just to that degree.

But if he has a dogfight, fails to shake – shoot the other one down and then goes home and never mentions it, now he's actually got a transgression against his own group. You get the degree of complexity with which this mounts up. Well, it mounts up on this basis, this basis: agreement. What is agreement? It's two people making the same postulate stick. Two or more people making the same postulate stick – that's what we mean by an agreement. Two or more people making the same postulate stick – an agreement.

Well now, what if they go into mutual action and their mutual action is in the direction of survival? Oh, they've got the same agreements that they're trying to make stick and now they're going through similar actions by which they're trying to make survival possible? Now, what have they got now? Ah, they've got co-action and they have a confusion of one with another. They don't quite differentiate their own action, so they misown other actions in their immediate vicinity.

Fifteen men pulling on a rope trying to pull a seaplane out of the sea: Afterwards you say, "How much of each one's motion was responsible for the seaplane coming out of the sea? Exactly how many ergs of your motion was part of the recovery of the seaplane?"

Well, you try to break it down like that, he takes the easy course, you see? And he says, "Well, we did it. We pulled it out of the sea." He doesn't differentiate how much each one did pull it out of the sea. He just says broadly, "We pulled it out of the sea." In other words, it was fifteen men contributing unequally, some more, some less, to a line and they would contribute unequally if they were just at different positions on the line, because the lines get bent and twisted around things and people who are closer to bollards, you see, can't pull as well as people who are far from them. You get the idea? So, it's an incalculable mathematical problem. How many ergs did each one contribute?
Well, they all solved the problem by saying, "We did it." Oh, and they're very happy about this -- "We did it. Our motion."

Now, you take some fellow who has been running an engine for an awful long time. He's pulling water or something up a hill into a reservoir, you see? And he runs this engine and he sees the pumps running, the water going up the hill and so on. And he runs the engine and he runs the engine and he runs the engine. Well, why, after a while, when you talk to him, does he go kind of "gurgle, gurgle," you see? Or like these engineers that I had and so on, they start their motors. They start their motors before they begin to talk. They say, "Wrawr, wrawr, wrawr," and then they get to firing off and they give you the sentence. It's quite interesting.

I don't think anybody would believe that. But I've got Peter as a witness. He's talked to them over the phone. It's quite marvelous. They start their motors and then they talk.

See, they "co-action." In other words, their action of running the motor is undifferentiated by them with the action of the motor. So their action running the body and the motor's action in running the pump -- these are mutual actions. So you get co-action.

Now, you can go into this on havigness of motors and you can go into it on causes of things and you can go into it in other ways, but you actually separate it best by just getting the fellow to get the idea of a mutual action with the motor. And all of a sudden he -- up to that time he's been totally identified. His action was the motor's actions and the motor's actions were his actions and so they had actions. They had actions. And if the motor conked out and all of a sudden its coil went bad, why, he goes home and has a stomachache or something like this, you know? Their mutual action is too tied in.

And that is the source of an overt. Now, let's get around to what we're talking about here. That is an overt act -- or, that is the source of overt acts. You have mutual action with something else -- and you call it a group member, a mores, a moral code -- anything you want to call it -- you see that, but it's mutual action. And then you do something cruel to that with which you have mutual action and of course you experience the somatic. And it's just as easy as that. It isn't any deeper than that. That is an overt act-motivator sequence and that is its exact mechanics and that's all there is to it.

Now, you wonder why I've been talking about mores and groups and group action and survival and all that sort of thing. Well, it just adds up to that fact. After you've had a tremendous amount of group co-action, you then embark upon a cruel action to what you have co-action with and you'll get the somatic. You must have had a cruel impulse toward co-action before you can get the somatic you administer to somebody else.

You take somebody with whom we have co-action and one day, for some reason or other best known to somebody else, you accidentally break his arm. You go around afterwards nursing your own. Why? Because your arm is his arm. And that's how that crosses and that's what an overt act-motivator sequence is and those are all the mechanics there are to it. There aren't any fancier mechanics than that.
There isn't any mechanic such as, "Well, you should be punished because you have offended against another member of the group." No, that is the group dramatizing the fact I just gave you.

Religionists come along, Religionists come along. And these religionists, they tell you, "Well, do unto others as thou shalt turn thy other pig" I don't think that's one of the commandments, but it's something like that. They get this thing reversed.

In other words, they are forcing into existence something that already exists. See, they're saying, "Well now, you get mean, you gyp your fellow group member, and you're really going to suffer. You'll suffer in the long run." Yeah, great. "Eighteen paternosters and three pieces of bread; that's what it's going to cost you or you'll suffer from here on, you see?" They get paid for it.

But actually, there is nothing there to be paid for. A person who makes an overt act against something with which he has mutual action, of course, is incapable of differentiating what is his action and what is the other action. Fifteen men on a rope, one of them trips and butts the other one in the back and then he has a somatic in his own back, you see, because he didn't know whether the force was his or the force was theirs, but he engaged in a cruel action.

Now, all overt-motivator sequences become very pronounced when cruel actions are maliciously engaged upon while withholding. One is really a member of the group, one is really coacting with the group, but one engages on a cruel action toward another member of the group and then tries to back out. Why does he try to withhold? He tries to withhold because he doesn't want the effect of the co-action. See, he tries to individuate from the group when he does a cruel act because he knows that if he does a cruel act to something he has co-action with, then, of course, he's going to get it in the neck. So he tries to back out.

In other words, he disowns the co-action because he's trying to get rid of the motivator he will inevitably get. So he shoots a fellow group member and having shot the fellow group member, he then seeks to withhold the fact that he has shot a fellow group member so as not to be liable to the somatics of co-action, which experience has taught him will always occur.

And we're just down to the basic fundamentals of nondifferentiation and identification, that is all. He identifies every group member's action with his own action, so therefore if he is mean to a group member, he of course is liable to get it, so he tries to escape the penalty of what is woven straight into group action amongst all thetans and seeks to back out. And this will ordinarily coax him into withholding, too. So, withhold is part of the backout.

Now, if you ask him to recognize his co-action with that group member prior to his overt act, the overt act of course will blow. That's the mechanics of it, you see? You've got to get the prior action. Now, of course, the more commotion and the more action and the more withholds and the more nonsense preceded his overt act, the more the overt act is going to hang up and the more he's going to try to withhold it. Do you follow that plainly? That's quite easy.
In other words, he can only suffer from his overt because of former action – former co-action. He can only suffer from his overt because of former co-action. And that co-action is the most aberrative when it is mutual survival – mutual survival. And, of course, that means a disturbed, confused area. And it also – you will spot earlier and earlier overts against fellow group members as you're doing this, which is earlier and earlier efforts to back out.

Well, of course, he is involved in mutual survival, mutual action. He is involved with other people with mutual survival. And because he is involved with this mutual action, every time he has tried to back out of mutual action, he, of course, had sought to deny the mutuality of the action. And he thinks he can get off the overt-motivator sequence inevitability by denying it, you see? If he just denies it enough, then he's no longer part of that scene. So he individuates, you see, gradually out.

And you have to knock out his individuation totally before he can walk out. That is what is the most peculiar phenomenon about it all, you see? The action he takes to escape punishment is the action which then settles in the punishment. This is all very mechanical. There is nothing much to it. You'll see this thing unfold. You'll see this thing unfold left and right. It becomes very – well, you audit a pc and you ask him for a prior confusion. Well, you could ask him for a prior survival and you'd get about the same answer.

You're asking him for a former co-action. And of course you will find, every time you find a former co-action, it opens up the track a little bit more, so he finds a former withhold. And then you look earlier than that withhold, and of course you've found a former co-action again – usually a confusion, because it's a survival action against odds, a battle of some kind or another with these two people facing the world or these ten people or this race, you see – and you find him backing out a little bit more.

And then you get a little more co-action off the case by asking him what some earlier confusion was and of course he remembers another withhold, another effort to individuate from the group. And these uncover just to the degree that you uncover prior confusions or prior survivals.

It's quite patent. In other words, you've got to get the co-motion – if you want to use that word – the co-motion which preceded the withhold. That doesn't mean the overt act that preceded the withhold so much as it means the co-disturbance which preceded his effort to individuate. And of course you'll get the withhold and the motivator, just right now. You get it right now. You ask for the co-action, and of course, that blows the mutual action he was involved in with another group member, and having blown that, you then can release the other. And it – and then he no longer withholds this fact about what he was trying to do to the group, so he's no longer trying to disintegrate from the group, so he can move on the time track.

Every time he has a withhold, he parks himself on the time track, you see? And he can keep parking himself and parking himself on the time track till the whole time track looks like just one big now. And that one big now is the reactive mind. And that's all there is to the reactive mind; it's the combined withholds which he has stacked up, which have all become part of now. But they're efforts to individuate from groups.
Well now, he really never has succeeded in individuating from any group he has ever belonged to. Isn't that fascinating? It doesn't matter whether he talked to a shepherd back in the old days and they were talking there and all of a sudden a wolf came "rompthing" over, operatically, and the flock scattered. And so the shepherd picked up a cudgel and went after the wolf. And he was just a gentleman passing by the way, but he picked up his sword and he went after the wolf, too. And they both got ahold of the wolf and they chased him over the hills and far away and made nothing out of the wolf. And then they came back and gathered up the sheep and they shook each other by the hand and he went on his way.

All right. He made a group, didn't he? He made a group and they had an agreement. The mores of the group is: "Protect sheep. Kill wolves." That was their morals. That is what they were supposed to do.

Now, all right. He went along for a few years and one day a shepherd drove all the sheep through his rose garden and so he went out and put a sword through the shepherd. And he got it right in his chest. And, "Doctor, Doctor, I have this horrible pain in my chest. I just can't understand what this horrible pain in my chest is."

The doctor said, "Well, we – we look – we look upon that as advanced, galloping consumption. That's what that is. And you take this horrible black potion here, and it'll get you over it." And about eight, nine thousand bottles of black potion later, why, they bury him. [laughter]

He formed a group with a shepherd and then he killed a shepherd. Wasn't even the same shepherd. Well, what's he done? He's done an identification of shepherds, in the first place. And then he's done an identification of motion with a shepherd earlier. You follow this? So he gets an overt act-motivator sequence.

But nobody has ever left any groups. The magicians: Well, there have been magicians ever since there's been track. But magicians, from time to time, have expressed this in saying – they haven't come close to this at all. As a matter of fact, it's not a stable datum of magic. But they say, "A magician who starts in on one religion should not change his religion just because he's practicing magic." That's one of the rules of the game in magic. Mustn't change your religion. They know it's bad luck. They know people go to pieces on it.

Well, all they found out, just to that degree, is the fellow had subscribed to a religious group of some kind or another, and now if he goes and shifts his religion, why, he's going to get an overt-motivator sequence of some kind or other, he isn't going to be able to explain to anybody and there he's had it – which is quite interesting.

This opens up an interesting door for Scientology, because if everybody is – if no one has ever left any group he ever belonged to, against which he had a transgression or an overt, why, that means that all new groups being formed are formed by transgressors. [laughter] And then that follows, then, that if Scientologists could get off of that particular mechanism, they would form the first true group that has existed since the beginning of the universe. Isn't that interesting? Interesting vista suddenly opens up in that particular direction.

That's all rather beside the point at this particular moment. We're just talking about the mechanics of this thing. But that's true, that would happen.
Now, what, what is a moral code? A moral code would be agreements – a series of agreements – which had been cemented by mutual action aimed toward survival. And a transgression is an action against a person or being or thing with which one has a moral code or an understanding or a co-action.

Notice that we're trotting out *Dianetics: Modern Science of Mental Health's Survival*, in caps. Notice it's right back with us again. Because it is the action by which beings sought to survive that then brings about co-action on the part of those beings; which brings about, then, the development of a series of agreements; which then brings about the possibility of a transgression. And the transgression, withheld, is an effort to act against the co-action of the group without suffering the consequences. But the co-action, followed by a withhold, then parks the person right there.

You see, because that's not an action. Let me call to your attention that a withhold is a no-action after the fact of action. You break the cookie jar and then you don't tell your mother. And you're processing this person and he's going along the track and there he is all of a sudden and he's standing there in the kitchen. He's not looking at anything. He's not looking at anything.

Have you noticed the number of pictures which pcs have where they're not doing anything. Have you noticed this? They're not killing anybody, they're not breaking any bones, they're not robbing any cookie jars, they're not doing anything, see? There they were, just innocently standing there, just an innocent bystander.

They'll have a picture, suddenly, of a street; and there's absolutely nothing happening on this street. They'll have a picture of a kitchen; there's nothing happening in the kitchen. They will have a picture of a pot and there's nothing happening with regard to the pot at all.

Well, what are these things? These are the points of withhold where a person has withheld his transgression against the group. And the transgression may lie minutes, hours or days before the picture. You just ask for the commotion which went on before that and he'll give it to you and you find the withhold, then the fact that he withheld it against the mores of the group and the picture will spring, just like that. Very tight, close mechanism. There's nothing much to it at all.

So, you look for the prior confusion. The rule of the prior confusion comes out of this. So if the person is parked anyplace, he, of course, has a withhold at the point he is parked, but it is immediately preceded by a co-action or co-motion, for sure, and then an overt against that co-action and co-motion. And then the withhold. So it follows down consecutively in terms of time: 12 o'clock, co-action, co-motion, as a part of the group; 1 o'clock, overt against this group; 2 o'clock, parked – see, withhold against the group, the effort to move out of the group. I'm just giving you 12, 1 and 2 so you can see what I mean by consecutively in time.

So, we have childhood, co-action with a family; teenage, overt against the family; young adulthood, complete upset with the family and awfully parked; withhold, won't talk to the rest of the family. You get the idea, see?

Well now, this goes as far as this: One can withhold one's self – and you mustn't overlook this in processing. That fellow who thinks he should have been drafted and join the army
and who didn't then join the army, will be found to be in possession of a withhold which is inarticulate unless you know this particular fact: He is withholding a body, you don't just withhold thoughts. You just don't withhold deeds. You can withhold a body. You can also withhold stolen goods. You can also withhold objects of various kinds or another, which really aren't stolen, but they're withheld.

But withholding self is the commonest one, because wherever a person has engaged in a dogfight, such as I spoke about a few minutes ago, he all the time was trying to bring about the death of the other person while withholding himself from death, which makes a disagreed unreality about the whole thing. There's no agreement there of any kind whatsoever.

If you ask somebody, "Get the idea of withholding your body. Thank you." "Get the idea of withholding your body. Thank you," he'll wind up in all kinds of dogfights and all kinds of activities of one kind or another where he was trying to do something. It's not a good method of spotting overts, but that would find a hell of a lot of overts. You'd find a lot of overts.

You say, "Get the idea of withholding your body. Thank you." "Get the idea of withholding your body. Thank you." And the guy would be parked right in a whole series of overts. They wouldn't necessarily resolve, because that isn't where he's stuck. He's stuck just a little bit later, in each particular case, because – if he's stuck at all – because withholding your body from a dogfight is a moral action. That is a moral action. It's immoral to depart from your squadron. But to do something which is against the survival of the squadron and withhold that is far more aberrative. Far more aberrative.

So, the transgressions against the group – well, that's all this thing adds up to. That's all there is to it. That's all there is to an overt act-motivator sequence, that is all there is to taking one apart and that is how everybody is stuck.

Now, I'll give you – I've given you a Class II Auditor skill, which is simply, "Locate the prior confusion." Now, when you locate the prior confusion, of course, you're going to locate some prior co-motion – motion with – and you will fall at once into an overt, and then you'll fall into the withhold.

And you keep saying "prior confusion" and you'll just go bing-bing! See? You can force the pc's attention into the prior confusion, they come up to the overt and they'll hit the withhold – zoomp, boomp, bang! It's just a one, two, three, because that's the way it goes. Because they're held on the track by the prior confusion, apparently held on the track by the prior confusion, but only because they have a withhold later.

So it takes all three steps to park somebody on the track. It takes a prior co-action, then it takes an overt and then it takes a withhold. And when you've got those three things, you get a person stuck on the track and that's all there is to it. And that makes up the reactive bank. And that is the anatomy of the reactive mind.

First there is co-action, then there are overts and then there are withholds. And then that compositely gives us, eventually, a total jam of time. And that total jam of time, totally buried, becomes the reactive mind and that is the reactive mind. And that's all there is to the anatomy of the reactive mind. That's the lot.
Now, when you clear somebody, you, of course, clear those identities which the person has more or less teamed up with and those identities and their now-I'm-supposed-to's and their particular withholds and withholding these identities and helping the survival of the identity, then overts with or against the identity and then withholds with or from the identity. And that is the goals terminal that you are running and that's the anatomy of the goals terminal, when you get right down to it. When you run the Pre Hav Scale, you run all the sides of this thing off.

Every engram a person has, has these sticks that has this sequence in it. This you will find every place. This is the pattern which is stamped all over the universe.

Now, I would be less than kind if I didn't give you a very broad, general process that anybody could run rather easily, but there is one which knocks this rather heavily. There is one which is rather amusing. There is a rather amusing experimental process about this – is you find something the person has identified with something and you simply tell him to think of a mutual action with the one and then a mutual action with the other and of course these two identifications will spring apart.

I'm giving you an idea. You find out, quite by accident or by being smart or something of the sort – you find out that the pc has horses and beds totally identified. So you say, "All right. Think of a co-action, or a mutual action with a horse. Good. Think of a mutual action with a bed. Thank you. Think of a mutual action with a horse. Good. Think of a mutual action with a bed. Thank you." And all of a sudden these two identifications will spring apart.

Don't get bugged off into this, because all of a sudden, fifteen or twenty other subjects will emerge out of that particular zone. Well, don't get him to thinking about those, too. Just keep him with horses and beds. Oh, he'll be thinking about horses, women, beds. That's the first thing that'll appear on the thing. Well, if you Qed-and-Aed with him, you'd say, "Well, think of a horse. Think of a woman. Think of a bed. Think of a mutual action with a woman. Think of a mutual action with a bed." That's been suggested to him, don't you see, by the stuff that's coming up. Well, don't Q-and-A with it because the next thing you know, he'd think in connection with beds, laundresses, for some reason or other, you see? If you Qed-and-Aed you'd say, "Think of a mutual action with a horse. Think of a mutual action with a woman. Think of a mutual action with a bed. Think of a mutual action with laundresses," see? And this will keep on. And you could get about seven or eight hundred of these things, and seven or eight hundred pieces of the auditing command. It'd be seven hundred or eight hundred parts to the auditing command if you just kept this up. So you better not do that. You just better say, "Think of mutual action with a horse. Think of mutual action with a bed," and go on that way, and he will just give you more stuff that is tearing off of the bank, because, of course, you've found a point of direct cross.

That is not a very practical activity, but it's an interesting activity.

Here is one, however, which is very practical and is a broad, one-command process and nothing else but. And that process is: "Tell me a group you are no longer part of," or any phrase – phrasing thereof.

Thank you.
SEC-CHECKING:
TYPES OF WITHHOLDS

A lecture given on 5 October 1961

Thank you.

Okay. This is the 5th of October, 1961, Special Briefing Course, Saint Hill. And I'm going to talk to you today about Security Checking. And boy, do you need a talk about Security Checking. Because what you don't know about Security Checking would fill volumes.

Now, of course, I am a very bad authority on Security Checking from a subjective point of view because you realize that if anybody went into my crimes, it would just be too grim. No auditor would be able to stand up to that. We realize that, you see? These crimes are so innumerable because they cover such a long period of time. That's the main thing.

So I'm not talking to you from the viewpoint of sinlessness. Now, you must get your point of view oriented there.

If I were talking to you from the point of view of total sinlessness – this is an optimum state which religiously people get into. They somehow or another lay the right pennies on the right altar and at that moment they become totally sinless. Then they can condemn everyone. And this gives them the right to condemn everyone, you see? And they can't approach this subject objectively. And unlike various people of the past who have said, "Repent ye. Repent ye. Ye kingdom of heaven is at ye hand," something of that sort, people who do have sins, you see, find it much easier to talk about the subject. They have some reality on the subject. And let me assure you that from my point of view, if I had it all to do all over again, I would probably do the same things. [laughter]

So I don't want to give you the false impression that I give you any lecture on the subject of Security Checking from the basis that my security, unlike yours, has been pure for 200 trillion years. That would make a very great unreality. No, amongst us boys and us girls, what we have all been up to, only could not bear the light of day because we think it couldn't bear the light of day.

Now, it's funny that every group that has sought to enforce sinlessness on one and all, with the stake, vast punishment, condemnation, assignment to hell – that is the, that was the primary mechanism: They give you a ticket straight to hell.

Doesn't work sometimes, by the way. There was a rash of murders – I've told you this story before, I'm sure – but there was a rash of murders up in the Eskimo tribes. And the
Royal Northwest Mounted Police went up there to get their man and they found out that there had been a missionary in the area. And the missionary had told all the Eskimos what was right and what was wrong and had convinced them, of course, that if they murdered anyone, they would go straight to hell and burn forever. And the idea of being warm enough for any length of time... [laughter]

So you see, lecturing from the high platform of sinlessness, you very often run into the creation of more sin than you get rid of. And what's interesting is that any group which wishes to blow itself to flinders simply has to engage upon an activity of making everybody guilty of their sins. It'll hang together for a little while and everybody will be miserable while it does, but it'll eventually blow up.

Why? Because it now gives people a complete map on how to accumulate withholds. The group mores defines what is a withhold. It says you must not be guilty of such sins and such sins and such sins and therefore and thereby blows itself to pieces, of course, because it says everybody that has committed these sins should withhold them, even though they are saying at the same time: "You must confess them." But they make confession, you see, rather rigorous.

Now, we have to understand this at the outset of Security Checking. Thou, the auditor, are not sinless. That's what we have to understand about it. And thou art not an enforcer of a public mores while thou art being an auditor. Thou art simply a Security Checker, period. You got it? You're not the avenging angels of the Mormon Church or something like this, see, while you're security checking. You're simply a person who is skilled in certain technology to attain a better frame of mind and actually a much greater honesty and decency on the part of somebody else.

You have the weapon in your hands with which to attain a greater decency, a greater state of health, a greater efficiency, a greater ability, higher ability for ARC – you've got the weapon in your hands with which to do this. There is the E-Meter and there is the Security Check, and there is you and your technology.

So you are going to be able to accomplish what groups have been trying to accomplish for a long time. You are going to be able to make an honest man or an honest woman. You have the weapon with which to do this. That's very important for you to realize, because all of these other mechanisms – such as, "make the person guilty," "show the person the right way," you see, "and the error of his ways," and frowning upon him and punishing him in some fashion or other because he's just gotten off a withhold – are mechanisms of older groups by which they sought to enforce their mores. Because they had no way to make honest people that was positive and lasting, then they used these very poor mechanisms of: "Make them good and guilty, punish them, show them what will happen to them if they do that again." All of these other things are added in. But what are those?

Those are the security mechanisms of yesteryear. Those are yesterday's tools. So you don't combine Scientology with other therapies. And that is all that you would be doing if you were trying to make somebody guilty and so forth, and doing something else with a Security Check rather than just getting off withholds.
So let us get down to a simplicity. You, the auditor, may have successfully waded through innumerable Sec Checks and be in good shape and so forth. That doesn't necessarily mean that "thou hast been without sin all the days of thy life." That hasn't anything to do with it, you see? It simply means that technically you've gotten up on this step. You were lucky. You came 200 trillion years along the track with red hands and black heads, and finally got out anyhow.

Well, that's beside the point. This point is important because if you, the auditor, are still worried about your own withholds or if you are trying to put up the presence of being – because you are a Scientologist and an auditor, and maybe a Release or something like that – if you're trying to put up the attitude, you see, that you yourself are sinless, then you will sometimes Q-and-A and avoid the other fellow's withholds.

In other words, you let the public sell you the idea that because you are a Scientologist, you should never have any sins. You get the idea? What have they done in essence? They have managed to bottle you up just like putting a cork in a bottle. Now you don't ever dare get off any withholds, you think, maybe, you see?

You can get into all kinds of odd cul-de-sacs, because we are still crossed up with the older therapy of condemnation and punishment and that was unworkable.

Let me point out that there are several people in prisons in the world. There are lots of people still doing penance in religious groups in the world. And if we add this up and recognize it clearly, we won't put ourselves in the same category. The old processes haven't worked. So don't let them work on you in reverse.

Don't ever get into a state where, because you are in a district or an area where you are holding the fort and keeping the torches burning, you never dare get off any withholds. You've permitted yourself to be sent on the road to hell. Do you see that? And your Security Checking would deteriorate. Inevitably your Security Checking would deteriorate. You would be afraid to ask people questions. You would start tacit consent. You'd start mutual avoidance of certain subjects. You get what I'm talking about, don't you?

The most serious barrier that an auditor has to overcome in Security Checking is not necessarily his own case, but a courage in asking – to ask the questions. You know, that's kind of a raw, mean, brassy sort of a thing to do.

You sit down. Here's this nice young girl. Everybody knows she's a virgin. Everybody knows this. And you're in very good ARC with her and everything is going to go along fine. And then you say to her, crassly and meanly, "Have you ever committed any carnal sins of any character or another? Have you ever been to bed in the wrong place at the wrong time with the wrong man?" [laughter]

And put it mildly, this is a startling question. But since I've started security checking, I haven't found any virgins. [laughter]

Well now, it requires a certain amount of brass, it requires a certain amount of nerve, to sit there and ask all these fantastic questions, you know? "Have you ever – robbed, murdered, burned, slain, gutted, lied?" you see? And it sounds like you must be sitting there running off a catalog of the penal codes of French Guyana or something, you know? And here
you go! And well, that's rough enough, if all of your withholds are off, that's rough enough. You sit down – perfectly inoffensive person – and you all of a sudden start asking him this sort of thing, you know?

Well, if you've got a whole bunch of withholds that you yourself are very afraid somebody is going to get next to, you will back straight off of the whole subject of Security Checking. And that is the only thing I see in the future of Scientology that could happen, is all auditors become "without sin" – they have never had any sin and because they are Releasors or Scientologists or something, you see, then they never dare get off their withholds because the students in the Academy might hear about it. And all sorts of catastrophic actions might occur. And their reputation is utterly smashed and ruined, you see? So therefore, the best thing to do, you know, is just kind of avoid the whole subject. And that's what they'll finish up doing, too – avoiding the whole subject. They won't have that additional élan necessary to ask this poor, little innocent girl, "Have you ever raped your baby brother?" you see? You know, it's just something that they would not bring themselves to be able to do, providing they themselves were actually withholding withholds. Do you see the point I'm trying to make with you here?

So you could get a broad and general disintegration if you permitted the public at large to insist that because a person was a skilled Scientologist and in good case shapes, he had never done anything wrong. You see how that could be added up on you?

Now, you'll find some Instructor in an Academy here and there, and he's thinking to himself "Uuughh! If the students ever heard about this – ." And you think somebody in the HGC and he's saying, "We-ell, I don't kno-ow. I don't kno-ow. I don't know. Last year – here's this whole subject of Security Checking coming up again and if they found out last year that after I audited that girl, why, that happened – ."

And he sits there and he starts sweating over this thing: "What would the D of P think? What would other auditors think? What would the organization think?" so on. And the next thing you know, he's sitting in session and the question comes up. He has to make the decision whether to security check this person or go on running the level. Oh, he will go on running the level every time. He'll avoid Security Checking.

That person who is avoiding Security Checking in his own life will avoid Security Checking of other people. And you can just mark your – mark it down that if you find somebody who is ducking Security Checks in all direction, you have somebody who will not security check.

You would be amazed how your Security Checking improves to the degree that you yourself have gotten through the Security Checks. It is absolutely fabulous. You can almost tell whether an auditor has withholds to the degree of skill that he security checks. And the worse his Security Checking is, the more certain you become that he has withholds. That's an interesting coordination, isn't it? And yet it's a visible one.

So that going up the line and on the long haul in Scientology, you actually could get to a point where the public insists that those people who are carrying along – because Scientology is getting more and more important – more and more important. You could actually get people running an operation on you. They would start running this old therapy, you see? Be-
cause you're the leading auditor in an area, or something of the sort, you therefore must never have done anything in your whole life. Doesn't follow. But what it operates as is an "ought to be." And you could surrender to this "ought to be" and therefore never permit yourself to be security checked because somebody might talk.

Do you realize that that action alone would slow down the whole forward impulse of Scientology by putting in lousy case shape every important auditor and person in Scientology? It could be done. And that is the Achilles' heel of Scientology. That is it. That we become so important that we must therefore – it follows in some peculiar way – be without sin, without mishap, without ever taking our finger off our number in life, and without ever forgiving it if somebody has. If we ever got into that state, we'd be finished. We'd be finished.

But we don't have to get into that state because we've got the tools which keeps a group together without the whip. See, the whip has become a useless and antiquated object. Like the electric shock machine, it can be dedicated to the museums of tomorrow.

Now, someday we're going to take one of these prisons here and set it up with dummies just as a showpiece of what man used to do. That's the only use you'll have for it.

You know, I think I ought to at this moment probably make you all members of a very secret society. [laughter] Speaking of withholds, there is a very secret society. It doesn't do much withholding, but it is very secret, mostly because nobody recognizes it as an actual society. They all think it's a joke, see?

The society's – is the SPG. And the SPG. And I'm now going to make you all members of the SPG. It's the Society for the Prevention of Government. [laughter] Interesting society. All you have to do to be a member of it is say you are.

You know, I don't think a single revolutionary charge of any kind whatsoever could be filed against a member of this organization. Because everybody prevents government to some degree, you see? It'd just be to what degree are we preventing government? The only thing governments get upset about is the overthrow of government by force, which means, of course, the setting up of another government on top of an existing government. We're – aren't interested in doing that. We're just interested in preventing government.

But anyway, the mechanisms by which man has been governed had in it the idea that man was evil and therefore had to be held in line by evil practices. And if man was evil, then he had to be held in line with evil. And they never noticed that the evil in the world stemmed totally from holding man in line. That was the fascinating part of it.

You have to have been a member of a police force to recognize that the police create crime. They do it quite unintentionally, but they do create crime. They get a game called "cops and robbers" going. In this game – every criminal busily plays this game. If there wasn't that much to it, why, there they'd be.

Well, for instance, there's some young fellow was walking down the street one day and he suddenly read his name in the newspapers and reported to the police. And for the next six or eight days he was sitting under the hot lights and they were questioning him and throwing him into cells and being mean to him and so forth. Actually, he hadn't done a thing. He hadn't even been there. He hadn't even been present. And they turned him loose after a while.
He's very relieved to have been turned loose. What do you think his ideas are going to be on the subject of police now?

Now, we start building it up from there. A society without ARC is a society which inevitably will have crime. Man is good, but he is only good to the degree that he's in ARC with existence. And when you throw him out of ARC with sections of society or whole governments at one fell swoop, he gives the appearance of being very bad. Actually, all he's trying to do is survive and protect himself and keep the thing from going all to hell. He has his own peculiar notions about how he does this and the primary mechanism he uses is withhold. That's how he thinks he can hold everything together – by withholding everything. The primary mechanism.

So the police are dedicated to making everybody withhold till the mores of the criminal mainly consists of: "You must not talk to the police." Well, that's quite interesting. "You mustn't talk to the forces of law and order." Ah, well, that's interesting. Well, that necessarily forces somebody further out of communication with law and order.

And if you think criminals are without government, you're mistaken. They have their own government. And a very wild, gruesome government it is, too.

But the society is forced apart to the degree that people are made guilty.

Now, why does a man wind up as a murderer? Well, he has long since resigned from the human race – long since. If you want to prevent a murder, you don't hang murderers. You make it unnecessary to resign from the human race. That's easy.

I'll give you a murder where the law was definitely at fault. Washington, DC. A taxi-cab driver – if I remember the story right – had a wife and this wife kept going off with another man. And he had a hard time of it because he tried to take the matter to court, he tried to get a divorce, he tried to quiet it down, he tried to hold the home together – he took every measure he could possibly take, but of course there was no law that would back him up. You see, he didn't have any evidence and he didn't have vast sums of money, you see, to buy detectives to accumulate this and that, you know? And there was nobody he could go to. And he got more and more and more seething about this, because he was basically out of communication, and he finally killed both of them.

Well, what was interesting to me about this particular case is that for two years this fellow had some sort of a grievance and there was no agency in society to remedy any part of that grievance; there was nothing he could do about it. So he finally did the last desperate jump. Now, of course, he himself had various withholds, but were these withholds actual or unintentional? And now we get to a very interesting subject: the unintentional withhold.

This is where you get your new ARC break process, by the way, in the rudiments – is the unintentional withhold. So it's quite important, this unintentional withhold. I mentioned to you yesterday that a person very often finds himself in a position and then considers he's guilty because he's in that position. He finds himself outside the group, so therefore he feels he must have done something to be expelled from the group, which is quite remarkable.
Well, this unintentional withhold is the same thing The person is not able to tell anybody. Now, it might be that there is nobody there to tell it to. He's not able to tell anybody. It's not that he wouldn't tell anybody if he could, but he can't tell anybody because there isn't anybody to tell it to or nobody will listen. And you'll find these all over insane asylums. You'll find people sitting around with unintentional withholds because nobody will listen to them.

They say, "Well, these bugs, they just keep crawling all over me," and the psychiatrist and everybody says, "Yes, yes, yes, yes, yes, yes. We know, we know, we know. Yes, yes, yes, yes, yes, yes." And the person just knows he isn't reaching anybody and he just gets more and more fixed and obsessed with this idea of these bugs crawling over him, because it's an unintentional withhold. He doesn't intend to withhold it, but he finds himself in the position of doing so because nobody will listen.

So you must take into account this as a factor. It is a very important factor or I wouldn't have put it in your rudiments processes. "What weren't you able to tell an auditor?" Well, that makes a withhold. Well, you weren't unwilling to tell the auditor, you see? You were trying desperately to tell the auditor, but the auditor never listened.

And when you run this ARC break process, you are really knocking out unintentional withholds. And the results that you get from that particular ARC break process are quite similar to the results of a Security Check. But in this we're addressing some other subject. The Security Check is addressed to the more or less intentional withhold. But that ARC break process is addressed to an unintentional withhold. It is a withhold.

Now, there's many a criminal has walked in and said, "I've just murdered my wife," and the desk sergeant has swatted a couple of more flies and paid no attention to him. And he's walked outside and he's gone up to the cop on the beat and he said, "I just murdered my wife," and so forth. And nobody paid any attention to him and nobody ever found the wife. And he was perfectly willing to take the penalties of society, but nobody believed him. And you get the most peculiar kind of withhold there is. And you mustn't overlook this as a withhold in Security Checking. The unintentional withhold.

So that is, you might say, about the lowest rung of withholds. It's unintentional. He didn't mean to withhold it, but nobody will listen.

All right. Now we get the intentional withhold which is a withhold because he would be punished if he admitted it. And we get a different type of withhold although it has the same mechanism, produces the same actions.

And then there is another withhold: He must withhold it because it will damage his beingness – in other words, his reputation. Those are reputational withholds. He's got an idea of what people think his beingness should be and he's upholding his beingness by not admitting to certain withholds because other people might get another notion of him than the notion which he is trying to broadcast. So therefore he mustn't have reputational rumors and gossips and things of this sort of character. So therefore and thereby it's a reputational withhold. He hasn't really done anything. It's well, actually, his family came from the lower marshlands of the Thames or something, down in the mudflats of Southampton or something, you know?
And he just – well, ha-ha, ha-ha – he just wouldn't rather this be known, you know? His family, by advertisement, always came from upper Berkshire. It's quite interesting.

Now, familial connections aren't the least of it, you see? People are always trying to represent themselves as a little bit better. Well, that's fine. There's nothing wrong with that, but it results in a bunch of reputational withholds.

Now, between the last two categories there's a borderline category of things which, if they were out, people would think much less of him – you know, that kind of thing. He really wouldn't be punished, he isn't worried about it on account of beingness, he's just thinking, well, people wouldn't talk to him or something like that if they knew this sort of thing.

Well, if you'll notice, all these things add up to cut communication. And a group is based basically on communication. So a group falls apart to the degree that there is no communication and these are the three broad categories: the unintentional withhold, the withhold for fear of punishment and the withhold in its various grades that protect beingness. And these three things, of course, are all shattering to groups. They knock a group apart in a hurry, but in fact, up to a certain point, appear to cohere a group.

I don't know if you've ever been on Fifth Avenue or upper Fifth Avenue or in Hollywood or something like that and listened to what went on in lieu of reputation. It runs on something on the order of fifteen or twenty lies a minute when they're talking, you see? It's almost impossible to keep up with. And there's the most fantastic unreality about those particular groups. They are very unreal. And you get near those people, you see, and around in those groups, and you think, "Oooooooooo, I don't know," you know? It's a – . You don't quite know what's going on. You're just not quite sure what is – what is wrong there. But there just is something wrong. Well, what is wrong is that it's a group with totally cut communication lines.

Well, how can you have a group with a totally cut communication lines? Well, I guess they're the only people who will listen to each other's lies, so they stay together. Something on this order.

Now, a Security Check, or any method by which you are overcoming withholds, is dedicated to the restoration of communication. And it happens that if communication is totally restored, you see – if man knew what he was doing when he made people withhold slightly – with communications totally restored in any past group of which the fellow is no longer part, he will no longer be hung up in that group.

See, if you just restore his communication – it's just the ability to communicate; that's all you're restoring – why, you'll get this phenomenon of him no longer being parked on the track with that group. And that's the only thing you're basically doing. And those things which exist in present time, of course, prevent him from becoming a part of any group to which he is attached and so give him a basic isolation.

And of course the basic group with which you are working is not necessarily the group called Scientologists. The basic group with which you – which in itself is a powerful enough group and it has enough group to it by far – but the group in which you are doing the withhold is a group called a session: auditor and pc, you see? Now, that is a group.
And when the individual is too individuated and when he develops an unintentional withhold in that group, or the auditor conducts himself in such a way as to bring about punishment because of a withhold or a crime, or the auditor demands specious reactions from the pc, the auditor has shot the group.

It is a group. It's a group of two. Auditing is a third dynamic activity – even though sometimes it deteriorates into a second. And now and then deteriorates into a first. You burn your finger, and there's nobody around and you stand there and run it out.

Now, there, all three of these things must be pretty well patched up before you get a good group called a session. You've got to have the unintentional withholds off; that's for sure. Just try – you know the only thing that can deteriorate a profile in twenty-five hours is ARC breaks.

Now, if you're interpreting profiles – you find a profile and here it is, there it is, and the profile has dropped. Now, it is true that profiles move and they are pictures of valences and they do come on at the bottom and go to the top – all of that is also true. But the particularity we're speaking of now is where the person didn't do well and dropped: you can assume the pc was being operated with an ARC break.

Now, the basis of an ARC break is being made to have an unintentional withhold from that immediate group. And that, actually, apparently, from the immediate empirical results which one observes, is more serious than an actual withhold, intentional. An unintentional withhold in an auditing session reflects more seriously on the auditing group and on the results of processing than an intentional withhold. This is very interesting.

And now we move into another category. I'd hardly dignify the person with the title of "auditor" who pulled this one, but we have an enforced withhold on the basis of improved state. And you'll find this happens every once in a while. Some person who is pretending to audit gets no results whatsoever and then he shakes his finger in the pc's face and seeks to convince the pc that the pc has been much bettered by it all and is now Clear or something. And the pc thinks he had better not say anything to the contrary of this and you've got that third grade of withhold. You've got something there which is protecting beingness.

You see, he's now got a withhold. His withhold is he really didn't get any improvement and yet the auditor has forced him to admit that he got improvement. But actually what he's withholding is the fact that he didn't get any improvement, and if he said he didn't get any improvement, this would hurt his new status.

We just finish auditing the fellow, and you take him out in front of the PE and you say, "He's Clear." So now the fellow doesn't dare break down and say he's aberrated as hell and so you get one of these reputational withholds.

So all three kinds of withholds can occur in an auditing session. The unintentional, the intentional and the reputational. These three things can all occur as a result of an auditing session.

You very, very seldom find the third one occurring, because very few auditors are that bad. But you sometimes find a pc who is trying to propitiate and who is trying to tell the auditor that he feels much better now while his head is falling off, because he doesn't want to
make the auditor feel bad. You know the mechanism. So they don't want to make the auditor feel bad, so they say they feel better and they don't. Well, now they're sort of protecting their beingness in some fashion or other by a projection. They're protecting the auditor's beingness by not feeling any worse.

You'll find all of these mechanisms can be present in an auditing session. So where you get the idea of Security Checking -- and very odd, we very often develop a word in one field, you see, in one field of endeavor; and then we, because we have an agreement on that word, we develop a special term which is thereafter more or less meaningless to one and all. We all know what a Security Check is. A Security Check is something you do in processing to make the pc better.

Well now, how did that happen? Well, basically a Security Check was developed in order to weed out personnel and keep randomness from occurring in Central Organizations. And then Area Secretaries and Association Secretaries began to find that this made people much better, and the Area Secretary would be busy spending morning, noon and night and all the weekend trying to catch up with his Security Checking -- because sometimes they took, for one Security Check, twenty hours. So we get down to the *reductio ad absurdum* that Smokey told me about the other day: somebody actually turned in a whole bunch of overts on a written questionnaire against the Area Secretary in order to get another Security Check. [laughter] So I would say that at that point the idea of creating security with a Security Check was a -- not a very useful nor workable activity.

And yet we have this word. And I've two or three times halfheartedly started to change it over to the idea of processing check, and started to call it a processing check and so forth. But it still remains a Security Check.

Now we do have a Security Check, which is Form 7. There is an actual Security Check now in existence. So what do we call this Security Check? And I find myself, in writing a bulletin, getting into the interesting state of -- I write: "Now, you should security check -- the Area Secs should security check -- ." And then, well, how do I say this? So, the best way to say it is underscore security. So you have a Security Check and you have a Security Check.

So anyway, well let it ride, let it ride. It won't pull anything down if it stays that way.

So here we have -- here we have this thing called a Security Check. Well, basically, it's trying to establish a group which can engage in assistance. And no assistance can occur if there is no group there on the auditor to pc. So you have right in your rudiments there a method of getting around this. And you are asking the pc for all of his unintentional withholds when you say, "Is there something that you haven't been able to tell an auditor?" And you are really running a Security Check right at that point.

Well, of course the basic reply to it is, "What didn't an auditor do?" which would be the games-condition response that occurred at that moment. So these two questions go together rather powerfully. One of them is asking for an unintentional withhold and the other is asking for an auditor in a games condition. And they go *bing, bing, bing, bing*. And I think you find that since I dreamed up these new rudiments and tested them out, that you're doing much better.
I'll make a remark in passing about those new rudiments. There is an assessment that has to be done for the present time problem. I never bothered to remark on it. I thought you'd latch that as you went by.

It says, "What is unknown about that," or some such wording, "problem with blank?" Now, you can't run a condition as the blank.

The pc says, "Uh well, I'm terribly worried, I'm terribly worried about the airiness of everything."

Well now, the auditor then can't put the thing together as, "What is unknown about that problem with the airiness of everything?" You'll find this is nonfunctional.

What you've got to do is do a little assessment and get him to state the problem more exactly. And you do the assessment on the meter. And you try to find the terminal that is airy or the terminal that is everything. And you shake that down and you do a little bit of a terminal assessment and he suddenly comes up and he says, "Well, the airiness of the room," or something of that sort, or "The airiness of my car. It hasn't any hood anymore." [laughs]

And you would run it, if you had to, by that time. You see, you only run those things which you can't get rid of with two-way comm or assessment. You realize that, don't you? That running is the way you take care of the things that didn't blow. So you always be prepared to have an ARC break, a present time problem or anything else blow before you had to run it. You just start doing an assessment on one of these undifferentiated problems and you'll find it doesn't react anymore.

And you repeat the question, "Well, do you have a present time problem now?" And, you see, you had some enormous surges on the meter and so forth. And you say, "Well, do you have a present time problem now?" before you settle down to run the thing and you can't even get a quiver on it, see? You've blown it by assessment.

All right. Now, the pc who has a present time problem that the auditor will not take up is being given a withhold. So there is another source of withholds that cross at the present time problem level. But at the same time, the pc will very often try to withhold present time problems because he's afraid the auditor will take them up and waste session time. Because auditing is very valuable. All PCs consider auditing time very, very, very, very, very valuable. There just isn't enough auditing. That's it.

And this gets so catastrophic that a pc will force auditing where it shouldn't occur in some direction: He wants the auditing that is necessary to resolve his case, not the auditing which is just fooling around with those fool rudiments, you see – and will actually sometimes attempt to withhold a present time problem for fear that the auditor will take it up.

All right. Now, the action of running a Security Check is a relatively simple action. It requires a high degree of familiarity with the meter so that you aren't fumbling with the meter. It requires a very definite, positive knowledge of the E-Meter. It requires, in addition to that, a knowledge of whether or not the needle is reacting on the question or on the parts of the question. You have to know how to compartment a question. You have to know how to make the E-Meter tell the truth. And that is sort of high-school E-metering
People who didn't know much about E-Meters – I think there was somebody in – I think it was almost into Canada (someplace in the United States; they were just about as far – as close to not being in the United States as they could be) got the idea that everybody had been PDHed throughout the United States by everybody else. And this became ridiculous in the extreme. And they were going all over telling everybody how everybody was PDHing everybody and they were just having a marvelous time. And they were getting out magazines about the subject, and so on.

And the most awful quiet ensued. There was a quiet where you could have heard an engram drop, you know? [laughter] Because after I explained compartmentation in an article in *Ability* magazine, well, you know, we never heard another word. It is the most profound silence. It is a sort of a negative silence. It has texture.

Well, that's because of this: That whole nonsense took place because somebody couldn't really handle an E-Meter; they didn't know how to compartment questions. So if you ask anybody if he had ever been the **victim** of **pain**-**drug**-**hypnosis**, well, of course you were going to get a fall, a fall, a fall and a fall, because you get falls on just the word **victim**. you get falls on just the word **pain**, you get falls on just the word **drug**, and you will occasionally get falls on just the word **hypnosis**. And if a person has withholds on somebody else, you will get a fall on that other person's name – if you got withholds and overt's on some particular line. So there's a source of five falls in one question.

"Have you ever been a victim of pain-drug-hypnosis from President Eisenhower?" [laughter] Five falls. You see, it's falling on the words of the question. It isn't falling on the question. And the way you do that is you take the question apart. You knock out – just say the word: "Victim." And you get a fall. You say, "What was that?"

"Well, victim."

Well, what – what not?

"Well," you say, "what about victim?"

"Well, I always hate to be a victim."

"Well, what the heck. Have you ever made any victims? Have you ever accused anybody of being a victim?"

"Oh yes, my wife. She's being a victim all the time, all the time. Always a victim. Yes, yes, yes, yes, always a victim. And she says so, what's more."

"Oh, is that so? 'Victim.'" No reaction. Ah, we got that word cooled. "All right. Pain." *Clang!* goes the needle, you see? And you say, "Well, what about pain?"

"Oh, I've always been afraid of pain."

"Well, what about the word **pain**?"

"Well, oh, the word **pain**. Oh-ho-ho. Oh, you mean the word **pain**."

"Yeah. Well, how about the word **pain**?" No reaction.
"Okay. Drug Have you ever taken drugs? You ever give anybody drugs? Are you afraid of drugs? Anything wrong with drugs? Have you ever given anybody any drugs illegally?" Clang! "When did that happen?"

"Oh, well. My mother was very sick and I forged a prescription."

"Oh, is that so? Oh, how interesting. All right. Now, when was that?"

"Oh, such and such a time."

"All right. Thank you very much. Drug." No reaction. See?

"President Eisenhower." Clang, clang, clang, clang, clang. "What about President Eisenhower?"

"Oh, nothing. I was part of a ban-the-bomb march, and we said we'd dance on his grave. Yeah. That's what that was. Yeah."

"Is that all there is to that?"

"Well, yes. I've been violently opposed to that particular activity."

"Oh, yeah. All right. How many – how often have you done that?"

"Oh, lots of times. Lots of times."

"All right. How about President Eisenhower? Okay." No fall.

"Now, have you ever been the victim of pain-drug-hypnosis from President Eisenhower?" Now, if the person has, you will now get a fall on the question. And if you want to be absolutely sure, go back all through all the words again and compartment them.

Now, there is more to it than this on compartmentation. I noticed the other day one of the boys didn't have it quite straight. And that is, you compartment the phrases in addition to the words. You take the words and get the charge off them. And then you take the phrases and read the phrases out and see if each phrase is clean.

And then when you read the whole question, let me assure you that if there is a fall, it is true. There is no withhold or charge on it unless it is true. And there won't be a single needle quiver. And that is the proper way of compartmenting a Security Check question. And you'll find you very often have to compartment them quite painfully. Otherwise, you'll make some fantastic error.

Now, the first and foremost method of preventing yourself from making an error is to forget all about two needle phenomena. One of the needle phenomena you should forget about is the latent read. Just ignore all latent reads. Have nothing to do with a latent read. If the read occurred more than half a second after you finished the question read, ignore it. Just ignore it. Just drop it. Because it'll be on somebody else or is on another Security Check question. It isn't on the same question or it didn't happen to them.

Now, that's how come you sometimes wind up getting off other people's withholds. Other people's withholds will give you a latent read. So you are buying latent reads. You ask somebody, "Well, did you ever drown a cat?"

"Well, my Aunt Mamie drowned a cat once."
This would be the response. Now, that would be a latent read. You would get that as a latent read. And every time you pick up a latent read on a Security Check question, you can expect that you haven't got a withhold, you've got a red herring. And you can go chasing all over the bank looking for this red herring. And you waste more time on latent reads than any other single action in auditing.

That read, if the person has a withhold on it, let me assure you the question does not wear out. If the person is still holding onto a withhold on that question and it's not on one of the words of the question, it's not on one of the phrases of the question – nothing of that sort – but is on the question: the more you ask it and the more he withholds, the more instant the read. It gets so that he just realizes you're going to ask the question again, you get the read. There isn't a tenth of a second lag.

You read the question – pang – it's acting. You read the question – bang! – it's acting. Read the question – bang! – it's acting.

You see, the reactive mind is an instantaneous mind. All time is now. And if it's a really reactive mind, of course, the closer it is to reactivity, the more rapid and instant the read will be. And it's as simple as that. It is very simple. And if it is not reactive, the read will be latent. It will wait before it falls. It'll wait for half a second. It'll wait for a second.

And an auditor who sits there and asks the question: "Have you ever drowned a cat?" watching the E-Meter, and then gets a reaction, and then says, "What was that?" is going to find Aunt Mamie drowning a cat. And it was something the pc didn't do and it was something the pc never has withheld. You can just count on that.

One of the tricks of reading, one of the bad tricks of reading on latent reads – is to look at the meter, then look at the question, then read the question, then look at the pc, then look at the meter. You'll catch more latent reads that way and boy, will you miss more instant reads. You will just miss them left and right. Why? Because your eye isn't on the E-Meter at the moment you ended the question. And your eye must be on the meter needle the instant that you end that question. Otherwise, you're going to miss the twitch. So what you do is – the sequence is always: question, look at the meter and speak the question and then look at the pc. Paper, meter, pc.

Paper: You see that the question is about rape. You don't care whether the question is exact or not. That is to say, "Have you ever raped anybody?" You can ask that in a thousand different ways. "Have you ever contemplated rape?" "Have you ever had ideas of rape?" "Do you – have you ever remembered anything odd about rape?" "Has something odd to you – " like this. And you're going to get down to some kind of a withhold if there is one. So you look at the question and then you look at the meter and you say the question and then you can look at the pc all you care to. And you won't get into this nonsense about latent reads.

The way I see auditors doing this is they look at the paper and they read the question and then they look over at the E-Meter and then they wait and they wait and they wait and they wait and they wait and they wait. And the question is, what the hell are they waiting for? Because it would have occurred in a tenth of a second. If you're going to follow it through, it would have occurred in a tenth of a second. And that's the way you security check. Man, you can really tear down the line if you do that. Yeah. You can really rip up
a Security Check. Whammity, whammity, whammity, wham. Pc doesn't even have to speak.
You look at the paper: "Have you ever raped anybody?" Nothing. That's all.

Now, if you want to go at this a little more academically, you never look at the meter at all until the pc says "no." The Security Check can be totally without the meter right up to the point where he says "no," at which time you repeat the question looking at the meter. And that makes for very good sessioning. When you find you're doing this easily, oh man, it just goes on and on and on.

Why are you looking at the meter if you're not trying to catch him out? See? You're trying to find out if something is reactive. That's why you're looking at the meter. Well, if the guy is going to tell you his withholds, why are you looking at the meter? That's what it amounts to.

You say, "Well, have you ever robbed a bank?"

And the pc says, "Well, if you put it that way, yes. – I uugh-uh – yes, I robbed a bank," and so forth.

And you say, "When was that?" and so on, so on, so on, so on, so on. You can go a little further. "Who've you been withholding it from?"

"Oh, I've been withholding it from everybody," and so forth. "My fellow bank robbers. I didn't want them to know that – ," so forth, and then, etc., yap-yap, and so on. They got it all – they got it squared around. Good.

And you say, "All right. Now, you ever robbed any other banks?"

"Well yes, I did," and so forth. "And that was pretty bad," and so forth, and etc.

And you say, "Okay. Well, have you ever robbed a bank?"

Pc says, "Aside from those, no."

You say, "Good. Have you ever robbed a bank? Yes, what's that? What's that next one?"

"Oh well, that's just that little old bank down in Joliet." [laughter] "That'd hardly count." Got the idea?

Then you finally ask him again, "All right. Have you ever robbed any other banks?"

"No."

You look back at the meter, you say, "Well, have you ever robbed any other banks?" Meter's quiet. Go on to the next question.

You never look at the meter until he says no. You'll find out that really holds them in-session, man. That's very good sessioning when you can do it this way.

Now, the only bug that occurs when you do this is that you're repeating the question and apparently calling him a liar slightly. But you'll find out this isn't very damaging. He's already told you no, and so you confirm it.
Now, leaving a question hot is another very damaging action on an E-Meter. That's a very damaging thing to a session. Oh, that is something you mustn't do – leave a question with reaction on it. Don't ever go to the next question as long as a question is reacting. And don't ever go on to the next question unless you're absolutely sure that the question you are on has no further instant actions in it. Remember, we care nothing about the latent action.

There's no instant action left in a question, you can go on. And if there is, don't you dare! Because if anything is calculated to throw a pc out of session from there on out, man, let me tell you, it is leaving a question hot.

You know, there's been considerable randomity occurred because of this occasionally. HGC pc, and end of session comes along and – . One girl ran all over town telling everybody how Scientologists were all frauds and they were bums and how they were all trying to rape her and shoot her and so forth. And she actually blew the HGC and wrote letters to everybody that night before they could finally get hold of her. And finally they trailed her down and – they heard the rumors going around and they wondered what all this was about, so they traced them back down and they found this one girl. And they got her down and the question was something like "Have you ever committed adultery?" And boy, it was just falling off the pin. It wasn't an instant read. It was just – it was blowing up before the auditor could open his mouth, you know? Bang! Bang! And they got these fantastic withholds off of her, and that was it.

"Oh," she said, "I guess I committed an awful series of overts," and she hurriedly did a volte-vis and tried to straighten up everything she'd been doing.

But look at that. Isn't that interesting? It just – one question, and I think it was an end-of-intensive question. And the auditor just foolishly said, "Well, it's the end of the intensive, and that's it." Never flattened the question. I haven't got that particular particularity, but I do know that the rest of it did happen. They had about ten people running all around trying to round up what all this was about. It was just an unflat Security Check question. And you just mustn't leave questions unflat. Sure, take them up in the next session. You've got to, sometimes, because one question can go five hours – has done so.

The fellow is the father of eight children. And you ask him the question, "Have you ever spanked a child?" And he already feels awfully guilty about this and he's left his family and this is a great point of disturbance with him and the punishment of children is a very hot subject and so forth. And, man, you can just go on and on and on and on with this particular subject.

He's just getting off withholds and getting off withholds and getting off withholds. No one cares how long it takes to clear a question as long as the auditor is working on the clearance of a question, not getting off somebody else's withholds through the pc, not trying to find out what the pc thought or heard or did about somebody else. We're interested in the pc's withholds. And as long as the auditor is getting actual withholds off the pc on instant reads, continue with the question.

The only way you can waste auditing time on the thing is to just wait there for the latent read and then take that latent read. The read occurs two and a half – three seconds after you've read the question. You read the question ... fall. You say, "What was that?" You
knucklehead. You're immediately going to get something like this: "Well, I just thought it was getting awfully late." That's true. That's what it fell on. Didn't have anything to do with the question. Or, "Oh well, yes. That made me think of a book I read once that I wasn't supposed to read."

Look, this is a question about stealing, see? "Have you ever stolen anything?" See? Wait, wait, wait, wait, wait – clang! "Well, what was that?", you say on the latent read.

"Oh well, that was a book, I guess. I – I was thinking about this book."

"What about this book?"

"Well, I read this book. Well, it would – it talked about stealing."

"Oh well, what about that?"

Well look, knucklehead, nothing about that, you see? I mean, it – there just isn't anything. It doesn't have anything to do with it except the pc's mind was out of gear for the moment. It's like finding the gear wheels disengaged, you see? And you sit there and wait, and eventually the pc is going to think about something, isn't he? And if you wait long enough, you'll always get a reaction, even if it's just on the ARC break of "Why are you so damn quiet?" [laughter]

It's factual, and it follows through. Serious withholds or withholds that should be gotten off the case or have anything to do with a case and all the things that the person himself hath done, are as a result of an instant read. And you must follow through on that particular basis.

All right. The next thing that you should pay attention to, besides clearing every question as it goes on down the line – the next thing you should pay attention to, is selecting the type of Security Check. This is very important.

There is no sense in security checking somebody on something he has nothing to do with. That is rather frightful. Let's say that we have a special Security Check on the subject of boilermakers, see? So we get this girl who is a milliner. And we run a Security Check on boilermakers on this milliner. And we say, "Well, she's got clean hands because she didn't have a single fall." Well, that's for sure.

Similarly, it is equally an error to take a generalized Security Check when you know very well your pc has a particularized professional or action area. If this pc is living by some particular framework of mores – . Well, let's say you're security checking a person who professionally, this life, right now, is a bank teller. Well, all right. That might go along all right and so forth. But you just never seem to get around to writing up some additional questions to give him as a Security Check. And of course, you'll miss it every time. You just give him the generalized form of the check, and it only hits banks on about three questions. Now, you yourself have to be able to project your imagination and initiative with regard to that situation.

You'd say, "What would be the withholds of a bank teller? What would they be?"

And of course, it turns up at once what they would be. We're liable to find something like this: He has to stand in back of this cage all the time and he hates people. And the word
of the bank is that you must be pleasant to all the customers as you take in the money. And you must stand there with a smile on your face, you see, and take in the money and pay out the money. And you just can't figure out what's wrong with this guy's job, see? He's unhappy and he isn't doing well and nothing is going on and so we give him a general Security Check and it goes on and on, but it never takes into account what the man does in life. You get the idea? Now that is a floob. That is – comes under the classification of a boob.

We do put one together around what we think a bank teller might possibly have as withholds and then we find all sorts of very interesting things. He has held a deposit for twenty minutes so one of his customers, you see, wouldn't be overdrawn. Interesting thing. Nothing very much, but it was something to him, because, man, are you supposed to have those deposits right into the drawer and they're supposed to pass down the endless belt and go into the machines and so forth, and so on.

And he actually has, on his own initiative, which is just – that's pretty adventurous – has actually put his fist into the machinery of the bank and he has held it for twenty minutes. And that is a withhold to him.

And then you find maybe he's standing there with all kinds – every time a customer comes up he has a game that he plays on something on the order of an unkind thought. And he just has nothing but long streams of unkind thoughts. Every time somebody comes up – bzzzzzzzz, got this long thing.

And you ask him the right question – you say, bank teller. Well all right, bank teller – he must have customers. And you say, "Well, have you ever had an unkind thought about a bank customer?" And you're liable to run into an avalanche. And it'd just sit on that case till the end of time unless you yourself security checked against the reality of the pc. That you must always do. Whatever else you do with Security Checks, also security check against the reality of the pc. And that takes into account the moral codes by which he lives.

Now, you security check a Catholic some time or you security check a Baptist and you'd have two different Security Checks. They'd be different. You security check an Afrikaner and security check a Zulu. You're going to have two different Security Checks, man. And they're almost vis-à-vis different Security Checks. Almost everything one thinks is right, the other thinks is wrong.

Who's to say who's right or who's wrong? That hasn't anything to do with it, which is why I gave you a little bit about the moral note at the beginning of it. The rights and wrongnesses of things are what groups have determined on in order to perpetuate survival. And that's the rightnesses and wrongnesses of things. It's what is survival to the group, not whether you are enforcing the mores of a group because you are so sinless. So you have to actually be able to security check both sides of the fence.

Now, security checking a cop would be quite different than security checking a criminal, of course. Security checking a soldier would be quite different than security checking a chambermaid. It would be different.

So if you omit specialized Security Checking and putting together a list of questions that concern the activities of the person – if you omit this entirely, you've booped.

Your job is not to run a repetitive question at all, but to get off withholds. The auditing consists of getting off withholds.

Well, how do you get off withholds on the subject of rape? Well, some fellow says, "Well now, I just don't want to answer any questions about that at all. No, I just don't think you'd better be asking me any question. Let's go on to the next one. We'll still be friends. But we'd better go on to the next question." [laughter]

Well, how are you going to get around that? You can still ask the question, "What have you got against rape?"

"Oh," he'll say, "well, it isn't what I have against rape, it's what other people have against rape."

"Well, who has things against rape?"

"Well! My mother and my father and the public and the preacher and the parson and the state," and so forth.

"Well, when did all these come down on you on the subject of rape?"

"Well, that was when I got in the newspapers on the subject." [laughter]

"Oh, when was that?"

That is what is known by pulling a withhold from the back door.

Now, the next thing you must remember is that a withhold is generally a withhold of an overt act against the mores of a group. Now, actually, the enforcement of the mores of the group to make other people withhold is the overt act of withholds. Trying to make – you get the idea? You're enforcing the mores of the group against another person to make them withhold.

It's the overt act of making people withhold, see? So you err whenever you don't ask the "make guilty" question.

You can take every Security Check you've got and simply add an additional question below each level on: "Well, have you ever made anybody guilty of rape?"

You get this girl. She keeps telling you, "I have been raped. It isn't that I am withholding raping somebody; I have been raped." And the question is still hot.

And you say, "How in the name of common sense am I ever going to clear this question? How am I going to clear this question? How could I possibly clear the question? Because she just says – and of course she's an offended member – no, she hasn't raped anybody. She's been raped." Well, if you Q-and-A and just go off and say, "Well, we're not security checking now. She has a bad engram and we might as well run this engram and find out all about all of this rape and when she was raped and so forth," are you still security checking or are you doing something else? You're doing something else. You are auditing processes, you
are running engrams, but you're doing something else. You're not security checking so you don't stop security checking and start doing something else. You go on security checking. In other words, gets off the withholds. But of course, the overt act of a withhold is making somebody else withhold. And of course, the moment you ask the question, "Well, whom have you made guilty of rape?"

"Oh, well" – you get a nice big meter reaction, and "Him, of course, and him and him and them and them and them and them and them and them and them," and so forth.

"Well, have you made anybody else guilty of rape?"
"Yes. Well, them and them and them."
"All right. Anybody else you made guilty of rape?"
"Uh, well, no."
"Anybody else you made guilty of rape? What was that?"
"Well, it's just – I'm just restimulated by the whole thing."
"Well, have you – have you ever raped anybody?"
"Yes."

In other words, the "make guilties" all lay on top of an actual fact. She been raped all right, but Shakespeare's statement "Methinks the lady protest too much" can be Hobson-Jobsoned over: "Methinks the pc protest too much."

And whenever the pc protests too much, you are looking at the boiling broth. And you might as well pick the pot up and look under it, because you're going to find fire.

"You shouldn't be asking me that question. It is insulting." Oh, man. Why don't they run up a signal halyard and fly fifteen flags from it, you know; get blinking lights going in your face? Because that is the one question that is hot. And of course a person who has fantastic motivators which just keep rocking and rocking and rocking. The person says "Well, I haven't ever raped anybody; I have been raped. And that is why it is falling."

No, remember your original question was, "Have you ever raped anybody?" and you got an instant read. And the facts of the case are that the pc has, but the pc has tried to make other people guilty to such an extent that this lies on the top of it as the overt from the withhold motivator. Do you see? So there's what you got.

So you ask the "made guilty" questions any way you want to phrase it. "Have you ever protested against?" "Have you ever accused?" Do you see? This type of questioning for each subject matter of a Security Check will be found to be very, very beneficial in freeing up a whole security question; because, of course, it is making other people withhold and when you get the overt off, then the pc gives up his withhold. It's not actually, you see, an additional question. It is another way of asking the same question.

And then you come back and you always leave a Security Check question that has fell [fallen] – you always leave it with the same wording that you asked it in the first place that
produced the fall. Never miss that. And that is usually, for your ease, the way it is written on the paper.

You've been asking all sorts of things about rape. You said, "Well, have you ever made anybody guilty of rape? Have you ever – rape?" and so forth and so on. And "All right. Have you ever had unkind thoughts about rapists? What have you done? Have you ever wished you were raped?" Doesn't matter, whatever you were asking, you see? What produced the reaction – the reason you're asking these questions – is: "Have you ever been raped?" And the question you're trying to clear is the one that produced the reaction. So you always repeat that question in the same wording to see if there's any additional reaction before you leave it. And then you're sure that that question is clean. No matter how many other variations you ask – and you should ask variations in order to get the thing cleaned up – you go back to the same question again before you leave it.

In other words, always go out by the same door you entered. Don't go ducking out the side door. You've cleared up have they ever made anybody guilty of rape, see? So you say, "Well, that's it. Well go on to the next question."

Oh, you missed and you will leave a question hot if you do that.

All right. I've tried to cover here some of the elements of Security Checking.

You can tailor up Security Checks any way you want to. You can always add to a Security Check. You can always add to a Security Check.

You may never subtract from one. The reason why we lay that injunction down is that somebody who has a withhold on a subject who runs into it on a list will then not be tempted to avoid it.

And you would be fascinated at some of the Security Check questions being made up by people who have buttons on the subject. You never quite read as much of an avoidance as you get when you do that. You take somebody who's sitting down here in Dartmoor Scrubs and have him write a Security Check up on the subject of criminals, and you get a three-question check.

But you ask him to write – he has never been a soldier – and you ask him to write a Security Check question on the subject of soldiers and he writes you eighteen pages. It's quite interesting.

But people subtract from Security Checks where they have withholds. So you lay down this injunction; you say: "Always give the standard Security Check; add anything to it you please. Write up any special check you care to, as long as you give a standard check, too."

And then that keeps anybody from ever indulging in tacit consent and avoiding a question because "We know, of course, that this person has never stolen anything from the organization. Of course we know that, so we just won't ask that question." And sometimes a person does this in all innocence. It just seems to him like the question would not produce any particular result. That's all there is to it. And then somebody asks him the question and it goes hotter than a pistol.
And he says, "But I never have! I just never have." And you go tracing it down, and he has. He actually doesn't remember having done so. But the meter knows.

And the one final injunction on this is, please believe the instant read of the meter. A person who is telling you a lie, a person who has a withhold, gets an instant read on the question. And if they're getting a read, a needle reaction, there is a withhold. And never buy anything else.

I have seen a slug of hours of duration with the needle continuing to react and the pc saying "No" and almost in tears over it, because the pc cannot remember, the pc cannot differentiate it, the pc cannot tell what that withhold is. It just doesn't seem to elude anybody. And for the auditor to leave it is a serious error, because at the end of those hours, so help me Pete, it was found, and it did clear.

Now, I've had people with some pretty nasty withholds on the meter. And I've never failed to have the meter react when the question was charged so long as it was against the moral code of the person I was checking. That was the important point. And it's quite interesting to watch it. It will not wear out. The question will not wear it out. That is what is fascinating. You can ask it, and ask it, and ask it, and ask it, and ask it, and ask it, and ask it. And it won't wear out. It'll just produce, if anything, a little faster reaction. Until the withhold is given up, the action occurs.

So don't ever think your meter is busted. Make sure that your meter isn't before you start the session. That's the time to make sure the meter is all right, not in the middle of the session, thinking, "Well, it's just reacting. This rock slam must be because some dust has gotten into it." No, the rock slam is coming from a withhold if you're on a Security Check. Okay?

Male voice: Right...

All right. Well, I hope this clarifies a few points for you on the subject of Security Checking 'cause you're going to find this is a very, very important subject. It's going to be with us for a very, very long time. It's one of the basic skills of the auditor and is the first thing that an auditor should know how to do very, very well. He should know how to security check well. Because you can do anything under the sun, moon and stars with a Security Check. You can do anything with it. And the better you are at handling the basics and fundamentals of Security Checks, then the better you will be at making them work.

Thank you.
PROBLEMS INTENSIVE

A lecture given on 10 October 1961

What is the date here? The 10th of…?

Audience: Tenth of October.

Tenth of October 1961, Special Briefing Course, Saint Hill.

Now, supposing, supposing just for fun, supposing that Dianetics and Scientology did everything they were supposed to do. Supposing Dianetics and Scientology did everything they were supposed to do. Supposing that was a fact. And supposing this was all perfectly true. And when you got processed, why, all of these problems would resolve, everything would straighten out, and there was no vast difficulty of any kind. And this was the answer. And man hadn't had the answer before, but now we've got the answer. Now supposing all that were absolutely true. Now, just a moment now; supposing that were all true, completely true, and that was totally factual and that was it. Got that?

Now just supposing that were all perfectly true: What would your problem have been before you came into it? What would your problem have been before you came into it? Just before you came into Dianetics and Scientology, what would have been your personal problem in existence? Can you answer that question? Hm-hm. Is this a new look? Have you just suddenly realized something? Hm? Have you? Have you just suddenly realized that there was a problem there immediately before you came into Dianetics and Scientology?

Do you get a somatic at the same time? No?

All right. Now let's sort it out again. Was that really the problem you had? Was that really the problem you had? Has that problem been carrying along since?

Audience: Yes. [amusement in audience]

All right. Now I've just been giving you the approach you should use on a PE. That is the approach you should use on a PE.

Supposing Dianetics and Scientology were everything that they were supposed to be – and you can go on, of course, ad infinitum, and add it all up. And there's one old bulletin I wrote about a year ago, or something like that, that give all of its firsts. What is Scientology? And that gives a tremendous number of firsts that Scientology had – for the first time this, for the first time that. Supposing all this were true? And then you ask the people after you had carried on this way for about a half an hour and described Scientology to them completely,
and give them the broadest possible description of it, then ask them what would their problem be that would make them come to this?

Now, of course, you're old-timers. You've been processed a long time. Most of these things are dead and gone and long buried, but not with a group you'll get on PE. It will take their heads off. And that should be the first lecture given on a PE course. I got that taped. Take it from me. That is a piece of technology, not a piece of propaganda nor administration.

Why? What exactly are you doing? What exactly are you doing? You're giving them a stable datum. You're punching it in. You're making a conditional stable datum. And then if you carried it on that this was a very desirable stable datum, if it were true and if it existed – you keep adding that in – this is a very desirable stable datum, you, of course, have restimulated that basic problem of continued, long-time worry and agony up to a point where it's ready to blow their heads off. And then you ask them, "What was your problem? Why did you come to Scientology? What problem do you have that has driven you to this?"

Now, every other group in the history of man would at once conceal this tremendous mechanism, because it would hold a group together endlessly just because they're pressured in. If they never gave them the answer, if they never had anything out of it, they would be pushed together by the duress. They would be told all the time that this was it, and this was the exact thing, and so forth, and there they were, and it would restimulate that problem if processing or something of that sort was not adequate to relieve it. But we are rich in technology, and we have a little more nerve than that, so you could actually ask them the first crack out of the box.

A lot of them there for the first time, you could ask them just bang! "What is the problem that would cause you to accept this? What problem do you have in your personal life that would bring you to us?" Well, of course, you've keyed it in, only they haven't noticed it being keyed in. And when you ask them, of course, the problem is just staring them in the face.

And on a certain percentage of these people, you will produce a fundamental and startling change in case. Just like that! Bang! You'll turn on somatics on them in many instances, but they will be happy to have them, because they'll say, "Oh, is that what that is? Oh, is that what this is all about?" And they will have a personal recognition.

Now you can go on and describe to them what processing is, how problems are relieved, that sort of thing, and go ahead just from that point of view.

You could send them into a co-audit or into the HGC. And it would be better, actually, to send them to the HGC than into a co-audit. It's always better, in spite of the fact that they can fool around for a long time in a co-audit – unless you've got a co-audit running that is going to do something about problems. And if we're going to use that kind of an approach, then we had better doctor up the co-audit so it takes care of that exact situation.

We're not dealing with what the co-audit would do about this. We're dealing, actually, with what a Class II Auditor would do about this – a Class II Auditor.

We have a new series of classifications. A Class I Auditor is simply an auditor who runs anything, and that Class I exists for just two purposes. First and foremost, it lets an old-timer, who has a stable datum that a process will work, actually do auditing for you without
training, so as to give him an opportunity to get trained while he audits. That is an administrative problem in HGCs, and is an administrative problem in any clinic or any center. You have that basic administrative problem. You have people around, and instead of training them for nineteen weeks, or something like this, before they do a speck of auditing for you, you give them something on which they have reality and let them go ahead, because they will win with it, and they will get some wins, and it'll be a passable show. And this gives you an opportunity at the same time to train these auditors up to a Class II. And we're talking now about, really, Class II. I've just given you the key question, disguised as a PE question, that will take apart any case, providing you go at it right. And there is a new rundown, which you will see very shortly. It's just like a Preclear Assessment Sheet. And it has two new sections on the end of the Preclear Assessment Sheet.

Now, you know that anybody can do a Preclear Assessment Sheet – anybody can do a Preclear Assessment Sheet. You can sit there and ask these questions and fill out these forms, and you can get the data from the pc and there it is. Do you agree with me that that's a fairly easy thing to do?

_Audience: Hm-mm. Yeah._

All right. Now, what if you had a process which added a section on top of that, which asked them simply some more similar questions and got you a list of things; and then you had a new section on top of that which you just filled in as you process the exact processes given in that new section? That would be a very easy thing to handle.

There's your O section, and that asks a certain series of things and asks for a certain series of circumstances, and you get – you just write down this new series of circumstances from the pc, and then when you've got those, you read them off to the pc and notice the needle reaction of the E-Meter for each one. And you take your steepest or most reactive needle reaction. You don't do it by elimination. You just read it off and you say, "Well, it fell off the pin or wobbled more than otherwise."

You just take that one, and then with that datum which you've gotten out of the O section, we move over into the P section. And in that section we take that one datum and we just do this, and then we write down we have done that; and we do this, and we have written down we do that; and then we process this exact process for a while, and then we write down that the tone arm isn't moving anymore on this process; and then we do this, and then we do the next, and we write down each time we've done one of these things and we come down to the end of it.

Now, that is one P section. And the P sections are interchangeable – I mean, they're additional. So we take the same form that we've got now, including the O section, and we do this assessment again down through the O section, and we get the biggest read we get this time. And we move over and do a whole new P section. And we finish that whole new P section, and so forth, we lay that aside, we go back to the O section, and we go down the whole list of the O section, and then we write down what was the steepest reaction now; we take that one and we move over into the P section, and we do it down the same form of the P section. We just keep doing this. That is a Class II action, and that is a very easy one to do.
It includes the rudiments' Problems Process, and it includes a Security Check on the people in the prior confusion.

Now, I'll give you the modus operandi by which this is done.

O section simply asks for changes in the person's life. It asks for them specifically: Times their life changed, and it makes a list of each one of these things – whether that life changed because of death or graduation or anything else, we don't care. We just write down this particular point of change.

And now, because the pc has not noticed the most significant points of change – if he has, it's all right, but if he hasn't, it's all right – we've got a series of new questions: "When did you take up a certain diet?" "When did you join a certain religious group?" "When did you decide you had better go back to Church and go back to Church?" You get all this type of question. We fill out a whole bunch of these questions. And they're all what? They're all major change points in a person's life.

Here's the sleeper: Each one of these change points must be eventually taken up in the P section, because the P section asks, after the assessment is done, for the problem which they had immediately before the change – and you knock their heads off. That is the prior problem combined with the prior confusion. And the two things are deadly.

You find each time they had a problem just before that change, and that the change was a solution to the problem. And therefore, the problem has been hung up ever since because they solved it. That is the sleeper. And of course, just before that problem, there was a hell of a confusion. So you're going to take up the problem. Now let's see how this would be done. O section – we ask them this long list of changes. It's just very simple. It's "When did your life change?" you see?

"Good. Prep school. When was that?"

"Well, I guess that was in uh… oh, well, that was in 1942 – no, that was in 1932. No, that was in 1952. Uh… that was in um… it's sometime in the past."

Well, you don't ask the auditor to date it particularly. All you want is an approximate date. That's why I'm giving you this lecture, is to give you the gen on how to run one of these forms, and I'll tell you why in a minute.

The date can be very, very approximate. It can be ten years ago or anything. We don't care, see? And we'll say, "All right. When was another change in your life?"

"Well, when my mother uh… ran off with the iceman. That… that was a big change in my life." Or whatever it was, see?

Well, so we write down, you know, Mother ran off with the iceman. "About when was that?"

"Well, I guess that must have been about, uh… fifteen, twenty, thirty, forty – I don't know. Twenty-five, six, eight, fifteen. No, I was a small child at the time. Uh… no, I was a
small child at the time, and I'm so-and-so now, and so on. And I must have been about... I was either five or fifteen or something like that."

Because all of these things, you're asking for stuff that is floating on the time track, so you don't care about the accurate date. You just get him to make a statement on it. You just get him to make a statement. You put down, well, it was twenty years ago, something like that, see?

And you keep getting these changes. Now, these other changes have missed him usually, but every time he took up a diet, a fad, changed his clothes, all of a sudden changed his methods of living in some fashion, you get all those as changes in his life, too. And you actually will have, by the time you finish an O section, most of the changes in the life. Now, of course, it's going to occur, later on he's going to remember new changes in his life. And it's a moot question whether you bother to add these new changes on or not. You'll wind up with a lot of changes, and they'll be the most significant changes in the fellow's life, and you'll hit it.

This, you see, is not a very precision activity, is it? You got to ask questions and you got to get the answers to the questions. The truth of the matter is, no pc is going to kick the bucket because you miss.

In other words, this is a very safe activity. So this is a safe activity, and that would be a very happy day for the Director of Processing in any organization, to have a safe activity.

See, that compares tremendously different than Routine 3. Routine 3 is not a safe activity at all. You get the wrong goal and the wrong terminal, and you run it and you've had it. Oh, you can patch the case up and hang it back together again with sticky plaster, but this is a very precision activity, Routine 3. Well, we're talking about Routine 2, so we've got an imprecise activity. What I have discovered, actually, just as a side comment here, is an imprecise activity that will change the living daylights out of a case and not exaggerating now. You run this and you'll see. And it can be done rather imprecisely, and it can be done rather skimpily, and they can forget to flatten things, and they can do other goofs, and they can have the rudiments out, and other things can happen, you see, and they're still going to get results. So that's a good thing to have around, isn't it?

All right. You see, you've defeated me down here. [laughter]

Now, anyway, here's... this long list of changes. Now just reading off these changes: "All right. Your mother ran away with the iceman, and so forth. And later on... and you joined the Holy Rollers of God Help us, and..." this and that. And you just read each one of these changes you've written down. And you've written it down in his language and he can spot it. That's the thing. It's just a communication that he can spot. And you read your needle reaction; you put your needle reaction down. But you're doing the P section, you see, by the time you do this.

And you get the needle reaction. And then it's number so. And you'll find all these changes are all numbered over here. It's easy. So it's number so-and-so. And you write that
down in the P section, and you put a descriptive note on it if you want to, to make it very plain. And now we spring the big question.

And it's written right there in the P section on about the third line, something like that. And it says, "Now say to the pc, 'What problem did you have immediately before that change?'" Now, you think I'm being sarcastic, but I am not being sarcastic. I'm showing you that this is an easy one to get across. And I'm trying to ease your mind, because you will be administering people doing this one, you see? And I'm trying to give you an easy mind on doing it.

And they're going to have worries. And I'm just telling you, now don't have these worries. I'll tell you the only – about the only two things they can do wrong in the test. We will take those things up, and they're rather minor.

All right. So we say now, "What was your problem?" And we get him to state the problem. Now, this is the first thing that can go wrong, is that he states a fact and the auditor writes it down as a problem. He's got to state a problem, so you've got to keep him stating it if he persists in stating facts instead of problems.

Now, the difference between a fact and a problem is simply this: A problem has how or what or which. It has a question, it has a mystery connected with it. It is not a fait accompli. A fait accompli, a fact, is this: "My head hurt." See, that's not a problem; it's a fact.

So you ask now... you ask that change, and you say, "What problem did you have immediately before this?"

And he says, "My head hurt."

"Good." You say, "All right. Now how would that... how would you state that as a problem?"

And he says, "Well, my head hurt pretty bad."

And you say, "Well, did you have a problem about it?" You see?

And he said, "Well, also my head uh... sometimes didn't hurt."

And you say, "Yes, well, good. But did you have a problem around this?" And it finally drives home to him that you're asking for a problem.

And he says, "Well, yes. Sometimes it hurt and sometimes it... oh, well, a problem. Yes. Well, it's 'when my head was going to hurt.' Yeah."

And you actually have to work at this point until you get the person to state the problem – as a problem, not as a fact. And you're going to find some auditors that are under training in Class II that will have a rough time doing this, because you'll get the slips back and they will be saying on them "My head hurt." What is the problem? And then the fellow has run an hour and a half of processing on this fact, you see? And he couldn't fit it in, because it isn't... so on. And it's very all... very complicated. And he couldn't run the right process. He didn't do anybody any harm, but he didn't get very far either. You want a problem, not a fact.

All right. Now having gotten that, it says right on the next line that what you ask is simply your problem process. It gives you the wording of the rudiment for problems. Of
course, you're running what? You're running a present time problem of long duration. Naturally, you're into it with a crash.

Now, your next point is that you're just going to run that till the tone arm quiets down. Now, that doesn't say how long. Supposing they leave it unflat. Oh, it doesn't matter. It'd be nice to get a nice, neat, workmanlike job done on it, where "unknown" was run against the problem until the tone arm no longer moved for twenty minutes. That would be nice, but it is not vital.

Now, it ceases to be vital after the somatic that turns up with it has disappeared. It ceases to be vital. But if a person just backed off of it while the somatic was in high gear, there possibly might be a little repercussion.

When we first gave, oh, I don't know, let's see... "Is this a withhold from Scientologists or is it an overt to say so?" You know, you come against that all the time. Would it be an overt to say it, or is it a withhold if you don't?

We gave Mike Pernetta the gen on how you flattened a level, and we said you ran it until the tone arm didn't move, you see? He got the tone arm into motion and then left it. And that was his interpretation of it, and he did that on three consecutive levels on a pc I'm looking at right this minute. I had his head and dried his ears, but it didn't do any good. This is what he had done.

So you see, that can be badly interpreted even by a relatively good auditor. That tone arm motion, on just an old point like that, you know, everybody knows "Well, you run it till the motion goes out of the tone arm and it finished," and so forth. And you'll get somebody that'll turn it square around and say, "Oh, you get the tone arm so it's moving, and then you knock it off."

I know this sounds utter idiocy, but I'm telling you something that has happened. So you have to do a little police work on that point. And that is the other point you have to be a little bit shy about. Just make sure that the problem gets flattened, the tone arm motion disappears, on that rudiment command.

Now, you're not running that rudiment against the needle, as you ordinarily would, because this has directed us to do what: This has found for us the present time problem of long duration which will produce hidden standards. And I've just shortcut the route into hidden standards here with a large, wide knife. So it's a present time problem of long duration that you're running, so therefore you'd better run it by the tone arm.

So you run the tone arm motion out of that. Now how long is that going to take? Well, at a conservative estimate, I would say that it was two to five hours of auditing. I would say it was something on that order, two to five hours of auditing.

Now you say, "Well, what happens to Model Session while you're doing all this?" and so forth. Well, we assume that some kind of a session was set up at the time they started the assessment. We assume this, and we assume that the next day that they start auditing, that they're going to do a Model Session and move into it. But what if they hit a present time problem?
Well, you're running a present time problem, so you are running a rudiment. So a nice, precise job of auditing would include running the pc on this particular rundown with Model Session in full play. Yes, that would be a nice, neat job of auditing. But let me tell you something. It doesn't much matter if the whole rudiments and Model Session are omitted. That's a nice, sloppy process, isn't it? [laughter] I designed a real sloppy one here. That's real good. You can make lots of mistakes with it.

All right. Now what happens when he's got the tone arm motion off of this problem? Now, he asks, it says right there, the sixty-dollar question: "What was the confusion in your life immediately before that?" "What confusion was in your life?" And it does an assessment of the people in the confusion. You write down then all the names of the people connected with the confusion in his life, see? And the idea of listing and asking for another person in the confusion of the life will keep putting the person back into the confusion, and stop him skidding forward, and you will wind up with a list of personnel. And now you security check this personnel.

Now this, of course, perhaps could require a little bit of acumen and alertness, because you've got to sort of make up a Security Check. But at the same time, there are other Security Checks, and so on, and there will exist a Security Check that matches up to almost any person, you see? You know, the idea "What have you done to him?" and "What have you withheld from him?" is about all it is.

Now you could put in at this point – run overt-withhold on that person and get some result out of the thing. You actually could do just that. You could run O/W rather than security check, but it is much slower, and it doesn't get you anywhere near as far as it should, and it is running against a terminal for which they have not been assessed. And so it has a point of danger to it. It is better to security check the terminals. Now, that question is going to come up, and you're going to be asked why you just don't run O/W on each one of these terminals. Well, it's because you're using a terminal process on a terminal that has not been assessed on the goals line. And if the terminal is not on the goals line, it can beef up the case. The only thing you can do is security check it. That won't beef up the case, and all you want to get off are the withholds, and you don't want the overts at all. Simple, huh?

All right. This is the kind of a list you've got: "Now, what was the confusion immediately before that?"

"Oh, my God, I'd forgotten all about it, but there was an automobile accident, and this and that happened, and so forth. And uh… my father was very upset, and there was a terrible confusion. And uh… uh… actually, I had to pay for the car and I borrowed some money from my uncle George, and then they all… oh, that's just terrible."

You say, "All right. That's fine. That's the confusion area. Now, who did you say, now – your father?" and you write that down, you see? The people in the confusion – it provides a long list there for the people in the confusion. You write down, "Well, the people in the car. These were so-and-so and so-and-so. And there's your father. And this was so-and-so and so-and-so. And this was… and your mother was part of this, and your sister and…"

"Oh, yes," he says, "and my… my… my boss. He was part of this, too. Yeah." So you write down boss, you see?
And you just take this list... Now, if you were doing a very workmanlike job, of course, you would assess that list. But again, it isn't important. You could just take them in order of rotation, and you just get the withholds off on each one of these people with this type of question: "What were you withholding from your father at that time?" You see? "Good. Well now, had you done something else that you didn't dare tell your father about?" You see? "What didn't your father find out about that?" You see? "What hasn't your father ever found out about that?" You know, just keep plugging this type thing to get the withholds off.

Now we get the withholds off of Father, and that seems pretty good; and then we get the withholds off of the next person, and that seems pretty good; and we get the withholds off the next people, and that seems pretty good. And it isn't done thoroughly, it doesn't have to be done thoroughly. It's going to resolve the confusion. Why? You got the problem off the top of it already. And you can just take a sort of a lick and a promise at the thing – now, it'd be nice if it were done thoroughly, and it would produce a much better case gain, and all of this, and you would for sure have this thing out of the road if it were well – done well, but you understand that if it were done at all, why, it's successful – you'll have success on every hand just doing it at all, don't you see? So that could be kind of sloppy, too. You try to get them to do it well, but they do it sloppy and they still win. All right. So you go down the end of this list, and that is the end of that P section. And you put that over here, and that is that.

Now you take up the next item assessed off of the O section. Now you assess the major changes in the person's life – you've got a new P section form, see – you assess the major changes in the person's life from the old O section that you had, and you write down the one which you now find produces the biggest needle action. And you go through the same routine on it: Find out the problem that preceded it, run the rudiments process on that problem, find the prior confusion to that thing, get a list of personnel involved in that prior confusion, get the withholds off from those people.

This is kind of a, kind of a different Security Check, in that it's withholds from those people specifically. It's the not-knows, actually, that he's run on that personnel. And you got that nicely cleaned up, and then you, of course – that's the end of that P section.

And you get a new P section form, and you go back to the old O section and you do a new assessment. And you just run the whole thing down till you can't get any needle motion anymore on that old O section.

And at that point, we could say at that point, with a considerable amount of truth – when we have finished up this activity – we could say that the person was a Release. We could say it just like that. And we could also say, with some security, that the person had no hidden standards and would do auditing commands.

All right. Now you could go ahead with general Security Checks. You could go ahead with checking against any lingering chronic somatics, using Model Session, getting the rudiments in and that sort of thing, and you could finish up the activities that a Class II Auditor could do. You could do all of them. But you know these things are going to be fairly functional, because you've gotten the hidden standards out of the road. You've gotten the basic problems of a lifetime, the hidden standards have been swept away by this particular packaged activity.
Then you'd go ahead, now, and you would assess for goal – you turn him over to a Class III activity. The pc would have to be turned over. After all the Security Checks anybody could dream up, or any Security Check published anyplace had been given, why, that would be as far as you could take him at Class II. But you've gotten quite a ways. You've got Security Checks done. You've got hidden standards off. You've got chronic problems of long duration off the case. And that seems to me like that would really be setting one up, wouldn't it? And the case would have an enormous reality! Let me tell you, some enormous reality can greet this particular activity, because this is a sneak way of finding the present time problem of long duration, which I've just dreamed up for you and squared around, and you'll find it very functional and very workable.

Now, a case that had had this done to it, coming into a goals terminal assessment and a goals terminal run, of course, would run like hot butter, because the only thing that's getting in your road in clearing is the hidden standard and the withhold. That's all. The present time problems of long duration and the hidden standards – let me say that – and the withholds that you get off in Security Checks: those are the only things standing in the road of people going Clear. And if you could handle all of those, why, bang! that would be very profitable. And it isn't just turning somebody over to an auditor, because you haven't any auditors that can do anything else. It actually is very profitable to set a case up.

Now, this would be a much more profitable way of running 1A, and it supplants 1A in full. This is how you get the problems off a case. You find out this is more workable, and it will work on people who have not had their goals and terminals found – even better than 1A. Short. It's very fast. Produces a high level of reality in the pc. Produces a tremendous amount of interest. The interest goes way up on this particular activity.

Well now, just look at the assessment alone. Let's go back over the points of improvement now. Look at the assessment. You mean to say that somebody is going to sit there and actually have spotted for him all the changes in his life without getting a case gain? He'd cognite. He'd cognite on some things, because these things will start turning up, you know? And after he thinks he's given you all the major changes, you ask him when he went on a diet, or something screwball like that, or when he started eating special food, you know, and he...

"Special food? Yes. Well, you know, uh… well… I've just been doing it for so many years. Actually, I'm not any vegetarian or anything like that, but the doctors put me on uh… a diet, and I actually haven't ever much exceeded it since. It's no salt and uh… so on. It's a very mild thing. But come to think about it, yes, I am on a diet, and uh… Well, good heavens, when was that? Must have been about '50 or 1935. No. I wasn't born yet in 1935." And all of a sudden, a new area of track opens up. So this type of assessment just keeps opening up track – in this lifetime, you see; opening up track in this lifetime – just the assessment all by itself.

Now, you've already asked him earlier than this, on the straight Preclear Assessment Form, for his operations, and for everything, and you've noticed that that sometimes opens up track on PCs. Well, an assessment of the major changes of a person's track, that certainly
does. And now we take these things apart, because every one of them sat on top of a problem. And don't be surprised.

Now, here are the limitations of all of this, and things you shouldn't be surprised about in doing this particular rundown.

Don't be surprised at all if it always turns out to be the same problem before each change. And if it again turns out to be the same problem, what do you do? Now, you will be asked this. You will be asked this pleadingly and burningly. "This is the second assessment we did. We've already got the personnel all 'hidden confused' out, and we got the thing flat with the rudiments process – and it was flat. And we had an awful time because he kept going back into a space-opera engram. And we kept him out of that." (Knucklehead.) "Um… and we guided him as well as we could, and all of a sudden we find this 'left school,' 'left prep school,' and he comes up with the same problem, and it's still alive on the meter! Now how about that?"

Well, your proper answer to that is, "What came up on form of the P section? What came up on that form?"

"Well, this problem – same problem. Uh… he had the same problem just before he left prep school."

"All right. Now what is the next line on the P form?"

"Well – oh, well, I see what you mean. All right."

So he goes back and he runs the rudiments process on the same problem again. Of course, it has changed aspect and shifted over into a greater or lesser intensity of some kind or another. And he'll run that thing down. He'll find the area of prior confusion. And of course, the whole of the fellow's schooling opens up this time. And that had all been closed in. And so on. And he has a win. Everybody has a win, you see? But it'll worry people because the same problem will turn up, as it will often do. And it'll now turn up live all over again because it's got a new aspect.

Of course, the joke about this is, is he's had this same problem for the last hundred trillion, you see? So, it doesn't matter. It doesn't matter. You just get some more running on the same problem, and then get the application of that problem to this life by getting off the area of prior confusion, don't you see? And you're just unbaling the case and unbaling it and – naturally, and so forth. But it'll worry people. You mark my words.

Now, sometimes the person is dispersed off the main problem and nothing happens with this; nothing will happen, I guarantee you, for the first four sections that you fill out. The first four P sections that are filled out, there's nothing – nothing really happening. The person is just plugging along and… Find the areas of prior confusion. The problems are wildly different. And on the fifth one, you get the problem. And it almost blows their head off. You get the idea?

So that may happen in the first one you do, and it may happen in the fourth one you do, and it may happen in the tenth one you do. It's going to happen. Sooner or later he will
move onto this, because the other problems are simply baling off the center-line problem. And he'll recognize that all problems are this problem, and so forth, and he will run it.

Well, after you've addressed this problem for quite a while, this problem will move out into another perimeter and he will feel freer and more in communication in this lifetime. And more important than that, you will have keyed out his hidden standards.

Now, let me warn you about something: Until you have the goal and terminal of the pc, all you can do with a case is key it out. That's all you can do with a case until you have his goal and his terminal and start running them. You say, "Well, then it's unfair to the case." Ah, well, but this is a double sort of a package. You can have his goal and terminal without getting off his hidden standards and problems of long duration, and they won't run.

So, you could find his goal and terminal, and then go back and do this problems straighten-out – I've been calling it a – Problems Intensives. You could straighten out all of his problems and hidden standards, and so forth, and then go back and run the thing; or you could do the Problems Intensive and then assess him and then go back and do all the thing. But you're going to have to, in any case that's going to hang up – and that is something on the order of 90 percent of the cases you'll audit – you're going to have to do something like this to get the present time problems of long duration and the hidden standards off the case, anyhow. So it doesn't matter whether you do it before the goal and terminal are found; you will certainly have to do it after the goal and terminal are found if you do that first, you see? So it doesn't matter which side of the thing you do it on. It really doesn't matter very much, except that the pc cognites faster if he knows what his goal and terminal are. He gets a little bit more zip out of this particular activity. That's about all you can say about it.

If you haven't got the pc's goal and terminal, and you aren't running Prehav levels on the pc, all you're doing is keying things out. You are keying things out.

Now, the funny part of it is that when he gets his goal and when he moves over into his terminal and when you go on down the terminal line, the Prehav runs, and he collides with engrams as he goes down the thing, this headache that he thought desperately was turned on by having left prep school, this difficulty he has had with women, and all of that sort of thing, are suddenly found to be resident when he was a telegraph operator on the Mason and Dixon line. There they sit. And it's there in full, and the somatics come back on in full, but this time they run out. A somatic is where it is on the track, and it's no place else.

But you've put him in shape to be able to function without the somatic for a while, don't you see? And then when he runs into it, it runs out rather easily. Otherwise, you're always running him in the engram when he was a telegraph operator on the Mason and Dixon line. See, that's the silliness of it all.

You can't get anywhere if you don't key it out, because he's in 7,762 engrams, various kinds, and your goals preparation keys out the hidden standards and fixes these things up and gets this life so it's functioning, and so forth. And then you've got a pc who can stay in session. And then you can run him on down the track and really find where they are. Otherwise, you're only going to run into locks anyhow, and you're going to do a key-out and a key-out and a key-out as you run with the Prehav Scale, and so forth, see? You're going to do key-outs, key-outs, key-outs, then all of a sudden he goes into the engram.
And on a Class IV proposition, don't be too surprised to have somebody almost Clear, or actually reading Clear, that moves over then into a Class IV activity. And the reason they came into Dianetics and Scientology is because they had terrible pains in their appendectomy, and... the pain is not in their appendix, it's in their appendectomy. And all of a sudden, they find out this has nothing whatsoever to do with an appendectomy. Actually, it wasn't that type of thing, but earlier on the track they used to install meters in people at about that period of time, and so on, and somebody's screwdriver slipped. Something real goofy. And it comes off – right where the somatic went in, the somatic will come off. Somatics are where they are, and they are no place else.

So this is a key-out activity so that you can run a pc. Of course, he gets very happy about all this and straightens out his life to a remarkable degree, and you are making case gains, and they are stable case gains. No doubt about that, because it'd take him another lifetime to get him keyed in this nicely again, see? But if you just left him at this point, that is what would happen. Next life, why, he'd just stack them all in again, because you haven't got them out at source. Got the idea? So this is the value of it. It actually sets a person up to be audited, and incidentally makes them much happier with life, and also gives them a reality on Scientology.

Now, the reason you are handling hidden standards should not be hidden from you. You are handling a hidden standard not because the individual has his attention stuck someplace, you are not running a hidden standard because the individual via auditing commands through it, although that is one of the things that it does; you are running a hidden standard only for this reason: it is an oracle. Every hidden standard is an oracle. The pc has got an oracle.

Now it may look to you this way: The pc every session takes off his glasses and looks around the room to see if his eyesight is better.

"Well," you say to yourself, "well, that is a test he is making to find out whether or not his auditing is progressing." And that's what you think is going on, but that is not what is going on at all. His eyesight somatic knows, and it's the only data there is. That is all the data there is. Observation and experience have no bearing on his knowingness. Airplane crashes in the front yard: He sees if his eyesight is worse. If his eyesight is worse, he knows that the airplane crashed in the yard. If his eyesight isn't worse, he knows it isn't there.

The fact that the airplane crashed in the yard hasn't anything to do with his knowingness. It does not much influence his knowingness. This you have to get straight. A hidden standard is his present time problem of highly specialized import, but is in highly specialized use. And when you first collide with a hidden standard, when you first begin to study a hidden standard, you think of it rather loosely. You think of it as, well, it's just a specialized present time problem of some kind or another. And the pc is viaing his auditing commands through this thing and he hasn't therefore got his attention on the session, and therefore anything that would disturb the pc during a session would be a hidden standard. And actually, then, aren't the pc's hidden standards all expressed in his goals for the session? And therefore, isn't it true that a person who is trying to find out if he is brighter or not after a session is over would be operating from a hidden standard? And therefore, isn't it true that every-
thing the pc ever gains is basically a hidden standard? And isn't it true, then, that everything,
every change the pc notices in his case would be because of a hidden standard? You see, you
can get the hidden standard is no longer hidden, man. It's "any change is a hidden standard."

Well, that's not its definition. That is not what a hidden standard is, by a long way.
And you at right this present instant are labeling things "hidden standards" which are simply,
oh, little bit of a present time problem of long duration, or a goal for the session, or it's some-
thing else and it hasn't any real influence on the auditing, see? A hidden standard is a pretty
vicious proposition. It is not a tiny, light proposition at all.

The fellow does it every command or every session. And if he does it every command,
every session, it's constant – then it knows. Then you must assume this about the hidden stan-
dard: The hidden standard is, it knows and he doesn't. So he has to consult it to find out. But
because you're not auditing him out of session, you don't notice that he does this all the time
in life. Ear burns, it's not true. Ear doesn't burn, true.

What a way to adjudicate a piece of music. Now, most music critics are pretty badly
spun in, but here'll be a music critic: All right. He listens to the medulla oblongata in E-flat
minor, and he listens to this.

I was listening to some music critics the other day on BBC. They were criticizing jazz,
and I thought this was very amusing, because they were all sitting there, and every once in a
while they'd talk about "being sent," [laughter] and so forth. And "it didn't do something," one
of the fellows said. You know? "It didn't do something," and he touches his chest, you know?
And these people weren't judging music at all. They were reading their own somatics. [laugh-
ter] The poor composer. If the composer knew this, he would pay less attention.

Well, let's take a music critic and actually he listens to a symphony orchestra or some-
thing tearing off a long chunk of the "Overture of 1812." And afterwards he says, "Well, actu-
ally, it was not a bad performance but it lacked impact." What does he mean? Now, you go
back over his criticism and you'll find out that every time things are pretty bad, they lack im-
 pact.

And if you, the auditor, were to ask him what impact, he would say, "Well, here, of
course." And then if you searched a little bit further, you would find out that when he heard a
piece of music, he knew it was good if he got a pressure on his chest, and if it was bad, he
didn't get a pressure on his chest, so therefore he knew it was bad.

And this tells us (hideous thing) that this person actually never really hears the music.
He is paying attention to a circuit which gives him a pressure or doesn't give him a pressure
on his chest. Now, you're going to teach this person?

All the composers in the world could hire all the symphony orchestras in the world to
play all kinds of music to him, loud and soft and so forth. He would not notice any of this
music. Something else is listening to the music and reacting. And if it doesn't react, he knows
the music is no good. That's why you get these wild criticisms on art.

You know, some kid has stumbled over a paint pot in a kindergarten and spilled it on a
piece of canvas, and somebody has come along and put it up in an exhibition. And you have a
number of critics, then, all of a sudden raving about the beauty of form and rhythm and im-
The impact of this particular painting, don't you see? It was when they walked by it, did it restimulate an engram or didn't it? Had nothing to do with the painting. And so you get off into wild schools of bad draftsmanship, bad music; you get sudden popularity of somebody who goes flat on every note. You know, she always wears green dresses when she sings, and this adds up to certain producers getting a restimulation from green dresses. You know? And so here's this great singer. And then they put her on TV, you see, and the eggs pour out of the television screen like mad, and she gets no Hooper rating, and they say, "What happened?"

Well, you see, her impact wasn't singing, it was a green dress. And television is in black and white. You see, it's as screwy as this. Just as crazy as that. It's just as far offbeat.

All I'm trying to punch home is that the person's knowingness is not a result of experience; the person's knowingness is as a result of circuit. And now you're going to prove to him that Scientology works? And Mamie Glutz is going to get well? And everybody is going to get happy? And everybody is going to live better lives, and they're going to make more money, and that sort of thing. And this character goes on, and he knows it isn't working. Why? Well, you see, it lacks impact. Well, what impact? The impact that moves in and out against his chest, of course. You see how this could work?

Now, I'm not berating anybody who has a hidden standard, particularly, because it's too easy to knock these things out. But recognize what they are. They're consultation mediums with which one knows.

And I think it'd be a highly risky thing if, flying an airplane, you knew you were on the right course if you had a pain in your right hip, and didn't have to pay a bit of attention to the instruments. I would say that…

This is the lower mockery of the great pilot who has a homing in… pigeon built in and actually can fly a straight course and wind up in the – with tremendous accuracy, and so forth. But he does that because he's a great pilot, not because he's got a circuit.

You see, anything a circuit can do, a thetan can do. [laughter] And do better. Any knowingness which can be imparted to the person is the mechanism of Throgmagog, which was handed out in *Dianetics: Evolution of a Science*. You can set up an independent intelligence alongside of you that tells you right from wrong.

Now, most criminals are the product of circuits. It isn't true that people who have circuits are criminals, but a criminal is a specialized part of this. Now let's look at what a criminal does: A criminal knows right from wrong because a circuit is active or inactive. In other words, because something is restimulated or not restimulated, he knows right from wrong. And therefore he knows the cops are crazy, because they don't agree with his circuit.

They say, "You shouldn't have stolen the car." Well, he's got a little green light that lights up, and when he's doing right, why, the green light lights up, and when he's doing wrong, why, the red light lights up. And it happens inside of his skull, and when he passed this car the green light lit up, so he knew he should get in the car and drive off and that that was a right and proper action.

And the cops pick him up, and the cops tell him that wasn't a right and proper action. Well, man, they're crazy, if they're observed at all. And he is very puzzled as to why he's in
court. You never saw more baffled people than criminals. I've studied this breed of cat and found it a very interesting breed of cat, because it's a type of intelligence which isn't generally credited with being insane. But it isn't there. And they are very baffled.

They say, "People pretend that you can tell right from wrong. Ha-ha-ha. Talk about silly. Nobody can tell." That's the extreme one, see? Or, "Yes, of course I can tell right from wrong. When I'm doing right, I feel well, and when I'm doing wrong, I get a terror sensation in my stomach. And as long as I only do things that make me feel well, that is right, such as murder babies and steal jewelry. And if I do those things, that's fine. But if I become... if I get a job, this terror sensation turns on, so it's wrong to work." And if you went into it closely with one of these characters and had a conversation of that depth and that searching type of questioning, you would learn some of the most fantastic things you ever heard of.

Well, to some slight degree, anybody with a hidden standard, you see, is no blood brother to this criminal – that's just a lie – but he's doing this to some degree.

So the auditor says, "Are you in-session?"

And the pc looks inside to find out if the little white bulb is burning. And the white bulb is burning, so he says, "Yes, I'm in-session."

"Now, did you get any result from the processing"

Now he looks at the little white bulb, and it's not on, so he didn't get any result from processing.

But what during the auditing did he do? He would do the command on a sort of a via. It'd come from the auditor, and then he put the command over here, and something over here gives him the command and then he follows the command. He's on a self-audit. It knows, he doesn't.

Now this is the way people get that way: First, they're a thetan as themselves, actually, and then they become so invalidated, or they invalidate people so much that they get overwhelmed with their own invalidations, and they pick up a valence. Now, everybody's got a valence – everybody's got one of these things. Even people with hidden standards have valences and you can find them.

But the steps are two more than this. There are two more steps of overwhelm. The next step to the valence overwhelm is the somatic overwhelm. While being the valence, he got a hell of a somatic. Now, an impact is easily substituted for knowingness. Impact, knowingness – these can integrate in a mind as the same thing. Impact and punishment can also integrate. They don't necessarily integrate as knowingness, they sometimes only integrate as punishment.

So the fellow is walking down the street, and something is thrown out of an airplane and a wrench hits him on side of the head, and after he gets out of the hospital he has a definite sensation that he must have done something. Well, the only thing he was doing was walking down the street. But he got a definite sensation he must have done something. Now the truth of the matter is, he doesn't even have to go back and pick up his own overts, but he must have had them to make the thing hit him, but he doesn't even have to go back and pick up the
overts to feel that he must have done something. The fact that he was hit meant that he was being punished.

So the punishment must have had a crime that goes with it, and he's got a terrible problem: What has he done? What has he done that caused him to be punished? And he doesn't know. Well, of course, the answer is very often he hasn't done anything. But he can't separate this thing out.

Now, an impact, then, can go into that category, and people with guilt complexes – which is a small section, by the way, of mind. You say everybody has a guilt complex, it's like saying everybody has an inferiority complex. It hasn't any level of truth, you know, at all. It's just taking a small class of cases. There are a small class of cases have guilt complex. There are a small class of cases have inferiority complex. There's a small class of cases that have superiority complex. There's a small class of cases that have complexes that tell them they can never do anything wrong. There's... You know, there's classes of cases. But this is not a broad generality at all, that everybody is guilty or that aberrations comes from guilt. That's a hangover from old psychotherapies. Sometimes they ride along and you've given them credence at sometime or another, and it takes a shake of the head to get rid of them.

Well, now, an impact can interpret as knowingness. Because the person's been hit, he feels he now knows something. You'll sometimes have a person coming out of an operation telling you he knows something. Well, the odd part of it is, two things can happen: He can come out of an operation knowing something, or he can come out of an operation feeling that he knows something. In the second case, he doesn't know anything.

For instance, if you take a thetan, you operate on his body and he blows out of his head, and during the operation he finds himself outside, he will wind up later on knowing that he can exteriorize. That's a perfectly valid piece of information. Because this other thing happens so often, that gets invalidated. Lots of patients wake up out of the ether and then now they know something. Only they don't know what they know, see, and the more they search for it, the less they find out. They don't know what they know, but they know they know something. Got the idea?

Well, a circuitry can get set up in more or less that fashion. The person himself has been invalidated – his own knowingness, as a valence, is invalidated – and so he's got an impact knowingness that he keeps around, which is part of an engram. The engram is actually on his goals-terminal chain – that's where it comes from – but it is not reachable or attainable because it's right in the middle, and you can't audit him down to the goals-terminal chain because he's got this thing in the road. But it's on the chain, and you can't audit him through it or past it, but you can't audit him because of it, and yet unless you audit him he's not going to get rid of it. This is the kind of a problem one of these circuits sets up.

So here he is – here he is with this thing, and it actually – his own knowingness has been terribly invalidated. As a circuit, then, he can go on being validated in his knowingness, but he has to be careful because this thing knows more than he does, and it's a somatic of some kind. It's a pressure ridge. It's a sensation. It can be almost any one of these things. It's a difference of light. It's an occlusion. It's a singing in the head. It's bubbling in the beer, you know? Doesn't matter what it is, it just is. And he's going to have bad luck tomorrow.
Well, actually, all of Roman superstition, and everything else, stem out of this circuitry. Rome had a circuit called the auguries. And they used to shoot down birds and gut them, and they'd examine the entrails and then they'd know whether or not tomorrow was going to be a lucky day. Well, that's a circuit. You'll find in superstitious peoples that have very little and have been knocked around very badly, you have just absolute huge catalogs of superstitions. You've got some superstitions yourself, and so forth. Well, this is just a hangover on the third dynamic. That's a sort of a third dynamic circuit.

They were looking at the moon one night on some planet way back when, and it was half-full. And they get a restim on the thing every time they look at the moon half-full. And it was half-full this particular night, and a couple of spaceships came in and blew up the planet. So they know that a half-full moon is dangerous. And this kind of gets established somehow or another. So you have to be careful when the moon is half-full. What are you saying? Well, the moon knows more than you do, because you couldn't find out what happened. But the moon obviously knows what happened because it's a symbol of what is happening so now the moon knows, and you can set up a whole moon circuit. Quite interesting.

The circuit knows, the pc doesn't; the circuit can observe, the pc doesn't; the circuit can give auditing commands and the auditor can't. All kinds of these things happen.

Now this moves out into a secondary state, which is the fourth state up the line, and it becomes an audible, dictational circuit. It's worst off. It's where the ideas come from. It dictates to a person. It speaks. It gives him his orders aloud. All kinds of wild things go on with regard to it. But the person never does anything unless he's told by this particular mechanism. Well, what is this? This is the total, final result of a valence that has been overwhelmed by a somatic, which has been overwhelmed in itself by some other thinkingness, and you've got just continuous, consecutive overwhelms.

Now, of course, there can be many cases after this where these conditions are consecutively and continuously overwhelmed, but they will all be of the same character. They will not be more personalities; they will be circuits, from the acceptance of the first valence on out. And that's something to know. You haven't got an endless number of valences on the pc, but you can have a near-endless number – it will seem to you sometimes – you can have a near-endless number of hidden standards. You can have a lot of them on a case, if they're real hidden standards.

Now, what is the test of a real hidden standard? It's whether or not the pc consults with something each command or each session. "Consults" is the clue. Now you see, he could look around to find out if his eyes changed. But does he always look around to find if his eyes changed?

Now, the change in his eyes is not particularly the hidden standard. The hidden standard lurks in the vicinity of that. And it moves on and off his eyes. The day is bright. The day is dull. This is the way life goes. It's going to be a good day because the day is bright. It's going to be a bad day because the light is dull. There's going to be something going on like that to make that a real hidden standard. And then it becomes a consultational circuit.

Now, that is a rather mild form of one. That is not particularly a very bad hidden standard; possibly a person could even be audited through it without much trouble.
But now let's take this one. This is how bad a hidden standard can get: Pcc sits down in the auditing chair, and the hidden standard says to him – says to him – "Uh... well, that auditor is going to do you in today." So he relays all the commands through the hidden standard, because the hidden standard will give him the safe commands. So he can do some commands and he can't do other commands, because the hidden standard will only relay the safe commands. And oh, wow. You haven't got a pc under control. You haven't got a pc there. You're not auditing a pc. See, this is all vastly removed from the thing.

But these hidden standards key in with problems and areas of prior confusion. And that is what kicks in a hidden standard. It comes in because of a problem of magnitude or an area of prior confusion. Now, I've put in the "or" there just in case sometime or another the guy got a problem without a prior confusion. But the usual course of human events is that the individual went through a lot of trouble and a lot of confusion, and he couldn't quite figure any part of it out, and it left him hung with a problem.

Now, he's an active cuss – any thetan is a fairly active thetan – and he will up and solve it every time. He solves that problem by changing his life in some way. Now, this can get so bad that the effect I talked to you about the other day, the effect whereby, because something happened, the individual felt – and I've mentioned in this lecture – because something occurred, then the individual must have done something. He didn't do anything, but something occurred.

So some of these changes in his life are going to be red herrings. That is to say, there was a change in his life, so he figured he must have had a problem ahead of it. A person could have a change in his life without having a problem before it.

He's got a couple of very active parents that go flying around to every place, and so on, and they change his location rather continuously, but one day they stopped moving around. And he finally finds himself sitting someplace, and it was a change in his life because he was now in one place. And you ask him for a problem before this, and he'll almost beat his brains out trying to dream up what problem he had that caused this to occur. Well, actually, he didn't do anything to cause it at all.

In other words, the change in that particular case is other-determined than by the person. So there can be other-determined changes, and they, however, do not assess by an E-Meter reaction. So, therefore, assessment becomes necessary in doing the O section of this type of Problems Intensive I was telling you about – necessary to assess – because it eliminates those changes which occurred without a problem having preceded them.

All right. So there's the one, two, three of the hidden standard. The hidden standard develops out of problems of long duration. Individual solves the problem with a hidden standard, has solved the problem at some time or another with a hidden standard, and says, "Well, I just won't think anymore. I will let this think for me."

Now, I should say just one brief note on, where does a circuit come from? Well, frankly, you'll find circuits first mentioned in *Dianetics: Modern Science of Mental Health*, so they're not very hard to find. They're quite obvious. They're quite visible. You could go around looking and asking people about circuits. You'll find plenty of circuits. You'll find
talking circuits and pressing circuits and color circuits and all kinds of things. They're how-do-you-know things. This is circuitry as different than valences.

Valence answers the question "who to be" or "how to be right with a beingness" – "how can you be right with a beingness?" A circuit answers it entirely differently. That is, "Without changing the beingness, how do you know whether you're right or not?" They are two different aspects. A circuit furnishes information. A valence furnishes beingness.

Now a circuit, from furnishing information, can step upstairs to furnishing orders. And then it can step upstairs to furnishing orders and commands which are below the level of consciousness. But they always express themselves to some slight degree in terms of a somatic. One knows they're there if the somatic occurs.

Most people live in haunted houses. There are a lot of people around will tell you there are other thetans inhabiting their body. These are just circuits. You will occasionally run into somebody that after he got a bad shock, why, just thousands of voices turned in on his body in all directions, or a dozen, or six, or something. And they all spoke to him, and so forth and so on. You'll run into an experience of that character in somebody else.

A circuit can be… is very easy to set up, and you actually think and use circuits all the time. A circuit isn't a bad thing. It's only when it goes out of a person's self-determinism, is no longer in the individual's control, that a circuit becomes a bad thing.

A person is totally knocked in the head as far as a circuit is concerned.

He has no longer any life or reason of his own. Only the circuit has life and reason. And when a circuit is in this particular condition or state of ascendancy, it, of course, furnishes a hidden standard. It's right or wrong according to the appearance of the circuit, or according to its behavior. It tells the individual right from wrong, and the individual himself never differentiates, never experiences, has no criteria, and so on. That is a circuit in operation. And this circuitry is set up by a thetan very easily, and is set up by him every time he turns around, and is one of the easiest things that he does and there is no reason he should stop doing it.

We're only talking about the obsessive, out-of-control circuit. Circuits are very often completely reasonable, that a person sets up. But he's still totally in control of the circuit. He set it up and he knows it, see? And it's gone. He doesn't set it up forever.

Well, you look at… look at a motorcycle, and you say to yourself, "What's wrong with the motorcycle?" You see? And you sort of set up a computer that is like a motorcycle engine or something, you see? And you say, "Gosh, there it is, and it goes this way," and you kind of mock it all up. "And it goes this way," and so on. You go to bed that night, you no longer got the motorcycle engine in front of you, you see?

And… Tesla, this great character Nikola Tesla, who invented alternating current and tremendous numbers of other things, set up the alternating current motor and let it run in his head. It wasn't in his head, of course; he probably had it out somewhere. I wouldn't want an alternating current in my head – motor in my head, see. Because if he set it up right, of course, it was greasy. But anyhow, he set up an alternating current motor and he let it run for two years just to find what parts of it would wear. That's right.
So that was kind of a long time to let a circuit run, wasn't it?

Well, it was to tell him something, wasn't it? So he set up a mock-up in order to find out from it, and there's nothing wrong with this. This does not mean that Nikola Tesla, as a result, had a hidden standard. He didn't have any hidden standard. He knew he set it up and he knew he took it down, and he knew when he set it up and he knew when he took it down.

But you'll find circuits are not in this degree of control when they're obsessive, you see? Now the person doesn't know when he set them up, he doesn't know why he set them up, he doesn't know why he's listening to them, he doesn't know where they came from. All he knows is that he has a total slavish obedience to them. See, that is the difference.

You can set up circuits that'll answer mathematical problems for you. You can do all kinds of wild things with your mind, you see? There's nothing wrong with doing this, you see, as long as you're doing it. If you're doing them, why, you can't hurt yourself any. But when you start burying them, and when you say, "I'm no longer responsible for that thing," and when you say, "This thing will now from hereinafter and aforesaid tell me which side of all electrical circuits will go this way and that way"... The individual looks at a house and he hears a buzz-buzz-buzz. This is eight lifetimes later, see? Buzz-buzz-buzz, he hears in this house, and he knows there's something wrong with its currents.

You get an electrician sometime and you say, "Well, how did you know the house was old?"

"Well, I get this sensation," or something. "I knew the wiring was off," or something like this.

And you talk with him, "Well, how did you know that?"

"Well, I don't know, but I always get this sensation right under my left rib, you see, and so on. And I can kind of hear a buzz-buzz, and so forth. It's very easy to tell." That's a knowingness circuitry on the subject of electricity, you see, which he doesn't know anything about. He just told you so.

A thetan, you see, is totally capable of this operation – of permeating the whole house and finding every short circuit in it. And says, "Zzzzzzit! Well, that was one. Zzzzzzit! There's another one. Zzzzzzzzit! There's another one." See? "Oh, well, guess we'll have to re-wire that." Thetan is totally capable of doing this, so, therefore, it's one of his skills.

The basic on this is setting something up on automatic and taking no responsibility for it at all. And out of that you get trouble. You always will get some trouble. And it becomes a hidden standard, and so on. But to have set one up and put it on total irresponsibility and let it run totally automatically, the individual had one God-awful problem just before he did it.

And just before he had that awful problem, he was in a fantastic amount of confusion. And just before he got into that fantastic amount of confusion, he had plenty of withholds from all of the people connected with the confusion. And those conditions must have occurred. And all of those conditions need to be present to unravel a circuit – to have a circuit set up this way – and you've got to pay attention to all of those things to unravel a circuit.
All right. So how would an individual get into this sort of state? All right. Life would be pretty active, and he would start withholding from everybody he was in contact with, about everything, or about some special thing, or something like that. He isn't free to communicate in any way. He's withholding from here and he's withholding from there, and he does an overt here, and he's got a withhold there, and he does another overt someplace else, and things start running a little bit wrong. Naturally, he's out of communication with it. You're answering the first requisite of a circuit: going out of communication.

You see, the individual who has a circuit that tells him about house wiring never has to permeate the house. Well, he never has to communicate with the house. All he has to do is communicate with the circuit. The circuit does all the communicating for him, you see, and he doesn't have to do anything about it. All right.

So he had all these withholds and all these overts against all these people, and life became pretty confused, and it got more and more confused. And it finally wound up to where this confusion added up to a distinct problem. Whether he could state it or not is beside the point, whether he's aware of it analytically at that stage of the game or not, but it got to be one awful problem. And it's a statable problem. *Blang!* it went, and then he had a problem on his hand. And then, of course, he solved the problem.

Now, if you got enough withholds and overts, you'll blow. You get enough overts and withholds against any one person, or any one thing, or any one area, you'll blow out of that area or off that course of existence – if there's enough.

All right. So the individual had this awful problem, and he blew. He blew that particular life channel that he was on. And of course, this brought about a change. And the only tag that is uniformly left in view for the problem, the confusion, the people, and the withholds and the lot, is the change. "When did your life change?" So, of course, by tracking that back, you can find the problem. You get the problem more or less handled, you find the people. You get the people security checked out – this individual security checked out about the people – he comes off of the nervousness of the confusion which was, after all, yesteryear. But his withholds have got him pinned in that area of time. He's stopping and not communicating in that area of time, so nothing as-ises in that area of time, so he's stuck there.

And this, of course, tends to turn on a circuit, because it's a withdrawal. Now, the point of change, of course, is a withdrawal. The point of change of life is a withdrawal from his former change of life. So the whole story is out of communication, out of communication, out of communication, and then out of communication.

Now, if he wants to remain out of communication safely, he has to have a periscope up. So that the periscope is very dangerous to approach the eyepiece of, so he has to have a periscope that not only looks but tells him. And that is a hidden standard. And when an individual has gone through that cycle violently, he comes up at the other end looking at life through a circuit. He never looks at life, the circuit looks at life; he never gets audited, the circuit gets audited. That is an experience. Experience must not approach this individual. And remember, auditing is an experience.

So, if the individual is living a life on a via called a circuit, then of course, your auditing is only part of the via, and of course never reaches the person. And you are trying to audit
the person, you are not trying to audit the via. And when auditing takes a God-awful long
time, it is just because you are not auditing a pc, you are auditing a circuit. You haven't got an
Operating Thetan, you've got an operating GE, or an operating circuit. And so all experience
is filtered through the circuit, and it is true of auditing, too. Auditing also filters through the
circuit.

Now, the trick in supervising auditors is to give them some type of a rundown that hits
all this, and knocks all this out of the road. And they can do it rather sloppily, and they don't
have to finish it up in any terrific way, and they'll still knock the circuitry out of the road so
the person can be audited. And that is what this Problems Intensive is all about. And this
thing is tailor-made for a Class II activity. And people can be trained to do this much more
easily than they can be trained to locate goals and terminals. Why? Because goal and terminal
operation, and Prehav Scale running, requires a precision of auditing which is a very, very
high, hardly won precision. And you know that because right this moment you are struggling
up the line toward that precision. But it requires a terrific precision. There's only one goal;
you must never get the wrong goal. There's only one terminal; you must never get the wrong
terminal. There is only one level of the Prehav Scale live; you must never audit the wrong
level. The auditing commands have to be exactly the right auditing commands. The individual
going up and down the track has to be run precisely against the E-Meter. Precisely. When it is
flat, it is flat. And when it is not flat, it is not flat. And furthermore, the individual cannot be
run with rudiments out, much less assessed when the rudiments are out.

So that is a highly precise level of auditing, don't you see?

You have another level of auditing, now, in Class II, which is imprecise and will get
the job done.

Now, this has an additional advantage. Where you are shy about an individual coming
in off the street, this has to solve this problem. The individual is coming in off the street, he
doesn't know very much about Scientology; without giving him a broad, general education,
you cannot easily sit down and open up a Form 3 on him. You won't find auditors doing it
very glibly.

And the individual, not knowing what it's targeted at, is going to feel that he's being
suspected, and he's going to get some kind of an ARC break with the people who are doing
this to him.

Ah, well, on such a person, very simply, you run this Problems Intensive. It is what? It
basically goes back and makes the most fundamental Security Checks that can be made on the
individual, without getting very personal about the individual.

Now, when he's opened up and is expressing himself a little bit better, and you've got
the hidden standards out of the road, you can, of course, uncork a Form 3. Now the individual
knows what it's all about. Now he'll go for this now, he'll stay in-session with this now, and
he'll get it off. And he'll know where he's going because he has a subjective reality of what
he's been doing to himself with withholds. He got that out of this rundown.

So this gets you over the bridge of "How do you take raw meat and audit it directly?"
And actually, you could get somebody up here that just was walking down the road, say,
"Have you ever had any changes in your life, and what has your life been all about? Have you ever had any operations? Have you ever had this? Have you ever had that?" – it doesn't matter. It'd be any of the data. You could ask this individual any of the data on any part of this form right up to O, and the individual will be pitching right straight with you. And now, of course, part O, why, he'll be happy to tell you all about the changes in his life. Everybody is very happy to talk about all of their troubles and difficulties and changes. They're very happy to tell you their problems. That's for sure. And of course, the Security Check is not between you and the person, it is between the person and people who aren't there. And he's perfectly willing to give you withholds from people who aren't there.

So this is the answer to raw meat. And you take this particular rundown, which will be released to you shortly, and you will find out that an individual is then processable. Practically any level of case becomes processable if you approach it that way; requires no specialized address of any kind whatsoever. And the most self-conscious auditor would be happy to sit there and do that.

I developed this from this reason and this way: I found out that auditors will fill out forms. [laughter] That is not a sarcastic thing. That happens to be a common denominator of all auditors. They will all do it, and they will do it very well. All right.

Let's build on that cornerstone, and let's move it on up, and run some processes up along the level and you've got it made. How could you miss? [laughter]

Okay. Well, it's taken quite a bit of thinking to get this squared around, and quite a bit of looking, and so forth. I hope you make good use of it.

Thank you.
A lecture given on 11 October 1961

Thank you.

Okay. Now, we have before us, on this eleventh of Oct., the little handy jim-dandy, the Class II Auditor's pride. It's called a Problems Intensive for Staff Clearing. And you notice it says Staff Clearing. Staff always gets the best.

Okay. October eleventh, 1961, Saint Hill Special Briefing Course. And this is Problems Intensives for Staff Clearing. This is the second lecture on this subject.

All right. Now we take this up, we look it in the teeth and we find that we are looking at basically the Preclear Assessment Form.

And you've been using this on preclears or should have been using this on preclears for a very long time. The earliest edition of this is 1950 – Elizabeth and Los Angeles Foundations, 1950. So you're not looking at anything new. This has come a long way, and all that's happened here is we're now using it to resolve the case.

All right. It is of vast information to you and vast importance for you to know what the devil your pc is all about. I have seen an auditor, believe it or not, process a pc for weeks on end and not find out that the pc was having a dreadful time with a court, or a child has been taken off by the authorities or something. Now, you'd say that'd show up in present time problems. But it gets worse than this. I have seen an auditor process a pc forever, and not know their right name; not know if they've ever been operated on; not know they suffered from various ills; not know whether they were married or single. We'd say that auditor was running a big not-know. Now, the basic part of this and the early parts of it right up to section O, but not including section O. You notice the directions have been modified on this. They've just been deleted a little bit, so I had better say something about "when you do this."

If you have a new pc who is brand-new to Scientology, you certainly do one. But if you have somebody you are going to give an intensive to, that you have never done one of these things on, you should do one. It gives the pc some little confidence to know that his auditor knows something about him. And that, in itself, is an interesting factor in holding a pc in-session, all by itself.
Now, we see here that it starts out "Who does the assessment? The auditor assigned to audit the preclear does the assessment." Now, what does that mean? It means that's his first action. That's the first action the auditor undertakes. He doesn't go in and run fifteen hours of "Create a reactive mind. Thank you." "Create a reactive mind. Thank you." He doesn't do that. He sits down and he doesn't do rudiments and he doesn't do anything else, he simply sits down and runs off this form. And he sits there and makes out the form. But it is auditing. It is auditing. It is done in the paid auditing time of the pc, because it is auditing.

And when an auditor gets a preclear that he has not had before, he takes one of these forms, and he fills it out on the pc. Now, why is this?

The pc has a sneaking feeling that the auditor doesn't know anything about him, until this form is filled out. And therefore, you have a hard time keeping the rudiments in. But it's because the pc is certain that there is a not-know sitting in the auditor's chair. But as soon as you've filled out this form, then the pc feels that the auditor knows something about him, or her, and is happier thereby – feels more comfortable about this. Pcs always have certain things that they feel that somebody should know and those things are pretty well covered in this assessment form. All right.

The assessment form is for information. Auditors' reports are for information, not your information. They are almost never for the auditor's information. He knows. So if you could read your own writing, that would be for your information if you wrote that way. But it's for somebody else's information. An Auditor's Report Form in a Central Organization goes from the auditor to the Director of Processing, goes from the Director of Processing – very often is inspected by HCO, sometimes – but is certainly forwarded into here or one copy of it. And in a class of this particular character, you are – if I ever see Mary Sue complaining about her eyes and so forth, why, I'm just going to go back and find all the badly written forms and put a curse on you. [laughter]

You want to know something, and bad handwriting is just another method of running a not-know on somebody. It is withholding the information, writing illegibly. Now, some of these fellows in commerce that we occasionally do business with, you look at their signatures. Look at their signatures. Can you read their signatures? It's a bloou rh and so forth. And you'll find that fellow has withholds. You look over the letter he has written you, and you wonder how much of that letter is true, how much of it is false. The fellow is withholding information from you, ordinarily.

Now, that's true of all handwriting, and you would be amazed how your handwriting improves after you've got a Sec Check Form 3 flat. There's a direct coordination. So it is made to be read, and if it's illegible, somebody trying to check up the case is denied information that might be of value.

Now, we look down the line here, and we find out that we want information on the name of the pc, the age of the pc, and we want the tone arm position at the start of the assessment. Now this will give us some sort of an idea, as we look this over, whether or not this pc is going to respond to ordinary and routine auditing, because as they give you the answers to this form, they should get some tone arm shifts. And if they get no tone arm shifts talking
about themselves, of any kind whatsoever, oh-oh, oh-oh, this is a pretty desperate situation. You're almost running into a CCH situation when you're doing that.

So that gives you that information. If you carry your tone arm position notations throughout this form, why, you'll be fine.

Now, we have the first questions are "Family," and we want to know this data about Father and Mother and so forth. And this gives us reactive personnel, as you will see here at once.

(I'm going to pull this microphone closer to me.)

Okay. You will see this at once, that the individual had very bad relationships with his father, and that you're going to be running into Father, Father, Father, Father, Father. And that he can't remember anything about his mother, and so he's going to be trying to run into his mother, his mother, his mother throughout the auditing. You see what we can divine from that at once.

Now the next thing that we go into here, is the other relatives who are in immediate line. Now at this stage of processing, if this is the beginning of an intensive, the first intensive the pc has, you're going to have missing personnel here like mad. Well, should you try to find them? No. Just let it ride. Let it ride. The significant allies of the case are going to be missing, _always_, during the first Preclear Assessment Form. Great-aunt Agatha, Uncle Bill, the fellow who made a drunkard out of the pc, you see – he is never going to be mentioned at this stage of the game, if he is aberrative.

Now, if it is known to a pc, it isn't wrong with the pc. If the pc _knows_ about it, it is not aberrative. Someday you will hear me, and you will _stop auditing all these big knowns_, and you will start making some progress with cases that is rapid. That's one difference between my auditing and sometimes yours.

If the pc knows about it, I pat him on the back, shake him by the right hand, cheer him up and go on hastily to something else.

And you all too often say, "Well, obviously, look here, his father was a drunkard and a jailbird and beat him, he says, every day. And obviously we've got to spend a lot of time on Father."

And you do. You waste a lot of auditing time on Father, because Father has nothing to do with the case. How do we know that? The pc knew about it! If the pc knew about it, it doesn't have anything to do with his aberrations. The only time that crosses up is a hidden standard, but a pc usually doesn't even know about a hidden standard, until you start interrogating him. So this gives us _all_ of the areas we don't have to monkey with in auditing. You see, it's a negative assessment. We're not going to have to worry too much about these.

It's going to say, "Family: Mother."

"Mother living"

"Yes."
And you don't then, of course, ask what was the date of her death [laughter] and the pc makes a statement of relationship with Mother.

"Well, Mother was a dear, sweet person. Mother was always very good to me, much better than I deserved – much better than I deserved. She lives with us now. And somehow or another, she keeps the marriage from going on the rocks. She tries. She's nice – nice person, and so forth."

Well, you get trapped into this, you see? You say, "Well, what the hell is this? Some kind of an overwhelm here of some kind or another," you see? "And just exactly how does this thing stack up?" You say to yourself, "Mmmmmm-mm. Tries to keep their marriage from going on the rocks. I'll bet!" [laughter, laughs] See, and you actually get trapped into this, because you have a little piece of knowingness that is intriguing. Well, go ahead and be interested in it, but the pc knows all about this. Well, there are some things the pc probably doesn't know about it, but that will turn up in the line of auditing. But what the pc knows about, we couldn't care about.

Then we get into Father, and we – same thing applies. And the pc says, "Oh, yes, well, the old man died when I was eighteen, and so forth. And it was good riddance. He used to beat me every day, and he shot me on Sundays, and he's what's wrong with me."

Oh. Well, that's one area we don't have to have anything to do with. Get the idea? It's just negative rundown.

If you were to shake that down, you could find some surprising data in it. And the pc sooner or later, in this particular type of intensive, will find very surprising data in it – extremely surprising – such as his father spanked him once. Very ordinary. His father beat him every day and shot him every Sunday, and so forth. And you find out the father spanked him lightly once. That's the truth of the matter; see, he's got some kind of a synthetic. But this is something that's going to come up, sooner or later, and you're not going to have to worry about it too much, particularly if he says that is everything that is wrong with him.

If the pc knows that is wrong with him, and has known that's what's wrong with him for a long time, why has it continued to be wrong with him? See? That's the 156,000-pound question. Why has it continued to be wrong? Why hasn't it as-ised? Well, it hasn't as-ised because it isn't there, and it never was there. But it gives us a method of skirting these things. We're not going to take that up. It'll all come out on withholds sooner or later.

Now "Relationships": And there you're going to have missing personnel. And "Married," very often you find missing personnel.

Now, there's one thing that may possibly go haywire, is "numbers of times divorced" on this. That is important to know, because the pc is very often holding this up, and it'll hold up his case. But it's the number of times divorced. Well, maybe he didn't get divorced. Maybe he got married five times and only divorced once. And that would be quite a withhold, wouldn't it? So nevertheless, you fill that in, try to get the data on there.

"Any difficulties the pc presently has": Now that gives you some sort of an idea how many present time problems you're going to have to cope with in session.
And "If divorced, the reasons for the divorce and the pc's emotional feeling about divorces": And you had better remember again that it doesn't say how many times he is not divorced, or something of this sort. There might be some sleepers back on the case of some kind or another that never get mentioned. So you better get that question answered very, very well and very thoroughly.

And then "Educational level": This has some interest in the matter. Very often you will find a pc squirming around and telling you that he is not educated, and he has never been to school, and so forth. And it would actually turn out to be a withhold if you didn't go over it slightly. You every now and then find a pc who's ashamed that he hasn't been educated, and you very often find a pc who is ashamed that he has.

You know, I have a lawsuit I've been very laggardly in filing. It's against the University of Texas, and so forth. And these things do come up in education. But I want to claim all of the German courses that Mary Sue had there. I want to claim back the fee and considerable damages, because every time we're around Germans – she's had four years of German, see? And every time we're around Germans – I've only had a couple of lifetimes as German, you see, I've had no courses on it – and I have to order all the beds and breakfasts, you see, and so forth. And I turn around to her and I say, "Suzie, ask the lady to sell us a loaf of bread," you see? And Suzie looks sort of blank, you know? And then finally, I finally get brot. Let's see, brot, brot, brot. It restimulates hell out of me. After you've been killed in a country a few times, you know, and you try to talk its language, you get restimulated. So the University of Texas is going to get sued sooner or later on this business.

But you run into oddball angles on education of some kind or another. And if you were processing – well, I think probably if you were processing dear old Mr. Jenner out here. He's quite a fireball. He's our bricklayer, and he's quite a boy. You go out there, and if the materials are available, and if the East Grinstead merchants have been talked into letting go of something, [laughter] you go out there and you will see a low wall of bricks – a low wall of bricks being put up – and you go back about a half an hour later, you know, and the wall is over your head. You just never saw bricks throw themselves and plant themselves and get masonried into shape as fast as Mr. Jenner can do it. He is terrific. Right now I don't know how many cubic yards of dirt they've moved out there this afternoon, and bricks flying in all directions, and that sort of thing. But I don't know particularly he has a thing on education, but he rather considers, to a slight degree, that he is not educated. And he is likely not to inform you on this subject. And it sort of is a withhold, because you are processing him in some highly intellectual line, see – Scientology, and that would be intellectual.

And then he tries to kind of measure up to all this, and he gets into some kind of an impressive fog. You got the idea? And it - his relationship could be actually twisted and made poor with the auditor if this point wasn't straightened out with such a pc. Other people, they've had twenty-nine years of education, postgraduate courses and all that sort of thing, and they can't write their name, so they're ashamed, too. And they try to say, "No. I've never been to school." But you get a lot of lies in this particular area. And so you'd better get that pretty well straight. It's not that it has anything to do with whether he can run the process or doesn't run the process, but it's a fruitful subject of withhold. And you'll find most of this is.
All right. And you ask him about his professional life, and main jobs he's held and so forth. You ask him about serious accidents, and the date of such, and any permanent damage and that sort of thing. You ask about principal illnesses, and now you're getting into an interesting zone, because if you didn't know some of these things, you could run into them head-on. You could keep running into engrams of one kind or another that you wouldn't have any information on whatsoever because he never mentions them.

And then you go into "Operations" – and that's one that you should do briefly. Accidents, illnesses and operations are all subject to restimulation; and you can restimulate the living daylights out of a pc if you start auditing these things as he brings them up. Now, how do you audit them? All you have to do is ask about them. Just ask about them, thoroughly, and he'll be in it. You can throw him, as an auditor, straight into such an incident.

Now, you get somebody out in the Middle West, and you ask them if they've ever had any illnesses or operations, and of course there goes the intensive. [laughter] Don't know if you've ever read any letters coming from the Bible Belt. As I've mentioned before, they read something like – what was that quack's name that was arrested down in Texas for practicing medicine without a license? And somebody awarded ten million dollars damages for his having – Morris Fishbein of the AMA. Morris Fishbein, the head of the AMA. This is all true about Morris. He was arrested for practicing medicine without a license. But they actually read like his primary textbook. How to Get Sick and Go to the Doctor, I think the textbook was called.

And you get somebody started on this and my God, here we go. You get some pcs started on this who have a slight strain of hypochondria and man, they will give it to you blow by blow, and writhe around, and run their havingness down, and so forth, and then start on their families' illnesses and so forth; and then they get to all the mistakes the doctor made, and how the doctor had to open them up again in order to – in order to recover his nurse or something. [laughter] And this can become far too windy.

So your ability to acknowledge is the only way you turn this off. Your ability to acknowledge, in making out this form, must be good and never better than under "Accidents," "Illnesses" and "Operations." Your ability to acknowledge, wonderful. And you can say to them, if it doesn't turn off, "Well, you know, we'll be taking up that sort of thing in processing, in the direct processing. We'll be taking that up more directly." That shuts it off. You will, too, because inevitably, if they're going to talk about it that much, they're sort of hung in it. But this is not an auditing moment of running engrams; this is not the engram situation that you are running into.

All right. Now, what do we have here essentially? What do we have as we go down this line but data? And that data can be confused with the auditor – isn't ordinarily; auditors do well filling these things out. But an auditor's natural impulse is to take these things up with the pc. Well, don't take them up with the pc while doing such a form. That's all. Just don't take them up, that's all. Forget it. Acknowledge it and get off of it and get on to the next line – you got the idea? – without creating an ARC break. Now, sometimes that is neat. Sometimes you have to be very neat in order to get off of a subject and shut a pc off, because, you see, an ARC break is composed of "not able to talk to the auditor."
But if you've ever watched a pc talk his havingness down, you'll agree with what I am telling you. They can talk their havingness straight out the bottom, just as nice as you please – down it goes with a dull thud.

They talk themselves right down the Tone Scale: Enthusiasm, and the next thing you know, they're a little antagonistic; and the next thing you know, they're crying; and the next thing you know, they're not talking.

You can watch them. They'll slide right on down the Tone Scale if you don't hold up this. So, it's best, in entering these, to tell the pc – this is "Accidents," "Illnesses" and "Operations" I'm still talking about, (E), (F), and (G) on this form – it is best to say, "Now, I just want to know these things very briefly, exactly what these things were, very briefly." And you sort of emphasize this "very briefly," and you won't run into him talking himself straight back into an engram and finishing his first auditing session with a Christ-awful somatic he didn't know where the hell it came from. Got the idea? That's a good prevention.

Remember that a pc can talk down his havingness. If you're accustomed as an auditor to ever letting a pc run on and on and on and never stopping him from talking, you are doing him an unkindness. And don't think you're doing him a kindness, because you're not. You're doing him an unkindness. The best thing you can do is to get on with the auditing, but this can sometimes create an ARC break, and so you have to handle it carefully.

And the best way to handle it is to preorganize it. Don't try to handle it after the fact if it's going to be difficult. Handle it before the fact. So that part of your auditing statement is, "Now in the next minute or so, I want you to list for me all of the accidents you have had." you get that kind of a trick? "In the next minute or so," you see?

Oh, well, he's put in a sort of a little games condition now, and – is how fast can he do it, and he says, "Well, let's see, there were fifteen automobile accidents and twenty-five bicycle accidents and seventeen times when I fell off of railway bridges – I always seem to be falling off railway bridges. And let's see. And that's about all. Ha-ha, I beat you. It didn't even take me a minute." You see?

Any kind of trickery like that is better than letting a pc talk his havingness down. You got the idea? So you get the data without the ARC break.

"Present Physical Condition": Once more I refer you to the letters which you might see coming from the Bible Belt. This is one of the marvelous subjects.

"Well, I have misery. It's – misery has been going on for a long time." And you very often will see a pc, very often, just sit back and heave a long sigh, and you're just setting in for a long chat. This is going to be a nice, quiet afternoon we're going to spend. [laughter] And that's not what we're there for at all.

Once more, the "briefly," the this and that, the inference that we've got to get this listed so that we can get on to the next item. And the next item is something else, and we don't care what the next item is, you see? Briefly, you know: "Let's get this briefly so that we can get on to the next item. Now what is your present physical condition?"
And they say, "Long after... Oh, no. He... She... She really wants to know." [sighs] "Terrible."

"All right. Now how is it terrible? All right. Where are the pains exactly? Inform me exact – what parts of the body and so forth?"

"Oh, well," she says, "all over – my eyes, my head, my back, and I have athlete's foot. And so forth, and so on, and et cetera."

Now, you remember that the pc is on a meter. So at this point it'd be an awfully good time to look at that E-Meter. Now, we're not interested much in the E-Meter except for the tone arm, up to the point we get to this (H). Is there a withheld physical condition? That we're terribly interested in. And so we read the needle. And you can put right opposite that (H) that it's a little old needle-reading stunt right here.

And you want to know if there are any illnesses the pc hasn't told anybody about, if there are any worries about health the pc has not imparted to anyone. Pcs sometimes go around thinking they're dying of some dreadful disease, and they never let anybody in on it because it'd be too terrible for others to know – all that sort of thing. And also, and very, very much to the point, "Are there any diseases you would hate to have people know about?" Ah, and you're liable to collide with a freight train, where it can save yourself one God-awful amount of dodged processing. Just get it right there. Just – let's just get any possible withhold on the subject of present physical condition off of this case now. And you'll save yourself a lot of trouble, because a withhold about present physical condition is one of the most serious withholds there can be on a case.

All right. We come to section I. And section I is "Mental Treatment." And it says, "List any psychotic, psychoanalytic, hypnotic, mystical or occult exercises, or other mental treatment which pc has had, the date of the treatment and the E-Meter reaction." And you could very well add to that "Any treatment he is now receiving," and you would get yourself something else.

Now this, too, you want to shake down with the needle. You want to get any withhold in the area of mental treatment off, off, off. You know, a person who is withholding the fact that he has been adjudicated as stark, staring insane, is, of course, sitting on the one withhold that can stop his processing in its tracks. And, right here on this course, there has been an instance or two of somebody continuing treatment while training. And evidently this was not shaken down well, because you find no trace of it in their Preclear Assessment Form in the beginning of their folder. The auditor just did not find it.

Those things are important. Those things are very important during auditing. They're very important in an HGC. The person goes – gets auditing all day, and then has somebody cracking his spine all night while they're hypnotizing him or something, and you're going to get no place, man. He's going to be out of session every morning, going to have a high tone arm every morning. And then it takes about the middle of the morning to get the tone arm down. And then the next morning he comes in and he has a high tone arm again. And about the third time this happens – that he goes off with a low tone arm and comes back with a high tone arm – you can suspect that there's a withhold on "Present Physical Condition" or "Mental
Treatment," or "Current Treatment." That is the most fruitful source of that particular activity. There is something wrong. There is something going on here. The person is doing something else and they don't want you to know about it.

Although running Prehav Scales, of course, puts up the tone arm, the usual cause of high tone arms – it's not that a tone arm must not be high. As a matter of fact, they can't run the Prehav Scale properly without getting high tone arms, you understand; but I'm talking about the mechanism of the pc's always showing up with a high tone arm. You know, you process a pc for a week, and then all of a sudden for a week the pc only has a reading of five and a half. Well, there's just something wrong in this division. The pc is either physically ill and doesn't want to tell you, or the pc has some bug on the subject of the mind and doesn't want to tell you and so on; or the pc is actually getting treatment in between your treatments and doesn't want to tell you. So if you shake those things down during the Preclear Assessment Form to get the withholds off – now, this is not a chatty afternoon over a cup of tea. You're just going to go right to it and you're going to get the withholds off on this subject. Now, he actually won't mind you getting the withholds off on this subject. Be kind of a relief to him as a matter of fact. And if he does have withholds on this subject – if he does have withholds on this subject, and if he doesn't get them off, you won't be his auditor. That's it.

But if he does have withholds on this subject and you do get them off, then you of course are his auditor. Obviously. You know about these withholds and nobody else knows about them, so therefore you must be his auditor. Follows, doesn't it?

You know things about him, now, that other people don't know, so therefore that follows, then, that you are the person's auditor. You'll find session ... in-sessionness increases very well if you do that.

Now "Compulsions, Repressions and Fears" doesn't necessarily follow in that same category at all, and we just couldn't care less. It's going to be of no value to you to know of his compulsions, repressions and fears to amount to anything, except as a gauge of how daffy he is or isn't. And that's the only gauge you're going to get out of that. It's just a measure and you can already read that off the graph.

So you go over that rather rapidly, and you get down to "Criminal Record," and this, too, is a matter of grave interest to us. Because people who have criminal records and don't want us to know about it – that can make a bad show in auditing. So let's, when we get to (K), let's once more bear down on the needle, and let's examine that needle very carefully on this interrogation on the subject of crimes, prison sentences and so forth. And let's make sure that we've got that thing showing up.

It's interesting that I had a letter from a preclear that has gone through London HGC on several occasions over a period of time, and he's complaining about his case gains. He is; he's not blaming anybody. He's not mad at anybody or anything, but he's just written me a letter and asked me to please, can't I tell him why, or do something about it.

And the side note that appears on this thing, of course, is the man has a record as long as your arm. Now, I -- we know that here, but does his auditor know it there? See, that could just account for no case gain, right there in a lump sum, bang! Well now, if each new auditor
he has had has not done a Preclear Assessment Form, then he feels he has a withhold to some degree from that auditor, and maybe nobody has ever dug this up in this particular fashion. I haven't followed back the other data concerning this, but that is just an interesting point.

I very seldom get such letters. My letters are usually quite the reverse. They're "Dear Ron, I just this and so on, and wonderful processing and I feel better, and so on." But this chap – he's just worried about himself, that's all. So we would also have found him under "Present Physical Condition," and we would also have found him under "Compulsions, Repressions and Fears," and we might have found him under "Other Mental Treatment." See, it would all have dropped out of the hamper on the Preclear Assessment Form, had we done one properly, and if every new auditor that had the case had done one for himself.

Although I have said you have to write on this legibly, remember it is for you, the auditor, to facilitate your auditing of the case.

All right. Now we get down to one that we couldn't care less about: "Interests and Hobbies." This will have no great bearing on a case. It'd be very unusual. Once in a blue moon, he has the hobby of "killing little girls in dark woods" or something like that, but it isn't often, and it has very little case bearing. It, however, can serve as a cross index to his goals terminal. Not very important.

Now we have "Previous Scientology Processing." And this is far too specific when we list the auditors, the hours, and the E-Meter reaction, and everything else, in the HGC or the Academy. This is just too confoundedly specific. And we don't have to be this specific. There isn't any reason to be this specific.

The number of auditing hours he has had, he will seldom recall. The auditors you want to get to on the case will be buried, for the purposes of this preclear assessment. So we press him very lightly in this particular line. Very, very lightly.

So you would do much better to ask him a general idea. A general idea is what you want, and that's all. Otherwise, you're going to plow up all of his auditing, restimulate all of his auditing: You're going to have to take up all of his ARC breaks; you're going to have to take up all of his ARC breaks and failures with past auditors; you're going to have to take up all of his successes. And you've got another afternoon's activity all mapped out in level M unless you say, "Well now, briefly, and just in general – just give me some sort of an idea – when were you first processed – something – some date. And, yes. And you had some organization processing, and you had – all right. And field auditors?" – so on. "All right. That's good," and so on. "Thank you." you know, it's very brief.

The best way to get this data is to run the ARC break process on the pc. And you're not running it at this time. And you'll find all their auditors, and he'll find the auditors that are aberrative and so forth. But you just want to know how long this fellow has been in processing. And you've got another afternoon's activity all mapped out in level M unless you say, "Well now, briefly, and just in general – just give me some sort of an idea – when were you first processed – something – some date. And, yes. And you had some organization processing, and you had – all right. And field auditors?" – so on. "All right. That's good," and so on. "Thank you." you know, it's very brief.

Now, when you say, "List briefly the processes run," man, that's a grim one. You take somebody that's been around since 1951 – the number of processes run. In the first place, the
pc almost never remembers them, and you've got a big hang-up there, and so forth. So I would say instead of that, instead of that sort of thing, I'd want to know, "What's been run on you, more or less, that made a change in your case?"

Oh, they'll tell you those glibly and very rapidly; they can remember those. But those things that have made no change on his case, we couldn't care less. But at the time this thing was first compiled, it was important to know what engrams had been started and hadn't been started, you see? And then this was taken off the earlier form, so it has arrived that way.

And "List the goals attained from such processing." Well, now you've asked him the same thing, if you just asked the one I just gave you. You said, "What processes have given you a change?" You see? Well, that just – write them diagonally across the (2) and (3) all at once.

And "Goals not attained from such processing" is an adventurous question to ask a pc, but should be asked. And it'd be a very good thing to find out what he has not been able to do about processing 'cause you'll be able to refer to that later on, and it's part of the O section.

It gives you a clue of coordination. You want to know what he's been trying to do with processing that he hadn't done. He might even give you a hidden standard.

All right. The "Present Processing Goals." Now, he's going to give you some brief goals of one kind or another. These are not very important at this particular stage, but you want to know what he's trying to do with processing, but very often at this stage of the game he just gives you a social response. "Well, I would like to be better," and that sort of thing. Well, you don't want anything more than that.

Now, we have a whole section here, which is the ne plus ultra of the whole thing, and we get to what makes this a Problems Intensive. We get to section O. Now that was where we wanted to get; that was where we wanted to arrive. And this we are going to do now with the greatest of care. We are going to write this up ad infinitum, and if there are not enough spaces, we're going to make some more.

Here we have "O. Life Turning Points: List each major change the pc has experienced in life." And that means his whole life ever since he was a very small boy or girl.

And of course, you're going to have the pc giving you – you're going to see the perfect example of cyclic recall as you do this. So don't try to ask for a certain period at any given time, because you're going to get near present time ones, then you're going to get middle range, and then you'll get early, and then you'll get near present time ones, and then you'll get early ones, and then you'll get middle, and then you'll get near present time, and it'll just go back up and down this way.

But you want to list each one of these carefully, because you are now going to use these for assessment, so they have to be listed with precision. They have to be listed with great precision.

Now what precision? Well, it's going to be so that you can say it easily on an assessment. You're going to have to say this several times. So we don't want it long, lengthy and long-winded. We want a precise statement, so that's what we keep asking the pc for.
"Major change the pc has experienced in life," and the pc may want to know what you mean by a major change. "Well, when you didn't any longer do what you were doing and started doing something else; when you didn't any longer live where you were living and moved elsewhere; when you didn't any longer have that state of health but had another state of health."

"Ah, well, oh, well, you mean – you mean," and he'll tell you something else.

All right. Well, we'll get those changes and you take that up very carefully and then get these changes this way: "Well, after I had an operation for goiter, I found out that I couldn't go out as much."

So you put down "operation for goiter." That's all you write. Major change point. Then, "All right. What was another major change point?"

"Well, um… It was when I… It was when I finished my first year in college. I had to leave."

"Oh? Well, did you go back?"

"No. no. Never went back. Yeah. First year in college."

So that's what you want. So it's "leaving college" is a very, very excellent way of expressing that, see? So that's expressed very briefly. Your next point. Express them briefly, succinctly.

Now, each one of these is followed by a date. And his idea of the date is going to be the wildest scramble you ever heard of so don't press him for an accurate date, particularly, and don't go pushing on it, because the person will do enough hemming and hawing here to last a lot of people a long time, and the dates you get aren't going to be very accurate unless you sit down with an E-Meter and go through a timing exercise of putting the things on the time track. And we're not asking you to do that particularly. So "ten years ago" is good enough. But write down something like "around 1948." See, that's plenty good. Anything the pc tells you is the date.

And we go on down the line and we fill out all these major changes. Now, you may find yourself needful of more space in order to get all these major changes, and if you do, you just clip another piece of paper up at the top of page five on this assessment form. And you just keep writing them in the same wise. Pcs might have lots of them. This would be fairly adequate for the usual case, but you might find somebody with a lot more.

Now, he's probably missed a great many of these changes. He probably hasn't looked at these other things as changes at all. So you continue the list with specific requests. You want to know when the pc newly joined any religious group. That'll be a major change point in a person's life, you see? And the pc didn't. All right. He didn't.

Now, "When did the pc start going to church again?" 'Course, that's a major change point. Ha-ha. "Start going to church again." Well, that tells us something.

If I had been doing this on an archbishop in northern Greece one night down in Athens – if I'd been doing just this, I would have pulled half of his aberrations by asking him why
he joined the church when he was nineteen in New York City. Because his sole goal was "to die and go to heaven." He did have a psychosomatic goal, which was "to keep himself from going blind." But he gave me the whole story about he was in a terrible upset and so he joined the church, and here he is at 70 or 80 or 205 or something like that – there he was, and he's still riding the same stable datum.

This, by the way, is interesting. Maybe in the *National Geographic* sometime or another you've seen a monastery – picture of a monastery in northern Greece, where the people can't ever walk in and out of the place. They have to be lifted in baskets. And they're lifted up the face of the wall in a basket.

This was the archimandritid [archimandrite], I think, of that particular monastery. And he had come down to – he'd heard of Scientology, and they – had a couple of sisters with him. I could have pulled his whole case right there. Clank! Interesting. Because the major "When did he start going to church again?" would, in this particular case, have become "When did he become a member of the church?"

Well, he became a member of the church after a long period of confusion back in his middle teens. And that was almost sixty years before. Interesting. And had been riding the same confusion, and he'd been – he was sitting right there on the same chronic somatic. Fascinating.

"When did the pc subscribe to a fad?" Now, he's liable to give you anything, and even insult you with saying Dianetics is one, or something like that; we don't care what the pc said. But when we say "fad" – when we say "fad" we mean anything everybody else was doing with enthusiasm. But we also mean food fads, or clothing fads. He joined the Edwardians; he became a Teddy boy. Anything like this, you see? He joined up into something or other, but it will indicate a change.

"When did the pc begin dieting?" And the pc's normal first response is to tell you that he never did. And you should be very careful about that particular point – ha-ha – because after a moment or two, he'll find a dozen periods of his life when he had to change his eating habits.

Well, he was – he was in the army. And yes, well, he did start dieting, "If you want to call it that." You'll get that kind of response, you see? He couldn't stand Spam. He just couldn't stand Spam, and he stopped eating Spam, and he hasn't been able to eat meat of that composite-type ever since. And he won't eat meat of that composite-type ever since. That's it. "That – if you want to call that a diet, fine. All right. That's a diet. But they just serve me one more piece of Spam and they would have had it." That was a diet. It's a negative diet.

Of course, at that particular level, you write down when it was, and you want to know what it was. So you'd say, "1943, Spam." That would be your notation.

"All right. What other – what other diets have you started off on?"

"No other diets. I'm not dieting. I'm no vegetarian, or food faddist, or anything like that. I have no other unusual diets of any kind whatsoever."

Well, this one has to be followed up. You have to get a little bit clever.
So you have to ask a question like this: "Well, do you eat differently, or have you ever eaten differently from other people that were around you?"

"Oh, well, you put it that way, yes, they eat these poisonous meats all the time, and they eat these meats, and they didn't care what meat it was and what meat it wasn't, and so forth. And actually, for some years, I haven't eaten any meat." But you see, this to the pc is not a diet. He doesn't define it as such because that is ordinary, that is usual. And the thing he is doing ordinarily with food is the thing to do with food. It isn't what everybody does on the subject of food. He never notices that.

All right. He's liable to give you some answer and say, "Well, I was out on the China coast, and all the Chinese were eating rice, and who the devil could live on rice all the time, but I managed to get some food. And I was eating differently than other people then – very differently from the other people who were around me then. They were all eating rice, and I knew you couldn't live on rice, and so forth. And I had to eat other food from that, and there was a lot of trouble getting other food at that particular time."

You say, "When was that?" And you put down "1948, China." Not "rice." That'll all give you clues, clues, clues. Something was happening there. Something weird was going on. His life was changed. That won't be much of a point, but this is liable to liven up the next point, you see?

"Well now, did you – are there any other – any other food changes, any other diets or anything like that?"

And he all of a sudden tells you for the first time, "Well, my family only eats kosher food."

"When is the first time you had any difficulty eating kosher food or finding kosher food and so forth?"

"Oh, well, you want to know that, that was when I joined the army. Had a lot of trouble. Had a lot of trouble."

Put down "kosher food" and some sort of a date. There's upsets associated with all this sort of thing. But those are not as important as this one:

He said, "Well, I started to live on lettuce and muldeberries – dried muldeberries\(^7\) and lettuce in um… 1951." That's right out of the blue, you see? There's no explanation to this of any kind whatsoever.

You don't say, "Well, you did?" you know? [laughter]

You better write down "dried leaves" or "dried muldeberries and lettuce, 1951," right there. Bang! Because, boy, he must have run into a freight train.

If you look back of this, you see, you look back here, you won't find anything else happening in 1951, you don't think, you know? You look back here and Mother's death, Father's death – 1951: Where the hell is 1951? Nothing happened in 1951. Nothing. That is just

---

\(^7\) a made-up word for a type of berry
a stroke out of the blue, and you'll get it on such things as diets and fads, and that sort of thing, much more rapidly than you'll get it on something else.

All right. "When did the pc leave a job?" And, of course, this may get very lengthy, but you better take down every one of them. Much more important than the auditing he's had is how many jobs has he left? How many, how many, how many, how many, how many? And you get some sailors, for instance, and they never show you all their discharges. But they were on a ship in 1949, and they were on a ship for two months in 1955 and they were on a ship for one month in 1958.

"What have you been doing the rest of the time?"

"Well, I've been going to sea."

What the hell goes on, you see? There's holes all up and down the line, don't you see? And something going on during that period; it's all a big not-know as far as you're concerned. And as far as the pc is concerned, it's just all a big withhold.

So when the pc starts to give you his job lines and there's something going wrong with this, you want to start asking, "How long did you hold that job?" And get his job record so that it's somewhat chronological. Find out his leaving points, and at these leaving points – he says, "Well," he'll say, "I left a job... I left a construction company in 1951. And I left the um... Yes, and I left uh... The um... Merchandising department of Taylor & Sanford's in 1955."

You say, "That's good." Now you've jumped – made an unreasonable assumption: You think that from 1951 to 1955 he was in the merchandising establishment at Taylor & Sanford's. He wasn't. There had been about eight job changes in the middle of the thing, see?

So always find out how long he kept the job. That is the only keynote there. Find out how long he kept that job, and then you will see where the missing links are.

Now, because the changes are sufficiently interesting in that particular line, you had better E-Meter needle it. "Any other jobs you've left?" Blang! "What was that one? Any other jobs you left?" Blang! "What was that one? Any other jobs you left? What was that?" Blang! And so forth. And you get a pretty good employment record just as number 13's number of lines imply. Because every one of those, he was in coaction with a group. And a person who has too many jobs is having difficulty with coaction, mutual motion. He's having great difficulty with mutual motion. And this lends itself peculiarly to the development of tremendous overts and withholds. Overts and withholds all stem from mutual motion; that is, the whole theory moves out of that particular field. And job and employment and work are things which are notably milestone a man's decline and aberration, and that sort of thing. It's not that they're aberrative in themselves, but he is in mutual action with some group, and then finds himself in violent disagreement with some group. And then he's in mutual action with another group, and finds himself in violent disagreement there. Well, there must have been some confusions; some hidden confusions are in that period. And by getting a job record, you can spot a lot of hidden confusions.

Now supposing the person is not a working person at all. Then you change the question over to "When did the pc leave a certain type of activity?" And you'll find out she was a
housewife, and then she was a club member, and then she was a this, and then she was a that and you'll get a type of job record which is just an activity record. But this whole number 13 of section O is devoted to spotting departed or areas of co- or mutual motion on the third dynamic. You won't have much other record if you don't make a full one here.

Now again, that all has to be written in such a wise that you can easily assess it later because you're going to use this and use this and use this data.

Unlike everything up to and including (M) and (N), you're going to use the O section till you practically wear out the paper. So do your best writing in this particular area; make sure that you can read your own writing. That would be a good thing to be able to do, because you're going to assess it, and assess it, and assess it, and assess it.

All right. "When did the pc have to take a rest?" Ah, that's splendid. That's real good. And those are marvelous, because you're going to find those are the points just before which there were prior confusions of magnitude.

So you're going to find out all these points when he had to take a rest, and you're going to write all those down.

And "When is the time the pc noticed a body difficulty?" Well, you're going to write all those down, but this is going to be awful comm-laggy. Going to get all that straightened out.

Now, "When did the pc decide to go away?" Now, of course, you get wives, husbands, little children, almost anybody subscribes to this one, and of course, it is always preceded by an area of confusion. So here's a very fruitful source of confusions. Now, if these things are – suddenly start, about this stage of the game, to be the same areas as you've already recovered, don't worry about it. Just keep writing them down, see? Don't call this to the pc's attention at this stage and say, "Well, I see that you left a job in – in June of 1955 – you left a job June of 1955, and you started going to church again in June of 1955, and you decided to take a rest in July of 1955. Well, what about that?"

Well, you're jumping the gun. You are jumping the gun. That's the sort of thing you do in section P. So let's not take up anything here but data. You just want data from the pc, data from the pc. And you'll find out soon enough that it adds up and cross-checks and does all that sort of thing.

Now, the catastrophe for this whole procedure would be if the pc gave you nothing under the sun but the same date and the same incident. Of course, a pc doing that would be nuts. But an institutional case would do that. And you have one thing to assess. All they talk about is when they brought them to the institution, or something like this, you see? That would leave you with just one thing to assess, but people that you ordinarily audit aren't that daffy. But remember that if you did that, you'd have to, next time, fill out another O form. If you haven't got enough data on the O form, you fill out another O form after you've handled a P form.

All right. "When did the pc decide to leave and when?" Now that's almost the same question, but not quite: "Decide to leave." He didn't leave. He decided to leave.
After you've got all the departures then you find out that there were eighteen periods of deciding to depart and not departing. And what are you running? You're running leave and then failed leave. Asking him questions about leave and then questions about failed leave. Simple.

Now, "When did the pc start being educated in some new line?" That is doubled over with "What have you taken up?" "What have you taken up?" "When did you take up a course in this, a correspondence course in something else?" You see? "When did you start to study something else?"

Now I just – I just had a maintenance man out here suddenly take up pottery. Hadn't studied anything for years and he's suddenly taken up pottery. I know there's been a catastrophe and a confusion in his life someplace. Isn't any reason for him to take up pottery. He's had a little connection with pottery around here to amount to anything. But that's Mr. Jenner's job.

That's very interesting, isn't it? He's suddenly moving over into another field from carpentry, over into masonry, you know? And what's happened? Well, I also notice he looks a little upset. Now, I haven't interrogated him in any way, but I'm just giving you something there that is a cross-question. Now it isn't anything wrong with taking up new lines. Isn't anything wrong with studying something new. But it might be an indicator. It might be.

That's true of most of these things, is the bulk of them are "might be's."

Now, "When did the pc's physical body change characteristics?" Getting this out of women, you will have to take the E-Meter and beat them over the head. [laughter] A woman at 110 will never admit that her body changed anything from that of a beautiful 16-year-old girl, or something like that, you know? It's just things they won't talk about, so you have to pull that the hard way. Go ahead and grab it.

Now, "When did the pc collapse?" They've probably omitted telling you anything about this up to that point.

And "When did the pc start a new life?" That's just the same question over again in some other line, but this is with magnitude. They may have omitted any of those.

And then "When did the pc stop going to parties?"

Most girls tell you this, they look very sad, and they say, "Well, I met – I met Bill, and he was a stay-at-home type, and so forth. And so we stayed home thereafter." Well, I'll let you in on something. That wasn't the reason they stopped going to parties. You'll run into it in the P section, if this ever assesses out.

They did various things. There were various things occurred about parties. There were various heartbreaks and upsets, because stopping a girl going to parties is only done with sixteen-inch guns. [laughs] You just mark a big underscore under that. They don't easily stop going to parties. Might have been last lifetime, but they… It took something to stop them.

Now, "Who has the pc never seen again?" Now, you notice this is down toward the end of the O section, so that if we have to send for the fire department, and so forth, and get them to dam up the grounds because of the resultant flood, the end of this is very much in
view, because the pc is liable to spill a grief charge. Because you've shaken the pc up considerably by this time, you see?

You ask him for change, change, change, change, change; you're auditing him like crazy all through this O section. Now all of a sudden you say – all of a sudden you say, "Who have you never seen again?" [makes sad sounds; laughter]

And we finally finish up, "What does the pc now consider his or her major life change?" And we don't care what the pc said it was. We just don't care but it's a good thing to ask.

All right, let us go back now – let us go back now to what we are going to do with all of this data. We have now assembled the doggonedest potpourri of data that was ever recorded, and if employment offices ever interrogated employment sheets to the degree that we have shaken this one down, don't you see – even though we did it fairly rapidly – man, would they know something about their applicants.

Miss Jones comes in, applies for a job as a typist.

"Where did you work last, Miss Jones?" Lie.

Uh, "Where – why did you leave?" Lie. [laughter] Here it is, you see? "Is there any reason you would not be able to continue long on this job, Miss Jones?"

"Well, no reason at all, except the doctor's only given me two months to live."

You know, you'd have the lot.

So we're going to take the O section. We're not interested in any other part of this now except as a review and a cross coordination. And we're going to take the P section.

Now, if you are very wise, you will have stopped the O section – at the end of the O section, you will have taken a break. Because you didn't start this thing with rudiments, and the P section has to be started with rudiments.

So you either finished that whole thing off and ended the session and that was the auditing for that day or something of the sort, or that morning, and you start up the P section again, so it might take a little bit of interesting timing to get this thing straight.

Now, this, bluntly, starts an assessment of the pc's major life changes. But you start it in Model Session, and you start right going here with Model Session and you want to clear the rudiments. You want to know if anything upset them, you know, about what you just covered with them. You kind of aim the rudiments, you know, a little bit in the direction of what you've just been doing earlier.

And if you've only got fifteen minutes left of the session, and I find out that you started a P section with fifteen minutes left of the session, I will be upset. You could possibly get away with a rapid assessment, but you certainly couldn't bank on the assessment and so forth.

Now, if you had a half an hour or an hour left of your auditing period, well, by all means, do your assessment but don't go any further. Don't try to do anything with it. And the best thing would be to have them in completely different assessment periods because you're
going to shake this person up like mad doing an assessment. They're going to be in a fit state to be audited, let me tell you.

Now, you're going back here to O – you're going back here to O, and I don't care how many doodle-daddles or code marks or symbols you put on the side of this. You could put .1 divi- I mean 1.0 divisions, you know, fall, or something like that. You could make little notations. But all you're going to do is read them this.

Now, you go down the line. You make that notation: Fall, rise – don't ever note rise. Just fall, theta bop, whatever it is, how much. And you're going to make it, and this time I'm going to ask you to get clever.

It doesn't matter much if you assess this wrong. But this is a wonderful opportunity to get clever on a one-pass needle judgment. After you've finished up reading through this thing once, your record and recall, and so on, are quite adequate to tell you which change point of the person's life registered most. You just read it through once, rapidly.

Now, of course, you can do that by saying to the pc, "You don't have to say a word while I am doing this. You just sit there and hold those cans and I am going to read all of this off" – you've got him in-session, your rudiments are in and so forth – "and I'm going to see what this is all about."

And you simply read this thing off, each one, and note the reactions that greet each one of these change points. When you get over here, you will be able to say that "It is number 13 – something or other – was what assessed. That's good. That got the most reaction on the needle."

Now, that completes step one. Step one consists of that reading, it consists of your adjudication of picking out from the E-Meter reaction, needle reaction, which one of those life changes that you have gone over in O produced the greatest needle response – not just fall, but what had produced the greatest needle response.

Ordinarily, that needle response will be much bigger than the remainder and it will not be unusual for it to be a theta bop. A nice, wide, staggering theta bop – if you found something like that, you're right on his rock chain and it audits like mad.

All right. You've got to note that down and square that around.

Now, this is a disposable form, this form P on page seven. And you notice it's just on one side of the piece of paper only. And in mimeographing this thing and repeating its mimeographs, that format should be followed because that's – this is disposable. This is "add-it-able." After you've done this, this gets added to the pc's record. And then without throwing away anything from one to six pages, you get another form P. See, and you just keep running a new form P, and it's just on one page, one side of the paper. (Very well done here, this mimeographing job.) And of course, you look straight at the pc and you say to the pc very meaningfully, now that you've got the point – it was their "leaving Taylor & Sudrow's" – biggest change in their life, you see? That's the most reaction.

And you ask the pc, "What problem existed..." This is very meaningful. It's just – you plow that question right into him. Everything else has been rather conversational, don't you
see, and this and that, but you just plow this one into him hard. And you say, "What problem existed immediately before you left Taylor & Sudrow's?"

All right. He's going to tell you. Now, he may give you a fact. And if he only gives you a fact, you say, "Yes, yes. All right. That's fine. Good. But state that as a problem. Now what -- what was the problem connected with this? What was the problem? The problem connected immediately before you left Taylor & Sudrow's?"

"Well, it was that I did the accounts wrong."

"Yes. Good. All right. What was the problem?"

"Oh. Oh-ooh-ooh-ooh-ooh, ah... I ah... I -- I see. I s- I see what you mean. You want to know what the problem was. I didn't like my boss."

"All right. Good. Thank you. Now state that as a problem."

"...How to keep from going to jail."

Blang! You see? That's a problem but it's the first problem they actually state as a problem.

Now, they may be mystified as to why you won't accept these as problems, because they seem good enough problems to them. But you could even say to them, "A problem is who, when, what, where, how. There's some question about a problem. There's something undecided about a problem. We want the undecided thing, you know, the thing that was worrying you, the thing you were anxious about, before you left Taylor & Sudrow's."

"Oh, well. Uh-huh-huuuuuu, well, that's different. Ah-ha-ha-ha-ha. Oh, well, you ask me that way. I didn't like my boss." you know?

"Yeah. But what anxiety did you have about it?"

"How to keep from going to jail." So you write it down.

Now comes a little bit of a problem. "How to keep from going to jail." Now, how do you phrase a rudiments thing? You've got to do a shakedown on this sort of thing. You've got to do a little assessment here sometimes. You got to find out what this was all about. But it's not much of an assessment, because it's obviously jail that is a worry here.

So your with would have to be changed to about, you see? And you'd say, "What was unknown about that problem -- what was unknown with that problem about jail?" You've got to change the about to with and change it around. "What was unknown with that problem about jail?" Any such phrasing that gets it across to the pc so that you're running an unknown on it.

Now, if he gives you some significance -- "How to keep from worrying." Oh, man, that's -- that's a rough one because there's no target. You're not running any kind of a terminal.

Now, how do you state this around so that you run about "What was unknown about that problem with worrying?" Man, that is not going to be any process that makes any sense to anybody. Or you are going to say, "Just worrying? Worrying? Is that what it was? Worrying about what? How to keep from worrying -- worrying about what?"

SHSBC TAPES 001-100 1453 04.02.15
"Oh, just worrying."

Boy, you're really getting a defeat here, you see? A problem about – just about worrying. "I just found myself worrying. All the time I just found myself worrying and worrying."

All right. In the last moment of defeat, you can give up and say, "What was unknown about your worrying?" Because that's as far as you're going to get.

In other words, don't cave the pc in and don't abandon it. Just try, successfully if possible, to find a proper terminal to add into this problem. If you can't find a proper terminal, you can move off a bit and say what it was. Because you've got to have the thing run as the pc has it. There is no sense in doing anything else. And he could have a problem just about worrying, you see?

So if you can't get him to state a noun, or get him to state something else about this problem, or if you don't get a noun out of him, you will have to use the exact thing that he said.

"Oh, well, worrying," but this is liable to be your response.

"How to keep yourself from worrying. Yeah, well, all right. How do you keep yourself from worrying? Were you worrying about something specific?"

"Well, of course. Of course, naturally. Bill."

"Well, what is the problem then?"

"Well, how to keep from worrying about Bill, naturally, naturally. I mean, this idiot!"

You know, that kind of reaction.

All right. So your process is "What was unknown about that problem with Bill?" See, you've gotten the terminal out of the thing. But the pc could have a problem about – just about worrying. The pc knows that people who worry go to pieces. And the pc finds himself worrying. And that is the most problem the pc has got. And that's as close as he can come to any terminal. And you actually would defeat your purposes by being too forceful about giving him a terminal. There are times to be reasonable about this sort of thing. Try to get a terminal if you can. If you can't get a terminal, run what he'll – run the condition. And you'll still make it. But if you do, you better watch your havingness. And when you finish up that session with Model Session, just hardly ask him if it's all right with the room. Just run TR 10.

Because if you're running a conditional problem, his havingness is going to go down. It can be done, you understand, but his havingness is going to go down, and in end rudiments you're going to have to run some havingness.

All right. Let's take up the next brutal step here rapidly. "What was unknown about that problem?" has got to be flattened on the tone arm. It's got to be flattened on the tone arm. And that may take a long time, and it may take a short time, but you're going to get the tone arm action out of it and get the twenty-minute test on it and so forth, because that problem – you're really going to take it up and beat it to death.

Now he's in a position to answer number 5. We've got to "locate the confusion before that change (as number above)". Not before the problem but before the change. And now
you're going to list the persons present in the confusion. And this is going to give you some difficulty because there will be innumerable persons missing. So you got to shake that assessment down on the E-Meter needle.

"Were there any more people in that confusion?" And you keep reading that until you no longer get a needle reaction. You've shaken all the people out of that. And the most important person to the whole confusion will be the person who comes up last. Just take that as a general running rule and you'll be safe.

All right. You make a list of those persons, and then let's just read that list off, as you've written it right here on the form – don't write it anywhere else than on the form – and you run a rapid assessment which just gets your most needle reaction, not by elimination, and you write down the name of the person who reacted most on the needle as you read that list.

And now you've got to get the withholds off from that person. Now, that means that you might have an additional piece of paper. That means that you might have written up an additional withhold section. It might mean that you have used a standard form to get the withholds off, or it might mean that you just sat there and got the withholds off.

"What were you withholding from that person?" "What had you done to that person?" "What were you doing at the time that you didn't tell that person about?" And we want to get the basic withholds off that person. But we're not going to do a fantastic hour-after-hour grind to get the withholds off of that person. We're just going to get the major withholds off of that person. You're going to try to clean that person up till that person doesn't react. And that's as far as we want it cleaned up. We say the person's name. We don't get an E-needle – a meter reaction. And then we're going to assess the list again leaving the person's name in. We don't take names off as we clear them up. We just keep leaving their names in because they will turn up again. That tells you why we're not being terribly thorough.

So you run down the list, get the most reaction and you get the withholds off from that person. You get what the person has done to them, what the – what he hadn't told them, what he was unable to tell them. Remember the three classes of withholds, see, involuntary withhold – the unintentional withhold, rather – all of those things. We get that off and we'll find out that we've eventually – when we've taken care of all these people and none of these people react anymore on the needle, we'll have cleaned up the confusion.

But the end of that is when the needle does not react while you read the list with the rudiments in. And you don't get a reaction. All right. Great. Great. That's the end of that confusion as far as you're concerned, and that is it.

Now, you've just – run that again, and then you – again, as it says it in (9) and (10). You know, just keep repeating the same thing till you get all that – the people in the confusion off. And now, you return to the O assessment and do all of P again, which is to say that you take this P form as complete and you file it with the person's record and you make out a brand-new P form in exactly the same way. And you go over that thing exactly as you did before.

Now, that is the extent of a Problems Intensive. How long does it take? I don't know how long it'll take you to do this on how many pcs. But I know that this is terribly productive.
And this will get out all the hidden standards, and it'll straighten up most of the present – it'll straighten up all the present time problems of long duration. You'll have all kinds of interesting things occurring as a result of it.

It becomes better when you get the Havingness and Confront Process of the pc and run at the same time. You could do a lot of things. They could get a lot more complicated and so forth. But if you just do this just as it says through here, and keep up and finish until you finish every one of these change points of a person's life, you'll find the last ones are going just fast, fast, fast. They're just disappearing quickly. He gets the problem, he finds the confusion, bang! And he finds the withholds on it, boom!

Don't be too surprised if the person goes terribly backtrack. Let them go backtrack all they want to while you're running the problem. But that they went back running the problem doesn't let that lure you into getting the confusion before the engram. No, we want the confusion before the change in this life, always. And we never wander onto the backtrack from a standpoint of getting off the confusion.

But they will of course run into engrams while they're being audited on the problem. And we don't upset them by trying to get them off of it. We just audit them.

But we want the confusion prior to that change in this lifetime. So that this thing – we don't prevent them from going backtrack – but this thing basically, mainly, handles, and is only designed to handle, the present lifetime.

Okay?

Well, I wish you lots of luck with it. I think you've got a piece of dynamite in your hands that won't preexplode in your face. I think it'll do your pcs a lot of good. Okay?

_Audience: Right. Mm._

Thank you.
PROBLEMS
A lecture given on 12 October 1961

Well, what do you know. I can see the room. [laughter] I just wanted that as a good example. I can discipline myself, too. No smoking. Now, of course, the first one that does any smoking, now, gets a ten-thousand-word infraction sheet. [laughter] And if it's me I'll write ten thousand words in the next few weeks anyway, so. [laughter]

Okay. This is the 12th of October 61.

Now, continuing our dissertation on the subject of the Problems Assessment. Okay?

Now, the grim part of this is that between yesterday's lecture and today, we have had a few mistakes. Now, in the view of the fact that it isn't possible to make mistakes on this, this is remarkable. [laughter] I'd say this was quite a feat. This is quite a feat. Well, it just shows you that anything is possible.

Now, the first mistake that was made is on writing down the changes. On writing down changes, we wrote a short story. When you're writing down the changes in a person's life in Section O you are succinctly and briefly dedicated to simply putting down something that can be assessed. Now you cannot assess, "Well, I went down to the store and bought two pounds of sugar and this was very unusual for me because I only ever buy one pound of sugar." Now, try and assess that, see.

So you've got more or less when it was. So your assessment statement would be something on the order of "1943, sugar." Got the idea? And if you want to get terribly long winded, "buying sugar." You see? It's that brief. Your changes must be brief or they cannot be assessed and your assessment will go by the boards because as you read the assessment, restimulative words will give you a kick on the needle. So that's the way that is. You write that very briefly.

What was another one, Suzie?

Female voice: Rock slams take precedence.

Oh, rock slam takes precedence over other needle phenomena. Rock slam is always greater in meaning than a mere fall. A rock slam will develop into a dial-wide slam if you pursue it. In almost any case, if you keep pushing the fellow into it, it will develop and develop.

If you have a rock slam turn on and the thing turns off again, well, you just ticked the edge of something and it wasn't anything there. But a real rock slam manifestation that really means there is something there – if it goes by rock slam – when you start to run it, you will see yourself a nice, great big rock slam, even if it started with a little rock slam. Rock slams always increase in magnitude.
A rock slam is a very badly overrun flow. It's a tremendously overrun flow. A fall is just a slightly overrun flow. But you still have the index of reality expressed by a rock slam. The only needle phenomena you pay no attention to while doing any kind of an assessment is a rise. And I suppose at any moment this rise is going to rise up again on some of the new students and so forth and they're suddenly going to say, "Oh, well, that was a very strong reaction because it rose and it rose and it rose." My comment on something like that was "I hope you provided him with a parachute." [laughter] This is about as close as that is to Scientology.

Why don't we pay any attention to a rock slam, pardon me, a rise? We pay no attention to a rise of any kind whatsoever because you don't know what turned it on. You have no idea of what turned it on, because it doesn't turn off. And so it doesn't mean anything. You see why it doesn't mean anything?

It is a latent reaction of the needle. It's always latent. You've said something. The person thinks it over and gets there and it's too much for him, it exceeds his reality and he can't confront it. So after – on that question or in two questions or in six questions or a half an hour later, while you were saying something else in each case, you start to get a rise.

A rise is not a spontaneous start. You do not spontaneously start a rise, so you cannot identify what began the rise. So if you start to run it down on the basis of what he couldn't confront ... You could adjudicate this. You could say, "The needle was rising. Therefore, it was obvious that the pc could not confront..." Yeah, but how are you going to finish out the sentence? How can the sentence be finished? In the first place, he's not going to confront any part of it, so you're not going to find it.

Now, you could go over, if you had a tape recording of everything you had said and everything that had happened in the last few minutes preceding the rise and the few minutes after you noticed it and then you took this one by one, item by item – it might be a word, it might be a phrase, it might be a this, it might be a that – you could probably find what started the needle rising. And after that, you would be no wiser than you were before, because the needle would simply stop rising. That's interesting, isn't it?

A rise is meaningful. It does mean that something has occurred which the pc is not about to confront with magnitude. It means something has occurred; he is going to throw his vehicle into reverse and step on the accelerator straight down to the floorboard. That has happened. But what from? What from?

Now, it is highly, highly, highly doubtful if you would ever be able to trace what it is from. You could get near what it was from. But, of course, you have to resolve the whole case to get him to approach what he retreated from. So now it's not worth it because after you've resolved everything you could resolve and worked everything you could work, all you would know then is that you had said something that began a rise. That's all you would know.

Forcing the pc to confront something which the pc is seeking to get away from will normally cause some sort of an ARC break. Now, an auditor has to do it to some degree. But when you have a rising needle phenomena, you are already confronting something that he is not about to go near and no matter how much you pushed him, overwhelmed him, beat him,
ARC broke him, overwhumped him in general, you're not going to get him to front up to it and that's it.

He'll front up to something else and tell you that was it, but you're asking for showers of red herrings to go across the track. You're asking for all kind of things to occur. So you just don't fool around with a rise. I'm just repeating that just to make sure that it's on the record good and hard. You just don't fool around with one. It means the pc couldn't confront something.

But in view of the fact that tracing back the something is both time consuming and uninformative, why do it? Now, you go over a series of terminals. And you're going over a series of terminals and all of a sudden you notice the needle is rising. Well, it means that somewhere in the last five terminals you went over, you struck one that he couldn't confront.

Well, it violates the rules of auditing, because he doesn't have a reality on it, to audit it. So why are you interested in it? See? You couldn't audit it even if you found out what it was. A pc will not respond under auditing to something which causes a rise.

Now, you've got something else that baffles you sometimes as you're busy doing something. You'll see a pc all of a sudden start to rise and rise -- and rise and rise and rise and rise and rise, and then rise and rise and rise and rise. Well, there's nothing wrong with a rise because it'll eventually wind up with a high tone arm, but as you're running things, tone arms go high. Don't try to restrain the rise of a tone arm. So it causes a high tone arm. All right. And you audit a little bit further and then the needle falls and falls and falls and falls and falls and falls. Well you don't change the process, do you? I mean just keep on doing this.

All tone arm rises and all tone arm falls are, of course, accompanied by needle rises and needle falls. Has to be because the two are interconnected -- of course, unless you have a meter built by Pembry. Then they're independent.

I'm merely saying that because there's just been -- we've just laid down the law on "HPA/HCA must have a meter" because we're about to turn out HPAs and HCAs that can operate with E-Meters, and an auditor should have the tools of his trade and they are beginning to show up already with old pieces of garbage, you know, that have been hoisted out and were built in 1952 by God knows who, you know and they're mains-connected, short-circuited, only put 220 volts between the hands of the pc, you see. And we're already running into this. So the -- hence the crack because this is the first squawk I have heard was from the gentleman mentioned.

Now, the best guarantee of case increase is the needle rises and the needle falls which causes a tone arm rise and a tone arm fall. Well, so therefore rising is a part of it, but it is not diagnostic when you're doing something.

Now, sometimes your pc has an ARC break and your rudiments are out and all the needle will do is rise. And when you get all of the rudiments in and the ARC break cured up, why, the needle doesn't rise much or it falls or something -- or something. You get the idea? I mean, what you want to know from a meter: Number one, you want a meter that will tell you the truth. See? You want a meter that is a good, standard meter that won't give you a buggy
reaction, won't be so sensitive you can't read things, won't do this, won't do that and so forth. A good standard meter.

All right. Given that, what you want is a positive reaction and your positive reactions are all needle reactions except rise. Rise is the unpositive reaction so it is not diagnostic. And that is about all there is to it. You – just for fun sometime, when you see a pc's needle rising and you're coffee shopping somehow or another, try to trace down what started it rising. Oh, you'll probably be able to do it fifteen, twenty minutes, half an hour, something like that and you'll probably find out a cat walked by the auditing room window or there was a lawn mower started up in the next field or you mentioned the word "work." [laughs, laughter] All of which gave you data that you could have had anyhow or didn't need, of no value.

All right. What was another one of these?

Female voice: Rudiments out.

Oh, well, yes. Pcs do not run with rudiments out. Goals will not assess with rudiments out and if it's also true that this list, this checklist, when you start going over it for Section P, why, it'll also misbehave if your rudiments are out. That's why the assessment has to be done in Model Session securely and severely. So you have to get the rudiments in. Because any assessment will go by the boards if rudiments are out.

It happens on an average of once a week, someplace in the world, that for half an hour of one session – someplace in the world – a pc is audited with rudiments in. It's accidental. It's accidental. He didn't mean it that way, but they cure it up pretty quick. [laughter] This is snide – snide and sarcastic, isn't it. But honest, that's almost the way it begins to look to me, you know. You know?

If you really want to know what rudiments in looks like, run a session like this: Short-session the pc. Run a Model Session and get the rudiments very severely in. Audit the pc for ten minutes on something – we don't care what, even the process you should be running – and then, put the end rudiments in. And you're going to say, "What happened to the rudiments that I put in a little while ago?"

All right. So you put the end rudiments in. You give the pc a little bit of a break and then you start the session again. And put beginning rudiments in and they're out. And you say, "But I just put rudiments in. There hasn't been any auditing; there's been a break." So you get the beginning rudiments in and you run ten minutes worth of process and then you put the end rudiments in and the rudiments are out. What's going on?

And you will begin to get of the opinion that it is impossible to put rudiments in. You know why? You never asked the question a second time. You very often, as a common failing – you say, "Are you withholding anything?"

And the fellow says, "Well, no." Clank!

"What's that?"

"Ah, well, that's uh – it's nothing, really, but Joe and I – Joe and I uh – we were down at the cafe last night till two o'clock and did nothing but discuss your auditing."
"Oh, I see. All right. Okay. All right. Now, is it all right now if I audit this process on you?" Something or other. [laughter]

What? You yourself run a – sometimes run on the rudiments a nonconfront. Get the idea? You don't quite confront this and you don't repeat it.

You say, "Do you have a present time problem?" Clank! "What's that present time problem?"

"Well, I had an awful fight last night with my landlady. An awful fight. And she's throwing me out. And as a matter of fact, right now while we are being audited, why, my bags are out on the front porch and the bags are all out on the front porch and so forth and it's raining. And so forth and so on."

Well, a man of no action at all would go ahead and try to run a session. A person who thinks auditing will do everything would go ahead and try to run a session. A person who wouldn't would say, "You go get in a taxicab or something of that sort and you move yourself over to your lodgings and pick up your baggage and bring it back and then we will start the session." See, present time problem.

But whatever you've done about this present time problem, we eventually get it so it doesn't knock anymore and we don't get a needle reaction on it anymore. So we sail along to find out if the pc has an ARC break and we find out if the pc is withholding anything all the way down the line. Well of course, the next time you take a swish across the rudiments we are doing what we should have done in the first place.

You see, that was just a present time problem. He had twelve! So every time you go over the rudiments again, you will run into what you should have run into by the repetitive question. You should have asked them again, you see?

After he came back, straightening up the bags or you had audited it out or something like this, why, you should have asked him again. Good. Just as though you had just thought of it and it was a brand-new rudiment, you say, "Now, do you have a present time problem?" And it goes clang! and you say, "What's that?"

But your self-satisfaction, your glibness, your feeling of the canary-that-just-ate-the-cat feeling, you know. You're feeling so good about all this, that it doesn't occur to you that he's got another present time problem, see. Or that there is also something else wrong somewhere. You got the idea?

So each rudiment, each rudiment itself, is in sequence to the last rudiment. Now look. There might be an ARC break on "Are you withholding anything?" but you don't now, of course clean up the ARC break because it occurs before the withhold.

So of course when you do end rudiments, you run into an ARC break, but it occurred in the beginning of session. Well, that's a criticism of you because it means that your rudiments were out during the whole session. You must have been wasting auditing time. Well, how could you cure such a thing?

Well, there's no provision in the Model Session for curing such a thing except just asking enough and realizing that you can take up a rudiment at any time. You can always take up
a rudiment. It's bad practice to take them up so often that the pc gets no auditing, but you can always take up a rudiment.

Now, just for fun sometime – just for fun, to enforce and show you what I'm talking about – run somebody this way. This is an experimental action.

Run the beginning rudiments and then run the beginning rudiments and then run the beginning rudiments and then run the beginning rudiments. And you will just be fascinated what happens. And it will be a wonderful example to you of the care you should utilize in handling rudiments. And when somebody tells you your rudiments are out – when somebody tells you your rudiments are out, why, you of course very well must realize that the rudiments you put in are still in.

You see, nobody is saying that the rudiments you put in went out. See, what you straightened up on the case is still straightened up on the case, if you did any kind of a job at all, but there were more things out than you asked for. You see, you've cleaned up this present time problem. There was another present time problem. You didn't ask for it.

It was there. It would have knocked again. There was another ARC break, but you didn't ask for it, you see. There's something else wrong with the room, but you didn't ask for it. That is much more difficult to achieve, this room proposition, because usually it takes care of everything in a full sweep and we've tried to get an ARC break process now which takes care of it at one full sweep, so that you get all the ARC breaks and we're moving up there into better rudiments.

But one of the things that happens as your rudiments went out is after the pc got off his withholds, he had another withhold but he didn't ask for it – you didn't ask for it.

Well, now how could he have another withhold and you didn't ask for it and he doesn't get a knock on withholds or anything of this sort? That's because the withhold he gave you was a damn lie. You ever consider that? It happens so often. So, your rudiments keep going out, keep going out, keep going out, keep going out. Why? Because the pc's withholds are not coming off; you're getting something which isn't true or something that is half true.

And so we have this new end rudiment line which is in lieu of the withhold question in end rudiments and that is to the effect, "Have you told me any half-truths or untruths in this session or said anything just to make an impression on me?" Could be worded, by the way, "just to influence me?" as in some types of case you find that more workable. The pc is always trying to get you on their side by complaining about somebody and that would get that.

Well, now, how about this? You ask a pc for a withhold, you get a knock and then the pc tells you a lie of some kind or another. And you ask him – and you try to clean up withholds and the withholds just aren't kind of cleaning up very well. Well, they won't clean up if you're getting half-truths or untruths. In fact, you're going to worsen the case because it – to tell an auditor an untruth, of course, is an overt. It's just throwing auditing away like crazy. So you have this new end rudiment situation.

We still have short sessioning with us. So now, by beginning a session, doing an assessment such as the P section here and ending the session, you've found it, you see, and by
ending the session, giving the pc a break while you figure it out – as good an excuse as any – and then starting the session again, why, you get the pc pretty well oriented, because this is about the first time you will have put him in a formal session doing a Problems Intensive if you've taken him straight off the street.

So that would be very, very good practice – extremely good practice – is to finish the O section. Get that all set, you see. And then put him into Model Session, come right down, get the rudiments in, do the assessment out of O section to fill in the first part of the P section. Do end rudiments. Give him a short break. Note which one it is and bring him back into session again. Why?

Well, you're going to get a double crack at this pc's rudiments. Now, you see that a double crack at the rudiments is beneficial because let us say again an ARC break – we have had an ARC break while pulling a withhold and of course, you don't have another ARC break question following the withhold question. That sort of thing is cared for by doing beginning rudiments, doing something or another which is – looks like a finished activity to the pc and doing an end rudiment. Bringing him back into session, doing a beginning rudiment. By that time, you've got this fellow pretty well grooved. Now you start asking him questions, you're going to get much better answers.

Now look, you put the rudiments in three times if you did that. Now, you see why it might be a good thing to put the rudiments in three times? Because a rudiment can go out while you're putting another rudiment in.

Now, that would pretty well guarantee that this pc had your – had you very much his auditor at the moment you ask this burning question: "What problem existed immediately before – ?" and you give him the change that you have assessed. Now, if you've got him in good session, man, it'll shake him down to the bottom of the Earth, see.

And he'll be able to recall it and he'll be able to handle it and he'll be in good shape doing that. So it would be a very good idea for you to do this in view of the fact that you're having some of this difficulty with rudiments. See how you could handle rudiments?

Now, are you aware of the fact that short sessioning has in itself therapeutic value? You can do the darnedest things with short sessioning. Everywhere a pc is restive, he can't keep his attention on something. You are putting rudiments in, normally, because he can't put his attention on the session. Right?

All right. A child's attention span is called to your interest and attention. It's very short. So is that of an extremely worried pc. His attention span is terribly short, very brief. So, you put the rudiments in, do something, handle something, out-rudiment the thing and give him a break. Put the rudiments in, do something – something final and finished, you see – put the end rudiments in, give him a break. You got the idea?

And if you were handling somebody like that early in an intensive – short sessioning him – look at all the rudiments you're going into and through. Now, he isn't going to get very restive, if every time you do this, you do something. And look at all the doingness you've got in this P section. This is fascinating the number of things you can do as a finished product or a finished action. Well, look them over. You do a whole assessment; you can do a
whole assessment. It's not going to take you very long to do an assessment, so therefore you can short-session an assessment.

All right. Now let's look at the next point here. We say, "What problem existed immediately before – " clank! – whatever the occurrence was. You write down the problem the pc gives. And now you could just turn loose and you could simply run, "What was unknown about that problem with (whatever descriptive word it was)." Get the tone arm action free on the thing, in pretty good shape. You find that this twenty-minute test will get in your road sometimes on one of these things, but I'd leave it in for Class II Auditors.

But you could finish up that problem, see, just neat as a package, you know. Finish it up. Dust it off. Might not last long. It also might last for three sessions, but end your session, give him end rudiments, give him a break, something like that. Now, if they've got a new auditing period coming up in the afternoon, take up something else, don't you see – which is of course what? You've got to locate the confusion before that change.

Now, I call to your attention, by the way, in passing and discussing this activity, it's the confusion before the change. It is not the confusion before the problem. Now, you must be very sure that that is what is asked. The confusion before the change. And you may get some entirely different period than existed – that the problem existed in. The problem also might have drifted out of that time area while you were running it and is no longer the confusion before that change. It is a problem he has had for a long, long while. Now, if you ask him "Confusion before that problem," he will say, "Well, actually, the soldiers of King Henry VIII were after me because I had written a brochure criticizing him for his number of wives."

Violates the Problems Intensive, see, because that problem went a long way back. Now, to understand that fully, you must realize that the only reason people move slowly, get parked on the track or anything else is that problems become timeless. The timelessness of problems compose the reactive mind. A timelessness occurs.

Whenever you are having difficulty in dealing with companies that do business, in getting them to answer your letters, in getting them to despatch any goods, in getting them to this, in getting them to that and you just can't seem to get anything done, think of this: They are slow to the degree that they have problems they can't solve. They are inactive to the degree that they have problems they can't solve. So most of their actions, then, are reactive. They are not as a result of thought, but they're drifting in the timelessness of problems.

Every new action adds into the old problem and it gets to a point where "Nothing we do will resolve the problem, so it doesn't matter what we do, then, does it?" And you'll find more business firms get in that frame of mind. They've had terrible problems of some kind or another and so on.

Well, I'll give you a better objective view. The bailiffs – in US, the sheriff – has just moved all one's goods out of the house and Aunt Isabel is being upset because the table was not polished that morning. And she goes around and tells everybody in the house that she is very upset because they have forgotten to polish a certain table. It's going to be sold at public auction.
Now, can you get the sort of attitude people would have toward Aunt Isabel? Well, do you realize that a person who is totally overwhelmed, whose head is half cut off by the guillotine or something of this sort – he just feels totally overwhelmed by life – you come along, you give him something that is so trivial compared to these enormously important problems he's worrying about... See, this is 1961, and he's terribly worried about having his head cut off in 1789, see.

He's so concerned about it that, really, there's nothing you can do about it and it's a terrible problem and that is so big in comparison of magnitude of what you want him to do, which is maybe wipe his shoes before he walks in the house, that anything you say is stupid. Do you get how this could work the other way?

And he has this same attitude toward other people that the whole family would have had toward Aunt Isabel at that particular moment. He just sort of looks at them apathetically. They're talking in another world about another subject that has no bearing on any reality. Something on the order of "Come to dinner," "Let us go to the show," "The car has run out of gas" – anything that you want to say to such a person, no matter how immediate it is, maybe he's standing in the rain, you know, and you say, "Well, let's walk over and get under the porch."

The suggestion you have made is as silly, you see – it's as silly as Aunt Isabel having to have the table polished. And sometimes you can get these things in some kind of an order of magnitude in an attitude and you can see how some people do that or see how people react. And such people react to everything in life this way. Everything in life that comes up, such as you ought to go out and get a job so that you can earn money so that people can eat, you see.

And they are crippled in this tremendously overwhelming problem of some kind or another and their immediate response is saying, "Oh, well, you go. It doesn't matter really, you know. Eat? What?"

What you see is an apparent apathy. Actually, the person in actual apathy is really not in apathy at all. He's just apathetic toward everything. He himself is in a fantastic foment. He's in agony, but his attitude demonstrates one of apathy.

And when people have problems of such magnitude that nothing could possibly solve them and everything is trivial compared to them, then they give this response of never doing anything, never communicating, never acting, never solving any problems and they kind of go along and they just hope it'll all somehow work out – somehow. But they couldn't say how. But, of course, none of that has any influence on this tremendous, overwhelming problem which they have. The odd part of it is, is they don't know what the tremendous overwhelming problem is. They can't articulate that either.

And you get the state of mind of people who are stumbling around in life. And the ineffective – where you see a person being terribly ineffective about existence and so on – they've got some state of mind like this. They are not easily and calmly in an apathetic serenity. No, no. They – volcanoes going off would be a better order of magnitude to describe how they feel about things.
So that if you ask them to take their attention off these tremendous problems, they
know they're going to get et up. So they have no attention to spare you, see. And they know
that if they get their attention off of this thing or if they get handled a little bit roughly or if
they get twisted around or they get an ARC break or if something is wrong with the session,
they know what's going to happen to them – their attention is going to shift and the whole
world is going to fall in on them.

There is some tremendous problem that's about to eat them up. And you've asked them
to shift their attention too hard or too fast and it is painful; it's extremely painful.

All right. You get a person who is in this state of mind. They can't spare you very
much attention for auditing and you get the rudiments in and they can spare you a little bit
more attention. And you run something that's effective, it illuminates their case immediately,
directly on the heading of a problem, see. Like, well, "What was unknown about that prob-
lem?" is what you're going to run. And now you're going to assess the confusion before the
change.

All right. All of these things are right what they're stuck in. They're very meaningful.
They – your assessment will put them right there where they can put their attention. They
know you are with them. They know they're being audited because they know where their
attention ought to be. And their attention can be there comfortably, if you've done a good job
of assessment, you have found where their attention is stuck, on what problem their attention
is stuck. And having found on what problem their attention is stuck, you then can go ahead
and audit them. But they pay very little attention to your auditing unless you follow some of
this stuff.

So you get your rudiments in. Make sure that the environment is as dressed up as it
can be. Then, to handle one of these bad-off cases – I mean, a case that is having trouble, is
getting no advance; not necessarily bad off, but it just isn't getting advance in auditing – and
then handle problems and confusions within this illuminative fashion as given in this Prob-
lems Intensive. What immediately is going to happen?

Well, the individual's attention is being traced right where his attention is. The reason
he can't doing anyth- do anything effective with your auditing command is his attention is all
tied up on something else. Only what little attention he has left in present time is either tied
up on something else also or trying to find out what his attention is tied up on. And he very
often thinks that his attention is tied up on something in his environment. So he's quite restive.
He's quite nervous.

Now, almost any pc is difficult to audit. If you think pcs are easy to audit, you'd better
change your mind because you're looking at the wrong standard and you'll never as-is the
situation. Pcs are never quiet to audit unless they're in total catatonic apathy. Pcs do things
about auditing. Sometimes they are a good response, sometimes they are a bad response, but
pcs respond to auditing. And if you think that when you audit, nothing ought to be there re-
sponding, then you should change your ideas about auditing because something ought to be
responding. And if you don't get any response at all from a pc, you start worrying.

If there's no change being registered in the pc, you start worrying like mad. The pc is
just sitting there and the pc is just answering the auditing question. "Yes. Well, how have you
endured a poker in a king's eye or something, you know. And how have you not endured it or something. And how has a king endured a poker in your eye? You see."

And the pc is saying, "Well, I've endured it so on and so on and so on and so on and so on. And so on and so on and so on." And you say another question and he says so on and so on and so on. And you say another question. He says so on and so on. Another question, and he says so on and so on. And it just goes on like that, hour after hour! Well, your rudiments aren't just out, they're in the next county! [laughter] There is something really wrong, because there's no change occurring.

Actually, to audit a pc in that line, you are in violation of the Auditor's Code. You're in direct violation of it, which says you audit a pc – audit a process as long as it produces change.

Well, what's change? Well, change is registration or action on the E-Meter. But where a pc has tremendously heavy problems, these problems are of very, very long duration. And all you're getting, ordinarily, are harmonics on the main problem and you've got to cut him back to the main problem.

He'll get there eventually. Sometimes he gets there, splang! and almost blows himself all over the ceiling. The first time you ask a certain proportion of cases – I don't know what that proportion will be – you put him in Model Session; you've got their Problems Intensive all done right up to the point of the first assessment. You put them in-session. You assess it. And you ask them a question, "Now, what problem existed immediately before that change with – ?" you know, whatever the occurrence was.

"Eyaaaooor" And with a pale scream, his brains practically spatter all over the ceiling. You're going to get that every now and then. Pcs' going to look at you with some horror. He gonna flinch. They're always glad to find out. Sometimes you're going to turn on wild somatics. And they're awful, awful glad to have them. "Oh, that's what turns on these somatics," they say. "Oh, you'll – that's what this is worried about. Yes, the whole back of my head is off. Ha, I can feel it, you know. It's missing except for the horrible, excruciating pain that is going through the middle of my head. So that's what's been turning that on."

You know? Whatever it was. They got the problem, they didn't hardly hear themselves speaking, you know. And all of a sudden a terrific cognition.

You'll also get a totally different response. You have to take the top of it off so lightly that they give you, "Well, what was the problem that existed before that change about buying sugar? So let's see. I guess it was how much sugar to buy. Ohhh."

I'm afraid I would follow that through at once with, "What was the confusion that existed just before that change of buying sugar?"

"Well, trying to figure out how much sugar to buy."

I would say, "Thank you very much," and go back and do a right assessment this time. That's just a total miss. But sometimes the pc is so worried about it that he can't confront it, that he can't differentiate it and you'll get a lot of little, tiny problems. And your first few runs
on this thing will be little, tiny, microscopic problems that he guesses he must have had. That's as close as he can get to this area, you see. He guesses he must have had them.

Now you ask him, "Well, now, how did you arrive at that?"

"Well, I just figure it must have been so."

And you say, "Was it so? Did you really have that problem? What was the problem you really did have there?"

"Oh, well, I really wouldn't know what problem I had. Actually, I could just guess at what problem a person in that particular circumstances might have had. You see, there was a change. I bought a new car and I just guess that a person who was buying a new car, he would have to have – he would have to have some kind of an idea that he wanted to buy a new car. So I guess his problem would be what kind of a new car to buy. Yeah, that must have been it."

You're going to run into that one, too. And that's about as profitless as swapping pounds for Chinese taels. This is totally profitless. What are you going to do about a situation like that? Well, handle what he gives you if he can't get any better. Handle what he gives you. Do another assessment. See if you can come closer to it or take it up. It might really have been a problem. Maybe that's just the way he talks while he's having the problem.

But in the presence of tremendous problems you get a freeze of time. Time is – doesn't exist. Time just doesn't exist in a problem. It's just something that goes on and on and on. How else would you account for the fact that people still have problems they had several thousand years ago? And you start tracing back one of these problems and the common run, when you hit the jackpot on one of these questions, the common run is saying, "Well, yes, and I – so on."

"What was unknown about it?"

"Well, the color of the ladies' hats."

And out of curiosity, you say, "What ladies' hats? You got a picture there or something," so on.

"Oh, yes, I got a picture here."

"Well, what kind of hats are they?" Thinking, you know, you got something in the seventeenth century, you know, something like that.

"Well, it's these – these priestess ostrich hats."

"Oh, yeah. Oh, where is that? You got any idea about it?"

"Well, priestess ostrich hats, you see, that was on the planet Zimbo, and so forth. And there it was and so on. And we all had that problem there. Everybody had the problem." The funny part of it is there was nothing unknown about the problem on the planet Zimbo. Everything was known because everybody knew what the problem was. Everybody knew you had this problem. No, there wasn't any unknowns about the problem at all. Man, have you hit the part of the track where the problem was the know.
You know? You see, a problem itself can become the total knowingness. Can you think of any problems that are in that category? The problem itself is the total knowingness? Let me mention something to you. And of course, there are no unknowns about the problem because everybody knows the problem.

Well, those things run way back along the track. And in the normal course of running, if you were to ask a person on the next line, "All right. What confusion occurred just before that problem?"

"Well, everybody in disagreement about buying new hats on the planet Zimbo. Yeah, there was a hell of a confusion."

Well, that isn't what we're trying to straighten out with a Problems Intensive. No, you've got to ask before that change, and your change has got to be very specific and you must have your rudiments in some kind of shape at the time you ask that next question, because it's another assessment, only it's just in a verbal assessment, you know.

You say, "What – what confusion existed just before that change?"

"Oh, well, oh, oooh, yes, well, no. That was eight years before that. No. No. Tha – tha – . Yeah. That – yup – confusion and so forth." And now you're going to go off onto a list of persons.

Now, to get any kind of thinkingness on this subject at all – you see, it's a species of assessment, so you had certainly better have your rudiments in some kind of shape. So when you're sorting out pcs, do the rudiments, do something of this, do the end rudiments, give them a break. Do the – do the rudiments, do something about it, you know, do the end rudiments, give them a break. And you'll find out if you're handling particularly wild cases that have been stalled, you'll really get places – even though the person appears to sit perfectly happily in that chair hour after hour and say, "Well, I guess I'd put out a king's eye. Yeah, well, the king had put out my eye. Yes, that's right. Yeah. Let's see. Other people would put out the king's eye. Yeah, that's right, and so forth."

And he's – evidently going on like this and you're fooled; you're fooled. Actually the person is just frantic and they're sort of given up and they're sort of asking it anyhow, even though it doesn't do any good. See? That's their basic auditing response. Well, you can queer that pitch by short-sessioning them.

Well, I didn't mean to overlabor the point, but I'm trying to give you some kind of design of the thing and what happens.

Now, the problem floats, but the confusion didn't. So it's the confusion that got them oriented. The confusion won't float. That confusion you're asking for, that occurred, and then you nailed it down to a specific dramatis personae: Mama, Papa, Aunt Agnes, Uncle Bill, the schoolteacher, George and, of course, Mamie. Now when you start security checking that area of the track, it's a sort of a "Hey, son. You've really got to confront this. This one you've got to confront." Because it nails an area of track and therefore that isn't going to float anyplace. It's going to stay right where it is. It's going to have an immediate and direct influence on present time.
You very often will have a pc who is escaping present time by being in the past. And you make a mistake sometimes when you're auditing a pc by believing that the pc would audit better on his terminals line. And you could just skip rudiments or any problems he's having in this life and just skip those things because it's much more significant and you could undercut it much better if you went back on the line. No, the pc is back on the line because it's safer and one of the symptoms of that is the pc who never gets a picture. Pictures are dangerous. Well, when did they become dangerous? You trace it back and you find out a pc had some pictures at one time and then in auditing something happened.

On the special course which is occurring right at this moment in Los Angeles, they have responded with enormous enthusiasm to these new rudiments. And one person, one student on the course, they were just getting the rudiments in, ran into the ARC break process and promptly and instantly had his pictures turn on for the first time in six years. They had turned off during an auditing session. They'd been off ever since and all of a sudden they had turned on, on that process. They were good and bright and clear and he was sailing beautifully. Everybody is quite happy on that course, apparently. But there is an example. There is an example of response to getting a rudiment in.

All right. How about just getting the rudiments in on somebody that never had any processing before? Well, you'd be surprised how much there is to get in on the person and what you're doing is showing him that life is solvable, life is solvable, life is solvable. It's solvable at these little finite points.

Now, it's a characteristic of a pc who is in apathy, that he's got to solve it all at once. That's a characteristic of a pc in apathy. That if he's going to solve it at all, it's got to be solved all at once, now. You very often, working in a Central Organization or running a great many pcs, will have a pc who has got to have it solved by this afternoon or they are going to die; that's going to perish the lot. Got to be done by this afternoon. Their case has got to be resolved is what I'm saying, you see, by this afternoon. And that is a symptom of the most severe apathy backed by a terrific fraticness and sometimes you'll move this little gauze of apathy off and you'll expose some of this fraticness and then they all of a sudden have got to solve all the problem, right now. They won't do an available auditing command. They will take the auditing command you give them, which is the available command and then they will make it into a right now command. This command has to resolve their whole case by one answer. Well, why is that? That's because the whole track has collapsed. The fact that problems are timeless and problems join to problems and it all makes a sort of a timeless strata, also makes a very explosive strata. And of course, anything that is that explosive about which they would worry that much, of course, has to be solved as explosively as that.

They have a look at it the way sometimes soldiers or something like that – they're trying to fix something and they're all standing around trying to fix this thing, you know, and all of a sudden, one will haul out a gun and shoot hell out of it. Or they'll kick it or they'll throw it away, you know. It's just got to be a huuugh! It's giving them trouble so, boy, are they going to give it trouble, you know. It's just a straight Q and A. Nothing to do with solving the thing. It has to do with "we must have a desperate solution by which to get rid of it all at once, now". And of course, we know "all at once now," "get rid of it" is going to add up exclusively to just one point: we don't get rid of it; we get rid of the pc, if we had such a thing.
Every once in a while we look for one button that just on – when I say one button, it is often interpreted as one command given in one unit of time, one expression and that one expression is very explosive. You see that, we just give one command, not repetitively, just one order to the pc. We say, scarooooow, see. And the pc goes Boom! Rrrrrrr – goes Clear. [laughter] Have you seen this around? Do you recognize some of this? All right.

Now, that becomes necessary to the degree that the pc can't. If a pc can't do any of the little things, he then in desperation will have to do one of the big ones and all auditing is done by gradients. All auditing is done by gradients. And it depends on this kind of thing, successful auditing: It depends on reaching a reality the pc can tolerate. It's getting to a picture the pc can see – that the pc can see at this moment of time in the auditing session. It's not what the pc should be willing to see or ought to be able to see. It's what the pc can do and what they really can do are little gradients.

You could possibly confront building a house if you thought of it in terms – I mean yourself, with your own paws. You could probably confront it on the basis of the fact that, well, you could work on it a half an hour every Saturday. That'd seem all right, you know. You could go out and scrape some mortar and bricks together and cut a little grass and so forth. That would seem all right.

I'm sure that you could confront building a fairly large house, if you thought you could do it at a half an hour every Saturday. You can afford that much time, don't you see? And it wouldn't take too much exertion and the amount of bricks and things you'd have to carry, you see – you certainly could carry them for half an hour and you start adding it up, that'd seem pretty reasonable to some people.

Other people, you say, "All right. Now, building a house from scratch ..." And the person gets the idea of "Well, building a house from scratch – uhm – oh, look why can't you just put it all there right now? You know? Why do we have to go through all of this – this you know, nonsensy little steps and all of these doodle-dads and so on and so on and construction of things and building things. Why can't we just say house, you know, and there it appears."

Well, they're on a lower harmonic of OT, you see. But the reason why they say that – the reason why they say that – should be of interest to you, an auditor. It's because they can't confront spending a half an hour every Saturday. That'd be too much. Oh, brother.

Now, we have to carve that down and we have to get something that is real and we will eventually achieve it on the basis, "Well, what is it that if every year we go out and move one brick one half an inch, could you tolerate that much action toward building a house?"

You see, it carves down from the gotta-be-here-right-now – you actually carve it down, you find out the pc has a reality of this.

Take money. There are a lot of guys running around – I know some of them personally, that are running around on the subject of money the like of which I never heard of. Their wives and they are just in some kind of a wild mess on the subject. Because they've got to have a million dollars or a million pounds now, see. There isn't even time for it to be carried in the door sack by sack, see. It's got to be now. And every idea and plan they get, you see, and that is to say, "Well, you see, if we took the North Pole and connected it with the South Pole and put a subway between them and charged the penguins eighteen-million dollars a
penguin for using the subway and so forth, why, then our profit on the matter would be so-and-so."

And you'll find them sitting around with some highly impractical stupidity of this particular character and you know, they just seem to sit back in their chairs further and elevate their feet higher and smoke more slowly. But these structures that are going to happen right now and the amount of money that has got to be made by tomorrow, you see, keeps increasing.

All right. We take such a person and we say how much money could you have? "Oh, millions" is the first response. "Millions. I could just have millions and millions and millions of dollars." Read it on the E-Meter. You start taking it down million by million and try to find the reality of how much money they could actually have. And the first thing you know, you meet the other side of the circle which is how much money they really can't have. And you'll find out that it is two cents or a farthing or that nobody makes a coin quite small enough. And that's the amount of money they could really have and they could really have that. And if you gave them that much money, they would know they had some money. But they think in terms of millions. All the time, you see, it's got to be millions and millions. They get poorer and poorer and poorer, you see. But they – the only money would be millions. It's very interesting.

I'm only bringing that up – just one point. I'm trying to show you something about a case. The case that has got to have the total change now, the case which makes no change now, are almost the same case. Now, the case that just sits there apathetically knows that there cannot be a big enough change or a big enough effect right now to solve his problems, so he's given up on the idea of millions. He's given up on the idea of the huge explosion. He's given up that anything is going to happen at all. He's cancelled all this out and he's on a lower rung than that. He can't have a change because there is no change tiny enough, until you figure out what it is.

Well now, how does he get into that state? Well, he got into that state by having problems that were so overwhelming that he must keep his attention on them all the time. And he knows nothing could be done about them, but they're terribly important. But you have to do something about them, but there's nothing can be done about them, so that everything else that's going on in life is trivia, including your auditing command.

Your auditing command has nothing to do with his problems – nothing to do with his problems unless you have the exact problem. If you've got the exact problem, your auditing command will have something to do with his case. If you've got the exact confusion which made him get that problem, your auditing commands will have something to do with his case.

But up to the point of that, even though you can find his goal, even though you can find his terminal, even though you can do other things to him, even though you can run processes of one kind or another on him, you couldn't find a gradient tiny enough for him to do.

The case, actually, cannot do any of your processes except find the problem he is stuck in because he – but you're not finding any problem. You get the misnomer here. He's sitting looking at it, so all you have to do is just kind of shake it. You don't have to put him back on the track because he's there. You don't have to move him around. You are not moving the pc anyplace. You're just trying to find out what's the pc looking at and the whole of this Prob-
problems Intensive is just dedicated to that. Where is this pc stuck? And what problem is this pc overwhelmed with?

Now, the trick is, is he doesn't know or they wouldn't be. He can tell you, then, a lot of problems glibly. But a proper assessment on this thing does give you exactly what his attention is on and an improper assessment will give some offbeat. So that's why he gives you such "I figure-figure" problems sometimes.

You say, "What problem existed immediately before that change?"

"Well, I – it must have been, I guess ... Well, one could say ..."

"Now, how are you – how are you getting that now? How are you figuring that out?"

"Oh, well, it just seems to me that a person in that condition would ordinarily have this type of problem."

You haven't got it, because he's asking from what he conceives to be a different time band and the first clue to any of this is, the problem is the time band of the pc. It is the moment in time of the pc and he wouldn't be saying, "a person who would have had a problem like that way back then, so on and so on." Because he isn't way back then. He is in the problem he is in, and he's in no other problem. And you will find him sitting square in the problems, if your assessment is done properly. And if your rudiments are in, your assessment will get done properly.

You haven't got any difficulties if your rudiments are in. And if you keep your rudiments in, your assessments and questions and that sort of thing will, perforce, fall right out in your lap, because you've said the one magic question that attracts his attention instantly to where his attention is. And then he conceives that to be instantly now and when you hit this phenomenon exactly right on the button, the pc's attention is not being dragged off of anything.

You never drag his attention off of something to the problem. Well, he doesn't have a present time problem. He doesn't have an ARC break. He doesn't have an immediate withhold. The room is all right. The session is in progress.

All right. You're already eliminating anything that might get his attention off of this problem and you've got his attention not in-session, but on problem.

And now you say, "What problem existed immediately before buying sugar in 1948? What problem existed immediately before that?"

And if you've done it very smoothly, his attention will be sitting right there and he just goes off brrrrrrrrr, there it is, see. And you will very often get an "Oh, my God." Now, you don't get a "What do you know." It's much more heartfelt expression.

Now, a pc who is ARC breaking while you're trying to do a Goals Terminal Assessment is ARC breaking or getting apathetic because you're taking his attention off of what his attention should be on and it is violating his idea of what's safe. The only thing that is safe is to keep his attention on this problem. That is safe and nothing else is safe. So you're trying to drag his attention off of the problem and he knows that's not safe, so he's flying back in your teeth. So he's ARC breaking. He's flying off this way. He's making extravagant statements to
you. He is upset. He is caving in one way or the other. He is upset! Now, exactly how does he get upset?

Well, he moves his attention just *huh-huh-huh-huh*. You're asking him something now. "What goal would you like to – if you think that you had when you were a small child? What goals you had?"

He's saying, "Huh – huh – huh. Do I dare look? Let's see. Let's see, all right. Oh, well, it's safe enough. When I was a small child, let's see, I had a goal of playing with trains. Yes, I had a goal of playing with trains." And he knows he's doing something pretty adventurous. What is he doing? He's actually putting his attention on a different part of the time track and he knows that's not safe. But he is doing it, for your sake. And if you've got the rudiments very heavily in and they're very well in and he's very smoothed down and he's lots of confidence in the auditor, you can do this. You can actually get his attention off of his main problems and get an assessment and it all runs off and he doesn't get ARC broke hardly at all. And everything is fine. And you wind up – and you've got his goal. And you've got his terminal. And you can actually do it. And it's a good thing to have because all of a sudden he feels swell about it. He feels fine. Marvelous, he's got his goal and terminal – can still have his attention on this problem. He got away with something, you see. That's great.

Now as we start running him level by level, however, we start getting into something else. He's got to keep his attention on the auditor, and he's got to keep his attention on this terminal. And he's got to keep his attention on and do the auditing command. And that is just too damn much mental doingness.

He goes, then, by hidden standards. He resigns from the auditing session. Runs it all on a circuit. He tries to get by with it. He vias the auditing command so that he can still put his attention properly on the problem. And boy, does he ARC break.

He ARC breaks and he gets upset, or he's just apathetic and just grinds – which is a level below ARC breaking.

A pc who just sits there and grinds is very often not up to getting ARC broke. Remember that. [in an apathetic tone of voice:] "Well, I see, you got – I guess you could put out a king's eye with a poker. And a king could put out your eye with a – with a – with an order. And somebody else could put out a king's eye with a – I guess uh – uh – uh – put out a king's eye with a ... I've forgotten the auditing command; what was it? Oh, how could you put out the king's eye? Well, you could put out a king's eye with a ... oh, just put it out; just put it out. That's all. Just put it out. Yeah. Just put it out. That's it. Yeah, well, thank you very much for the session." [laughter]

You watch that when pcs – they don't even have to run in that tone of voice. It's just grind, grind, grind, you see, nothing occurring, nothing much changing on the case. Ah, pc has got his attention on some horrendous problem of some kind or another, and so he gives you this little attention over here which is monotone. And any time a thetan's attention is monotone on the lower ranges of the Tone Scale, you can just bet your bottom kropotnik that the most of his attention is absorbed in some tremendous problem that if he looked at it squarely and if it looked at him squarely and it was all solved, the whole universe would blow up.
Attention is all absorbed over here because that's not a natural action. One of the things that speeds up my auditing of pcs and that sort of thing is because I look at them and I see them drifty-eyed and dreamy and so forth and drifting off and getting apathetic and they're grinding and I say very forthrightly, I say, "All right now. What are you looking at? What are you doing? What are you thinking about? What are you worried about? Where's this going? And where's the ARC break? And how – when did the havingness start to go down? And what is this and what are you looking at? And what are you worried about? And oh, well, that's what it is. All right. Now you can tell me. It's okay." And after five or ten minutes of pleading with them, they will get their attention off of the problem enough to actually say what it is. See, because that requires an effort, too. See, it'd be too much effort to say what the problem is, so it's kind of all operates as a withhold. You see how a pc would act?

Every time you have an ARC breaky pc, you would – you have violated to some degree fixation of attention on problems. It isn't just fixation of attention; you have violated his fixation of attention on problems. You've asked him to do something he doesn't consider safe. It is not your auditing he is finding fault with. He is actually, merely finding fault with having his attention shifted.

And when a person is in this condition, you have to work like mad to make sure that you keep his attention centered where it is centered and not shifted around. So therefore, a Problems Intensive is just about the hottest thing you can do with a case because there's where his attention is sitting.

But now what we've done is add up a way of getting backtrack problems, not present time problems. We're getting backtrack problems which slide up and become present time problems of long duration.

But we're getting the problems which underlie the hidden standards and then we're getting the prior confusions which made the hidden standards and the problems necessary.

In other words, we're turning loose machine guns, howitzers, hedgehogs and a few atom bombs loose on this same problem. But all of it can be turned loose because his attention is right where his attention is. His attention is right there anyhow, I mean, so you haven't asked him to shift his attention and he'll run a Problems Intensive like a lamb whereby he'd blow up in your face and explode all over half the universe if you did anything else. You see?

Therefore, it looks like very calm, safe, productive auditing – which it is, of course – but it looks like, well, it looks like anybody could do it. It gives that very definite appearance, you know. Well, anybody could do this. It's rather a sloppy process, rather wide and so on. It actually isn't a sloppy process. It actually isn't wide at all. You're just being assisted like mad in running it by the fact that you're running the pc only where the pc's attention is obsessively fixed and you never ask him to move his attention very much. The only attention you're asking him to do is just improve his attention so that he can feel confident and not have to worry about sitting there in session. He can go ahead and worry about his problem all he wants to. And you'll find out you don't have ARC breaky pcs if you bust in on cases to this wise.

Now, we do need a Problems Intensive that covers the whole track, that doesn't just devote itself to one lifetime. Whether I will ever dream one of those things up or figure out a way to do that and so on is neither here nor there. You have this one now. Be happy with that.
I would like to say one more thing. I've done a lot of talking here which may or may not have assisted you. It may – might not be meaningful to what you are doing. But auditors blame themselves because of ARC breaky pcs. They think they must be doing something wrong. There is some self-blame of some kind or another attached and pcs blame themselves because they ARC break. So that if you can get a certainty as an auditor on exactly why a session goes wrong, if you can see the exact mechanism and its exact magnitude, if you can see exactly where a session is detouring and why a session detours just in terms of a person's attention is on a fixated problem of such magnitude, his attention is on this problem to such a degree, it must be on it because of the tremendous importance of the problem, that he doesn't dare have any other attention for anything so that anything else that disturbs him causes him to go into – through this phenomena you know as an ARC break and the only thing you have done is disturb his attention.

But let me make one more comment on that which I think you will find of great interest. You very often – as this Problems Intensive will eventually demonstrate to you in running it on a pc – you very often have been running pcs with present time problems without recognizing any part of it. And very often a pc has, unknowingly to himself and unreceivedly by you, stated to you many times his problem. He has stated many, many times his problem and you have never heard it as a problem. You never hear it as a problem; you go ahead and solve it. And yet he has told you this problem over and over. And he ARC breaks when you're auditing him. And he gets upset and so on. And yet he's actually telling you the problem in one way or another over and over and over.

It is actually quite vocal. It's quite out loud. You're hearing it with both ears, but it's not going any deeper than the drum. It's fantastic. A problem is a problem. It is what the pc is worried about. That's what a problem is or it's the problem of unresolvable long-parked timelessness of conflicting forces which the pc can't do anything about or which is – he feels he ought to do something about or somebody else ought to do something about, but it's a big problem. And he will sit there in the auditing chair very often and tell you over and over and over again his present time problem of long duration and you never hear it.

And when you're running this Problems Intensive, you're very often going to have a pc come up and give you something and something is going to go, if you've been auditing before this, you say – go clink! "Now, wait a minute. This pc's been saying this all the time." Well, don't feel silly. Don't feel silly about it. You're going to run into problems that pcs have talked about and talked about and talked about. Because you've never recognized them as problems, usually on the basis that everybody has them or something of that sort. I wouldn't actually – shouldn't actually generalize any further than that, but I will give you a classic example of a problem that went on for a very, very long time and actually neither the auditor nor preclear in this particular instance recognized it as a problem.

The problem was how the pc could get some auditing and the auditor always solved it by giving him some. Only, it was totally goofy because the pc was basically worried about whether or not he could be audited! That was the problem. Was he auditable at all? And the auditor always just audited him to show him that he could have some auditing.
And they went on for a long time with the problem and solving the problem and it interrup-
ted every session and it upset every session and it went on for the longest kind of a
time. Why would it go on this long? Well, that's just basically and flatly and positively the
auditor never recognized that any problem is a problem and there aren't certain problems that
become solvable targets. There aren't certain problems you should solve and certain problems
you should run.

I'm sure that nearly all of you at some – if you'll think it over, there are certain prob-
lems that you feel should be solved, not should be run. The pc has these problems and he
doesn't recognize they are his problems and then you do something about the problem as a
problem.

Now, we go reductio ad absurdum. The pc says, "I am hungry." You say immediately,"That is a problem," and so instead of feeding him, why, you give him a big rundown on it.
Well, what you've missed at this particular point, you see, is it isn't a problem with the pc of
long duration or anything else. He's going through a repetitive cycle and he long since has
become totally submerged into the mishmash of this universe, so he no longer considers any
of these things problems. It isn't a problem. He gets hungry every few hours, and that's just
the way it is, you see. It's not a real problem to the pc, so of course you wouldn't take it up as
a problem. You'd tell him, "Well, go on. Have something to eat."

But there are other ones. They're much more definite like this. They're much more
positive. Is there's the fellow with a problem of, well, "Can auditors audit?" You know, he's
an Instructor in an Academy and he's been teaching a lot of auditors and he – something of
that sort and he sits there and, "Well, do you have any problems?" and so forth and he, well,
pling! you know. "What problem was that?"

"Well, I was having a little problem with the students and so forth," and about the
third session that you get a pling! and he's having a little bit of a problem with the students,
why, you'd better get busy, you know?

He's got a problem. He's got a present time problem. What is this present time prob-
lem? And you start searching it out. You find out by this time that it's with these – with stu-
dents. Well, all right.

And, "What is this problem with students? Now phrase this problem with students. What
is this problem with students? Now, all right, how would you describe that? All right.
State that as a problem. All right. Give me another version of it. Now, what is this problem?"

And all of a sudden the fellow says, "Ooooooh, well, can – can – the problem, actu-
ally, is not with students."

"Well, what is it with?"

"Well, it's why I became an Instructor."

"Well, why did you become an Instructor?"

"Well, I became an Instructor because I wanted to find out if people could audit. And I
don't think they can, you know. And uh – it's – it's – the problem is how to get audited by
people that I know can't audit – including you." [laughter]
You get the idea? So you very often take the matter-of-fact problem that you think is just – you should just go right ahead and solve and it's actually right in there. It's a real present time problem. It's a real, honest-to-goodness, dyed-in-the-wool, got-bronze-stars-on-it present time problem. There it is.

And if you say, "This is ordinary. This is usual. This is natural. This is like eating, so therefore, we don't have to take it up." Well, I'll call something to your attention: A problem on the subject of Scientology is of the order of magnitude of a withhold on the subject of Scientology.

Now, you've seen a withhold stop a case cold, haven't you? Have you ever seen a withhold stop a case cold? Do you have any reality on that at all? Hm?

Audience: Yes.

All right. Now can you imagine a present time problem on the subject of Scientology stopping a case cold? Right?

Well, that doesn't mean that you should pay attention to every present time problem the pc has, just making eight sessions out of it or something like that. But watch this pc and if he starts coming up with problems about Scientology, then for heaven sakes get it stated, measured, so forth. "Have you got a present time problem?" Cling! And it's something about Scientology and so forth, give it the same order of magnitude that you'd give a withhold on the subject of Scientology.

And this fellow says, "Well, I got a withhold. I didn't phone my boss from the country club be – and tell him I was not coming back to work on Monday. I had a withhold from him."

You know, that's the bing you get. Well, man, you could run the case weeks with that withhold and nothing would have happened.

"Well, I made an appointment to be audited yesterday and then I didn't keep it." Now, try to get over that one. Because the withhold is on the subject with which the pc is dealing at the instant he's being audited. So, therefore, the auditing itself and the presence of the subject matter itself are a restimulator to the withhold or to the problem and everything you are doing is a restimulator to the withhold or the problem.

He can forget about his boss; his boss isn't here. But he can't forget about Scientology; he's being run on it. So you give present time problems on the subject of Scientology the same order of magnitude you'd give withholds on the subject of Scientology.

When you're assigning somebody to do a Security Check, always assign the last two pages of Sec Check Form 3. The last two pages. You'll find, there, they outweigh all of the earlier pages. If there's anything wrong there, it'll just park the case in its tracks. Well, similarly a problem. And because you're an auditor and the pc says, "I have a problem about auditors. I just don't ever seem to have an auditor, to have a problem." Get him to state it, for heaven sakes.

Don't solve it by being a better auditor than he's had before. Get the idea? Because you're running a pc who has a continuous, constant present time problem and the case will
behave just like a case with a present time problem. And it will ARC break and it will get very upset and it will blow all over the place and it will be very critical of the auditor and it will do all of these things. Why? You're running a case with a present time problem. How did you miss it? Well, you ran a case with a present time problem and missed it because the present time problem is something you're solving. That's the most usual course of human events.

You don't look at the problem the pc's got because you are doing the solution to it. The solution to it is right in his hand. So, therefore, there is no particular reason to handle as a problem.

The problem I just discussed with you just a moment ago was in existence for eleven years before it was contacted. Now, smile over that one if you want to. It was in existence for eleven years.

Could the person ever get any auditing? That was the problem and it was eleven years before it was suddenly detected. The pc, of course, had never gotten any auditing in all those years, because he was being audited over a present time problem of could he ever have any auditing during those eleven years. How do you like that? Interesting, isn't it?

So a present time problem – and the only thing I will give you is a passing note on all of this Problems Intensive – a present time problem in rudiments, a present time problem in the produ- in the Problems Intensive is not what the auditor would like to think a problem is; it is what the problem is to the pc and what the pc thinks the problem is and what is a problem to the pc.

Whether the auditor is solving it or not solving it or what he's doing about the problem or how intimate the problem is to an auditing session or any of these considerations have nothing to do with it. A problem is simply a problem and it is a problem to the pc. If it is a problem, it is a problem to the pc. It may be a problem to you but not a problem to the pc, you see. It's "What's the problem to the pc?"

The problem is yours. Every time you give him an auditing command, he coughs in your face. No problem to the pc. [laughter] You could keep – you keep running him, you know. You keep running him on "What part of that cough could you be responsible for?" Doesn't do anything for the cough because it isn't a problem to the pc. And you can't solve problems for a pc who doesn't have them as problems.

I know I've said something that sounds terribly obvious, but it's true. You can't run and solve and clear problems to – in a pc if they're not problems to the pc. It sounds an awful obvious statement, but very often auditors have made up their minds what's a problem to the pc, dive in immediately, run that because that's a good, hot, juicy problem and it's the fact that the auditor – the auditor misses the fact that the reason he doesn't like – well, there is something about coughing. He always has a problem about coughing.

What is it? Well, it's how to wash pocket handkerchiefs.

"Well, it – what about coughing?"
"Oh, there isn't anything about coughing. It's handkerchiefs, though. My poor mother, you know. You know, she might have had to have gone out and taken in washing to support us children."

"Well, what's the problem here?"

"Well, there isn't any problem."

"All right. Do you have a present time problem?"

No, he doesn't have a present time problem. Skip it! See, no matter while it should look to you dramatically that the thing ought to be the problem, the problem is what registers on the meter and what is a problem with the pc. And a problem is what it is no matter how idiotic you think it is.

See, don't edit problems, because you can miss problems. And problems that have directly to do with auditing have more weight on the case in slowing it down than any other type of problem. Just like withholds that had to do with Scientology have more stoppage value on a case than any other type of withhold. Okay?

Well, I hope some of this information about how you do a Problems Intensive is valuable to you. I see that you are sailing into them now and you will be doing them left and right and I think a lot of fur is going to fly and you'll probably have lots of questions to ask about it next week.

In the meanwhile, thank you very much.
Problems Intensive Procedures

A lecture given on 17 October 1961

[Part missing]

How are you?

Audience: Okay. Fine.

Okay. This is the 17th of October 1961, and boy, are you in for it. I hate that sadistic look. Actually, one life I – whole life I spent as a pirate I've resented ever since and I take it out on bad auditing. Bad auditing restimulates this life of piracy. Because that's what it is; it's just butchery. And there's just no sense in it. There's no sense in bad auditing.

To show you how bad it can get, when Saint Hillers go back for the first time into an area, the few who have left here, they've given demonstrations and they've found interesting things like this: The whole crowd they demonstrated to, all professional auditors, saw for the first time a null needle on an E-Meter. It's kind of a bitter criticism, isn't it. And the statement uniformly is made by somebody leaving here and going back to some area, "Well, Scientology has just never been done."

All right. You can dream up all sorts of fancy processes and you can find out what's wrong with the mind and you can search deeper into it and turn it all upside down, but if this never gets applied by the most elementary basics, what have you got left? You got wogs. That's all you got. Because nothing, no good, no wonderful process, no good and excellent analysis, no diagnosis, no expert textbook, seventeen libraries of tapes and all the rest of it are not going to make anybody well if Scientology is not applied.

Nothing is going to do it unless an auditor is going to do it. And there you have it. And an auditor has to do certain basic, definite things and he has to know these things very, very well. First and foremost of these things, he's got to get his TRs down, particularly TR 0. And then he's got to know what an E-Meter is all about. And then he's got to know how to Security Check.

Well, if he's gotten that far – if he's gotten that far, he's going to get results; and if he hasn't gotten that far, he isn't going to get any results. So this is the exact distance we're trying to pull up every auditor in the world just now. We're just trying to pull him up that exact distance. And that is a cornerstone on which we can build. That any results at all have been gotten around the world attest to my hopeful essays in ability, certainty, understanding, affinity and the other basics. Oh, that's a bitter statement, isn't it.

That's invalidative, but I've never invalidated before to this magnitude. But I keep getting these reports back from people who have left here. Now, I haven't really straight up, vis-a-vis trained anybody for a very long time. And now that I've started doing it again just here
at Saint Hill, in spite of the fact that I don't sit there and hold your hand every session, I'm to a marked degree looking over your shoulder. And Mary Sue is looking down your throat.

Now, to be able to do a good assessment on Routine 3, and so forth, is like asking most of the auditors of the world to build the fifteenth floor of a building before they have any cornerstone in the place at all. Let's build the fifteenth floor and let's have it float. On what foundation? The foundation on which it floats is a tremendously accurate ability to do the TRs, an excellent command of E-Meter and E-Meter phenomenon, an excellent command of Model Session, and a horrendous ability to security check. Now, if you've got those things, then – then we'll have something on which to build. But without those things, we have nothing on which to build.

I know now why characters like Mathison could go on and sell 18-dial, 14-gauge, short-circuit-through-the-pc E-Meters. They were just window dressing. Nobody thought they worked. And nobody thought they did anything. So, of course, you could sell anything.

No, an E-Meter is a very precision instrument, and when you can make an E-Meter talk, you can make a pc talk. But you have to know how to make an E-Meter talk first.

Now, there are other methods that have been used in the past to make pcs talk, such as my career as a space pirate. I recall one incident vividly. I was part of another unit. I wasn't being a pirate that life. I play hooky every once in a while and go out and get active. I'm a great believer in activity.

I go between being very active and being very scholarly, and I'm afraid the – there are burn spots on most planets where I've sacked towns while being active or have prevented people from sacking towns; same final result, you see?

And alongside of that sort of staggered things to confound students in the libraries. Yes, I've been a perfect example of the Aristotelian Pendulum. Don't ever go in for any half-way measures. Either be very active or very scholarly. No, no, no middle ground, no middle grounds.

And in this particular incident, a space pirate came aboard this merchant ship, and in order to make them talk to find out the destination and where the gold was going to be picked up, took a crowbar and pried the spine out of one of the crew members. It sounds like a rather exaggerated activity, doesn't it? I thought it was exaggerated myself as we told him.

The Inquisition – the Inquisition used to warm people's toes at the stake and pack their chest and mouth area in ice so that they wouldn't burn and die too quickly. Well, that was after the fact they couldn't make them talk, don't you see? And if you'll find out, most torture comes and most punishment comes after all media to persuade communication to exist has failed. Brutality is after the fact of communication. Brutality follows failed communication. Overts are always to be found in the wake of no communication.

For instance, there's a ruddy alleged British vice-consul sitting in a town in Spain just now who is sitting on a couple of suitcases of ours. And what are we going to do about these suitcases? Well, he refuses to answer any communication of any kind whatsoever. We shamed him into giving us one letter by taking some pesetas we had and pinning them to a self-addressed airmail envelope and sending it down to him. And he wrote back some entheta.
You know? It was some bad news he'd had from some other quarter but didn't mention these suitcases. See, all he's got to do is call up a steamship company, tell them to come over and get the suitcases and take them on the next boat, you see? Very simple. But he won't communicate.

Now what frame of mind do you think people get into after a while on something like that? I'm just showing you a tiny, little, present time piece of nonsense, you see?

Well, the immediate idea is to get the British consul at Vigo to go up and give him a good swift kick where it will do a lot of good, you see? Or write the foreign office and tell the fellow he's in league with the Russians, you know? [laughter] Of course, he probably isn't too honest or he would dare say something. But he evidently doesn't dare talk.

Failed communication always carries in its wake punishment. It's why you get mad at a pc. There's something the pc won't say, and you can't seem to find the means to make him say it. He's sitting on some type of a withhold or a noncommunication or something of the sort and he just won't communicate.

The pc says, "Well, my mother beat me and she used to lock me in the closet every day and then she wouldn't give me any dinner. She never bought me any clothes, and very often threw me down the coal chute. Every time we went for a ride on a streetcar, she threw me under the wheels, and I was killed."

Along about this time you suspect there is some sort of a withhold about Mother. And you're tired of this violin solo because it's not by Stravinsky, and so you ask this fellow if he has a withhold from his mother or a withhold about his mother. And you get no response of any kind whatsoever.

"No, I was good to her. I was always good as gold, and I always smiled every time she threw me under the streetcar and killed me."

You say (depending upon your immediate antecedents) a word of a few letters. [laughter] The auditor's ARC breaks down at this point.

Now, if all of this is true – that it's after communication fails that brutality begins – then any of an auditor's overts against a pc or any of his impatiences against a pc, must perforce arise by the auditor's own failure to make the pc sing – must so result. Doesn't that look fairly obvious to you?

Bad auditing follows failed auditing. You very often pick up somebody in a co-audit, you sit him down, have him just chatter repetitively some sort of a phrase at a pc, and the pc gets wonderful results, and everybody is happy.

Of course, the Instructor had to be there and everybody had to be there and somebody had to fix up the place and somebody had to put him in the chair and somebody had to hold the pc still. Well, beside that, there wasn't any failure involved and there's no brutality involved, and you'll find this (quote) auditor (unquote) loves the pc like a brother. And everything is going to happen for the best in this best of all possible worlds.

And then we put him on the Academy course and we fail to teach him how to run an E-Meter and we fail to teach him how to run Model Session and we fail to teach him any of...
the TRs and we fail to show him how you can make a pc talk. And he runs into his first pc or
two, and they don't talk. So we've eventually got an auditor who is going chop, chop, chop,
chop. And there is no "love thy neighbor" there anymore. Why?

The auditor did not learn the tools of his trade, so he instinctively falls back on tools of
former trades.

Now, even the inquisitor, as he walked in in his blood-encrusted robe and said to the
prisoner, "All is up, bud," in Spanish, German, French or hog Latin. He would still say,
"Now, if you will just confess and say that..." I don't know. What god were they worshipping?
Molech, Baal – no, no, that's – that's – I'm off the trail there. Some other planet. Anyway,
whoever they happened to have dreamed up at the moment. "If you'll just confess that he is a
trio consisting of Mama, Papa, Baby (or something like that)." [laughter] "If you will just say
this – if you'll just say this and give your soul and sin into the hands of, I don't know, the chief
goat or something like this, why, we'll let you off. We'll let you off, and that will be it. We'll
just execute you quietly or we'll...we'll let you go to prison, or something like this. We won't
do anything very vicious to you." And that's all you've got to say.

Of course, the reason I'm gagging that up is because, of course, the same gag has hap-
pened over and over, religion after religion, planet after planet, trillennia after trillennia. It
just happens to be in your history books that there's the Father, Son and the Holy Ghost.

Well, this is just modern parlance, and you'll notice it's gone up scale to a condition,
see? It used to probably be the rock, the tree and the plow or something, you know? Probably
more solid.

Now, let's look that over. He still is trying to make somebody talk, and when that fel-
low fails to do so, he takes him out, puts him in a red robe – or a yellow robe it was – puts
"heretic" or something on his chest in Chinese characters, and puts him out there and ties him
up to the stake, and puts some dry ice on his chest, if that's available from the local space op-
era club, and burns him. But he won't say it. He just won't say it.

That isn't a response of some cruel monster. The inquisitor is not a monster. He's just a
failed thetan. He's just a living being. He's got mixed up in some effort to make everything
come out right in the social dynamics – he thinks. He's trying to do a job.

And the net result is that he does a brutal job because he has no methodology to get
any information or to get anything figured out. He has no methodology. So therefore, an audi-
tor who is not trained in the basics of Scientology is somebody who has no methodology. And
you can absolutely count on the fact that as the decades march along, Scientology would go
exactly the same route of the Spanish Inquisition. And any Central Organization or group of
Scientologists anywhere in the world will move directly and immediately over into the same
frame of mind with regard to pcs and the society and their job and everything else, if they
themselves do not know that they have basic tools that make people talk. It is so simple.

You do not pull an overt when you badly process a pc. That is not much of an overt.
Yes, it makes you a knucklehead, and he's unhappy with it and all that sort of thing, but you
have not killed all of his chances. His chances are not all up the spout. Maybe next year,
maybe next life, he'll get processed, you see?
Maybe somebody will open the gates yet. No, the overt is bad dissemination because if you disseminate badly you head Scientology toward a brutality, and you make it impossible for this fellow next year or next life to have somebody open the gates.

Bad dissemination slams them shut and locks them forevermore. Now, the gates are well open at this particular stage, but they will not stay open unless the technologies of the application of Scientology are well practiced and well understood. That you can count on.

Now, I didn't mean that to turn into much of a sermon, but I'm dead in earnest about it.

Now, new students coming in here have a tendency to go on living at their same rate of speed. And we have introduced a new and shocking state of affairs. A person can audit, obviously, to the degree that he can command his tools. Certainly, that's true. The more I know about the mind, the more I know about my tools, the better I can audit, myself. So why shouldn't it follow true elsewhere?

There are about seventy-eight items on a student checksheet here. Seventy-eight items. If you passed one examination on one of those items every week, it would take you seventy-eight weeks. Oh, you aren't here that long. But if you passed one examination a day, one examination a day, you could probably make it. So that's what I want you to do. One examination passed – passed, not taken – passed per day.

"Oh," you say, "it's impossible." Well, you're in good company. Scientology is impossible. Nobody could have dreamed up Scientology; that's the impossibility. So if the impossibility is also nobody could learn it at that rate of speed, all right, so it's merely impossible. One exam per day. One bulletin per day. One tape per day. Whatever that checksheet item is. One per day. And you'll find your auditing skill will rise.

But it is fundamental that you have to get out of the road your TRs, your Model Session. That's very fundamental. Your E-Meter. Very fundamental. And how to security check. Because, listen, if you can't security check, you will never be able to make a pc talk. It isn't that security checking is looking for all the evils of his life, but how could you even find out if he has an ARC break if you can't security check.

After all, isn't it a Security Check situation? You're asking this fellow who doesn't want to talk, "Why are you not wanting to talk?" And find out whether he wants to or not want to because he's liable to sit there in some kind of a social chatter with you. And maybe you could look in your crystal ball or between his ears or be three feet back of his head and ascertain his exact state of vibration at this particular aura. Maybe you can do this. But it seems just a little bit odd that we should have to since I point out to you that people have also been able to do this for the last couple of hundred trillion years and we didn't have Scientology and we didn't have well people.

So don't buck against the E-Meter and its ability to pick up information because your inability to get information from the pc is what drives you down first into not asking for any information from the pc and then drives you into a vicious frame of mind about pcs, and then will drive you eventually into not wanting to audit any pcs at all.

Now, it's an oddity that the auditor who has withholds will not ask for withholds. So if an auditor has withholds and then on top of that can't get information from the pc and doesn't
know how to go about getting information from the pc and doesn't know how to sort this out and can't make any sense out of what he is doing – he of course will wind up eventually not auditing, won't he?

And any auditor who at this instant is not auditing is not auditing because he didn't know his business, or at the time he was auditing, the business was not well enough understood. And he is not capable of using direct tools. He has lost confidence that he can obtain the information necessary to resolve the case. He's lost his confidence in this.

Now, I'm looking at a couple of students right now that came down here because there is a Scientologist sick someplace, and they want to get the newest and best and go back and do something for this fellow.

Oh, yeah, but this fellow has had a lot of processing by this auditor and that auditor around about the place. Why hasn't he suddenly recovered? Because I tell you there's nothing wrong with him at all but he's got an area of withhold. And that's everything that is wrong with him. I could find it and knock it out in minutes. But so could any trained auditor who knows his tools.

There is no reason under the sun, no reason at all why Scientology should fail in anybody's hands at this stage, at this precise instant on its developmental track except if he doesn't know his business. Now, he could fail if he didn't know his business.

But you have just had placed in your hands a Problems Intensive. Oh, surely the form will be rewritten and will probably be rewritten again. It will probably be in the process of rewrite ten years from now, but it's a useful form just as it exists right now. And it will simply be rewritten and rewritten only to the degree that auditors goof with it. And the only reason it'll be rewritten is to add another line or something saying, "Do not ever assess Section A," you know? "Assess O.", you know? Something like that. I'm shaking this Problems Intensive form down. I'm shaking the form down. We know exactly, exactly at this instant, what the stack-up is in current lifetime that puts a pc out of action.

One can go in on this with such accuracy as to practically stand anyone's hair on end. And a new person, dragged off the street and given a Problems Intensive, her hair will stand on end because we not only have the tools of how to get information, but we also have this other thing: we know exactly what information to get. Because the anatomy of the current lifetime's confusions, failures and upsets is clearly laid out before us.

It is one of these idiotic maps, once it is drawn, of how to get to the house next door. I mean, it's that simple a map. There is nothing very complicated about this map. Exactly how you follow the map depends once more upon these basic tools which I have enumerated.

There are tools secondary to these tools which you will find it very useful to have around, such as the Auditor's Code. Recently, a Central Organization got ahold of somebody who was an epileptic. Person didn't say they were an epileptic. Nobody spotted they were an epileptic. Nobody spotted the fact the person had been on drugs and had knocked it off the day before processing. You know, after a year or so on drugs, you all of a sudden don't take drugs. All of these goofs, you see? But if they had followed the Auditor's Code, they still would not have come to grief.
We have never had anybody go spinnny – oh, this person is all bailed out and is all straight or will be – but we've never had anybody go spinnny under processing unless they've had usually a change of auditors or they weren't eating or they weren't getting any sleep. Those are part of the Auditor's Code. I haven't actually seen a good example of this for years because people follow it very, very well usually.

And sure enough this pc, because she was off of sedation, was getting no sleep and, having been on sedation, was not hungry and wasn't eating. I don't know how the change of auditors set up, but it probably was all awry, too. And the person spun.

So it's a good thing to know the secondary tools of one's trade, such as the Auditor's Code. It is secondary, but it is a tool of the trade. And you can spin people if you don't know it.

There are a lot of people around, for instance, that invalidate like mad while saying, "Never invalidate a pc's data."

You know, they invalidate, and then you say, "Well, all right, you're invalidating."

And they say, "Oh, no, I'm not."

And you say, "What is invalidation?"

They misinterpreted what invalidation is. They don't know what invalidation is. They don't know what evaluation is, so they disobeyed points of the Auditor's Code, so the next step comes up. It's a good thing to understand the tools of the trade in addition to being able to use them. And understanding of those tools is quite valuable.

What is evaluation? What is invalidation?

I had an old-time auditor suddenly blink one day and say, "By George, I do evaluate." Had never realized it before. It was on questions, and this auditor was asking questions something on the order of "Do you still beat your wife?" They were unanswerable questions. The question could not, of course, be answered by the pc. So it was accusative. It accused the pc of beating his wife. That was of course evaluative, invalidative, all in one fell swoop.

No, I explained the pc had to have an out. The pc had to have an out. That is to say you can't say, "Do you still beat your wife?" You have to say, "Have you ever beaten your wife?" And he can still say no. Don't you see?

So you can actually write up security questions that are completely off base. "How long have you been a dope addict?" you ask the pc out of the blue. Just out of the blue, you see? He's just sitting there, you're running down the list, and you say, "How long have you been a dope addict?" There's no out. He can't say, "No, I've never been a dope addict," without going out of agreement with the auditor, and so forth. And that is both invalidative and evaluative – both things in one. The auditor is saying, in essence, "You're a dope addict," you see? And he's also invalidating the pc to the degree of saying "You mustn't answer this 'No.'" But it's more of an evaluation than otherwise.

So in writing up security questions and so forth, you have to know about such things as invalidation and evaluation, and more importantly, know what they are. What is invalida-
tion? What is evaluation? What are these shuns that you must shun? But these are basically elementary tools.

All right. Now we front up to another one of these elementary tools when we front up to the form of a Problems Intensive. This form is one of the oldest forms of Scientology, oddly enough. This form was first dreamed up in Elizabeth, New Jersey, in 1950. Found out that auditors knew nothing about pcs that they were auditing, so therefore, it was an awfully good idea to find out something about the pc, so this basic form was written up, and that was it. And this is almost the form. The early form was very close to it. I think that earliest form was used to make up this form.

Now, where you have an early form that comes through, it must have had some usefulness. There must have been some use all the way through. Right? Something that lasts this long. Well, so therefore, knowing something about your pc is valuable. Knowing something about your pc is valuable.

You can get into all sorts of messes knowing nothing about a pc. Well, it's just like a Central Organization. They never bothered to ask the pc, "Miss, have you ever been sick?" You know? "Have you ever been well? Have you ever been sick?" "Have you ever been?" And went ahead and audited the pc without ever finding out any information about the pc. Adventurous activity. Fortunately, it only happens once in a long while, but there it is.

Now, that was what this form originally set up to cure. Just that; no more. And we found it of value to know where the secondaries on the case lay. That's why you have Mother's death and Father's death and other deaths.

That's why those deaths are there. Because they tell you the most fruitful source of secondaries.

Frankly, if you run any one of those points as an engram, if the pc is capable of running an engram, if you know how to run an engram, if that is the engram to run on the case – all of those things providing – you'll spill considerable grief charge. And you open up a lot of track. Very often around a death like that you just get a total close in.

All right. We go into these various things, these various sections. They are simply an effort to find out something about your pc. Now, of course, a pc will always answer questions of that character, and if those sections I've already covered with you in another lecture, an individual going on down the line will run into some of these things and rather be unwilling to give you the dope; and after that will be out of session on you and you will be in a perilous state of nowhere with the pc.

A great many pcs have secret illnesses. A great many pcs have had mental treatment of some kind or another. A great many pcs have compulsions and fears that they don't want you to find out about.

As long as you have a social mores built around "One must be social" in some fashion – there are actually thousands of such mores – as long as you have those things, people will violate them. And when they violate them, they go out of communication with the group. And when they go out of communication with the group, then they're out of communication with
groups. And an auditor-pc relationship is a group. So therefore, you've got to raise their group consciousness before you get an auditor-pc relationship. Auditor and pc form a group.

So therefore, some of these sections are pulled with an eye on the needle. You put your eye on the needle, and you get all there is to know on that particular thing. Not operations. Who cares? Who cares how many operations they've had.

You say, "How many operations have you had in your life?"

"Well," the fellow says, "I had tonsillectomy, and I had a tooth operation once, and I had a uh – uh – had a uh – uh – hernia and so forth. Let's see if there are any more."

I say, "Good. Fine. Thank you. Now, what is your present physical condition?"

His operation denotes nothing. You don't know who made up whose mind that who had to have an operation, you see? That is not the type of change or anything that you care to have much to do with at this particular angle because you can throw him into the incident. You can throw him right down into the incident. So it wouldn't do any good to plunge him into a series of engrams, would it? So there isn't any point in plunging him into engrams.

You take accidents, operations, dust it off lightly. Just very lightly. Skip it.

I know if you're from Iowa or something like that, you'll have to restrain yourself because that's the sole source of social conversation. But dust it off lightly.

And then we get into this thing: physical condition. What's wrong with the pc? What is wrong with the pc? Oh, well, the pc has a couple of social diseases. Oh. And if this is a withhold, it becomes a circuit. Ho-hoooo. And the pc will never answer an auditing command as long as you audit him. The auditing command is always addressed to something or other which is addressed to something or other which is scheduled to cure this thing he hasn't told you about.

All societies set themselves up to be ill. No society is any exception to that, because as soon as you get together a huge mores of thou-shalt-not's, you of course get the two phenomena of withhold and make guilty. And people will use them to make other people guilty. And people will withhold them and make other people withhold them. And it throws the people out of communication with the people and therefore you get no as-ising of those conditions and so all civilizations grow ill and die, whether they are Egyptian or Greek or Roman or British or American. They all become ill from their own mores because they bring with them the attendant phenomena of withholds and make-guilties. Whenever you have a mores as the sole method of being civilized, you will have decay and death.

Now, Scientology is the first track area that has ever been which could form a mores which did not result in destruction. But it can only do this if Scientologists know their business. It would inevitably sicken and die the moment that nobody could make anybody talk. Then they could only make people guilty.

You see, if you can't as-is sin and if you can't wipe away sin, then you can only repress sin. However you look at it, that is the only way civilizations have had of handling sin. "Thou shalt not kill." "Thou shalt not butter thy brother's wife." Didn't matter how idiotic or stupid or odd it was. The thou shalt-not's were their method of holding it all in line.
And they never noticed that to the degree that the thou-shalt-not's were enforced, the society sickened; the more punishment was administered to criminals, the more crime eventually took place. Direct ratio. Punishing criminals: just making people guilty of. After some criminal has been punished, of course, everybody else who was guilty of the crime is supposed to be restrained from committing it again because of the punishment. Well, it's a short-term activity; it's very short-term and it does have a workability. A very crude workability, but it does have a workability.

Now, someone could debate alongside of me on this subject – some character back along the track or something like that who was fond of oratory could debate along this line and could prove to you absolutely and conclusively that civilization, any civilization, owed its becoming a civilization totally to the mechanism of making people guilty and making people withhold their crimes and sins. He could prove this conclusively as long as he was arguing from the basis that man is evil. If he was arguing from that basis, he could prove it conclusively. But remember to examine his premise. And his premise is "man is evil."

Now, you have to process somebody and find out that they are nicer people before you suddenly realize that "man is basically evil" is not a proper premise on which to base an argument. But man has uniformly used this premise and therefore has not thought any other method of civilization was possible. Obviously, if man is basically evil, what you have to do is punish man. That's the only thing that you could do with a man. If man was evil, you have to punish him. There couldn't be any other mechanism because if you freed him, he'd become more evil.

You will find that in trying to disseminate Scientology. You will find people horrified: "You mean actually erase this man's sexual repressions? Well, what is he going to do now about his sexual morality?" Oh, I think most sexual morality is based upon not getting any fun out of sex. Immorality is based on an anxiety to get fun out of sex or an anxiety to create a new generation. There's worry mixed up in all of these sexual abnormalities.

Somebody who can experience sex or doesn't have to, of course, would not then be immoral. But you get into all kinds of debates. And you can get into many philosophic debates about civilization, punishment, make guilty, evil, sin – all of these things – you can get into a lot of these debates. But you have to watch this one point: The premise on which the person is arguing – is that demonstrated? Is the premise proven? And of course, you can knock all such arguments apart merely by pulling the rug out from underneath the premise. There's nothing sillier than a premise sitting on its "blank" on a bare floor.

Now, if you look over argumentation, you'll find you can always win the argument by pulling somebody's premises out from underneath him. But you've got lots of examples. You have demonstration which is quite interesting.

A person is spreading entheta, chopping up, nattering, raising hell, leaving – leading a very unhappy life and is actually committing sins which are recognizable sins of one character or another through life.

All right. You process this person; this person stops doing it and becomes more effective. All right. When you've watched that yourself and when you yourself have seen this with your own two eyes, then you will be able to conclude from your own experience that when
you free man from his inhibitions, he becomes better. That you could prove positively. And then you could surmise, then, from that, that basically, if you let man's nature be demonstrated, and if you see his nature demonstrated and find it good, then you have to make up your mind that man is basically good, not basically evil.

This flies in the teeth of almost every Christian premise there is, by the way. You can get into some very, very nasty arguments on this subject because the concept of the original sin is the whole basis of Christianity. But I'm not leading you out into debates. I'm just showing you where this is and where it sits.

Oh, it's quite interesting. A preclear of whom you have some information – Quentin; he's a very, very little fellow; pint-size pc. He had five weeks of auditing at about thirty-five minutes a day, five days a week. Now, add it up, whatever it is. He's seven years old. Found his goal, found his terminal and ran his levels, and did a child Security Check.

That was what was done during that period of time. Needle is so loose now that the tone arm wobbles. He is very close to Clear. The next sprint of processing he will get, which is two or three months up the line, he will undoubtedly go Clear because he's proceeding that rapidly.

But it is quite amazing to have a polite little boy who is very active. [laughter] This is one of the oddest combinations I have ever seen, you see? He's extremely polite and very active. He's now able to run about twice as fast as he could before and he can yell twice as loud. [laughter] And he's about five times as polite. It's kind of fantastic. You wouldn't realize this when you saw him running around shouting, particularly, but if you had a conversation with him – even you – I think you'd find that he was very polite. Well, you see, that's just happened. He wasn't very polite before.

All right. Now, there's an example. There's an example. Now, what happened there exactly; what precisely happened? Actually, he became freer. He no longer has an odd feeling of being pushed around and being enturbulated. He described it to his mother, shaking his shoulders, as one of the results of his processing, that he no longer felt – just shook his shoulders and that – back and forth and grimaced, you see? He had no word to describe it. But that was evidently the way he had felt before.

Now, there's what we mean by freedom. Of course, you wouldn't think in seven years that a man could accumulate much crime. [laughter] Well, it's very interesting the tininesses of the crimes, you know? Hit his sister, you know, little things. Made a big difference. When you see that, you will see then the workability of this. The freeing of the person brings about a goodness. The person becomes more pleasant to others, and so forth. It's quite interesting. So that you can see to that degree a group restoring itself and you can see a vitality. You can see a greater motion, a greater action.

And where an individual has drawn out of earlier groups, they then become accordingly difficult to process in the group called auditor-pc and similarly hard to get along with in the group called Scientology. That's about all there is to it. If they've withdrawn, you see, to too great an extent from some recent group to which they have belonged, you'll get withholds, and so forth.
You try to make a psychologist into a Scientologist and – I mean a real, honest to God, dyed-in-the-wool, sat-in-class-for-six-years-and-learned-nothing psychologist. I beg your pardon. They did learn something. They learned the parts of the brain. I don't know what that had anything to do with it. I'm talking about a real, honest to goodness, supertrained psychologist.

All right. He comes over. You put him in the Academy. Oh, man, wow! We had one in Washington. And I think it took her three or four weeks to get through a Comm Course, and she was really trying. She was really trying. And everything it took a normal student a week or two to get over, she was taking five or six weeks to get through. Her rate of study was something on the order of about four times the amount of time consumed for the same absorbed datum. Slow!

She was not stupid. She simply was a renegade from a group. And nobody had run out the "renegadity," see? [laughter] Because the person was now a failed group member, they didn't make a good group member, you see? And that mostly applies not to past groups, but it applies to more recent groups. That is to say it's most forceful right here in this lifetime.

You'll find it showing up in former lives and affecting the pc. Of course, that is the basis of it, but you will find out that you can't even get him in-session if he's messed up with groups in this lifetime. So if you get too much withdrawal from groups and so forth... So therefore, processing against the mores of groups is quite interesting. It – well, it rather forecasts a Security Check for a college student, a Security Check for a high-school student, a Security Check for a basic student in earlier forms, a family Security Check, so on.

If you were to just take a Security Check for each group that the person had been part of and then gradually patched them up so that they actually could again be a member of that group, you'd all of a sudden find them going into session, bang! you see? They go into session very easily. Their rudiments would go out very slightly.

And some day you'll be picking up psychologists. After all, they had the goal of healing people before they got mixed up in black magic. And the psychiatrist similarly, the medical doctor, and so forth. Just remember that this fellow, when he moves over into Scientology, is a renegade. And as a renegade, of course, he has overts and withholds from the group he has just "renegaded." So you had better – you better pay attention to that. It isn't what has he done to Scientology that is bothering him. It's what he has just done to medicine. That's what would get him in, you see?

No matter how idiotic this group sounds to you, it is worth investigating on the basis of a Security Check in order to get somebody in-session.

You know, it could have been the Girl Scouts or it could have been anything, you know? Suba-hooba-hooba. Well, they probably believed in it while they were doing it. Didn't get them anywhere; that's why they left it. But they're still a person who has been part of a mores, see, and certain things were guilty and certain things were make-guilty and certain things should – had to be withheld, and so forth.

And frankly, you have to be quite clever to do some of these because you have to figure out what is the mores of the group they have departed from. For instance, what's the mo-
res of a medical doctor? I don't think it has very much to do with social mores, but it certainly is a mores that is a mores. "Never give the patient an even break." I don't know if that's part of it. "Never sit down to dinner with your fellow doctors without discussing the gruesome points of the last operation so as to condition them."

"Have you ever failed to try to condition one of your fellow doctors so that he would be able to better practice his profession?" You'd get a knock on it.

Yeah, well, the fellow went to dinner one time and didn't bring up a single bloody operation. You know? It might be a breach of mores, you know? Well, what the mores of the group is, is what the mores of the group is.

And when you realize that there is no crime on the face of the Earth – there is no crime on the face of the Earth – that isn't somewhere else on the face of Earth a virtue. You'll realize that there's differences. There are pretty wild differences from group to group.

Now, when you start coming down this line, you will be able to spot groups that the person has been a part of. Present physical condition. Well, he said, "I was in the army and ..." we don't care what else he says. He was in the army. Ooooh!

Now as you go through processing this case, you've got a lot of processing bait here. It says "army." Army. Right there under present physical condition. Well, of course, we picked up "army" someplace else probably, but we might not have, too.

Well, his present physical condition – when he was in the army, he got pretty tired and actually was hospitalized for a while, but is better now. That's interesting. That's interesting all by itself. Now, you're going to get it later over here on O, but as you go down the line later on when you run this thing, and when you've run O two or three times and found the areas that you ought to get off the case, you would be very clever to go back over the whole form and find out if there are any more possible changes in there that he gave you on the rest of the form that you are now beautifully missing on O and add them to O. And just include them in your next assessments.

Well, his physical condition is much better now than when it was in the army. What army? What is the mores of an army? Later on you are going to have to realize that when you're cooking up a Security Check. He's going to mention a sergeant. Well, I don't know. What is proper mores for private soldiers about sergeants? It hasn't anything to do with obey the sergeant; be nice to the sergeant. It has nothing to do with that. He almost lost out in the whole military field. As a matter of fact, out at target practice, he never really used to be able to go up on the firing line with any degree of confidence. Why?

Well, he had a withhold from his other privates. He'd laughed at a sergeant's joke. [laughter] It's all right to laugh at a captain's joke, but not a sergeant's.

There's various types of mores, Lord knows. And then it's of importance what army he was in. Zulu army would conduct itself quite differently. And in addition to that, you'd find out, I think, that the Algerian rebel army conducts itself quite differently.

I know the Chinese armies conducted themselves very differently. A withhold from a Chinese general would be something like he did engage in a battle once. That showed he was
very decayed, and he's never told any other – anybody else about it. Or he thought of actually joining a battle. He thought of doing this. Of course, Chinese generals never do. What you do is maneuver. They used to in the old days – they used to maneuver until the enemy was at a disadvantage, and then the general who had the other fellow at the disadvantage then made bids for his rifles – for the men's rifles, and bought them at something on the order of ten maces per rifle or something like this. And that was the way the war ended.

In 1914-18, I think you would have found the soldiery involved in 1914-18 – I think you would have found them very, very pleasantly disposed toward that particular idea because the prevailing idea then was to take the generals of both sides, put them in an arena with clubs and let them fight it out. And you know, I don't know that at 14-18 it wouldn't have settled just as much. I don't know that it wouldn't have settled it much better.

You look back on wars, you know, after you've been in there pitching and trying to prevent this or save the world for Rooseveltism or something like this, you know? You look back on these things and you begin to, you know, say, "Well, I don't know. This is the way it is now, and we don't seem to have saved anything," you know? Usually can be depended on to give you a lose.

But mores depend on groups. And the more data you get such as interests and hobbies, his criminal record (group of a prison), compulsions, repressions, fears. These might tell you all sorts of groups of various kinds. You're getting future bait for putting together a Security Check, so you want to shake those things down with an E-Meter.

Furthermore, they could operate as a withhold from you. And in view of that fact, they could knock you out as a group, you see?

Now, as previous Scientology processing, you usually require four, five, six, eight, ten pages if you had it one by one and so forth. So we're not terribly interested in long dissertations on it. All we want is an estimate because we're not trying to run an ARC break here. We're not trying to patch up former processing. We just want to get some idea on how long this character has been around and more or less where has he been processed and how much just vaguely.

You're going to get all of that in the ARC break process anyhow, you see? Now, his present processing goes – we couldn't care less about that. But his life-turning points and so forth – O. And now here's where I get into a frame of mind where I speak to you the way I have spoken to you early in this lecture, sadly, urgently, disappointedly. Look, nobody – nobody – could do this form wrong. It isn't possible. You have to try.

So let's go over the points which we have caught. And these points are simply these: "List briefly". What is the word briefly? How do we list briefly? What does the word briefly means? Well, briefly, translated through ancient Anglo-Saxon means two words! No more.

Now, you'll find the pc assesses better if you move his time track around so you get the change. And then you move over in front of the change and put the date in front of it. And if you will make that change, you will find out your assessment has less trouble. Write the date, and then write the incident, the change, briefly: "1955, left Boeing". Totally adequate statement. "1947, tobacco." It's all shorthand. It means something to him. He either gave it up
or took it up or something of the sort, but it means something to him. But if you said, "1947, tobacco," you see, this gets a proper registry. It doesn't mix it up with "1934, tobacco," when he smoked his first cigarette. Get the idea?

You'll find out your assessment goes more rapidly if the date is first. I've been studying what you've been doing and I've come up to these conclusions that you had better be doing it this way and this answers some of your problems. It's not an extraordinary solution. Your next forms that are issued on these things will be written up so that you can't do it any other way than this. You got that now?

All right. Date, then item. Date; item. Now, what is a change? What is a change? What change are we interested in? And don't let me catch you after this exact hour and minute on this particular time track ever listing again in the O Section: "graduated from high school." Don't. Don't ever write it down. Why not? Because it is not a self-determined change.

The fates called the school board decreed it years before that in 19-yumpf-de-yumpf he was going to be graduated from high school. And it gives you no forerunning change. It does not assess. It does not mean anything at all. In 1950, he certainly was going to graduate from high school in 1954. Right? When he went to the university, he certainly graduated from the university. So graduating from the university, from high school, anything else – it is not a self-determined change.

Left the university in the third year – oh, well, now, now, now we've got something here, you see? That's a self-determined change. You say, "How come you left?"

"Well, I just wasn't getting along well, and I decided. And I talked to my father and we decided and ..."

Got it? That's a self-determined change. Understand?

Demobilized from army. Do not ever let me catch you soiling the end of a ball point with that one. Why? Men are demobilized from the army quite without any consultation. That is not a self-determined change of any kind whatsoever. The war is over or the enlistment is up or a time that is predestined and predetermined has now expired or the individual was foolish enough to stand up and bare his breast to the winds of the gunpowder and they couldn't use him anymore.

Well, what are you doing? What are you doing if you write that one down? Oh well, you're just setting it up to assess the times the pc has been a victim. And it will give you a totally different result. And I'm rather horrified to realize that I have to explain this because I will tell you this: that this whole thing can be thrown and its whole effectiveness can be knocked out and all of a Problems Intensive can be knocked in the head by listing other-determined changes.

If you list other-determined changes, what do you get? All you do is actually list Sections A to N all over again. And look, you already listed them. These are occurrences. O is a different kind of occurrence. And I should make this completely clear if you're ever going to make any. O is a different kind of occurrence. It is a self-determined occurrence.
He up and made up 'is mind, he did. For reasons best known to 'im and God that 'e was going to do something else with 'is life. That's what.

And that's what O is. O is not "Had an operation," "Was in an automobile accident and that made a big change in my life. Yes, yes. Well, there's the automobile accident. And you had better put that down. And then one day I was standing on the curb and a bus came by and the conductor hit me over the head and that put me in the hospital. Yeah, that was a big change. That was a big change in my life. And then I graduated from school, and I didn't know what to do with myself. And that was a big change in life. That is for sure a big change in life."

Now, you get these things one after the other, and you assess being run over by a bus, being operated on, being graduated from school, and what do you have? You have a picture of a pawn being moved on the chessboard of life. And there it moves and there it moves and there it was taken by the knight. [laughter] Oh, how sad.

"My career as a victim" is what you're liable to get under O if you don't know the facts of life. And the facts of life are these: What you are looking for – what you are looking for in the times when he made up his mind to change. Why? You're only looking for the solutions to problems. You're not looking for changes in life. He changed in life as the solution to a problem he didn't know he had. And you're never going to find the problems, and you're never going to find the prior confusions if you go ahead and list other-determined changes.

Well, how will you never do it? Well, of course, an operation will rock on the E-Meter. You give a complete list of operations – try it someday. Have somebody say, well – let's have somebody that was – really been hanging around the medicos, you know? There's only one part of one fingernail left of the original body. And here we are, you see, and you list this person's operations. And you say, "Did these make any changes in your life?"

"Oh, yes, made a big change in my life. Changed me from the house to the hospital, and then changed me over to the rest sanitarium. And then I got home. Yeah, that made a big change. And then from the house to the hospital and the rest sanitarium, and the house to the hospital to the rest sanatorium to the house to the hospital to the rest sanitarium ..."

And you assess this. You assess this: "1956, had right foot amputated. 1957, had ear operated on for earisipulus." [laughter] "1958, had torso annexed." [laughter] "1959, had head amputated. 1960, toenails trimmed." [laughter]

And you know what you're going to do? You're going to get some reactions on the needle. There will. [laughter] There'll be reactions on the needle. Because you are listing a list of engrams. You don't want engrams.

You want times when he was walking straight up, apparently his own boss, and he said, "School, thou shalt not anymore house my sacred portals." And so he went, he did. Why?

He was going on a ship from Pernambuco to Liverpool, and it stopped in Bermuda, and although his ticket was paid, he got off. Why? You get the idea? The kind of change. He decided to go. He decided to do something.
And behind each one of these things, you will find a major problem in the hidden confusion. And that is the plot you are trying to solve. So why list anything else but the self-determined change. Have I made that abundantly clear?

All right. Now, in your problem, this is where you had quite a little bit of stumble. We are running Routine 3. Routine 3 selects out the terminal of the case. Now, some tests made recently indicate conclusively, and this changes something, because it's very rare actually I change anything in Scientology, but this changes something.

As long as you weren't running up against goals terminal, and you weren't pushing the person toward a goals terminal or anything like this, you could get away with running terminals, of course. But if you've got a person's goals terminal, you better not run any other terminal except with withholds and overts. O/W can be run on other terminals. You can security check Mama and all that sort of thing, but you sit down to a long grind of "What about that problem with your mother?" "What is unknown about that problem with Father?" It's this sort of thing.

It's Father, Father, Father, Father. Grind, grind, grind, grind. Repetitive process. Repetitive process. And it toughens up the bank. Makes a present time problem too hard to solve. I'm giving you a new datum.

But when you – you can run terminals, and we used to do it, and it's quite well to do it, but when you have the goals terminal of the pc, it doesn't do him any good to run repetitive processes on any other terminal than the goals terminal. You can security check other terminals, you can talk about other terminals, you can move other terminals around, you can find them as parts of prior confusions, but you cannot run repetitive processes on them with any profit.

So you just ups and takes whatever the pc gives you as the problem and you fit "unknown" into it in the simplest, possible fashion and you run it. And you find it'll do no damage whatsoever. As a matter of fact, it is better to do it that way than to run it with a terminal. Sounds strange. Sounds like a volte-vis, but I'm giving you the latest stuff.

Now, rudiments – don't ever assess for a terminal while doing your rudiments. A person says "I have a problem."

"Well, what – what problem do you have?"

"Well, I've got a present time problem." You finally isolate this present time problem. "And I'm having dizzy spells."

Obviously, the process is "What is unknown about dizzy spells?" As easy as that, you know? And the only mistakes you're going to make is get too complicated.

There's one other rule goes along with it...

You don't avoid terminals! Don't get that idea.

It's just – "Well, I just – what was my problem then? Well, I just thought I would go, gee, you know, how to keep from going mad living with my mother another day."
"Well, what is the problem there? Is it how to keep from going mad? The problem living with your mother, and so forth?"

And it finally works out to be "Living with my mother."

"Well, what is unknown about going mad living with your mother?"

Yeah, all right. But it is the most elementary statement you can make of the problem using the most of the pc's phrasing. You know, run the process he gave you.

Now, don't go over into a terminals run under the line of running a problem. "What is unknown about mother?", you see? Ahahaha. No, you're not running the problem. That is not what we want out of life at this stage of the game. We want this problem flattened.

Now, in view of the fact that you're not going to work on it for the next seventy-five hours, it's perfectly all right to run a significance. Oh, yeah, it'll run the pc's havingness down, but it'll only run it down to the degree that you've got the rudiments out.

Pc's havingness goes down to the degree the rudiments are out. That's a stable datum for you, by the way. If you find yourself having to remedy very much havingness for a pc, you know your rudiments are way out.

All right. Now, is there anything else to be known about this problem? Yes. Yes. One more thing that is quite interesting about problems.

Never run a stop. Avoid stills. Avoid stills.

I'll give you a problem that actually came up: "How to stop fighting," came up on a pc's report here. "How to stop fighting."

What is the first consideration there? You say, "What is unknown about stopping fighting?" No. No. The better process is "What is unknown about fighting?" You know? Avoid those stills. Try to keep the still out of your – out of your terminals, your levels, and so forth. Get away from the still.

The Prehav Scale is a doingness scale. And you notice No Motion has now come out of it. So avoid the stills. Don't avoid them in life particularly, but you'll find out that in processing, oddly enough, is what it takes to make the thing move.

Well, how to stop smoking. "What is unknown about smoking" is your problem phrase. "I was worried stiff about staying home, and I thought I would have to stay home the rest of my life and there I would be and that is it." And that is the pc's problem.

Well, as the auditor, that's your problem, too. How are you going to word this thing so that it is not a still?

Do something. "What is unknown about home?" Assess it out on the E-Meter. Find out what you get a bang on, you see?

"What is unknown about not being able to leave?" See? That's right around on the back door, see? Not being able to leave home. Try to avoid the idea that he's stuck in the house. "What is unknown about being stuck in the house?" Well, boy, you're going to be stuck on that process from here on out, see? But sticking in the house won't blow.
Remember that even while you're running the problem, the theory of the prior confusion still operates, and unless you've got movement in the auditing phrases, you see, why, the thing is just going to stick. And you're going to get onto an awful grind. And if you find yourself grinding sometime on a problem, and you keep running "What is unknown (blank, blank, blank) on this problem?" and you go on and on and on and on and nothing's happening. Nothing is happening at all. And it just doesn't seem to be flattening, and there seems to be some tone arm motion, but the thing just doesn't seem to be flattening, and "What are we going to do? What are we going to do?"

I think you'd better go back and look at the phrasing of the problem that you have phrased for the pc, because it's probably got a stick in it, and it's probably doing exactly what it says. And you've probably phrased it something on the order, "What is unknown about Mother not moving?" See, that's great! That's going to run practically forever and get nowhere and wouldn't blow. You see that?

It's just the thing to do. If you find yourself running too long on the problem process or running too long on a rudiments problem process – which comes up all the time, not just in this Problems Intensive – and you find this thing isn't flattening well, look over the thing to see if you've inadvertently included no motion in the auditing command. "What is unknown about your being stopped in life?" Oh, boy, that'd be great, you know? That'd just jam the bank, and it'd just keep going and going and going.

Oh, there is no expert, instant way unless you've got the pc right in front of you to transpose it over into a motion command. You get the pc to state it a couple of times, and hell generally give you a motion version of his problem. Take it quick before he changes his mind.

"How to keep from being stopped in life," don't you see, is not a no motion. See, it still implies action. See, he's still preventing himself from being stopped. Well, the preventing himself from being stopped at least implies action. And that will barely run. You're right on the dividing line there, you see? Right on the dividing line. How to keep from being stopped in life.

Well, it's questionable, you know? But it'll run. "What is unknown about being stopped in life?" Oh, no, no; that won't run. "What is unknown about keeping from being stopped in life?" Oh, that's very clumsy. And you can get a pc, however, phrasing it and ... "Well, you know! How to keep going in life. That's what I'm saying, you see?" he'll explain to you. "How to keep going in life."

You say, [speaks hastily] "Good. Well, then the auditing command, then, will be 'What is unknown about keeping going in life?' That's good. Here we go." And you'll find out it'll work out to the same process.

See, everything goes on the stop and the motion. So in putting these problems together, don't do an assessment, and make sure that you keep it in a motion category. And make sure that it's as close to the pc's problem as you can possibly get.

The best way, if it doesn't include the total stuck in it, is just to use the pc's statement of the problem or use the action verb of the pc's statement of the problem or the noun of the pc's problem.
"Well, how to get over being in France life after lifetime," you see? Maybe this is the problem, you know?

Well, you can avoid that very easily. "What is unknown about France?" See? That gets around the stick. You got the idea? He's got a lot of significance about this thing, but there must be something unknown about it, and you just use the subject matter of the thing and throw it in.

You'll find these problems will run. It requires no great anything, but you do have to know those two points.

Don't assess, and keep sticks out of the phrasing.

All right. Now, as you're running your assessment on the P form – "List persons present in the confusion" – you're going to be doing a Security Check on the assessed person. In other words, you're going to list all the people present and then you're going to do a Security Check on the person who falls the most – the most reaction rather. See? Everybody present in the confusion. What was the confusion immediately before that?

And he, "Oh, well, so-and-so and so-and-so."

"Well, who was present in that?"

"Well, there was Mama, and there was Grandpa, and there was Aunt Bessie, and there was Sister Kate, and uh... Oh, yes, and there was my father, yes. That's it."

You write all these things down, and that's it.

Now you assess this thing out and you find that you get quite a bang on Mother. All right. So you get the withholds from Mother at that time, and you pull these out in any Security Check fashion. And you get him security checked on the subject of Mama. You know, what had he done to her? What is he withholding for – about that thing. And in that period what had he done? And all that sort of thing

And you finish up Mother.

And you come back again, and you say, "All right. Now, with regard to that confusion, was there anybody else present?"

And you nearly will always get the hidden person that is the source of the whole thing. In the hidden area – you see, you got the change. That was the only tag showing, and then you got the problem, and you ran that. And now you assess the person in the confusion which immediately preceded the problem, and just as the confusion was hidden and just as the problem was hidden, so there is a person hidden in that confusion. Ordinarily that person has gone.

So the only thing I want to tell you is add to line 6 – or section 6 of P – add to it. After you've done one Security Check on it, let's find out who else was there in that confusion. Let's find out who else was present. And you're going to get some jim-dandies dropping out of a hamper. They will appear suddenly and mysteriously and the pc has not thought of them for years.
All right. Now, one more thing. There's no need to read the meter while listing O changes. Why would you read a meter on the list that you're going to assess anyway? So you just skip the meter while you're listing changes for O. Just skip it.

Now, don't do section O – A to O in Model Session. It is simply done. You do not get any Model Session until you get to P, and you do Model S-... P in Model Session complete. But no Model Session in A to O, and you don't remedy pc's havingness, and you don't do anything with the pc except pat him on the back and cheer him on. Okay?

Your Model Session starts with section P. Those are the basic things that have shaken out of the hamper. Those are the basic things which so far have shaken out of the hamper that auditors are having difficulty with doing this Problems Intensive.

It's not possible to have difficulties with but some people manage it.

All right. Now, the results coming through on this Problems Intensive are very, very, very, very, very good. They're excellent. They're hitting right on the button. And it's very nice. So if you're not hitting on any button when you do a Problems Intensive, you better call for Mama quick, in a hurry.

What you have done wrong? You have probably made a list of occurrences, have assessed the problem for some terminal that isn't the goals terminal of the pc and are running something else. And it doesn't have anything to do with the case or it's been a misassessment of some kind or another. There's – a wild misassessment can keep you from getting a result with this Problems Intensive. You can do the assessment pretty bad. But I have seen a couple that were completely off, and boy, you talk about there was no problem, there was no prior confusion. There was nothing.

So a misassessment, you say, is never preceded by a problem.

Oh, here's the other test. The person – I did have a test for it – the person sits in present time and surmises what his problem must have been at that time if you have done the wrong assessment. They do that every time. They sit in present time and guess what their problem must have been during that period. If you have done an actual, prompt and proper assessment, if you have the actual changes and you've done an exact assessment and you're dead right, you ask them what the problem is, they could not fail to tell you; it just leaps out of their mouths.

So a test of whether or not you're on the right run is to say to the person – just flatly – you just say to the person, "Well, is this – are you trying to figure out what your problem might have been during that period?"

And the person says, "Yes, I was trying to figure that out."

"Are you trying to figure out what the problems of a college boy would have been?"

"Ah-hah-hah. Well, that's what I'm doing."

And so you say, "Well, let's go back and assess this thing again." See, it's that abrupt an action as you'd take on it. Skip it! Because if you've got the right change and the right zone in his lifetime, you ask, "What is the problem?" you say pointedly, you see?
And he tells you, *Boom!* See? It's an "Oh, my God." Almost a "What do you know" reaction if you've got it right on the button, you see? And it's a "Well, I guess my problems during that period – let's see, what would have been the problems of a young boy at that period? I guess getting dressed, and going to bed in the evening, and so forth, and so forth."

And you say, "Well, I'm going to assess again. Now we're going to ..."

I actually go further than that. I'd look over the list. If I'd done the assessment, I'd know it was fairly right, and I'd know that he just hadn't mentioned a lot of changes in his lifetime. I'd do another O section. If I was getting something that crazy.

If it works, it works. And if it doesn't work, you haven't done a proper list of changes or an assessment. That's all.

Once more, just go back and do the whole thing again. I mean, go back to the beginning of O section, ask if there are any more changes in his lifetime that he himself determined. Find out if you haven't maybe added a lot of other-determined points in it. Correct the thing up as I've been giving you gen about in this thing.

Get it going again, and that time you'll hit it, *Boom!* He'll feel like he's been run into with a sledgehammer if you do it exactly right. A person couldn't have a lifetime without having one of these or he wouldn't be in bad shape. Do you get the idea?

So the person either has one of these or he's Clear. If you don't find it, you haven't done it right. Okay? It's one of these selfproving mechanisms. If there isn't a black cat in the middle of the room, there is no black cat in the middle of the room. It's very simple; very elementary. And if you've done it right, there's the damnedest, biggest black cat in the middle of the room that you've ever heard of.

Okay. Well, I've chewed you out a good bit, and you realize now that there is one slight thing I will have to let you in on. That every day you *don't* pass one of the checksheet points on your checksheet, you owe an hour's auditing. Some of you would drown at that rate, so let's get going.

Thank you. Okay.
Valences, Circuits

A lecture given on 18 October 1961

Yeah, you see, that's all for Mary Sue. That's good. [laughter] That's good.

All right, this is what? The 18th of October, AD 11.

Now today, you are dealing with Problems Intensives, and so forth. And the modus operandi which we are following, very ordinarily, can be considered to be finding somebody's goal; finding somebody's terminal; giving them a Problems Intensive; giving them runs on the Prehav Scale on the found goal; flattening off two, three levels; spotting and assessing some engrams that have been turned up during that period; running those; flattening some more levels on the Prehav Scale; and then probably giving a whole track Problems Intensive; and then flattening off a few more levels on the Prehav Scale. If they're not Clear by that time, run a few more engrams, and then run some more levels.

Now, the truth be told, they had a barnyard one time and they had an election. I thought that would wake you up. [laughter] And they had decided that all animals were equal. And this is perfectly fine, but they had decided all animals were equal and they're having an election, and the pigs were finally elected as chairmans and governors of the barnyard. So, life went on along the barnyard way, very nicely and smoothly and everything was going along fine, except most of the animals began to notice that the bulk of the feed was going into the pig trough. And so they complained about it and were overruled by a point of order. [laughter] And then they noticed that the pig quarters had been moved to the warmest part of the barn. Oh, by this time it got a little bit rough. And finally it got to a point where there wasn't anything to eat anyplace but in the pig trough, so they had a big meeting. And the animals wanted to know why, if all animals were equal and all had equal rights, the pigs should be living in the warmest part of the barn and should be getting practically all the food in the barnyard. So, the pigs had a considerable meeting amongst themselves as an executive committee and finally came up with this conclusion, which they published: that some animals are more equal than others. [laughter]

This thing about equality comes up amongst preclears. Are some thetans tougher than other thetans? Are thetans all of 61.1 grasshopper power, or you see, and so on. That is by the way, an unanswered question. But the basics of the thing are that some people are certainly – all cases are rough, but some cases are more rougher than others. And in this particular wise, all cases will now be found to respond to what we know, but some require more of it than others.
And regardless of the equality of thetans and how some thetans might be equal to some thetans and all thetans are more equal than other thetans – in spite of these problems, which are unanswered – you'll find that all thetans who are here at this time on this particular time track in this universe (you must qualify it in that wise) are suffering from exactly the same levels of aberration.

The difference is magnitude. And that is the only difference. Now, this is an important conclusion because it doesn't give you Kraepelin's – I think it's probably pronounced differently, but I prefer the pronunciation of "Craplins" – Index of Insanity. Now, his Index of Insanity goes on for some pages, and it's all the different kinds of insanity that people have. And it's very interesting, and it was developed many, many decades ago in Germany, and then was exported and arrived almost simultaneously on Park Avenue and Madison Avenue. On Park Avenue it was applied to the rich and on Madison Avenue it was applied to the advertising world.

And they expanded it. And in most insane asylums in America – I prefer that, too. I prefer that derogation of "insane asylums." I think they're insane, don't you? [laughter] And they have expanded this. Believe it or not they've expanded this almost unexpandable list. Well, it begins to look like Kraepelin's list originally was quite simple compared to the list which they now have of the numbers of types of insanity.

Well, these different types are only manifestational. It's how does the basic aberration manifest itself? And that is the only question which is answered by a long classification of types of insanity or aberration. Manifestational – they manifest themselves differently; they are the same aberrations. So you have different manifestations and different orders of magnitude and you have no difference of insanity.

In other words, this is what we have been working for, for some time in Dianetics and Scientology, is to understand all of these various types and responses. But basically, you have the condition of all aberration arising from the same causes, but manifesting itself differently and manifesting itself to greater degrees of magnitude or lesser degrees of magnitude. It's the same thing, you understand, but it can look different and it can be greater or lesser.

And what are these manifestations? Well, we've talked about them for many, many years; there have been many points of address to them. But the reason why we are clearing people, broadly today, and the reason why you can clear people, is because you are taking people out by the same process that they went in. At the beginning of Book One, *Dianetics: Modern Science of Mental Health* – actually its third volume, not its – I think it is – not its first volume; it's the third book of the first book. It says if you can just parallel what the mind is doing, why, you can lick most anything. So you have to parallel what the mind is doing. That's one of the fundamentals.

Actually, the fundamentals with which we operate are expressed in that book. And also many of them, of research, are expressed in *Dianetics: Evolution of a Science*, and *Dianetics: Evolution of a Science*, as a little short essay, is basically more important than it looks, because these are the various indexes which are used in sorting out data, and it's the only place they've ever been expressed. But here today, we have a process in Routine 3 of
becoming aberrated – the process of becoming aberrated. And we, in Routine 3, you see, reverse the process of becoming aberrated.

And it sort of works like this – it does work like this: A thetan, doing and acting in this universe, loses confidence or conviction of his own strength, independence or power. A thetan loses confidence – basically in himself. He loses confidence in his ability to do and to survive. Having lost that confidence, he then assumes an identity which he considers will stand instead of self. He himself goes down into degradation.

Now, what he is overwhelmed by – or what he has overwhelmed consistently – is adopted by him as a full package of behavior, and that stands in lieu of self. And that is a valence. And that's – technical terminology for that is a valence: A valence is a substitute for self taken on after the fact of lost confidence in self.

Now, as a thetan sinks into degradation – lost confidence in self – he goes down into personal oblivion, so that he himself has no further memory of self, but has only memory as a valence. Now having – having taken on this valence, he then carries it on as a mechanism of survival. This is the thing that is surviving. He is doing a life continuum actually of what he has overwhelmed or what has overwhelmed him. This is a valence.

Now, at the point of degradation you will find it backtracking this way: Now, just before he assumed the valence he had a problem concerning his own survival, which he himself could not solve. He could not solve it as himself. Now, just before that problem, there was a tremendous confusion in which, by processes of overt and withholds, he became enturbulated as himself. Usually these overt and withholds were – well, always these overt and withholds were against the various dynamics.

Now, that was the route by which he went in. He missed his way and he had some overt and some withholds, particularly against the mores of the group in which he was operating. And then he lost confidence in himself completely. He felt he couldn't go on as himself, and this gave him some tremendous problem relating to survival. He felt he couldn't solve this problem and he adopted a valence to solve this problem. He adopted an identity he thought would stand as a solution to this problem and then he went on as that identity.

Now, that identity in turn, as the millennia progressed, submerged by the same cycle. As the identity, while a member of a group, the thetan committed overt and had withholds from other members of the group, and this finally mounted up into a tremendous unsolvable problem. And this problem, of course, was solved by him by actually the acceptance – usually, not of another valence – but the acceptance of a change or a different status.

Now, there are several ways with which he can face up to this situation. Now, I've described the most basic one. The most basic one is represented by Routine 3, which is to say he had a certain goal line of some kind or another, he did not succeed in this particular goal line, while part of a group he accumulated overt and withholds, and this amounted to a tremendous problem. This problem was solved by him by the acceptance of an identity.

Now, he is in trouble because he himself has gone into oblivion and the identity knows, the identity knows, but he doesn't. All right, that's the most fundamental. But how many ways can this then work out thereafter? Now, having committed that basic error, how
many ways can this work out thereafter? Fortunately for us there are not very many of them, but the cycle is always the same: While a member of a group having certain goals, he commits overts and has withholds from other group members, from which arises a confusion, which summates into a problem, which he then solves by... Now you name it, see? And there's the only variable, is what does he use to solve the problem.

Now, he has always used a valence, early on the track, to solve the problem. He always has done that. That we're sure of. So that you always have a thetan that you're processing who has adopted a valence. That's for sure. See, you know that. And you can take a look at any person, any human being, anybody walking around, and you know that he's had some goals and he's – as a member of a group, he's had overts and withholds, and this has amounted to a tremendous problem. And that he has solved this by assuming a valence, and that this valence is greater than himself, and that he himself has disappeared into an oblivion while the valence is dominant and paramount. This we know about every human being we meet who is not Clear. That's fundamental.

But remember now, as this valence, with certain goals, while a member of a group, he has developed overts and withholds which have culminated in a problem which he then solved by... And we've got the next variation; we've got the next thing he did.

Well, now, the common denominator of it all is change. And of course he's always solved the problem by changing. By changing what? See? We don't have to say what. We just say he solved the problem by changing. There change came about in his lifetime.

Now, that is equally true of the first assumption of a valence. You see, that was a change of identity. And life after life, as he's gone along he's shucked the old identity – the dead body – and he left it lying there in the coffin with the relatives weeping about, or left it stashed up underneath the dashboard, rather poorly preserved meat. He's done something with this body and he's gone ahead and he's picked up a new body.

Now, the whole of the Buddhist concern was the life-death cycle. The birth-death cycle of Buddhism is their total fixation, and actually is probably the greatest wisdom that Earth had up until we came along. It wasn't much, they ran it kind of backwards. But nevertheless it was a lamp burning.

Now, here, an interesting thing: The whole goal of the Buddhist is to escape this cycle of birth-death, birth-death, birth-death. And he's very afraid of making a change. The Buddhist is afraid of causing something, and he is afraid of making any change in life because he might then change somebody else, and he might then become responsible for broader changes. You see? Now, actually he's doing all this on the basis of "If I shirk enough responsibility, why, I will somehow or another float out of my ead." Well, unfortunately, it doesn't work very well. If Buddha did it sitting under the Bodhi tree, he didn't write it down on rock. He wrote it on men's minds and that is writing as upon quicksand, because there's something, something missing.

Now, it is true, that occasionally, accidentally, a thetan can sit down and be very quiet and go out of his ead, bong! You know how he does it? He's so concerned about escaping from dead bodies that he will actually set up an ejector mechanism, like a fighter plane ejects the cockpit and all at the press of a button, you see? The fighter pilot in these modern jet
planes – the better governments build them this way at least – presses a button and the whole cockpit flies out into space on a shot, and a parachute bangs open and he floats to earth.

Now, you'll find every once in a while – while you're processing a thetan, you'll find one of these things. And you'll know when you find it because he got an awful start, something happened, he exteriorized, it's all very mysterious, it's exactly what happened. We are hard put to find out unless we know that we have simply run into one of these ejector mechanisms. Accidentally we've pushed the button.

Well now, they don't work. Usually they're – most of them are broken and they haven't been functional for ages and they're quite silly, actually. Now, one fellow was so afraid – . You see, they get all mixed up. If they got into severe pain they should be able to die and get out of their heads. See? So they will set up some kind of a mechanism like a guillotine right above their foreheads – actually, it's a mocked up, heavy-energy guillotine. And at a certain time, when they experience enough pain, they feel they won't be able to think while they're doing this, so they trigger this to respond to pain. And they get enough pain and this guillotine will go – clank! And it's supposed to knock off the body. And nearly everybody has wound up at this stage of the track with the belief that you have to kill the body before you can get out of it. That is very interesting – you have to kill a body before you can get out of it. And people will just work like mad trying to kill a body so they can get out of it. And, of course, it has nothing to do with it – it is a via.

If you didn't have that many overts against – on the body, you would float out of it anyway. You'd have a hard time sticking with it, unless you had a few overts on it. So in trying to get out of the body, they try to kill the body, and they're – they're just all mixed up. And this is a silliness. They – they're doing the exact thing they shouldn't be doing.

All right. You find people are gimping around, being ill and that sort of thing. They very often have triggered some of these ejector mechanisms. Mysterious how these things occurred. Here they are, twenty years after they triggered something that was supposed to blow them out of their heads, or knock off the body or something like this. And they're still in their heads, and it didn't blow them out. And this is a big defeat and it's a – wow! – it's a problem the solution of which failed. It's a failed solution.

Do you see now, there is the birth-death cycle. And the Buddhist believed that he could escape this cycle. He could leave this vale of tears and woe. Now, it's one of the mechanisms of that particular series of truths that they believed that the world was horrible and poverty-stricken and that it was pretty well all bad over there. Now, the basic truths which they were putting out are so interlarded with these other exaggerations, overts and unkind thoughts, criticisms, alter-ises, and so on, that it operates as a selftrapping mechanism. If you get a guy to be still long enough you will key him in like crazy. All motions of the past will come in and kick him in the head.

Well, why do you find your pc sitting in the middle of a problem? Or why do you find him sitting there with that solution? And why is it such a still solution? Well, it's a still point on the track. And every time the pc has tried to rest he's practically been overwhelmed. And then as soon as you get the problem out of the way and you look back for the motion and the confusion, the motion and confusion runs and the still spot disappears. In other words, the still
spot is held there because of the pressure and duress of an active spot behind or earlier than the still spot. Do you see that? So therefore, every time the man tries to rest, the motion threatens to overwhelm him. You see, the still spot is there to hold back the motion earlier. So, every time he goes still, of course he restimulates the earlier motion.

You run into somebody, he can't rest, he can't rest, he can't rest, he can't rest. He doesn't dare! He walks down the street, he doesn't even dare stop in the middle of the block to look in a shop window. All of a sudden something goes merrrrmmmmm! He knows better! And a traffic light stops him as he's driving the car, he hasn't got any place to go. As a matter of fact, he's sitting alongside of a pretty girl; he would just love to have a moment to chin-chin, you'd think, you know? And there's the traffic light — perfectly good excuse to stop, you know? Does he talk to the pretty girl? No. He says, "Well, damn the police department! Rrrrrrr. And these traffic lights and so on — . And look at it, there's nobody on the side streets anyhow. Rrrrmmm." and so on, you know? And he finally throws it in gear and jumps the last instant of the light and goes roaring across the thing. Why? Why? Because it's upsetting to him to be still. Because the second he goes still he starts getting overwhelmed by all the former motion. The former motion restimulates on a still. And this is an oddity. The still is there to prevent former motion. So of course, then, the still becomes the restimulator for former motion.

Every thetan is subject to this. The Buddhist, he wanted to go out of his bloomin' head, 'e did, and sail around in the sky. Now, the last time I was sailing around in the sky, do you know I was bored stiff! Interesting. I was just bored stiff. Interesting! There was nothing to do! There was very little to look at. There was nothing to participate in. But, of course, there's enough former motion to make me feel like maybe I ought to be in motion, or ought to be doing something.

That's all beside the point. The point is that there was nothing to do. So the basic goal of the Buddhist must have been "do nothing". That is the defeatist goal. Whenever you have people in defeat, they are telling you that they wish to do nothing. Now, they will gauge it in many, many ways, and they will say it in innumerable ways and justify it in a thousand, thousand ways; but it still adds up to the fact that they want to do nothing. That's what they think they should be doing.

Now, of course, the nothingness is the point of overwhelm. So people who yearn for nothing inadvertently yearn to be overwhelmed — inadvertently, by mechanism. They get overwhelmed. And so you have every great culture working hard to achieve peace. And they achieve more peace and more peace and more peace, and it gets terribly peaceful. It's awfully peaceful everywhere. And then up jumps one barbarian with a busted slingshot and knocks over the whole ruddy lot. They finally achieve no motion. And, of course, that is synonymous with death.

So a thetan's ambitions can often be contrary to his best interests. But this is not surprising in view of the fact that there are no real liabilities to being a thetan, except the liability of inaction, of no interest, the liability of nothing to do, the liability of nothing to have, no place to go, nothing to be. Those are all liabilities. And when you see people around preaching these, you are seeing people in the finest possible games condition. That is the ne plus ultra of all games conditions.
When you see somebody preaching to everybody that they must be very still, that they must be very good, that they must be very, very peaceful, that they mustn't move around much, that they should settle down on the farm and never again do anything else, that they should content themselves with that little swivel chair in front of the desk, that they must not do anything else. Whenever you see somebody preaching this – or "What you need now, Mr. Doakes, is a long rest." The fellow strokes his blood-stained lapel and gives you the business, you know? What a finer, finer way to kill a man, there isn't. That's the medico – his advice is always in this direction, you see?

But when you see these people talking about peace, peace, quiet, still, stay in one place, don't move, the best life in the world is for you – is to stand there like a lamppost; look at the wonderful life a lamppost leads – especially with dogs!

Anyway, you're asking. You're seeing somebody there who is in a games condition. He is playing a game in which he wants the other fellow to get overwhelmed. And he's using basically and fundamentally the mechanisms of the track which will best overwhelm the other person. It is not at all in the interests of helping somebody out. That is all part of the game. "The best way we can possibly help you out is to give you a long rest."

Now, the proofs of this are quite interesting. The proofs of this are all over the place. You take a soldier wounded on the firing line, and you put him in the first-aid shop, which is right hard beside the 155s that are slamming away, and you would think offhand that that would be the worst place in the world (because you see the propaganda is otherwise) for him to recover from his wounds. But what do you know! The death rate in the first-aid station alongside the guns is much lower for the same wounds than the death rate in the base hospital. Why, that's fantastic!

They move the guy back to the base hospital and they say, "Peace, peace, rest, rest. Now you take a long rest." And – poof! There he goes! They got rid of that one right now!

Yeah, but what kind of care does he get in the first-aid station up alongside the guns? "Is this one gonna live, or is he gonna kick the bucket? Oh, well, tie him up a little bit, move him over there, we got three more in the tent! How you doing Joe?... All right."

You know, just not, "You poor dear fellow. How are we possibly going to save you?" You know? People practically walking on them with hobnail boots and the characters get well. Because nobody up to that moment has introduced the idea of quiet. Nobody has introduced the idea of motionlessness.

Now, they've attributed it – the "psyrologists" of yesteryear – attributed it to the fact that he did this. They had no explanation, except perhaps he felt he was still participating or something. But this is one of the great puzzles, because the medical figures are so directly contrary to what the medical doctor does. If you leave him in the first-aid station between a couple of slamming guns, he gets well. And if you send him to the rear, he dies – same wounds, same type of case. They know this, so they keep sending him to the rear.

Now, there are many instances of this. You take old Mr. Doakes. Well, he's worked hammer and tongs in that lumberyard for the last forty-five years, man and boy, and he built it up himself, he did. Splinters in all ten fingers. And here he is, he's working on the thing. And
truth of the matter is he does know more about the lumberyard than the other people around there, and he's going around just having a time.

And one day he gets gallbladder trouble or something – one of the splinters got in his gallbladder. And he finally has to go down and he unluckily lands in the middle of "Peace, peace," you see? And he gets a bit sicker. And he keep – first few days he's there he keeps fretting away, you know, and he's saying, "I wonder if that damn foreman is going to load that pine up on the wrong truck again, and do you suppose they remembered to get the oak out of the rain?" You know? And worry, worry, fuss. And every time he starts worrying about it, what operation is run on him? Is "No, no, they'll get along all right. Be quiet now, and don't fret yourself." Can't you just hear it running off?

Well, it's an operation. It doesn't do him any good. The best possible thing that could happen to him is for the telephone call actually to come in, and the foreman has left the oak out in the rain. And they loaded the pine, not only on the wrong truck, but sent it to the wrong continent. No peace going on. Next thing you know, he says, "Well, hell with this gallbladder," and goes back to work.

Well, now, you see examples that are pointed out to you as fellows who are dying from overwork. These are examples of fellows that are killing themselves with work. And the whole society subscribes to this. You see how a thetan lays the red herrings? He doesn't throw red herrings across the track, he throws flats of red herrings across the track. Dumps truck-loads of them – because the evidence isn't there. He's dying from stills; he is never dying from motions.

How does a thetan – how does a thetan get sick? You know yourself that the moment that you release the still that he is stuck in, he'll get well. What is an engram but a still, you see? He'll get well if you can release that still. Now you – he's lying there with a broken leg and it's going to take him six weeks for the leg to get squared around – well, all right, how about this? This is wh – . We've done this so many times it's just routine, practically. If you go in – we go in and we get rid of the engram of breaking the leg, and we get all holds out of the thing and all resistances out of the thing and so forth; he's out of there in about a week or so and the doctors are flabbergasted. They can't believe it.

You've been around – if you've been around where they've given lots of these assists, or if you've given some yourself, well, you recognize that you've run out what was holding him in the accident. Now, that's well within your own reality.

Well now, he was suffering from a broken leg because he was held in the accident – not because there was too much motion, but because there was too much still. It's this motion before the still, don't you see, which is crowding the still into being a still. And you could release it better by getting the motion before it.

But what has happened to him that he is not any longer in this condition? That he falls off a motorbike, hits the pavement, several limbs bend the wrong way to, he picks up the body, puts it back on the motorcycle and rides home. The punctures close in the flesh, and the bones go instantly back together again – what has happened to him that he cannot do this? He's been leading too quiet a life, that's all. That's all that's happened to him.
Now, you get around, you get around very active people, you will see them taking fall... Well, get around a circus. That's not too good an example because they're on display. Another factor is entered into it, if they're giving other people mock-ups all the time. But you'll see these fellows take falls and flops, and so on, that would kill you. And they just pick themselves up again and they never think twice about it, you know? Of course, every once in a while their, the bull elephant, or something like that, will lean into an elephant man, and he will lean until the elephant man is pasteboard. But that's not the type of accidents I'm talking about.

But I also could add: what's the matter with the elephant man that, having become pasteboard, he now doesn't resume his former shape? Why is it that when you hit a body and knock it out of shape, what's the matter here that it doesn't come back to shape again instantly? Well, we say immediately, "Well, it's broken. Well, it's like a toy, or it's like a piece of wood, or something like that, it's broken." No, toys and pieces of wood are not alive.

Why doesn't the body come back to shape? Because we know the body comes back to shape slowly, why doesn't the body come back to shape rapidly? Because of stills. Because it is held out of shape. And that should be well within your reality as an auditor that if there is something wrong, it is being held that way with considerable magnitude of force. Those things that are wrong with people are held wrong at the expense of considerable energy.

How a man can stay crazy has often been a great deal of mystery to me. The effort it must take to stay crazy must be fantastic. And true enough, if you get the exact unknown spot in a person's craziness, you undo him utterly. He goes zoom, and he goes sane. I've seen it happen time and again.

The most fruitful source of these sudden recoveries of course are withholds. Withholds best overcome stills, because they're the motion before the still. The motion before the still was going on while the person was not participating with the motion. See, the person was withholding himself from the motion already, so while in motion he was being slightly still, in that he was withholding himself from the motion. Get the idea? He's practicing withholds.

So he's already dragged himself back out of the motion. And eventually he drags himself back so hard and so thoroughly out of the motion and he makes so many overts against the rest of the participating elements of the motion that he is no longer part of the motion. And what is there left for him to be but still?

When you haven't any right to longer be part of a motion, you have only one other choice. If you are – cannot be part of all available motion, you can only then be still. If the only motion available to you in a group is motion A, B, C, D, E, F, you know, and yet you've withheld yourself from the group, and have overts against the motion of the group one way or the other, of course where can you go but still? There's no place else to go. If that's all the available motion there is, is the motion of this group, and you withhold yourself from that, you go still. And, of course, that is the basic mechanism by which you get a confusion, overts and withholds, winding up in a problem.

Well, the problem is the still. It's postulate-counter-postulate. It's idea-counter-idea. It is a held and timeless mechanism.
Now, everything I've been talking about problems this past summer is totally applicable. We haven't gone astray a bit. What we've done in a Problems Intensive is find just a better way to handle the same mechanisms. There have been a couple of new discoveries on the exact anatomy of those mechanisms. Exactly how do – how does a problem hang up? That's what's been found. Very closely stated that the confusion comes before the stable datum on a time plot. The confusion and the stable datum are not in the same instant of time. It's the confusion, and then time lapse, and then the stable datum. The stable datum is always after the fact of the confusion, and that the overt and the withhold eventually culminate in a still. And, of course, that still can say it's a problem, it can say it's a this, it can say it's a that.

But immediately after the problem is a solution to the problem. Now, because the problem is held motionless in time, of course the solution becomes continuous in time. So you have a thetan with a terrible problem: how to get some motion, how to have some excitement, how to do something, how to stop sitting on this condemned cloud.

Now, you could say, earlier, well, he must have had motion earlier that prompts him into this. No, we have to accept the fact that although moving is quite aberrative – obviously – thetans like to do it. And we sort of have to accept the nature of the piece that thetans will move around, and that they are happiest when in motion, although motion is apparently very foreign and to them and very bad for them. It's something on the order of a child gets sick every time he eats ice cream, but he does and will eat ice cream. You can say, well, motion is very bad for a thetan, a thetan likes to move. You could – the Buddhist adds it up, of course, and these other people who are practicing this games condition are saying that motion is very bad. That is their first lesson: motion is evil, evil is motion.

So we get the concept of the Devil, of course, is fire and the concept of God is nothing. But the Devil is at least something, and the Devil is always up to something, and the Devil is always in motion, and the Devil will find something to do for idle hands, [laughter] and nearly every – and nearly every phrase that we associate around, around Lucifer has to do with doingsness and motion. So, the lesson which we should of course gain out of this is that if we want to be godly, we'll stop dead-still and do nothing. And that is the penalty. And, of course, the second you stop dead-still and do nothing, everything you have been doing then overwhumps you. That's the way it is.

You see, if you hadn't been going at – taking Reg's new car – if you hadn't been going at 165 miles an hour, having your bumper up against another car's bumper – [laughter] nothing wrong with that, is there? You've got a bumper against another car's bumper. But if you add to that, just prior to it – that you were doing 165. Reg would have to get a new Jag! [laughter] You get what I'm talking about, see? It's the motion before the fact that makes the impact. And there you have the – the mechanics of existence – you have the motion and the still.

Well, now, there's nothing wrong with a still, actually, if there hasn't been some motion. And there's actually nothing wrong with motion if a – if a still doesn't occur. But like oil and water, alcohol and petrol, these things don't mix. Motion is motion and stills are stills. And if you're going to live a life as a priest, for heaven's sakes, live a life as a priest! But if you're going to live a life; if you're going to live a life as an alpineer or an airplane pilot or
something of the sort, well, for heaven's sakes, live a life as an alpineer or an airplane pilot. You got the idea? Unless you can adjust.

Now, if you can tolerate motion and if you can tolerate still, you never get into any of this trouble. But those are the two things that a thetan cannot do. There are certain motions he cannot tolerate and there are certain stills he cannot tolerate. Do you know that if you just put a huge boulder in the middle of a courtyard in an insane asylum, and just let this boulder sit there, and put a lot of seats around, and the patients could go out and sit and look at the boulder... Doesn't have to have any further significance than that.

You could blow this up and make it a temple, you see? You could have a – you could have an idol there, or you could have a piece of architecture or something of this sort there, but just as long as it's a big massive still. And they go out and they could sit and look at this still. Well, some of them would at once be sort of overwhelmed, and some of them at once get terribly enturbulated. But I assure you that if they were permitted to do this, day after day after day after day after day, after a few years, in the wildest state, why, they'd all of a sudden go more or less sane. You're familiarizing themselves with a massive still, you see? Just familiarize them with a still, familiarize them with a still, familiarize them with a still. You could do that and you'd blow – you'd blow them up the track. You'd move them around and so forth, without ever processing them. It's something to do.

But you say, never process a still. All right, that's perfectly correct. Don't process a still directly. But that hasn't anything to do with familiarizing somebody with an actual still. Processing a still in the bank and making somebody observe a still in the physical universe are two different actions.

Now, observing a still in the physical universe can be quite therapeutic, and observing stills in the bank without blowing them can really louse a thetan up. His bank has limited quantity and he loses havingness and other things happen when he observes bank stills.

Now, if we look carefully over how a thetan got aberrated, we will see that he went through a cycle of: action, confusion. Confusion is caused by overts and withholds against the people he's in action with or the things he's in action with... And of course he was in action because he wanted to do something. The mores of the group, his goal, the goal of the group, and so forth – this is all part of motion and action; it's a goingness-doingness proposition. That is followed by overts and withholds, and that culminates in a problem which is a stop. And the problem which is a stop is then followed by a change which is a solution to the problem. Now, we get that anatomy repetitive. It goes over and over and over and over and over. And it's been going on for the last two hundred trillion years.

Thetan wanted to do something and he was in motion, and then while in motion along with others he developed overts and withholds against the people he's in action with or the things he's in action with... And of course he was in action because he wanted to do something. The mores of the group, his goal, the goal of the group, and so forth – this is all part of motion and action; it's a goingness-doingness proposition. That is followed by overts and withholds, and that culminates in a problem which is a stop. And the problem which is a stop is then followed by a change which is a solution to the problem. Now, we get that anatomy repetitive. It goes over and over and over and over and over and over and over. And it's been going on for the last two hundred trillion years.

And he always set himself up for a new cycle, and every cycle is like every other cycle. And this is the – this is the sameness which runs as the woof and warp of life. That is the cycle of action of a thetan's aberration and a thetan's doingness and so forth, but basically the cycle of action of his aberration. And it doesn't matter what aberration he winds up with or
how that aberration manifests itself, it all goes back to the same anatomy. There's no difference of the anatomy at all.

All right. Early in the game he adopted a valence. That was the change which solved the problem. He had a goal, and that was a basic goal and that has been going on ever since. And then he got a problem across this goals line, and then this valence came along and this valence solved this goal. And here he is now. He's now somebody else.

Now, while being this somebody else, ever since, he still picks up new bodies who are somebody else. Oh, well, this masked the whole show. This really made it complicated. The thetan already is not himself. No, he's a valence. And as a valence he then picks up new bodies, each one of which is an identity. So he apparently would just stack up endless and endless and endless valences on top of his basic valence. Funny part of it is, he doesn't. That's what's amazing. The basic valence is in there so solid that transient valences from lifetime to lifetime don't overwhelm it. That's what's going on.

So while living these lifetimes he could subscribe to the identity which he had in the lifetime, but it still was underlaid by his valence – the – key, central valence which was motivated by a basic key, central goal. And although he gets other goals and these goals come and go, he still has that valence; he still has that basic goal.

Well, that is the biggest single shift; that is the biggest single change that takes place in a lifetime that is available to the auditor. Now, that is a big one, and it is available on anyone with whom you can communicate.

That's available on anyone with whom you can communicate. That is a requisite. Because you wouldn't have much chance getting the basic valence of a Chinee while you were speaking Portuguese and he was speaking Japanese. I mean, this is – get rather adrift. So some communication is necessary to the resolution of this situation. Given that communication, you'd be able to do something about it.

Now, to a limited degree, you would be able to process the Chinee with the CCHs without the benefit of communication. So you have a whole strata of processes which one way or the other will work out things for somebody, called the CCHs, which are without much benefit of communication. Those things will work on – those things will work on animals. You probably could process insects this way, maybe you could even process a stalk of corn or something this way, who knows. But it would be a CCH proposition. And we've got that whole band pretty well taped, and it's an important series of process, because it means processing in the absence of communication – that is what that gives us. And that is really what the CCHs are used for, is processing in the absence of communication.

If you can communicate to somebody, or with somebody, and get that person to answer your questions, even somewhat laboriously, and so forth, you have no business using the CCHs. That's about what that amounts to. And the CCHs can be categorized in that fashion now only because we can get rid of hidden standards. Now, until 1A came along (1A did a little bit), and until prior confusion came along (which did it much, much more), we had only one method of getting rid of a hidden standard, and that was the CCHs.
Now, in view of the fact that we have Problems Intensives, you can relegate the CCHs back to where they came from, which is processing in the absence of verbal communication – you can process somebody you can't talk with. And that's where the CCHs belong. Well, therefore, they are important.

But now, what else could happen to this thetan? Remember, he's still going to go on this same cycle – going to have a goal to get something done; he's going to be part of a group; and then he's going to get overt and he's going to get withholds from this group; and then he's going to get a big problem; and then he's going to change.

Well, what other changes are available asides from valences? Well, the first and foremost one that you run into, as far as body line is concerned, is he can pick up new bodies. He runs into an awful problem in life so he decides to die. The solution to that, of course, the change of that, is a new body. And you have the Buddhist cycle of birth and death. And that is – the Buddhist cycle of, of birth and death is simply the problem of "How do we keep going after the fact of an unsolvable problem?"

You could say that every death is accompanied by, preceded by – that every new life is preceded by an unsolvable problem. Somewhere in the vicinity of that death is an unsolvable problem. Death was a solution to the problem. And then new life was the solution to the death. Because in between the life and the death he ran into the brand-new problem. Is – that is being an unemployed thetan. [laughter] So he solves that problem.

And he goes ahead, then, by his action – desire for action and accomplishment culminates in overt, withholds which produces a problem which he then resolves. And then – we're talking now about – specifically about the resolution point. Well, it can be solved by death, couldn't it? And all illness – all illness of whatever kind – derives from unsolved problems. All illnesses dissolve – resolve or, or evolve from unsolved problems. That you must know pretty well, because that is the key to illness.

There is no illness in the absence of a wish to live. Illness is always a gradient scale of dying. Illness is always a gradient scale of dying. It is – expresses a resentment against life. It can be traced back to that.

The person is so overwhelmed by it he can no longer tangle it out, and we say, "Well, that person is ill because he wants to die." Well, it's a rather careless statement of it, because you're saying that only reactively does he wish to die. It's a reactive problem, and therefore not exposed to his analytical consultation.

So the person gets ill. He wins a football pool and they come around and after the government's had its cut, why, they stuff his pockets full of five pound notes, and shovel them into his living room and say, "Well, you won the football pool," and he gets very ill – in spite of the medicos. The medicos occasionally have written essays showing that every time you win a football pool you get well. Well, that is not – doesn't follow. It's too much change there. This fellow's goal line, long ago, was set up that you were safe as long as you were poor. And if you could just be good and poor then nobody would want anything you had, and so you wouldn't get stood up in the corner of the basement and hung up on raw ice tongs and be bled to death – which was the last time he had anything – what happened to him, you see?
So he solved this problem by saying, "I should be good and poor." And he's gone along being poor, and he's been a very successful poor man. I have – I feel like shaking a beggar's hand sometime, and when he's a really, he's really a mess, you see, and congratulating him, you know, on being such a successful beggar.

You'd be amazed, if – if you congratulate somebody who is pretending to be a victim, congratulate them on being such an excellent victim, you suddenly do something – bwww! of course, because they are doing that reactively. It's intentional, reactively.

So where you have this beggar being very proud, reactively, because of accomplishing the act of beggary, you'd have somebody who was being very proud of being a poor man. And then somebody fills his living par – living room up full of five pound notes. Ooooh!

Oh, boy, this is the one thing – this is the one thing – that he shouldn't have. We are – had case – case here. I seldom quote cases out loud, but this – this – this fellow came into possession of something and has been sick ever since. But most everybody would consider that it was good luck to have come into this possession. And medically, and by all other rules, this should have made him well. But it didn't, it made him good and sick because, of course, it made him unsafe – he felt unsafe. Somehow or another the possession of these things threatened his survival.

All right. So havingness is also the consideration of how much havingness should you have in order to survive. And, of course, you have lots of fellows that if you just filled their pockets full of gold they would be terrified. That is too much havingness to survive. And although they might say, "I'd like to have a million dollars," hand them a million dollars. And they go "Duhuh! Oh-oh! Um-hmm!" Just hand them a million dollars in one-pound notes, you see, or one-dollar bills. Whew!

The guy… Well, preferably do it about dusk, five or six miles from the fellow's home. And he doesn't have a car. Just do that to somebody, you see? Oooh! Why, the fellow wouldn't be fifty – fifty yards from the house before he'd have a nervous collapse. Why every sparrow in every tree would be lining up its beak on him to drill him dead, you know? It's unsafe.

I just give you that as an exaggerated aspect of what normally happens. Some child suddenly finds itself part of a rich family and is terrified. How did he get there? Family wasn't rich when they were born into it, but got rich afterwards, and now the child's a nervous wreck. It's too much havingness.

Now, they'll solve the problem some other way: by dying, by getting poor, by wasting things, by – by trying to make everybody else poor. I'm sure that Edsel Ford over in America, considers himself utterly overwhelmed by the magnitude of the Ford Motor Company, because ever since he's had anything to do with the Ford Motor Company he's done nothing but boob. He's a complete idiot. They've got a Mercury, so he builds another more expensive Mercury and calls it an Edsel. He's torn up every textbook and policy of the Ford Motor Company wherever he operates so as to do exactly the wrong things. You see? It is not safe for him to be in that position. So he can't destroy himself – that's bad, so he's got to destroy the position in some kind of a fashion. How else would you account for the fellow?
The whole country is starved for a cheap car. The compact is on the way up so he builds a clunk that is exactly like another Ford Motor Company car, and calls it the Edsel, and sells it for too much money, and the dealers all go broke, and he goes broke, and everything goes broke in all directions. [laughter]

Now, these – thetans aren't stupid. That's the other thing you must recognize about thetans. One of their aberrations may be stupidity. But according to the computation on which they are living, what they are doing is very clever. And you will always ha... always find, inevitably, that the very stupid have the most fantastic belief in their great cunning. And you often find somebody who is very bright who has great belief in his own stupidity. But these are mostly survival mechanisms of one kind or another. These are ways of getting along, ways of surviving, ways of living.

All right, not to be tortuously long-winded about it. How many changes could occur – how many things or ways of change could occur – at that point just after problem? You know, problem! exclamation point. Now, how many types of changes could there be? Well, you could think of billions of them in life. But how many mental changes could there be? Well, actually, very few. They could suppress or enhance certain characteristics or they could get rid of or adopt certain manifestations. And you've just more or less got the whole package in those two things – you could get rid of or adopt certain manifestations. Characteristics, manifestations – there aren't even two, see? – there's just two of them.

You could get some kind of a manifestation or you could get rid of some kind of a manifestation, and that's about all a thetan could do mentally. And what's the earliest step of this? Well, he takes on a valence. He takes on his valence. And that, of course, is a manifestation. A valence both limits and exaggerates a person's own skills – exaggerates some, limits some others.

Anything a thetan has, a thetan can do. Anything a thetan is doing a thetan can do. You can put it down to that. A thetan can be stupid. It isn't thetans are always smart but they get aberrated and get stupid. No, thetans can be stupid. Thetans can be bright. If a thetan can fix up a circuit of stupidity, therefore a thetan can be stupid. You see? He can only set up what he can do. He can only do that. That's all there is to that. But he is so dedicated to the idea that it requires a strongman's body to do that, that he only walks on the stage and does it when he has a strongman's body. You see that?

All right. Now, your next little step on the thing is he only walks on the stage and does that in a strongman's body when he is feeling – when he – when he is in training. See, a strongman body has to be in training. Then he can lift the thousand-pound weight. You get the conditions he's adding on to these things?
All right. Now, he can only do that when he is in a strongman's body, when he is in condition, when he is well. Get the additional conditions that are added on to this. All right. Now we get this additional condition: He can only walk on the stage and do this when he has a strongman's body, when he is employed to do it, when his agent has permitted it, when the billing has been perfectly okay for him to do this, when he is in condition, when he does not have any problems with the manager or the family; when, you see, he believes in himself.

He's got – now got a new circuit. You see, he feels powerful tonight. But on another night he doesn't feel powerful, so you see, he only picks up a five-hundred pound weight, you see? And he gets very prima donna-ish about all this, you know? And this gets wilder and wilder. But these are all vias.

And in actual fact the basic truth of the matter is that a thetan can walk on a stage, pick up a thousand-pound weight, twirl it around in a circle and put it down on the stage. That's what this all basically comes down to. A thetan can do this. But these conditions – limiters, limiters, limiters – are each one of them the solution to a problem he couldn't otherwise solve.

So limitations or exaggerations are always solutions to problems which are otherwise relatively unsolvable and which are hanging up. And the problem got there because of: they wanted to get something done as part of a group, and in that motion had overt, had withhold, and these resolved in a problem. And that whole story goes back of each one of these problems which results in a solution like, has to have a strong-armed body, see? Has to have a strongman's body. All of these things are just more and more complicated, more and more complicated, but it's just a summation of problems. And each time that whole cycle has had to take place for him to wind up at the other end with some kind of a wild solution.

Now, the solutions you are interested in, as an auditor, are not very many. You are not particularly concerned that he is in a body, because he's been in bodies before and he's gotten out of bodies before or he wouldn't be here. So there can't be very much wrong with him in this particular department. But what is he doing with this body? Now, that gets very interesting. In the first place he isn't being the body he is in. He basically and fundamentally, way back when, is being a valence which is in a body. Ah, he is not a thetan in a body, he's a valence in a body. He is a thetan who is a failed thetan, who is a valence which is a failed valence which is in a body. You get where this goes?

All right. Now let's move ahead just a little bit further, and recognize that there are new things that enter in which put you out of communication with him. Now, up to this point* we'd find it very easy to communicate with him. There'd be no difficulty in communicating with him. But these new problems and solutions with their changes that come after, interpose such things as constant somatics.

A constant somatic is a solution to some problem, and you're auditing him through the problem. You've got a constant somatic so there you've got a problem, and you're auditing him through the constant somatic because his attention is on the constant somatic because it's on the problem. And his attention is not on valences so you can't run Routine 3.

* Editor's note: the next few words up to and including "There'd be" were deleted out of the audio version.
Oh, you could find his goal, and you can find his terminal. But I fully expect there are some people that you'd actually have to run a Problems Intensive on before you could find the goal and terminal. You will not find them in Scientology, or able to do any kind of a job of auditing or anything else. They're really bad-off people. But you could find that condition. Now, they're just a total circuit, you know? And the valence just wouldn't be available, nothing else, you see. You won't find those, I repeat, in somebody who can walk up to the front door and say, "Here I am."

Now, he could be in a circuit. Well, what's a circuit? Well, a circuit is a kind of a subsidiary valence. A circuit is a mechanism which modifies a valence. A circuit is a solution to the realization that the valence can often be wrong, so therefore needs dictation to or needs things hidden from it. So you've got a circuit. And you set up a valence that can think, allegedly, and then you set up a circuit to modify the thinking of the valence. All of which happens, of course, when the – the thetan, as a valence, has run into a problem where the valence has failed. Do you see what could happen here?

You see, after the fact of the thetan failing, now everything he adopts after that is susceptible to failure. And each one of them becomes a barrier to processing. And a circuit is something which modifies the thinkingness and doingness of the valence. It's a dictational machine. It's like you set up a tailor's dummy or something in a window, and the tailor's dummy is animated. And it's supposed to be able to turn its head backwards and forwards and shake its finger at the people who are looking outside, and it's doing this all the time. And now you set up a circuit to keep it from turning its head quite so fast. See, it's already built in so that it will turn its head at a certain speed, and will raise its hand at a certain speed. Now we'll put an entirely new machine over here. We will modify this dummy, see, with an entirely new machine over here, and wire it in to slow down the turn of the head, see? Of course, this is rather uncomfortable because the machinery in the thing is to speed the turn of the head at a certain speed, and then you put another machine on top of it to turn it at a slower speed, see?

Now, there's another machine there that, because it is turning its head so slowly, this new machine is fixed to turn the head up rapidly. So while – while it is turning its head at this speed, it's got a machine which turns the head at this speed, but this machine over here turns the head this speed. And after a while the dummy starts wearing out. [laughter]

You see what these circuitry things are, you see? They're things to slow down or speed up. They're things to show or to hide things. They're occlusion circuits or demonstration circuits; they're picture circuits. They are all kinds of wild things. They're secondary thinkingness apparatus that modify the basic thinkingness which is built into the valence.

Now, if those circuits get too wild and there's too many of those and it's all too complicated one way or the other, then the person can modify the circuit with a somatic in some fashion and do something there. So that, frankly, if he gets some kind of a circuit that goes operative, he gets a somatic, and that sort of makes him turn the circuit off. Soon as a circuit gets operative, and the somatic comes on, and off goes the circuit. And it's – all kinds of this weird via, via, via, speed it up, slow it down, hide it, show it, do this with it and do that with it.
Now, you get somebody that has this amount of – of bric-a-brac, additives and subtractions… You get this amount of bric-a-brac which is modifying the modifier, you see? You've got something that modifies and then something that modifies that, and then something that modifies that, and something that modifies that.

Somewhere down along the line, about the level of the somatic I mentioned a moment or two ago, or any one of these circuits, you would have a hidden standard. You could have a hidden standard. It knows more than the valence, which of course knows more than the thetan. Of course, the valence itself could be crudely classified as a hidden standard, but we don't so classify it because it is a whole package of thinkingness, doingness, beingness – that is a valence. It's a whole package. It's complete. You see that package when you get a profile. And when you don't move off that package you don't get a profile change. That's all there is to that.

Now, the modifications can be many without becoming hidden standards. A hidden standard is only qualified this way: It's what knows better, to which the thetan is paying attention. See, a fellow could have a hidden standard to which he was paying no attention, therefore it wouldn't be a hidden standard. You see, you could have a circuit that he never gave any attention to. Well, it has all the qualifications of modifying his thinkingness, but it would not slow up processing at all unless he paid some attention to it. Hey, if he paid some attention to it, then it would have a modifying characteristic on processing.

Now, the difficulty is this: A concentration on this item – whether it is a circuit or a somatic or anything else – the concentration on this item can be so heavy, so thoroughly concentrated and the dependency on that particular circuit or item could be so tremendously heavy that the thetan only knew if it knew and if it tells him it's true, but if it doesn't tell him, it isn't true. And that is what we exactly mean by a hidden standard – must be a very heavy concentration on it and it must be what tells him.

Now, when you're auditing him, he goes in to the cycle of only consulting it: He does not see you really; he does not hear you, really; he – it's all set up on vias to such a degree that you're really processing some kind of a piece of circuitry. It knows, he doesn't.

This produces some of the greatest oddities you ever saw. I mean, an individual could – he could be standing in the auditing room, as you often see a newspaper reporter do, and he'll see some demonstration and not even see it. But such a person could be standing in the room; a person comes in, sits down in the chair, you take two passes with your hand, and they grow two legs that they didn't have before, you see? And they walk out of the room, and the person would ask you, "What was the price of..." You expect him to say, "an intensive," or something like that. He wants to know the price of the cigarettes you smoke.

This used to absolutely drive me daffy, you know? I'd give some kind of a demonstration. It'd be a fantastic demonstration, some wild thing would happen or another, and some newspaper reporter would ask me, you know, very searchingly and so forth, what – what – what state was I born in. You see, he'd say – like it just had nothing whatsoever to do with anything observed, and it was non sequitur to anything he had observed. And seeing this originally got me onto the track of this sort of thing – not because I was not getting proper
recognition from such people – I began [laughter] – I began to wonder if they could see any-
thing.

To some degree everybody's attention is absorbed in various parts of the bank, to some
degree. To some degree they're absorbed. But where a person's total overwhelm exists, attention
is so absorbed that only it knows. So, they walk into a room, the person who is in the
room sets somebody down in a chair, they throw a sheet over the body. The person who threw
the sheet over the body picks up the sheet, and nothing – no change has occurred. And says,
"There you are." And the person walks out. And you turn around to this person with a hidden
standard and you say, "Isn't that wonderful?" And he says, "Yeah, I guess it is," and so on.
"It's probably very wonderful." He doesn't even know what he's seen.

That is how you can fool such vast numbers of people. You can fool people – you
don't really ever do anything. Why? Because they don't see.

Now, this is more real to you in this wise: If you had any difficulties with your parents
of any kind whatsoever, you had them because you were assuming they knew you. You were
assuming they observed what you were doing. You assumed they heard what you said. They –
you assumed that the basis of their judgment was based upon the actual fact of your activities.
And after a while you became very confused. Because if you were having very much trouble
with their parents – your parents, they never observed anything you ever did and they didn't
know anything about you at all. They had somebody else there entirely different.

If you had asked them for a recount of what you had done in any given year of your
life you would have gotten the doggonedest potpourri you ever heard of. It would have had
nothing to do with any part of the fact – not because you didn't have a different memory, but
because they didn't observe anything you ever did.

Now, their adjudications of what you did do – should do in life are usually based on
not having observed anything you could do in life. So you get into a hell of a lot – if you'll
excuse the French – get into an awful lot of confusion. You've demonstrated conclusively that
you can't dig ditches, and your parents absolutely insist that that is the very career for you.
And you assume, then, that they have observed that you cannot dig ditches. And the joker in
the deck is, is they've never observed this. They have not seen you. They have never met you.

What have they met? They are running on a social circuit of some kind or another.
They're running on a whole series of now-I'm-supposed-to that is dictated by some kind of
circuitry. And it runs this way: "If I have a son or if I have a daughter, why, that person
should go to a certain kind of school and they should do this and they should do that and in
life they ought to do this and the best way for them to survive is that and so forth…" And if
you don't compare with all these I'm-supposed-to's – the pity of it is, you see, you don't even
know what these I'm-supposed-to's are – if you don't compare exactly with these, of course,
you're a great disappointment to your parents. You're an enormous disappointment to your
parents.

Of course, you get baffled in that you might be quite successful in doing what you are
doing. You might be going along fine and be driven half out of your mind all the time because
they keep telling you you're not doing well.
Child goes out, wins a contest of some kind or another. Comes home just overjoyed, you see, covered with laurels and so forth, and Mama says, "You know your feet are muddy." And the little girl looks at her feet and, by George, she doesn't have any mud on her feet. And she - "What is going on?" and she gets kind of confused along about this point, you see? The truth of the matter is, Mama has a circuit that says "Children have mud on their feet." See, it just happens that "You should take care of a child's appearance at all times," or "A child should always be polite." Or there's something – some I'm-supposed-to circuit operating like this, you see? Hasn't anything to do with it.

And you could sometimes appear, you see, in total dishabille – never a word. The next time you appear, you're neat as a pin, you see, and you get all, all scolded. Why? Because what the circuit protests against, of course, activates the circuit. Now, a child is supposed to have good appearance. So any child who has good appearance gets criticized. You – the circuits are idiotic, see? They're set up on the basis that the thetan didn't know, so, what is set in its place is usually pure idiocy. "A child's appearance should be very good." So a child has very good appearance and he's criticized. But if his appearance is very bad he's ignored. See, it's an A=A, you know, it's not the reverse.

And this confuses children, and they don't understand what they're doing right and when they're doing wrong. You trace it back and you'll find out that it's just the awfulest mishmash of 8-C you ever heard. It's all reversed 8-C, and so forth. Little Johnny's sitting in a chair, and he hasn't made a noise for an hour, and all of a sudden his mother comes in and says, "Johnny, be quiet now!"

"Well, what have I been doing?" you see, big protest, injustice, betrayal. All of these things follow immediately in the wake of this sort of thing. But a circuit is most likely to go into activation on the thing it is trying to achieve. So a circuit most ordinarily protests when it has won. It'll protest its own end product at any time.

The basis of this is most circuits are set up on overts and withholds resulting in a problem and going over into, then, a change of some kind or another. And of course the circuit will dramatize the problem, or dramatize the overt and the withhold.

Most things that are protested against, the person will do. We call it hypocrisy. This fellow goes around, he's always on the platform, he's always beating the drum, he's always screaming at people, he's always jawing about secret drinkers. Well, he's got a circuit about secret drinking. He drinks secretly. See? It's all A=A=A=A. It defies logic because it isn't logical. Because circuitry is an escape from knowing. It is knowingness in a substitute for lack of knowing.

When a thetan escapes from knowing he sets up a circuit. When he no longer wishes to confront life he interposes circuits between himself and life, or valences between himself and life, or identities between himself and life. Get the idea? He makes an interposition of some sort. He has thinkingness done for him. He has beingness and doingness done for him. He wishes to divorce himself just a little bit from life. So he sets up an interposition of some kind or another. And when you start to audit him, this gets terribly important because you are part of life. Aren't you? You're right there in the room, aren't you, as the auditor? And if you
were there in the room, as the auditor, of course anything you are saying or doing is liable to get an interposition.

So he sets up the interposition between you the auditor and himself the case. And you are auditing a circuit from there on. And that is why you cannot do a pure Routine 3. That is why only a few people go Clear on straight Routine 3 without preparation.

Now, by getting off his present time problems, his ARC breaks, by accustoming him to the room and getting his rudiments in, of course he is less susceptible to this particular phenomenon of an interposition between himself and life. You cut those things down and you can talk to him for a while. And that is the most powerful general and common mechanism to make it possible to talk to the pc, not a circuit. Because circuits go into action on PT problems and ARC breaks – withholds, that sort of thing, pop a circuit into view. So you're talking to the circuit, you're not auditing the pc when the rudiments are out. You get the rudiments in, and for a short time you'll be talking to the pc.

But people have problems of such magnitude on the immediate backtrack that it sets up as a permanent circuit. And you're always auditing at the circuit. And you are making very slow progress. Well, you now have a tool or a weapon with which to get this out of the road. Understanding the exact cycle that a circuit comes into being on, you can then get a circuit out.

You find any self-determined change, trace the problem immediately behind it, flatten that, get the confusion, the withholds and the overts out of the confused area immediately ahead of it, and you will find out that a circuit will disappear if done right. And that is a Problems Intensive.

Now, all a Problems Intensive does is pave the way so that you can at least audit the pc out of the valence he is in. It keeps scraping the top off so that you can actually pull the bottom out. Okay?

That is the system of aberration which has been operative on the whole track, and that is how it works and that is what it is, and you have the tools that get rid of it. And it's never any other cycle, but you have, of course, different tools that are effective on it. Okay?

Thank you.

_Audience: Thank you._
How are you today? What is this, the 19th? Guess it is. The 19th.

Okay. 19 October AD 11, Special Briefing Course, Saint Hill. And today I have nearly one and all who is busy wrestling with the gruesome problems of problems.

If you're having trouble doing a Problems Intensive, then I could say offhand that you're simply Q-and-Aing with the title of it. And if you're having too much trouble with a Problems Intensive, why, call it the "Solution Intensive" or something. [laughter]

I could absolutely count on labeling something "Difficult Procedure" and then have the comm lines jam. It isn't quite that bad. I'm in a snide and sarcastic mood today. Mean. [laughter]

All right. Now, it is unfair to release a new procedure without giving you an opportunity to ask intelligent questions concerning its application. So this is your opportunity to let us all in on the fact that you haven't quite surrounded this one. If you have any question about a Problems Intensive, its administration, its expected result or anything else, speak up. Yes.

Male voice: There used to be a process, "Spot a change in your life." And when you um – told us to list changes, I was reminded of that. Is there anything we can do wrong to a pc by sort of having their kind of Change Process unflat as it were. A sort of change list ...

Is there anything wrong with ... There's an old process, "Spot a change in your life," and is there anything that we might be doing wrong by doing the assessment which then leaves an unflat process.

Male voice: Yes.

No. Don't worry about it because, in the first place, if you are doing your assessment properly, it will come out at the other end as simply a list, such as a terminals list or a goals list. And it'd be no more restimulative than making somebody go over the goals. You see, there used to be an old process called, "Recall a goal you've had," or something like that. There was an old process like that. And that could be completely unflat and we would still be able to get the same Goals Assessment that we got before.

No, I wouldn't say in any way. The only reason changes have been difficult for the individual lies squarely on the fact that there is one that has a tremendous problem behind it. The changes were never the difficulty.

That would not, by the way, be a very good process. It wasn't a very good process. It was abandoned a long time ago. And the reason it isn't a very good process is it turns out in
this particular case that it changes a solution. That's a wild one, isn't it? The change is a solution and therefore, in this particular instance, you're running solutions because you're only asking for self-determined changes. And if you ask for self-determined changes, you're asking for the same thing as, "How many times have you solved problems in your life by changing your activities?" That would have to be the auditing command.

"What change have you brought about in your life in order to resolve your activities?" That is really – if you're going to run a process on the thing, that would be the process you were running. Okay? Does that answer your question?

Male voice: Yes, that does, thank you.

All right. Yes, Reg.

Male voice: on assessing for change, should that be done in session? As it does come under section O which we were told to do out of session – out of Model Session.

Yeah, well, it's out of session.

Male voice: You assess out of session, then.

Yes. That's – there's no – there is no particular reason to do any part of the Preclear Assessment Form up through and including O in session. There's no particular reason to do it.

I don't know how some people manage to miss goals and terminals with the rudiments out, but evidently rudiments out, they miss goals and terminals. It might work out that with rudiments very far out in doing this out of session, it might work out that the individual is unable to give you the number of self-determined changes that he might, he might not be able to find the change. But if that condition ever occurred, why, you should let me know about it. But in case of doubt and where you feel absolutely the pc is insufficiently in-session to give you a proper list, well, it's your pc; go ahead and do it in Model Session. Okay? Right.

Yes.

Male voice: Ron, in doing the command, "What is unknown about the problem?"

What is unknown – doing the command, "What is unknown about the problem?"

Male voice: Right. The pc scans the whole track when he's doing this. Is that correct?

The pc scans the whole track when he is doing it.

Male voice: or can do this.

Well, he doesn't scan it. That's an old technical term.

Male voice: I mean, he's – he's – he's – looking at the whole track.

Well, he picks up pieces of the whole track. That is absolutely right. You want that answered?

Male voice: Well, what I want to know is what – what's the – what's happening here? I mean, with a problem that's reoccurring many, many times.

What is happening here with a problem reoccurring many, many times?

Male voice: That's right.
You mean how much track are you running on this pc.

Male voice: This is true, I don't...

All right. Well, you get this – I'll try to straighten it out for you. You get an auditing command, any auditing command – any – which is a statement that the pc is to do something; unless you modify the command itself, there can be no understood about it. In other words, everything in an auditing command is implicit in the auditing command. If you want something in the auditing command, you have to put it in the auditing command. We cannot arrange before we run the auditing command that the pc is only to recall that particular zone or instance of his life while we are running this process, see.

We'd go back to this and we would say, "Well ... " here's – this is dead wrong. "All right. Now, you and I understand that we're only running this lifetime. Is that correct? So none of your auditing replies are to be outside of this lifetime. Fine." You see, that violates the rule of the understood auditing command. Because then he is always running the first command you gave him. And of course, you've set up a problem in the session. And you won't get very much result in the running of it.

Every time you have the pc understanding something about an auditing command which is not stated in the auditing command, you are running the pc on a perpetual problem. He has to come back to the beginning of the session every time and remember this, you see. And then he does the auditing command. You're actually processing on a time via.

So that you get this rule, this inexorable auditing rule, that everything you want the pc to do must be implicit in the auditing command. You must say so every time.

All right. The reason I'm going into that is one has to cover these points now and then, not that you don't know it Bob, but here's what it amounts to.

This particular problem that the pc has is located by you as prior to a change the pc has had. And, therefore, must have come immediately after a confusion the pc has had. And we are apparently, at first glance, only addressing this small section of track.

Well now, if we wanted him to stay in that section of track, we'd have to give him a command like this: "What is unknown about that problem you had in 1955 ... ?" (something like that). "About your father and mother and wanting to leave them?" See, now it would have to be terribly implicit. It'd not only have to date, it'd have to have the substance of the command, it'd have to have everything in it.

All right. Now if you ran that just that way, you would get an interesting result. You would get the problem out of that section of track. You would get it out of that section of track.

But there's the old rule about basic-basics, that the first time something occurred has more weight and is more easily run than any other time it occurred. That's the basic-basic on the chain. Any similar circumstance repetitive through a person's whole track has a first time it occurred. And that first time that it occurred we called basic-basic, you see. That's a basic-basic on this chain of occurrences.
We have no guarantee this is the first time he thought of this problem, so it is perfectly – not only feasible, but it is best that the pc wander all over the track on that problem, because we will actually go picking it up anywhere and everywhere. It not only is riding back then but is riding up in present.

There's another reason for this. He will get the illusion of wandering all over the track, because problems are timeless. And if you tried to run a problem with an imposition of time on top of it, you would have trouble. So it basically resolves down to this: That it doesn't much matter whether it's best that he stay in 1955, the moment of the problem or not. Your ability to make him do so is almost – well, you just couldn't do it, that's all. So you'd have to let him do it. He would do it inevitably because this problem probably isn't resident in 1955, but has been coasting on forward now since 1720.

And although you're apparently running a change of 1955, you find yourself suddenly running 1720. And you've already run into this. Well, he will try – tend to wander to the beginning of the chain. He will tend to go backwards on the beginning of the chain and the only reason we're running it is to knock the chain out. Now we want to get the chain out so that when you get the confusion out of that particular zone and area immediately before it, the problem isn't hanging up.

So what we're actually doing is running the problem so as to get him all over the track so we can get the prior confusion. But we only want the prior confusion of 1955. If we didn't run the problem off, we would have no chance of getting only the prior 1955 confusion. He's going to go all over the track while you're doing a Sec Check. And you don't want him going all over the track. You want to know what he did do to his schoolmates or whoever it is that's in that zone.

So by running the problem permissively and letting him wander all over the track with the problem which he has stated, you then are able more or less to keep him in that space of time immediately before that first time he says the problem occurred. Because the problem always occurred earlier. Okay?

You get two types of run out of this thing. It's quite interesting. You get a whole track run and then you get a present lifetime run. And it wasn't basically – I won't pretend a bunch of knowingness here. It wasn't basically designed this way. I just knew you had to get the problem out of the road. And then in running it, it's obvious that people go all over the track to run the problem and that's fine. And if you find if you try to get the Security Check done before you get the problem run, I think you'll find you're going to have trouble. And the reason why is the problem is prior to the zone of confusion. See, it's going way back. So you wouldn't have much of a chance getting out the zone of confusion.

Apparently, from what fragmentary data is to hand, it is much, much harder on the pc to run the zone of prior confusion if the problem isn't well run.

Something that's quite interesting. I don't know if you've noticed this. You haven't – maybe you haven't tried to do the prior confusion. Oh, yes, you have. Yes, some of you have done the prior confusion. You had a hard time slugging at it. Well, if you had any hard time getting the prior confusion, that was because there was this lousy problem hidden in there, see? And the problem wasn't about to surrender. Does that answer your question?
Male voice: Yes, yes, it does.

All right. There's another point I've got to make here about problems. There is something else. There's always something else. But you have a permissive type of auditing command on the problem run in a Problems Intensive is sometimes not feasible on a pc who is poorly, who is rather introverted on the subject. If the pc is too introverted on a subject in general or if it's an apathetic sort of a problem or if it is a problem which seems to take in or could easily take in many people, a one-command Problems Process is not good enough.

I'll give you a direct idea. This has turned up several times here. But a problem something on the order of "What am I going to do with myself?"

This is not – this is not a strange problem, you see. "What am I going to do with myself?" This has turned up.

Well, "You – what don't you know about doing something with yourself?" or some such command as that comes out of it. And the pc has been so introverted on the subject that it is not a permissive command – "What is unknown about doing something with yourself?"

And he just runs it from his side. He just says, "I – I – I – I," and the next thing you know he's in a stuck flow. He never thinks of it being unknown to anybody else. His ideas never extend into that zone and he already has spent years of saying to himself, "What am I going to do? What am I going to do? What am I going to do? What am I going to do?" And he's on a stuck flow of "I," don't you see? Here's your stuck flow. Here are flows lifting their ugly heads.

And it just never occurs to him that when you ask him the problems question, "What is unknown about doing something with your life?" to say, "Well, it was unknown to my father." See, he never says that. He always says, "It was unknown to me. It was unknown to me. It was unknown to me. It was unknown to me." And he's just going on running the stuck flow.

It's already stuck. Now all he's got to have to do is invent a couple there and he's really in bad shape promptly. See, he's got a stuck flow and you're compounding the stuck flow.

So in such a case, it is actually necessary to put a second leg on the auditing command. "What didn't you know about doing something with your life?" Or "What was unknown to you about doing something your – with your life?" "What was unknown to others about doing something with your life?" Not a terrifically model command, but it gives you the idea, you see. "What didn't you know about doing something with your life?" "What didn't others know about doing something with your life?"

And if this is an introvertive type thing, such as that particular type of problem, you'll rip up an automaticity on "What did others know?"

All right. We – give you an example. Here's this girl and she wanted to be a painter. And her parents said, "Well, that is just fine. And the thing which you really ought to be in life is a housekeeper. And we're going to teach you to be a housekeeper."

And she says, "I really want to be a painter."

And they say, "Housekeeper. Housekeeper. Housekeeper. Housekeeper."
So she finally says, "Well, all right. Housekeeper."

And then they say, "Well, dear, we have been very, very mean to you and you wanted to go into the field of the arts so we will let you study millinery."

And she said, "Well, uh – all right. Uh – uh – all right. Yes, yes, I'll study millinery," and so forth.

Well, so she goes ahead and she goes and gets a book on millinery and she's all set and she's getting herself briefed up and then her mother says to her, "Well, you know, there's a nice opening over here someplace. There's a nice opening over here on a drill press operator and I really think you ought to study drill press operating." And what it is actually – ask yourself this: What would happen to a pc that every time he gave you a goal on an assessment, you said, "Oh, no. Here is a much nicer one"?

If you did it in the most pleasant tone of voice, there would be a small splash heard and that would be the pc going into the soup.

Well now, a person who is – has one of these occupational, particularly, problems – you see, "What am I going to do with my life?" something like that – has really only got a problem because other people had an opinion and their idea of what they should do with their lives was directly contrary to the mores that other people were expressing. And the other people, of course, being many and not – it wasn't their life, gave them varied things to do and all kinds of alternates and lots of contradictions. And it made a ridge, see.

Here was a ridge. Pc wants to go that way; the other people all sort of want to go another way, don't you see? So we ask this pc the question, "What didn't others know about doing something with your life?" And he gets up brrrrrrrt.

And he thinks, "Oh, yeah." And he thinks of one person, he thinks of another person. He thinks of another person. And they all had different ideas. Or maybe none of them had any idea at all. So any time he tried to get any answer to this, "What to do something with your life?" he ran into "I don't know." "Well, you just make up your own mind about it." And of course, they could surround some youngster with that and you would get the immediate result of nobody knowing what to do with his life.

He'd not know what to do with his life. And others wouldn't know what to do with his life. And anything to do with his life was unknown to others and was unknown to him. You'd get the same result if you had fifteen other people with fifteen other ideas about what he should do with his life, all of them in contradistinction to what he wanted to do with his life and you see what kind of a nonsense you're building up.

One, is you're asking him to go into a valence of other people's unknowingness (they didn't know what to do with his life) and two, you're asking a terrific conflict to occur which would build up a ridge. It's a ridge of disagreement. You see what I'm talking about?

So you get a two-sided auditing command then and it dispels this. Any auditing command may have inherent in it – I will make it very plain and state it for the ten thousandth time – has inherent in it flows. There's a potentiality of flows.
You run a girl on the subject of jewelry. And, well, let's say that she's been successful on the stage or something, was always getting jewelry presents, you see. Jewelry presents, jewelry presents, jewelry presents, jewelry presents, jewelry presents, jewelry presents, jewelry presents, jewelry presents, jewelry presents. And you know, one day she can't have any jewelry?

If you ask her to hand you a ring for its inspection also, she's liable to start screaming. You see, the jewelry has only gone in one way. See, there's a one-way flow of jewelry from out there to in here. You got the idea? And it's always gone from out there to in here. And it's never gone from in here to out there.

She'll eventually wind up with boxes of jewelry under her pillow and she won't be able to separate herself from jewelry and she also won't be able to wear jewelry. A lot of rich women have tremendous quantities of jewelry all locked up in a safe.

And you say, "Well, why don't you wear it to a party?" or something of this sort.

"Oh, no." They never think of wearing it. You know? But they've got jewelry, but it has to be hidden. Well, it's some kind of a stuck flow. Now, to resolve that you'd have to say, "Recall being given some jewelry" and "How far away from you could you move a piece of jewelry?"

This – it wouldn't matter ... You wouldn't ask them "How could you give away some jewelry?" You see, this is a – this is an antisurvival action to them. It's counter to games condition which is why it won't run. And you'll start an avalanche of jewelry. You start asking this and you'll unlock the ridge on which it's held up on. And you'll get a brrrrrrrt. And all of a sudden, jewelry just starts flying in from everyplace.

You'd have to be a pretty clever auditor to get one of these avalanches triggered. But you can sometimes trigger an avalanche. And it'll be an avalanche of jewelry or an avalanche of cars or an avalanche of mountains or an avalanche of something. The person's had too much of it, don't you see. And they have – it's been a stuck flow and it's kept coming in. And then pretty soon it just stacked up and when you start to run it again, why all the facsimiles of the inflow all turn on on automatic. And you have avalanches. And that's what an avalanche is.

You can also get an out-avalanche on some item. Well, take a person is lecturing. If he's lecturing and he's pretty aberrated and so forth, why, you just, "Get the idea of lecturing. Get the idea of lecturing. Get the idea of lecturing," and all of a sudden he gets visual manifestations of words pouring away from him toward others. You get the idea? But because it's across games condition, you wouldn't audit it.

Flows. Flows are part and parcel of every auditing command. And if the pc is running an auditing command up from A to B and the next time he answers it, the flow is from A to B. And the next time he answers it, the flow is from A to B. And the next time he answers it, the flow is from A to B. All of a sudden, he can go into a black occlusion.

Everything will turn black. His pictures turn off. All kinds of odd things can occur simply by having this one-way flow. And that's why we call it a stuck flow.
Now, if you have him answer the auditing command from B to A, B to A, B to A, all of a sudden the occlusion goes off and he isn’t occluded now, suddenly. It’s quite mysterious. Stuck flows. You’ll see these things register on your E-Meter. A stuck flow starts sticking the needle. In fact, all needle sticks are stuck flows. When your needle sticks up, why, you’ve got a stuck flow.

Now, you’ll see this in a fellow’s withhold. This individual is withholding. He's got something. He's done something minor. He's shot the king of France or something. And he's withholding it. Well, that is a nonpermitted flow. So of course, everything that goes in against it sticks because there must be no backflow on it of any kind whatsoever. He regrets the backflow. He should not have ever backflowed the bullet in the first place, so he's withholding it now. So he holds this fact in.

Now, everything you offer him about the king of France flows in, and – but nothing can come out on the subject of the king of France, don't you see? And you'll see that needle go up. Stick. You'll see the tone arm rise and not go back down again. He's got a withhold, he won't... – you know?

And the more you make him conscious of it, the more he becomes conscious that he had better withhold it. So the more you flow in any question toward him, why, the more he holds the question in, see. And he keeps packing himself up finally and he's squashing. And you can just see it register right over here on the tone arm. He just squashes himself with the withhold. Got the idea?

Now all of a sudden he says – gives up because you're clever and you ask the right questions and you say suddenly – you say, "Well, did you ever murder a king?"

"Oooo-oooh-oooh." [snips fingers several times] He can't withhold it, see. You triggered it. "And well um ... " And you say, "What's that?" you know, in an authoritative voice. "Oh, that has to do something about..." "which king was it?" "Oh, well, I murdered the king of France." And you'll see him go down – see the tone arm go down. Well, you've reversed the flow. That is why you see that manifestation occur. The most that an E-Meter registers is stuck flows.

Now, an oscilloscope – stuck flows or not stuck flows. An oscilloscope properly rigged up on somebody shows the direction of flow. This is really weird. You can set up an oscilloscope – a one-hand electrode – and you can set up an oscilloscope and you can ask this fellow to "Get the idea of getting – of receiving some candy. Thank you. Receiving some candy. Get the idea of receiving some candy. Thank you. Get the idea of receiving some candy. Thank you. Get the idea of receiving some candy. Thank you." And you'll see the oscilloscope start moving in one direction. Zzz-zz-zz-zz, zzz-zz-zz-zz. You'll see the sine wave move, move, move, you see, from left to right, left to right, left to right, left to right. And you say, "Get the idea of receiving some candy. Good. Get the idea of receiving some candy." And the oscilloscope is moving over from left to right, left to right, left to right and then slower as you keep asking to get this idea and slower and slower. And stick. And the sine wave will be right there on stuck. And it won't move in any direction. And you say, "Get the idea of receiving some candy." And it just kind of gets a little more rigid.
Now you say to him, "Now, get the idea of throwing away some candy." And you'll see this thing still stuck. "Get the idea of throwing away some candy." Still stuck.

"Get the idea of throwing away some candy." Tremble, see, on your oscilloscope.

"All right. Now get the idea of throwing away some candy," and you'll see the sine wave start drifting from right to left, the opposite direction and you'll see it going from right to left. Very slowly.

"Get the idea of throwing away some candy. Okay." And then it'll speed up and the sine wave will go from right over to left faster and faster and faster. And finally it's just whizzing. And then as you keep asking, "Get the idea of throwing away some candy," it will slow down and it will stick.

And now, you have to say to him, "Get the idea of receiving some candy." And now you'll get it going from left to right again. And that is a stuck flow. And it's one of the weirdest things you ever cared to watch.

The reason we don't use an oscilloscope: (1) they're terribly expensive and (2) they register, all those formed up so far... Reg was good enough to get me some experimental scopes and we had a lot of work done in this particular direction. But they register terrific body phenomena. The pc wiggles his nose and oh, the oscilloscope just goes crazy, you see. And somebody four feet away from the pc moves his shoulder and the oscilloscope moves, you see.

But you can have the pc's case right in your lap, you know. You can say, ah – you could – big withhold is the fact that just yesterday you robbed a bank or something. And you could say, "Well, ah – did you ever rob a bank?" And you get the tiniest, faintest, tremble, see it's very, very faint, it's extremely faint. But the pc just wiggling his ears causes the thing to go mad.

The E-Meter's quite valuable. It doesn't do this. It registers the mind before it registered body motion. Body motion is registered much less than the mental reaction on the way this E-Meter is built. But on an oscilloscope – those that we have so far worked with – why, the body reaction, the movement of the pc's finger or anything of this character registers wildly on the scope. And yeah, nobody could read it. I can read it but with a microscope, you know. I mean, what are these little vibrations. That's the difficulty.

But you'd set up an oscilloscope anyway, in spite of these limitations (and tell the pc not to breathe anymore than necessary) and you can watch these flow phenomena. Now, you don't see them on the E-Meter. An E-Meter goes up whether the pc is flowing in or flowing out. The stick occurs, the E-Meter does not tell you the direction of flow, whether it is in or out. Now, if you draw a map around a pc, you will figure out how many kinds of flow there could be. How many directions of flow could there be? Oh, you get lots then don't you? You get not only in and out and – to another, in and out from another – you get all these various patterns. But you'd also get up and down and back of you and away from you and on your right side and away from you and to you and on your left side and away from you and to you.

You get all these things and if you were putting up mock-ups you would use these things. But the basic 5 bracket that you use is the most common and the most important flow...
directions. And that's why you use that 5-way bracket. That's what's known as a bracket. It's a 5-way flow pattern. It's from the pc out to somebody else, from the somebody else in to the pc.

Now, there's another little one of the other person's flow pattern is more important to the bank, you see, than many other directions there could be around the pc. It's important to the bank that the pc flows in and out. This is most important. But next in importance is another person's outflow and inflow. And then, next to that is somebody else's outflow and inflow to the other person. And then there's, of course, the internal flows and ridges inside the person the pc is confronting and then the flows and ridges internally inside the pc.

So you've got these various patterns. You could work them out. They're the most important patterns. And if you only run two ways of a flow you could sooner or later run into one of these – the third one. You go too long on the thing, such as you run on a long Prehav run, you can start running into the third one. You'll see the interchange in flows around the person the pc is confronting in the bank. And that person's flows can jam and you will get a jammed E-Meter. In other words, if you don't run enough flows and directions, you'll get a stuck up meter.

Now, this applies, of course, in running any process. But what do you care, doing a limited process? Very limited. You are only going to run it for a few minutes. Something like this. You can't get anybody in very serious trouble.

But is there anything that you could get somebody in trouble with? Yes, you can overrun a flow. And now you get a stick and a kind of a – of a break-up that is known as a blow-down. You can run a flow too long in one direction and eventually it'll blow up. Something will happen. It's not necessarily good for the pc. But you can overrun a flow. And that's why I say when you're running a Prehav level you're overrunning all flows. You know, you can run them too long. There's nothing left there to run and therefore your tone arm is no longer moving. And you know you better come off of it, because the more you run it the more stuck it's going to get and you're not now doing the fellow any good. All flows are exhausted out of a certain zone or area or on a certain subject, so therefore, you get off of it.

So, all flows can run out and leave something else there. Well, you're running a, "mean to a mother." See? And you're saying, "Now, when have you been mean to a mother?" "When has a mother been mean to you?" "When have you been mean to yourself?" "When has a mother been mean to herself?" "When has somebody else been mean to a mother?" "When has a mother been mean to somebody else?" See, you're just – here's lots of flows, don't you see? "When has a mother been mean to others?" "When have others been mean to Mother?" You see? It can go on and on out – oh, I don't know, you can get it up to thirty-two commands without half trying.

And then you could make all these positive and negative. You can really get complicated. "When have you been mean to Mother?" "When have you not been mean to Mother?" "When has Mother been mean to you?" "When have – when has Mother not been mean to you?" Get the idea? "When has Mother not been mean to somebody else?" "When has Mother been mean to somebody else?" "When has another been mean to Mother?" "When has another not been mean to Mother?" Well, you get what we're doing here, you see. You're getting the
negative flow and the positive flow at the same time and you're getting all available flows that might stick up the case at the same time.

And you can just get... Well, it's something like the Ensign goes out and he takes his sextant, you see and he takes the eye piece of the sextant and he polishes it all up with a dirty handkerchief – he can't see through it, you know – and ruins the glass on that, you see. And then he takes the shades that go across it and he sees there are about ten shades in this particular sextant. So he pulls them all down across the eyepiece, you see, so that you can't see anything through it. And then he takes the thing and he adjusts it to – on the backwards limb of the sun, you see, so he's got to shoot over his head toward the sun, you know. And then as he's fishing around – it's evening, you see, so he can see the horizon and the sun and the stars. Sun's going down, you know and all this sort of thing.

The sun is too low on the horizon. He finds that's very difficult but there is some position that he can get into that he can see it very, very well. And he gets a beautiful shot. And he marks it all down. And he reads the vernier with a magnifying glass, you see, reads it down to the last second. He takes his time – Greenwich Mean Time – he takes it on the finest stopwatch you ever heard. He takes that down to the chronometer, you see. Compares it exactly. Then he starts looking up in his mathematical tables, you know. And he gets dozens and dozens of figures. And then he crosscorrects these things and he figures everything down absolutely perfectly. He scorns the air almanac because it's too crude. He's got to have the nautical almanac, you see, with everything. And he figures it out down to the last second of the day, the exact geographical position. Puts all these figures down; he's filled up the whole table full of figures, you see. And he's all set, you see and he takes – he takes a very sharp pencil, you see and he takes it and puts it right down exactly on the chart and he says, "We are exactly right there." And he says, "Well, that's a job well done," and pats himself on the back. And the only difficulty was, he didn't shoot the sun, he shot the truck light. [laughter]

Now, you can very easily do that, you see. You can very easily do something beyond the necessity to do it, you see or beyond the need of the situation. You can figure out the mathematics of it, you see. And you could figure out the mathematics of these flows down to a thirty-two command flows. See, thirty-two flows, thirty-two commands and then positive and negative on each one of these flow lines, you see. And that would give you sixty-four consecutive commands that you would have to give before you go around the next time. You get the idea?

Well, that's just opening up book after book and figuring out the nautical almanac, you see and getting it all figured, tight, tight and all perfect, you see. And you spend so much time doing this, you don't notice the pc has long since been out of session and has forgotten what the terminal was and has no longer any interest in it and so forth.

You get the idea. The – you see, the mind is actually capable of a considerable resurgence and you cash in on that all the time. You give the mind a free look at present time. The mind is free in present time. That is to say the person hasn't got a present time problem out in the society someplace, he hasn't got an ARC break with the auditor, he's freed up as far as present time is concerned, his auditing room is okay and he's being audited. All right, he gets with that freedom an ability to as-is. He does have a certain ability, don't you see. And this
takes care of a tremendous number of rough spots. He can take care of a lot of omitted lines. For instance, you can run a 5-way bracket and you wind up just fine. He'll get all of it. See, it will all come loose. You get the level as flat as is necessary in order to resolve his case. You get the present time problem resolved, you see, sufficiently, so that he can be in-session. All of these things are sufficiencies, they're not absolutes.

And auditing is not an absolute practice. If it were an absolute practice you would really be in the soup. Well, if every bad experience he had ever had in the last two hundred trillion years had to be audited out as an engram, it would take you the next two hundred trillion years, of course. Because a fifteen minute engram, quite ordinarily, if it's not on the goals-terminal line takes 4 or 5 hours to audit. So you get your multiple. So if you want to audit him two hundred trillion years, then assume that it has to be the absolute of everything ever – bad that has ever happened to him has to be audited out. Well, this makes an impossible look, don't you see. So auditing becomes impractical.

But nearly everything bad that has ever happened to him is going to blow if you pull out certain pins. Well now, that is the cushion on which you're operating, you see, that if we get this and this and this adjusted with the mind, then the mind is capable of readjusting. And it's the capability of the mind to resurge which is your biggest stock in trade. And the mind resurges to the degree that the rudiments are in and that the pc is in-session. In other words, you get somebody who is not quite in-session and you will notice that he won't as-is things easily. You grind and grind and grind and grind and grind and grind and grind and he just doesn't seem to be running anything and nothing seems much to be happening and so forth. Well, that's because you actually aren't operating now with the ability of the mind to resurge. This has been cut down to nothing By what? Well, by some present time problem and so on.

The reason you're running a Problems Intensive is to make the mind resurge sufficiently so that when you run the goals chain, you will – you will do ten times as much work in the same amount of auditing ordinarily. You see, you save time by freeing the mind up so that it can do these things. You got the idea?

I notice some of you looking a little blank about this. But flows – flows are pretty hard to get across to an auditor. I'll tell you that this has not been easy to do. So I give a talk on it every once in awhile. But it's usually not too well telegraphed.

Best thing you can do is go out and play with a garden hose for a while. You know, have somebody squirt it on you and you squirt it on somebody else and then have them squirt it on a tree and ... You'll eventually get the idea. Then you'll be hung up on this one probably: "Well, what is it that is flowing?" Well, the reason you're having a hard time with it is you don't realize the mind is full of particles. You think the mind is full of thoughts. Well, if there was anything wrong with the thoughts of the mind there would be nothing wrong with the mind. How do you think these thoughts ever connect up with anything?

Well, the thought gets connected with the particles and the particles get connected with solids. And the pc tries to think and runs into solids. And you audit him and you run into particles. And if you think there's nothing in the mind, put away your copy of Mary Baker Eddy [laughter] and start studying Scientology. You're actually, noth – there's nothing wrong with the pc's thinkingness. There's nothing wrong with his thoughts. It's the fact that his think-
Ingingness gets joined up with the creation of energy, space, time manifestations. And these things get all mixed up with thinkingness, so that he can't think a thought without getting a mass. Or he can't think of a mass without getting a particle. And he can't think of a time without getting a space.

These things are all mixed up and he cannot differentiate amongst these things. He can't differentiate amongst most of the dynamics, when he gets to thinking in the reactive bank. And the reactive bank, of course, is all dynamics associated with or identified with all dynamics and the sixth dynamic in particular identified with all dynamics and the seventh dynamic then identified with all of the reactive mind. And if you wanted to draw a map of the reactive mind, that would be the identifications in it.

You see, thinkingness only goes haywire when an individual is no longer able to differentiate where he should or associate where he should. He's no longer in control of differentiation or association. He gets identification. "Mama is monster. House is jail. Horses – beds."

And then he'll get up into verbal identification. You'll find out there are a lot of people around who have these semantic identifications that *Dianetics: The Modern Science of Mental Health* was built on. Had so many of them around that I specialized on it. Semantics of it are quite interesting "He rowed a boat. He r-o-a-d a boat. He r-o-d-e a boat. What did he dode with the boad." These are identifications.

And he – we found an airline pilot one time. .. You can do some interesting things with semantics. But they are either not very lasting or very, very pervasive. But they are terribly interesting and you can produce very fast phenomena with semantics. Over here in England, if we'd specialized more with semantics than we have, HASI London would do better. But HASI London has to suffer along because it's compared with the rest of the world, don't you see? And you find more semantic identification, probably, in HASI London than elsewhere.

But you get some kind of a situation like this. An airline pilot came in – I think he was National or American Airlines – came in, we audited him for a little while. All we did was look for the phrase that gave him a compulsion to have accidents or why he was flying. And this is what finally turned up, is a statement of his mother's. Well, actually, he had run a garage and he'd failed and he'd run this and he'd failed and he'd finally gone back to flying and he hated it. And he just couldn't figure out any part of this. But it was one phrase of his mother and the phrase was identified with many things, you see – with pain and so forth. But it then became identified with all things and the phrase was "He was no Earthly good." So reactively this worked out that he ought to fly.

We cured a case that had leukemia one time. It was just one phrase in the bank that was causing the leukemia. Just one phrase was all that was identified. And that is "It would turn your blood to water." He was a little kid, sick and his mother just said this all the time. And the auditor heard the mother saying this sort of thing and simply got the kid to repeat it and repeat it and repeat it and repeat it and repeat it. That was the end of the leukemia. Blood was water and that is leukemia.

But you could make some interesting stunts this way. Old semantic auditing; identifications of words with words – there – these things are very, very interesting. But an auditor
has to be very clever and he very often isn't successful and he fails many times and some people – just impossible to drill into their heads and find out what it is that is associated.

If you could run engrams on everybody, with semantic association, we'd probably still be doing it, but you can't so we'd have to look for more basic things. You see, Dianetics ends right about there; doesn't go much further than that. It has to do with the engram, identifications that are associated with the engram and an understanding of semantics. And then it takes off from there and the first real departure is the discovery of overt acts, 1950, end of 51 – that everybody was running motivators, motivators, motivators and the only thing that made it come free was getting the overt off. That's as early as 1951. I don't know if you knew it was quite that old.

But just exactly how to apply all that and how to get it simple and how much importance it had in the mind and so forth – it took many years to level this thing out so that it was functional.

But this flow situation can be overdone by the auditor. You see: positive-negative. Thirty-two directions of flow. "Get the idea of giving something to somebody behind you." "Get the idea of somebody behind you giving something to you." you know. There – well that's a flow line. "Get the idea of not giving something to somebody behind you." "Get the idea of somebody behind you not giving something to you." "Get the idea of somebody under you giving you something." "Get the idea of you giving you something – giving something to somebody under you."

Well, we're just getting – it's getting ridiculous, you see. We've over-enumerated the whole problem, you see. The mind is more capable than that. The mind could actually take care of many of these things. If you get the pins straightened up somewhat, the rest of them will straighten up, don't you see? So, you can use a 5-way bracket and get there.

Well, the only real mistake you can make, of course, then is having so many flows that you really never get a chance to get down to the root of the problem. It's all goes into the mechanics and then you'll find you've shot the truck light, the pc isn't even in-session.

And you can make a mistake the other way. And that is to undercut, that is to under-number the flows. You find the pc always runs something from out there in, always runs something from out there in, always runs something from out there in. Your E-Meter is going to start getting a sticky needle. Your tone arm is going to start going up. You won't know what in the name of common sense is happening

Now, of course, he has withholds. So, crudely, you could get off a withhold and stop him from doing this. But you should understand why the E-Meter acted that way. The E-Meter acted that way because he was running everything as a motivator, everything as a motivator, everything as a motivator.

"Oh, well, yes. Yes, I did have trouble with my family." You'll find in the Problems Intensive. "Yes, they beat me and they beat me and – then... My mother beat me a great deal and when she got tired, my father would beat me. Then they would both beat me and then my older sister beat me and then they all beat me. And that was – that was times, of course, when
they weren't swearing at me. They used to swear at me awful badly. And uh – and uh – then I had an Uncle George and he kicked me; he kicked me."

Well, after a long sad dissertation somewhere down along this line, you're going to find this E-Meter will keep going up, tone arm keeps going up, the needle starts getting sticky and so on. Well, he's just going motivator-motivator-motivator-motivator-motivator. Well, of course, that's just one flow. Them out there was hitting in toward him here, you got the idea? And you've got an inflow, an inflow, an inflow, an inflow, an inflow. Well, he's been going on like this for years. It's not just in the auditing session. You're just going on letting him do what he has been doing for years and years and years. He's told everybody about how they beat him and how they kicked him. And of course, this is just more in, more in, more in.

Well, in view of the fact they didn't do half of these things or didn't do them at all, he's not going to run anything out that really isn't there because, in the first place, what's holding it pinned is the fact there's never any flow going the other way. There's no reverse flow of any kind. He never mentions what he did. Well, he did – he did outflow. In fact, the outflow is basic on the chain.

So until you trigger this outflow, none of the inflow will release. It's quite mysterious. You trigger – it looks to him like, well, it was what he did and he really should have been guilty in the first place or something. It looks – it looks moral to him. But in actual fact it is not moral. It's the fact that he started an outflow along a certain Tone Scale level, you see? He decided to be mean and nasty and he gave out a heck of a lot of overts. And he opened the gates wide open, because he made a line on which an interchange could occur. And having made this line on which an interchange could occur, now he can be inflowed upon on mise-motional levels. Well, for some reason or other, every time he starts to get off his outflow line, the inflow line attracts his attention and he can only pay attention to the motivators. So he says motivator-motivator-motivator-motivator-motivator and he never gets well.

Now, you say, "What did you do? What did you do?"

And he says, "Well, not very much. In fact, I've never done anything." And your needle gets a little higher and it gets a little stickier. And you finally – say, "Well, at one time, the actual fact is, when my father was beating me – he had me down on the floor and he was beating me with a two-inch thick stick. And he was beating me very hard. And I did, I had an overt: I frowned slightly." [laughter] And we – and we move upstairs on that gradient and we eventually get his overts off and the beatings disappear, which is all quite mysterious.

And that is simply based on this one horrible fact that a thetan was never inflowed on, until he himself had outflowed. That is a basic rule. A thetan was never inflowed on until he himself had outflowed. And that, you can mark your stars, is right.

I'll give you an example. Well, you come along to this new planet. Now, how is anybody going to know how to shoot at you? Figure it out. How is anybody going to know how to shoot at you? They don't even know you're there till you outflow. See, you're totally invisible till you outflow. So you have to outflow in order to get an inflow. So basic on the chain is always the outflow. You aren't visible until you outflow.
Therefore, you get an awful lot of social codes of the best and safest thing to do: Never say anything and never be anywhere. That's safe. See, that's good and safe. Of course, you never do anything and you'll never see anything and nothing will ever happen. That's true too; nothing will ever happen. Nothing ever? Not for millions of years, nothing will ever happen. You see how it would be? You would at – never at any time outflow in any direction.

Well, the police, evidently, in many areas think this is just the thing. Because the only two things that are ever punished in this universe is communicating and being there. If you will be there or communicate, these things can be punished. If you want to evade punishment, and if there mustn't ever be any punishment of any character, of course, obviously if those are the two things that are punished – just never communicate and never be there. You won't live either, but that's all right.

Many people solve it this way. Somebody that you think of as being in apathy simply has solved the thing that way. He's got life solved. It's all taped; it's all taped. He'll get along just fine if he's never there and he never speaks. And he goes around and he gets a reputation for being a good listener. And he gets a reputation for this and he gets a reputation for that. And after a while they know he's there. And then they find out that he's inoffensive. And he's very easy to inflow on. So they kick him! [laughs] And that invalidates his solution.

His solution only applied to while he was out here in space someplace, you see. But where he adopts this as a halfhearted modus operandi for existence it won't work. Yet you'll see it taught as a social code. You'll see in schools they're always teaching some young boy, or they're teaching some young girl. Lot of girls wandering around have this down pat: "All you have to do is listen to a man and not quite be there and never really be on time for appointments, you know. Be a little – a little bit late; joggle it somehow." That keeps a man anxious. They have ways and means of explaining why they do this, you see. There's lots of rationale about it.

Actually, all they're doing is solving life by not communicating and not being there. And then one day, somebody gets mad at them and knocks their head off. Well, why does somebody get mad at them. Well, they get mad at them because they're not there and they're not communicating, of course. [laughter]

All right. Well, I just wanted to go over this with flows, because here you are going into Problems Intensives and all of a sudden you're having to put together auditing commands and you find that these auditing commands are somewhat dependent on the subject of flows. And being so dependent, you must pay some attention to it. This is something an auditor should always pay some attention to when he's putting together an auditing command. One is clear the auditing command. Make it – sure that the pc understands it. Make sure that the pc can answer it or get the thing squared around or spoken or worded so that it can be understood. That's clearing the auditing command.

The next is registering the auditing command on the meter, which is almost clearing the auditing command, but not quite. Let's make sure that this is something that makes the needle move. Let's not just dream up some oddball version of an auditing command and never inspect it on a meter. You should always look over your meter with regard to an auditing command you're going to run.
And the next thing is, is every time you give a command get it answered. Now, those are the things to know about commands, basically: That you've got to get it answered, get it understood, get it runnable, make sure that it registers and make sure that when you speak the command, finally, it is all set, all squared away, you know what's going to happen. And when you speak the command, you do get that question answered.

Yeah, it's a pretty hard one. But part of putting together the auditing command is making sure that you don't set up a stuck flow situation. You're not going to run a thing like, "Think of beating your wife. Thank you. Think of beating your wife. Thank you. Think of beating your wife. Thank you. Think of beating your wife. Thank you. Think of beating your wife. Thank you." After a while, the tone arm is going to rise, the needle is going to stick. And you're going to say, "Well, that's flat." Yeah, well, as far as it went, it's flat. It's flat into a ridge, that's what it is. You've made a ridge. He's out, out, out, out, out, out. The games condition of it is violated, of course, because beating your wife actually is giving her something. It really is, you know.

You'd be surprised. That's why war is degrading: soldiers are always giving each other things. You start to run it and you test it out and you'll find out that it'll run just that way. "Be nice to the enemy, give them some bullets." Now, if you could run a war – if you could run a war so that it was a total inflow war – that is to say – that probably wouldn't work either. But so that you never gave the enemy anything – if you could run a war so that you never gave the enemy anything; never any bullets, never any mock-ups, never any signs of soldiers or anything like that, why, that'd be fine. That'd probably work out all right. But you'd have to – it'd be a peculiar kind of a war you'd have to figure out in order to make that come about.

But otherwise, there sits the machine gunner. Holy cats! You ever figure out the amount of weight of a belt of machine gun bullets. Well, he's just handed them gratuitously to the enemy. He's giving them away and eventually will feel degraded. Then he explains it all to himself on a religious basis. He says, "Well, actually, thou shalt not kill and here I am out killing and therefore, because I'm doing that and these actually are this and so on and that... " and figures it all out. And, actually, it's – the most fundamental of it is, is he's giving something away while in a games condition. So he must be losing if he is giving away. And he figures it out that he's losing the war if he's fighting the war, if he fires any bullets during the war – 'cause, it's total nonsense, but that's the kind of the way this flow thing figures out.

Then he'll have thoughts about it and it is contrary to certain mores and then that gives him efforts to withhold so he is firing bullets while trying to withhold them. And then he's got a lot of things explained to himself as to why he's fighting the war and they have nothing to do with him. So he's fighting the whole war on an irresponsibility. If he kills any man, that's not his fault, it's the war, you see.

All of these things start adding up and you get so many lies and so many curves and so many vias that the whole thing becomes quite degrading after a while.

But the – an auditor shouldn't run a counter-games-condition process if he can possibly avoid it. If it's all give, it's contrary game conditions. You can have it all receive and not be contrary games condition, but it's contrary to flows. So these things you have to keep in mind in putting an auditing command together. So you want to get some kind of a grasp of
exactly what they are and put the auditing command together so that flows will balance and the pc can understand it and so that when you finally haul back and let go with the auditing command, it can be answered, it will be answered and you are going to see that it's answered and that's it. And then don't wind up at the end of the session finding out that only 25 percent of your auditing commands were answered. You gave twenty-five questions, you must have twenty-five answers.

If a question is missed, you could even go back on this basis. This is important enough so that you can ask a pc – you know, the out – the end rudiments are out, see – and, "During this session, is there one auditing command you failed to answer?" Almost important enough, you see, to be an end rudiment. "Is there one auditing command or more that you failed to answer to your satisfaction," and so forth "in this session?"

And all of a sudden he tells you, "Yes, there was. Yes, there was," and your end rudiments go in. You see, it's as magical as that. But we count on the auditor making sure that those auditing questions are answered, so we haven't added it into the end rudiments yet. But it's actually important enough that if I were recomposing end rudiments I would probably put it in there.

All right, well, I've talked a lot here. Tried to give you some answering of that, you woke up something. But I've had to hand out a couple of two-way flows on problems, already – two-way flows. You know, I had to have a double question for the problem because the problem was so gauged that the pc never would have reached the other side of a flow. It never would have balanced itself up in the run. You see, you can use an auditing command wording that the pc will run all sides of the auditing command. Like "What was happening during that period?" Well, you've now asked him – any flow that comes up, he will tell you about, don't you see? "What was happening, during that period." But now you say, "What were people doing during that period," you've probably got him out of it, see. So you've deleted it down. So if you said, "What were people doing" you'd also have to say, "What are you doing?" See, "What were you doing during that period?" you know. You'd have to balance it up.

But there are wordings of auditing commands which go as a total. You get a wording of the auditing command so that it will take up any flow that comes up. And there are quite a few of them. "What is happening?" Well, or "What was happening?" "What was unknown?" should be one of them, if it isn't such an introvertive problem.

Also, I should mention to you, before I forget it, that O/W also runs that problem. You know, you could – you could assess it out for some people and run O/W on the people, you'd still run the problem. You could say, "What part of that problem were you responsible for?" or " ... have you been responsible for?" That would run that problem. Any one of the old Problems Processes would run on the Problems Intensive problem. We're just running the best one which is "unknown," you see.

Pc couldn't get an idea of "unknown," you always have "forget." That's the lower harmonic of "unknown." "What has been forgotten about that problem?" "What have others forgotten? What have you forgotten?" if you wanted to broaden it out. "Forgotten" is always the lower harmonic of "unknown." "What didn't you know? What didn't others know?" "What shouldn't have been known about that?"
You – any – there's lots of versions. You remember all the versions I gave you on how to run an engram with "not-know?" There's a lot of them. There's all the versions of "unknown," "not-know," "forgotten," "they forgot," "shouldn't have known" – all of these things. All these types of wordings actually could be run on that problem, in trying to clear it with a pc, you see and the pc can't get the idea of unknown. Well, you have other choices. It isn't good enough to just leave the problem unrun. You've got other choices. There are many types of wordings and flows and so forth you could run a problem with.

Because I pointed out that in a Problems Intensive, your basic goal is to run the problem – not to word it; your basic goal is to run it, you see. And the reason you have that goal is you wish to clear it. So, therefore, if you're going to run the problem, you should run it in such a way that it will clear. And if you run it on a stuck flow, of course it won't. And if you run it with the pc unable to do anything about it, you won't.

Yes.

Female voice: on this running a problem, do you use the terminal ...

Hm?

... or the terminal's name?

Oh, you use the terminal, terminal's name. When you get a problem now, in that particular bracket, you aren't doing an assessment. You shouldn't be assessing for any terminal or terminal's name in the problem. But if there is a terminal inherent in the problem, you just use that. The whole question of getting the problem in a Problems Intensive is getting the pc's statement of the problem. It's a rather limited run. You get the pc's statement of the problem. Now try to make an auditing command out of it as close to it as you possibly can that is an intelligible auditing command. It's very simple. What evades you is the simplicity of it. That is what will evade you.

Female voice: He wanted to please a person.

Hm?

Female voice: He wanted – the problem was how to please a person – a particular person.

Well, what did he say? How to please, I wa ... ?

Female voice: How to please ...

"How to please Joe."

Female voice: Yeah.

All right. But now, the way you would apply this. The person gave you the problem "How to please Joe." All right. Now, the way you apply this rule is the simplicity. Always go in the direction of the simplicity. "What was unknown about pleasing Joe?" But we make sure that the pc understands that, that it registers on the meter, that it is answerable and that it doesn't violate too much of two-way flow.
Now, that doesn't necessarily violate because you haven't said, "What is unknown about you pleasing Joe?" You – all you ask is, "What is unknown about pleasing Joe?" Well, the flows will come into it, but it'll still clear, probably. But you hear the pc say, "Giving him this. Giving him that. Giving him something else. Giving him something else. Giving him something else," and you know right away – now what's going to happen here? His tone arm is going to go up, up, up, up and then the needle is going to stick. So, you're running – actually running into a stuck flow in some fashion.

Now, you could simply stop the thing. You know, just casually – just end the process momentarily, without upsetting the pc. I do that – I do that very wordy. There's a – there's a whole ritual that I use connected with this. I have a whole boxed-in ritual. It's very – it's done with a surplice, you know. And you get this surplice on and you do this big ritual, see. And after you've burned the incense and everything else and interrupted the pc and gotten him out of session utterly, you go through this ritual. It has to do with wardrum chants and so forth.

Now, I say – I say, "I'm now going to add another side to this," and give him the other command. And he usually never notices it, he just answers it. We're going along, "How would you please Joe? How would you please Joe?" "And, how...? What's unknown about pleasing Joe? What's unknown about pleasing Joe?"

"I wouldn't know what to give him. I wouldn't know what to give him. I wouldn't know what to do for him. I wouldn't know what to do for him. I wouldn't know what..."

And you say, "Well if it's all right with you, now, what we're going to do is just add this other command." And, "What isn't known about Joe pleasing you?" And, "What isn't known about you pleasing Joe? Thank you. That's good." And the pc thinks it's all right and it goes along. I did it so it must be all right. You don't get him out of session either.

I – it curls my hair sometimes when somebody uses a piece of ritual to blast a pc out of session, get him totally disoriented, get his agreement on something new, clear a brand-new auditing command with the pc, use the next twenty minutes or so, something like that, getting it all straight (what pc? what session?), when all he had to do was just add the other leg of the command.

What in essence is he trying to do? He sees his tone arm is going up and the thing is going to go "stick." And he says, "Oh, oh yes, oh yes. The flows are out. Yeah, well..." And he just adds the other flow; says, "Well, I'm going to add this other command. All right. Here it is," and bang. Or something on the order, "It won't upset you now if I add another command." You know, subtle. [laughter] You'd be surprised how often a pc settles right down when they know you mean business and you're getting auditing done.

If your intention is to get auditing done, not to follow a ritual or go into nonsense, boy, you'd be surprised what you can do with a pc. You just tell them, "This is the session. This is what we're trying to do man," and give them the auditing command and they stay right with it, bang, bang, bang.

And the pc tries to give you a bunch of this and he gives you a bunch of that and so forth and you go around and you run an ARC break and you go on and run another ARC
break and then you give him another command and then you run another ARC break and you give him another command ... 

Well, if you're going that way with a pc sometimes, try this one. Try this one: You give him an auditing command and the pc has an ARC break, give him the next auditing command. The pc has an ARC break, give him the next auditing command, make sure it gets answered. And he has an ARC break and give him the next auditing command. Make sure that it gets answered. The pc says, "Well, all right," and goes on and runs it to the end of the session. You can hardly find a trace of it in the end rudiments. Because you're sitting there giving the pc a session. The pc is in-session, *clank!* He's in good solid control and the pc is really worried, because he doesn't think you're going to give him a session. That's really why he's worried. *That's* what worries him. And when you go – plow straight on, giving the pc a session, the ARC breaks vanish under the realization that he's having a session.

That's always the better way to go about it. Pc blows session, leaps out of the chair – if you're not smart enough to be between the door and the pc always, as standard practice, you should get different ideas about pcs. If the pc is nearer the door than you are, what chance have you got of stopping a pc who blows session? None!

On several occasions pcs have blown session on me and have *always* found me between them and the door. They never, ever found me getting up. They never had a chance to get out of their chair, usually. If they did get out of their chair, I'd whirl them around, put them back in their chair and give them the next auditing command.

And they'd say, "Yow, yow, yow, yow, yow!"

And I'd say, "And the next auditing command *is* ... Answer it!"

"Oh! Oh, well, if that's the way you're going to be about it." [laughter] Bang! That was the end of that ARC break. And, by George, on the end rudiments you sometimes will look in vain for the incident. It's not buried, it's not occluded. It just didn't bother 'em.

But this would have bothered 'em: "Well, did you have an ARC break?" "What did I say that upset you there?" "What were you thinking of at the time you tried to blow?" Well, the pc will keep on blowing. Why? Because the pc is short of auditing The pc has an ARC break because he is short of auditing. The pc is having difficulty having auditing. Anything that goes wrong to a pc in a session is registered on the basis of a scarcity of auditing. Just mark that down.

I don't care how complicated you want to make the statement, it adds up to that – and of course, is best remedied then by *giving* the pc auditing. All protests by the pc are from the basis of not receiving auditing. He doesn't think he's receiving auditing.

And you just think over the number of protests you've made as a pc, the number of protests that you've heard as an auditor and they all add up to this: "You're not auditing me," see. That's all they add up to. Or basically, more fundamentally on the raw public or something like that is, "You couldn't do me any good." In other words, you're not auditing me. Boy, scarcity of auditing is fantastic on people who don't know anything about it. But do you know it's just scarcity of auditing? That's what's odd. It's scarcity.
Some guy goes on and on about how terrible Central Organization is and how awful it all is and how terrible the HGC is, and so forth and how the auditors never audit anybody. And he goes on and on and on and on and on and on and on and then he winds up and says, "Besides, they charge too much and I can't afford to have any auditing there." Interesting. Fascinating.

But there is your basic protest. And in handling all such commands or handling any auditing situation, the best answer is always to give auditing.

Now, I lost your question in the run. I hope I did answer it in passing. Okay?

Female voice: Thank you, Ron.

All right.

Okay. We got time for one more question. I did want to talk to you about flows again and about commands, putting them together, because you're getting into this strata of the Problems Intensive and you're going to have to have some oddball commands, believe me.

You're trying to security check somebody and they never security check on doing anything "Doing something to Uncle Harry? Oh, no, I never did anything to Uncle Harry."

"Well, what did you do really to Uncle Harry?" or "What do you think you do?" or "What was a bad thing to do to Uncle Harry?" and so forth.

And you find out, "Well, I had an unkind thought about him." And that is a hell of an overt. And this is the pc's level of overt to Uncle Harry, so you have to, right that moment, start – it's actually, you start a kind of an auditing question, "What unkind thought have you had about Uncle Harry?" You see?

And this will run and run and run. And all of a sudden you'll find out that this doesn't run anymore, although they have more unkind thoughts about Uncle Harry – or what is this all about? And then you'll find the other side of it, is you've run into a stuck flow. You're running a stuck flow, see, unkind thought that he didn't tell, didn't tell, didn't tell, didn't tell, didn't tell. You get the idea, didn't tell, didn't say, didn't say. And you're just ripe for one – "Did you ever do anything to Uncle Harry?"

"Oh, I never did anything to Uncle Harry. I just broke his golf clubs one time and stuffed mud down the barrel of his shotgun. [laughter] And, of course, that was reasonable in view of all of the things he used to think about me. Oh, yes and uh ... oh yes, and broke his razor and uh – yes, as a matter of fact ran his car... oh, that one. Oh, well, wait a minute." Now we find it, see? They wrecked Uncle Harry's car. They ran it into a telegraph pole and that was it. And it wasn't even insured and he couldn't even buy another car. And it was a fantastic situation. This is all buried under the unkind thought.

But you could overrun one, don't you see. You could overrun an auditing flow line. And you have to pay some attention to that, because there's no ritual I can write up that'll get you over it. Because sometimes it runs and sometimes it doesn't run. Pc – you can sit there on Black and White on a pc who has a field and if you run exactly the right flow the field will go white and then you reverse the flow, the field will go black. It's the most mysterious thing you ever saw. It's easy to do, you – you should see some of these phenomena that associate them-
selves with flows. It all goes together with putting together auditing commands. You have to be doing it, that's it.

Okay. Time for one more question. What is it?

Yes, Reg.

Male voice: What uh – would be the criteria for the length of a Problems Intensive – of uh – of this Problems Intensive?

The criterion of what now?

Male voice: of how long to run it.

How long to run a Problems Intensive?

Male voice: Yes.

That's total tone arm. Tone arm. Now, a tone arm going flat can go flat from two sources. That's why I'm being so insistent here about flows. A tone arm can stop moving because the flow is out. But if you're running a proper auditing command, getting it answered and so on, the tone arm will move normally and you just run it with the twenty minute test on the problem. It's a good thing to get that problem out of the road and to get that real good and flat before you go into your check. And how long to run it – you run it exactly against the tone arm. Does that answer your question?

Male voice: Well, I was wondering, is there another problem going to come up when you flatten the first one?

Oh, but you never run the second problem.

Male voice: You don't run it.

Oh, no, no, no.

Male voice: You can't run the confusion uh – with the – with the uh – change stuff.

Well, you're going to run the one problem. You're going to run that flat on the tone arm. When the tone arm is no longer moving, then you're going to do an assessment of people in the confusion immediately prior to that situation. All right. Now, having done an assessment on all these people, you're going to wind up there with one person and you're going to run some Security Check on that person.

You're not going to admit of anything else happening. Nothing else can happen. The pc thinks of eighty-five more problems, that's just tough. They're simply under the heading of cognitions. You say, "Fine." The pc says he has a problem with that person. You say, "Fine. That's dandy." And you just go ahead and run your Security Check on that person. As soon as that person no longer reacts on the needle, you run another assessment on that list and you run that person flat.

Be prepared about that time to find an unknown personnel suddenly leaping into view who is the central character of the whole ruddy lot. Put that person down and that person assesses this time and run the Security Check against that person. And you'll wind up at the other end with this list here in a state where you can read off these names and you don't get...
wild needle reaction. In other words, it's not a charge situation now. It's not a charge situation. And so you just leave it; you just leave it.

And now, you go back, you take a – you file that P section and you get another completely new P section. If you have done a very poor O section, which is to say the changes on O are not self-determined changes but other-determined changes, something like this – and you just got a whole bunch of occurrences, operations and that sort of thing – you have trouble getting a new assessment that will make any sense to you. So make sure that O section is okay. But then you just reassess the O section and do a brand-new P form right straight across. You only want one problem. You only want one set of people. You can add to that set of people, you can't add to the problem. Does that answer your question?

Male voice: Well, yes, Ron, except for there – I am asking how it will be intensive. How will we keep running problems on this individual. Uh – I've got the one incident run right through and ... All right. All right. How long do you want to run this?

Male voice: Yes.

Okay.

Male voice: What's the criterion there?

The criterion, far as it's concerned, is the pc has many difficulties. As you assess these one after the other and go down the line of his O section and you don't get anything in the way of an assessment, you're through. In other words, these things are no longer troubling the pc. These changes which you have assessed are no longer troubling the pc. Then you are through with that intensive. That's how long you would run it. Now, how many hours that would take to run would be too difficult an estimate.

I originally planned this as a twelve-and-a-half-hour run. That's how long it would take me to run one. I don't know what it's going to get into, because I've seen three sessions to do O – an O list just done at the end of the third complete session – all of which should have been done at the end of the first session, see. So I wouldn't say. I dare say that on a rather difficult pc an auditor auditing fairly rapidly – I'd say twenty-five hours should cover it fairly well.

But that isn't the last you're going to see of this Problems Intensive, you see. You – this isn't the last you're going to see of this. You're going to do – after that you're going to run the Prehav level on the terminal and you're going to run those terminal – the terminal on those levels and you're going to get some of those out of the road. You're going to straighten up some of the engrams that you run into. You're going to run some more levels and then you're going to do this thing on the whole track. It's almost identical with the form. And it's not much change. After you've opened the fellows track up one way or the other, you say, "Well now, what self-determined changes have you had in your lives?" [laughter] And you do an O session – section on that and so on. Probably have to be some other wrinkles connected with it. But that isn't the last you will see of that.
And it never pays to use up too much time on a person's present life. One, it doesn't pay actually to audit a pc too long who can only remember their present life and who has never seen a past track facsimile and so forth. Your Problems Intensive will actually blast that open. Get a goal, get a terminal, do a Problems Intensive and I guarantee you that he will be looking at the past track.

All right, now to open up that past track, level runs and then engram runs and some more levels. Now, you're going to have a lot of past track open and then you could do a much more effective Problems Intensive. You think this first one here is effective and produces "Wows!" on the pc. Well, wait till you do one of these whole track ones. Yeah, that's pretty wild.

For instance, I don't know, I ought to get somebody to do one of these present life Problems Intensives on me, see how it goes. Because, in the first place, I haven't been able to stay in that zone and area. I can't think of a single problem I've had in this lifetime. They all – all are somewhere else. They're old friends, these problems. [laugh] Does that answer your question Reg?

Male voice: Yes, thank you.
You bet.
Yes.

Female voice: How does this new rundown affect the routines?
What new rundown here?

Female voice: This O and P. We're doing this on uh – this time – lifetime and we're going to do it on whole track as well.

What?

Female voice: This O and P section.
You mean, this new – this Problems Intensive we're doing now?

Female voice: Yes.

Has nothing to do with whole track.

Female voice: Yes, you said we're going to do it against the whole track – Problems Intensive.

Ahhh. You – come on, come on, come on, twist your brains around here. Listen. "Eventually" means when a pc is ready for it, we will do a whole track Problems Intensive. But if a pc isn't ready for it and you're just at the beginning, we'll do a present life Problems Intensive. This doesn't mean that eventually we're going to change our minds and on all pcs we do whole track Problems Intensives. See, there's a difference here.

What we've got, essentially, is a progressive opening up of track. And you'll find that the pc somewhere on down the line, after you think he's going to go Clear and everything is very nice, will all of a sudden jam. Well, this mystery of his jamming is the fact he's run into a new problems chain of some kind or another and you have opened up a new circuit.
you're running through a new series of hidden standards. And therefore the pc doesn't go Clear. But I've been studying, here, the barriers to Clear. That doesn't influence it at all. Okay?

**Female voice:** Doesn't influence the Routines – 1, 2 and 3 – at all?

What routine?

**Female voice:** Routines 1, 2 and 3.

**Another female voice:** We're only doing Routine 3 and Problems Intensive now.

**Female voice:** Okay. Thank you, that answers it.

No. Routines are routines. This doesn't influence any of those routines. Routine 3 is exactly what it is, which is, actually, Goals and Terminal Assessment with Security Checking and Prehav level runs. That is exactly what Routine 3 is. It's never been anything else and it's not going to be. A Problems Intensive – a Problems Intensive is actually a broad method of doing rudiments and Security Checks. And you shouldn't look at it as anything else but a method of doing broad rudiments and broad Security Checking and that's all it is. It looks like a brand-new package, but if you investigate it very carefully it gets the rudiments in and gets the Security Checking done where it'll do the most good. Okay?

**Female voice:** Thank you, Ron.

Okay. Now, by next Tuesday, I trust that some of you will have finished this Problems Intensive and you will have that all straightened out and that'll all be going on swimmingly and you'll be getting on to your Prehav level runs – by next Tuesday.

I have a certain impatience about this and I have news for you: The number of problems a person has is in direct proportion to the slowness that he audits. The number of problems a person has tells you exactly how fast he will work in life. If he has quite a few problems he may get hectic and work hysterically fast, but then he will eventually slow down. He'll tire out. But the number of problems a person has, determines his speed of accomplishment. And if you want anybody to speed up in life in general just care – take care of his problems, get his stuck problems out of the way and get those things all squared up and you will find that the individual speeds up in doingness in life. That works, by the way – that's quite a handy thing to know. You see that a workman or an executive or something like that, just can't ever seem to accomplish anything. Well, he has problems.

**[Editor's note: The tape ends here abruptly, as does the original master recording.]**
Okay. Here we are and this is the 24th of October 1961, and a very interesting day it is. The reason I'm late is I've been building a fireplace, and if I start making little errors here and talking about, "Well, the flue goes over here" or something, you'll understand this.

Now, you are embarked upon an interesting activity just now. Not all of you, but the bulk of you are running your terminals on a new series of commands. And this new series of commands is a very well thought out hydrogen bomb. And I can't tell you at this moment that there will be exactly no change in this particular series of commands, but I have been working on nothing but this command package for about two weeks. I'm just trying to smooth these things out.

Now, this very well may shorten clearing. Do you think it will?

*Audience: Yes.*

Because I have told you many times that auditing was a third dynamic activity, and so it is. Even more importantly, apparently, most aberration, as we learn in a Problems Intensive, stems from group mores.

Now, how would this be? It'd be basically that there was an agreement. And if you look at the Reality Scale, you will see that an agreement ranks high on the Reality Scale.

Well, a group is a multiple agreement. And as an individual agrees to and then disagrees to, he runs a one-two contradiction on his own postulates.

In other words, he says, "I agree," and then suddenly he says, "I don't agree." When a person becomes a member of the group, he *agrees* to certain things and then finds that he cannot uphold these certain things, and then of course disagrees to these certain things. Now, this is one of the highest levels of the Reality Scale. This is very high on the scale. But having agreed to and then having disagreed to, he of course does not then as-is, ordinarily, his original agreement. All he does is disagree to.

So he finds himself in disagreement with himself. Well, it was his agreement, wasn't it? And now he disagrees to this. So now he is in disagreement with his own agreement, which of course is the – apparently the first and foremost invalidation of a thetan. He invalidates himself by agreeing and then disagreeing to his own agreements.

In between the agreement and disagreement, we get a further set of agreements and activities, all of which are less in value but nevertheless bring about a complexity. He agrees to be a member of the I Will Arise Burial Society of Birmingham. And he agrees to get hisself buried. And he agrees to pay twenty-five cents a week from here on out until he's buried. And he doesn't get buried, and he hasn't got the twenty-five cents. But he also finds out that the
treasurer of the organization doesn't spend this on tombstones as he's agreed to do. He hears some kind of a rumor or something of the sort, that he spends it on new Buicks.

And then he finds out dat the last few brethren dat was buried – dey was buried face down. [laughter] And dey wudn't wearin' no coffin. So he now disagrees to pay his twenty-five cents a week, and he disagrees that it's a good thing to be a part of the I Will Arise Burial Society. And now he runs up a whole series of overtures. He goes around and tells all of his friends that they must stay out of the I Will Arise Burial Society.

All right. So we're busy running this fellow, and he tells us motivator, motivator, motivator, motivator. "Dey took dis twenty-five cents, and dey put it in dey pockets. And dey didn't put anybody in de ground proper." And he tells you all of this. "They did this to me. They did this to me. Actually, it was seventy-five dollars, nine hundred dollars," or something of the sort. It doesn't matter what.

And he tells you motivator, motivator, motivator, motivator, see? Well, to free up this whole situation, you have to somehow or another uncover the – something on the order of the original agreements or activities.

Now, it so happened that the I Will Arise Burial Society had a great many social activities. And after they joined, they had a right to go to all of the funerals. And the I Will Arise Burial Society always provided all of the beer. And they provided a band and it was supposed to be quite an affair, you know?

And actually, as we begin to sound this particular activity with this group, we find out that for something on the order of twenty-five cents a week over a period of five or six years, this fellow averaged a funeral party a week, and at every funeral party drank fifty cents worth of beer, you see. And frankly, the I Will Arise Burial Society ceased to exist for economic reasons. They were burying people too proper. That was the trouble, you see? And they exceeded their exchequer.

Well, what have we got in there? We've got a whole area of motion – enjoyed motion. The individual enjoyed himself during that period of time, mutually, with other members of the I Will Arise Burial Society. In fact, he was, at one time, completely unable to differentiate what was his decision and what was anybody else's decision in the I Will Arise Burial Society. Dey was dancin' and dere was lots of beer.

And during some of those beer times, it was totally impossible to differentiate who was decidin' what. So we get an unknown area. We get a mutual action area. And all of these things have to do with a little group that came and went and disappeared because of financial insolvency. And we find our pc absolutely certain that he will never be buried. And we've got half the pictures he's got on the track of being – of dying on a point of land, you see, that is out in the open and just lying there with his bones being picked upon by the vultures. And he's got it with full somatics, you see?

And we've got pictures of him floating as jetsam, flotsam on the high seas with the seagulls scratching his eyes, you see. There he is, stone dead. No, women float face up, that's
right. Anyhow*, scratching the back of his neck and so forth, and there he is decaying into a cadaver with the fishes nibbling upon his face.

And all of these are very interesting pictures. And I'm sure that we could be very elucidative on the whole subject of how these pictures came to view. And we all agree that this is a horrible circumstance: not to be buried. But we begin to look at the chain of "not being buried" on the track, and we find out that he practically never got buried.

Well, we've cracked through a barrier here which has been in existence for – let's see, 1948 to 1961. Why, if the thetan was making his own pictures, why was he making that particular type of picture? Yeah, why was he making this? What was his proclivities for morbidness? And we find the answer in the fact that he can no longer differentiate between his actions and other people's actions. That's one of the first things we find out. He cannot differentiate. He can't tell what happened. He doesn't know what he did, and he can only condemn what they did. And he is not sure who was cause. That's what it all amounts to. Who was cause of any of these communication lines or actions. Who caused these lines?

Well, you find somebody dancing in the I Will Arise Burial Society Hall, and there's a tremendous crowd of them, and they're all dancing and they are dancing faster and faster. And all of a sudden there's a tremendous crash, and all of the beer barrels which are stacked up roll on the floor because the combined efforts of the crowd move too surgingly in that direction.

Who caused it? Well, he gets a we caused it. Oh, isn't that interesting? We caused it, did we? Now, that's fine. There's actually only a very few of his motions were contributive to the beer barrels going out on the floor, but which motions? Well, he doesn't know.

And he gets confused with his causes. Then he doesn't know who caused what. And one day at a particularly violent funeral, there was a fight. And he was in a tremendous fog because of too much beer, and when all of the smoke cleared away of de fight, dere was de brother lyin' on de floor, and he wasn't breathin'. Who killed him? Well, he doesn't know who killed him. In fact, nobody ever finds out who killed him. The I Will Arise Burial Society sort of killed him, but there is no motion caused by any mass called the I Will Arise Burial Society. That is a bunch of motions individually caused. And the fellow after that begins to wonder if he maybe didn't kill that brother dat was lyin' on de flo'.

Some commotion occurred. And he doesn't remember what he did. And it could be that he killed somebody. But certainly he was a member of a group who killed somebody – that he knows – but where he was at the exact instant of the death of this brother is not something he can tell you. In other words, he's getting interiorized into the motion of the society till he can no longer differentiate between his motions and the motions of other individuals in that society but begins to call them "our motions." There is no "our motion."

All motions are, of course, caused individually, fundamentally and basically. All motion is individually caused. There is no collectively caused motion. That's where the governments of Earth are going astray left and right. They say the people, the people, the people, the masses, the masses. And you'll find people right up here in the Council House not ten miles away, five miles away, I'm sure will tell you that we must protect the people. And every peo-

* Editor's note: the next few words up to and including "and so forth" were deleted out of the audio tape.
clearly, as an individual that comes up to the door, gets a kick in the teeth, because they're not the people, you see.

Every individual is himself, and the government doesn't want anything to do with the individual. The government can only be concerned with people in the mass. And each person as an individual moving in to ask for assistance in some category is immediately told that he's not the people and that he shouldn't think selfishly for himself this way; that it's for the greater good of the greater people.

And you'll find there are people in government like this. You would be amused some day as you begin to look it over. The people, the people, the people, the masses, the masses, the masses, see? And they shoot individuals. And they have never realized that this thing they're calling the people is made up of nothing but individuals. And if you shot every individual that you found in the people – now, I'm not talking of the Russian cultism of individualism; I'm just talking about this identity, a single identity, not a people identity – if we shot every single identity we found amongst the people, we of course would have no people. Isn't that correct? All right. The government goes on the basis that you must only take care of the people, and you mustn't pay any attention to the single identity. Well, of course, then they're governing nobody, are they?

See, there we get a condition where all motions are confused with all motions to a point where nobody can differentiate what his motions are. And the third dynamic, attainable for the preclear, is the most fruitful source of this confusion of mutual motion, you can call it. The confusion of mutual motion. The individual doesn't know what he did, who he did it with or which was his effort that contributed* to the motion. And he's no longer able to tell about this and he defends himself from this confusion by backing out of it. And he says, "Well, it was all bad, and here I am outside of it. At least I am still an identity."

And a thetan has gone through this on and on and on. Actually, the dynamics give us an excellent picture of this. The sixth is exclusively a co-motion undifferentiated. All the collective, undifferentiated co-motions of the past become what we call matter, energy, space and time of the sixth dynamic. That is what the sixth dynamic apparently is. It is the cumulative effect of undifferentiative, mutual motions. Nobody can say what he did.

And a builder gets through building the building, he stands back and he's in a bit of a fog about it. And there were five thousand windows put in this building, and he knows he put some windows in. Which windows did he put in? Well, he might be able to count them up, and he might not be able to, so he – but he takes a defense from the effort of not as-is-ing it. He takes a defense from not as-is-ing it. He doesn't as-is it. He simply says, "Well, that was our activity." Well, now, that's a very innocent action and it doesn't have very much to do with anything. And, of course, life was made up of "our" activities. But it's only when these things come a cropper. We built this bridge. And then the first locomotive that goes across it caves it in. Everybody says, "The company built this bridge, and they built this bridge." They instantly deny their own co-motion.

* Editor's note: the next few words up to and including "tell" are missing or were deleted out of the audio tape.
Well, they've forgotten their individual contribution. And then they have denied their part of the co-motion. And then they say they had no part of it, and that is about the cycle that these group things go.

Now, if we were processing this fellow from Birmingham, and he was trying to get squared around on the I Will Arise Society, and he has this terror of being buried – of not being buried. And every time we get anything like it, we find these pictures of burials, and we find all sorts ... Well, we don't know any background history of the I Will Arise Burial Society. We don't even know he's ever been a part of it. It happened in an earlier lifetime. It doesn't even exist now. It is just a lost piece of co-motion on the track. That's not commotion, you know, I mean it's just co hyphen motion. Cooperative action.

And we've got a pc who is terrified of not being buried. And if we trace this down very carefully, we'll eventually run into the I Will Arise Burial Society.

He has so many overts against the I Will Arise Burial Society and such a tremendous dependency on being buried by it, that, of course, he can't be buried if he's not a member of it.

Well, he was a member of it three lifetimes ago. And he has a terror of not being buried.

Well, now, if we were trying to chase down every phobia that a person had on the basis of find the phobia, find the group, run out the co-action, get a redifferentiation of the individual's responsibility toward and for the group, all of these things, we could probably do it, but we would also have this fascinating thing: that at any given time on the track – at any given time on the track – an individual is a member of two or three groups at the same time. Member of the family, he's a member of the society, he's a member of the business he's connected with. I mean anything like that, you know? Even if he's a bum, he's a member of a group called bums. He's at least two or three groups, you see?

All right. Now, how long has he been on the track? About two hundred trillion. And I'd say that it was about three groups every twenty-five years would be the most conservative underestimate of the situation. So that is something on the order of twelve groups a century times two hundred trillion less one hundred, you see? Less two cycles.

So, it's two trillion times twelve, or twenty-four trillion, and you would have to do this twenty-four trillion times. Now, how long are you going to live? Could you afford the number of E-Meters that you were going to wear out during this period?

Now, if you are going to be able – to be able to differentiate or get the individual to differentiate every single area and point and action of the track where he had come a cropper because of co-action, it would be that kind of an operation. If you were going to take each one of them individually apart, it would add up to something like twenty-four trillion.

You see, every time he died, he deserted the society. Just take that. Every time he died. He left a group. He had overts on the group, too. Dying was also an overt on the group. All kinds of wild computations will come up on this line, but it becomes an unauditable situation is all the point I'm trying to make.
And it's a good thing that we're assisted by a thing called automaticity. All overts and withholds are preceded by co-action – which is an interesting thing in itself. There must have been co-action for a later overt and withhold to occur.

All right. Let's be much more down to earth here. There's a husband and a wife, and they have a fight. And she decides to leave, and he decides to leave. Perfectly routine, daily situation all through the societies. Some kind of a small vestige of this takes place, you see. Well, how come? How come? Well, they are a group. They're a group of two. They have mutual actions which are also flanked by nonmutual actions.

Well, just get the idea. She takes care of the home and he takes care of the business. She cooks food; he eats it. He earns it; she buys it. They're almost duplicative but not quite. Now, if we look this over, we find out that there's an ample opportunity here to have mutual action and a great deal of different actions all going on at the same time, which makes it rather confusing.

An individual has – is evidently duplicating somebody else while not duplicating anyone. Wife's wearing powder and paint; he isn't. He's shaving; she doesn't. You get these differences? And all the time we have an appearance of mutual action, we have tremendously different individual actions going on.

Well, this thing could very well add up, just as itself, to a bunch of overts and withholds because the mutual action is always being interrupted by differences. The differences exist. So they speak of these differences, but of course it's just overts and withholds and that sort of thing. But there were mutual actions.

Now, you can straighten out these people by running the O/W or you can free the effect of the O/W by differentiating the co-action. And that is the basic discovery which I am telling you about now.

You can knock out the co-action which preceded the difference of action.

Now, we take this fellow with the I Will Arise Burial Society and we start processing all the parties and good times he had, and we'll find out that it'll rather automatically discharge all of his overts against the I Will Arise Burial Society. And we think it's because, well, he looks at the good times he had and to where he understands the situation, you see?

Well, there's truth in that, but the co-action precedes the other and you're running a more basic action than the O/W. But the co-action is something he cannot face. If he is withholding himself from the group, he of course can't even remember the co-action of the group. There's many a fellow saying, "Oh, well, I belonged to this terrible space opera society, and everybody dressed like spiders, and we all went around strangling people. They were terrible, and I finally got down on the whole thing, and I left them all. I didn't want anything to do with them, and so forth." And we run this down a little bit further, and we find the withhold is, is he is no longer a member of the group. He was withholding a group member from the group, namely himself. That's your most fundamental withhold.

All right. So, as long as he is withholding himself from the group, he also withholds his memory from the group, so he really can't tell you what the group was all about.
All right. But we can get him up now to confront the idea that he's done something to the group and he's withholding something from the group, and he's done something else to the group, and he's withholding something else from the group. And something sort of goes bzzuh. Well, he gets, you know, a little freedom occurs. Well, he's in close enough to the thing now to be able to observe.

So now if we ask him about the co-activity of the group, he would be able to tell us. And the next thing you know he would look it all over and say, "Well, I don't know. Us spiders, we just tramped all over the universe and we kept doing this and that and we'd jump on a planet and we'd eat it all up and it was marvelous and we actually had a lot of fun, if truth be told," and get rather nostalgic about the whole thing, and tell you all about what they did. And you go, "Well, what about these overts and withholds against the group?"

"Well, it's nothing in particular."

"Well, how about your not being a member of the group right now. You're withholding a body from the group."

"Well, that's not very important. Groups break up, and groups come and groups go. I'm just not a member of the group now." And there's no reaction on the needle.

You see the approach? The fellow is so far outside of it that he couldn't touch the co-action to begin with it. So, an initial approach to the situation is not "find the co-action." It's sneaking up on it.

You ask – you can ask about the co-action, and he'll tell you something about it. And then you have to get a withhold off or an overt off or something, and then he can tell you more about the co-action, and then you get another overt or a withhold off, and he can tell you more about the co-action. And you get another overt, withhold off, he tells you more about the co-action. And all of a sudden, he realizes everything they did do, and that group blows. Do you see the progress made?

Well, these mechanics are inherent in the processes which were issued to you that have to do with groups. A body of agreement has been violated and thereafter will remain aberrative. And there's where you get the packaged I'm-supposed-to's. There's where you get the packaged postulates. There's where you get the whole-cloth personalities. We call them valence, and so forth. They were enforced by group mores.

You'll find some young girl who is a member of a family, who didn't have any great avidity for family life perhaps, but she was a member of the family and she was going along. And now we find her years later in terrible condition.

And she says, "The family chopped us up." – Chopped her up. And the family chopped her up, and the family did this, and the family did that, and the family did something else of the sort.

And we'll find that even the memory of that family causes her pain. What's going on? Well, she can't as-is it because she can't get near it. Because she's got overts and withholds on it and is withholding herself from it, of course, she cannot approach the actual situation at all. So she really can't tell you what went on in her family.
And it's quite common for somebody to say, "Well, my mother beat me everyday and twice on Sundays and my father used to take an ax to me every Tuesday." And then to find out as you run the situation out that nothing like this occurred at all.

His father once threatened him with an ax, and his mother quite customarily used to duck when the preclear threw schoolbooks at her. I mean, this was about as close as we had to the situation. Well, why are we so far from the situation? Actually, the individual is withholding himself from the area of the situation in the physical universe and in his mind at the same time. So the mind, you see, is approximating what he is doing.

Now, let's take another activity. Let's take a speedboat driver. He drives speedboat races. And we find this pc wouldn't go near a speedboat. If you put him in a speedboat, why, it'd go off both sides of the harbor. There's no telling what would happen if we put him in a speedboat because he doesn't want to go anywhere near speedboats. And we say this is a peculiar thing. This man sees speedboats and he gets sick at his stomach. "Well," you say, "but that's natural. You get seasick in those."

No, it's not natural. No, these things have causes. What activity was he engaged in. What is that group all about? I'm afraid it's something on the order of "We are a group who are at total odds with one another and who, when we tangle, tangle with violence."

Speedboat 27 running into speedboat 34 – seldom do it quietly. The co-action of the group is crash. Otherwise, they're in total contest with one another so they're not an actual group. But the collision of the group is the co-action of the group. So you ask this pc, "What is the mutual action of speedboat racers?"

"Wrecking speedboats, of course."

Well, he doesn't want to be any part of that group because the whole mission of the group is to wreck speedboats. That's the way it looks to him at first, you see? There couldn't possibly be any other differentiation other than speedboats. What is a speedboat racer? A speedboat racer is a member of a group who wrecks speedboats.

Then we get him a little closer into it, and we get him over and he sees the individuality of the whole thing, and we see how it's running, and it all of a sudden begins to run. He can look at the situation.

But his first look at the thing will probably be "I don't want to have anything to do with the process you are trying to run on me." That's probably the first entrance point.

Because he'd say, "Well, I've been sitting here for generations perfectly happily withholding myself from anything to do with speedboat racers, and then you, you son of a aarr! you come along and you say, 'Associate with them that speedboat racers.' And I thought processing was to make people feel better." And look at me now. [laughter] You done it."

Well, what are you actually asking a pc to do? You're asking a pc to stop withholding himself mentally merely because he's withholding himself physically from a zone of co-action and motion. You see, he's withholding himself mentally as he withholds himself physically.

* Editor's note: the next few words up to and including "now" were deleted out of the audio tape.
You're processing a grown man. He's no longer a member of his family. Well, he's no longer a member of his family or he has some difficulty with his family. All right. And there he is. He's withholding himself mentally from his family, so you ask him to think about his family. It's almost the same as asking him to go back and join his family as a full participating member of the family. He doesn't know that he wants to do this. In fact, he wouldn't consider it wise. So you'll find all sorts of weird dodges being used by pcs not to run this process. Computational dodges of one character or another.

Now, why do the rudiments have to be in order to find a goal or terminal. Why?

Well, it's because you're asking the individual to walk very closely to the fact of an identity from which he is actually withholding himself. He's withholding himself from the identity and being the identity. He is not executing the goal while executing the goal.

You're asking him to look at something he is in the middle of. Now, as you start to run groups, you normally ask, "What group co-motion are you still in the middle of that you are now having nothing to do with?" And this appears very confusing to him.

Nevertheless, it works out and it works out very well. There is nothing very esoteric about the way the process works. You should know, however, this one sequence of there's an agreement to join or to be a part of or to agree to the mores of or the activities of or – and all groups have mores of one kind or another – followed by co-action, followed by overt, followed by withholds and more overt and culminating in a total withhold, physically and mentally, from participation with the group of any kind whatsoever.

All right. I'll repeat then the steps that you go backwards on it. You could security check the individual on this group, and he would walk a little bit closer to the group. And then you've got these overt and his withholds off, don't you see?

Now he could be asked about the co-action of the group. And pretty soon he would get a recall of a co-action and be able to differentiate his own actions from the actions of the group.

Now, the next step above that, of course, is not something you necessarily, I don't think, would have to process. It certainly could not be processed originally, because look at the barriers that'd intervene. And that is his agreement to join the group.

That should fall out of the hamper sooner or later in processing. You've walked this group backwards, in other words. But there's the way you approach it. The pc is being a tank driver. That's his terminal – tank driver. Well, you can't even find his terminal at first, but he's right in the middle of it.

Well, the rudiments have to be in so he can look because he's going to need all the attention he's got in order to look. And the rudiments have to be in to run these things because you're going to ask him to run O/Ws and you're asking him to get the co-motion of tank drivers, really, by getting the O/W off. We get the co-motion of tank drivers.

At each point of this, you're asking him to confront just a hair more than he would be comfortably accustomed to confronting, see? There he is, perfectly safe. He's just got a busted

* Editor's note: from here on frequently little pieces in the audio tape are missing.
neck, arthritis and three 88 millimeter shells through his brisket. There's nothing wrong with the man. He's a perfectly normal human being. Sits there and gibbers.

And there he is, comfortably, and they'll even tell you this: "Well, I have left that a long time ago. And I no longer have anything to do with it. And I don't know why you should ask me to look at these things which I considered so unpleasant at the time."

You'll hear this out of more pcs when you start running into this sort of thing. "I am not sure I want to go on with this" is the total expression. And the common denominator as you start to clear somebody of all his ARC breaks, all of his computations, all of his figure-figures, all the reasons he should blow, all of everything is "I am not quite sure I want to get any closer to that group of spiders." That's what it adds up to, you see? But it expresses itself in various ways. He says, "Well, I don't want to get Clear. I don't know if I should go along with this. I feel fine the way I am."

He'll show up for the next session, but he's always kind of telling you this all the time. He expresses it to you as a member of your group of an auditor-pc, you see. He expresses it to you as "I see no reason to go on with this because it's all been unproductive of great unhappiness in the past, and I am trying to escape all that, and the main reason I am being audited is so that I can escape all that. And here you, you traitor, are turning me around and pointing a long, bony finger on the backtrack and I'm not sure I want to look down over that fingernail because it's just been just a little bit grim."

"Now, this cough is perfectly easy to understand. It's caused by bacteria. These holes in my stomach – they've been perfectly diagnosed as ulcers. My eyesight – well, everyone knows that when you get along in life, when you get up to twenty-one or twenty-two your eyesight starts to fail. And of course, with the world in the state that it is in, you can't expect anybody to be – to be happy, so naturally I'm unhappy. But I've been getting along somehow, and I don't see any reason why I shouldn't be permitted to go my own unhappy if somewhat aberrated way because I have everything explained. There's no mystery here."

And you say, "Well, what are your goals of life?"

Ah, well, this is great, see. You've just come up there with a roan horse, all sleeked up, ready saddled, and it's pointed on the out trail, see. It's up that-a-way, see. And he's come from down this-a-way. And he is not about to go down this-a-way again. But goals, "Oh, future. [snips fingers repetetively] Ah, now, future. Oh, well, let's get out of here. Good. Future. Well, my goals are ..." Brdrdrdrdrdrdr!

And you sight it out and you find out which goal sticks. He says, "That's sort of funny. I didn't really realize that was my goal. But it is, you know? Hadn't thought about it for a long time. That's it."

"Well, now, who would ..." you ask him. "Now, give me a list of people."

And he gives you a list of people. Very interested in this list of people somehow or another. There's a sort of a compelling horror. [laughter] There's the bird looking at the – the bird-staring-at-the-snake sort of a fascination about this terminals list. And it finally narrows down right straight on the head of a very unlikely thing, which seems to explain it all. And he's there all right. That's perfectly correct, you understand, but he really didn't expect that he
would land there. "But, of course, it is perfectly obvious why he is there, but no, it – on the other hand ..." so on.

They never seem to tell you that the assessment is wrong. They will sometimes tell you they don't like it. They sometimes are quite pleased with it, and it very often explains many things to them. But they hope, more or less at this point, that you will go off and let them sleep quietly. Because now you've got this roan horse, and you've turned the roan horse around and you say, "Now, just go back down the trail there and go around that pile of rock."

The guy says, "Well, I just came from there. And you know what's on the other side of that pile of rock. We all know there's a bunch of vultures. And if I go around there again, why – be the end of me."

And you're liable at that moment to get the most remarkable series – the absolute, most remarkable series of reasons why they don't want to become Clear.

And now begins the most critical period in processing. Oh, they go along with the goal, like a shot. They go along with the terminal like a shot. They themselves want to get Clear, that's for sure.

But the fact of facing back to the group and that group and that group and those people and those locations of the track and that activity and what they did then and what happened to them someplace else – oh, well, now, that's another thought. That is another thought. That is something else.

Yesterday was something that should remain buried. It was okay as long as we could skim along the edges and skate along the corners of the pond and never fall in. That was all right because that was fancy figure skating, but it was very safe. But we go out there, and we're liable to have anything happen to us. And the most critical period of processing is immediately after you begin to run the goal and terminal, particularly with a powerful process. And that can be wicked. That can be very wicked.

In the first place, if you have the wrong goal, and if you have the wrong terminal, you'll throw the pc in over his head and it'll take some real experts to bail him out. So it is not a light thing to attempt.

There is only one goal. There is only one terminal available. And now we have given you, if this works out all right, a surcease from your nervousness about the assessment of the Prehav Scale. That was a little bit tough to do. Of course, the goal and terminal is the critical things to do. That is really something. You have to find the right goal. The right goal can only be found with the rudiments totally in.

You have to find the right terminal. The right terminal can only be found with the rudiments totally in.

All right. Now, our period of departure from that point begins what could be some very trying times. In the first place, the pc does not want to have anything to do with what he has left. And he does not know that – if he has to cross over that again – he wants to get Clear at all. So you can look for all manner, apparently, of ARC breaks, rudiments out, this and that, figure-figures, ducks and dodges. You can look for all kinds of ducks and dodges. He doesn't
want to go back there. So there's all kinds of this and that. He doesn't know that the price he will have to pay isn't too great for the prize of being Clear.

After all, he's still alive as aberrated. He doesn't know that he'll be still alive after he gets through with all that.

Why doesn't he know this? Because it's well proven. He died last time, didn't he? He got hurt last time, didn't he? Well, he's certainly going to be hurt again. And you get the "mustn't duplicate" situation and you get other things coming up.

A pc can also begin to slide out from underneath a terminal up into degradation. And this is one of the more alarming facts of running terminals, and one of the things which is very discouraging to an auditor. An auditor really has to understand this in order to survive much of it because the pc looks so pathetic. The pc comes up to degradation. The pc is no-place. The terminal is everything. The pc isn't there. And the pc's first awareness is in gooey, ulnyah and degradation. It very often happens this way. It isn't necessarily usual, but it does happen this way.

The worse off a pc has been in life, the more interiorized the pc has been inside the terminal, the more liability you have in trying to pull him out of it because he comes up through a degradation band and he doesn't know that he wants to go on at all because it is too doggone grim.

Somebody can get degradation practically dripping off of him. But all of his escape-ments are reactive. All of his mechanisms to escape are reactive. And you mustn't lose track of that fact. Those are all reactive. By keeping the rudiments in and keeping the pc being audited and pointed straight ahead on his line, you will succeed. Why? Because actually the pc, what there is of him, at the time you begin to process him, is with you all the way. And the objections are reactive objections, and if you Q-and-A with these reactive objections too much, you stop the pc's forward progress. And that is basically what is the most critical period of auditing.

Given the right goal, given the right terminal, right now with the process you are running, the first six to eighteen hours after that point will be the most critical period of auditing. Once you've got them over that jump, all right.

Maybe they won't have any trouble at all. Maybe they'll just come through it like a dream. That they come through it easily doesn't mean nothing is happening. It just means you're lucky or your auditing is very smooth or your altitude as an auditor is very high or the ARC which you've generated is carrying the person through rather easily.

And this looks fine. It goes through very smoothly. And there is no dynamite happening. There's just lots of motion, there's lots of cognition, and lots of this and lots of that. And everything's going along very swimmingly. And the pc doesn't necessarily go into any degradation at all. Doesn't necessarily do so, but don't be so alarmed if the pc does because degradation is the lower harmonic of apathy. You know what I'm talking about when I say degradation? It's really gucky. It's the lower harmonic of apathy.

How can a person be more apathetic than apathetic? By being totally degraded. And it is the first emotion that a pc encounters on his road up. The first emotion encountered on his
road up – if he is below the point – is degradation. And then he comes up through some other unnamed oddball emotions up to apathy.

When he's up in apathy, man, he's way up. Of course, the pc goes through a band between degradation and apathy of dying. The band of death lies straight across the line. A thetan is easily below death. Easily. In fact, most aberrated people walking around are a bit below death.

And when you bring them up, they get odd ideas about dying and things of this character. Well, what is this? This is just en route from degradation to apathy, they pass through periods of dying. Obvious. It's just a band on the Tone Scale. That's all it is. It's just the individual goes through this before he comes out of it.

Now, it'd be very fine if you could take him from totally dead, totally insensate, totally unfeeling, to total enthusiasm with no gradient. Be wonderful if you could do that, but I think the only way you could do it is get an electronic cap and put it on his head and implant him and have him be totally enthusiastic, and of course you haven't cleared him. You haven't freed him. He's even more down there than he was before, but you've given him some kind of an implant of [in a chanting voice:] "You now feel enthusiastic about everything".

Well, if he's going to go up through degradation and up through death and up through apathy, remember, he'll also go through grief. Well, he doesn't have to cry to go through grief, but he'll go through grief, and he'll go through fear, and he'll go through anger, and he'll go through the lot. He'll go right on up the Tone Scale. And there's a sort of a hurdy-gurdy goes on which you must understand.

Did you ever see one of these little counterbalances whereby you put some pennies or some sand in one bucket that is up in the air, and the bucket goes down and the other bucket goes up. You know, there's two buckets over a pulley, you see, and as one bucket goes down, the other bucket goes up.

Now, the up bucket, as you start to process the pc, is the valence. And he is as overwhelmed as, of course, the valence is high-toned. That's a rule. The pc is as overwhelmed as the valence is high-toned. It's a direct rule. Although valences can have chronic tones of their own. You'll find this on the Prehav Scale.

The rule is the higher the valence is on the Prehav Scale, the more the pc has been overwhelmed by it. Works reversely. The more – or the higher the valence is on the Prehav Scale, on the Tone Scale actually, the worse off the pc is underneath.

So if the one bucket valence is way up, inevitably the pc is way down. And they swap positions. And in the process of processing them, you find out that the position interchanges, that there is a period when the buckets are even. Just as you lower one bucket, the other bucket comes up. There will be a period when they are both level. And that's a very schizy situation.

The pc is not in his valence and he is not out of his valence. And the valence is not there – it's not effective but it's not ineffective. The I'm-supposed-to's are not working very well, and the pc has not begun to function yet very well. And these two buckets pass each
other on the counterbalance, and the valence sinks out of sight and vanishes, and the pc goes on up to the top. That is essentially what happens with a valence.

That demonstration, by the way, of the Tone Scale is not inept. It is very factual. You draw two buckets connected with a piece of string, one bucket at each end of the piece of string, and hang the center of that string over a pulley, and then plot a Tone Scale back of each piece of string as it drips down – you'll get the exact operation that occurs. The Tone Scale – the valence goes down tone, down tone, down tone, down tone, down tone, down tone – What valence?

And the pc goes – what pc, see? Then, "Oh, I'm so degraded. Oh, terrible. I feel awful – very degraded. I don't know whether I'm ready to go on with this sort of... Is it always this bad?"

And then they up a little bit and they say, "Well, I want to die now. I've seen everything, I've done everything. I've done everybody. There's nothing left," and so on. And then they go up to a point of "Oh, God, what's the use?" That's better than dying, you see, but it's just, "Oh, God, what's the use."

A little bit later, why, you see, the bucket has gone up to a point of "It's so sad. It is all so sad. Everything is so sad. Is there anything in the world that isn't sad?"

And then it goes up to a point – "You know, this is pretty scary stuff to be going through. Are you sure you know what you're doing?"

And then "God damn it! What do you think you're doing?" You know? And then "Well, we can leave this now. I haven't – ha-ha. Actually, this doesn't bother me any now. I'm not worried about it. We can leave the whole thing" And that's a wonderful invitation to an auditor. These are all wonderful invitations to an auditor to do something else, but particularly this one – "It's flat now." [laughter]

The pc tells you, so it must be true. And they strike that boredom band. And more processes and engrams have been deserted by auditors at the boredom band than any other point. And they go up to the boredom band, and then the person says, "It isn't bothering me now." So the auditor says, "Well, that's wonderful. That's a good time to leave it." They've just struck boredom.

You go a little bit further, and they will become conservative about it. "Well, it probably is all right if I am careful." And then they will get enthusiastic about something else. And they've come out of it.

The valence goes down the same course. Now, this fellow is a gambler. The valence is a gambler. And you have at first a serene gambler. Nothing bothers him. All pervasive. Nothing worries him. Not a successful gambler – just nothing worries him, you see. He's very serene about it as he trumps his partner's ace. And down goes the bucket a little bit as you process this. The next thing you know, you have an enthusiastic gambler.

Now, this is what's weird. You've got an enthusiastic gambler about the same time as you have a dead pc. And these two things give us an odd view.
And then it goes down a little bit more, and you have a person who says, well, they're bored with gambling, and they don't think they will gamble anymore now, as they pick a packet of cards out of their pocket and start to deal you a hand. But it really doesn't interest them, and they can really leave it alone. And they now know that they can leave gambling alone, and so forth. Leave life alone. Leave everything alone. They'd still deal you a hand, however. While not being interested in what you have.

Then they go down, and you get an angry gambler, and you would then, about the time, you see, you have got an apathetic pc, you've got an angry gambler.

And then pretty soon, why, you have a weeping gambler. You don't see every level of the Tone Scale. Very often in processing, they're passed by fairly rapidly, or they don't express themselves or manifest themselves very cleanly. And you see a skip. Go from for instance, boredom to fear, and there'd be no anger.

And then the pc – about the time the pc is getting sort of griefy about it all, why, the gambler is sort of scared. And that is an interesting time to process him because you've no stable high tone. There's no stable high tone to fall back on.

The valence is now frightened. And the pc is weeping. Well, which can the pc be, you see? The pc is weeping and his normal escape from it would be to be a serene gambler, but the gambler is now afraid. So there's just no place to hide along about that point.

And the pc really starts really unloading about this point because he finds out that if he's gone this far, there is no backtrack that he can reverse on in processing. He's got to face up to the lot.

Next line of action, of course, is the gambler just sort of fades out of view, and if you looked around a little while later you might find a degraded fragment left. And then it sort of disappears. The pc meantime has gone on up the Tone Scale.

Now, after this interchange of the counterbalance on the Tone Scale has taken place under the action of auditing, tell me, now, what happens? What should you do? How would you know whether or not this interchange has taken place? How do you know if that valence is flat? If your rudiments are totally in, and the tone arm is getting no motion, the valence is flat. But you make awful sure that you sweat hard over those rudiments. Zzzzzzz. Get them really in before you make a final check and make up your mind. Because the most fruitful source of fouled up cases is unflat valences, next to wrong goal, wrong terminal.

Now, what occurs here. What occurs? You've got a valence flat. You've checked it out. You've had another auditor test it very carefully on the pc. Check the pc for rudiments. Get the rudiments in. Check the terminal very carefully. It is apparently no longer active. Rudiments are in, and it's not active.

The pc is not Clear. What do you do now? You do it all over again. You do everything that you did before, step by step, the whole works. You do the lot. Except please don't take so long at it. Because if you take thirty hours to assess each new goal and each new terminal you're going to find on the pc, thirty hours for the goal and fifteen hours for the terminal, you are getting up into astronomic figures, because at the end of it they will blow it something on the rate of fifty an hour. So, you see, your plot of time is – starts being thrown.
Your next assessment is done exactly the same as your first assessment was done. You get the original list, and you try to add any new goals to it the pc now has. You get the rudiments in with great thoroughness and you assess that list and try to find a goal. And that time, you probably will find one.

You take that goal and you do not use any old terminals list at all. You simply go over this situation with the terminal – what terminals, cause, effect – and try to find the terminal that will hang up and will register. And you assess that exactly the same way as you did before.

Now, you take the terminal, fit it into the commands which you have been given, or in the old way, the Prehav Scale ... And there are a lot of pcs, by the way, that you will have to run on the old Prehav Scale run, children particularly. Children, you won't be using any other than Prehav Scale. So, the Prehav Scale has not disappeared out of your lives. We simply upgraded some of it.

And the individual's terminal is then assessed on the Prehav Scale and you run that level and so here we go. And it's all perfectly okay.

Same way as before, except don't expect that to run very long. Don't expect it to run long. Don't expect it to run forever.

I don't know. It'd be a wild guess. You couldn't tell how long the second terminal is going to run. There'd be no guessing it at all. But it should be much less than the first terminal took. But, of course, many other things could happen. And if it starts taking long or as long as the first terminal took, you should really get in and check your rudiments, and check your – do a Security Check and find out what in the name of common sense is going on here because his rudiments out. There is a difficulty here that had to do with rudiments, not to do with the other.

Now, you run that one flat and you do the same thing all over again. All in the twenty-minute test of the tone arm. And you just keep doing this over and over. The only trouble is, you will very shortly get into this kind of a situation: It is utterly, completely impossible to do an assessment, but the thing that you have to face up to is you have to keep trying. Because the "keep trying to do the assessment" is actually auditing. And you'll just blow them by the bucketload. You'll blow goals, goals, goals, goals, goals, goals. You get a goal and it stays in, out, thuu-thuu. "We got that goal. That goal's staying in. Thank heaven.

"Well, we got that goal staying in. All right. Now, how is the terminal now? How is the terminal? All right. Let's get a list of eight, nine, ten terminals. Oh, we got these terminals. Now, if we find one reacting there – oh well. Are there any more terminals?"

"No, there are no more terminals."

"Are there any more...." you can't get any reaction. No more terminals. And the guy hasn't got any more terminals for that particular goal. You go back and you look at the goal. It isn't reacting, so you get the rudiments in with the greatest of care, you see. Because two reasons the thing can be reacting, you're always in the bind as an auditor.
It isn't reacting because the rudiments are out or it isn't reacting because it's flat. Until you get to be a flat-out expert on it, you won't sometimes be able to tell which, so you have to make sure that those rudiments are in.

And you go back to find the goal which you just found and it's gone. And it's like trying to shuffle quicksilver. It just keeps disappearing. And the tone arm settles closer, closer down to Clear, and the needle begins to float more and more. And then the needle does nothing but float. It's totally free needle.

Needle is totally free. You have to be terribly quick at that particular stage of the game. You have to be fantastically fast to get any kind of a read at all. The pc is – the pc isn't stabilized as a Clear yet, see. The pc's just a borderline Clear. And he's got a stomachache so you sit down and you try to find a stomachache and give him an assist or something or find something. And trying to get the needle to react enough to find any kind of a confusion that would give him a stomachache or anything that's left out... It's just straight on the fly. You can't – it is not possible to build a meter that will react little enough that will still react on the reaction. I mean, if you cut down the reaction of the sensitivity enough, you wouldn't get any reaction of any character whatsoever on the thing that was wrong. And the thing is just defeated in all directions.

But that's perfectly all right. There's nothing really wrong with that.

You merely have to be real fast. You have to watch the needle very carefully, and you suddenly see that at a swing of the needle, it did a slight hesitation as it went by you. Got it. You got that engram. It has to do with murdering eight babies and [laughter] being operated on and so forth. And then you have the pc look it over, and you're going to straighten it all out except now it's gone. And it's still there. And the pc can put it back and confront it and handle it, and so forth.

Well, what do you want to know about it? The name of the doctor? Well, it was Jones. And you're not getting any reaction on this thing There's no reaction on the pc. Oh, a pc has still got pictures. That's all it says. It blows.

And that is about the way it goes. That is the way the thing rolls on up the line. Now, we just speeded and accelerated this enormously, but at the same time we have done this, we have taken away one of the tests which you had. The test is the Prehav level.

If a terminal is wrong, or if a goal is wrong and the terminal is wrong – of course, the goal is wrong, also the terminal usually is wrong. But if the terminal is wrong, and you give the pc a run on the Prehav Scale, you'll have maybe ten levels alive at the first assessment of the Prehav Scale. And you give him a run on the Prehav Scale, and then if you've got – less levels are alive or react on your first assessment, chances are your terminal is right. And if there are more, your terminal is wrong. And you are forewarned from running that terminal any further. It isn't necessary for you to run the terminal any further.

You've got to go back and check the whole thing over again. But you haven't got this now that you're not running the Prehav Scale, that you're running a packaged process. You have no prevention whatsoever from running a bad terminal. And let me assure you of this: that if you run the wrong terminal on a pc, with this particular process particularly, you will
just foul up his bank like fire drill. That will be one awful mess. And I just cannot warn you too much about it.

It gives us an administrative problem. How in the name of common sense are we going to be absolutely sure that everybody who is run to Clear all over the world is always run on the right goal and the right terminal. Because this has been invariable now. It's very solid. It's leading right straight through to clearing. How can we guarantee that every one found will be the right one. How can we guarantee this – because there's not even now a secondary test to find out if it's the right one.

There is a point of skill. There is a point of skill and excellence. So you can only say, never run a goal and terminal unless it's been checked by an expert who has been well trained at Saint Hill. That would be the most conservative thing that you could – possibly could do about it. I mean – I mean, the most sensible thing you could. I can't see possibly how we could do anything else but that, because let me let you in on an interesting datum that maybe you don't know. We have had a lot of people arrive here – a lot of students arrive here – with their goals and terminals already assessed.

And let me tell you they have been assessed with the greatest of care in the best possible spirit. And they have been 100 percent wrong. And if run, they just would have spun somebody right into the ground. Food for thought, isn't it.

I'm not exaggerating or trying to tell you how important Saint Hill is. I'm telling you a point of danger on the road.

Running the right terminal does not react the same on a pc as running the wrong terminal. The misemotional states the pc gets into is not an index of wrong terminal. Misemotional states will only occur if the right terminal is being run.

What you get on a wrong terminal is a rising tone arm which eventually sticks and doesn't blow down. You've beefed up the bank, and that's what a wrong terminal will do on a run.

Now, there are other things that can make the tone arm do this, too. The rudiments can be out, and the tone arm will do this. So, if your rudiments are put in, then you have an opportunity to sort out the goal and the terminal and make sure they're right. But there's a terrible danger – I'm not exaggerating this – in actually running very long a wrong terminal. It is very dangerous.

The whole bank goes solid, and although it will key out in three to seven days if the fellow just – you just leave him alone, see. Three to seven days, why, it'll key out. He'll be feeling all right. Any psychosomatic he's got is going to get worse. But not with any misemotion about it. It's simply going to get worse. The pressure in his chest is going to get harder. The pressure on his head is going to get worse. That is all. It's just going to get worse, all the way around, and the tone arm is going to come up and stick because the bank is getting more solid.

If you are running the right terminal, you generally get more and more action and a looser and looser needle and more and more misemotion. You get emotional changes if you are running a right terminal. And if your pc is crying and everything and you're just having a
hell of a time because you haven't got a big enough mop, and if it's just terrible what's going on in life, and it's all so grim. And you say, "Well, it must be the wrong terminal," come up and see me sometime. I have some antique dueling pistols. And you can load them up with ground glass and other bits of razor blades so I can shoot you. I have to add that preventive just for one reason because we have had cases of auditors who ran from emotion.

You know, the pc is getting too emotional so let's change the process. There must be something wrong because the pc's getting emotional.

No! That's the reaction. No, if the pc isn't getting emotional, there must be something wrong. It's just exactly the reverse, you see? The pc sits there, "Yeah, well, the Rosicrucians, they read things. Yes. I left them. Yes. All right. Good. What is my problem? Yes. No."

And this goes on by the hour. And there's never any cognitions. He never sheds any tears. He never says, "What do you know!" You got the wrong terminal.

So there are ways to tell. There are ways to tell that you've got the wrong terminal on the pc. But the best way to be absolutely sure that you have the right one is the best way. And that's to get the right one in the first place. And make sure that it's the right one before it's run. That's the Achilles' heel right now of Scientology on Routine 3 is getting the right goal and the right terminal. Because I've just packaged you up a set of processes that perhaps will have to be downgraded or rearranged as we run into cases and so forth, but for the usual case should blow it straight on through.

And you don't have to worry about Prehav Scale if this continues to work out properly. May run into some bugs, but I don't think so. I've been working on it here for months, actually, and just for the last two weeks have been doing nothing but orienting this set of commands. And it looks to me like they're pretty well oriented.

You could add to them. There are quite a few commands you could add to them. And you get a 15-, 30-, 40-, 60-, 112-command bracket. You could go on and on and on. And what you're trying to strike is the intermediate, whereas you give the effective commands which are adequate so they won't hang up the case.

All right. Do you understand a little bit more of what you're about now with regard to this? You say, "Well, what – where does this leave a Class II Auditor?"

It leaves a Class II Auditor right where he is. Security checking and running problems. You say, "Well, what happened to all these Problems Intensives?"

Well, nothing happened to these Problems Intensives. You can still do Problems Intensives. But I have learned this about a Problems Intensive, and you taught me: that after you found the problem, just as you've been going about it, you don't dare run the problem. The problem is simply an index and an indicator to give you the area of confusion immediately ahead of it. And you do nothing but Security Checking after finding the problem. And you never do a repetitive run on the problem of any kind. You disregard the problem.

You find the problem – find the area of change, find the problem. And then, disregarding that, list the personnel in the area of confusion immediately ahead of that and do a Security Check on them. And that is how you do a Problems Intensive.
I'll write all this up on a form. It's all going. It's just fine. It'll just work dandy, and everybody will be pleased with it, and a lot of cases make a lot more advances than they're making now. People will be set up so that they can be assessed and cleared that never have been before. All this is very valuable. But just at the present moment, why, this doesn't happen to be for you. You're on your road to Clear. So don't strike any barricades. Just go right on through, will you?

By the way, by the way, you can always talk to me. Did you ever realize that? You can always talk to me. You never realized that? Well, you always can, you know. The least way you can do so is send me a note. I always see all of them. This works for people all over the world.

I see an enormous amount of correspondence, believe me, and although I sometimes snarl at people on staff for sending me a note or letter, and I sometimes don't see letters and so forth, if they're just totally routine and that sort of thing, if somebody really has to, I generally – I generally listen.

And before you drop yourself off London Bridge, I can probably – I can probably give you some pointers on waiting on tug schedules so that you won't... [laughter] so if it gets too horrible, why, you can write me a note or have a word with me. Okay?

Audience: Yes.

Thank you.
IMPORTANCE OF GOALS TERMINALS

A lecture given on 25 October 1961

In just a second you're going to clap louder than that, because I'm going to relax the problem of your having to pass examinations in order to have auditing, on the condition that you go on and get your noses to the grindstone and get them passed. [applause, laughter]

So you don't have to worry about that now. Don't look so spooked. Now you can run out all of your unkind thoughts on it. [laughter]

Okay, what is this? The 26th of October?

_Audience_: 25th.

Well, now having given you some good news, I'm going to give you some good information. But the main thing that you had better know about goals, terminals, runs and that sort of thing, probably has not been made abundantly clear. I have been on this particular track here for some time and the lecture I'm giving you is pretty much of a hallmark in this particular line. I mean, it's pretty much of a high-water mark, because there's a great many things have been resolved that had been a question for a long time.

You see, when you're attacking life head on, the doors open and the highways go out long and white quite regularly. But sometimes you know that there're some dark woods behind you. And now and then, why, as you're going up a well-known road, why, you all of a sudden find out that that wood is not a dark wood anymore, that you've gotten some data which wrapped up some little bit of something. In putting together the jigsaw puzzle of life, in trying to piece out what it is and what it is all about, you have a problem not unlike having a jigsaw puzzle with an infinite number of pieces and it's almost infinite.

And when you first look at this problem, as when I first looked at it many years ago, it was just a potpourri of odd pieces. And the funny part of it is, they didn't even look like they would ever fit together. None of the pieces were made to fit to any other piece. In other words, it was a brand-new thought that it could be fitted together, in one piece, not in eight thousand different islands.

Now, philosophy in past days has tended to compartment life and you have all sorts of compartmentations. And philosophy has never actually attempted a total view. It has been a bit beyond them and so they compartmented things up. They do various things and we've used some of these dodges ourselves in the past. I've used some of them as we've come along. I've – well, take Spencer, Herbert Spencer. He said that there was two zones of this and that and
he broke down various things; but within the framework of this and that and conditional to this and that, you then had a rule. You get the basic thought that goes behind this. You have things like the knowable and the unknowable. And that's an awfully interesting word – unknowable. Oooooo.

Well now, more to keep people from worrying about it than any other reason, I have used that analogy in the past, but that was more to keep people from worrying about it – not that I thought there were unknowables. I just said that there were areas that you didn't have to know all about before you knew the answers to the situation.

And tremendous reservations ... Kant, for instance – he not only compartmented it into the knowable and unknowable, but he said that there was transcendentalism and "You, you little worm, you, you-you-you rat – we're all calm up here on the philosophic clouds, you bum, you stupid jerk. [in a quivery voice:] It's mostly all unknown to you and always will be and nobody will ever know anything that has anything to do with anything that is important, so just go on and be stupid and be happy about it."

I don't know exactly where he got this particular notion but I suspect it was his bank. [laughter] And as we look at this huge, piled table of pieces of jigsaw puzzle, we get some of them together. And it makes a little bit of – more of a picture and we get some more of them together and it makes a little bit more of a picture. And then it turns up a yellow piece. And we've got a picture and it doesn't fit in any part of the picture we have got, so we put it over here on the side and we say, "Someday we will know about this yellow piece, but right now we're not going to worry about it particularly because the picture is making sense."

And we go on and we make more picture and we understand more of it and then all of a sudden there's a green piece. And it's a hexadiagonal shape and it fits nowhere. And we take this green hexadiagonal piece and we put it over here with the yellow piece and we say, "Well, we're not going to worry about them for a little while."

After a while, you've put enough pieces over here, green, purple and pink, that didn't belong in the proper picture that you stir them up a little bit and all of a sudden they go clank, and then they become – and they go together of themselves and then they go clank, and go into the main picture. Every once in a while we make one of these forward surges. Well, this is one of those occasions. This is one of those occasions.

I can tell you a flat fact. That is to say this is one of these facts that's without reservation. And it's rather startling, because we have done it and we didn't realize there was anything important about this. But we have done this in the past, but it's a fact which becomes one of the fundamentals of auditing.

Now, I must tell you clearly that auditors are divided into two categories, ritualists and fundamentalists. They're divided into these two categories. There is the auditor who, without any understanding of what he's doing, actually goes forward with the ritual and carries through to the end. And he's perfectly happy and he very often gets a result.

But he runs into more bugs than other auditors. This is the majority of auditors. They go down the line and they think that's just fine. And I appreciate it, you understand, because it demonstrates a very great faith in me. But that's what it demonstrates and that's all.
Now, they would be better off – and any ritualistic auditor who is getting results would get more results and be better off – if he knew the fundamentals on which his ritual was based. If he knew the fundamental. For instance, we say "agreement to begin a session." Now, if he knows what the fundamentals of agreement are, he realizes at once that he's got to have a mutual knowingness about what this session is all about.

And regardless of the ritual, his end product is going to be a mutual knowingness. "We are going to do so-and-so and such-and-such and then we have an agreement." And this agreement then precludes the preclear from having an enormous amount of not-know. Do you see this as an example?

So one auditor could just go ahead and run Model Session and everything is fine and run it off to the end and he comes out, he gets a result. It's an attestation to Scientology and the way it's put together that he can get a result under that basis. But how much better, how much better, if he knows he's trying to get a mutual knowingness about what is going on and make a contract and he's a fundamentalist, he's going by definition. What is agreement? You see? Well, agreement is a mutual knowingness, a mutual postulatingness towards certain end products and he knows if that's absent – if a mutual knowingness about what this session is all about is missing, that there's going to be a not-know throughout the session on the part of the pc. It's all going to be a little bit of a mystery, so he's not going to make as fast a result as he would if he were auditing by fundamental.

Now, you can audit by fundamental and use the ritual, you see. You could actually succeed by just using the ritual and not knowing the fundamental, which is quite interesting, but you could succeed much better if you knew the fundamental which underlay the ritual. And also used the ritual. That way, why, you have many more wins.

Fundamentals are quite important and this is one of the fundamentals of auditing which has been missing right up to this date. We could not answer this formerly, but if you have traced through – I think you could trace through the lectures for the last several years and occasionally find a remark by me that I have for a long time studied this particular facet and hadn't yet an accomplished answer to it, a finished answer.

That is, is it better ... I even thought I had it licked one time and it was very close to licked, but it is not quite right. "Can you audit conditions at all?" Now, we've inclined very definitely up until recently, up until now, to believe that you couldn't audit conditions very successfully, that you should audit terminals.

Now, let's clarify this. Let's clarify this. Let's classify terminals. What terminal can be run on the pc? And this is one of these great basic facts of auditing, so flap your ears. The only terminal that can be run on a pc is his goals terminal. And no other terminal can be run with impunity on a pc.

You can run another terminal for a short time. You can run it rather limitedly. You can appear to be getting away with it. Everything can be going along fine, you hope, and all of a sudden the bank stiffens up and the pc doesn't seem to be making much progress and so forth.

That's because you're auditing another terminal than the goals terminal. Now, factually, on the long haul you can get away with auditing these terminals sometimes for twenty,
thirty, forty, fifty hours. You can get away with them for a while – and all this will become very visible to you shortly – but you cannot continue to audit any terminal which is not the pc's goals terminal. The only terminal which can be audited with complete impunity, with total unlimited runs, is the goals terminal of the pc. And that is all that can be run in the way of terminals with perfect impunity. That's a fact.

Nail it down. Give it its proper level of importance because it will solve for you "Why did the pc's tone arm go up to 5.0 and stick?" It went up to 5.0 and stuck – refer to this particular moment and you will know why it went up and stuck. You must have been auditing some other terminal than the pc's goals terminal. It doesn't matter what other terminal. You must have been auditing another than his goals terminal.

So if you were running his goals terminal and it went up to 5.0 and stuck after you began the run of the goals terminal and then it got sticky and sticky and sticky and there was something real wrong running some double-barreled process (such as your groups 10-way bracket that you're running right now) and the tone arm went up and it stuck and nothing happened – ha-ha-ha, there's something wrong with the goals terminal. That is what is wrong. You're auditing some other terminal than the goals terminal.

You are busily, busily, happily clearing up a present time problem on the pc. You're happily clearing this up and all is going well and all of a sudden the tone arm starts going up and it goes to 4.5 and the pc gets very logy and it gets very sticky and starts to comm lag and gets misemotional – a-ha, you're running another terminal than the goals terminal of the pc.

Now, there's two things which can make that tone arm go up and stick. You understand, "go up" is all right. Go up, go down, who cares? But go up and stick. Now, that will happen on a Prehav Scale run and it does for this reason: You've exhausted that particular line and you must get over onto another part of the Prehav Scale. There, it is the Prehav Scale that is doing that. But on the 10-way bracket, if it did this, you've not got the right terminal, that's all. There's something wrong with the terminal.

Withholds can make the tone arm go up and stick. And running the wrong terminal can go up and make it stick. Running the wrong terminal on any process. Now, there's a great temptation to run a present time problem and so on.

You see, this particular class has helped me resolve this and I wish to thank you for it. You haven't suffered for it particularly. Pon was crying the other day and I recognized at once why she was crying and I use her as a particular example. I examined her auditor's form, wondering about this and I found out that she had been run on the ARC break process very hard and very long. And what happened?

She was going up – if you don't mind my using this?

*Female voice:* That's all right.

And she was running along happily, cheerily, cheerily, cheerily and everything was going along fine and then all of a sudden started to get a little bit misemotional to the auditor and a little bit upset with things in general. And then they went along and ran the ARC break process a little longer and the tone arm went up to 5.0 – clank!, and there it stayed.
And they kept on running it, but Pon didn't – didn't calm down and didn't feel better. Now, I see today she looks much better and I think they undoubtedly are following the auditor's report directions which I gave out last night. I'm sure they ran a terminal today. And she feels much better. Isn't that right? Probably not much better, because the terminal itself cause...

[laughter]

But look at this. I wish to use this as an example because it's right here in your midst. Now, the ARC break process refers to an auditor and refers to a pc. Ah, those are two different terminals than her goals terminal. These are not her goals terminal. See? That comes under the heading, then, in spite of the fact that it's cleaning up auditing...

It doesn't work like this on every pc, but it'll work eventually like this on every pc, you see. It doesn't work fast on every pc like that, but it'll work that way eventually. And this will become very comprehensible to you when I go out and tell you all about the mechanism involved in this thing.

Well, what happened here, see? The auditor is not her terminal, a pc is not her terminal. She has been run on an auditor and a pc, running that 15-way ARC break process and her attention is being taken off of her goals terminal and her bank is beefing up.

Now this is the Create/Six phenomena. It is right here. The Create/Six phenomena is not involved with creating. And I've known there was a spook back of that and every time I've mentioned that to you, every time I've gone over it, I've had some little reservation. You remember, I've always made a little bit of a reservation – "Well, I don't know why this happens," you know? "It doesn't seem reasonable to me. And it doesn't happen with me and if it happened all the time, why, it should happen. But some people's banks get very solid when they start creating. And so we don't run Step Six."

This has happened enough times, you see, so that we abandoned a process which was not uniformly a bad process at all. Why? Why? And that little question has just stayed around. It's one of these yellow pieces with orange polka dots. Lord knows where it fits or how. Why do some people run Step Six – which is "Create something. Create something. Create something" – and have the whole bank go solid? But just a few people have this happen. And other people run "Create something. Create something. Create something." and as a lot of old-time auditors right here in this room can tell you, you can go on and have them create things and create things and nothing bad happens. They go on and they get well and everything else. Well, why does it only happen to a few?

So if it was create – if create was the total basis of this, why, then – then of course it would work on everybody. Only it doesn't.

All right. Instead of saying, like the ancient philosopher, sitting on his stone – it was probably very unhealthy sitting on stone, but anyway – sitting on stone, he said, "Well, there are different types of people. There are different types of bank. Everything is different, you see and you have to have understandings of fifteen or twenty different classes because, you see, they don't all head under and respond to the same principles. So men are different and thetans are different and it's all different, you see. And therefore, after you get through studying the alpha system, then you have to study the beta system and then you have to study..." you know and here we go, you see?
Well, I don't work on the same principle. I'm perfectly welcome – it's perfectly welcome for there to be great differences, but if you have the answer to life and the mind, you don't have different types of cases and you don't have some cases responding to something and other cases not responding to something, you see. It must be that you're not quite down to the fundamental. It must be that you're dealing with a fundamental which is not rock bottom. You must be up the tree a ways.

Well, in this particular instance, I'd never accepted this create phenomena without protest, even in the lectures when I talked about it. Maybe you can remember my having objections to this, here and there. "I don't know why," I would tell you.

Well, it isn't create. That's why. It's wrong terminal. That's why, huh-huh-huh. Hu-huu., a little difference here, ha-ha. Some people are so stuck on their goals terminal that you take their attention off their goals terminal and the bank beefs up. Or when you were running create on them and telling them to mock up things, you were having them mock up things other than their goals terminal, which were off their goals-terminal line and it distracted their attention off their goals terminal, so bank picked up.

So we get another fundamental here – not from that angle, this is from another angle entirely. This is empirical. I've watched this and watched this and watched this and I noticed that banks become solid and the pc gets more somatics and the pc gets more misemotional about the thing and things get more tough and it all gets tougher and tougher and tougher, rrrurrerr – he's sort of going into concrete.

What is this? Why? It's running the wrong terminal. Running another terminal than the terminal of the pc's goals chain. The pc's goals terminal doesn't do this. And it is the only terminal in the case that won't. There is just one available terminal in any case, one available terminal and that is the goals terminal of the pc. There is only one goal. There is only one terminal. And if you run that terminal, no matter what you do in the way of a process, the bank will not beef up. It'll not become solid. But if you run any other terminal longer than its basic tolerance or until the pc notices you're running it, [laughter] why, he gets cast in concrete. You know, I mean, he gets misemotional, the engrams get tougher, you get more screams, the circuits suddenly start acting up, and so on. The case gets rougher.

Now, usually in from three to ten days you will get a drop out of this. If he doesn't get any auditing for three to ten days, it'll just disappear. It's not a particularly dangerous condition, beyond the fact occasionally in Dianetics or Scientology somebody has suddenly had weight added to them in the process of processing.

*Why? Why?* Running something else than their goals terminal, that's all. Every time you saw increased weight by reason of auditing, it was because the bank was becoming more solid; it was manifesting itself on the body line and you were running something else than a goals terminal.

That will be good news to several Scientologists. [laughter]

Let me call to your attention that the – I must say this in defense along this line – this fantastic situation where every person is walking around with a different valence. All from the
same source, but every person has a different valence and it is usually different than the identity he is.

It is true that the terminal, running a terminal – this is perfectly factual – is much superior to running a concept, but the only terminal that can be run is the goals terminal, which is the added statement on the end of the line which makes it completely factual and useful. You audit against a concept and the pc's havingness will go down or something else will occur. You must audit – if you're going to audit for a long haul or do anything permanent for a case, you must audit a terminal. But what terminal? It is only the goals terminal of the pc that is available for auditing. If you don't know that terminal, you cannot run any terminal. I cannot say that too emphatically.

Don't run any terminal if you don't know the goals terminal of the pc. You can do almost anything with the goals terminal of the pc. Let us say the goals terminal of the pc is a "motor machinist's mate." Unlikely terminal. "Who would be a motor machinist's mate?" Anyway, his goals terminal was a motor machinist's mate.

Well, I don't ask you to experiment in this particular line, but you possibly could do something like this: "Mock up a motor machinist's mate. Thank you. Mock up a motor machinist's mate. Thank you. Mock up a motor machinist's mate. Thank you." And then nothing would happen. Nothing would happen bad to his bank. He would get the total kickback of his terminal. Oh yeah, he'd be very upset, but it will be emotional upset from the terminal and that upset will reduce and discharge and it'll run out.

Now, why wouldn't some – I go clear back to 1950 – why wouldn't some engrams run and why wouldn't other engrams run? And why, when running some engrams, did they just get tougher and tougher? And why, when running other engrams, they got softer and softer? Now, why?

Well, because the engrams that ran out were on the goals-terminal chain and the engrams that weren't on the goals-terminal chain wouldn't run. Now, I've already shown you here in the – just a few weeks ago that an engram that lay on the goals-terminal chain ran like hot butter. If you knew anything about running engrams at all, it just ran out and swamped up. There was not any great difficulty about it. It ran easily and the pc felt much better afterwards.

But if you ran one which was off the goals-terminal chain, as some of you knuckleheadedly did ... You know, I mean you're doing a Goals Assessment and the pc all of a sudden gets an engram and you say, "Well, Ron says it's all right to run engrams" and you all of a sudden run the engram and you made no progress and something happened with the Goals Assessment and everything would start to blow off and little jets of steam started to come out of the pc's ears and it didn't work. You had your hands on an engram that wouldn't run.

Why wouldn't the engram run? Because the engram was not on the goals-terminal chain and did not contain in it a terminal of the pc's goals chain. In other words, his terminal wasn't in the engram, so it didn't run.

Now, how we got away with running as many engrams as we did, Lord knows. This bug sat there all the time. So some engrams ran and some engrams didn't run. You get a per-
son early enough on the track and you usually run into his goals-terminal chain, so we went basic, basic, earlier, earlier.

The "earlier" principle still applies, perfectly valid. You use it today on the prior confusion to knock out a hidden standard. Marvelous. It'll work. You get the prior incident that underlay all the incidents. The first time the individual ever had an overt against Dianetics and Scientology, you can park his whole case until you find it and then the rest of the chain blows. That principle is right there. But lying right alongside of it there's another principle. And that is, in running engrams, if it is not on the goals-terminal chain of the pc and does not actually contain his terminal and is not directly related to his terminal, the engram will not run. And that's all there is to it.

That terminal which is not the goals terminal of the pc, that item in the bank which has nothing to do with the goals terminal of the pc and so forth, have only a very limited run and if run too long at some point in the line – either at once or twenty hours from now – will all of a sudden find the bank going solid. Fantastic, isn't it?

I know some people hearing this and some people thinking about this and looking at this, are saying, "My God, we've been walking a tightrope." Yeah, we have. We have; we've been walking a tightrope. There was a fundamental there, which was a goofy fundamental – an oddball fundamental of some kind or another.

It wasn't much of a tightrope. I had the ends of the thing pretty well nailed in. They were well set in concrete. Very few have fallen by the boards, but nevertheless there was that spook factor. And now we discover it. Well, it's a good time we do. This is our first year of clearing, where we're doing very wide clearing. We certainly better know this now.

All right. Then if you can't – for heaven's sakes, if you can't run anything but the goals terminal of the pc and if you can't neglect running the goals terminal of the pc and if you can't run other terminals on the pc, then how're you ever going to get a rudiment in? How are you ever going to get a rudiment in? Because they contain other terminals than the goals terminal of the pc. Oh-ho. Well, that's horrible, isn't it? And how are you ever going to clean up any present time problem of long duration if it's not on the goals-terminal line, huh? Becomes impossible, doesn't it? Huh? Isn't this fantastic? Well, fortunately it's not impossible. We'll go into that in a moment. [laughter]

I looked at this with a ghastliness before I brought it up here. All right. [laughter]

Let's go into the basic and exact mechanism and I'll show you the other mechanisms. Let's go into the basic, exact mechanism of why the bank acts up and won't erase if you run something else than the goals terminal of the pc. All right. Let's take this object. Let's take this object here. All right. And this object we will say is the goals terminal of the pc and this object over here we will call an other terminal, other terminal.

Now, you're all of a sudden – to see why life becomes practically unlivable and why, also, the people who have been going around spreading these nice quiet philosophy, like "It takes living in order to live your life out. You have to do some living, you see, in order to erase it totally." Oh, yes, that's around, you know. "Processing isn't enough." You hear this occasionally. "Processing isn't enough."
We get some old mystic philosophy or something – somebody will say, "Well, you have to do some living, too, you see." And now we get where they get this "living, too." "You have to go out and live because it'll spin you in every time." Now, I'll show you how this all amounts to.

All right. Here we have the pc valence. This is his goals terminal, this is the valence that you plunge for and that you assess so crudely and so circuitously for with the valence acting up and the rudiments out and you eventually find it. And outside of Saint Hill they occasionally find one, once in a while. They haven't found a right one yet but they find otherwise. All right. That's actually just – that's just – put it under the heading of a dirty crack. That's all it is. It's true, but that's ... [laughter]

I just had a lot of cable traffic today on exactly this subject, back and forth, bang-bang- bang- bang- bang, all on this subject. "We can't find the pc's goals and we can't find the pc's terminals. And there are no ways to find the pc's goals and terminals." And it can't be because the rudiments are out. I mean almost. Wasn't this bad. But I took it in that frame of mind. I just chose to be annoyed and superior. [laughter]

All right. Here's a thetan. He's in the middle of this thing. And this is his terminal and there it is. And the basic postulates on which this goes in are quite interesting. And as soon as you know this, by the way, you could probably, by using fundamentals and a little bit of Straightwire, occasionally make a case go bzzut-blunt-voom! You know, not clear him but make him feel awfully odd. [laughter]

The basic is this: As long as the thetan – he knows this – keeps his attention on his goals-terminal valence, as long as he keeps his attention on it, it is all right. Everything is all right. This is introversion deluxe. As long as he keeps his attention on his goals terminal, everything is all right. The bank is only normally psychotic, and these various things occur.

Now, to this and appended to this goals terminal we have innumerable considerations, packages, personalities, postulates, circuitry and machinery. It's all a complete package. Here it sits. There have been others. There have been earlier ones. But I'm talking about the one which is now available to the auditor and which can be run with impunity and which you find with your ordinary and general run assessment. As long as he keeps his attention upon this valence, he's okay. All is okay. The bank will not misbehave; it'll just be normally nuts. He's taken care of. And that is built into the machinery in which he is operating. That is the built-in strata on which he is functioning. And as soon as he puts his attention on any other terminal – now get this – as soon as he puts his attention on any other terminal, he's doing something that is not quite right.

He is rigged so that the valence in which he is will assert itself. The punishment mechanism is that the valence gets more solid and more assertive and more it, the second that ... The thetan, you see, punishes himself by the basic built-in mechanism and the basic fundamental of the valence that if he puts his attention on anything else then the valence is going to do something extraordinary; it's really going to act up and it's really going to call attention to itself All right.

So he puts his attention over on this other object and instantly this valence, his goals-terminal valence, goes "Woof-rrrrruuum-creak, ummm-UMMMMM, MM-MM,

[laughter] "All right. Calling operator, electric-current switch panel, mysterious current passing through temples. Numb feet, numb feet, calling up numb feet." [laughter] There it goes. The whole machinery goes into action as soon as he puts his attention on another terminal. Now, you thought I was talking about auditing, huh? Oh, I'm not. I'm talking about day-to-day living. Oh, oh. Isn't it fantastic that the more terminals he is asked to put his attention on the worse he will get. And we have just found a big hole in the road called life.

I'll go over that again. The second he puts his attention on any other terminal than the one he is interiorized into, it acts up and he gets his head knocked off one way or the other. And that applies to life.

So when he sees a streetcar conductor, if he were to see the streetcar conductor, the bank would start acting up because this terminal is what we call the bank.

An interesting thing. I have found – I've found Lucifer out today. This was the rig. He goes up to see the bank manager. If he puts his attention on the bank manager, his terminal doesn't even have to be anything related to the bank manager. If his – he, by the way, would be fairly comfortable, comparatively speaking, if his terminal were to be an arch bank robber and it wouldn't be quite so bad putting his attention on merely a bank manager. If they were slightly related, why, it might not be so bad. But his terminal is a washman and he puts his attention on a bank president, you know? The bank president startles him: the bank president says, "Well, all right, I'll give you an overdraft and extend your loan" – depending on what country he's in – you know and it startles him.

You know and for a second he looks at the bank manager. Just for a second, you see, he puts his attention actually on the terminal called bank manager and his bank goes creak, creak, creak, creak, bing! One of these pinball machines you see in these penny arcades, you know, because he put his attention on another terminal.

The pc is drifting along in-session, being well interiorized in running and all of a sudden the auditor drops the E-Meter. Now, just the mechanism of attention sliding off of what the pc's doing is, of course, a shock and a surprise, but that doesn't account for the repercussion that very often occurs.

The pc is well interiorized into his valence because he is running and all of a sudden his attention is shifted over to another terminal, whether it's E-Meter or auditor or – it doesn't matter what. Over to another object or terminal. His attention is shifted outside of this goals terminal.

It could happen to him in life, but in view of the fact his attention is fairly comfortably relaxed on his goals terminal, one way or the other, on his bank in an auditing session, it's just the magnitude of shift. You see, he's more interiorized and it exteriorizes him harder, so his bank goes crunch! clank! Gets solid and acts up.

All of the mechanisms by which he prevents himself from becoming other than this goals terminal go into action and punish him back into becoming the goals terminal. Interesting mechanism, isn't it?
Life, you see. He goes – he sees a fellow student. He feels nervous around this fellow student, you see. He feels nervous. Now, he'll feel as nervous about a fellow student as the fellow student is appearing. A person is as nervous about any other terminal than his goals terminal as it appears or manifests to him. It's a direct proportion.

In other words, the more he is forced to put his attention on another terminal, the more nervous he gets, of course. It works out quite easily and simply.

So here's his – here's the pc and his goals terminal. He's going along just dandy, just fine. He's living totally interiorized. And as long as he never sees anything and as long as he never meets anybody, as long as he never really notices anybody, as long as he never talks to anything or notices the physical universe in any way whatsoever, as long as all this is occurring, he is all right, he thinks. Now, that he can gradually become familiarized with his surroundings or gradually familiarized with other terminals is just marvelous. It just comes under the heading of familiarization.

But if you familiarize him along the line and then suddenly familiarize him rather too suddenly about something of the sort, the whole goals-terminal structure, which is being violated up to this point, will go in again, clank.

Life is an aberrating activity. Well, there are other terminals in life. Now, you wonder why people don't see well. Well, if they don't see well they don't have to see any other terminals and if they don't see any other terminals of any kind, why, of course, their bank doesn't beef up. If they see any other terminals their bank will beef up.

They're teaching themselves this lesson all the time: "If I look not at something else, if I put not 'mine' attention upon any other terminal, I won't get this cotton-picking backache." They know this reactively.

Now, everything in Book One applies. It's how the fish protects himself from being eaten and how he uses restimulators and all that sort of thing. But the one restimulator and the one mechanism that he used is not sufficiently delineated. It's in Book One. It tells you all about it in Book One, 1950, but it doesn't press it home. And there's one factor missing in that book: that there is only one such terminal. And there's one consequence missing in the book: that if he puts his attention on anything else in the way of a terminal, to some slight degree it's going to mess him up.

Well, I just level with you. There's the data. There's the data.

You get out and board a bus, the conductor comes by – click, click, snap, snap – he wants your pennies. You get along just fine if you just hand him the pennies, you see. You see, don't really notice him, don't pay much attention to it, you know. It's perfectly all right. But if he then goes snap, snap with one of these punchers, you see and your attention goes this way, you say, "Damn that," you know? You get – you get about what the borderline is. There's apparently some tolerance and probably the tolerance varies from person to person to the degree that they've been forced to look at other terminals. And they can tolerate quite a bit from another terminal before they go booey. They can tolerate quite a bit. They can talk to people. They can go to parties. They can talk to people. They can act around.
But, actually, life is not peculiarly life that has nothing to do with the mind. That's the way it's mostly been regarded. But why is it that people, as they go along in life, quite ordinaril
gy go to less and less parties. People ordinarily become less and less gregarious. Well, naturally.

I don't think bodies wear out. I think the thetan's – not the body's – the thetan's goals terminal beefs up. And when it beefs up to a killing point, that's it. And that's age. I think this mechanism is that pervasive in life. So you see it's pretty, pretty fundamental fundamental, isn't it.

All right. Well, this puts us in a bind, ladies and gentlemen. It scraps every rudiments process you've got, just like that. Not possible. You can't put rudiments in, obviously. It violates this rule. Obviously, you can't audit a person because the second that you put his attention on you, the auditor, why, the goals terminal beefs in and he gets worse. So obviously auditing is impossible. Obviously, you can't clear up the minor difficulties of the individual if it involves running other terminals. That leaves you with just, of course, a Goals Assessment, a Terminals Assessment and a goals terminal run, period. That's what it leaves you with as effective auditing. That's the lot, as far as effective auditing is concerned.

So the importance of Routine 3, in those characteristics, could not possibly be overrated. We've come back onto the highway and all of a sudden found out there's just one road there. Mess up that road and you've had it. Uruuh! That's a bum show, isn't it?

Look, you can't run the auditor out, because he's a terminal. So if a fellow had too many bum auditing sessions he would have had it, right? Finish him. You may as well think this through in its most gruesome [laughter]... most gruesome lines. I'm presenting it to you with as much crepe on it as possible. If you find some places on it where I haven't hung any crepe, why, you supply them to yourself. You can see that it's a closed channel.

A person who's had a lot of bad auditing, of course, that's ruined him. It's obvious there's no recovery from anything, except by his goals terminal. Yeah, but his rudiments are out so nobody can find his goals terminal and he's not at Saint Hill; he's being audited by somebody who read a – read a short leaflet on it.

So this gets very interesting, doesn't it? That's as narrow a view as you can get. Now, can the view be expanded at all? Now, these long yards of black crepe, festooned about, give us this other aspect. Is there any slightest peepholes of light shining through the funeral crepe? Are there any? Yes, yes.

Here's another bug. Here's another bug datum, another interesting bug datum. It's a purple piece with cross-diagonal orange and blue slots. It's shaped like a biscuit cutter, dissected and made into a tolahedron. And it's ridden along with us for a long time because every once in a while an auditor has sat down and run fifteen or twenty different processes on a pc, all of them figure-figure, think-think processes and the pc's got a tremendous case gain. Next time we try the same processes or anything like these processes, nothing happens.

Did you know this bug factor occurred? You must have run into it yourself. You must have asked somebody to think of being well, sometime or another, you know or something like that and ran this for a little while and something wonderful happened with the case. And
then you got hold of another case and you said, "Think of being well" – with great confidence, you see, you did this; enormous confidence – "Think of being well," you know. And the fellow says, "All right, so what?" [laughter, laugh]

But this funny looking piece is this: that cases have recovered on conceptual address; they have recovered from running concepts. When I first dreamed up Concept Processing, way, way back – I guess it was – I don't know, 52, 53? 52.

A bunch of psychiatrists and chiropractors and a whole bunch of birds, they – next year or something like that – they read all the bulletins carefully, backwards and, God, had something like "conceptualism" and so on. And they just took this original material. Actually, for – at one time, I think only four or five years ago, they were running two or three hospitals in the United States and this is all they were doing. They were doing it all messed up and backwards and they weren't getting much in the way of results. But it – there was something there.

And I didn't know how much there was there. And fortunately – fortunately, I knew basically that it was only a terminal proposition and I knew you couldn't do anything unless you did something with a terminal.

But it was – it's taken a long, long time to sort out what terminal and to find out how to get that terminal and how to run that terminal well. That's taken a long time to do. And if we'd stopped with conceptual activities, significances, we never would have gotten anywhere; nobody would ever clear on significances, but you can make people feel better.

The reason you can't clear on significances is, of course, significances are part of the package of the valence and terminal. They're the valence that the pc is in on his goals-terminal line, see? His considerations can be shifted around and it doesn't do very much. It's processing the terminal. See, but you can shift the terminal's considerations somewhat. Don't think you can't.

One of the ablest of these processes is old Rising Scale Processing. This can change a terminal package around faster than anything you ever heard of. But it doesn't get rid of the terminal, but it doesn't beef it up; it doesn't get it upset. And you can audit it.

And you can lay this one down, not for very permanent results, not for any broad wonderfulness, not for any spectacular thing – merely a miracle here and there. Depending on the good sense with which you pick out the concept, you can audit concepts on a preclear. You can audit concepts on a preclear as long as they do not in any way hook up with a terminal. That is the basic rule. You can audit concepts on a preclear as long as they do not in any way hook up with a terminal other than his goals terminal. That can be done – and that's fairly fortunate for you.

But here's the limiting factor from an auditor's practical viewpoint. Not that it limits this, but the auditor, trying to apply this, is going to every once in a while goof. He's going to think he's running a concept or a significance when actually he is running a terminal. He'll say, "Let's see, we can run concepts and significances so it'd be all right to say, 'What does your mother think? That sounds good. All right. What does your mother think? Thank you." "What does your mother think? Thank you ... Thank you... "
Tone arm starts up, you know. "What does your mother think? Thank you." Tone arm goes on up higher. "What does your mother think? Thank you." Tone arm gets up to 6.0. "What does your mother think? Thank you." Tone arm sticks. "What does your mother think? Thank you." "I don't know. Ron said that you could audit concepts as long as they weren't... connected with any terminals. Uh, oh, wait, wait. Oh, oh. Oh! I've – I've been ... Oh, oh, oh, oh! I'll have to run this out in my next Security Check because I've been running his mother. I've been running a terminal on the pc, you see. And because I had think connected with the terminal, I for a moment, you see, didn't realize there was a terminal there." Now, that's a very gross one. That's a very gross one.

You can – you can duck one like this and you can say, "Well, what would – get the idea of running away from things," you see. "Oh, that's good. That's an easy concept, see. Doesn't put anybody's attention on any terminal." And the tone arm starts up, it starts up and it starts up. And the only thing it is, it's got a terminal mixed up with it, see.

Now, you can get away with running "you," because this covers, to some degree, the goals terminal, see? You can run "you." But you can't run anybody else, not on a pc on a concept. All right.

And you can – here's the next big, broad basis of it: You can security check terminals. Why can you security check terminals? Because the person's overt and withholds from the terminal in a limited sense were when his attention got pinned on another terminal than his goals terminal and if you can separate his attention at those points on the track when they have been pinned against other goals terminals, you of course are less activating his goals terminal. You are picking out times on the track when his attention got onto other people selectively and pinned and stuck on other people and you're picking those points off. And not running any repetitive process or fixing his attention on the terminal and – in any particular way, but by getting his attention on the things that pinned his attention in the past over onto the terminal, he therefore feels better.

And that's why a Security Check works. Hasn't anything to do with God and sin. Has to do with broken mores and attention pinned on groups and it has to do with all those things, that's for sure. But I'm talking about just why would coming into the church and confessing that you just murdered one of the choir boys last night, for immoral reasons, produce a tremendous case gain, as they claim? See?

Well, his attention – he's got an overt and he's got a withhold which pinned his attention on the track on another terminal than the one he's on. You weren't saying, "Think of murdering choir boys. Thank you. Think of murdering choir boys. Thank you. Think of murdering choir boys. Thank you." Eventually, the only thing that's coming through to the pc is choir boys, choir boys, choir boys and his bank start – is likely to get solid. See, he's liable to get a high tone arm and get very upset and that sort ...

Now, why does the high tone arm occur on a withhold? Why is it accompanied by a high tone arm? The person is withholding something and so forth. It's because at that point on the track their attention is pinned on another terminal, other than their goals terminal, so you get a high tone arm. You got that one? All right.
Now get the idea of a time track and the individual at intervals in the past has had this mechanism violated by life. Life has demanded of him that he take his attention off his goals terminal and put it on another terminal. And of course those are best expressed under the heads of overts and withholds. So there's the points where his attention is on other terminals.

So if you can just knock out those points delicately – flick, flick, get the overt off, get the withhold off – he frees from that terminal and his attention is no longer, at that point of the track, violating his goals terminal, so he feels better. So knowing that rule you can security check with impunity, as long as you don't put his attention on too many terminals.

That is to say, let's not sit down and make a list of 8,795 people and then let's say, "Mother, Mother, Mother, Mother, Mother, Mother, Mother, Mother" – and all of a sudden the pc's tone arm starts up, up, up, up, up, up. Of course, it's the auditor who is putting his attention on the mother.

See, the auditor is not disengaging his attention from Mother in the past; the auditor is putting his attention on Mother in the session. Now, you get the two differences there? That's a very delicate difference. We can say, "All right, now, what have you done to your mother?"

"What was that?"
"Well, I did this and that..."
"Have you ever withheld anything from your mother?"
"Yeah." Plang. "Did that and so forth."

"When was that?" Plang, you know. Boom, bang. "All right. Now, have you got any other withholds from your family? All right, that's fine. When was that one? All right." You know. Just – you could run almost regular Security Checks.

As long as you don't say, "Well now, what sort of a person was your mother? Now, was your mother very mean to you, one way or the other? Now, was your mother a big woman? Was your mother a small woman? Did your mother talk loudly or talk softly? Exactly how did your mother ... And all of a sudden it gets to be a word Mother to this fellow, with letters about six feet high, you see and it's all massy and bulky and he feels very crushed in and starts to feel sort of solid and sort of upset.

You've just taken his attention off his goals terminal, that's all. You've stressed the other terminal too much. You get the idea?

So you can get the overts off and the withholds off. Oh yeah. Well, this takes off the times on the track when their attention got stuck on the other terminal. And as long as you don't get this other terminal pushed in to a point in the session where their attention is being fixated on this terminal which is in violation of the goals terminal, their bank won't get solid, they will recover and they'll feel fine. Okay?

I gave you all the rudiments processes that are effective processes here several lectures ago. They are very easy processes actually. The basic process is this: "What's your attention been on lately? Thank you."
"What has it been on?" Not "What could you look at?" You see, "What could you look at?" is a violation of the goals terminal. "What has your attention been on?" I just give you that as the fundamental form. "What has your attention been on?"

You could spot where his attention had been on things and the rudiments would clear up. So here's a fundamental way. This is actually part of a lecture of some two or three months ago.

You've got a present time problem. All right. Don't run problems because problems bring up terminals and the person then finds himself facing a terminal and then you'll find the problem doesn't run because it's not his goals terminal and you're going in circles. So you don't run a present time problem. You merely spot the problem, when he has had it before and try to get the earliest time his attention was on such a problem. You just sort of backtrack it and pull out the earliest pin and let his attention just come on up to present time on the thing. And you'll find out that the problem has discharged without running terminals in connection with the problem.

You understand, rudiments have not been unsuccessful because they are not run very long. You're not putting his attention on this terminal over any long period of time, so you've gotten away with them. But recognize, we can recognize now that we have gotten away with something.

And you can continue to get away with this and you can go on running rudiments processes the same way you are running them without running into too much trouble. But here and there you're going to run into enough trouble to cause us to gradually graduate it over to merely this "What has your attention been on?"

All right, let us take an ARC break. All right. How would you clean up an ARC break? You would say, "Well, do you recall any other AR – any other things there that were bad that you didn't – you know, was – your attention was on saying something to somebody and you just couldn't say it and so on? Do you recall any other circumstances like this?"

"Oh, yes, yes."

"Oh, well, got another one? Oh, yeah" – boom. "Got another one?" – boom. "Got another one? Yeah, that's right."

"Oh well, I see what's wrong in the session now," the pc says. "I've – I've been trying to tell you something and I couldn't tell you," see? His attention is still stuck on trying to communicate to the auditor or something of the sort, see.

Find out where his attention got fixed in the session and unfix it and of course he'll feel better because it's not in violation of his goals terminal. Simple. So if you just specialize, in rudiments, in unfixing the pc's attention where it is fixed, then he will feel better.

You see, wherever his attention was fixed on the past track on another terminal than himself, he violated his goals terminal, so it's a little aberrated point on his track. He feels a little bit funny about it.

It's amazing the amount of – number of terminals that pcs can actually look at without spinning in. But if you take auditing, with all of the heavy-drill mechanics back of it and try
to make them face up to a terminal in auditing, wow, wow, wow. It gets to be pretty wild. I mean, you keep bringing up ... Well, let us say that you have taken up his mother, you have run his mother; and it was perfectly all right; and it worked out all right. And you ran his father and you started running his father. And this had nothing to do – you never assessed this fellow and you've run his father and you were just going to clean up his whole family, you see. And you ran his father and you ran his father and you ran his father.

And, I don't know, the tone arm seemed to be getting up and the case seemed to be getting sort of sticky. So you ran his father, so you ran his father, so you ran his father, so you ... The case seemed to be getting awful sticky by this time and you couldn't quite see what the devil was happening on the thing and you sort of knocked it off. And you decided, well, you couldn't do very much about that. And you just skipped it after a while.

And three or four days later it was all right. You asked him about his father and he didn't seem to be particularly upset, so you let it go by. Have you had that kind of thing happen? Well, that's what's the back of it.

You're putting his attention on Father and his father was a wild violation of goals terminal. So was Mother, but you see it's Mother plus Father made quite a lot of violation of goals-terminal attention, you see and by the time you'd gotten – some pcs you could get fifteen family members or something like that up the line before they finally went clank!

So Sec Checking can be done. Disengaging attention fixed in the past can be done. And goals terminal running can be done. Everything you have learned about prior confusion becomes terrifically valid if you omit the problem running. Don't run the problem because you immediately and at once run into groups and other people and other terminals.

All right, that's what I learned from you. I watched your tone arms going. Boy, you sure had a time. That's why I changed you over quite rapidly on to running your goals terminal so swiftly, on almost the identical process. Of course, it was a good thing. You got used to the process, got used to the form, got used to auditing it and it didn't do anybody any particular amount of damage, except one class member, and she's recovered today, so that's all right.

And there is the view of the thing. Don't – just in the interest of not goofing, just in the interest of having nothing funny happen in the session, just in the interest of everything going along smoothly and the pc never having any ARC breaks – if you want to have no ARC breaks with the pc, keep his attention on his goals terminal and run him on his goals terminal. Never put his attention on the auditor and never let his attention go on anything else but the goals terminal, pockety-pockety-pockety-pockety-pockety-pock.

Now, there's another mystery on this I'd better tell you about, is why did it take one of thirty-six or more of thirty-six Havingness Processes? Some pcs ran on one Havingness Process and some pcs ran on the other Havingness Processes. One of the thirty-six Havingness and one of the thirty-six Confront Processes do not violate, for some peculiar reason, the goals terminal of the pc and therefore, remedy his havingness and let him move on the track. For some reason or another they're all various combinations of commands and it sort of lets him walk through a gate.
So you ask one pc, you say, "Look around here and find something you can have." He can't run it. The thing gets stiff. Why does it get stiff? Violates – "attention must be on his goals terminal." His attention must be on his goals terminal, you ask him to look at the wall. Oh, no. Well, you've asked him to look at the wall in this particular way and that's no good. So you finally ask him, "What emotion does that wall have in it?" or something like this. Oh, he'd tell you that. That's easy. And for some reason or other this doesn't violate his goals terminal. It's where the concept of the havingness and the concept of the confront are matched to the now-I'm-supposed-to packages of the goals terminal.

And where these things are exactly matched – where the havingness is matched to the goals terminal and doesn't violate the principles of the goals terminal and where the confront doesn't violate the goals terminal and matches its principles, then that havingness and confront works like a bomb on the pc. You only find two or three or four of those processes will work on each pc. And there's thirty-six of them and pcs work on all different ones.

Now, what's variable in cases? What's variable in cases is the goal. What's variable in cases is the terminal and the now-I'm-supposed-to's that go around that valence. And these can be infinite. You can have the most complex sort of a valence. Think of your own valence just at the moment – did you ever see so many complex facets to anything in your life as that valence?

Well, people really don't understand what a bank president is. They really don't. He does this and he's now-I'm-supposed-to do that and he's now-I'm-supposed-to here and he's now-I'm-supposed-to there. And for practically every answer and facet of life, the bank president has an answer. That's marvelous, absolutely marvelous. And as long as you don't violate any of these particular principles, you can live a happy life. At what cost? Well, just the cost of you, that's all. Of course, you can't be a good bank president, either, because it takes more than I'm-supposed-to to be a bank president.

But somewhere in those Havingness Processes – somewhere in the Havingness Processes, somewhere in the Confront Processes – there's one or two or three or four that work. Well, they don't violate the terminal. They're not necessarily what the terminal would do or not do, but they are not in conflict in some mysterious, alchemical way, with the now-I'm-supposed-to's of the valence. And so you sort of found a little hole in the picket fence it went through. Well, that's very good.

Now, we're also, then, in contest with looking at other holes and for other holes in the picket fence in the way of how do you do things with a case. Well, most concepts would be functional as long as they're strictly concepts. They'll patch up a case a little bit.

Of course, you can't change this valence around. No, the valence is in in concrete. You can run the valence out, but you can't change it around. But running concepts you can make somebody feel better and you can alter something of their considerations. And remember there's a thetan there, too. And concepts are a hole in the fence. Because it's all right to put his attention on an idea, but it is not all right to put his attention on another valence.

Therefore, you have innumerable people able to absorb or pay attention to or have concourse with ideas that cannot have any concourse with masses. They cannot observe mas-
ses. They can't do anything with masses or people or something, but they can do something with an idea.

Well, a hole in the fence is that the – an idea is not a violation of the valence terminal. Now, *unpinning* attention off violations of the goals terminal in the past – you see, times when his attention has been fixated over on another terminal... Of course, that was a violation of the goals terminal, so you're patching up that; you're of course freeing his attention on the backtrack. And that's done by Security Checking.

So Security Checking is a wide hole in the fence. Now, there's another hole in the fence, is that you can run any problem by picking up the zone of prior confusion and sec-checking it. His attention stuck on the problem because his attention was already stuck on violations of the goals terminal prior to the occurrence of the problem. So you can always get rid of a present time problem by finding the incident of prior confusion.

I did this the other night with Mary Sue. Just the most mysterious thing you ever saw. You get used to these sort of things – takes it in stride. I was thinking about this and I noticed that after you – after you left, she was wheezing and sneezing and so forth. She was sitting in the other room and there was no heater in there and she was very cold. And I noticed that she put on – as any Texan would – put on a wool sweater and then she put on a coat over the wool sweater and then she put one of these driving-sports-car, heavy-padded jackets on over that, you see and she was looking around for a couple of shawls or something. [laughter]

And I said, "What goes on?" She says, "I'm cold." So frankly, she was under a very heavy pressure to get her reports done, don't you see? And I was standing in the door talking to a lot of you, you know and I was slowing her down, you see. So time was sort of stopped. But her attention, you see, was rapidly snapped over on to the group standing in there holding the door open.

Now, you said, "All right, now, all you have to do is get off her overt thoughts of why don't they go home and why doesn't Ron shut the door and why doesn't it get hot in here and why doesn't somebody turn on the heater?" You know, this sort of thing you would have said. "That's the thing to do and that's all set."

Well, I just made a nice interesting little two-bit test out of it and I did all that. And she was still sniveling and she was looking around for four or five more mackinaws and shawls, Texas fashion and so forth. And then I found that while reviewing your sec checking earlier, she had become just shakingly furious with a couple of incidents where a lousy job was being done and it was the prior confusion.

Everything blew straight up. She took off the mackinaw after throwing me out. I actually [laughter] ... You get this as an incident? If Suzie will beg my pardon. But you get that as a very homey fundamental little piece of nonsense. See?

The apparent O/Ws that would directly cause the situation had – and the exact problem had nothing whatsoever to do with being parked on the track. That was all much earlier. It was actually an hour or two earlier than that. And then some other incidents had happened and made the earlier incident key in. It was just the prior confusion to what the pc was saying.
And she didn't have any recall of having done this other thing at all. She wasn't thinking about it at all. The second it blew into view, [snips fingers] that was it.

So actually you haven't lost anything. You have a faster method of getting rid of a present time problem than you had before, when you get a Sec Check of the prior confusion. Just find out who was there earlier and did the needle move while they were there earlier and find out what they did earlier than the time they are worried about. If they're worried about eight o'clock, find out what happened at five. They are very stuck in a fight with their wife as they come into session and you say, "There's a hell of a present time problem. We've got to get rid of this problem and so on, in order to get on with the session." And you say, "When did this fight take place?"

And they say, "Ho-ho-ho-ho-ho. It's been going on all evening. It started about supper time."

You say, "Good. When was supper?"

"Well, supper was at six-thirty."

"All right, that's fine. What happened at five?"

"Oh well, that was before the argument with my wife, you see. And this has nothing to do with the present time problem. Because my present time problem with her – she didn't have dinner ready and I had to get back here for the session and so forth and we had a fight."

"Oh well, all right. Well, what did happen at five? Where were you at five?"

"I was down at the lumberyard."

"Well, all right, so you were down at the lumberyard. Who was down at the lumberyard?"

"Oh well, nobody, but there were those-" Clank!

"Who was that? What was that? What occurred then? What did you do?"

"Oh, well, I completely forgot. As a matter of fact I fired the foreman." "All right," you say, "thank you very much. Do you have a present time problem?" You won't get any action. You didn't even discuss the fight with their wife. Anything the pc is worried about is pinned by an unknown prior to the fact. That is the rule. Anything that the pc is worried about is pinned by an unknown prior to the fact. Any present time problem is fixed as a problem by a prior occurrence, prior to the occurrence or subject matter of the problem.

I've told you for some years now that any time a pc blew on you, they had had an ARC break for at least an hour – half an hour to an hour and a half. And maybe when I get your goals terminal all run, maybe you'll notice what's happening to the pc and be able to put your attention on the pc without caving your own bank in. [laughter]

So, you clean up an ARC break. How do you clean up an ARC break? Well, the pc goes clank, blump, thud, tone arm goes up, things get sticky. You say, "Do you have an ARC break?"

"Well, yes."
"What happened?"

"Well, you muffed that command." Hm-hm. All right.

Now, let's use the attention — "What was your attention on?" sort of a thing. You get the idea? "When was the first time your attention was distracted from your auditing, from being audited, that you can pick up now?"

"Oh well!" And bing, bing, bong, thud, boom, boom, pick up two more, bang, bang, another one, boom, that's it. They're in present time, no ARC break. If you don't believe it, try it sometime.

Or it was the fight they had before the session that you didn't pick up as a PT problem. But the ARC break is hanging up and is an ARC break because of a prior enturbulence which is not now in the consciousness of the pc. Anything that is wrong with the mind is unknown to the mind.

You needn't make a full fetish out of that and say, "Well, if the pc says he has a stomachache there is no need to believe him at all, because the pc knows nothing about his case." You see, you could carry this out to a ridiculosity. But if the pc said he had a stomachache and then told you where he got the stomachache and why he has the stomachache, you should realize that this has exceeded the knowingness of the pc, because if he knew where he got the stomachache, he wouldn't have one. But you still use where he got the stomachache and when he got the stomachache, so that you can get a few hours earlier than that.

Fellow says, "I had a nervous breakdown." All of a sudden, why, it's most — you see, you're all trapped into this as being the most logical thing in the world. He said, "I — I was sitting at my desk and," he said, "my business was semibankruptcy and — and everything was going to pieces and all of a sudden my secretary stuck her head in and screamed at me, 'Your father has just died in a convulsion and uh — his will is bankrupt,' and uh-uh—and so forth and that's why I have this nervous breakdown."

Well now, you must believe that the pc has a nervous breakdown. That's perfectly fact. He can observe that. But why he has the nervous breakdown, when stated by the pc, is a violation of this fact. He still has the consequences of a nervous breakdown. If he knew where the nervous breakdown came from, he would not have the consequences of a nervous breakdown.

So you take the fact that he is suffering from a nervous breakdown — all right, that's fine. And you take the fact of when he thought it started and what he thought began it, in order to get a bit earlier than that and find out what did begin it and start it. It'll always be earlier and always be unknown to the pc. That's how life hangs up.

Now, couple this with the fact that it was always a violation of his goals terminal because his attention fixated on something else. See, his attention fixated on something else, some other terminal. If you pry his attention loose from having fixated on prior terminals, why, you've got the thing taped.

In other words, Sec Checking works, concept works, getting the person's attention off parts of the track it is fixed on, that works. Running terminals — don't do it. Might as well lay
the law down now, rather than soften the blow and try to make myself look very intelligent about the thing. I pat myself on the back for knowing there was a terminal there. Nobody else knew it. Yeah. And now I find out that we've got a firm grip on the terminal. We know that there is a terminal there that is the terminal we're looking for.

And I can impart to you this oddity that apparently, now that the checks are all in, some of the variations of auditing, the ARC breaks of pcs, a lot of "Why does the tone arm go up and stick?" – a lot of these answers are rapidly satisfied by the fact that his attention mustn't be on any other terminal than the goals terminal. And it's only by taking his attention off the goals terminal, by running some other wrong terminal to the case, works.

I'll give you an oddity. Do you know that many Dynamic Straightwire – not very many, but enough to make it interesting – Dynamic Straightwire terminals that were found for runs in yesteryear are the goals terminal of the pc. Isn't that interesting? They're sometimes worded just a hair different or something like that. It's quite interesting that auditors here and there just picked right out off the cuff, you might say, by doing a Dynamic Assessment and actually would arrive with something which was a near throw on it. One instance – the Dynamic Assessment gave the food of the terminal, which the Goals Assessment found. In other words, it was right on the line. It wouldn't have been damaging to have run it.

Did a Dynamic Assessment and let's say – well, this wasn't it – but "chop suey." For some reason or other the only thing that could fall out of the hamper on a Dynamic Assessment was chop suey. And we assessed the fellow and we find that his goals terminal was a Chinaman.

You see, they're – they're matched up here and there that closely – There are probably other methods of crosschecking whether or not the goals terminal is right. There are safeguards of this, having become sufficiently important.

Mary Sue just proposed a safeguard. She says, "Well, why don't you do a Prehav Scale assessment, then do a run on the 10-way bracket on groups and problems on the goal. Not do the Prehav run, you see. And then go back and do another Prehav assessment and see if a lot of new levels have suddenly come live, as a crosscheck."

There are probably a lot of these crosschecks could be used, one way or the other and you'd know very well whether or not you were running the pc's goals terminal. But the best run is, is the pc interested? Is his case running? Is it fairly easy to keep the rudiments in? And does the pc say, "Oh no, I never want to get Clear"? Is the pc getting upset with life? And is the pc saying, "Oh, I never want to be audited again; this is just too ghastly," yet continues to appear for session? [laughter]

There are a number of tests. There are a number of behaviors which are peculiar to the goals terminal.

All right. Well, there have been a lot of snarled spots taken off the line and they've made a much neater picture. You possibly will feel a little bit confused. Some of your data you may feel you now have in crosswise, it's been unstabilized. That's why I've gone over it carefully to tell you what data is or is not crosswise. And the only thing I'm telling you is that
you have assisted me to the degree of showing me that you cannot run a problem. Can't be done.

We still have the whole Problems Intensive, the whole lot, but we have it in its original version. You go ahead and find it, you find the problem. And you only find the problem in order to find the prior confusion. And then you just sec check the prior confusion and you've got your – your Problems Intensive is just fine. Just omit running the problem. You get in trouble running the problem, but you won't get in trouble taking their attention off violations of the goals terminal earlier, even though you didn't know what the goals terminal was. Do you see that?

So it's the same thing. You do it the same way. There's absolutely – everything is just exactly right. The only thing I've got to change on the form is just that one little line about running the problem. You don't even have to word or run the problem and none of you could do that anyhow, so it's all right. [laughter]

Yeah, you could run it all right, but wording it, that was beyond you, you see.

Okay. So there we are. I've brought you up to date. Some of your cases ought to be running like startled deer. I've relaxed the rules now on which you're being examined, therefore, I expect you to be examined even more frequently, but not under so much duress. The thing for you to do is to get Clear by Saturday and then start studying Monday, finish up the checksheet by next Thursday and you've got it made. [laughter] Okay?

Thank you.
SECURITY CHECKING: AUDITING ERRORS

A lecture given on 26 October 1961

Thank you.

The subject of the lecture today is Security Checking. And this is the 26th of October AD 11. It better be called AD 11, because something new and strange is happening. There are some cases breaking up, in a fine way. Of course, you probably don't think so. [laughter] Do you think anything is happening to cases?

Audience: Yes.

Female voice: Yes.

Oh, you think something is happening to cases. Isn't that nice? Isn't that nice?

Is anything happening to your case? No. Nothing is happening to your case. Is that right?

Audience: Yes.

Tell me the truth. Do you think anything is happening to your case?

Audience: Yes!

All right. Do you think anything is happening to your pc's case?

Audience: Yes!

Male voice: Yeah.

Well, is your goal to make something happen to cases?

Female voice: Yes!

You sure? [laughter] All right.

Okay. I want to talk to you, why things don't happen to cases.

There are certain definite fundamentals of processing which must be observed before a result is obtained in auditing. There are certain safe things you can audit: You can audit concepts, ideas; you can Security Check and get overts, by getting the times an individual's attention was pinned on another terminal on the track; you can find the goal and terminal of the pc and run it; you can run engrams on the goals-terminal line after a long run has established that they are on a goals-terminal line. And that is about all you can do. That's just about all you can do, successfully, to a case.
If you try to do anything else – such as run a generalized terminal (to run "Mother" out of the case while his terminal is "a tinker"); if you try to make him create things which are off his goals-terminal line; if you try to do many other things having to do directly with terminals and running terminals which are not his goals terminal; or if you ask questions too searchingly so that they are repetitive and are newly attracting his attention to a terminal which his attention was not on before – you're going to get a slowdown. His bank is going to become more solid and he's going to be upset.

I'll give you an idea. Your idea of what's wrong with the pc is he's having trouble with his father. Well, your idea stems from the fact that the pc has told you repeatedly that he's always having trouble with his father. So you say, "If I could just get Father out of the road, then we're all set here and we will therefore run Father." "Now, what have you done to Father? What have you withheld from Father? What have you done to Father? What have you withheld from Father? What have you done to Father? What have you withheld from Father?"

You see, it sounds almost right. Sounds just like you're going to get away with it and everything is fine. And then the pc doesn't recover and things look a lot different to the pc – all bad. You see that?

Because you're saying, "Father, Father, Father. Your attention on Father? Put your attention on Father. Put your attention newly on Father. Put your attention – brand-new attention – let's search for more things which you have done to Father." The guy has already given you everything he's done to Father, you see? "So put your attention on Father. Put your attention on Father. Put your attention on Father." And of course, that means "Take your attention off your goals terminal. Take your attention off your goals terminal." That's the one thing he must not do.

At no time must he take his attention off his goals terminal. He knows this. This is the one thing he knows better than he knows that there's air and sunshine. He never found that out yet that there's air and sunshine. But he does know that there is this terminal, "a tinker."

Of course, he knows it so well that he doesn't know it at all. It's buried completely down in the further deep reaches of the coal mines. Yet, it is nevertheless there and it is reactive. So we can say bluntly what some of these oddities that we have run into occasionally – we've piloted our way through them; don't think that we've just been making mistakes left and right, and front and center. We've had things that prevented any casualty from occurring along in this line.

But let's take a look at what you could do that would be wrong. Let's take a list of wrongnesses that an auditor can pull: (1) he could disobey the Auditor's Code; (2) he wouldn't know his business; he – (3) he audits a pc with a screaming present time problem; (4) he audits a pc when the pc knows he can't communicate with the auditor – which is Clause 16 of the Auditor's Code, after all, goes out of two-way comm, but that's a particularly serious one. And he could run the case with tremendous withholds on it, and of course, this is another violation of Clause 16. It's a violation of the Auditor's Code to run a case with tremendous overt undisclosed on the case, because the pc is not in two-way comm with the auditor. So that would be dead wrong. And the other dead-wrong thing he could do would be to pick a terminal at random and run it ad nauseam. And that's – that's dead wrong.
That's the first time you've heard that that was dead wrong. This is the first time we've known that was dead wrong. Before, we said only do a terminals by assessment and only do this and only do that. These are little preventives which kept very much bad from occurring, but now I can tell you broadly that you just shouldn't fool with it. You just shouldn't run any terminal but the goals terminal of the pc.

All right. Now if you can't run any terminal but the goals terminal of the pc, where does this leave you on the subject of Security Checking? Because you've got to find out what he has done to his mother and what he hasn't done to his mother and what he's withheld from his mother and so forth. Is that running a terminal? No. It is not running a terminal as long as it's run against the E-Meter and you're only asking for it every time the meter falls. Because every time the meter falls, the pc's attention is stuck on that other terminal and it is a violation of his attention being off his goals terminal. And every time your meter falls on a security question, you have located a time and zone on the track where the individual has violated "attention must be on the goals terminal." This is the basic modus God-elp-us of the pc. This is the stuff of which he is built. His attention must be on the goals terminal.

So every time you get a knock on the meter, and you say, "Have you done anything to anybody? Have you withheld anything from anybody?" – you actually find a knock on the meter, you find a reaction on the needle; it immediately says his attention is stuck in violation of the goals terminal. That's for just Security Checking. That isn't the – what's back of every fall you ever get on a meter. But that's the violation of the goals terminal.

So, on an E-Meter, where you get a needle reaction, you have a violation of a goals terminal. Now, if you leave him in a violation of the goals terminal, you have an upset pc. If you find one, you got to clear it. That's the rule which goes along with it.

This assumes tremendous importance, because here, there, I've been picking up cases, time after time after time where an individual has been left with an uncleared withhold. And I've found in every case that he's squirrelly; he's thinking unkind thoughts; he's wondering about things; he's wondering if Scientology works or doesn't work; he's having an awful time. Actually, he dreams up all sorts of gossip trying to lessen the overts of one kind or another and he just gets into a terrible spin.

And this is an empirical datum. This is a datum which I've been watching now through auditors' reports coming in from Central Organizations, from this particular class and they are just mounting up to be legion. They are innumerable. This is a datum which is being forced upon me by constant, constant, constant observation of that datum. And it is not a datum which you can ignore, any more than I have been able to ignore the datum. So I say, "Well, all right. Huh – Susie Ann is in an HPA class and she doesn't know what she's doing, and so she misses a couple of Security Checks. Ha-ha-ha-ha-ha-ha. So what?"

Oh, I'm afraid that an auditor has to learn how to swim perfectly the first time he's thrown in the bay on a Security Check. Isn't that interesting. Because frankly, you could get blows out of the Academy. Every time a student sits down and he picks up the E-Meter and he says, "Let's see, these are the – that's the tone arm. No, no, no, that's – that's – that's – . Ah-ha," and so on. And he hands it to somebody diffidently and he says, "Now let's see."
The Instructor finally comes around disgustedly and says, "This is the 'on' button, and ..." – throw it on.

"What's this moving needle?" [laughter, laughs] "When you turn it on, the needle moves. Move the tone arm; needle moves. Ha-ha! Ha-ha-ha-ha-ha! Ha-ha-ha! Move the tone arm and the needle moves. I see what they're doing. When the auditor gets something on the pc, he moves the tone arm and that moves the needle. Now I understand an E-Meter."

And he understands it all for two days and then a pc actually has a stray, unkind thought about what he's doing, you see – one of his fellow students – and the needle moves when he isn't touching the tone arm. "Broken." [laughter]

And during that period of time, unfortunately, although he has to be practicing in something vaguely resembling meter actions and so forth, he is asking people questions and these questions, any of them, we could – then become Security Check questions. And he doesn't know enough at this period of time that he's got to clear it off. The needle moved. What's he supposed to do? Well, he writes it down on the piece of paper he has, "Needle moved."

The Instructor comes around and says, "Where's Pete?"

And this fellow that's just written it down, "I don't know. He went out..." [laughter, laughs]

And you have the HCO squadron of cavalry riding all over the neighborhood trying to round up Pete. By this time he has socked a policeman, he has done this, he's done that and slept with his best friend's wife.

Well, somehow or another they get it patched up, but that is the immediate consequence of what would happen if he missed a Security Check question. We can't ignore the fact. That is what happens. It's just in from every place. Some of the most confoundedly weird things have occurred you have ever heard of.

Girl in an HGC: They missed a Security Check on her. She rushes straight out. She sees every friend she's got. She says, "All auditors are doing in that organization is sleeping with their pcs and there's all this going on and there's that going on, and it's all terrible and it's awful over there, and horrible things are occurring in that organization." And then this girl went and wrote a whole bunch of letters on the subject, and all this in relatively a few hours. She was the busiest person you ever saw.

And you know, it took the organization about a week to round this up? They got ahold of the girl and they put her down, and had enough sense to realize that the last thing she was doing was unflat. That was probably all that was really known about it.

So they made her do the last thing she was doing and it was a hot question on a Security Check. And it was something to do with the second dynamic. And the auditor had simply gone on, you know, and not asked any questions about it and then sort of ended the session and it was never going to come up again, and boom! Immediate repercussion.

So hell hath no fury like a pc whose withhold isn't pulled. It works completely reverse. I don't know whether the pc instinctively realizes he's been done wrong or if he has had some-
thing reactivated so that he must compensate for it or if he is making – trying to make nothing out of the overt by making nothing out of the people who might have gotten the overt, so that nobody will believe them when the overt does come up, you see? But an unpulled overt has horsepower in it. It has real horsepower. And it drives people to the most confounded excesses you ever heard of.

I think the excesses of the criminal are simply on the basis of just tremendous numbers of overts against the society. And the overts and the withholds – the overts which are a withhold – then become the horsepower which make the criminal. Not quite that the man goes wrong, you see, and then – who hides it from the society, the way we ordinarily look at it. I think it's quite different.

I think, because the individual is withholding something, then you get horsepower. I think this is a source of explosive reactor fuel of some kind or another. So a restimulated withhold becomes a lighted charge of dynamite. And when you ask the pc if he has a withhold and then you don't get it, you have just the same as stuffed a stick of dynamite down his throat and litten the fuse. You've lit the fuse and then you say, "Well, you don't have anything." You see? That's it.

After a while in the distance, there's a dull boo-om-m-m-mm! You see? And you say, "What's that? It has nothing to do with me. Ha-ha-ha-ha-ha. It has nothing to do with me. I mean, I audited him. I tried to help him. Tried my best, but he came to us too late."

You see, you could get off into all sloppy things. You realize this – a psycho-analyst always and totally excuses every failed case on that one phrase: "He came to us too late," which I think is quite amusing. He believes this, too, you know? He believes it implicitly. Fellow has been with him five years and "He came to me too late." Always. I've talked to these birds and they tell me with a perfectly straight face. Well, three of his patients have committed suicide in the last month. And he tells you this, quite frankly: "Oh, yes, they committed suicide in the last month. Yeah, a lot of them. Well, there's Bessie. She came to me too late. And there was George. If he'd come sooner, I could have done something. And then there's Mehitabel. Well, long, long overdue. She should have come to me much earlier."

You say, "Well, what were you doing with these patients for that time?"

"Well, they just lay there on the couch and talked."

"Well, did you ask them any questions?"

"Well, of course. I asked them what had been done to them in their childhood." [laughter] Restimulate every overt in the bank, don't you see?

Boy, I tell you. You talk about people who have taken people's lives in their hands, look into that field. But it'd be any field where you didn't pursue the question.

Now, the poor old Catholic church that I have raised so much the devil with occasionally, from time to time – the poor old Catholic church – for the lack of this datum which we're talking about right this minute, has developed all of its heretics, its Martin Luthers and the lot. The boys they've had all the trouble with, they manufactured at the confession box.
Person comes up, he's just groveling in the dust, you see, and he's just gone through having intercourse with his sister or something. And he scratches on the confession box, you see, and he says, "I have something to confess."

And the priest is sleepy that day, you know? He says, "Yeah, what – my son."

And he says, "Well, I've done something very..." And his courage fails him, as you see in pcs all the time. The guy's courage fails him, you see? And he says, "Well, I – I heard some nasty gossip about the mayor." [laughter]

And the priest says, "Well, what was it, my son?"

"Well, I heard the mayor was sleeping with the alderman's wife and that the alderman – and that the alderman has committed incest with his sister." [laughter]

And the priest says, "Well, that's eighty-nine and a half paternosters and two ump-teegahs, so tool off now."

And the fellow says, "Whew!"

And a little time goes on and the Inquisition all of a sudden is called upon to find out what all this sin is going on over there and what's all this commotion against the true church. And all this commotion against the true church is getting more and more commotional.

Well, they managed to burn most of them. After they'd missed their withholds, then they had to burn them. But they managed to burn most of them, but they missed just enough to cause an overthrow of the Catholic church, because it's no longer the dominant church on Earth. Well, I forget, we in the white race consider ourselves extremely, egocentrically, as being the races of Earth. But as a matter of fact, there are so many other churches elsewhere that are bigger than any church we have anywhere that that was it. But one time the Catholic church could have numbered up along with some of the great Eastern churches, and so on, and it doesn't anymore.

But that's it. There's your Martin Luther. There's your Calvin. I'm sure that it happened right there at the confession box: priest didn't have an E-Meter. I think it's very poetic justice, because he buried most of the knowledge – the church buried a great deal of knowledge that came out of ancient Greece and Egypt, and so forth. They put a lot of this knowledge away because they didn't think it was good for people. They kept it in the catacombs. Actually, they released Aristotle – just in the Middle Ages, they suddenly broke out Aristotle complete and released it to the scholarly world.

Nobody had ever heard of Aristotle and Plato before that. They broke out Plato so as to prove that Catholicism was the true religion. All of these various things occurred and they sort of shut off knowledge, one way or the other. And they didn't have an E-Meter. That's – that's what it amounts to.

Well, what problem are you faced with then? You're faced with an immediate heretic. He doesn't like you. He doesn't like your organization. He's going to dream up all sorts of wild tales and lies about you and your organization, or about others or something, because of the missed withhold. And what are you supposed to do then?
Well, let me caution you against following the policy of our immediate forebears on this particular planet. Firewood is very costly. If only on economic grounds, why, you shouldn't have to go burn every person, you see, who has been missed on a Security Check.

Now that's what it would amount to, sooner or later. You're walking up the line, you see? You're walking into a heavy – a heavier power position on this particular planet and that's what it would amount to. You already have means and ways of cutting down the overts against the group, to keep the group from being sundered and keep individuals of the group from being cut to pieces. You have that, inherently, in a Security Check.

Now, supposing the Security Check becomes badly done and overts get missed left and right. Well, the very mechanism which is supposed to prevent dissension and upset and slowed-down cases, and all of this sort of thing – that very mechanism is the mechanism which restimulates an heresy, of some kind or another, which eventually brings about an overthrow of the group.

So it's no very light thing I'm talking about now. And this has been presented to me so many times, on so many folders, by so many people, and it has happened so often, that we must conclude that it – not that it is an invariable reaction. No reason to conclude that it is invariable, that because somebody has had a withhold and it hasn't been pulled, that this person immediately tries to destroy everything under the sun, moon and stars. We're not justified in concluding that, because it's happened many times without repercussion. And some auditor got it later or didn't get it at all and the case merely stalled. And some Director of Processing or some auditor someplace noticed the case wasn't moving sooner or later, and decided to get ambitious, and went back and found the withhold.

And the only thing that happened there is the case stalled, which is an overt enough, but nothing happened to the group and nothing happened to individuals. But you can count on the fact that it will happen sufficiently often that a repercussion will follow the act, that in the cumulative centuries it could utterly destroy anything we're trying to build up.

It is not at all a tiny mechanism. It is a big, important one. You could disobey most of the Auditor's Code and you wouldn't get into terribly serious trouble, except a pc would be upset, and case gains, and ARC breaks and you'd feel unhappy, and a few things like that. But Clause 16, "Stay in two-way communication with your pc," is violated the moment that you find – that is you tick, that you come close to – a hot withhold and don't get it.

You're asking a Security Check question, you say, "Well, have you ever raped anybody?"

And the individual says, "Well, people who rape people – actually, I heard about a terrible rape, and there was an awful situation occurred over in Northumbria, and so forth. There was a number of rapes over in Northumbria and I think this is pretty terrible. And that's what the needle is falling on."

And the auditor says, "Well, I guess it is pretty terrible," and goes on to the next question. As I say, it isn't invariable that he burns the house down. It's amusing that the psychoanalyst in – Freudians, in dealing with kleptomania make statements of this character.
They're the most generalized, sweeping statements you ever wanted to hear in your life. It's something on the order of "Every time a kleptomaniac fails to steal anything, they burn the house down." I don't think there are that many houses. That statement is part of a text. It's a direct quote. The bad English in it is not mine. "Every time a kleptomaniac fails to steal anything, they burn the house down."

Well, it isn't of this order of generality. It's every now and then when you fail to get a withhold, you set off an atomic bomb. And it's often enough as a group repercussion, and it's often enough and far too frequent as an individual repercussion, because you get a stall.

The individual goes through this cycle: The overt having failed to be pulled by the auditor restimulates the necessity for the pc to minimize the overt that he has done by running down the target against which the overt was committed. So the pc, far from having an overt pulled, or having a withhold pulled, has been tricked into committing a new overt on top of the withhold, against the people who tried to get it. You see the mechanism?

All right. The Rosicrucians were trying to get the withhold and they failed to get the withhold. The individual would then go "natter, natter" and his withhold, then, is against the Rosicrucians. So he immediately tries to blow up the Rosicrucians. You got the idea? They have no such mechanism as this. But, I'm just giving you an example.

If his overt is against the ETU, and he's withholding it like crazy, and it's the ETU that ticks the overt – see, that tick the withhold, but not get it in any way – he is liable, if it's a center-line withhold of some sort or another, fly into a fantastic potpourri of yip-yap against the ETU, don't you see?

The overts are always against the people who fail to pull the withhold. Knowing that, I think it might put a little spurs to your ambition never to miss one, because the succeeding overts are always against you. You fail to knock out the withhold and you or your group will get the benefit – questionable benefit – of the succeeding overts. And this is one of the primary principles of mental reaction.

They try to lessen the overt, to make nothing of the people who might find out. They've had the overt restimulated, so now they have to make nothing of the people, to everyone, so that nobody will ever believe the people, if the overt-withhold is suspected.

They might have an idea that – you see, as long as the thing is unpulled, it has dynamite. The second it is pulled, there's no dynamite connected with it. It's just – they just throw a flounder out on the table, you see? It's a very mysterious action, this whole thing of pulling a withhold. You reach down into the pc for this smoldering volcano, you know, with lava running all along, and the villages burning on all the mountainsides; everything going to pieces, you see, and the steam flying out of the sea. And you've reached down his throat to pull out this unsavory, bombastic object, and you drop on the table a dead haddock.

Just in the process of it passing from his throat to the middle of the table, it goes flop. There isn't even a cinder. Have you noticed this? A cleanly pulled withhold transmutes from the most bombastic explosive manufactured to about the limpest fish ever caught, in the process of being pulled. It is just nothing. The pc sits there and he looks at it. And he says, "What on earth is that?"
And he's mystified. There's always a little "unknow" follows this thing, which doesn't do him any damage at all: "I wonder why I was so upset about that." He always has this kind of little action. You yourself who have had a withhold of magnitude pulled on you have probably experienced the same thing, you know? You just grind and you worry and you search, and so forth, and you're, "It's – well – mm-ulp. Oh, I'll try – I don't know. Well, let's see if I can get away with not telling them. Well, actually, the truth of the matter is, I really have never had anything... Well, I'm gonna tell him. Ahem-ahemmm. All right. Well, I'll come out with it... All right! All right! I pick my teeth. I pick my teeth. I pick my teeth."

"What is the matter here? There's nothing very important about picking your teeth. Now, why was I so upset about telling the auditor?"

And when you've had a big one that you've been sitting on for a long time, you – you can see the partnership in that particular series of reactions. It is – absolutely feels ghastly just before you hand it out. Have you had something like this occur? Some. All right.

Now, supposing it went this way: "Well, tsk. On the subject – well, you a- you got reaction on it. You – you sure your meter is working? Are you sure your meter is working? Oh, you're not sure your meter is working? Oh, well. Oh, well. That's – it's ... okay. Well, I feel much better now. Let's go on to the next question. All right. That's good."

And the auditor goes on to the next question. And you get outside the door, you know, and you say, "Should have told him. No, I couldn't have told him. Uhrrrrrr."

You get home at night, you know. Wheels start going around, and you say, "God, he's a lousy auditor. Well, that's terrible. Horrible things. I remember something Ron did once." [laughter] "Let's see. Hm. Hm. And I heard of an auditor one time who – who charged too much for auditing, and so forth. And see, see, see, see, see, see?" Immediate reaction of that kind of thing on a withhold of magnitude that's missed.

And a guy sits around – actually, he's disappointed. He's left sitting on the middle of something. It's too much for him. He can practically feel the steam coming out of his ears and nobody did anything for him about it. He basically is disappointed.

Also, he knows that it is so forceful and so powerful that if he had told about it, there might have been great repercussions on the subject. And therefore, it's much better that he didn't say anything about it and he has really won because, you see, if it got around that he'd picked his teeth – oh, well, I don't know, lots of things might have happened. The Dental Association might have gotten onto him, and all kinds of things might have occurred. They might be ... so it's a good thing. It's a good thing. And – lousy auditor and he shouldn't – know better. And actually, truth of the matter is ... But that's all because the withhold is simply restimulated, don't you see? And the person is fighting back and forth, and he's left sitting on a charge of steam, dynamite, volcanic lava, and so on, all of which amounts to – when he finally gets out and looks at it – in the final run, why, he picks his teeth. He picks his teeth. He picks his teeth.

Well, what was so important about picking your teeth? And when you've had – seen that mechanism occur, you'll realize that if you interrupt it before it is displayed, you've left
the pc with a full head of steam. And of course, the pc is liable to do almost anything. Do you see this?

You know, you might as well face up to the fact that there are liabilities to auditing. There weren't liabilities to unsuccessful auditing. There weren't liabilities to very mild auditing. There weren't liabilities to simply running out a few engrams, if you could get your hands on them, and so forth. There weren't any great liabilities to it, nor were there any great liabilities to running concepts – no real mess on that. So we got away with that fine.

Now we move over into the heavy artillery, and we bring up parks of 155s and German 88s, and we string it out along the line. And then we put a bunch of rocket launchers in the lineup. And then we say well, that's fine. Let's take some B-47s and line them up over here and put atom bombs in their stomachs. And now let's – let's go ahead. And along about this time, you're possessed of sufficient tools, that what – the stuff you are handling, which is the root stuff of human aberration, and so on, has to be handled as it should be handled. That's all.

Now you'll go, in this basis, from one extreme perhaps, to the other. I don't remember if this was the exact sequence, but it makes better telling this way: A bunch of recruits who were just out of boot school were assigned to a ship and they were afraid of ammunition. And the main battery was sitting there, and they, of course, were the loaders. And they were handling the ammunition and slamming it into the breech – they were supposed to, you see? And they'd pick up a long shell, you know – a shell about that long, you know, with an explosive fuse nose, that if you ever dropped it, you know, it'd go m-m-boom! and that would be obliteration with magnitude.

And they'd pick up this thing, you know, and they'd – they'd pick it up with their – you know, and hand it to the next one, you know? You can see in a – in a rapid-fire action, that shells being passed with that slowness and that care into the breeches of guns, you see, are not going to obliterate anything. It's quite the contrary. They're liable to be dropped on the deck and blow everybody in the gun crew to smithereens.

Well, I adjudicated that they had been talked to too long about the great care that they must use, the great care they must use in the handling of ammunition. I assume that they probably had been talked to by fellows from the Ordnance Department, that explained to them, "These were the nose fuses of the goodygumps and if you ever dropped one, why, it went blang! and so forth. And you must always be careful to keep the ammunition in its proper cases and in its proper slots and you must always keep it marked and flash-marked, because it's all very dangerous. It's all very dangerous. It's all very dangerous."

By the time they got to the ship, of course, they were afraid to touch a piece of ammunition. They had no familiarity with the ammunition. They just had the sensibility that the ammunition was dangerous.

Well, I saw this, at drill, you know, that sort of thing. They're trying to whip this gun crew together and so on. And at drill it was just this matter of "Huh-n-huh-n-nuh-oooooo-ahhhh, you got – you got it, Joe, you got it, Joe? Ha-ha-ha! Oh, thank God, you've got it, Joe. All right. Now open the breech very carefully. Don't hit its nose against anything, you know."
Oh, God, it was terrible. So I asked them if they had any dummy shells. I asked the gunner's mate if he had any dummy shells. And he said, "Yeah, I got some dummy shells."

And so I had all the gun crews of this particular type of gun in the main battery around and line up in a ring on the foredeck. And I took one of these dummy shells and I handed it to them and told them to play catch with it. It was the same size and weight, as everything. It was just what was used in order to demonstrate or drill-load something. And of course, they were very happy with that. And they'd catch back and forth and kicked it around, and they got so they were -- they'd throw it so it was spinning to one another and toss it back and forth across about five, ten feet of deck, you see, to one another. They were happy with this dummy shell. Of course, not live, no fuses in it, no powder, nothing.

And they kept doing this and doing this, and I had them do it for two or three days, if I remember rightly or maybe a day or two. And I saw they were at it one morning and they were having a fine time playing catch. So I went down, opened up the magazine, had the gunner's mate hand me a real brass case, fuse-loaded, nose-fuse-set piece of artillery.

And I said, "Here you go!"

And the first guy in the line -- they were looking at me sort of like snakes -- you know, like birds who'd just sighted a snake or something, you know. And I took the first shell and I said, "Here you go." And I just threw it to him across the open deck, you know?

The guy caught it. "God! Theept-eept-eept."

Three days, they were throwing that live shell with a set nose-fuse fifteen feet across the deck to one another, playing catch with the thing. Some ordnance officers came down from ordnance and saw this ship lying there alongside of the pier, and its gun crew was playing catch with a live shell, and he went straight up and a mile south.

He had no authority over us. He pointed out to us though, if anybody had dropped it, it probably would have been the end of the USS Washington which was lying alongside of us. And I said I didn't like battleships anyway. [laughter] But he totally was overlooking some of the principles with which we are now totally familiar: that a person has to become familiarized with a dangerous object before he can use it easily and well and not have accidents with it.

The way you can have accidents with a dangerous object is to know it is dangerous and not know there is any way to handle it. And if you know a dangerous object is dangerous, you can always have accidents with it.

Now, the actions of an auditor are given publicity on this particular basis: because people are generally very nervous about auditing and very nervous about looking into people's human minds, and because "everybody knows" you mustn't have anything to do with a human mind -- oh, "everybody knows" that.

Some of your friends -- you say, "I'm studying Scientology."

And they say, "Oh, well, what does that have to do with?"

You say, "Well, that just has to do with the human mind."
And they say, "Oh, well, you shouldn't – I don't know if you ought to tamper with that or not. It's a pretty dangerous situation. You mustn't have anything to do with it."

Well, why don't you point out to them at that time, "Well, you mustn't have anything to do with it? Don't you think they have an awful lot of casualties with this thing they mustn't have anything to do with, you know? Don't you think it's kind of dangerous not to have anything to do with it? Haven't you got one? Have you got one? Well, don't you have anything to do with your own mind?"

Whooo-uh, that would be a staggering thing, but the guy is liable to go into a funk when he realizes that every time he figures out an arithmetical problem, he is tampering with the human mind. [laughter, laughs]

And we're liable to err along this line. We're liable to say – we're liable to say to people, "Oh, well, auditing is very easy. You can't make any mistakes. There's no way to make a mistake. There is nothing you can do wrong and you just sit there, and you go through a certain – there's nothing to it. You actually can't do any damage." And there is a tendency on our parts and on the part of Instructors and so forth – in order to give students confidence – to say that you can't really do anything very damaging or very wrong.

There's a tendency on our parts to do that. And that is in the effort of restimulating their courage because, well, students in an Academy and that sort of thing, are awfully nervy characters. They sit there and they pick up the E-Meter and wonder if they're handling a thirty-megatron hydrogen bomb, you'd think, to look at them. They can't even look at the thing. The needle wobbles and they don't even know what it's all about. They think it's a dangerous weapon.

So we say, "Well, it's not dangerous and there's nothing you can do to hurt anybody, and so on and so on."

Well, we've actually leaned too far in the other direction. All this attitude was possibly perfectly justified in 1956 when we were running a tremendous number of concepts, and sort of Havingness Processes and SCS and things like that, all of which are perfectly valid. (Add to your list of processes early in the lecture: objective, physical-universe processes as a safe series.)

But all of these things are valid. And they – you don't get into danger with them and they don't blow anybody's head off. But look, for years and years and years now, Ronnie has been at work. And I've been trying to get the hydraulic jacks underneath of the basic core of human aberration to a level that any case – without paying much attention to the auditor – that any case could be resolved fairly easily, within some finite period of time. Well, they're resolving Clears now and some of the places are making Clears, and so on. We're resolving Clears maybe, in something on the order of two, three hundred hours, some top figure. It's a finite period of time. Last Clear made in Australia was 118 hours. This is finite time, you see?

Yes, but what have we paid with? With what coin have we paid for the speedup? Ha-ha-ha-ha! We have paid for it with stripping the safety precautions off, because now we have to run things that, run wrong, wouldn't spin somebody in, but it'd certainly make a pc unhappy.
as hell. It'd certainly mess things up. It won't do any permanent or lasting damage, but it'll certainly make somebody awful sad. And it'll certainly make them very uncomfortable.

And done wrong – we have moved into a strata of processing – done wrong – that will make somebody awful miserable, because you've got hydraulic jacks. And all you have to do, you see, is you just take another little notch on one of these jacks and it puts thirty tons of pressure against this particular engram. And the pc says, "Well, it isn't resolving." And all you've got to do is lean over and put another notch on the thing and put another thirty tons of pressure – another inch, you see? And the pc still says, "Well, it isn't resolving." And you're dealing with technology that it is very easy just to pick your finger up and just put that jack over another inch. It's the wrong object you got the jack leaning against. Wrong target.

And your pc, of course, gets very uncomfortable and blows session, gets very upset with you and gets extremely disturbed, and he acts like a nut. And part of his shame is the fact that he doesn't know how come he is acting like a nut. This is a mystery to him, don't you see? You've sat there being nice and sweet and kind, and there's – you're not doing anything wrong. Obviously, you're sitting there to help him and all of a sudden he feels like hell. Well, what is this? You didn't do it, so he feels guilty every time he gets upset and you have a much harder time with it. And he's upset of course, because something has gone awry in his bank – don't you see – that a gross error has to be entered in.

Don't think that it's a minor error the auditor would be making, you know, like running a command one time too many. No, it'd have to be the wrong terminal and the wrong command, run on top of a present time problem and an ARC break. But the auditor, because of the processes he is handling and so forth, actually can, in spite of all this, hold a pc in-session and throw that hydraulic jack an additional notch. And of course, that's the one notch it shouldn't have been thrown, because the whole thing is awry anyhow. You see what I mean? I mean, you're dealing with high horsepower, high – highly skilled technology. And if the technology is wrong or if you do some of the most obvious wrongnesses that can be done, you're going to get a repercussion. And the repercussion is considerable. I don't wish to minimize it, so I'm just leveling with you. Do you see?

So on the one side, we could say, "Oh, auditing is easy and anybody could audit, and there's nothing you could do to hurt anybody's human mind, and so forth." Well, it's true. There's nothing we can do to permanently injure or damage somebody's mind, but oh brother, could you give somebody a very nasty cold, for instance. Could you give him an awful bad bellyache, could you do a lot of other things, don't you see, that would be damnably uncomfortable. They'd all fade out in three days or ten days or a couple of weeks, or something like that. But it wouldn't be good.

Now, there's no sense in saying, "Well, you can't do anything. You can't hurt anybody and nothing will ever upset the pc, and so forth." That's an extreme and it's a dangerous extreme because it's not, strictly speaking, true.

And on the other hand, on the other hand over here, we say, "Oh well, auditing the mind is very dangerous and there is no way possibly that you could really tamper with somebody's mind. It ought to be done by an expert. Call an electrician," or something like this, the way the psychiatrists are doing these days. And you get over to this and you can say, "Well,
it's very dangerous and you shouldn't have anything to do with it at all," you see? Between these two extremes, there is the sensible level of: "Yes, there are tremendous numbers of things you can do with the human mind, if you don't make gross errors."

Now, the errors that you can make that will be damaging errors to the human mind are, all of them, under the heading of gross errors. They are glaringly large. They are huge. They loom up out of the rundown like Marble Arch up in Hyde Park. I mean, they're big. You run into that with a car and you'd know it was there. And if you've got the idea that an auditing error is the size of a twig that just fell off a tree on Rotten Row, tsk, change your mind, you see? You go over that with a car wheel, it just goes flick or something like that. You hardly know it's there, and so on.

Auditing errors are not of that order of magnitude. The auditing error, to produce a bad result on the pc, has to be absolutely huge! And you, in running auditors or directing an HGC or doing something in this particular zone or area, do a good job only when you get your eye off the twigs and start looking at the marble arches that have gotten across the road.

You know that that's quite interesting? It's quite an interesting fact, that people directing auditing and supervising auditing, when they get auditing reports and see that the case is not running well, or something like that, always look at twigs. Yeah, the little tiny things, and they say, "Well, are you very sure that you're giving him an acknowledgment every time? You know? Are you very sure you're acknowledging well? How is your TR 0 as you're auditing him?" You know? Little, little things.

Of course, the auditor's TR 0 has to be good, but an auditor's TR 0 can be totally out and the case will still make gains. It's fact! And the acknowledgments can be nonexistent. You can say, if you're running a goals terminal or something like that, you're running some level, "Well, how have you helped a mugwump?" "How have you helped a mugwump?" and "How has a mugwump helped you?" "How have you helped a mugwump?" "How has a mugwump helped you?" The preclear probably wouldn't notice from one second to the next, whether you acknowledged him or not. Do you realize that? He's just so interested in the thing. He follows the auditing command and so on. He doesn't notice it.

On the other hand, he gets so interiorized into high-power techniques that you acknowledge him perfectly, your TR 0 is perfectly and everything is perfect, and he never notices that either. You get the idea?

So these are tiny. These are tiny. You've got to know your TRs to be a good auditor and the combined effect of all TRs out can be rather interesting. But let's not, when we say something is happening with this case that is wrong, go into these tiny things. And do you know that you will most often avoid the gross errors, you know? And it's the gross error... Now, what's a gross error?

Well, was the auditor there for the session? Now, that would be a gross auditing error, don't you see? And you know, in directing auditors, you almost never ask these burning questions: "Did you have your E-Meter turned on? Does it work? Have you gone into any screaming fits at the pc?" These are all gross auditing errors, you see?
"Now, when you clear the rudiments, do you clear the rudiments?" Gross error is: "Do you ever look at the needle while you're clearing rudiments?" That's a gross auditing error of course, how the devil can you audit and find out anything about the pc if you're not looking at the meter? And you would be amazed how often this is the auditing error which causes the miss. The auditor under training is doing everything but looking at the meter. He asks the question and then looks at the meter. The meter's reaction takes place in a tenth of a second and he takes a half a second to look from the question to the meter. So he misses all reactions. And do you know we've had that going on right here? That comes under the heading of a gross auditing error. It's just not doing auditing.

All right. Now, you read along and this auditing report is just fine and everything seems to be okay about the thing, and you just can't understand why this pc isn't making any advances and you say, "Well, now, are your rudiments all in?"

"Oh, yes, rudiments are all in. Yeah."

"Well, is – you're running the goals terminal on the run? You're not overrunning the assessment? Still getting tone arm action?"

"Oh, yes, getting tone arm action."

You check it all out. Everything is perfectly beautiful, and you're running in some Podunk, someplace, where you've got auditors there, you know, that haven't been very well trained, or something like that on the line. Whole case becomes a total mystery, and you say, "Well, gee, we must have some wrong combination or the technology is wrong," and we start adjusting the little things, and we say that the auditor's TR 0 has got to be improved, and there must be a different command used here, and there must be a this, and there must be a that, and we fix it all up and we get a whole bunch of extraordinary solutions.

Truth of the matter is, if we went back and checked it up from beginning to end or if we had a motion picture of the session, we'd find out that the session went along just fine, except right in the middle – because after the break every day and after they go back into session every day, the auditor gives the pc a total spinal adjustment! [laughter]

Now, you think I'm kidding, but this kind of thing – this kind of thing is the usual – the usual gross auditing error. It belongs in that category, don't you see?

All right. Gross auditing error: You could actually audit a pc on the technology you have today with somewhat of a present time problem. You could get him through one session, and he has a bit of a present time problem, and just kind of bully it through and somehow or another arrive at the other end, and he'd get a little bit of gain. It'd be almost impossible to miss. But you couldn't do it with all rudiments out. Or not running any rudiments at all. You say to the auditor – it's this pumpkin center that you're running and you say to him, "Well, now, are you sure you got your rudiments in?"

"Oh, yes, sir. I got my rudiments in. They're all in," and so on.

And then a brilliant stroke of genius comes to you and you say, "Well, when you're putting the rudiments in, do you put the pc on the E-Meter?"

He says, "Oh, no. Never."
"Well, how do you know if the rudiments are in?"

"Well, the pc tells me so."

"Well, how does the pc tell you so?"

"Well, I ask him, 'Are all your rudiments in?'" [laughter]

Now, this sounds utterly, fabulously idiotic to you. But do you know that auditing errors of this magnitude exist? And when you're supervising a large number of auditors and so on, you will always have some people who are just out of the Academy, who are pretty green, that sort of thing, and you can just beat your brains to pieces trying to figure out why the technology isn't working. The technology always works. But is it being applied?

And the gross auditing error comes in the application of the technology. And that's the zone you should look in, in order to correct a case.

Now, we can add to these gross auditing errors, leaving a withhold in restimulation. Because then, I assure you, the case is not going to make any progress.

We right now have a course running someplace in the world, and in weeks of run they have only found, in a number of students, a goal or two. And those they have found a goal or two on early, they found no terminals for. You'll find this quite common in various places, by the way.

A whole group can go sailing along and getting no terminals and no goals and no nothing and so forth; we were doing it right here, till I finally just got right down and figured out what the devil this was all about. And I found out the rudiments were just wildly out and the auditors were actually in a games condition on the subject of goals. You know? I mean, just frankly that: they were in a games condition. They were so ARC broke on their own goals, they were damned if they were going to let anybody else have any goals. I think that was about the way it added up – something of that sort. So, by straightening the rudiments out, and raising the magnitude of importance of keeping rudiments in, why, what are we running into now?

Well, I was just asking a question. There's a student been here for about two weeks and a little bit – two weeks and two days – and we don't have his goal and terminal. I'm starting to ask questions. What is happening? Because this is not usual now.

You see? We've learned to keep our rudiments in before we do goals and terminal assessments and having learned that, why, we find our goals and terminals, and that's about all there is to it. That was the gross error: It was just not having any rudiments in.

It wasn't that we needed new trick methods of finding goals and terminals, we just had to have somebody sit there and actually ask for the goals and ask for the terminals, and not invalidate any of them and not add a bunch of things to the nonsense that was going on. Keep the rudiments in; we found goals and terminals just bangity-bang! It's very easy to do. And some of you right here were – have experienced that particular gruesome experience. And that was gruesome, wasn't it?
You see, the light and dark of the situation was too fantastic for words. The first
course I taught, immediately ahead of this course, I found all the goals and terms, I think they
were all found the first few days, weren't they?

*Female voice: Yes, it wasn't very long. We did Presession 38 first and then ...*

We did Presession 38 and shook down a lot of – 37 and 38, wasn't it?

*Female voice: Thirty-seven and 38, too.*

Yeah, and we'd had them – we had their PTPs and their withholds all off – and bang!
Assessment: There was just nothing to it, just fell in your lap. Nothing to it.

Well, now, this unit, at great distance from here, happens to be running into the same
difficulties right this minute. And I have sent over cables about "Get your rudiments in," see?
"Get your rudiments in. Get your rudiments in." And I don't know whether this will be heard
or not, because this has to amount to looking at the E-Meter. And I've just had a datum, from
that particular unit, that some of the students on that particular course can be forced to stand
and look at an E-Meter which is reacting and be asked what the reaction was, and they can't
tell you that the needle moved.

Well, we look for a gross error, so I tell them, "Get the rudiments in, get the rudiments
in, get the rudiments in." I probably ought to be saying, "Show them an E-Meter and find out
for them where the tone arm is. Show them which is the knob or black object, that wiggles." We'll find out it's some gross auditing error, you see, of that magnitude.

It always defies your imagination when you run into these gross errors, and running a
great many people, a great many auditing teams or a great many staff auditors, or something
like that, all – it's a great many students – it all boils down to the same thing: You're just sure
that you have a dog case that has avoided technology, and then you try to do everything under
the sun, moon and stars you can with technology, in order to straighten out this case. And you
find out the case hasn't advanced for some time, because "Well, you see, actually we're sup-
posed to look at tapes at four o'clock and the auditing session is also at four o'clock, so we, of
course, have been skipping the auditing session."

The case wasn't being audited. I mean, this sounds idiotic, but that is how idiotic and
that is how gross most of these errors are.

"Oh, yes, I always get the rudiments in on the pc. Yes, I always get the rudiments in
on the pc. That's very good. I make sure that the needle is moving when he says he has with-
holds. When he has no withholds, if the needle moves, then I know I can pass on to the next
rudiment."

I know, they're all so stupid and all so incredible that they get missed. And you are
very often persuaded into being very inventive about technology. This is – even I have been.
On the basis of persuading some – of being persuaded that you just – you've got to think of
some new solution, that's all, because this case just isn't moving, you know? And then we find
out that, well, he doesn't get audited, either. Tapes are at four o'clock, and the case is sup-
posed to be audited at four o'clock, so he just doesn't audit the case, but hasn't really had
nerve to tell you. Or something *wild* like this, you know? And it comes down to something fundamental.

The common denominator of all of this is *no auditing done*. It'll be some degree of that, and I wanted to give you the common denominator of it. It's some degree of no auditing done: Whether they just – the auditor never reports to the auditing session at all or after he gets to the auditing session, omits some large section of auditing, oh, doesn't run the goals terminal of the pc; decides actually that he's got to get Mother out of the way first, and he just goes on for ages auditing Mother. Mother, Mother, and we audit more Mother and supposed to be auditing "a tinker."

And you'll get errors of this character and I hate to say it, because staff auditors are actually terrific. I have lots of confidence in staff auditors. I've never had staff auditors balk at doing anything; I've never had them do anything but – when they followed through results – just try their level best to deliver. Terrific willingness. Main failure has been – is me telling them, comprehensibly enough, what I wanted done, so that it could be understood.

I consider that any main failure, because the willingness – there's never been any want of that. So therefore we come down to a simplicity, and they can do this and everybody goes off at a smart trot, and everything is working along fine this way.

But I've seen some of the wildest miscomprehensions of a relayed communication, such as this: You run the level – this actually happened – you run the level until the tone arm gets moving and then reassess for the next level. And that was the way the auditing direction was interpreted. You know, you run a level long enough to get the tone arm moving well, and then you assess for the next level of the Prehav Scale, and you run it.

Man! I can tell you that if you did that for about four or five levels, the whole case would come down to a slow jam and the pc would feel like he was going crazy! It'd take him about ten, twelve days to get over the idea, too. He'd just feel like he was going crazy!

If you want to audit a pc into a feeling that they're nuts, don't do a terminals run on his goals terminal, but just take some kind of a general Routine 2 run and assess the pc – very carefully assess him – and find out a real live level, a good level. Find his level real good and then audit it and audit it until you get the tone arm moving good, see? And then just skip it. And then do another assessment – and ignore the fact that that one is still going – and pick up some other level of the Prehav Scale, and then run it – don't get rudiments in – [laughter] and run it, run it, and run it hard and run it hard and run it hard and run it hard, and all of a sudden the needle will freeze up and the tone arm will freeze up or something.

Well, insist that that isn't so good, you see? That isn't so good that it did that; run it a little bit longer. And don't get in any rudiments – no need of end rudiments, either.

Now on the next line, assess again, get some other level of the Prehav Scale, and just run that one till you finally get the needle broken loose – just get it broken loose. And then reassess again, and your pc, about this time, will go "Hmmmh! What's happening? Everything is going green! I have this horrible sensation that this ear keeps tying a bowline with this ear! Ha! I knew I shouldn't have drunk the coffee." [laughter]
He'll actually have a sensation of going mad. He won't go mad! A few days later it'll drift out and he will merely spit every time he sees you. [laughs]

But that actually – that actually is the direct results of not flattening levels of the Prehav Scale. But that's a pretty gross auditing error: Every time you get the needle moving, every time you get the tone arm moving well, reassess and get another level; and when you get the tone arm moving well, reassess and get another level. Never flatten anything. And on the Prehav Scale, of course, a person feels like he's going mad if you do that, because you're using one of the most powerful set of boosters you can. You talk about thirty-ton hydraulic jacks! The commands can't help but move his mind around. You know, he could sit there and resist even doing the command and suddenly he realizes, well, he does it, you see, and Rrrr! Rrrrrr! It's running a ship on a rocky ocean, believe me.

Do you see what could happen? Because the technology is quite adequate to really pushing the thing down the line, you see? He will do it, willy-nilly and he goes far in, much further in than you would ever dream that anybody could be pushed.

It'll all drift off in three to ten days and he will feel fine, whether he gets any auditing or not. But that's not the point. You've wrecked a pc and you may have wrecked a goals-terminal line. And believe it or not, this actually occurred in a Central Organization. This actually occurred.

Yeah, the interpretation of my request was – wasn't any backwards reason – is as soon as you get some motion in the tone arm, you reassess and do a new level.

All right. Gross auditing errors is what you are dealing with here. That is a far, wide departure. Now, technically, there aren't too many of these things. One would be, right now, to run any terminal but the goals-have terminal. We would consider that a very gross auditing error, because it would really make a mess out of things.

Leading that, in term of violence or even worse than that, is leaving a withhold question unflat. That would be a gross auditing error. We have to move it up to there, because it produces a gross mess when it is done.

Doing a wrong assessment or using an assessment that was done carelessly, indifferently or incorrectly and not getting it checked: That would be a gross auditing error. Getting or using an assessment that was briefly and carelessly done, or even lengthily and carelessly done. But use an assessment that you just aren't sure of: It's a gross auditing error.

Failing to continue to security check a pc as his case advances, because again this is quite case damaging and is a gross auditing error.

You haven't heard that one for some time, have you? But nevertheless, it's very much present right now. Do you realize the faster the case gains, the more withholds are going to come to view? And if there's no Security Check to pull them off, your case can ball up in a knot quick as scat. So, the auditor who is running the line should think of his withhold point of the end and beginning rudiments – and the withhold should be left into the end rudiment, also. Just add another one in there. You know, add a "Have you told me any half-truths, untruths?" and so forth. And also add withholds in, because your technology is going too fast, it gives you another crack. So you got an additional one, additional crack at it.
I haven't given you a new write-down of this, because I'm still redoing the end rudiments. You'll see it shortly. There are two or three things that I'm questioning and don't know quite what to do with yet, but I'll know pretty well, very shortly. That's why I haven't issued you a new slip on it.

And the auditor who is running a run on a goals terminal – having found it and he's running a run on it – and he doesn't pay a considerable amount of attention to withholds in beginning and end rudiments, is actually guilty of a gross auditing error, because the withholds are going to appear by the reason of the case is making advance, and the case will advance just to the degree that the withholds are off of it.

And he'd say, "Well, I got all the withholds off at the beginning of the week, and the – it was just clean as a wolf's tooth. And so the rudiments are in, so I don't have to pay very much attention to withholds on this particular case just now." And then we had two days of marvelous and wonderful gain and everything was just going along beautifully, so of course we're going to have a third day, aren't we? Ah, that's an unjustified assumption, because there is this about withholds: The withhold which is not pulled – which is restimulated but not pulled – can raise hell.

That's "missing a Security Check question"; can just raise the dickens with a case. And a case advance is also marked by an advance in responsibility, and being marked by an advance in responsibility, brings to view more overt s than were formerly available to a Security Check.

That is a test: Is a case advancing? If a case is advancing it develops more withholds; more withholds come into view if a case is advancing.

Now, I'll give you an example of how a case is not advancing We've done a Security Check, we've cleaned the rudiments, we ask a sort of a Presession 38-type of question in the rudiments, and "What question shouldn't I ask you?" And we've done a good job and we've got the rudiments all clean, and he's just had a Form 3 and everything of this sort. We already have his goals terminal; we go on a goals-terminal run. And we run it Tuesday, and we run it Wednesday, and we run it Thursday. We pay no more attention to withholds, see, and we – Thursday and Thurs- what the hell happened? Everything is stuck, and so on. The pc is very unhappy and appears rather blowy. And Friday ... oh, well, it's an ARC breaky session; it's all very upset.

Well, what could possibly be wrong with the case? Well, the case advanced – that's what's wrong with the case – and if a case advances it develops withholds.

Now, this is how it should run, according to some auditors. Let's look at this one: Now, you get all the withholds off, and you get it all straightened out, and you run him Monday, Tuesday, Wednesday, Thursday, Friday. And you do another Security Check and you're just very careful of withholds on Friday, and you make sure they're all polished up and of the end rudiments, and so on, and so forth. And you don't find any more. There are no more withholds than there were on Monday.
And you say, "Boy, I'm sure doing a good, clean job of auditing." *With absolutely no advance of any kind whatsoever.* It's almost unthinkable you could do that these days, but it theoretically could happen.

And if you got no gain on the case of any kind whatsoever, it will occur then, that the case will not raise in responsibility of any kind whatsoever. So it will occur, then, that at the end of a considerable period of auditing, the person will not have remembered any new withhold of any kind whatsoever, because no raise in responsibility, no additional or new withhold that he hadn't remembered before. See?

Gross auditing error not to keep the withhold off a case while you're running it. It's one thing that can really stall it down to a walk. It can just go to a sudden *thud* and so on.

Withholds, then, make a good test of case advance. Actually, you could take a short Security Check and shake a case down at an end of a short period of auditing, and find out whether or not the case was winning. You do the short Security Check at the beginning, then you audit him for a little while, and do the same exact Security Check at the end, and he has remembered nothing new – no advance in case. Much more reliable than a profile. A profile is reliable, too, but it'd tell you directly and immediately.

Yeah, because in the first place, remember that withhold are not relegated to current lifetime only. What happens if you start opening up whole track? Don't you think anybody has got any withhold on the whole track? You mean they – you mean they lived all these lifetimes right up to this lifetime, and so forth, and they never had any withhold in those lifetimes? They just died by natural acts and causes, you see, and everything would go along. But this lifetime is different; in this lifetime they have withhold.

Well, you start opening up a track and you, frankly, will see it in running this Groups Terminal Process. The individual all of a sudden realize he has a withhold from a certain particular group. *Ughh!* He didn't tell them that!

And then it finally occurs to him, at the long end of a run, or something: "You know, I'm not in that group anymore? And this amounts to the fact that I am actually withholding my body and my beingness from that particular group. Yes! I have a withhold on that group."

He'll recognize with great clarity that he isn't in the group and therefore is withholding himself from the group. He recognizes things like this, and they didn't occur to him earlier.

"Oh yes, well, there was the Marcab government, and there it was, and still there! Yeah, I was part of it once and it's still there. No, I haven't anything on them. No withhold. No. There isn't anything I've done they wouldn't like. It's funny, you are asking me that, because, actually I've never done anything, you know, as far as they didn't like. I never have, never have. They get along fine, I got along fine with them, and there's just nothing, you know; and it's all kind of imaginary anyway and hasn't anything to do with me."

And after you've run the process for a while, why, you come back across the same thing, and he says, "Well, the Marcab government is – eeuulpt!"

And you say, "What's that?"
And he, "Ugh! Well, the last time I was there they had a warrant for my arrest. Ha-ha-ha, ha-ha! I'm not about to go back there!"

And every time, of course, you run across one of these "I am not about to go back there. I am not going to there anymore. No, I do not want to be a member of that group! No-o-o-o-o! What? Become a member of that church? Oh, no! Under no circumstances! Well, that's silly! Stupid! I mean, I don't want anything to do with them, you know, I mean, ruhh!" and so on. "Of course, I'm totally unemotional about it."

"Have withholds from the subject?"

"Oh, no, I don't have any withholds! What made you ask as ... ? oh, wait a minute. Ha-ha-ha-ha! We had a treasurer once that robbed the exchequer and took all the cash that was in their account. I know that happened and the group was pretty mad about that."

And then we go through and we mix up – and a few questions later, maybe the next auditing session, all of a sudden the pc goes back across this church group, and he says in a little small voice, "You remember my telling you about the treasurer that embezzled all the money? Ha-ha-ha. That was me!" [laughs]

Well, what's the phenomenon? It isn't that he didn't recall it. It's that it was below his level of responsibility. And if his responsibility increases, he eventually remembers more clearly what the situation was and takes responsibility for his own overt.

So actually, the number of overts and withholds that show up newly on a case haven't very much to do with what a criminal the person has been. Everybody has plenty of withholds. You can just assume that – everybody has got plenty of withholds.

The question is, how many are available at any given instant? How many can be pulled or how many are they willing to talk about at any given instant? Well, it's a direct coordination with the amount of responsibility the case has.

Now I'll give you a brand-new way of thinking about this: Everybody has a number of withholds. Let's just say everybody has a number of withholds. This would be pretty close to a fact, you see? It's a finite number of withholds – 800 billion or something – but it'd be the same for every person. People aren't necessarily different from one to the next. But that number could be considered more or less constant, person to person, pre-auditing – before they're audited.

All right. Now, what is different? What is different is the degree of responsibility the individual can take for his withholds. So that you have a criminal sitting there. And he says, "Yeah, I robbed, I – and I did this and I did that, and I did the other thing, and I did.... Oh, yeah, yeah, I murdered babies and so on. And I just killed my wife and children one time and left home," and so on. There's not even a knock on the E-Meter.

Well, his irresponsibility is down to such a level that they're not even withholds. All right, he gets some auditing progress, and he finds out that out of this whole potpourri of crime, one time he was standing outside of a bank and he turned the dead guard over with his foot. And that's an overt. That's a real withhold. And he hadn't remembered that, and now he's
telling you. And he sort of feels a little bit bad about it, and he's happy to get it off of his chest.

Then we go on, a little bit more auditing and we got – a session or two later – and other things are coming and going, and so forth. And he tells you, "Well, wheegh, I just realized I'm wanted in Chicago," even though that was two lifetimes ago. "Remember that bank guard I said I turned over with my foot? Actually, I shot him."

You say, "All right."

Few sessions later, you're running across things, and so on, and you're getting off withholds and so forth and that's fine. And the criminal comes back across this point and he says, "You know that bank guard I told you I shot? Well, the truth of the matter is, I shot him when his hands were up and his back was turned to me. And I read later in the papers that he was the sole support of his wife and children and two aged parents."

And you say, "Well, all right. Good. All right." And he's glad to get that off of his chest.

And then you audit him a while and he comes back across this thing later and he happens to be clicking down the line on his various overt s and so forth. And he says, "You know that – that bank I was – told you I robbed in Chicago. And I was just a hood and I was just nobody, and so forth. Actually, I was the leader of the gang. Ha-ha-ha-ha. Ha-ha-ha-ha. Hate to have to confess this, but I was, and we dealt exclusively in bank robberies, and we brought about the panic of 1929. Yes. Ah-ha. I hate to have to tell you about that. There – there it is. There it is, you see?"

You get the idea? Perfect pattern of it was pulled by a fellow one time – I mean, a pc, a very famous guy. I won't particularly expose parts of his case, but he said, "We had a plan one time. And this plan... Well," he said, "it was just a bunch of us fellows, and we put some people in ice cubes, and we got rid of them – and, you know, heh-heh, just – just nothing. Didn't have anything to do with thinking of anything. Nothing much going on, so we just thought this'd be a good thing, and it was a gay thing to do. And we – later on, I realize it was bad, now, but we just froze them up in some ice cubes and dumped them in an ocean on another planet, and that's all there is to it."

Well, on a little further questioning, why, it turns out that well, actually there was some plan in it; there was some reason they did it, and so forth, and it went on on this kind of a stupid gradient, and so forth. And we find out that we're talking to the fellow who thought up the plan, and executed the plan, and directed the plan that had to do with the implantations of all planets in this corner of the universe.

That was just too much overt, don't you see? It starts out with the basis, "Well, a bunch of us got together and some people weren't behaving very well, and just some crummy little people, didn't amount to anything very much, you know? And we just put them in some freezer compartments, and we took them over and dumped them in an ocean. Ha-ha-ha! Funny joke, wasn't it?"
You get the difference of magnitude in how these things walk up. Of course you don't know what series of withholds are going to develop into big ones, and what will nearly remain little withholds.

But the only thing dangerous about it is not clearing the question that you come to as you go across it. So it amounts to one of the greater auditing goofs, and it is a goof of magnitude. The individual that you let sit there and, "natter, natter, natter, natter," you're actually ruining his case, because you're letting him sit there and lessen the overt, lessen the overt, lessen the overt, lessen the overt. And you should realize what he's trying to do. He's trying to tell you, "I have a withhold!"

And you never say, "Yes, yes, but what did you do of that type and kind that would make you feel that way, yourself?"

And the individual says, "Nothing!" and the needle falls off the pin. And then you find out, "Well, yes, as a matter of fact..." And it is quite something else, the time you do this. And all of a sudden it clears! And the case starts going Clear.

But by finding things which other people have done on the pc, you see, getting the motivators, and finding that the pc's – other things, and so forth – you worsen a case.

The only thing you ever want is what the pc does, and what the pc did.

But it comes under one of the headings of one of the finer crimes, to leave a Sec Check question unflat. It can do more damage per case, per question, than any other single action; obviously, from the case histories which I have immediately and directly at hand.

So take it to heart, that's something you should never do. Make sure that it's flat before you leave it. And then don't think that a little later – when the person has had a lot more auditing – that the question, if found unflat now, was left unflat at the time it was hit – it wasn't. This is a whole new series of withholds coming up under the heading of the same question, and you differentiate that particular difference.

Okay?

_Audience Voices: Yes. Mm-hm._

Well, will that do you any good in your auditing?

_Audience Voices: Yes, sir!_

All right. Thank you.

Audience: Thank you.
RUDIMENTS

A lecture given on 31 October 1961

Thank you.
Okay. And this is...

Audience: October 31st.

Saint Hill Special Briefing Course, October 31st, 1961.

All right. Now, you have come to grips with clearing since I've talked to you last in a very definite and broad way and I want you to do this with your pc at the very next session before the session is started. Do a Dynamic Assessment just for the dynamic. Do a Dynamic Assessment for the dynamic before your next session. I simply want a Dynamic Assessment.

Now, if you don't know how to do a Dynamic Assessment, that is very simple. You just ask the pc how he feels about the various dynamics and you take the one that reacts the most or the change of needle pattern from the remaining dynamics and then you tell me which dynamic fell the most on your pc.

Now, there's a few bits and pieces of news with regard to processing. And you are posing the problem in a very heavy way of broad, rapid clearing and we have been using some Class II types of technology in order to clean out circuits that interpose and so forth in clearing and so on.

Now, you know that it would be very difficult to audit anybody unless you had some Security Checks squared away on this person. I think you will agree with that, with the experience you have had here. Isn't that true? That'd be very – rather difficult, if you never did a Security Check on a pc to expect him to go anywhere.

Now, you see the goal will disappear rather easily. The terminal will disappear rather easily, so that assessment becomes rather difficult. But remember that you are running a goal and a terminal and in view of the fact that you are running a goal and a terminal on the pc, whether you're running it by Prehav Scale or some other process, no matter what you're doing with the goal or terminal, it can disappear. These two can disappear as easily during the run as they can disappear during the assessment. So you see, a goals-terminal run then must be handled with the rudiments in just as you have to have the rudiments in, in order to assess them. Does that make good sense to you?

All right. Now, those things which are closest to present time often have a greater influence upon the preclear than the whole track. Now, where is the boundary? This life is more important than other lives. In the pc's eyes only, not from the standpoint of his aberrations. His past lives have far greater aberrative value because of course, they're more hidden. But in the pc's eyes, this life of course has much greater importance than any past life. So you have at once a situation where the person who is sitting there being processed by you is completely
convinced that anything that is wrong with him has happened to him in this lifetime. Well, this is one of the things that's wrong with him: that he considers that he could get this aberrated in just a half a century or less.

You see now, that's silly. There's really nothing happened to anybody in this lifetime compared to what has happened to them over thousands and thousands of lifetimes, you see. So you're processing somebody who believes that this lifetime is more important than past lifetimes, when in actual fact this lifetime is not at all important as far as auditing is concerned. As far as the basic seat of aberration, as far as his reactive bank is concerned, it all has its fundamentals in his past track before this lifetime ever began.

All right. Now, let's take that a little bit further. What has happened in the last twenty-four hours is more important to him than has happened in the last month. Let's just look at that again.

Now, of course, what has happened to him in the last twenty-four hours is not more important to him than has happened in the last month. But the pc thinks it is. Well, here we go again. You see, it's the same equation working out now in a little more finite piece of time.

All right. According to the pc's viewpoint, what has happened to him in the session is more important than what has happened to him in the day. Let's get it down – you know, not this lifetime-past lives, but let's move it down now to this day is more important than this month. Therefore, to the pc, what has happened in the vicinity – in the immediate vicinity of this auditing session or in it is more important than what has happened in this day. That's what the pc thinks.

So of course, you get a tremendous reaction on the part of the pc from an ARC break and he thinks this is the thing. Right now this is what is wrong with him. It isn't what is wrong with him at all. It's probably those fifteen thousand prisoners he had executed way back when, you see. And he made them sit in a chair, you see – he made them sit in a chair and he executed them with electrodes which look remarkably like E-Meter cans. [laughter] Something on this order, don't you see.

So he has an ARC break and he will tell you it is the ARC break which is holding up his auditing, when as a matter of fact it's the fifteen thousand prisoners. But because of this value, you cannot audit across the top of the ARC break easily. You can't do it because his mind is fixated on the moment of time nearest to present time. He fixates on this superficially and analytically. So that has to be pulled before you can get to anything else.

And it's something on the order of a little tiny gate made out of strips of flimsy tin or bits of Dennison crepe paper and the pc says, "This huge, enormous, iron gate, which is spiked, counterbalanced and which weighs seventy-five million tons, called an ARC break, is the gate that is interposed between me and getting on in this session." See, that's what he says; that's what he thinks. All right. It isn't true. It isn't true.

This ARC break, actually, as far as his future life is concerned, is made out of Dennison crepe paper. But it looks awfully big. Now, as this ARC break floats back into the past, gradually drifts back into the past, it gets to be yesterday's session, it is not so important you
see. It gets to be last month's session, no great value. It gets to be last year's session, well, you have to dig like mad to find it.

Well, why is this? Because of progression of time. The analytical mind fixes closest to all of the havingness. You've got all this havingness around here, you see. Present time has got all the havingness in it. Therefore, those things which are closest to the havingness are, of course more valid than those things which aren't close to the havingness. He no longer has Camelot, see. But he does have modern England.

So what happens close to modern England, of course, that's close to the havingness, so that's fine, you see. But Camelot, he never can get that back; that's gone. Of course, it really has no value as he looks at it. It has great aberrative value, but it has no analytical value.

So there is this basic disagreement always occurring in an auditing session. What is wrong with the pc is in the yesterlives and what the pc says is wrong with him is right here and now. Now, if you treat what is wrong with him right here and now with bulldozers and heavy axes and dynamite, as though the gate which is closed in your face is made out of iron, is of enormous tonnage, is a tremendous barrier – if you treat it in this fashion, if you slug away at it as though it is iron – the pc will think so, too.

You can validate the pc into out-rudiments. You can work on him and you very often will be right, but in the process of working on him too hard, you can actually blow rudiments out.

You start removing rudiments ineptly, you start sluging them around and you get the PT problem out and the ARC break in. And then you get the room out because it's the havingness around which the bad incident occurred, don't you see? And the room goes out and of course withhold goes in. But by this time you've cleaned up the PT problem and the ARC break, but now you have the room out and the withholds are out.

Now, if we were to go back over the rudiments again and check them, we would find this to be the case, but in order to get on with it and have an orderly progress of rudiments, we run, of course, the rudiments consecutively and never cross them again. So we don't notice this other point. An auditor has to judge this way. He has to make a judgment. He has to say, "Is it going to do more damage to get the rudiments in than to audit with them out?" Now, that is sort of a – sort of a wild one because it's up against this perfection: is that the best auditing and the best gains always occur against rudiments in. And a goals run is very, very difficult to achieve with rudiments out.

All right. That's – that's the ideal, isn't it? The ideal is all rudiments in during the entirety of the run, right? Now, how about crudely putting the rudiments in? You can actually put the rudiments in with such ardor, you can attack this gate the pc has got closed against auditing in his bank with such ferocity, with such battering rams, with bulldozers and dynamite and so forth, that he becomes utterly convinced one way or the other that the rudiments are way out and that it's all a pretty hopeless proposition. And you throw the rudiments further out than you throw them in.
Can a condition exist whereby the handling of rudiments worsen the run? Can a condition so exist? Yes. And this is the discovery which we make here and it's an interesting discovery. There are two or three I will detail to you here.

And that is that any auditing of a terminal other than the goals terminal of the pc can increase the density of the bank and the resistance of the preclear. It doesn't happen a hundred percent, but it happens enough to make one very wary.

Any auditing of a terminal which is not the goals terminal of the preclear can result in difficulties. Tone arm rises; it gets sticky; it goes up; the pc gets very uncomfortable; the pc becomes very ARC breaky; the pc gets very, very upset; the rudiments are very, very hard to keep in. Why? Why? Because in not auditing his goal and his goals terminal, you are of course liable to be auditing other terminals and these increase the density of the bank. So that the pc becomes more ARC breaky by auditing certain rudiments than if you left them alone. See how this could be? It's one of these – one of these horrors. It's one of these superimpasses. It's one that requires judgment on the part of the auditor.

Well, I'll give you an idea. The pc's goals terminal is "a willow wand." Let's take something nobody has for sure and so the pc runs a willow wand and you can do all sorts of weird things with this willow wand. You can run concepts on it and brackets on it and you can run it backwards and upside down and nothing very grim happens on the willow wand, see? This can run, you see.

But in the rudiments, he has a present time problem with his boss. So we say, "Well, get an idea now of getting even with your boss; get an idea of your boss getting even with you. Thank you. That's fine. Get an idea of getting even with your boss, your boss getting even..." We're auditing the PT problem, you see. And we're going to clear up "boss." The boss is not a willow wand. And the harder we try to get it in, the less it goes in, because the pc's attention is distracted off of his goals terminal every time we say the word boss. He goes flink, boom. "Boss, boss, boss. Wow! Boss. Well, us willow wands ..." See? So off it goes and the bank gets stiffer, heavier.

All right. We're going to have an ARC break. We're going to run this ARC break in, see. This is going to be real good. Well, the person has an ARC break with the auditor and has had ARC breaks with past auditors and we're all set now. And we'll say well, "What has an auditor failed to do? And what have you not been able to say to an auditor?" And we go on this way, and we go on and we go on and we go on. And every time we say the word auditor, the pc's bank says, "Well, us willow wands..." No, thank you. His attention is being pulled out of session, out of session, out of session, out of session. Don't you see? So the ARC break eventually disappears without the tone arm going down. You've stiffened the bank up, don't you see?

Now we had it stiffened up on the PTP. Now it gets stiffer on the ARC break. And now you say, "Do you have any withholds from me? Me over here, see. Me. Me. Me. You know? Me. Me. Me. You know? Withholds from me. Me. Me."

And all of a sudden – all of a sudden, "Us willow wands..." And the bank again doesn't go down. Nothing deflates here; nothing happens. So having "gotten the rudiments in" (quote)
(unquote), in this particular instance, all we have succeeded in doing is getting a nonregistry of the meter by stiffening the bank up past registry. You see how this could happen?

Well, it's happened here lately to several cases. I've been steering you along the line, I've been steering you close to the edge in a few places and out of the last week-or-so's auditing, these facts have emerged: that some of the cases present in the last week or so being audited – a very few of them, only something on the order of about 20 percent, but that's good enough – would have done much better, thank you, if the auditor had never touched a rudiment. Because the auditor was getting them in by attracting the pc's attention violently off the goals terminal with a resultant rise of tone arm.

In other words, the rudiments weren't being put in; the meter was sudden – just being beaten into nonregistry. So finally all rudiments are out but not registering and rudiments can go out and not register if the tone arm is very high and the needle is very sticky. You should realize that as part of your auditing kit.

Try it sometime. Assess somebody very carefully and get a terminal. Let's say it's a "hyperbolid," see. And then very carefully for a very long time in auditing, avoid ever letting him put his attention on a hyperbolid and very carefully put his attention on everything else but a hyperbolid. And you'll wind up at the end of this particular run with about 20 percent or something like that of the cases so run with a high tone arm and a sticky needle. The rudiments have just all been violently driven out.

How have they been driven out? Well, the pc is actually experiencing a scarcity of auditing. That's one of the reasons. He feels he isn't being audited. So that would be one reason. And the other more important reason is the person's terminal is not getting the attention it thinks it deserves, which is total attention. You see how this could all add up then to a miserable sort of a situation?

So if, in the process of putting rudiments in, the tone arm starts up, it's a very good thing to look very pleased as though you've just gotten the rudiments all in beautifully, [laughter] give two more questions, give the rest of the rudiments rapidly and look very pleased – needle falls off the pin on withholds, you get the idea – look very pleased about it all. Even have a sigh of relief if you want to make a liar out of yourself, but the sigh of relief would actually amount to the fact that you've actually gotten him out of that particular embayed position without running him aground completely. He's just partially aground. And then run whatever you're running and for heaven's sakes make sure that what you're running has something to do with the goal or the terminal of the pc. And his bank will soften right up and it'll all come out all right.

But if you keep at it – if you keep at it, pound, pound, pound, pound, pound, pound, pound – and that tone arm isn't coming down and the needle is getting too stiff to read, you're just heading for trouble. You can just park the case just like that.

Oh, I'm – can tell you all this because it has been subjected to considerable test and nobody here was being used as a guinea pig. It just turned up as a gratuitous fact. It just turned up and took off its hat and said, "I am a sturgeon." And we said, "Well, how do you do?" That's the truth of it.
Now, terminals arrived at through a Dynamic Assessment, a full Dynamic Assessment, were apparently not too far off goals terminals, so old Dynamic Assessment runs were not too bad, but any vast concentration on the case where the auditor simply picks the terminal out of midair and makes the case concentrate on it, is liable to bring about in enough percentage of cases to make you worry about it on all cases – any time it gets up above 20 percent, well, it's liable to happen to you at any time, so just avoid it. We recognize clearly that the goal and terminal of the pc, properly run, will get the case further than any other single process.

Now – remember now, as we say this, that rudiments are just a process. They are four or five processes. That's what rudiments are. They are just processes.

Now, if those processes take the pc's attention off his goal or terminal to too great an extent, you suffer from this other liability. The rudiments will go out faster than they go in and that's what I've been talking about. On such a case, you will get further, actually, by auditing with the rudiments out rather than audit with the rudiments further out.

Now, it isn't true that a case makes no gain with the rudiments out. The gain is very tiny. There is some gain with the rudiments out. It is very slow. It's quite microscopic. But it is a gain. It is a gain. And that little, tiny gain of course, is better than a negative gain, see. It'd be better to audit toward a tiny gain than to a thoroughly messed-up case, see. The better choice.

Now this is no invitation to assess people with the rudiments out. It is no invitation to run people with the rudiments out. I'm just pointing out to you that under these circumstances that when assessment is driving the tone arm up – pardon me, when rudiments for assessment just drive the tone arm up and make the needle sluggish, when rudiments for the original runs on the case just drive the tone arm up and make the needle sluggish, you're much better off saying, "Well, how do you feel about the room? Good. Is it all right if I audit you? Fine. Do we have any ARC break? Good. Do you have any withholds? Oh, fine. Good, so forth. Oh, yeah, present time problem. You haven't – you don't have any present time problem. Oh, that's good. That's fine. Fine. That's wonderful. All right. Now we're going to run this process, and it has to do with a willow wand."

Or in assessment – in assessment there is another dodge. You pick up the pc when the rudiments are most likely to be in and assess him at those times when the rudiments are likely to be in and don't assess him during times when they are likely to be out. Doesn't that sound weird? You say to the pc, "How do you feel?"

And the pc says, "Oh, I dunno. I'm not too good," and so forth.

And you say, "Well, we'll have a session tomorrow." [laughter]

You see? You actually could do this. You recognize that you could do this.

You say, "Well, what time of the day do you feel best?" [laughter]

And the fellow says, "I feel pretty good around three o'clock, usually – afternoons." He thinks this over, "Well, yeah, usually, afternoons I feel pretty good. After lunch I feel pretty fine."
And you say, "Well, that's fine. That's good. Now, we're going to have our assessments here. We're going to assess for thirty-five minutes immediately after lunch."

That'd be a way to get the rudiments in, wouldn't it? So it wouldn't be impossible, even if the rudiments appeared to be out, you would get someplace this way by picking only times when the pc was in good shape.

Now, you're laughing about this now, but you actually will encounter this in your auditing and I can see that sooner or later you're going to use this on somebody.

Well, why all this? Why did they go out? Well, I should give you this very important datum, this extremely important datum. You understand the datum I just gave you as important was that taking the pc's attention off his goals terminal could result in a stiffening or a massifying or solidifying of the bank as registered on the tone arm and needle of the pc. And, therefore, it is a liability to run any other terminal than his goals terminal.

All right. Here's the other one: The pc's goal, if run by itself on a two-way or more flow, should bring down the tone arm and that is a wonderful thing to know. That is a wonderful thing to know.

You've got the pc's goal and terminal. You can't get the rudiments in. Everything you're trying to run for some reason or other causes the tone arm just to go higher and causes the needle to be stickier and it goes along with an ARC breaky pc and you're trying to run the goals terminal, but you don't seem to be getting anyplace at all. You know, on a 5-way bracket or there's something messed up about the command or maybe the level isn't right or you've overrun a level. This was an old problem in clearing, was overrunning a level and getting the tone arm so high and getting the needle so stuck, you couldn't reassess.

Now, I can give you a method which should, under ordinary circumstances – since I haven't done it to enough people to tell you broadly that it'll do it to all cases – I myself believe at this time that it'll probably, will undoubtedly do it to all cases, but I can't tell you that from actual fact, I can only tell you my observation up to this moment – that running at least a two-way flow on the exact goal of the pc phrased in some action wording would cause the Prehav Scale – or stiffening of the bank or rudiments stiffening of the bank to come right off.

Quite marvelous. You see a high tone arm – you see a high tone arm, a stick needle, you don't know what's gone wrong. Your assessments might have been out on a Prehav Scale. You might have overrun something. It might not have been a proper command. You might have been running with the rudiments too far out. There might have been a level which was left unflat, and then you went on to another level and this goofed it. There might be something wrong here and you can't quite find out what it is. You apparently have this to fall back on: You can phrase up the pc's goal. You – it's given. You have to have his goal already. You can phrase it up so that it can be run just as itself and that is all. You just run the goal.

It has to be action phrasing, however. You can't just chant. Let's say the pc's goal was "don't want to go home." You can't just say "Don't want to go home. Home don't want to go," you know. [laughter] That would not be a proper command phrasing. You would have to say how, or what, or something like that. "What would you have to do to go home," see, something like that, you see. "What would go – what would wanting to go home involve," some
such phrase, but it's better to have it in a two-way flow and you'd say "What would make you want to go home? What would make another want to go home?" Now there's a very good one, see. "What would make you want to go home? What would make another one want to go home?"

"What would you have to do – ?" – any such phrasing – "How could you go – ?" "What would this involve – ?" Any such phrasing woven around, leaving the goal more or less exactly worded and intact will give you a brand-new lease on life.

Now, you can – you can discharge it all down. You get back to where you were and you've now got a needle that you can assess. You got a pc who isn't ARC breaky and you now feel happy about the thing and you can go on auditing and find out what is wrong. This is to get him back into the realm of the living. So you see, that's a valuable thing to know.

If that fails you, well, you've always got suicide. You could propose that to the pc. That would solve his problems. "R2-45" by its various – various other techniques. So don't think that you just have this one technique to fall back on.

Now, that's a valuable thing to know, that you can probably desensitize the situation – that is to say, you can resensitize the meter by running the goal.

The goal run all by itself apparently produces some interesting – interesting phenomena. Apparently, a goal can be run all by itself. Now let me give you a further ramification on this.

We find the pc's goal and the pc has a goal of – well, let's say it was, "Under no circumstances to let the auditor have my terminal." Let's just corn it up, but let's say that that was the pc's goal: "Under no circumstances to let the auditor have my terminal." Now, of course, you'd recognize clearly in black and white letters of fire that under no God's quantity of expert terminal-finding over the next three weeks were you going to have much of a show because your pc is always going to have the rudiments out. The pc's always going to have it mucked up one way or the other – obviously, with a goal like that. You see that clearly? "To never let an auditor get anywhere near my terminal," or some such goal. That's his – the lifetime he's – I mean, it's a goal for the last trillion years, see. He knew he was leading up to this lifetime or something so he had his goal all set.

Well, you could turn around and run it and all you do is run the goal. That's all you've got. You haven't got a terminal. So you just run the goal until you can – got the goal kind of tamed down a little bit and you can find the terminal now. Cute, huh?

In fact, this is so good that I don't know that it wouldn't become standard procedure to run the goal before you looked for the terminal, because it'd be very fast assessment if you did. I don't know that it would become standard procedure, but I'm just giving you warning. Having made a discovery of this particular magnitude with what you can do with a goal, why, you can be prepared for anything

You can do something with a goal and if I find you can do something with a goal, why, I guarantee you – ha-ha-ha-ha – that we will do something more with a goal, you see.
All right, so there is a method of short-circuiting it. Now, I've given you a very weird and corny type of goal: "To never under any circumstances, over my dead body, to let the auditor have my terminal." See? That's very corny, isn't it. How about a goal like this? How about a goal like this? "To remain totally undiscovered." Well, isn't that the same goal? Isn't that the identical goal? Now, how long are you going to sweat over that one before you get smart and remember this lecture?

I'm going to invite your attention to the pc's goal as indicative of his behavior in processing. You look at the pc's goal, I'll predict his behavior in processing and I won't be a hair off any time. I've been looking down your throats on this now for weeks. Matter of fact, I just – I once angled in toward a pc's goal because of his behavior in assessment. He was just laughing a minute ago there.

I did. I said, "Well, let's – let's sort that out from that angle because we couldn't get anything to stay in. Nothing ever would stay in on this goal and of course, the thing was practically "Nobody is ever to find anything on me," you see. That was the goal and it was very hard to find. And this pc, by the way, was being assessed, continually, with the rudiments wildly out. They were always out.

Well, look-a-here. It was after the fact. You've got the goal. So now you can understand why it was hard to get the assessment. But remember, you're doing – you're doing the assessment before you've got the goal. You – you don't have this datum yet, do you? Valuable as the datum would be, to know the person – the best way – the most easily – the easiest sessions you would ever run would be those sessions in which you were trying to find the goal that you already knew what it was. That'd be a very easy session to conduct.

The goal is "To hit the auditor over the head with an E-Meter," you see. And you know that, so every time he reaches over for the E-Meter and so forth, you put his arm back in the chair, and you – there's no surprise involved with it, don't you see. But we sweat along over this goal for a long time and we are considerably annoyed all during the assessment because at the least provocation, the pc picks up the E-Meter and hits us over the head with it and we think this is getting in the road of the assessment. [laughter] You might say that the pc sitting there is the assessment. So if we knew it in advance, the pc would never give us any trouble. But we don't know it in advance.

But let's use this idea. We go down a long list of goals on the pc – Routine 3 is just done Routine 3, you understand. There isn't big changes occurring here. I'm just showing you some of the mechanics back of all this – and we do an assessment. We get our rudiments in. We get them in very well. We make sure that a Sec Check has been done on the pc. We make sure everything is grooved in and everything is very neat and everything is very nice. And we go down and we get the goals list and we get the thing all assessed out and we wind up with the pc's goal. All right, that's the way we should do it.

Is there any way to make it any easier on us? Well, that's for sure. There's ways to make it easier on us. As we look this thing over, we should do a goals list rather relaxedly. We shouldn't attack the pc and extract his goals list from him something on the order of a highwayman taking the gold off the night mail, see. This is kind of a wrong approach.
We can weight this thing up with importance, you see. We can make this so terribly important. We can make it under such strain. We can put so much attention on these Dennison crepe paper doors of the rudiments, you see, that he begins to think these things are castle high. "Oh, God, nobody could ever – . Oh, I hope I don't – I hope I don't have a present – I hope – I hope I don't have a pr-present time problem before this session because, of course, I won't get any place in the session. And we'll have to spend the whole session on present time problem, and I hope I don't have a present time problem. And let's see, how can I keep from having an ARC break with the auditor. Let's see, if I get an ARC break with the auditor, then the auditor won't be able to find my goal and terminal and – and the session will be no good. So let's see. I guess no matter what the auditor does, I won't pay any attention. I think that would be a good idea. Now, let's see, room. Room. Well, that room always makes me nervous, so-so-so the best thing for me to do is just not look at it, the whole session."

See, the pc is helping you out, see. "Ah, now let's see. I have no present time problem and I'm not going to say anything much to the auditor or not going to hear anything very much that he says and then I'll get no ARC break and – and then I won't notice the room, so that'll stay in. And – withholds, withholds. Do I have any withholds? Do I have any withholds at all? Let's see, do I? Do I? Do I? Is there anything I haven't told anybody? Let's see. Let's see now. No, I guess I don't have any withholds, but – but on the other hand – on the other hand, he might find out the first third of my life. Somebody might get into that quarter of my life and maybe at the time of withholds, maybe if I just sort of clench the cans convulsively"[laughter] "when he starts asking about withholds, we'll get across that one all right. Now I've got the rudiments in, we will have a session."

You'd be surprised what goes on. The pc – pc tries to help you out all he can. I just ran an assist a little while ago, by the way, on Quentin. It had been carefully buried. Nanny had told him it was all better now and he was now well. And you know, I couldn't get a single somatic out of him? This little kid runs like a – like a baby carriage, you know. He'd fallen out of bed on his head. No somatics? This character? Impossible. Because usually all I have to do is say, "Bing, bing, bang, thud. Put your attention on this, that, boom," and it blows. And that's about the end of that. But in this place, no somatic? No somatic? So I trace it back and I find out how he's been reassured while he's in a state of near concussion that "it doesn't hurt now." Somebody's installed a somatic shut-off. So I had to search this over, and – it took me a moment or two, and I said, "Well, has anybody said anything about this? You mentioned this to anybody?"

"No, nobody but so-and-so, and they said it didn't hurt now."

And I said, "All right. Well, do you recall when that was and where it was? All right. That's fine. Got that all straightened out. Okay, now let's go through this whole thing again." Somatics, you know, bang! Right in there, thud! And he was running.

So don't think that I'm saying you don't have to have rudiments in. Here was a somatic shut-off and here was somebody auditing before me. At the moment of the accident, he had another auditor and he was still – as far as the accident is concerned, you see – still totally fixated see, on a person that was supposed to be helping him out at that time. So as long as that person was standing there in the incident, the incident was shut off.
Well, of course, rudiments are in essence an effort to be the pc's auditor, and if you can become the pc's auditor through putting the rudiments in, of course the pc runs wonderfully. The somatics go on. All kinds of things happen; various phenomena occur. Pc goes rapidly through the bank. The rudiments are out; benefits occur less to the degree that the pc doesn't have an auditor, you see. I mean, it's a direct proportion proposition. The more he has an auditor, the more confidence he has in an auditor and so forth, why, the more will occur in the session beneficial to the pc. It's a direct proportion, so don't let me discount in your mind the importance of getting rudiments in. I've just told you that there are times when it's better to leave them slightly out than to drive them out with clubs.

I think we need a new phrase about there. Let's just call them muzzled rudiments. Muzzled rudiments, you know. You say, "Rum-thum-thum-thum-thum-thum. All right. Now we're going to run this process." And bang, here goes your session. You see, you've gone through the form of Model Session and if one or two questions didn't release the needle, you leave it alone. You don't run any process on the pc. You would do that at times when the tone arm was high and the needle sluggish during the last session that you gave the pc.

Of course, the pc comes in – of course, any pc of mine comes in with a high tone arm and a sluggish needle and they left the last session with a low tone arm and a loose needle, I curl my long, nonextant black moustache and I say, "Well, I don't mean to inquire into your private life, but what have you been doing?" They usually tell me and the needle goes down thud, see. Needle goes loose. Tone arm goes down. They go into session. Now in essence, however, if they're not going to and if this phenomena is not going to occur by reason of everything being out, you – you're better off auditing them with rudiments out than trying to slug the rudiments in.

Do you see? That's the only point of judgment I'm trying to make with you. Muzzled rudiments. If you notice that every time you try to get the rudiments in the pc becomes more ARC breaky than before, you might decide that it's a marvelous idea to do certainly one thing – to sort of muzzle down the rudiments. Toughen up security checking on the pc.

You see, that's not a rudiment. Security Checking is Security Checking, see. If he's going to be so chopped up and messed up and ARC breaky, he's probably got withholds like crazy, so throw that over into the department of Security Checking and if his tone arm and needle are not responding to any process known to man or beast, if you're lucky enough to have his goal, run it. You just run it and the whole thing will soften up. It'll bypass everything else that's happening to the pc because this is the single, more important thing than present time.

You have something more important than present time. So, therefore, it overrides the top of rudiments and so forth. So is the terminal more important than present time, but less so than the goal. The terminal is not quite as important as the goal. And the goal is the softer road. See, there can be several terminals to one goal. You can run a terminal flat for that goal and then have to find another terminal for that goal. See and maybe have to find another terminal for that goal before you get rid of the goal. But goal? That's just one goal. Zoom! When it's out – when you've got it audited out, then it is out. And that is it.
These are all points of adjudication. What do you do in auditing? And a very finished auditor, an auditor who really knows his business, can handle a pc well, goes on the basis of fundamentals. He sees what is happening with the case. He knows what he wants to have happen with the case and he just throws aside all barriers which interpose on his having that happen with the case. I gave you a very crude example but a very easily understandable one.

Well, all right, I'm trying to give a little boy an assist. No somatics. Well, I don't try to sack into his past life and do this and do that and the other thing. I just figure out "Well, what – woo-woo. This boy has no somatics and he should have somatics. And nobody has run this thing. And must have been something in the environment at the time." And sure, we find a somatic shut-off. Somatic shut-off. Knock it out. There goes the rest of it.

Would it have ever come out into the clear if I'd just run the process? Yes, yes. I could have run the thing and run the thing and run the thing and all of a sudden he would have remembered the person telling him this and it would have blown anyhow and I would have come out the other end. And it would have been the difference between about a two-hour session and a fifteen-minute session. The way I did it was a fifteen-minute session. You can always cut corners by knowing your business.

You understand that an auditor can almost always get there in some knuckleheaded fashion. Skill does just this: It makes a time difference in auditing. It can make an enormous time difference in auditing. It can be something on the order of five hundred to one. See? It can be five-hundred hours for one hour. See, pc gets this session. Auditor really understands this. Gets a good grip on it. Has a little bit of luck. A couple of horseshoes in one pocket and a rabbit's foot in the other pocket and some shamrocks stuck in his lapel. Just hits it, you know. Bing! And he said, "Is it so-and-so?" And the pc says, "Yes, it's so-and-so." And he does so-and-so. And zoom and that's it. And that clears all that up and that's the end of that.

And somebody else runs the CCHs and then follows through the CCHs and he runs a Present Time Problem Intensive one way or the other and gets that out of the road. He runs all existing Security Checks, fifteen Security Checks more that he himself has thought up and so on. And somewhere in this mass of stuff, why, he hits the exact thing that the pc was on. And it happens more or less at that point because the pc is softened up. You get the idea?

You could get there. You can always get there, you know, but riding what tortoise sometimes.

Now, it isn't just basically that you always have to get there faster. As a matter of fact, getting there swiftly is sometimes an economic liability and in a society of this particular character, getting there too fast and getting there too slow can be looked on alike as undesirable. They would have you strung up in short order, I'm afraid, if you went out on the roads and you saw somebody sick and you said, "God bless you, my son," and it – he instantly was well. And you looked around throwing these God-blesses in all directions and so on. Well, they'd say "That fellow down there in Judea. It's about time we hang somebody else, man." They'd hang you, that's for sure.

Furthermore, it'd be economically very difficult. Negotiations – economic negotiations before you said "God bless you," you see, would take more time than the cure and this would all be rather silly. And of course, I'm joking now about this, but the economics of the situation
do influence the length of time in auditing. I just don't want them to influence the length of
time in auditing the way they did in psychoanalysis. Almost the total end product of psycho-
analysis is "how long can you get somebody to be analyzed." Hasn't anything to do with what
you do with the person in analysis. It's how long can you go. Because the longer it goes, the
better your paycheck is and the more weeks you're sure of it. So there's an optimum that the
society will accept in terms of speed, economically.

Now of course, I'm just joking on that point, but there is another point: it's how much
change can a pc accept over what period of time and you just start talking to this pc you're
having too hard a time with on the subject of Clear and you're liable to find out that it's just a
totally unacceptable proposition because he looks on it as a rapid proposition. And you talk to
him about rapid clearing, he's all set to tell you that he wants to be cleared this session.

Well, that's interesting because you'll see some pcs putting it down session after ses-
session after session that the session goal they put down is to be Clear. Well, that's dandy. We're
awfully glad they put that down as a session goal. Nobody's criticizing it. Wouldn't say any-
thing about it except for this: It should occur to you as the auditor once in a while not to ques-
tion the goal, but to discuss the subject with the pc with your eye on the needle.

Now, you shouldn't take up the pc's goals too arduously as did he reach them or didn't
he and his goals are his goals, and they are his goals for the session. And you take up the ses-
session's goals at session end and find out if he made them or didn't make them. But if all the pc
ever said was "to be Clear," "to be Clear," "to be Clear," "to be Clear," we wouldn't question
the goal, but sooner or later we'd find out what was he talking about. What was he talking
about?

And you'll find some tremendous variability. They – he doesn't really know what he's
talking about. Now, not that you would do this in a session – very often he definitely does
know what he's talking about – but, not that you would do this in a session but you could do
this in a session: You could say, "All right. This session we are going to try to make this goal
of yours 'to be Clear.' And we're going to make it in this session." And this, of course, to
somebody that's reading at 6.5 and stuck up and so forth.

It won't necessarily violate his reality, but it'll violate his speed-of-progress factor. The
idea of sitting down in this session in one condition and coming out at the other condition
without any time allowed for adjustment, healing, feeling whether or not the water is cold,
doing all of these things, you see – and you're liable to get – you're just liable to shake up the
meter just – just horribly. I'm not saying you should do that. I'm just saying the consequence
of doing it on some pcs who have this as a goal. Speed. Speed. The speed with which you
clear the pc is sometimes unacceptable to the pc and you very often will find a pc planting his
heels in. But what has got its heels in? And this is very important to you. His goal has got its
heels in. That's what's got its heels in.

Examine a case from the aspect of its goal. Examine the goal from its aspect – from
the aspect of what dynamic it is an overt against and you'll find out something about pcs.
You'll find out how a pc got a goal in this solid. He had this goal. It was a perfectly honest
goal – perhaps. And – it was – it was a perfectly good goal and he went along, but nobody
wanted this goal because it didn't fit with certain dynamics. And they invalidated it and he
reasserted it and they invalidated it and he reasserted it. And they invalidated it and he reasserted it, and they invalidated it and he didn't assert it very much. And then he reasserted it and then they really invalidated it. And after that, he skipped it and it kind of crops up now and then. He thinks about it, you know, sort of, "Well, sort of a fairy-tale thing. I mean, nobody really believes in it, you know. It doesn't amount to much – just something you ..."

And when you first pick it up, you'll find out it behaves like an overt. A pc's goal, even though it is a goal – and it is a perfectly honest goal – nevertheless behaves like an overt. And you can run it as an overt. And that's why it works to run it two ways. It's running overts. It's the most remarkable thing you ever cared to run into.

All right. Let's take the goal "to climb a mountain." Highly unlikely goal on some pc, but we will take it that way. "To climb a mountain." All right. "To climb a mountain." Very good. And you say – you can't figure out that this would do anything to anything very much. And you say, "What would this do to a group?" And by golly, the pc will come out with a long chain of overts. It is an overt against a group to climb a mountain. You wouldn't think so at first glance, but of course the goal wouldn't be stuck to this degree if it hadn't been invalidated, if it hadn't been an overt. See, it was treated as an overt, so it becomes one.

Naturally, it's been objected to so often that it's easily invalidated and this is how a goal or terminal goes out on the pc. Any goal that was not a mass goal of the race or line of the pc – but not – you know, just actually not an axiom; any goal that isn't an axiom – is out of agreement to some degree and therefore has been invalidated very often by other members of the groups with which the pc has been associated, has been invalidated on other dynamics and having been invalidated on other dynamics becomes a fruitful source of invalidation.

Now he's used it to invalidate eventually and people invalidate it, so you say to this pc – you're doing a goals assessment on the pc – and you say, "To climb a mountain. To climb a mountain. Did you ever go in for mountain climbing?"

And the pc says, "Oh, huh?"

And you say, "Well, your goal here 'to climb a mountain,' did you ever go in for any mountain climbing?"

And the pc says, "Well, no, not particularly. I thought it'd be very nice to climb a mountain sometimes."

And you say, "Well, don't you find mountain climbing awfully tiring? Ah, it's not being done much these days, you know. Did you know that – did you know that airplanes now fly much higher than Everest? Did you know that?" And you say, "Let's take up this goal now 'to climb a mountain. " It doesn't register.

Now we get the rudiments in and get the ARC break off and the thing registers again. Now, what's – what's the phenomena connected with this? It's just that the goal has been invalidated very often and has been used for the purpose of invalidation of certain groups of people and so is a fruitful source of invalidation. And you just sort of breathe on this goal lightly, you see, and it apparently folds up.
Actually, this is a misnomer. It simply disappears from view and it disappears from consciousness, but it sure doesn't disappear from the reactive bank. It's in there plowing and chewing and mashing, going on like mad, you see, down underneath the cover, but you can actually – can get it off of the meter by invalidation.

And because the terminal is an outgrowth of the goal, it of course could be similarly invalidated. Well, these things are easily submerged. So the rudiments go out; there disappears the goal and terminal. You could go forever. Actually, we have. You can pull a thousand, fifteen-hundred goals or terminals off of a pc when the original ones are invalidated? Mm.

Oh, I'll tell you one. An HGC didn't take the pc's goals list. Pc laboriously writes out a goals list, so an HGC didn't take the pc's goals list, but wrote the pc a new goals list down for the pc, taking it off by the meter. That was it; that was enough. I don't know how long they assessed and it wasn't length in that particular instance. They did a complete misassessment. The goal they found couldn't possibly have stayed in. The terminal they found couldn't possibly have stayed in. They ran it. They got nowhere. It was a complete mess.

Fortunately, we found the list. We found the list and found out about this and got this straight and so forth and it was just a matter of, I don't know, five, six hours. Just five or six hours. There it was. The pc's goal occurred on the original, handwritten, personally written list, but didn't occur on later lists. That any goal had been invalidated, you see – by not accepting just the pc's list of goals, the goal – the pc's goal disappeared. It disappeared because when the pc was asked to list the goals again, she didn't list it. She omitted her goal. Interesting, isn't it? Ha-ha-ha, boy, I'll tell you. Finding goals and terminals is walking a tightrope.

Now, are there any processes that you can run – well, I've given you one. There's this goals process. That's very good. Several brackets of the goals process; two brackets or something like that. It's marvelous. But there must be some other processes. Must be some other processes that you can run. Oh, yeah, well there's a hatful of them. I've just done a safety table which I think you already have. Should have been issued. It was last Thursday's bulletin. If it hasn't been issued to class, it should be. But it's a safety table. Safe processes. That's all.

Now, this particular problem is what can you audit and it lays down this rule. I have gotten enough information now so that I can write up a Problems Intensive and will talk and give a comprehensive lecture on the subject of everything about a Problems Intensive – all the form and so forth. I'm redoing the form and so on.

But it follows like this: that you can always ask a generalized Security Check question. Contains the word you and it contains the word "someone" or "anyone". You can always ask that type of question. You, someone, anyone. You know? "Have you ever robbed a bank?" Well, fine. Not much of a terminal, a bank. "Have you ever – have you ever sunk any boats?" These are not as good a Security Check question as "Have you ever robbed anything? Have you ever sunk anything?" See?

The further you can get the question away from a particularized or even what we used to call a generalized terminal, why, the better off you are. You say, "Has there been any commotion before that problem? Was there any commotion before you had that problem? When did you have that problem? Well, what activity was going on then?" See?
You didn't name anybody. You don't direct the pc's attention directly onto past terminals if you can possibly help it. Now, understand you can get away with it. You can get away with quite a bit of this. I'm just showing you that it's a poor practice and you should realize that it has liabilities and it has limitations. So it is a better Security Check question – "Have you ever robbed?" What's the – where's the rest of it? Well, just leave that to the pc's imagination. His mind will go over onto something, see? See, that – I'm just doing the *reduo* *tio ad absurdum*. Actually, this is being too careful, see.

"Have you ever robbed?"

The pc says, "Well, there's the next ..." You know, his mind connects on the proper terminal or whatever he has robbed, you see.

All right. This – that – that's nearly perfect, but too extreme. "Have you ever robbed anything?" or "Have you ever robbed anyone?" Ahs that's good. See, yeah, that's all right. That's quite acceptable. You can play that around and do a lot with this.

"Have you ever robbed your father?" Oh, no, that is utterly and completely unacceptable as a Security Check question. I finally got all of the bars down now and got this thing shaken out and seen where it lives and I know all about this thing and that is just not acceptable, as a Security Check question. You understand what I mean?

What does this amount to? "Have you ever robbed your Father? Thank you. Have you ever robbed your Father? Thank you. Have you ever robbed your Father? Thank you. Have you ever robbed your Father? Thank you. Have you ever robbed your Father? Thank you. Have you ever robbed your Father? Thank you."

Well, what's happening here? Attention on terminal, Father. Attention on terminal, Father. Attention on terminal, Father. This would be a little bit safer but also a little bit corny: "Have you ever robbed any member of your family?" See? At least his attention can flick around without you crushing it down against Father. He'd be better off. That would be the better thing to do.

You understand that you've got wide latitude here and you can get away with an awful lot. I'm just giving you the perfections of it. That's all. I'm being pedantic, in the extreme. You can run through a Security Check question, you can actually assess lists of people and you can find out who drops the most and run practically a repetitive command on the person of what they've done to them. You can do all this sort of thing and you just get away with it left and right – as long as it's a Security Check because O/W is the only thing that'll run against a terminal. It's the O/W that excuses it.

You can always run Overt-Withhold as long as overts and withholds exist. Don't run Overt-Withhold where no overts or withholds exist. That sounds awfully mechanically something, but why – why do I add the additional provision? Well, this is strictly and entirely because if no overts and withholds exist, you're still putting the person's attention on another terminal, than the person's goals terminal. And you're going to get some kind of a repercussion.
Therefore, when a pc runs out of overts and withholds against a certain person in the past, he would get ARC breaky. Why? Did you ever have a pc do this? "Yeah, but they're – but I don't have any more. I didn't do anything more. I – I – mean I have no – I – uh ..."

He's sensible now that his attention is being crowded newly over onto that terminal. You got it washed up before, but now newly you're crowding it onto that terminal. That's a bad show.

So Security Checking is the best way to run Overt-Withhold and a generalized sort of question is – having to do with the action, not the terminal – is much better than any other type question. And you get some sloppy, pronoun type of terminal – well, that's not, not perfect, but it's quite acceptable. "Have you ever robbed anyone?"

Now, you understand that you can throw questions in along the line, but you should realize, actually, that you are just to some degree getting away with something. It's a violation of this other, so you are – you're – you're just getting away with something.

All right. You take prior confusion. We'll take up prior confusion in another lecture and beat it to death. But you take prior confusion: the person says, "Well, was there any excitement before – when was the first time you noticed you had that problem? Oh, yeah, well, that's good. Was there any excitement occurred just before that? That's fine. Now, oh, yes, well, you had a fight with your sister. All right now. What did you do to your sister there? All right. Did you have any withholds from her? Was there anybody else you had any withholds from? Oh, yes, you had a withhold from your sister. Good. Is there anybody else you had any withholds from then? Any more and so forth? Oh, all right. That's fine. That's good. Did you do anything else in that particular period? Did you do anything to anybody else? Was there anything of this a little earlier? Did you have any unkind thoughts any earlier about anything or anybody and so forth?" And you're just running unkind thoughts, criticalness, withholds, overts, you know, just – just reach around the basketful and just clean up the confusion, you see. Just plug away at it and so on. That's almost perfect.

You'll find out the present time problem will blow. The somatics will blow. The person's illness will blow. You'll find out the ARC breaks blow and so forth and it opens up the door to a brand-new type of rudiment. It's a Security Check type of rudiment. You clean up your rudiments by Security Check and find out you can get away with it much better.

You don't have those at this particular instant. They're still in development. It is based on this other lineup, see – the prior confusion to get rid of the out-rudiment. Well, it doesn't violate the goals terminal, and it doesn't leave the pc sitting out in the middle of nowhere.

But let me give you just this – this other fact. I've talked about it quite a bit and I've been asked here a question of "What exactly makes the bank stiffen up by taking its attention off the goals terminal? What exactly?" Now, I've said that the terminal asserts itself. It's one of the built-in mechanisms of the terminal that if it is ignored, it gets apparent. This is one of the mechanisms of the thing. This is still, however, not answering this question because frankly I don't know, frankly. I can give you the generality and I can give you the basic law that makes it occur, but the exact mechanics of how this is done actually, practically – practically it just staggers you trying to figure these things out. Exactly how would the pc with his
left hand make his bank go stiffer and heavier and more solid and so forth, so that he notices it on the right hand, you see.

It's always this mystery about "How does the pc do it with his left hand – in order to feel it with his right hand and just exactly what goes on here?" Well, the exact mechanics of the thing – electronically and so forth – I could not tell you at this time. I don't know.

But I can tell you this: that you needn't worry about hidden standards anymore, because all the basis of all circuitry are to be found on the goals list of the pc. The basis of the pc's circuits are in his goals and the type of circuit he will have of various kinds will be found on his goals list. So that you get his main goal, you'll find out one line of circuits and when you go down and assess another goal, you'll find another whole series of circuits. After you've gotten rid of the first goal, you'll find another whole series of circuits obeying this other goal. And we have the basis of circuits for any given individual. And isn't it interesting that it's different for every other individual, so don't – and there are a couple of billion of them alive at the present moment right here on this planet, so don't blame me too excessively for not having noticed they were all the same mechanism before, but I have just more or less scouted this out at the moment.

If a person has a hidden standard type of circuit that is immediately in action, running the goal bypasses it. And if he has several types of circuits, they will be found somewhere on his goals list, and you will get to those as you clear him. As you get rid of the terminals and the goals, why, the next layer will unpeel. And of course, those that are most active may come last, but they will surrender the most easily.

Well, what – what is the goal of the pc? Well, you'll find this – the first goal that you find on the pc – remember you're going to find other goals on the pc, too, after you've gotten rid of the first goal. It has to get out of the road. But the first goal of the pc will describe the most available series of circuits and one of the things you do for the pc when you first find his goal is you actually do blow up some of his circuits. So actually, the best way to get at hidden standards is to clear the pc. Interesting, isn't it?

But you clear him with his goal and if you bring his goal into the command, his circuits will clear up, which is what's new here. You're getting commands now that include the pc's goals as part of the command, which we will also talk about at some other time.

But it's quite amusing if you recognize that the center ... This is a possibility, you see, that the pc has a goal "never to give the auditor a terminal." They actually will respond as a circuit which goes into action in the presence of an auditor and then which blanks out the pc's memory of anything if the auditor asks for the terminal, see?

I'm just saying – supposing this were the main goal of the pc, just giving you a piece of idiocy. Which is – nobody ever had that goal. You get how that would be? He's got a circuit set up so that you say, "Now, what is your terminal?" and immediately this thing goes into an occlusion, makes him stupid and doesn't answer. And he says, "Huh?" You know?

All right. That's his goal. His goal expresses itself in a circuit form. So you get circuitry goals. "Never to make money anywhere." See? That's his goal. Let's say it's "never to make any money at any time, anywhere." Every time he sees himself in danger of making any
money, a little voice talks to him and tells him that's the wrong thing to do. He just comes close to making some money and a little voice says, "Well, that's very bad. That's a very bad thing," you know? "Much more advantageous to sell it than buy it at this particular time," you see? And he gets caught in the stock market crash and he's always in financial disasters.

You ask this person who has a goal like that if he was in any financial disasters. "Oh, yes, yes. Lots of them."

"Well now, do you have any little voice that tells you what to do in order to make money?"

"Oh, well, it's funny you ask this, but I always have a hunch."

"Well, how does this hunch express itself?"

"Well, I get a burning in the – under my jaw here, you know. It sort of comes to life, you know? And I just know."

All right. You run the person's goal, you find the person's goal and run it a couple of ways and so forth and this somatic will go ke-pshwt! And there goes the circuit.

So we're down to – we're in reaching distance of straight ways to blow circuits, anyway. So we have made a considerable gain here in the past couple of weeks while you've been agonizing around. But I've decided to treat you all nicely. I've decided to be very good to you and so forth. And as far as possible at the moment, I have you running directly in the direction of Clear pointed and fired.

And it's some possibility that some of you in the next few hundred years – [laughter] might, as you're auditing might accidentally slip, you know, and disconnect the E-Meter so the needle will float and something on that order. I'm not going to threaten you with being Clear. You don't have to be Clear if you don't want to be. Really. You can go on being aberrated if you want to be and so forth.

The only thing I will say is if you – if you insist utterly on remaining totally aberrated and so forth, you have approached a period when you've got to be very careful. [laughter] You've got to be very, very, very careful and try not to do any of the auditing commands because if you do just a few of them, it's liable to happen. And so I'm not threatening you and I don't want to beef up your banks and so forth or anything like that, but I'm very happy to – no, I'm very happy, by the way, with the general run of cases for the first time in many, many, many, many, many, many weeks. First time this year, actually. First happy – where I'm very happy with all the cases which are running. There's a couple of little question marks hanging over the left ear of a couple of cases present, but that's all working out and it's all going very smoothly. But I think you must somehow or another accidentally have applied some of the information you've been getting on the bulletins. For that – [laughter] and for that I thank you. I thank you very much.

So I hope that – I hope you have a very successful run of it, and – I do. I want to see some Clears here in the very near future. So you, too, could sacrifice yourself toward this ambition or goal. Okay?

Thank you.
Thank you.

Well, that's enthusiasm. Must have some processing results today. [laughter] Maybe my popularity has gone up here. Who knows? [laughter] All right.

This is what the what?

_Audience: 1st of November._

You say it's the first of November? It is? No kidding. Halloween was last night. Guy Fawkes Day still has to arrive, the 4th of July comes later. [laughter]

All right. Saint Hill Special Briefing Course, 1st November 1961.

I should talk to you something about the formation of commands. Particularly at this particular stage of the game, you are not getting any opportunity of any kind whatsoever to form any commands. I am shoving them down your throat and you get twenty-five infraction sheets and your pc gets a knock in the head if they don't run it. I mean, that's – that's a – it's a very diplomatic address. It's one of these conditions of you can do exactly as you please. You can do anything as you please as long as you do _exactly_ what Ron says. [laughs, laughter]

Well now, oddly enough, commands as a subject is one of the most esoteric, unetailed, unformulated subjects in Scientology – how you put a command together and what you do with a command and all that sort of thing.

And I don't know. I don't know if it's teachable. I see once in a while, I see something wild going on like – well, let's say that the pc's terminal is "waterbuck" and the level assessed is "Anger". So we see a command like this with all the blanks ready to fill in and we see a command that's been filled in this way: "What anger waterbuck?" [laughter] You think I'm kidding, but it's as grim as that, see.

And by my laying out commands, it's more or less just by my knowledge of commands over a very long period of time. And along about midnight after you've turned in your ten o'clock reports – Mary Sue and I going over your cases and reports; along about midnight, one o'clock, two o'clock or three o'clock in the morning – you would be amazed the desperation I sometimes feel of simply getting your pc by the nape of the neck and putting him on an E-Meter for about two seconds and finding out which word will be the stronger reaction.

Now, it shows you however, that commands will run without drastically clearing them with the pc because such commands _do_ run. So you might say there is a – the commands are divided up into three categories: One is "utterly asinine." That's category one. That's an utterly asinine command. I mean, it doesn't make sense. It isn't together and so forth. It is not a smooth, answering command. And under that category, you can get all commands where a
Prehav level has been taken slavishly and simply put down in a blank and some sense is supposed to be made out of it. Or a command which has no possible concourse with flows: "How have you shot a waterbuck? How have you kicked a waterbuck? Thank you. How have you shot a waterbuck? How have you kicked a waterbuck? Thank you." You know, something weird like this, you know. One way flow, one way flow, one way flow. Well, the pc will hang up on it and that's all there is to that.

Under another type of error that is made under this particular command line is a command that is too complex. It is too wordy; it is too impossible to state. And some of the goals you've been getting, you've been taking, of course, just as you should, exactly what the pc says. The point has never come up because I've never before asked you to run goals. But you realize that a goal is something on the order of "to climb the tallest mountain and dance a jig thereon while shooting off rainbow flares with my tootle-gun." [laughter]

Well, that's what the pc said and so there it goes as a goal. All right. Well, that's all right; don't interfere with the pc's goal. That's for sure. But what of this is the pc's goal?

Now, I have to ask you at this particular time if goals are going to be made into commands, that you – to find out what out of all of this avalanche of verbiage was the pc's goal. And you may be able to get it right back down to just a verb.

It isn't actually "to climb the tallest mountain and dance a jig thereon while shooting off – " you know, it's – that has nothing to do with it. It's "to climb." And if you sort the goal out and compartment the goal the same way you do a Security Check, after it's all checked in and it's stayed in and there it is – you understand, you've checked it out; and now let's find out what part of this is the goal – you'll have a lot more success. You'll find out that the pc all of a sudden does a new cognition on the thing.

Now, you would just compartment the goal and find out what part of the goal's wording falls and then, the only part that falls is the part you leave in. I mean, it's elementary, my dear Watson. You just leave that part in. And it might be, of course, with such a goal "shoot off sky rockets with my doodlegun," you know. And all right, if that's what stayed in and if nothing falls unless you have "to shoot off skyrockets with my doodle-gun," that's the goal. Unfortunately, that is the goal.

But you may get it pared down and find out that it's just a word and that one of the reasons goals go in and out is because they're too particularized, they're too long. The goal might be "to shoot." The goal might be "to climb." And it might do a fade in and out because it's being overlapped, don't you see?

So after you've got a goal all sorted out or if you're having a lot of trouble trying to sort a goal out or something of this sort, you'd better go down the line on the goals that are still occasionally flicking.

You know, they're in and they're out and they're in and they're out. You've seen that happen. I think you better sort out what in that line that you are reading – just like you would a Security Check – what in that line reacts. What verb in that line or what noun or what something or other or what phrase is actually doing the reacting. And now there's a possibility – I have not done this myself; I just mention in passing – there's a possibility you might – I was
just thinking about that this morning – you might have a consistent read if you only had one small section of all this, you see, whereas the rest of the read is sort of knocking it out all the time and is losing the thing. Do you see what I mean?

So just as you compartment a Security Check – "Have you ever been PDH'd by a cat?" You know, that famous example, now. "Pain," "drug," "hypnosis" – these things are all reactive and go out, you see and so on. And finally it gets down to "cat" and we find out there's an overt against a cat and it clears.

But you compartment a Security Check question and if you had a long and involved Security Check question like "Have you ever shot any girls off the top of a mountain with a BB gun?", you see? And you keep getting a reaction on this thing. You're just a plain knucklehead if you don't go back – "Have you ever shot – any – girls – off – the top – of a mountain?"

All right. Three of them didn't react and it's, "Have you ever – shot – . Have you ever shot – girls?" Nothing else reacts. Well, what have you shot? Now, you should know that well in putting together a Security Check question because you can make fantastic errors in Security Check questions by noncompartmentation of the question.

Now, similarly with goals after you've got all the pc's goals and your rudiments are in and you're not ARC breaking him or anything like that. You've got some goal that's going in and out and you're having a lot of trouble isolating goals or you finally wind up with some sort of a goal "to join the I Will Arise Societies and lie quietly in a coffin while snoring." Well, now you can make up your mind that it is insufficiently fundamental. It has to do with one section of track and you've actually gotten a little tag. A little flag is shining there. But it is somewhere in this long goal and you're liable to get something tremendously fundamental. And all of a sudden the pc will wake up to it by compartmentation of this goal.

I'm not telling you as you go down an original Goals Assessment to compartment every goal. I'm telling you that when you've got some goals down toward the end and you're having a bit of trouble sorting them out, you should start compartmentation a little bit and you're liable to be able to break a goal down to a fantastic simplicity of some kind or another that absolutely pervades the furthest reaches of the pc's life, whereas "to join the I Will Arise Society and lie in a coffin quietly while snoring" pervades that exact time when he was in Birmingham. And we finally find out that it's "to lie." Ah, ha-ha-ha-ha. "Double-entendre. Ah-ha-ha. Quelquefois, que magnifique! Aha!" You get the idea?

The pc has not necessarily written his complete goals list when he gives you his original list. Remember this. He's not necessarily written it. Well, I daresay there are traces of his goal in any such original list. You see? And maybe some of your difficulties with Goals Assessment is the fact that there's a part of one of those goals which is the goal and not the whole goal at all.

And if you have finally settled down to it and you do have this goal at the end and it's "to join the I-Will-Arise-Society and to lie in a coffin quietly while snoring," and you've got that, we get to the subject of commands. If you're going to express this as a command, where are we at? So you had better work this thing around to make sure that it is what it is, and that
the part of it that is alive as the goal is the part. Now, this has a little more importance than just wording of a goal.

You actually, occasionally, will get a much better goal summary which will reach much deeper into a person's life by taking some section of the goal – the last few goals, that you have hit upon. You know, verb – goals don't always have nouns.

Well, you get somebody; he's got a goal "to be a waterbuck." All right. That's fine. Seems very peculiar. "To be a waterbuck" and so on and we get it going along fine. And it's kind of – it's all right. Now, before you finally turn the goal in, let's find out if it's "to" "be" "waterbuck" and find out what fell. And then we find out "to be" "waterbuck." And we're liable sometime to find out we've assessed the terminal and not assessed the goal or that the pc's goal is something on the order of "to be," which would be an interesting goal, you see. And it isn't "to be" anything, but "waterbuck" happened to be connected with it in the original list and it's never come apart since.

You see what can happen at the end of a Goals Assessment. It doesn't mean anything particularly is wrong with goals, but I would take any long goal that a pc has and check it over by compartmentation and now the least that can happen is that we get into commands, but the most that can happen is we get a more pervasive goal. Much more pervasive goal. We have some goal like "to climb Mount Button-Button in the lower Mojave Desert while carrying two burros on my back." You see?

That refers to one stupid incident someplace or another and all he has is actually he's got a piece of his goals chain. See? That would be valuable. He has a piece of his goals chain, but you don't have a goal. The goal is concealed in there someplace. We possibly find out elementarily his goal is "to climb," see. And there we are. His goal is "to climb" and that's that.

And all of a sudden the pc wakes up, pinwheels go off, Guy Fawkes Day combines with 4th of July and somebody drops a live butt in the firecracker box, you know? Bang! Got an entirely different sounding goal which is very pervasive, whereas the pc up to that time was going along with his goal but now we've got a goal which reaches the tip of his little toenails whereas before it gradually was seeping down about an inch below the left ear. You see how that could be?

Now, this is fraught – all goals formation and rewording of goals and that sort of thing – boy, that is really fraught with more perils. I'll tell you, navigating the coasts of England during a fog in a leaking boat is a lead-pipe cinch compared to – it's just nothing compared to trying to navigate a pc through the rocks and shoals of changed wording. We'll get this kind of a thing. I'll give you an actual incident.

We had a goal "space commander" and the next day the auditor shortened it to "commander" and it ceased to react. It was "space commander." That was it. That was the goal or the terminal?

Female voice: The terminal.
It was a terminal, you see. "Commander" – no, no, no, no, no. It did not react. "Space commander" reacted. That was all that reacted and that was the wording that reacted, and that was it.

Now, for the benefit of command, of course, it'd be very handy to be able to drop that "space," but with such eagerness in view, don't lose the goal or the terminal just because you want to edit it or bobtail it. Keep a firm grip on it while snipping at it and snip at it in such a way that it doesn't get invalidated and you'll be all set and you will wind up with a goal which can be phrased.

This all comes under the subhead of "Get a command that can be said." And the asinine category of commands are commands that just cannot be said.

"How would you be afraid of someone who wanted to join the I-Will-Arise-Society and lie in a coffin quietly and snore?" Well, the pc has gone to sleep. [laughter] His mind is incapable of holding that much verbiage. And you find out he'll be wrestling with this, you know. [laughter] And if he had a glass dome for a skull, you would see little whirlpools and dust devils starting up inside of his head, see. He just can't hold that much thought.

So you'll – you'll see occasionally some phrased up command which just goes on for a paragraph practically, you know and it's an unanswerable command.

Another impossible command is one that the auditor can't pronounce. [laughter] And you think that is – you think that it has not happened, you're being silly. It has happened. I remember one poor auditor that it was perfectly okay – I've forgotten the exact word that he – letter that he had trouble with. Was it S?

Female voice: It was G.

Huh?

Female voice: The G in "Give me that hand."

Oh, the "G." He could not say a "G" and he was trying to run the CCHs. And every time he hit a "G" he would stutter. And it was so "G-g-g-g-g-g-g-g-g-g-g-g-g-g-Eeuuh! Gimmethat hand!" And of course, it would have been quite in order for him to have said, "Hand me the paw, partner," and he would have had the same end result. As a matter of fact, he would have had a better end result because the pc would have gotten some commands.

Now, under that heading, of course, is some "She sells seashells by the seashore." And you once in a while will run into one of these things and you don't notice it until you get going, you know. And you just set yourself up colossally, you know, to have command flubs. It starts making you nervous about the thing. You should look over commands from that particular viewpoint.

Well, the next category of commands are the commands that are just generally workable. They're just generally workable. They do work and they are generally applicable and there aren't many of them. What do you know. There are very few. In fact, I'm looking at a mimeographed sheet here that contains most of them that are just generally workable. It's not even important to read it at this particular stage of this lecture because it wouldn't tell you very much. There's Rising Scale Processing is rather generally workable. The old wording
that occurs in it. The CCHs are pretty generally workable unless you run into somebody that stammers and he can't say a "G" or something.

You've got numerous categories of processes that you just spit them out and so on. Your rudiments, for instance, are your best example of this. They're just generally workable. "Are you withholding anything?" you see. Well, that works. And by that type of command it is, is without the auditor skewering around in any way to make the pc understand it, it gets answered. You know, it's a very directly communicating statement.

And then we get over into the third category of command and it is the type of command which is in blank form. It's the blank form kind of command that has to be fitted to each pc by reason of assessment. Well, you have a wonderful example of that. You have – you don't run the goal and terminal and level of the pc without assessing them.

Well now, you have certain blank-form commands and they start in at the beginning and they go through to the end, but you've got to have the assessed material before you can form the command. In other words, in order to run a person's goal, you'd have to have his goal. In order to run his terminal, you'd have to have his terminal. And in order to do any broad runs on the terminal, why, you ordinarily – and certainly sooner or later – will have to have a Prehav level and these things all fit into a blank form. But it requires the special information from the pc.

There actually is another category of commands and that is the command of blank form which has to be fitted to the pc. It's a blank form that has to be filled in by assessment and then you have to turn around to the pc and you clear it by meter.

Most of your clearing commands should fall into this fourth class. Now, let's take a sort of a generalized sort of a run. Here's – "Assess the pc on the primary Prehav Scale and run with the following commands:

"How would you (blank) a (blank)?

"How would a (blank) you?

"How would (pc's goal)?

"What would be attempted against (pc's goal)?"

Now, that's an interesting form there, but it's certainly a Class IV command. This thing has to be adjusted. You've got to have all the data off the Prehav Scale in the assessment. You fill it into these blanks and then it has to be adjusted to make sense. That was understood. But then it has to be further adjusted against the pc to work absolutely perfectly without ever a hitch or a flaw.

See, we say the command to him, clear the command with him. We ask him about this wording or that wording or something of this sort.

I'm not trying to make any kind of a stylized science here of putting together commands. I'm just giving you this so that you can differentiate amongst them.

You've got this "Think of a... " and that's terminal. "What would a (terminal) think about?" Well, now apparently, that's one of these Class II commands, you know. I mean, it's
just blanket and everybody works, you'd think. But it doesn't; it doesn't. And the second it
doesn't work, checked against the pc, you of course are in trouble because you've got to re-
form the whole command.

All right. Let's say his terminal is "a waterbuck" and you say, "Think of a waterbuck.
What would a waterbuck think about?"

All right. And as you're clearing this thing, you find out that the second you say
"think," you get no reaction on the meter. It's just dead. The pc is all ready to be buried. Of
course he gets a reaction on "waterbuck" because it's his terminal. But that "think" doesn't get
any kind of a reaction at all. And you say "Get the idea of thinking." "What do you think
about thinking?" is the way you'd clear a command on a pc, by the way. You got his terminal
by assessment. "What do you think about thinking? What about this word think?" You got the
meter there in front of you.

And he says, "Well, uuy-uuuuu-uuu. As a matter of fact, people have been fooling me
for a number of years."

You say, "Yes? Yes?"

"Yes, they say 'People think.' Nobody can think."

Well, frankly, you could run, "Think of a waterbuck. What would a waterbuck think
about?" for literally hours and hours and hours and you get no tone arm action. Because the
command is undoable to the pc. He cannot do the command. He cannot do this command
"think."

Don't laugh and this is not a rare case. This is about 50 percent of the people you'll
process, at a rough guess. Because it's just about that many that have had trouble with it.
There is a remedy for it. You can turn around and clean up the thing semantically.

I'll give you an old process. We had people looking around and finding things that
weren't thinking. And it is quite remarkable. After you've looked around and found enough
things that weren't thinking, thinking doesn't get so arduous. You see, a person's doing a Q-
and-A with MEST, of course, on the postulate that MEST doesn't think, which it doesn't and
so on and there you've got it and it straightens out. But nobody is asking you to process the pc
so that you can process the pc. This is kind of silly, you see.

So we – we process the pc for forty-nine years in order to run this command. No,
there's a better route – a better route for this and that is to find something he does understand.
This is peculiarly true of children. You're always having to word commands in some other
direction and work them around till the kid finally understands what your thing's saying. It
may sound silly to you, but he – he can understand what you're saying. You're saying – or
you're trying to get the idea of moving, you know or "walking" or something of this sort and
you just aren't getting anywhere with "walking" and so forth. So you finally hit on "jumping".

"Could you jump from point A to point B?" or something of this sort.

"Oh, yes, yes, yes, yes." He could jump from point A to point B. Their semantics are
limited and they're restimulated easily on semantics and so on. And you have to go into the
subject with them and clear up what – and find out what they can understand.
By the way, the expert on this is Mary Sue. She's not only your best expert on terminals, she's really an expert on putting together kid's commands and simple commands of a particular character. I'm very often amazed at what she can get away with running a child, you know.

She will word a rather complex thought and the child will be very happily answering it, you know, cheerily. But it's reworded. It requires a taste for a simplicity. It's cutting through the Gordian knots of semantic, polysyllabic English.

Now, "think" has a number of synonyms and ordinarily if they can't run "think" they can "get the idea". But this throws the whole ... Now, this is what you have to be careful of in commands. This throws the whole thing haywire.

Now, up to this time, whenever we had "think" in a command, it was a perfectly easy thing to do. You just cleared the person as almost – this is standard operating procedure. You clear the person whether they can be run on "think" – you get a reaction. Or no reaction on "think," then you can run "get the idea of," you see. "Get the idea of" has formerly been a good substitute for it and they can run like a bat on this. Everything is fine, you see. "Get the idea."

This person says, "It's not possible to think, but anybody can get the idea of, see." It's quite remarkable. But these things are true.

So our young auditor sails into this knowing this old truism about "think" and "get the idea of" And we say, "Think of a waterbuck. What would a waterbuck think about?"

Well of course, we're trying to knock out the postulates and now-I'm-supposed-to's of waterbucks. Smart, huh? So we transmit the command this way: "Get the idea of a waterbuck." That runs all right. "What would a waterbuck get the idea of?"

Well, after you've done some flub of this character on a command, don't blame me if you get no tone arm action and the pc has a hard time trying to answer it and stay in session and so on because it's all contained in the command. And if you're having trouble with a pc on some command, the time to have trouble is before you begin to run it. That's the time to have trouble with the command. Not after you've audited it for three hours. Because now, every time you've uttered it, the pc has done something else than answer the auditing command. The pc is getting pretty sick of it, withal.

Now, the time to find out if a command is answerable is before you run it.

Now, you can go to another extreme on this and every time you start a session – see, you've run this particular five-way bracket for the last twenty hours. And you start a new session, and each time you start a new session, you clear the whole command with the pc, word for word. That's a good way to waste auditing. Pcs will get very restive about it. That's the reductio ad absurdum.

But the first time you use an auditing command on a pc, you had better clear it. You had better find out. No matter if it's a standard command – it looks standard to you and it looks answerable to you – you should read it off to the pc and ask him if it's answerable. Not "Word, word, word, word." Let's read the thing off and find out if it's answerable.
"All right. It's 'think of a waterbuck.' All right. Is that an answerable – I'm going to read you this command now. I want to know if that's an answerable command – if you can do this, if you can answer this. 'Think of a waterbuck.'"

And the pc says, "Uh, no. A waterbuck. I just – I just (so on and so on)." Well, now you go back and now you take it apart word for word, see. Give him the broadside first, and then take it apart word for word. And find out what is unanswerable about this and you'd run into this word "think." "Well, nobody can think. I mean, silly business. How can anybody think? Naturally."

So you say, "Well, all right. We'll translate that," you say – very sloppily, you say. "Well, we translate that," and we say, "Get the idea of a waterbuck."

All right. Now, that means we have translated "think" into "get the idea of" and now you just insert "get the idea of" down on this second line on "think." If we did that literally we'd get "What would a waterbuck think of about?" It'll become that silly, you see.

Well, just because "get the idea of" was answerable in the first line is no reason it becomes answerable in the second line and you have to do something about the second line. And then, because you have to do something about the second line, don't be too disturbed if you have to go back now and readjust the first line.

Your object is – here is to adjust the commands with the pc so the pc can answer them, not to force the pc into some frozen pattern of some kind or another. Just get something this pc can answer.

We, after all, are trying to transmit a mental concept and mental concepts are not always expressed in words. As a matter of fact, mental concepts can exist in the absence of words. Now, you wouldn't think that – there – there are chaps in the universities – I think they call them professors? Something like this. There are chaps in the universities who teach semantics. And their basic consideration is this: that because all words mean different things to different people, then communication isn't possible. Well, there's some two-hundred and eighty-thousand Bachelors of Arts graduated a few years ago, all of whom had been taught this with great thoroughness. They've been taught that nobody can communicate with anybody. Nobody can communicate with anybody. It's not possible to communicate with anybody because the derivation of words are different.

Well, what is wrong with their thinkingness? Their thinkingness is just muddled on this basis. They think words – the word is the think and words aren't the think. You see? The word simply expresses the form and character of the think.

Now, I guarantee you, that if you shove Mamie Glutz and Joe Blow simultaneously up against a hot stove, they will have the same thought and it will not be verbalized. They will not think, "Goodness me, I am moving toward a hot stove. Now, I am burned. It is very hot." [laughter] That is not what happens.

They get a mental concept of hotness and they get another mental concept of proximity and the word hotness and the word proximity do not even occur. Now, you don't even have to know what the Spaniard means by "Hace calor, no?" if he mops his brow at the same time. He's saying "It's hot" and you agree with him and yet you didn't understand the words.
Well, you say, "Well, it's transmitted by the gesture." Oh, fine, what's the semantics of a gesture? Korzybski, front and center. Move thy tombstone and present thyself. What are the semantics of a gesture? "Different words means different things to different people" would then mean that when you mopped your brow, the holding out of the little finger while you mopped your brow would then make your communication incommunicable to somebody else who would normally consider that you held your little finger in close while you mopped your brow.

In other words, how pedantic can you pedant? [laughter] So you can get pretty stupid on this whole subject of semantics when it comes into commands. And semantics are bound up with commands. There's a whole subject. Alfred Lord Korzybski, Hayakawa – all these birds. It's interesting to read their books though. My golly, aren't those books wonderful examples of noncommunication. The basic book on semantics by Korzybski is called *Science and Sanity*. And if you open it up to Chapter One and start reading, you don't know where you are at. That's a fact. It's an interesting experience. You read several pages, and it's not about anything that you ever heard of before because he doesn't ever say, what he is talking about.

Actually, the book *Science and Sanity* is apparently a continuation of some earlier book and this earlier book ... It's supposed to be the key book, you see, but it doesn't say what it's about and it's a continuation of an earlier book and it actually – I think it's – the beginning is continuing an experiment which is begun in the earlier book, the conditions of which are not repeated in the new book. I think you find yourself reading about a horse or something of this sort.

It's supposed to be all about words, and you read about this horse. Or it's some such beast.

So they have trouble with their semantics. Well, the reason they're having trouble with their semantics is because they're giving the word importance and the idea that it conveys, no importance.

Now, learn the lesson better than that, and take a look at this and consult with your own wisdom. It's the thought and then the word. The auditor's thought becomes the word, becomes the pc's word, becomes the pc's thought.

So there's a four-step proposition here. There is the – the impulse which the auditor wishes to communicate which transmits into a word which is heard by the pc and is transmitted into an idea.

Now, the action following that idea is what the auditor is after but is really not part of the communication itself per se. All we are doing is, the auditor has an idea that he wishes to put into a word and then the word is received and heard by the pc, is reanalyzed and he gets the idea which is transmitted. And having done all of this and gone through it, Lord knows, ad nauseum ... If you figure out all these steps of what communicates to what and which communicates to where and – and exactly how he hears it and get a psychologist's explanation of how it registers on the neuro-aural cavities of the aurality and then re-echo against the medulla oblongata with the echo effect well known as the screen phenomena of the basic metabolism, you've just about got as much – It's – what I've just said is far more intelligent.
There's a thetan who, to communicate, goes through MEST. And to hear takes it out in MEST and that's how he keeps off other thetans. So it's – it's just this mechanism is all you are going through.

Now, to become slavish, you see, to the mechanism itself is very poor. It is important to duplicate your commands. That's very important. The command must continue to be stated in the same wording that it was stated in, but the time to catch an error in the wording is before you begin to communicate these commands. If you begin to communicate these commands properly, they're very easy to repeat.

The duplication factor is a sort of a havingness factor. It definitely does not challenge the pc's attention and it is doing something far more important than this; it is making him think a repetitive thought which eventually will push its way through and as-is most of his circuits and so forth. That's what you're trying to do with all this.

So it's a good thing to have the words right, but don't get pedantic about the thing. We don't care if a command has the word... Well, we're – we're processing a lumberjack from the backwoods of Canada and his hair sort of stands on end every time we say, "aren't," "Aren't you happy?" or something, you see. Aren't. Aren't. He knows the right word for it. It's "ain't," see. It's "Ain't you happy."

You unfortunately find yourself in the position ordinarily of having to process in the language that the pc speaks and that applies to dialects and colloquialisms as well as to different tongues.

Well, Devon – imagine somebody from Edinburgh, you see, and somebody from Devon as an auditing team, don't you see, that was – that got into a semantic argument. Well, actually, the auditor is at liberty to use any words that he wishes to use in a command as long as it relates between himself and the pc the exact idea that he wishes to have communicated. The words that he uses are secondary to the meaning transmitted.

The meaning transmitted is always primary, so that if you do not clear your auditing command on an E-Meter, you very often find yourself in a noncommunication state of the pc, in disobedience of Clause 16.

You might have to take this command and say – well, let's move this over into a possible thing. "Get the idea of a waterbuck. What ideas does a waterbuck get?" or "What idea would a waterbuck have?" – asking for just one idea at a time. Now, that's a doable command if you understand what you're trying to do. You're trying to get his attention on the waterbuck, his terminal and then get the thinkingness of the terminal as-ised. Tricky. So that he can then eventually differentiate between the thinkingness of a waterbuck and his own thinkingness. That's the total target of that type of a command, you see.

Now, if you're trying to compose commands – I hate to have to tell you this – but if you're trying to compose commands and hang them together without any knowledge of the basics and fundamentals of Scientology, I'll tell you it'd be far less trouble to yourself and the pc if you just went and hanged yourself quietly in some corner someplace, because it just isn't going to work.
"What afraid have you been about?" "What waterbuck has been about afraid?" It sounds like gobbledygook to you. It sounds like total balderdash to you and it is. But if you laid every command out simply with blanks – you know, you – here's the command form and a blank and you're supposed to put the Prehav level in the blank – you'll come up with things that sound as nonsensical as that. You have to make the command sensible.

All right. So we've assessed "fear." And the command form requires "What would a waterbuck be fear of?" and "What would fear a waterbuck?" Well, the second one isn't too bad. But the first one, that's sort of weird. So now we take off into the wild blue yonder and we simply say "That's easy. That's easy. We'll just say, 'What would a waterbuck be afraid of?'" and "What would be afraid of a waterbuck." That's simple. Now, let's start to run it." And an hour later we haven't gotten any tone arm motion and everything else has gone wrong. Well, that's because we didn't get this Class IV-type command has to be cleared on the meter. And you've had to find out if "afraid" made this – meant the same as "fear." Or maybe it was "frighten." You see, maybe it was "frighten" means the same as "fear," but "afraid" doesn't mean anything like "fear." Or "fear" is something solid that you hack off in pieces and carry around with ice tongs. And that's what has registered is this solidity called "fear."

And you have to bend the whole command around to something on the order of "What would put a waterbuck into a state of fear?" and this is transmittable and it is very understandable. Oh well, yes. And "What would go into a state of fear because of the waterbuck?" Or "What would a waterbuck drive into a state of fear?" This sounds like you're getting long and arduous, but this apparently communicates to the pc and this you get the most reaction on. He finds this very easy to answer. That's an easy one to answer, but the other one doesn't answer at all.

"What's a waterbuck afraid of?"

"Well, the waterbuck really isn't afraid of anything, you know."

"Well, fear. Fear is what assessed on the Prehav Scale, you know. How do we account – ?" We wouldn't be this invalidating. We'd say something on the order of "Well, how do we account – . What is fear? What's meant here by fear?"

"Oh, fear. Oh, well, fear. That's leaping about. That's trembling."

Well, Hayakawa was apparently right. Korzybski needn't come out of his tomb and account for himself because this pc definitely had a weird meaning for this subject of fear.

All right. This is sufficiently weird. It's not up to you to sit there – the pc didn't learn this in kindergarten when he was much smarter, five years old. He isn't going to learn it now. And this is not up to the auditor to run a language school any more than it is to run a process to clear the process. So a language school is not in order.

"Fear" does not mean frighten, does not mean afraid, does not mean timid. "Fear," at his first glance at it – because it, after all, fell because it was aberrated, remember. You forget that. You know, if he wasn't nuts on the level, it wouldn't fall. Now, don't expect him to be sensible about it if he's nuts on it. That's – that's what it amounts to, see. We find out there's just this thing called fear. And a waterbuck actually picks this chunk up called fear with a pair
of ice tongs and leaps about. This is about the – the meaning that transmits. "Fear – well, it's a sort of a dark brown substance that is carved off in blocks."

It is? First I ever heard of it. Well, you wouldn't abandon the level because the pc didn't understand it. No, I think the pc understands it and has slightly overreached his understanding and sooner or later that particular level will orient and many a time you've seen a pc all of a sudden brighten up and said, "Oh, angry, angry. Oh, angry!" You've only been running this for an hour and a half, you see. "Angry. Oh, yes, I see what that means. It means getting mad at somebody." Leaves you completely in the dark. What the hell did it mean to him before? What did it mean to him before?

Don't leave yourself in the dark with a pc. If you want to know, ask him. You say, "Well, all right. Good. It means getting mad at somebody. All right. What did it mean to you just before this time? Just for my own curiosity, what did it mean to you just before this time?"

"Oh, well, it's very simple. It means a pent-up pressure at oneself."

Oh, now you know why it fell on the Prehav Scale. He could never be angry at anybody. He could just be a pent-up pressure against himself. We don't know where himself was located – maybe the third button of his vest. But there it is.

Now, in hanging together a command, in other words, try and make the command communicate. And try to make it communicate regardless of the aberration of the pc, which is what the command is trying to take care of and now you will see at once why commands become a very tricky subject.

If all pcs were Clear at the time you formed and ran the command on the pc, this would be very easy and we would not be giving a lecture today. You see that, how factual that is. In fact, we wouldn't have to audit the pc at all. But your command that you're giving the pc is straight into the middle of the small whirlpools, dust devils, hurricanes and black ebbs and flows of tides which shift with the phases of the moon inside his skull.

He tries never to look at that particular part of his livingness because it is too painful. And you, adventurously, are going to say, "Very good. Now, look into the maelstrom that we have just found there. Good. Look into the maelstrom. That's fine. Now, jump in. That's a boy. Now, jump in. Now, swim about a bit. Thank you. Jump in. Now, good, good. Oh, you needn't flounder too much. I'm sitting here. Now, jump in. Get your head under, too. Thank you. Thank you very much. All right. Drown now." [laughter, laughs]

And, of course, your command is cleared with a pc who is standing upon the edge of the precipice and he is well aware as you're clearing the command that over there where he has not yet looked are the whirlpools, whirlwinds, dust devils and black tides which ebb and flow at the phases of the moon and which may contain terrible monsters which go tok! [laughter]

So where – where this particular situation obtains, there is aberration, you wouldn't be auditing the pc on that line if he weren't in that position and in clearing a command with the pc is rather unreasonable of you to ask the pc to do something terribly difficult semantically when he's already doing a tight-rope walk impossibly and the command which you're clearing
with him has already got him pretty spooked. And you're saying, "All right. Think of a waterbuck." Well, this is simple to you. There you are. You're sitting there. You're all right. You're not worried about waterbucks. Your terminal is a giraffe or something. [laughter] You're above all that.

You say, "Think of a waterbuck." With what aplomb you can toss this off. But in his particular case – in his particular horrible case – the idea of thinking of a waterbuck: that's a pretty adventurous proposition. [laughter] There's no telling what might happen if one did that.

Now, "Think of a giraffe" – he could do that. And you will occasionally get sudden resurgent agreements, overwhelming agreements by the pc to run something you really didn't intend to run very much. "Oh, well, yes, yes. Well, I think – I think it'd be an awfully good idea and I'm sure my terminal is a giraffe like yours." [laughs, laughter] Oh, he can run that command beautifully. Run it for hours, no tone arm motion, no auditing, nothing. Be good, but he certainly wouldn't have to walk... He'll have an ARC break with you, too, after a while if you run it.

So your commands are always being formed and cleared up against the raw stuff of which aberration is concocted. As a result, it becomes a very tricky subject. And it becomes a very vast subject. The fundamentals of the mind are very simple. And they are not very many. I'll have to retire one of these days, you realize, because they're practically all found, nailed down and there they've got signs on them and that sort of thing and I won't have anything to do.

Right now I'm rather pressed to the wall about it, you know. I'm having to build a fireplace that nobody ever heard of before. I just was out inspecting it just before I came down to the lecture and the estate bricklayer was just... He's just heaving sighs of relief. He's a happy man tonight. He's singing. When he was taking off his boots, getting ready to go home, he was cheerful and he was smiling and he was happy because he's got it licked. Up to this time he has been going solely and totally on a touching confidence in Ron. [laughter]

Nothing else has been carrying him forward. He has never seen a barbecue pit. He's laid lots of bricks, but he's never seen a barbecue pit. And to cap that one, nobody in America has ever seen a barbecue pit like this one. [laughter] Nobody could ever have designed it in the first place. It took me a week just to figure out how to make the thing. After it's made, it becomes very simple. But I was two days trying to transmit it to the estate bricklayer. Two days. And then found out that it was totally unsuccessful as a transmission, so I just stood by and when he started to put bricks up over here wrong way, you see, I'd say, "Mr. Jenner – you know. There it is. Good man." He's terrific. Nobody else could have done it. That's right. He's terrific. He's out there in that – in that big glass house – turning into a pleasure pavilion out there. One of these days, students will be eating their lunches in there and so on. But it's nothing but touching faith on his part has carried him along. With what relief today he realized that we had it licked. It's actually sitting there in the form it's in. It's far enough advanced now so he knows exactly where it all goes. The blacksmith has come down, checked it all out, and so forth. Everything is beautiful. The structure is done.
The time to audit a pc, of course, is when he's Clear and the job is totally licked. The time to clear a command and the type of command to clear with the pc is one that will have no effect whatsoever on his case or on a pc who has no case. And you'll never have any difficulty clearing those commands. But the command which has to do with a waterbuck – ohhh, well now that is something else.

In the first place, you have an awful time clearing it because every time you come into this zone and say "waterbuck" and you say, "Waterbuck leaping about!" – well, you've said "waterbuck," so of course you're going to get a reaction. And then the idea of a waterbuck leaping about is the basic reason he gets sick at his stomach and you're trying to clear the command to find out if it's answerable and frankly you should have had the command in the first place and be running it. But you haven't got it, so you can't run it. You get the ideas that lie behind this? These are the difficulties of clearing a command. So therefore, you very often have a tendency to just give up and take a textbook command or a command that I give you without any further check against the pc of any kind whatsoever.

Well, that's very decent of you and shows a very touching faith in Ron. And most of the time you'll find out these are dead on and they run and so forth, because I'm very careful to give them generalized enough so they don't need too much clearing, you know, with the pc. They will communicate. But here and there, here and there, because of a scribbled note by the auditor with regard to the assessment or something, I've read the assessment as "fear," and the thing that was actually assessed was entirely different. It was "failed woofing" And so we'll have a pc run very nicely on "fear," and "failed woofing" still stays live as a level of the Pre-hav Scale. That's not so good, is it?

Now, even if I give you a command straightly, try to understand what is being communicated by the command. What thought lies behind the command? Because that is what I have written down. I've written down the thought which must be transmitted to the pc.

Now, if it won't transmit this thought to the pc because of some peculiarities of some sort, you should be the first person to scream. Not at me particularly, but let's put the English on the English in it to make it fit and transmit. So we have something that says, "Think of a waterbuck. What would a waterbuck think about?" Clear it with the pc. Because I would write it and give it to you in the understanding – in the clean, clear understanding – that you would read it to the pc and the pc would be able to answer it.

And if the pc said, "Think. You mean think? Think? Think. I was afraid you said that. You know, all of my life, I think people are just liars. They are just swindlers and thieves because they keep telling you that they think and it's not possible to think. Nobody can think."

Well, don't just plow it into him with a bulldozer. That's too easy to get around it. You say, "Get the idea of a waterbuck. What would a waterbuck get ideas about?" Or any other way that you can put it around and make it make the same thing that has been written down there. You would be definitely out of order to vary the basic idea of the command. Or to vary the level unless the level, of course, were miswritten or wrong.

We had a case right here in the class the other day that was going back and forth and around and around and the auditor stayed calm. I got, of course, misemotional about it, but fortunately, the auditor kept his head. And that was just on this one basis: The auditor was the
one who had assessed the pc's goal and had then written down one of these long goals. But halfway through the session, the auditor decided that the pc had a different goal because the auditor didn't realize that in this form "How would you... ? How would a... ? What would (goal)? What would be attempted against (goal)?" He didn't realize that that form was just the goal, the goal of the pc.

So he dropped one word out for one part of the session and we got him back on it again in a hurry. And he all of a sudden understood that that was just the goal. But it was a question. Was the goal wrong? Because if the word could be dropped out, why, then the goal could have that word dropped out. But apparently, this was or was not checked, but the goal was put back in and it was run the other way – was run properly, and it was run right back straight again, don't you see?

Now, the argument was simply, then, on the basis of the auditor's understanding of what I was trying to do. And, you see, it is really not good enough to completely take a ritualistic form that you don't understand what you're getting at and by filling in a few blanks, have it work by just repetition. This is tape-recorder auditing. The command might as well have been fed onto a tape recorder by me, one of these repeating, metal-tape recorders, you know. They're very cute. They – they give you a whole song and then they – the metal goes around – the metal belt goes around and gives you the whole song again and then the metal belt goes around... Well, you see, you could put a start-stop switch on this thing and the auditor could sit there with his foot, you see, on this little throttle-like device and holding the E-Meter in his hands, you see, so the pc couldn't see what he was writing, using the E-Meter, you see, as a barricade. And every time the pc had answered a command, why, then, all the auditor would do is press this little throttle, you see and this belt would go around again and the next auditing command, you see, would be given to the pc. That is just not good enough.

The weird thing about it is, is that it will work. That's what is weird about it. That would work. It had – it would have a level of workability. But the level of workability is not as reaching or pervasive as the fact that ... All right, I give you the command form, and this command form is "What problem have you had about a waterbuck?" and "What was unknown about that problem?"

All right. That's fine. I give you that form and you say to the pc, "Problem?"

And the pc says, "Yeah, well, problem. Pretty easy – problem. What problem ... That's easy, you know – it's very easy to ... You see, a problem is something ... Well, you know what a problem is. A problem is something that nobody has any answers for. So I don't really see how the auditing command could have an answer because if you never have any answers for any problems, why, then you would never have any answers for the auditing command."

And you don't know your fundamentals well enough to know that a problem is also a confusion. It's also a motion. And just say, "Well, all right. Problem? Fine" – reading your meter – "Confusion? Motion? Commotion?" Not much of a reaction here anyplace or another. "Mess?"

"Ohohoh, what – what do you know! Ha-ha." Clang, the needle went.

And you say, "What is all this wham here? What's – what's this?"

"Well, a mess. That's – I'm in a mess, of course. A person is in a mess, I mean that... What do you mean, you have to have it explained to you? Are you stupid or something? Something goes along in life, you're in a mess. That is a mess. That's what it is."

So you have an auditing command which goes as follows: "What mess have you had about a waterbuck?" [laughter] "What was unknown about that mess?" And you're still running, "What problem have you had about a waterbuck? What was unknown about that problem?" because a pc calls a problem a mess. But he can't call a problem a problem and he himself, because he has aberrations about problems, of course, can never call anything a problem. And confusions and motions don't mean problems to him. He's – he's above all that.

But a mess. Well, that's – that's good. That's fine. And you will cut down the number of hours run by about 75 percent. Blang! Why? Because your auditing command is communicating closer to the whirlwind.

Now, what does the meter say? The meter says we are standing on the edge of a precipice that we can recognize at this time as a precipice and by looking slightly but not too closely over the right or left shoulder, we can detect the bubble, bubble, bubble of the cauldron, which we have never looked at very closely because underneath it there may be things that go pp! You got a reaction. You're getting a reaction on the meter. It's real to the pc.

Well, when a pc is in bad shape, why, anything that gets a reaction is real to him and is horrible and reality is horrible. And you translate all these commands over and you'll find out that's very interesting.

It's not an invitation for him to take the commands which you're running on the pc at this moment and change them. You're committed. When a command is committed along the line, it is actually worse to change the command, in most cases, than to monkey it up. It'll take the pc's attention out of session and so forth. Just plow it through. Grind it out. Get it flat and next time clear the command properly with the pc before you start this kind of thing, you see. You'll find out a command that is out won't give you much tone arm action anyhow. So I'm not telling you that you have to go on for days.

Now, most of the commands I give you, they need no fooling with. But what I'm shuddering about is that near moment when you, in north Andalusia or south Stakoma or someplace are sitting there and you've got a Prehav command to put together and you get a pc and you take it off the Prehav Scale and it is "failed withhold." And the blank says, "What about a waterbuck would be a (blank)?" you see. You say, "What about a waterbuck would be a failed withhold?" That's pretty good. 'What about a failed withhold would be a waterbuck?'"[laughter] "That's pretty good. That doesn't sound right but that's the way it fits into the blank. And 'What has another failed withhold on a waterbuck?' That's not quite right. And 'What is a waterbuck failed withhold on another?' Doesn't sound too good. 'Now, what has a failed withhold on a waterbuck on a waterbuck? " And you say, "Well, this doesn't sound quite right. But Ron said so, so we'll run it." [laughter]
So I just want to be on record that I didn't say so. [laughs] I said "Run 'failed withhold' in a 5-way bracket on a waterbuck would be the proper step after the assessment of the Prehav level."

And of course, you say, "A 5-way bracket – well, a 5-way bracket, that's from you to that, that around, so forth and so and so forth, and that's all dandy." And then you audit a child on this and you find out the child cannot even get the idea of communicating from himself to the second bracket.

He can get the idea of the second – the terminal communicating to the terminal. So if he can get the idea of himself communicating to himself, he can get the idea of a terminal communicating to a terminal and you've pulled on back down the line from a 5-way bracket to a 2-way, totally individuated bracket, which is, "What have you failed to withhold from yourself? What has a waterbuck failed to withhold from himself?" "What have you failed to withhold from yourself?" and "What has a waterbuck failed to withhold from himself?" Works like a bomb. Everything is gorgeous. Person cannot reach any further than that.

But now you err like the mischief that – as you run it you don't expand the bracket up to a five-way bracket. Commands have to be expanded. When you start down below where you should be, graduate up to it. Every now and then when the thing gets to looking a little sticky, add another bracket. So we'd have "What have you failed to withhold from yourself?" and "What has a waterbuck failed to withhold from himself?" becomes, of course, only two ends of the bracket. So "What have you failed to withhold from a waterbuck?" and "What has a waterbuck failed to withhold from you?" are the natural steps. But you've still left one in there which isn't flat – "What have you failed to withhold from yourself?" – and you wind up at the other end of it, quite well, with a six-way bracket. So what?

You don't do a violent shift on commands ever. And you eventually have graduated the person with his understanding of the snake pit in which he finds himself with this waterbuck. Gradually he gets so that he can get outside of himself a little bit and look around and he realizes a waterbuck can look around and there might be another person someplace in the world. So we include that in the command and – and so forth. Well, reductio ad absurdum. You could carry this up to a thirty-two-leg bracket. Just keep graduating it and you'd also find a little more action on it. You'd always find it.

I don't know. Nobody – no genius has sat down and figured out the ultimate bracket and counted it. I don't know how many brackets there could be. By specific name, there could be 250 billion for the people of Earth. "What has George failed to withhold from a waterbuck? What has a waterbuck failed to withhold from George? What has Bill failed to withhold from a waterbuck? What has a waterbuck failed to withhold from Bill?"

And now we add the numbers of societies and governments which there exist in present time and we'd say "What has the waterbuck failed to withhold from the Rosicrucians?" and "What have the Rosicrucians failed to withhold from the waterbuck?" Ah, great. And we could go further than that. We could then take every society on the whole track for the last 200 trillion years and every individual on the whole track for the last 200 trillion years, and we could add all them in with special, separate legs. Wouldn't that be interesting?
Well, it exceeds the necessity. [laughter] And you get up on legs of a bracket above five and it's starting to exceed the necessity of the occasion. You go up to fifteen and you're getting a little bit dull. But in some particular cases, you will find that you had better go on up into the higher-numbered brackets, you know. I mean, get fifteen on a bracket. Run a 10-way bracket. That's okay.

Run two 5-way brackets simultaneous. Two 5-way brackets simultaneous. It would have to be plus-to-minus brackets. So you get, of course, a 10-way bracket, which is plus and minus. "How have you failed to withhold from a waterbuck?" or "What have you failed to withhold from a waterbuck?" And "What has a waterbuck failed to withhold from you?" (Now, of course, you violate the Prehav level if you do this, but I'm just giving you this as an example.) "What have you not failed to withhold from a waterbuck?" See, that's – means nonsensical. It becomes nonsense. It wouldn't clear as a command. The pc couldn't answer it.

So look at your commands before you run them. Meter them on the pc. Find out if you get a reaction on them. Find out what the reaction is. Find out how the pc is reacting to this particular thing. But basically and primarily – it doesn't take you forever to clear a command – all you want to know is can the pc get an answer to it. "Something you wouldn't mind forgetting" here the other day produced an avalanche on a girl in the house.

And she'd go – "Something you wouldn't mind forgetting" Brrrrrrrr. Brrrrrrr. Brrrrt. And then she'd catch one by its tails as it went by, you see and she'd give that as the auditing... Well, clearing the auditing command would have run into the automaticity.

And you'd say, "Well, I'm going to ask you if there's something you wouldn't mind forgetting. Now, do you understand that command? Can you answer that command?"

And she goes brrrrrt-brrrrrt-brrrrp-brrrrrp-brrp. Automaticity. Bing-bing-bing-bing. And she says, "Well, it's awfully confusing, and – and so on. And it's pretty weird, and so forth."

And you say, "Well, I don't know. Maybe we'd better run some other command. Maybe we'd better word this command differently." Because she said it's awfully confusing. Well, your error, then, would be in what was confusing. Is the command confusing? Is the wording confusing?

No, you'd find out, "Well, all these – I don't know. It's just suddenly as though you'd turned on a motion picture projector or a stack of cards or something and something went off inside my head. And – and it's – I don't quite figure out exactly what's going – ." Man, if you've got a command that does that to the pc, that is cleared. [laughs]

You just cleared it. That's good. Leave that one in. Now, if you go to the next one, clear the next command and see if you have that much luck on the next one. Probably you won't have because the avalanche is ordinarily one-sided. And it'll be only one leg that'll go off in a brrrrrrpt.

But here is your – here is the basis of commands. Commands depend on good sense. They depend on judgment. Commands are a section of Scientology that do that. You get too concentrated on the semantics of it all and too pedantic in the perfection of it all and leave
alone the fundamentals of Scientology in the meaning of the command as transmitted to the pc and of course, you're in soup all the time.

The command is an idea. When it is written down, it's expressed as an idea. Mostly when I give you a command, I mean you to run that exact wording without the slightest change and so forth because I couldn't get my hands on the pc. But that doesn't mean that when you find out that the pc can't think that you won't shift it over to "get the idea of" You should always clear your auditing command with the pc. You should always check it over. You'll normally find out it's perfectly correct. Perfectly all right. Perfectly routine.

But every now and then you're going to squander ten, fifteen, twenty-five, fifty hours of auditing on some kind of a piece of balderdash. And at the end of that time, you find out the pc couldn't answer it in the first place and now you've stacked up-five hundred auditing commands that the pc has never answered. Oooooool. Well, you mustn't do that.

So you clear commands. You clear them on the meter. You run exactly what transmits the thought. Now, you want "What problem have you had about a waterbuck?" Well, now this is what you want on the pc. You want the pc to figure out if he has ever had a problem about a waterbuck and you want him to state the problem about a waterbuck. But the pc knows that nobody can solve a problem and that you can't have problems and mustn't have problems and problems don't exist – and – and – problem. Well look, you're not trying to run "problem." You're not trying to educate the pc on the subject of problems. You're trying to get him straightened up on the subject of a waterbuck.

Ah well, this is different then. So it is what – what is a problem to the pc? What does communicate this idea of confusion and upset and inability to answer or something that is not easily answerable or something that'll put a little barrier on the track or you have to think about it for a moment.

What communicates this to the pc? So you say, "Well, confusion. Commotion." And now you've got no guideposts. But let me call to your attention on a guidepost for this, you're only stepping a quarter of an inch off the trail. You're not going into the trees very deeply. You'll come out and you'll find my signs again. I mean, you – you're not going to get lost.

Think at that point. Think and say "Problem. Problem is something that there are no answers for and it can't be answered. So can't do problem. Commotion. Commotion. Don't know anything about that. Upset. Yeah, I've heard of confusion. Ron said confusion. Confusion. All right, confusion. Problem. Can't run the command. So we'll just run it this way. 'What problem have you had about a waterbuck? '")

The pc says, "Well, I know, but it's an unanswerable auditing command and you can't have a problem without a waterbuck. Because I've never had any problems about a waterbuck because a problem is something you can't have."

And you say, "All right, well, can you answer the auditing question just for the formality of getting on with the session?" [laughter]

Well, you can run into that if you don't suddenly, you know, get the old screwdriver out and sort of tighten up the cogwheels and see – "Let's see, a problem. What is a problem to the pc? It's an upset, upset, a mess, a stinking row, a to-do, and so on." Just say, well, "A

"All right. Well, could you answer this auditing command then? Now, I'm giving you the auditing command – ." I always warn pcs that way, by the way. It isn't in Model Session, but I always warn them when I'm clearing an auditing command. "I'm not auditing you this first question. I don't want an answer to the question. I'm not giving it to you." I tell them this seven or eight times because they know they're standing on the precipice ready to drop in. [laughter] See? And I kind of give them a little lifeline saying, "Well, you don't have to fall yet." [laughter]

Now I say, "There it is." And you say, "Well, can you answer this? What mess have you had about a waterbuck?"

"Oh, man, could I answer that. Well, that's easy."

"All right. And can you answer the question 'What was unknown about that mess?'"

"Well, everything. Yeah, well ...

"You can answer that all right. All right. That's fine. All right. 'What group did not believe in a waterbuck?"

"What group did not believe – believe in a waterbuck? What group did not believe – believe in a waterbuck. Believe, believe. Believe in a waterbuck. Group believe ... Believe. Believe in a waterbuck. Group believe ...

Well look, as an auditor, why are you sitting there? He obviously doesn't know what believe means or what you're talking about. So you say, "Well, how about '... wouldn't want a waterbuck?' Is that better?"

"Wouldn't want a waterbuck. Well, of course, no group would want a waterbuck."

He didn't clear the command. He just amplified it for you. But that's all right. He okayed it. And so you go on down the line and you clean it up. And you finally have all your commands answerable, all your commands understood. And then you say, "All right. Now, this little lifeline I've had on you up to this time that's preventing you from falling into the dreadful, Stygian dark – I am now cutting it. Here's the first auditing command. Pow! [laughter] What mess have you had about a waterbuck?"

And if you do that, if you realize that commands are communication, not semantics, why, you will just cut the living daylights out of the amount of auditing time you put in on a pc. Okay?

Thank you.
HOW TO SECURITY CHECK

A lecture given on 2 November 1961

Thank you.

Well, here we are at what date?

*Female voices: November the 2nd.*

Two Nov. AD 11. It's a 1.1 year. We're being very covert this year.

All right. I'm going to talk to you today about Class II skills in Security Checking and several new developments in this particular level and line that you ought to know about. And if you're not up to the point at this stage of the game where you know how to read an E-Meter, why, there used to be an old gallows – this was a Norman keep, you know? And we'll have to build it again and hang you. But you've got time during the building to learn.

The worst thing about E-Meters is of course TR 0. TR 0 goes out, if you haven't had any TR 0, it's not fairly flat, you have trouble with E-Meters.

Now, an E-Meter is a deadly weapon, and you can slaughter a pc with one by misreading it. It's not like a rifle. The only way you can do any damage with a rifle is use it with great accuracy.

Well, of course, you can also have a backfiring sort of rifle and you can also look down the barrel and put your toe on the trigger experimentally. But an E-Meter is not deadly at all unless it's misused. And if your TR 0 is out and you're looking at the pc and looking at the E-Meter and looking at the question, and you've only got two eyes, you see, and you need three, you can actually miss reads.

Now, a – the only read that is important is an instant read; you're never worried about latent reads. So you said the question and then you waited for a while, and then it finally sagged. Well, you'd just better go on to the next question because the thing is not there. What – all you want is an instant read. You ask the question: within a tenth of a second you get that needle reacting. If you've got an instant read, you've got a read on the E-Meter. If you haven't got an instant read, if it takes a half a second, a second or something like that, providing of course you're using a standard E-Meter of an approved pattern....

There are meters around, by the way – they're corny stuff that has been brought around – which have brought E-Meters into bad repute because they have a second lag built into them.

Have you ever seen one of these? They used to be quite prevalent in England. Somebody'd go down to the dime store and buy bits of old tinware and hang it together with some electric light cord. And they actually built a lag into the meter so when you asked the question it wouldn't react for a second. We have some of them in here in the electrical shop. I'll have to
show you sometime. It's how an electronics man can fix it up so that you don't get any results. Well, that is an unexpected one and we cut that one out by saying you use an approved E-Meter and we know that E-Meter will react instantly and behave properly. It's not a light thing to do work with a bad E-Meter.

The British Mark IV is the best of these meters. It is not the least destructible. It is a little tenderer. It's a better meter but it is more tender than the American meter. The American meter can be dropped for three floors and go on working. The British meter can be dropped one airmail flight and arrive at the other end with somebody having to look into it. We've got most of those bugs out. When we were originally sending these around the world, by the way, the extreme temperatures in a cargo hold would crack the transistors. Quite interesting. But we got that licked.

Anyway, with an approved meter you get an instant read and that's the only read you're interested in. And you're not interested in a latent read. If you follow up latent reads, your pc will start telling you what the other fellow did and what they have heard and that their aunt Mamie had a cat once that they think was stolen. Very valuable. It does a great deal for the case.

Now, the danger is, you take too many of these things off the case – you know, I mean, you get a latent read and he says, "Well, Aunt Mamie had a cat and this cat was in a decayed state. And I think it was stolen and I heard that and I thought at the time ..." yap, yap, yap.

And if you go on like this, you're going to wind up with a needle getting more and more sluggish, and more and more sluggish and more and more sluggish. And don't you be puzzled after you've let somebody get off an awful lot of "I heard" and an awful lot of unkind thoughts and an awful lot of that sort of thing, that you wind up at the other end of an E-Meter session with the tone arm not moving and the needle stuck and everything gummed up and the pc feeling like hell. How come?

Well, you let him sit there and get off nothing but overts. You let – the session was an overt. See? I mean, you let the man sit there, or let the girl sit there and commit overts for an hour. All right. So now they've got all these new overts. Isn't that what it amounts to?

But your latent read, when pursued, winds you up in the middle of nowhere. That works on all types of assessments. Whatever you're assessing, pay no attention to a latent read, a read which takes place – well, be on the safe side – takes place after a half a second.

Now, there's a borderline in there, the borderline in there: some pcs have got sort of a delayed-bank effect. And you'll notice working on some pcs the sound itself takes a moment to go through the circuit. And if you really wanted to be absolutely safe, you could space it out to three quarters of a second, but don't go any further than that.

Comprehension is landing on the reactive bank which is instantaneous. And those reads which are latent are landing on the analytical mind and the pc is figuring it out. That works for all types of assessments.

So I say again, if you want to be a successful E-Meterer, have your TR 0 flat so that you know what you're looking at, you know? Don't watch the ceiling and watch the floor and
then look back at the E-Meter to find out if it's reacted, because your instant read is the only important read and it is the one which, of course, you are going to miss. Naturally you'll miss it.

You look at the pc and you say, "Now, have you stolen any lollipops today?" And then you look down at your E-Meter. Well, it's read and gone. The reading is gone.

Now, this is why the E-Meter can be dangerous: because we have learned that if you miss a Sec Check question on somebody, you can wind them up in a ball. Not every time you miss a Sec Check question does the pc burn down the house. That is a commentary on the psychoanalyst who says, "Every time a kleptomaniac fails to steal something, he burns down the house." I love that "every time," you see? It classifies as a type of a remark of "jewelers never go anyplace." It's just about as nonsensical.

It is not a universal phenomenon that when an E-Meter read is missed and you miss the Sec Check and you leave the question and go on to the next Sec Check question with the last one unflat, that the pc always burns down the house, shoots the Director of Training or does something desperate. This is not always true. It's just 99 percent. There is still 1 percent of the time the pc does not do it.

Your pc comes in to session next time – "natter, natter, natter, natter, unkind thought. Whoo-ah-nyap-yap-yap-yap. I wonder if Scientology works," and so forth. And they go on and on and on and on and on and on.

You sit and listen to all this stuff. When are you going to get smart enough to put them on the meter and say, "Who missed a Sec Check question on you?" and find out what it was and clean it up?

And the person says, "Oh, well."

This is a very fascinating phenomenon that the fact of missing a Sec Check question is apparently a cross invalidation of everything that is going on. If you couldn't nail them, they now doubt. It's very funny. I don't care how long or how often the fellow has been sec checked. You miss a Sec Check question on him, he gets unhappy.

Now, that's a very important thing because there resides the easiest way to get rid of new Scientologists known. So I'll just lay it down there. If anybody wants to go out on a program of getting rid of every person they connect with that wants to have anything to do with Scientology, why, the program would be to either audit with a broken meter or a squirrel meter or something that didn't react, or to use a type of TR 0 which confronts the back wall or your own eyeballs while you should be reading the E-Meter and miss Sec Check questions. That's the first and foremost way of getting rid of people. They'll blow. They'll be very unhappy. It messes them up.

I think some of you have a little reality on that. Now and then, why, somebody has missed a Sec Check question on you wildly. And then you have found yourself sort of chewing your fingernails and nattering to yourself and not quite know what was wrong. And then somebody fortunately comes along and says, "Who missed a Sec Check question?" or something like that. And you get it off and straighten it out and all of a sudden you feel better. It's quite mysterious. It's quite mysterious.
I'm not going into the mechanics of how this happens. I can tell you the mechanics of how a bank beefs up, now. I've studied that for two or three days and finally got the answer to that. When you run the terminal, which is not the terminal of the pc, his attention is too bound up in his own terminal and goal to as-is the collapsing mass. So the auditor has – being more in control of the pc's bank than the pc, can of course push masses in on the pc. But the pc's attention is so bound up in his own goal terminal that this new terminal, which is being pushed in on him, does not get as-ised. And that is all there is to it. In other words, he hasn't enough attention to as-is anything but the goals terminal which he is stuck in. Do you see that? So his bank beefs up.

Similarly, your E-Meter starts up to the degree that the person is not as-ising what you're throwing in on him. So you get a high arm, high arm, high arm – an arm goes way up, an arm sticks. The person's attention is too bound up in something else to as-is what is being thrown in on him. Do you see this? So you could sec check a person into a high arm as well as sec check a person down from a high arm.

Now, how would you sec check a person into a high arm? Well, you'd make sure all the rudiments were out. You'd very carefully make sure that all the rudiments were out before the Security Check was entered in on. You'd make sure that the pc was unhappy in the room, had a present time problem, didn't want you to audit him, had an ARC break and had several withholds right in present time and then start security checking him on heavy questions. And the pc can't confront the question, can't give you the answer. Do you see the struggle which now ensues? And he can't get his attention out of present time, he can't remember the past and you actually could plunge him around until the arm would go high.

Now, it is not true that every arm going high during a run must be avoided, but you should understand why an arm is going high and why an arm hangs high during a Sec Check or during any other kind of run. An arm, a tone arm, goes high and stays high if more is being thrown in on the pc than the pc can handle or as-is. Period. That is all there is to it.

Let us say, if a pc were a coal burner and he were able to generate enough flame to burn one piece, one small cubic inch of coke per hour, and you emptied the hod into the furnace, you're going to get a rising tone arm which, of course, is measuring the additional mass entered in on the pc which the pc isn't as-ising. That make sense to you? I studied it out the last couple of days to see what the mechanism exactly was here and what was happening And it becomes valuable.

So when a pc's arm is high – you can just make a little side rule to go along with it that will serve you in good stead – be very careful to do one of two things: audit with the rudiments very well in or find where the pc's attention is stuck and audit that. Now, that doesn't say that you should run an engram, because the engram might have been the thing which was the hod of coal. You see, that might have been the upended coal hod.

The pc's attention was busily stuck, gorgeously impinged, upon a flower. You've been running a process, "What flowers have you failed to withhold?" or something. And all of a sudden an engram comes up. And you can ask too many questions about the engram and that's the same as throwing the mass in on the pc, you see?
You can say, "What's the largest object in that engram? All right. Now, what's some other object in that engram? Now, is there any masses in that engram of any character?"

Well, of course, that is understandably throwing heavy mass in on the pc, but you know, you can get the pc into the engram so the pc can't easily extricate himself, simply by asking the pc too pointed and too direct a question about the engram.

I'll give you a right-wrong example of this.

This is the right: pc says, "Woo! What an awfully big mountain. I wonder what's going on here?" and so forth.

And the right thing to do is to say, "Oh. All right. Okay. Here's the next question."

And here's the wrong thing to do: "Oh? Well, what is going on around there?" See, that's the same as upending the coal hod.

Now, don't be too surprised if the tone arm starts up right at the point you asked that question and stays up thereafter. The auditor can push mass, pictures, circuits, track in on the pc and move that track more easily than the pc.

This is one of the hardest things – over the last eleven years, this has been the hardest single point of instruction: that the auditor can move the bank more easily than the pc can move the bank.

I've even given demonstrations and told the bank to go north, east, south, west. And somebody who was totally stuck on the track and couldn't possibly move on the track and all that sort of thing, and I just said – not even to the pc – I said, "All right. Now, it will change to the picture of a theater." It did.

You know, the pc irrevocably stuck in this incident and can't possibly get out of it. Well, "All right. The incident will now become the picture of a theater." Bang! It did. He was no longer stuck in the incident. You can do things like this. You can move the bank around more easily than the pc.

So your interrogation – your interrogation of the pc can itself pin the pc's attention at various parts of the track where maybe it shouldn't be pinned. It's all right to get curious; it's all right to find out what's going on. But there are times when you should restrain yourself just a little bit.

The pc all of a sudden starts looking very sad and you say, "What are you looking at?"

"Well, these pictures of these pyramids. They're very interesting pyramids."

And you say, "Oh, all right," and give him the next question. That's real smart, you see?

Pc starting to look slow and comm laggy, you know? All right. All you'd have to say is, "What about the pyramids? When did they come up?" When did they come up isn't so bad. But, "What about the pyramids? Do they have big tops? Do they have small bottoms? Is there anything going on around the base of the pyramid? What is happening on the other side of the pyramid? Are there any ditches dug or anything like that around it?" This will – you're writing script now, you see, so that's – probably give him a good ARC break right at this point.
Now, you can go on and audit the process you've been auditing for another half an hour, and you say, "What are you looking at?"

"Oh," he'll say, "these damn pyramids, of course."

You gave him the pyramids. Now, don't be so alarmed about it because all you'd have to do is take them away from him.

Well, how would you take them away from him? The easiest way to take the pyramids away from him, the easiest way, is simply to tell the bank to do something else. You know? Say, "Well, what happened toward the end of that life?" You know? The bank will shift.

And you say, "What happened a couple of lives later? Is there anything that happened in a subsequent life to that that answers the auditing question?"

"Oh, there is. Oh well, what do you know?" You won't hear any more about pyramids.

You can move the bank around. One of the primary reasons auditors have trouble auditing engrams is they kept expecting the pc to move the bank. They would sit there and they would say, "All right. What are you looking at?" And be perfectly willing for the pc to go on and go through the incident, but nobody was moving through any incident. Why? Because nobody was moving the incident. Pc was incapable of moving the incident and the auditor wouldn't.

All the auditor would have to say is, "Well, the end of the incident will now appear. One year has now gone by. The picture of that incident, whatever is there, will appear."

It's very weird, you know. The pc says, "Well, you see, I was a beggar. I'm a beggar and I see all this. And it's a horrible marketplace and I'm a beggar. I'm sitting down there and I got leprosy," and so forth. And it's just not running, don't you see? And you say so on and so on.

He keeps saying, "Well, and this leprosy, and I – I've been leprotic for a long time," and he's getting more and more into the dramatization of the thing, and so forth.

And you say, "Well, was there a life later than that when you didn't have leprosy?"

Well, in essence, you've moved the bank.

He says, "Well, if you ask me that way, yes. Yes, as a matter of fact, I haven't had any leprosy since."

"Well, what are you looking at now?"

"Well, I'm looking at a small boy."

"All right. That's good."

Wrong: "Well, does the small boy have leprosy?" [laughter]

You can move the bank around just by the most innocent questions. You can audit, actually, with – by moving the bank by innuendo. Not anything direct – north, east, south and west – just ask the pc about this and that part of their life.
Now, you expect a pc to cycle through an ARC question. You just expect him to. He cycles through an ARC-type process, you see? He goes out of present time, he goes back into the past and back into present time again.

All right. If you depend forever on that automaticity, you're going to get lost somewhere because he's going to get into something he's not going to get out of.

You could always say to him -- you're trying to get him back up to present time -- "Well, was there an ARC break later than that?" or, let's say ARC processing, "Well, did you communicate to anybody after that?"

"Oh, yeah. Yeah."

"Well, the following year did you communicate to anybody?"

And he'll have to say, "Let's see, what year was that?" and so forth. And you figure it out for him, you know? And he figures it out.

And he says, "Oh yeah, well, that was 1942. Yeah."

"Well, all right. Good. Now, did you communicate to anybody in 1946? Oh? All right, all right. Okay. You did. All right. Now, did you communicate to anybody in 1950? Oh, all right. Good. Now, did you communicate to anybody in 1955?"

"Oh yes, yeah. I did."

"Anybody communicate to you in that year?"

"Oh, I'll say they did."

"All right. Has anybody communicated to you in the last few days?"

"Oh yes, yes, yes."

"Well, have you communicated to anybody today?"

"Oh, yes."

"And anybody communicated to you?"

"Oh, yeah. As a matter of fact, you just did."

Well, you've moved the person up to present time by just interrogation. Interrogation with dates. You just asked him questions about dates. You didn't directly say "The bank will now shift 1.89 years north." But you could do that.

The reactive mind is always keyed to other-determinism and never to self-determinism. And one of its common denominators is other-determinism. So, of course, the auditor can always move the bank.

Now, in Sec Checking you very often get somebody into some kind of a situation, and by your pressure and your demands -- you're saying, "Well, have you ever stolen anything?"

And the person says, "No, I haven't."

"Well, have you ever stolen anything at all? Now, stolen. Have you ever stolen anything?"
And the person says, "No, I haven't" – you're not getting any read on the meter because you're not looking at it and you aren't getting any anyhow.

"Well, you mean to tell me in the last two hundred years you've never stolen anything?"

"Well ..."

"Now, I'm going to – when I snap my fingers something you've stolen will appear." [snaps fingers] "Well, all right. All right. When I snap my fingers something bigger you have stolen will appear." [snaps fingers] All right.

Well, don't be too startled if the tone arm goes up. It isn't an ARC break. You could probably get away with it but you've just given him more and more mass that he is not prepared to accept. He isn't about to as-is it. And then if you just walk off at that point and don't do anything else about it, you leave these things right there. So make things vanish that you made appear. A good magician, when he makes a girl disappear on a stage, particularly at these straight-laced times of police and all that sort of thing, usually shows her again to the audience, you see? Well, that's a good principle. Good principle to follow. It's the decent thing to do.

Of course, in tougher, rougher, ancient times, we didn't do that. We showed the audience this brand-new trick: You put the girl in the box and you put flaming torches in at every corner of the box and you opened up the box and there was no girl. And they thought this was marvelous. And it was a marvelous trick. Of course, she'd burned up. [laughter]

But I call to your attention that you're auditing in milder times than that. So when you say, "All right. Take a look at those pyramids," remember to say, "Take a look at something else."

All right. Now, the auditor who is sitting there doing TR 0 on the report or on the auditing sheet only – no TR 0 for the meter, no TR 0, you see, for the preclear, no TR 0 for the room, and so forth; he's got – TR 0 has advanced as far as the point of a ballpoint pencil, you see, and he can write and he sometimes can even read an auditing command off a sheet but doesn't pay much attention. Boy, the man's dangerous. Do you see why he's dangerous?

He not only never finds out what's going on with the pc but he never sees these instant reads in answers to his question. He never clears these things. He never finds out what's going on. If something did go on, he wouldn't do anything about it because he wouldn't think anything was going on. All very fascinating.

But the high arm is often, not always, but is often cleared with withholds. You get a withhold off the case – any old cotton-picking withhold, it doesn't matter at all, any withhold – and you'll see the arm start down a little bit if it is a withhold to the pc.

Now, what makes it a withhold to the pc? Whether or not it is against the mores that the pc has subscribed to. That is what makes it a withhold. We can broaden this definition. We used to say, "Well, it was a withhold if the pc thought it was a withhold."
All right. That's fine. But that's not technically usable. Let's take a more usable statement: A withhold is a withhold if it is a violation of a mores the pc has subscribed to and knows about.

In other words, you get a violation of a mores and you get a withhold. In other words, if the withhold is a violation of a mores it'll register on the meter, the pc will consider it a withhold, he will give it to you as a withhold and he will feel better.

All right. Let's get down a little bit closer here. Why do some people feel so wonderful when you get off some withholds and others don't notice anything?

Why is this? Why is this apparently spotty? You sit down and you say, "Have you ever robbed a bank?" And pc A – you say, "Have you ever robbed a bank?" And he gets a tremendous fall and you say to him "All right. When was that?"

Ha-ha-ha-ha-ha-ha-ha! And he says, "Well, that was Chicago, 1931. We robbed a bank. There was La… Louie the Pits and a few of us guys, and we robbed the bank and we – we got away wit da loot. And as a matter of fact, we shot each other afterwards and threw da money in Lake Michigan and then I was killed. Yes, I robbed a bank. I – I got a recollection on it," and so forth. And that's fine. And you expect the pc to grow wings at this moment, you see, and so forth. He's gotten off a withhold. Oh – he wasn't withholding it. Nothing happens with the pc.

He did get a fall. We don't know what the fall is traceable to. We ask him now, "Did you ever rob a bank?"

And he says, "Nah," he says, "I never robbed any banks. Not any other banks than that."

And you don't get any more reaction on the needle and you say, "Well now, the pc should feel wonderful." But he doesn't. "Well, it did fall. So he should feel wonderful." Well, no, you see, robbing banks is not against the mores of bank robbers. And there being so very few citizens who subscribe to law and order in Chicago, you see – they're in the minority – that it doesn't make a mores. Quite the contrary.

Now, he might very well go into – get a terrific relief on the thing. You say, "Well, is there anything you've ever reported to the police? Ha-ha-ha-ha-ha-ha. Have you ever reported anything to the police? Ha-ha-ha-ha! Hm? Hm? Hey? Have you ever reported anything to the police?"

"Ooo-o-oh," he says, "that's really bad."

You got an instant read here. "Come on. Come on. Come forth!" [bangs on the table] What's this you reported to the police?" You know, good, smooth ARC here. [laughter]

And he says, "Well, I – I reported once my dog had been lost." And the fall comes off the meter, and he feels wonderful.

You say, "What on earth is this? How come?"

Same fellow, you see? He robs the bank, they shoot each other up, they throw the loot – they don't even get the money – they throw the loot into Lake Michigan, and so on. And this
has been a terrific withhold and a great unsolved crime of all time, and here it is. And he gets no relief. But he reports a dog to the police and he says, "My, I'm certainly glad you're auditing me. I'm getting such terrific results."

Well, that's because you're operating from one mores and he's operating from another, as I've already talked to you about. Fantastic isn't it?

Now, supposing we find out something about the pc's past and we guess at what the mores of the various groups and societies he's belonged to might have been. And we do a Security Check from this particular level. We are always going to get some kind of a result. But this is a rather stunt proposition. Is there a faster way to do this? Yes.

It's called Security Checking by Dynamic Assessment. There is the most available body of life or segment of life, the most available segment of life on which he has a reality, against which he could be security checked. And you will miss, miss, miss, miss, miss if it all still seems reasonable to you that he is sitting there in a body, part of a race, and so forth and so on, and all these "I'm-supposed-to's" are all taking place, and this is a social world and so forth. And you think this is all ordinary and reasonable.

You forget. You forget that it's very unusual. A thetan is sitting in a meat body in a culture of some kind or another that is doing some weird, odd things of some kind. It is not usual. And you know, the whole thing can be security checked out? Let's look at it from that weird angle.

All right. Do a Dynamic Assessment. Here's the way you do it. Dynamic Assessment is done, of course, to find the most needle change of any one dynamic amongst the rest of them. It is done, really, by change of pattern rather than largest fall or something like that. It is done the same way you assess anything else.

Now, you can do a Dynamic Assessment by Elimination – brand-new news for you. That improves Dynamic Assessment a bit. You can assess by elimination. It'll leave you sitting there with one dynamic on which he has some reality.

All right. What are the parts of that dynamic? And we now are confronted with the task of composing a great many new Security Checks. They will be the teen series. There will be check number 11, check number 12, 13, 14, 15, 16, 17 and 18. And each one of those is subdivided, as necessary to – let us say, second dynamic would be Form 12, family. That would be A. So Form 12B would be something on the order of children. You see, you already have a Child Security Check, but that should be its number.

And Form 12C, which would have to do with marital sexual relations and what is – commonly passes for mores in the present society. I think that's the total moral code, is contained in that narrow sphere.

Twelve D would have to do with unusual practices on the second dynamic. And in other words, you can get a number of Security Checks plotted out here. Of course, they go by the number of the dynamic. So your 18, naturally, is a bunch of Security Checks – questions on the subject of God. They're just religious Security Checks of some character or another. So you have a whole bunch of these things.
"Have you ever blasphemed?" Okay? That kind of – that kind of a Security Check. "Have you ever used paraphernalia for other purposes?" "Have you ever used a church for any other purpose than was intended?" [laughter] You get the idea. You just dream up all of the possibilities of misuse/abuse crimes that fitted into innumerable areas.

Of course, number 14 would be your species checks. And that's pretty easy, but it probably subdivides.

And a Dynamic Assessment could be done for the subdivision so that you could get not only the dynamic but you could also get the subdivision of the dynamic and you could wind up with a proper Security Check. But no exact form Security Check is ever going to do the whole job. You're going to have to add your own questions to it as they may appear.

Your Dynamic Assessment directs you to that zone of life on which the pc has most reality and, therefore, would consider he would have the most crimes as it exists. You will find a pc all messed up on seven dynamics and able to be security checked on the remaining dynamic. He's got some reality on it, so he's done something to it. He knows, you see, it's his withhold.

Now of course, Sec Check Form 11 – none of these are written. You're going to write them. Any time you're doing this and you're asking questions, now, by golly, you write the question you ask down. And I don't care how much little side time that you spend going off and grabbing off somebody's folder and find out what you're supposed to run on them next week and actually dream up a Security Check.

Make sure it stays in the folder and then we can go back over these things and we will get some horrendous thinking on the subject. Okay? And it makes a good show. As a matter of fact, some of you who are not sec checking this week but who will be sec checking next week have in these folders, right this minute out here, you have this type of Security Check to do. And those which are security checking – will be security checking tonight – you just run into it like a truck hitting a wall. You're going to open up the folder and there it is, and you're going to see, "Well, do an eight dynamic Security Check. Dream up the questions," it'll say. All right. Well, dream them up. And you will find that you're getting off the case the withholds that come nearest to this pc's locus aberratus. And there he sits.

In doing Security Checking – let's get out to a higher generality here on the subject itself – the trouble with Security Checking is that the auditor is usually security checking from his viewpoint rather than from the pc's viewpoint.

The auditor is security checking against what he thinks would be a crime in his own view. And it is not a crime to the pc. So the auditor gets all upset because this question should have worked, and he's got this bright, sweet, innocent little thing sitting across from him – a little high-school girl – and she's sitting there and she's saying, "Oh, yes. Well, I was raped in the third grade, the fourth grade. As a matter of fact, raped several boys in the fifth grade. Yeah, as a matter of fact, I'm having clandestine relations at the present moment with my uncle, except when I'm down at the firehouse."

So he says, "Man, you know, when I get all this off, when I get all this off and get all this straightened up, this girl going to be flying right, you know?"
About three, four weeks after he's finished this laborious task of Security Checking, he walks by the who- firehouse and she in her negligee waves from the window. [laughter] What he missed – what he missed was this, what he missed was this: her dynamic was the – was the eighth dynamic, and she was a renegade from the Temple of Astarte. And of course, it would have been a awful break of mores for her to have done anything else.

Now, if he'd asked her questions such as "Have you ever been leaning out a window and have not whistled to somebody?" he would have gotten a fall, and she would have gotten this off, maybe with considerable grief. She meant to do right. [laughs]

Now, the odd thing about thetans is they are thetans. That is the oddest thing about a thetan. And a thetan is not natively a member of any culture. There aren't just natural-born eighth dynamic thetans and natural-born second dynamic thetans, and so forth. They are just thetans. And they've come down the track by their own devious routes accumulating, in their own peculiar way, civilizations, cultures, mores, group ideas and so on. And some of them have come a long way down the track without finding out any groups exist. And all sorts of wild things have gone on, you see? It's quite weird, you see?

It isn't that everybody has the same body of aberration at all. They're thetans. And in view of the fact that all the rest of this stuff is collected, well, it's just what do they collect? Some collect stamps, some collect blondes, some collect debts, some collect executions – sort of a hobby.

But the various mores in which they operate are registered very clearly and cleanly on the dynamics. And as soon as you start doing this, why, you're going to see some interesting renewed upsurge results out of Security Checking.

Of course, I'm put to it right now. I have to have a zone and level of auditing which is a comprehensible, highly usable, highly workable level of auditing prior to finding the pc's goal and terminal. And I have to do that fairly rapidly because you have a Class II Auditor and he has to have a body of skills. So I'm not just busy inventing them, I'm busy throwing them together.

It's like the other day, I looked up in horror in realization that we had no co-audit processes of any kind whatsoever that could be trusted in a co-audit. By the new safety table, I – you look it over from a viewpoint of the co-audit, why, you're in a box. That's a bad spot. But there's an old one, 1951, that could be run in a co-audit: Rising Scale Processing. Probably be gorgeous! Probably be gorgeous. You can probably even do an assessment on the people as they walk in. You know, I mean you could take the old Chart of Attitudes and kind of work it out. What did this fellow want? He tells the co-audit Instructor what his goals are. All you had to do is pick out the column, that's Rising Scale he runs. He'll make it.

It's quite a remarkable thing what you can do with concepts and that sort of thing – leaving terminals alone – the gains you can get.

Now, in this body of Security Checking, here is a whole zone of activity – a very simple zone. There will be forms developed for this particular thing and all the Security Checks. We haven't got them all now but that's no reason why I can't show you what it is or we can't.
use it, don't you see? You, after all, don't have to be led down the road with your feet being picked up one at a time and set down on the cobbles by somebody else.

Do a Dynamic Assessment, take the most active dynamic, preferably by elimination, take the parts of existence which might be the subdivisions of that dynamic; look those over and take the most active one of those or the most fruitful one of those – just dream up a Security Check that has to do with it.

Security Check the pc on that particular zone and area. You will be asking him things he never dreamed of were an overt. He's doing them all the time. And all of a sudden, "It's horrible! Oh, God!" He feels terrible about that. And he is so relieved.

A vegetarian, for instance, that is also on the fifth dynamic – she has other reasons that she could be a vegetarian – it might be on the seventh or eighth dynamic. It's something they should be doing, you know, because of some religious action or something of that sort.

But when a pc is on the fifth dynamic and vegetarian, and we security check him, here's where your reasonableness will get assaulted, you see? You're going to ask this person such things: "Have you ever eaten an animal?" and the needle is going to fall off the pin. And you'll find out he's been withholding every dinner he ever ate that had any meat connected with it, and so on. All sorts of wild things here.

You ask somebody along this line that falls on the fifth, "Well, have you ever walked on the grass?" Needle falls off the pin. He's liable to explain to you that he had to. There wasn't any way you could go around the grass. Of course, he realizes he smashed up a lot of grass in his day.

You see, you look on this as being so ordinary, you know, for people to walk on grass or kill plants or eat animals, or something of this sort, or chop down trees or do various things on the fifth. This is all so routine that you wouldn't think – bang! like that, that it would have any effect on a case because it's too ordinary and shouldn't have any effect on the case. Well, that doesn't follow at all.

What has an effect on a case is what has an effect on a case, you see? What – it's what the thetan thinks is a withhold. And that goes back to what group mores are you operating against?

Well, any member of the old biological survey that was operating around here about six hundred million years ago has his hair stand on end, whether he knows it or not, every time a new species becomes extinct on Earth or every time man plows up another thousand square miles and plants it in cute cottages at contractor prices, you see? That's grim. And his hair stands on end. He knows it's very usual and that he ought to be doing it. He knows he should be doing it, you see, because it's a usual thing to do. And that's okay. And nobody else thinks it's bad.

But he looks at this or doing something like that and he kind of – it's just not quite right. He doesn't quite integrate why it isn't quite right. He doesn't think the thought through. He just sort of snarls a little bit to himself quietly, or he thinks of it as an overt or as something and he's disturbed by it. Well, it's against the mores of the biological survey. That's all.
"Thou shalt plant and populate planets, pard." They kept the life cycle going and balanced. Also, I imagine any one of them that ever gets in a schoolroom, and the teacher says, "Now we are going to talk about the balance of nature," you see? And they go back into the current biological nonsense about how there was a spontaneous explosion of an atom somewhere in some sea of ammonia that got there by accident, and then, by natural selection, [laughter] and quite by accident, everything got planned out this way, you see?

Well, a person that's been on that line is – somewhere back in his bank, you know, things gonna go whirr, and whirr. Well, it's an awful invalidation: the time he spent on computers figuring out how many petals there should be on a delphinium! [laughter] And of course, then they wog him. He finally doesn't like this explanation, so goes over to the church and they tell him God did it. [laughter] And suddenly he begins to feel sort of megalomaniac, you know? And it's – "I wonder if I did create all these thetans." [laughter] He didn't do anything but run the computers that planned the posies on this particular type of planet.

But you'll find these are overts. When they register on that dynamic then you have to plot out what the overts would be on that particular line; and you ask those questions, you'll find out the fellow has got overts, he's got withholds and there he is. And he'll all of a sudden feel much better. And some odd and peculiar things that he has been doing in his life suddenly come straight. And he remembers things, and so forth.

You see, men are very often so busy being ordinary that they don't recognize that every one of them is slightly, somewhere, extraordinary. And this professional ordinariness that we get, particularly in these socialistic times, is a great repressor. It not-ises the differences. And unless you can reestablish difference, you can never reestablish differentiation. You see, it's very easy to establish similarities and identities. This is fairly easy to do. Man does this very well.

He just dismisses all problems by saying "Everything is alike." You ever hear a girl that's had a bad love affair? She says, inevitably!, she says, "All men are alike." That's her next statement. They walk around, and she's liable to be saying something on this order for some days or... well, hours anyway. [laughter]

And – but she's done the easy way out. The way to solve all of mankind is simply and ordinarily and only to say that they are just all alike and that's it.

So you don't have to worry about it. And then the next thing to do is if you want to – don't want to have to go any further or exercise your wits any, all you have to do is say, "Well, they're all bad." So the easy way to do is to say they're all alike and then all bad, and therefore you're safe. And this is apparently a safe thing to do. You say, "Well, they're all alike and all bad and, therefore, after this I will be warned. And now I'm perfectly safe. Of course, I'm miserable but I'm perfectly safe."

And a person will then try to justify this kind of reasoning. Well, that kind of reasoning is so idiotic and so simple and so stupid and not-ises so many things that it's no wonder that countries cycle down into some – the great melting-pot togetherness of it all. "Pigs are more equal than others," you know? This kind of a – this kind of an attitude.
It isn't that thetans are unequal, but it isn't that they're equal either. Perhaps at the beginning of track this might have been true. But they've been gathering inequalities for some time and then masking them by pretended equalities until they're very hard to separate out.

Well, if you go ahead and look this over in Security Checking, you'll find out that the Dynamic Assessment is a very marvelous way to get a zone of life on which the person has overts and withholds. And you'll find that that works fine, and produce some rather interesting results.

All right. There is another thing called the Problems Intensive that we have been working on, and I'll tell you how to do this Problems Intensive. It's a simple thing to do; nothing much to it.

It's a form. And you fill out the form. And the only differences that you find from this and the first time I told you about it is you don't run the problem. You fill out the form. You get all the self-determined changes of the pc's lifetime. Then you assess those self-determined changes, you find the one that reacts the most and then you ask for the problem immediately earlier than that change. They give you a problem. If it's the right change, they will give you a problem which is a tremendous overwhelming problem that they have had for many, many years and that is their present time problem of long duration. And they would recognize that as such and that gets out of the road very nicely. The statement of it, of course, makes it easier. But now there's a faster way of auditing it than running the problem. A problem is too close to still to be audited swiftly. It isn't that a problem can't be audited. A problem can be audited but it audits more slowly than approaching it through motion.

In other words, it's close to a still, a problem is. You ever notice a workman when he runs into two pieces of timber that are going the wrong way in the structure: he stands back and looks at it. Yeah, he inevitably stops. And problems are associated with stops.

So what you do is take it as a still point on the track and find the area of prior confusion and then you sec check that area of prior confusion. Find out what the person was doing at that time, find out what he withheld and from whom and how he did it and what he did and why he said it. And you know, that – you just find out all of the things and stuff in that particular area which preceded the problem. And all the change in the problem, all you do with the change he made in life and the problem is use them as a milepost in time behind which you look for the confusion. And then you sec check the confusion. And you'll find out, then, the problem will blow unless it's gone back fifty thousand years and you're actually trying to sec check his life as a student barbarian or something – which you can run into.

You get that area of confusion unraveled and you'll find the problem blows, the change blows. And what do you know? It's usually accompanied by a somatic of some kind, and it'll be some kind of a chronic somatic, and that will lessen somewhat or sometimes even blow entirely. Don't be disheartened after you've got the person a goals terminal, and you are running him on the line, to have the somatic reappear where it really occurred on the track. And it'll reappear and blow.

Now, Sec Checking, however, will alleviate and get it out of the road and it usually stays out of the road, so – it stays lessened anyway.
And so doing a Problems Intensive, then, merely consists of finding all of the self-determined changes a person has made in a lifetime, listing those, assessing those, finding that change which gives the most reaction, finding the problem stated by the pc which existed immediately prior to that change and then finding the area of prior confusion to the problem. Find that area and sec check the living daylights out of that area.

What was he doing at that time? And who'd he know? And all this sort of thing. And basically and principally, what did he do and what did he withhold from whom?

Now, you don't have to do it person by person. You actually can delete the assessment of the people in the list. You needn't do that, there is no real point in it at all. You needn't make a list of people on a Problems Intensive and then assess that list of people, because it's a violation of a goals terminal.

What you should do is just go in on the basis of an area of confusion, find out who was present in it and then find out to whom he did what and from whom he withheld what. And all of a sudden the problem in a majority of cases will blow. Now, that is a – you call that a Problems Intensive, you see?

Now, a dynamics – Sec Checking by Dynamics is an entirely different activity and it is an isolated activity of its own. And a Problems Intensive is an isolated activity of its own. These things are distinctly different activities.

Sec Checking usually depends for its workability on the ability of the auditor to ask the right question at the right time. Now, when we're making the basic class of a very functional type of auditor – I mean, an auditor that we would depend on the skill of, that basic Class II Auditor – we're not going to say that the Class II Auditor is a muzzled auditor, and so on and so on, you see, the way we used to say there was a class. Class II is above that. This person has got to have enough imagination to ask the right questions and put together the right questions in order to knock apart this mess; that'd give him enough to think about. And you have to be very good at it. As a matter of fact, several members of this particular class are extremely good at this. I'm very interested in watching it occur. "So we found the hidden confusion and that was the end of the problem." You know? Bang-Bang - Doing it very well.

Now, what's interesting is, is that you could sec check out of existence every out-rudiment. Isn't that interesting. You could take the room and you could take the present time problem, you could take the auditor, you could take the ARC break, and naturally the withhold, and you could sec check out of existence all of these out-rudiments by just asking for the prior confusion. You find the rudiments out so you find out what went on before it.

You see, a rudiment can't hang up unless there's an unknown in it and an unknown can't exist unless there is a withhold.

These people who walk around being fond of being stupid should get wise to themselves because all they're doing is declaring that they have withholds. Here we have a class of thing which is all of a – all of a piece: unknowingness, forgettiness, withholdingness and stupidity. These all go together. These are all of a class. They are not the same thing but each one interdepend on another. It's kind of another triangle like we used to have in ARC and still have. But unknown and stupidity and withholds go up and down accompanying one an-
other. They are hand in glove. The more withholds a person has the more stupid he'd be; the more unknowns he will have. And you've got these three things just marching up and down beside each other. And as you improve a person's withholds, if they're actually withholds, of course he will get brighter.

But if you think you're going to take a member of the Bank Robbers Security League and see check him on a churchman's moral code and wind up with an increased IQ, of course, you're quite mistaken. This will not occur.

What you've got to do is see check within the reality of what the pc is and what the pc has done. You have to see check within that reality.

Well, there is one method of finding the zone by dynamics, and another method: zones of action by change. That is the Problems Intensive.

Well, the hidden confusion was when he was in school. All right. Now, that is not anything but a school mores. It couldn't be anything but school mores. It is not familial mores, particularly; it's school mores. The confusion immediately before this change that you assessed out was going to school. So therefore it's a school mores. It's a schoolboy's attitude toward the parents; a schoolboy's attitude, you see, toward teachers; a schoolboy's attitude toward all the other aspects of existence. Well, what are these, what are these? And what's the morals? What's the mores of a school? "Thou shalt not give the headmaster an even break," you know? It's the thousand-odd commandments of the schoolboy. "Thou mustn't peach. Thou mustn't inform on thy worst enemy." All kinds of weird moral codes, one kind or another. "Thou shalt take revenge." It's quite weird, you know? Somebody was mean therefore all the other boys enforce the fact that there must be a fight.

You know, it's quite weird. But so is any of these moral codes. And if you're living comfortably, ensconced in a sort of a even, easy-go sort of a society, and you'd say, "Well, I know what's moral: 'Thou shalt not, thou shalt not and thou shalt not and thou shalt not,' and that's about all there is to it. And, of course, I am a moral person." That is the emptiest remark that anybody ever made. "I am a moral person." There isn't any other kind.

It doesn't make him a well-behaved person, except in one group: the group that happens to have the same morals. See that, and then he's a well-behaved person only in that group. It's very interesting. The auditor's viewpoint can be thrown out. The auditor can see check securely from the fact of the Presbyterian church and then with what amazement discover that nobody but Presbyterians ever lives by the Presbyterian church. Always discovers this with some shock. And never under any circumstances realizes there's a moral code amongst marijuana addicts. See, so that is immoral.

Well look, it's only immoral to those groups that have a moral code that says what the other side is doing is bad.

I'm not now trying to tear down and rip to pieces every single moral code that has ever been developed anywhere. As a matter of fact, we have the only means that has ever been discovered of straightening them out. I don't know how anybody can be a Presbyterian after having been a Roman Catholic for fifteen hundred years. [laughter] If the Presbyterian church was smart, if it was very, very clever, why, it would come around and find a bunch of us audi-
tors and get us to sit down with our E-Meters and put the congregation up the line out of the moral area that they are stuck in so that then they will hear something of what the preacher is saying. I think it's a waste of air and church heat and a few other things. He's standing up there and he's ranting and pounding the pulpit and telling them they must not sin. And just think of this fellow who is totally stuck in the Never-Give-a-Planet-an-Even-Break Space Jockeys Protective Association. [laughter]

And here's this preacher ranting at him, "Thou shalt not sin. You must learn to become a moral person."

And something in the back of his mind says, "You know, I don't want to kill any more women." [laughter] "And this fellow is standing up there demanding that I kill women. And that is why I left the Space Jockey Protective Association because it was just too much – just one too many women. Now, why does the Presbyterian church want me to kill women?" This is what goes in crosswise, you see, in the reactive bank. And the fellow is very puzzled about Presbyterianism. And he can't articulate what it is and he can't understand about it. He just thinks that, well, it's not quite for him.

And if you ask him about it, almost [snaps fingers] on a flash response, "What does a Presbyterian church want you to do?"

[snaps fingers] "They want me to steal ships and kill women." And even he at this point looking at that would say, "You know, that's peculiar." Because they don't want him to commit sin.

If you raved and ranted at a large group of people with great force and decibels of sound that they must not sin, that they must be moral people, and never at any time held up what you were talking about or defined morals or showed them any moral code or anything – you just collect them at random and then just start screaming at them that they mustn't sin, they mustn't be immoral, so on – people would walk out of there and do some of the weirdest things. [laughter]

You should realize that there is no act pronounced immoral in any one part of Earth which cannot be found to be moral in some other part of Earth. So remember that, when you are doing Security Checking. Security check against the moral code of the prior confusion.

And, well, if your prior confusion, let us say, is a period after the person has been an auditor for years and it's a big confusion and it has something to do with auditing in an organization or something like this – there was a big confusion at this time, and after that he changed something or other, and that's the confusion you assessed, and that is the confusion that you are security checking. And you've learned that in his early life he was a Presbyterian or something. You know he's probably crossed up one way or the other. But probably the code he has gone against is the code he understands to be the code of a Scientologist – not the written Code of the Scientologist. The written Code of the Scientologist is not the code of a Scientologist, oddly enough. It is simply something that is held up as a – as some kind of a model of action to keep us from getting our heads kicked in. But we have developed quite a structure of morality, you know? "Thou shalt not audit badly." That's one of the foremost of them.
"Thou shalt not audit a pc with a PT problem" – it goes off into technical things, don't you see? And it – so on. A person, actually, is getting into a moral structure. He's not into a technical structure; he's also into a moral structure. And by sec checking him, you will find out that he thought of it as a moral structure. That was a moral structure to him. You look on it as a technical structure, but no, it's a moral structure.

He knew very well, he knew doggone good and well, that he shouldn't keep auditing this person badly after 3:30 A.M. He just knew he shouldn't ought to be doing that because it was against all of his principles: what he wanted to do and what anybody else wanted him to do and so forth – it was just bad. Pc was getting tireder and tireder and tireder and practically finally spun in. This gets to be a hell of an overt.

Somebody walks into the front room and swears and damns and screams and raises the devil about something or other and practically knocks the person's lease to pieces, don't you see? And you get that as an overt amongst Scientologists? You don't get it as an overt until they find out that they disturbed an auditing session that was going on. [laughter] You see? All right. They disturbed this auditing session. Well, that's an overt. Something they shouldn't have done.

So gradually out of technical lines and out of behavior actions and group associations, Scientologists are building a moral code of what they consider proper behavior. And it's built exactly and entirely against their experience, not what they've been told or what they've been dictated to. It's built against the experience of what they know to be survival and what they know to be nonsurvival. So you see, you check against that moral code one way or the other.

Now, you have a Security Check for an auditor. Now, whether it embraces all those points or not is debatable at the moment; I haven't got the thing to hand. Possibly it doesn't. But you see, you're in the driver's seat if you're security checking a Scientologist. You see, that's easy. That's nothing to it. Just all you have to do is say, "Well, what would I consider wrong?" You see, "As an auditor, what would I consider wrong? Well, all right. I'll ask him if he's done it."

"You ever disturb an auditing session? You ever done this? You ever done that? You ever written a nasty letter to Ron and couldn't get it back out of the post?" [laughter, laughs] See, anything, anything, you just bing, bing and think those up, just bang! bang! bang! That's because, you see, you're auditing in the same sphere of the moral code.

Now, let's move it just one out. You're security checking a person who is your fellow countryman and who has gone to similar schools to you, and so forth. Well, this is pretty easy. You know what you'd consider wrong so you can ask him what's wrong, and bang – you'll get all kinds of withholds and so forth, and that's dandy.

All right. Let's move it out just a little bit further. You're a member of the human race and you're checking – security checking a member of the human race. Well, you get past the language difficulties; you could dream up a security thing. You could – you know, you know enough about it – vaguely, other races and things – and you could dream up something. Even if it was only "Have you ever done something that a Chinaman would consider immoral?"
You know, you had to be that stupid about it but you could still brace it in somehow or another here and get it through.

All right. Now, let's security check a monkey. Well, what do monkeys consider moral? What do they consider immoral? I don't know. I haven't talked to one lately. But they go on a monkey code. They must have one because they all behave alike as a species. Don't they? Well, they must have a moral code of some kind or another which is a racial code of some kind.

All right. How about security checking a blade of grass? I can show you that a tomato will register. I can show you that a cabbage will register on an E-Meter. Well, the only problem there is not just how to get in communication with the cabbage? See, that's not the major problem. That's not the only major problem. The other major problem would be well, "What does a cabbage consider immoral?" That's from a Security Checker's viewpoint. I imagine "Not to be eaten," or something. You never know about these things.

The basis of which you operate must be the viewpoint of the pc, not the viewpoint of the auditor – the only point I'm trying to make here. You must – you must security check from the viewpoint of the pc, always. Doesn't mean you've got to be in his 'ead, but it means you've got to do some dream-up.

All right. If this person was a WRAC, was a WRAC for years, and the incident you're security checking and the zone of confusion – the prior confusion that you're security checking – finds that she has been a WRAC for some years. What is the moral code of a WRAC? Who knows? Well, you could ask some questions about it. You could dream it up.

"Have you ever spoken pleasantly to your commanding officer? Have you ever failed or refused to make catty remarks about a sergeant?" See? Who knows what their moral code is? But it might be immoral, see, it might be immoral to apparently be on good terms with your sergeant.

See? It might be. All kinds of wild things might be going on. You're not sure, because there are different standards of survival. And the standards of survival can be so different that there it is. It's laid out in front of you. Your work is cut out for you.

But you always – the rule is, you always security check within the moral structure of the pc, not the auditor. You never security check within the moral structure of the auditor. You just make a damn fool of yourself if you do that. You sound like a parson yapping. You've got a moral code. Well, what's so moral about it? I don't know. But there it is. You got a moral code.

Now, all moral codes tend to propagate themselves and people try to force other people into a moral code within a group, and so on. So an auditor does have a latent impulse to force some old moral code of his off on the pc while he is security checking. It's perfectly all right to force any moral code you want to on anybody, but not while you're security checking. You security check by the moral code the pc has violated and you'll get some terrific case gains. You'll get that tone arm coming down, and so on.

Well, I've given you two excellent methods of doing this; they're very, very good: your Problems Intensive to find areas of confusion; your Dynamics Assessment followed by a Se-
security Check along that particular dynamic line. I think you will find these things are quite productive of interesting results.

The question very often comes up, extremely, "Well, aren't you just running perpetual withholds, withholds, withholds, withholds? Aren't you running withhold on the Prehav Scale?" No. It never flattens; it's one of these total duration. If you've asked somebody, "Have you withheld anything from George? Have you withheld anything from George? Have you withheld anything from George? Have you withheld anything from George?" Yes, that will flatten and that will run out. But "Have you ever in the last two hundred trillion years restrained a communication or restrained a reach or restrained anything? Have you ever done this?" I'm afraid would take a long time to flatten.

Now, it is much more rapidly flattened if you say, "Have you ever overtly acted against or withheld yourself from some moral code that – ?" so on. Now, we've got what his real withholds are. We can get those out. So it flattens as fast as you've cleaned up all the moral codes which he has violated.

How many groups has he belonged to? I don't know. It's an inexhaustible amount. Fortunately, you don't have to do it that particularly to get a good result.

Now, there's one thing more here and that is the subject of the use of "blame," the use of "make guilty," in Security Checking and the ways of doing that. And there's one more item: is the use of critical thoughts in Security Checking.

Blame has nothing to do with a Security Check. Just forget it. It's just a part of the Prehav Scale. It comes under the heading of irresponsibility, by the way, not under the heading of overt and withholds. To "make guilty" – I notice there's a tendency to ask people if they have ever blamed anybody as a Security Check and so forth. And this just doesn't exist. It isn't anything. It's nowhere.

Now, if you ask somebody "Have you ever made anybody guilty of...?" and Security Check question – if you ask that bluntly just like that, your chances of getting a factual answer are something on the order of a roulette wheel in Las Vegas. There it is. Because the thing that is wrong with your pc is that he or she has never really succeeded in making anybody guilty of anything, anytime, and they are still trying. And the basis of their aberration is the effort to make others guilty, not the fact of accomplished guilt. You always use "tried to make guilty," "attempted to make guilty." Such words as that must modify this "made guilty."

"Have you ever attempted to make anybody guilty of rape?" That's a perfectly proper Security Check question.

"Have you ever made anybody guilty of rape?" Well, this is Las Vegas. This girl and – I don't know, she's been raped by the firemen, the police; she's been raped by most anybody and everybody, and just been raped for years. And all during this period of time, she has been saying, "You beast! You dog. Get thee hence. Take thy dark shadow away from my doorstep" and other equivalent remarks, less ladylike, in an effort to make fellows guilty. And she has never succeeded in doing it.

And you ask her, "Have you ever made anybody guilty of rape?"
Well, this is nonsense. No, she never has. That is the answer and that's the reaction you'll get on the needle. No, she never has. Tried for years. Never succeeded yet. [laughter]

But you ask, "Have you ever tried to make anybody guilty?" Ahhh, well. Now, that's a guilt of another hue. And you'll find your tone arm is reacting to that one. It can go up and down and back and forth. Do you realize that the only reason anybody has a victimish, motivatorish attitude is just an effort to make somebody guilty. But remember, it's only an effort to make somebody guilty. It is not successfully having done so.

Now, you can actually produce a considerable change of mental attitude on the part of a pc by saying, "Now, all right, get the idea of your mother and father standing in front of you and saying they're so sorry, and then have them fall away and die. Thank you." And the person will just cheer up.

There's a tremendous effort to accomplish that exact end. There's a tremendous effort. Everybody has it. It's not singular. They've got something they wanted to make somebody guilty about and they haven't ever made it. And it's still hung on the track.

So it's always "try to make guilty," it is always "attempted to make guilty." It is always a modifying word of that character and it is never, "Have you ever made so-and-so guilty?"

You ask a judge in sessions. You take him and you say, "All right, judge," and you put him on the E-Meter. And you say, "All right. Now, judge, we're going to find out if you ever made a prisoner guilty." And it gets no fall. Man, he has been sentencing them to be hanged, he has been sentencing them to prison, he's been banishing them out of the society, he's been shooting them from guns for years and years and years. Why, they've been sent to Old Bailey and Wormwood Scrubs, and here they go. And he's never, in his estimation, succeeded in making one feel guilty. They always have the insouciance as they walk out the door, "Well, I really didn't do it," you see? "And he's just a dog. And somehow or another, I will bear up with all this," see?

He's always got this as his image: he didn't succeed in making the fellow guilty. He pronounced sentence. You say, "Have you ever pronounced sentence?"

He will also say, "Yes. Oh yes, I've pronounced sentence, pronounced sent..." You probably won't get any fall on the meter either. That's what he's supposed to do. Pronounce sentence.

But you say, "Have you ever tried to make a prisoner guilty?" The thing will fall off its pin. Just run by the hour.

You just – well, how many prisoners do you want? Just one, two, three, four, five, six, seven, eight, oh, Joe and Pete and Roy and masses, masses and masses of prisoners. Because every time one of these ones would come up accused of some very hideous crime, he didn't think his punishment was adequate half the time or he didn't think the person would experience it in any way, and he's busy pounding with the gavel and screaming at the fellow, "Hang him by the neck until he's dead, dead, dead!" And the prisoner looks at him, you know, and goes kind of white and walks away. All the judge gets is a reaction after that, that somebody won't speak to him now. [laughter]
See, the fact of making the other fellow guilty may have been accomplished, but the person seldom finds out about it. May have been accomplished. But what he does know for sure is that he attempted to.

You could get a great deal of response, but it's always "try" and "attempt."

Now, another little point I'd like to bring up about Security Checking is a debatable one – this isn't a clear-cut point: whether or not you should ever take an unkind thought as an overt.

I say it's debatable just for this reason: that sometimes it's the only thing that is available on the pc. Apparently you can find nothing else, but they thought an unkind thought about somebody and that was an overt and they withheld it, and it sort of frees up. And it – a few of these gotten off will make the person feel more friendly and so on. Yes, there's some reaction to it.

But apparently – and this is not on my own observation – but apparently, there is evidence to the effect that a person with a body of unkind thoughts against something or somebody has an actual overt which he is wi... or she is withholding underneath those unkind thoughts. And just like you see a little flag waving above the powder mine, you go along and flutter at the flag, you see, and you don't pay any attention to the mine, you just don't get anything done about it, you know? You just monkey with the flag, you know? "Well, I had an unkind thought." So you make the flag wave a little bit more, you know? And factually, there's a powder mine there.

And you say, "What have you got underneath this here critical, unkind thought?"

"Nothing. I have been a pure, honest, good Samaritan, washing my feet properly morning, noon and night, and drying it in my wife's hair. I've been doing all the moral things I should be doing" (you'd be surprised how many moral things there are), "and I have never done anything in my whole life to that person and I have no withholds of any kind."

Well, there's little plumes – there's a couple little openings we're going to have to put in up here when we start this type of Security Checking to let the smoke out of the E-Meter because it's going to react.

So there is evidence to the effect that if you get some unkind thoughts, you ought to whistle up for the bulldozers and the cranes and the big grab hooks to reach in and find out what the devil the overt is because the unkind thought is apparently the indicator which shows that an overt and a withhold exist. And if you audit unkind thoughts in Security Checking as themselves, you are doing the same thing as leaving a Security Check question unflat.

So this is another reason, apparently, why a pc can be given a Security Check, and they get off a lot of unkind thoughts, unkind thoughts, and then all of a sudden, why, the needle gets all gummy, and they just don't feel so good and they aren't so good, and so forth.

Well, actually, the unkind thoughts were indicators. The little flag was waving in the breeze, and the auditor never really asked a comprehensive question such as, "What have you done to William?"

"Nothing" – thooong.
"What was that? What are you withholding from William?"

"Nothing. Nothing but his inheritance and his wife and all of his baggage and a few things like that," you see?

But it comes up as "Well, I thought William's tie wasn't so nice today, so that's a big overt." Actually, those things are not sufficiently important. They are not adequate to aberrate anybody; they won't do much for a case. But they are indicators. And there are several things in life which are these little indicators and something big lies under them.

Now, it isn't necessarily true, though, that the pc can get to it at his state of case now. It's something that you could kind of – you may not even get a reaction on it on the meter. It's too unreal to the individual, see? But a little X across over in the border on the Security Check indicates to you that sometime, someday this pc is going to come up the line and then you're going to find out, "Well, William ..."

Well, actually, he didn't do anything to William, really. But when William was dead broke and didn't have any train fare, he made him walk from London to East Grinstead. And when he got to East Grinstead, and so forth, had made sure that the place that was going to employ him had a bad reference on him. Yet he hadn't done anything to him, you know? And it was in the rain. And he got pneumonia and died. [laughter] Otherwise, he's done nothing to William. But pcs are not good at facing up to overts, so they miss them in that particular character.

All right. Well, there you are, and I hope this gives you some more data, some more interesting insights in Security Checking. But remember that Security Checking belongs in the category of metering. And unless you operate the meter, Security Checking is a very dangerous pastime, and I wouldn't attempt it if I couldn't run a meter.

Thank you very much.
Thank you. Well, you're lucky people. You're lucky. [laughter] You are. You don't know it but you are.

What have you done in the last two hundred trillion years to make you this lucky? [laughter] Hm? Now, what have you done?

_Female voice: Got smart enough to come here._

Aha. Got smart enough to come here. All right.

[part missing]

Now, your immediate, direct business today which is the – what is this? The 7th of...

_Female voice: 7th of November._

November, AD 11. All right. Your immediate, direct business today is Routine 3A and the talk I'm going to give you is totally concerned with Routine 3A and you should have in your possession HCO Bulletin of November 7th, 1961. This is one of those rare occasions where the lecture, the bulletin, the data and the cases are all assembled [laughter] at one point of conjunction.

Now, may I call your attention to a safety table which I think was the 26 October – hm?

_Female voice: 29th of October._

29th of October. The safety table – what it is safe to process. Well, it is safe to process a goals terminal. It's quite safe to process one. But it's not safe to process any other than a goals terminal. Therefore, the only people who should run Routine 3A are, of course, those people who have been trained, and the only terminals that should be run are those that have been checked out by a graduate of Saint Hill, period.

That puts a sort of a limiter on the amount of auditing done until you realize that I have simply said checked out. Checked out. That takes those zones and areas of the world that are too lazy to send anybody to Saint Hill or something of the sort and that leaves them unclear, but they can go ahead and beef up their banks and have a ball.

But we're not going to worry about them. Our next concern after this is after all of the bad assessments have been done and all of the bad runs have been done and everything is all messed up, how to salvage a case that has been put into that condition by auditing which is unauthorized.

And I call to attention a Class II at this moment is the only authorized auditing anywhere in the world where a Saint Hill graduate is not. That means all the field. That means all
organizations, and so forth. That means Class II, which consists of Security Checking, problems, getting rudiments in. There's tremendous numbers of things that can be done under Classes I and II, and we've been doing them for years and getting good wins on them. So why everybody has to stretch up against a Class III activity is a little more than I can comprehend. Because when you get up to this level of Class III, if you don't know your business you can really tear somebody to shreds.

Now, hitherto we have been running Routine 3, and this is one of those milestones in a line of research and we cease as of now to run Routine 3. It has ceased and desisted. We will never again run Routine 3. It is ended because it is modified.

And the modification of Routine 3 is extremely simple and all it consists of is simply adding a step to Routine 3. There is just a step added in.

Now, in Routine 3 we found a goal. And we did this by getting the pc to do a list or we wrote down the list the pc gave us. And we didn't do it, by the way, by taking the pc's list and then filing it and saying, "Well, of course, the pc doesn't know what's wrong with him so his goal can't be on this list, and so we put this away in the files. Now we get another list and we ask him if he has any more goals. And we can't find any more of those goals. So we try to find were the rudiments out. And then, of course, the rudiments are out. Nobody can get the rudiments in. And so – and you don't have to look at an E-Meter either because it doesn't know either." And then decide that the person has lots of marital difficulties so that their terminal must be, of course, a husband.

That is not the way we do – did – should do such a thing. What we do is get a goals list. It's all too elementary. I get at this point and I go into a little bit of confusion about this point, because I never can quite guess what people are going to add to something. They can always add something like, well, what I just said, you know: "The pc never knows what's wrong with him, so therefore his goal that he gives you couldn't be right, and you have to make up a goal for the pc." Don't think it hasn't been done. I mean, that's how they miss Goals Assessments. Terrific invalidation and all that sort of thing.

But we learned in Routine 3 that it was very difficult to get a goal. We learned that you had to get a goal with the rudiments in, in, in. And we had to be very careful of this, and we had to not invalidate the pc, and we had to be very, very sharp in getting our goal. And nothing of that is altered in Routine 3A.

In fact, it might now become just a little bit more difficult. Because we have found another piece of the puzzle.

Now, having found the goal – having found the goal, by doing an assessment as in steps 1, 2 and 3 of Routine 3 – A, also – same thing. We got it checked out of course by somebody else. We made sure that this was the right goal. And then we asked the pc, in Routine 3, what terminals would answer up to that goal, and we had cause and effect type terminals. And we made lists of these. And then we assessed this by elimination, and we finally came up with one terminal – only one terminal sounding. Just as we had only one goal remaining in, then we came up with one terminal remaining in. And that thing stayed in and was not sporadic or fluctuating. It always gave instant reads. That was the pc's terminal.
And then we assessed this on the Prehav scale and having assessed it, we put together a – found the level of the Prehav scale and we put that into a five-way bracket. And having put it into a five-way bracket, we then ran the pc on this. Along with this, we, of course, did Security Checking. That's Routine 3.

Now, if you've learned Routine 3, it is absolutely nothing to do Routine 3A. There's a wild difference between these two Routines, but not in the way you do them.

Now, we come to this problem with Routine 3. Difficulty of assessment. Skip it. That is merely a matter of auditing skill. You can assess or you can't assess. You can audit or you can't audit. I mean, that's all there is to that.

Given assessment and then assessment of terminal and then run on the Prehav Scale, we had only a small percentage of the people running in this particular fashion going Clear rapidly. Why? Why? What was this – rest of this percentage? And this has been my action and activity through April, May, June, July, August, September, October of 1961. Why?

They all would – apparently running on the right terminal. They all obeyed the rules of terminals and so on. So we went off into hidden standards and we investigated that very thoroughly.

And we did a lot of good for cases, and we found a whole new chapter in processing. And we found out that you get the prior confusion and blow off the stuck circuit, and you could do a lot of tricky things with this hidden standard. We learned how to take problems apart this way.

And actually right now all you have to do is just find the prior confusion to an out-rudiment, and the rudiment will go in. I mean, this was a big gain. So it's easier now to get rudiments in. If we just did them by prior confusion, we would get our rudiments in. These were wins and cases ran a bit better. We had the idea of group mores and that the individual was breaking down a third dynamic mores, and all of a sudden we have moved Clear from the status of first dynamic Clear through second dynamic Clear to third dynamic Clear. We've gotten that far.

In other words, we're cleaning up the first, second and third dynamic. Clears made prior to this date are beautifully cleaned up on the first. And just between ourselves, they sometimes act like it. So without graduating somebody up through a first dynamic Clear, we can at this particular stage of the game ... That's no crack on the thing, but I have actually had some backlashes in this direction that were very first dynamicy. They're very reasonable, but very first dynamicy which was no objection on my part. I never rolled them under because of it, but that was the way it was.

And we have here – we're looking at a third dynamic Clear, particularly in Routine 3A because we're going to run it in this particular direction. We keep broadening this concept of Clear and we keep broadening the stability and the expected stability of Clear and we keep shortening the number of hours to Clear. And shortening down the hours to Clear has been my main action, but it also has "Let's just knock out all of this slow gain." And I have been fighting on that research front here all during this summer, working with students and so forth. Notexperimentally – we were always doing exactly – where we were going and what
we were doing, and the most that we knew. But all of a sudden, all of a sudden there was a violent blue spark, and it went from one corner of the Saint Hill to the other corner of the Saint Hill, and it left ozone behind it all the way. In short, I had a cognition of some magnitude. What on earth keeps a goal hanging? Why does a goal – why is a goal alive at all? I mean, how has this goal come down the track endlessly, endlessly, endlessly, endlessly, eons and eons and eons. What is keeping this goal there?

Well, we know of only one mechanism that does this. Only one mechanism does this, and that is the mechanism of a problem. Problem definition: postulate-counter-postulate. And because they're postulate-counter-postulate, the thing gets suspended in time. In other words, you have a postulate, and that postulate would just evaporate unless it had resistance.

And there are two postulates counter-opposed, and each one of them are of equal force, so if these two postulates are of equal force, you get something hung up in time.

The way you can unsettle this postulate-counter-postulate, of course, is very easily, as we have recently discovered, just find the area of prior confusion. And of course, it weakens or strengthens one or the other of the two postulates as you get the overts and the withholds off, and the thing tips over, and the problem disappears.

But let's look at the difficulty of keeping a problem alive – the great difficulty of it. It has to be two balanced forces. Otherwise, one force overbalances the other force and ceases to be a problem, becomes a solution or ceases to exist.

We have a husband and a wife, and they have fought, and they have fought, and they have fought. And finally one of them gives up. They don't fight anymore. Maybe they aren't – maybe one of them isn't happy, maybe the other one isn't happy; but that's beside the point. They aren't a problem any more. They're a solved situation. It's a solved area. Or they get divorced and separate, and they aren't a problem any more there either until an auditor comes along to it and tries to settle why they're having difficulty in their current marriage. And he finds this past marriage still hanging fire somewhere in the bank.

But the problem has to have two more or less – two or more, more or less balanced, forces counter-opposed. You have a bull weighing twenty-seven hundred pounds with his forehead pushed up against a bull weighing twenty-seven hundred pounds. And these two bulls are pushing with twenty-seven hundred foot-pounds of thrust. And they're trying to collapse their heads into each other to the depth of one foot, in other words, but there they are.

And if you consider them from the standpoint of a problem, there they would be. There's nothing going to happen because one twenty-seven hundred pound bull is pushing against one twenty-seven hundred pound bull. And unless somebody makes their foreheads skid or trips one bull or something like that, there they are going to stand in the pasture. Now, that is a problem. And that is the problem. And that is the anatomy of a problem.

When the pc says to you, "I have a present time problem," and you get a fall on your meter and so forth, this is the kind of thing that's happening. The pc's effort to go in some direction is being countered by an effort of him not to go in the direction or somebody else's effort to go in a different direction. And these two forces are counter-opposed. And you get an nonresolved situation. It's nonresolvable. It is not nonresolvable as some pcs would have you
believe. It just doesn't happen to be resolved because it's in counterpoise. And that's what happens there.

Now, you run off, of course, the pc's end of this, and it then will cease to be, very often, a problem with the other party. Now, why does it cease to be a problem with the other party?

Well, it takes two twenty-seven hundred pound bulls. And you've just taken one twenty-seven hundred pound bull and you have either made him go up to three thousand pounds, you see, or you have headed him in an opposite direction with regard to this sort of thing. And of course you don't have postulate-counter-postulate now. You have something else.

And the other person who has the other side of the problem in present time, of course has nothing to push against, and so that postulate evaporates.

You see why this mechanism exists. This happens very often. I mean, all too often for just happenstance.

We process a pc on her family. And we process her on her family, and we spend hours at it and so on. And we finally finish up, and she seems all cleaned up on the family. She's not worried about her family now. She doesn't – not trying to make her family guilty, or not not make her family guilty. And there she is, and she suddenly receives a letter, a telephone call or something. And it says, "Dear Amy, All is forgiven. Come home." Or something like this will occur, you know. It's quite amazing.

One particular instance, there was somebody worried about money disappearing out of the cash box in an organization. Money disappearing out of the cash box. Money disappearing out of the cash box. This person was worried about it. Blaming herself. Blaming herself. Blaming herself for money disappearing out of the cash box. Couldn't figure out how the money was disappearing out of the cash box. Thought she must be guilty about it. Worried, worried, worried, worried, worried. Got it run in an auditing session.

The second that she had it run in the auditing session, almost within the hour following it, the person who had been taking the money out of the cash box came in, paid the money back. Mysterious, wasn't it. Well, apparently, the person worrying about it all the time, and force and so forth, had this interlocked in some peculiar way in the theta universe in some fashion where nothing resolved. Nothing was happening. Now, there we're getting a little esoteric. Do you see? That's a little bit out beyond the understandable boundary.

But we have this, of course, as the most obvious thing: There's the husband, and he goes home. And he has an awful fight with the wife, and they chop each other up. And then the husband gets audited. And then all of a sudden, why, he's nicer to the wife, or she hasn't got anything to push against. Or she's baffled, she has a new problem maybe – "Who is this?" You know? [laughter] Something on that order. And of course, the problem has ceased to exist by very material understanding. I mean, we can understand how that problem would cease to exist. We've changed one of the protagonists.
But how about this other one? Five thousand miles away the girl's family haven't written to her for years. We process her on her family and all of a sudden the family goes into communication with her. This happens all too often.

But these are all examples of things suspended in time. As long as you've got two interlocked forces, you get a time suspension. And when you're dealing with the mind... This is not necessarily true in the physical universe. These two bulls actually are moving on the time track. But in straight thinkingness, there is no apparent motion on the time track where two things are interlocked.

You've got postulate-counter-postulate, and it's all mental, so it's not really tied down to the physical universe anyway. And it just goes on drifting in time. Well, an examination of this demonstrates that there must be something on the other side of the goal. If this person has had a goal for the last eighteen trillennia, what has kept it there? You see? That's just the – how come? How come it doesn't as-is? How come he never realizes it? How come he never backs off of it? How come he never quits on the subject? How come he never wins on the subject. It just stays there. He's got a goal – "to pick gooseberries" or something. And there it is.

And if you'd put him on a meter six trillennia ago, I'm sure that you would have gotten some kind of a reading "to pick gooseberries," you see. Well, how come it stayed there that long?

Well, it's the same anatomy as the problem. There is on the other side of every goal a thing called a modifier. The exact definition of a modifier you have in this bulletin: "A modifier is that consideration which opposes the attainment of a goal and tends to suspend it in time." That is a modifier.

Just as you have the husband fighting with the wife and the wife fighting with the husband, and their equal velocities of fighting, then, suspend that fight in time, in the same way, let us think of the husband as having a goal and the wife as the reasons why he isn't going to make one. And you get their counterpoise, then, carrying forward the whole thing as a problem, don't you see.

All right. Or let us say the wife has a goal and the husband is damned if she's going to realize it and so in similar circumstances you've got this whole thing carrying forward in time. In other words, you've got these two people locked horns to horns and they're not moving. Well, a person's goal found by a common Goals Assessment – you don't do anything different in a Goals Assessment. You do it the same way you have always done. When you get the list of goals and so forth.

The next step to that is to find out how come it is locked in space. And you find out how it is locked in space by finding the modifier. Modifier is a technical term. I invite you to use it as such. You could call it lots of other things, but we don't happen to have called anything a modifier, so it doesn't mess up our [laughter] – it doesn't mess up our nomenclature. But it certainly does modify the goal. And that's what it sounds like when you get one. The thing it sounds most like is modifier.
Now, in doing Routine 3A, after getting your goal proved out and totally checked out on the person, you would then do a list of modifiers. This list, I think you will commonly find, is very short and I think the modifier is very easy to attain. But the reason the modifier does not come about is by the pure mechanics of its not-as-isness. It has a characteristic of not as-ising. It's a denyer.

If you know your old Dianetics, all pcs have denyers. And they'll go running along through an engram, yoppety-yoppety-yoppety-yoppety-yoppety-yoppety-yoppety-yoppety-yop, and then skip. And they obviously – there's something else went on there. And then they go on to the end of the engram, yoppety-yoppety-yoppety-yoppety-yoppety-yop.

And when you finally find this middle of the engram, it'll be something like, "It isn't here." You know, somebody has said at that point, "It isn't here." Or somebody has said, "Well, nothing is happening just now." And the pc runs down the engram, hits this "Nothing is happening just now," never notices it because, of course, nothing is happening just now.

In other words, they take it literally, dramatize it, and it becomes truth, you see? So if there's nothing there, why, of course, the pc never runs that part of the engram. And after you've run it and run it and run it and run it and run it, a clever auditor in the old days would eventually ask for the bouncer which made him get out of it or the comeback, the pullback, or something like that. He'd ask for one of these types of phrases. And amongst those that he asked for was a denyer. Something that says it isn't here. Something that says it doesn't exist.

And he'd ask, "Is there a denyer there?"

And the pc would say, "No, there's nothing here."

And the clever auditor would say, "Repeat that."

And the pc would say, "All right. There's nothing here. There's nothing here. There's nothing – well, what do you know? That's my mother talking. She is saying, 'There is nothing here.'"

Similarly, I have – you can get phrases and that sort of thing, and meanings and senses, doing all kinds of queer things.

I ran into a case one time that had sonic only on one section of the track for one instant. And he always had sonic at that point of the track. And you run him along through engrams and so forth, and he had no sonic, but he'd get into this one particular incident which he just couldn't seem to run, by the way. And he kept it around; it was a good showpiece. And run it down, and just before the sonic turned on, we finally found out, it says, "Get away. Listen."

And the pc, of course, listened, and he heard for the next few words. He'd hear pure sonic for the next few words. He'd hit this bouncer, and then he'd hit the listen command, and then he'd have sonic for a few words, and then the sonic would disappear.

People can become totally obedient to this type of phraseology. An old-time Dianetic auditor knows this very well. There's nothing – not much mysterious about this, but people who have – later on the line, have never had too much experience with this particular type of phraseology and so forth. So when I tell you that all modifiers found so far were denyers at
the same time, you'll realize why the pc's intelligence doesn't go on over into them. They're all a "It isn't here." See, they're all a "Doesn't exist."

"But you couldn't have any money anyway," you see? "But you couldn't have" – that is one. "But you couldn't have any money anyway; they would take it all away from you."

Well, of course, the pc states the goal. And then there's the rest of this thing over here. If it occurred in an engram, that would be the way it is. Occurring as a goal, he runs along and he says, "Well, the goal is to rob banks."

And you say, "That's fine." You assess it. You go find a terminal for it and everything else. Well, "To rob banks," but there's a little more to the goal, and it's a denyer.

"But you couldn't have any money, and they would take it all away anyway." See, so that end of the goal disappears. That's a disappeared end of the goal. Now, actually it doesn't take any real skill to get these modifiers once you've got the goal. The skill is to get the goal. The goal is what is important here.

But as you get to step 4, you ask the person to make a list of modifiers. Maybe there'll only be ten of them. Maybe there'll only be one. Maybe they'll come up with the first one, bang! And so on. But they get maybe eight, ten of these modifiers.

They've got a goal: "To play a violin." And you find that all assessed out. It proved out just the way you've been doing it. Now, when you come to step 4 here, you say, "All right. Now, what would make that goal difficult to achieve? What would be the consequences of achieving it? What would make it impossible to realize that goal?" And write down anything the pc says and make a list of these. And that list – you don't write down "To play a violin and - " so forth. You just write down "and" and the remaining tail, you see. Just write down the tail. Don't keep chugging the goal down his throat because you'll never be able to assess the modifier if the goal is in as part of it.

You've got to assess the modifier – the tail of the cat has got to be assessed all by itself. You keep saying the goal each time, and of course you're going to get – the thing will stay alive and you'll never find the modifier because the goal, of course, and the modifier react alike. You've got to assess the modifier as itself.

"To play a violin." And you've got that now. You've got it all proved out. Everything is fine. Now, you're going to come back to step 4, and you're going to ask him, "Well, what makes it difficult to do that? What would make it impossible to do that? What would be the consequences of playing a violin, and so forth?"

And every time he says something that this would be, you write it down on this list. And of course the pc actually is much more likely, if you've got the actual goal, to give it to you. Just bang! you see. And it's just a matter of whether or not it's an "of" or an "as" or just some little wording change.

So you write it down every way that the pc tells you, and you've got this list of tails of the cat and their modifiers. And now you turn around and assess those, and you assess those by elimination just exactly as you assessed the goal. But don't call the goal off every time
while you're eliminating them. Because, of course, none of them will ever eliminate if you keep calling the goal. You just want the tail.

All right. And you finally find out "to play a violin, but all the strings are missing." You know, the pc's intelligence never gets on to that type of a phraseology because it's missing. There's no way you can get to it, the pc will tell you. You're liable to get into arguments with the pc, but he says, "But there isn't any more of it. There isn't any more to the goal, you see."

And then eventually he'll say, "Well, it – well, it does seem there's something missing here. Oh, I see what it is. Oh, well, yeah. Well, it's 'to play a violin but all the strings are missing.'"

Well, that's the modifier: "All the strings are missing." And you write down "All the strings are missing." And then you say, "Well, is any other thing that'd modify and keep you from doing this?"

"Well, 'the instrument is gone.' That might be it. 'The strings are gone.' Or 'to play a violin that doesn't have any strings on it.'"

All right. You write down "doesn't have any strings on it." You see, you write down any way he phrases this thing. All right. You get a dozen of these things or whatever it is.

You ask him if there are any more modifications than he has given you. You get no knock on the meter. You get no knock on the thing You've got the modifier list.

Now, you simply go down this modifier list, one, two, three, four, five, six. Just do it by elimination. Just read them off to the pc the same way you assess goals, and you'll find that one is left alive, and that is it.

Now, having done that, you combine the goal and modifier. And you write that down. You combine the goal and modifier. That's step 6 here. And you combine the goal and modifier as the question for the terminal, but it's "to play a violin but all the strings are missing." And that was what proved out.

Now, you want to know "Who or what would play a violin with all the strings missing?" [laughter] Now, this is very tricky stuff you've got with this sort of thing. Because it gives you a different Terminals Assessment than a plain Routine 3 Assessment. It gives you a realer, completely real, terminal to the pc which scoops up, if you've done it right, all of his hidden standards at the same time. That's what I've been gunning for.

Now, it is true that the terminal the pc has been running – which was "to play a violin," and you have assessed out "virtuoso," and "virtuoso" did prove out. There's no doubt about it. And you've been running "virtuoso."

And "virtuoso" has been running, and it runs hard, and the pc goes vague on it, and there's sort of circuitry stays in, but the pc goes through it, and you're winning, and so forth. Well, there are many explanations for this, and I don't particularly care to be nailed down on the exact explanation, but I would say that you had, offhand, a more general terminal, or you had a terminal too early on the track to as-is easily, or something of this sort. You've got something else. It is on the goals terminal line, there's no doubt about that!
But you probably have the original form, or you've got something there. And the earlier you go on the track – you might know this rule – the earlier you go on the track, the tougher the energy masses are, so you get a rougher run. And you've been running "virtuoso" very nicely, but "to play a violin with all the strings gone" ... And of course you assess, "Who or what would play a violin with all the strings gone?" and of course we get something of the order of "a circus clown."

And then you assess it, "circuit," "clowns," "clown," well, it's "a clown." And you've got it. It's "a clown." Well, maybe it's a very decayed form of the terminal you were running originally, but it runs like a bomb because it's very close to the pc's reality, and it's very close to his circuits. So it runs more easily. And you'll find out it integrates more easily to the pc.

I'm not trying to tell you that Routine 3 terminals are wrong. If they are, hang me but it doesn't matter. All I'm trying to tell you is that they are apparently very resistive. They are quite hard to run and the pc bucks into them and he goes through big energy masses. And most of this to me is the symptom of trying to run too damn early on the track. Trying to run into the whole problem all at once.

Because look, if he had this goal for a while, and the goal was actually a pure goal, you, of course, would get a different kind of a terminal for the pure goal than the goal modified, you see. Now, you've got a different kind of a terminal. You may have a kind of a degraded type of terminal. You may have a different terminal anyway. It'll make different sense to the pc. And it actually assesses faster, and you will get a faster Terminals Assessment with it.

So you take the goal modifier – you say, "All right. Who or what would play a violin with the strings gone?"

Well, obviously, you could have got hundreds and hundreds of terminals for "Who would play a violin?" but you don't get too many for "Who would play a violin with all the strings gone?" "An idiot. Uh – a clown. Uh – a party cutup. Um – a fake." You see, a few things like that because it's so restricted. And you get a much shorter list. And it assesses rather easily.

So now you make up your terminals list combining the goal and modifier as the question "Who or what would (goal plus modifier)?" "Who or what would play a violin with all the strings gone?" And you make a nice list of these, and then – just exactly the way you've handled any other Terminals Assessment – you do this one now by elimination, and you'll wind up at the other end with a terminal, which is the only terminal in the lot that would react on the meter.

Now, you, of course – there are several things you could do. Now, we get in, because we accumulated more technology, we were doing it the hard way, we accumulated a lot of technology to do it the hard way, you could do several things. You could address it to groups with this group type of command. You could address it to – you could simply date it on the time track and find a prior confusion to it and do a Sec Check on it, and you'd probably blow the whole goal terminal mess.

You know, "When's the first time you ever ran into a clown?"
"Oh, well, that's different. The first time I ever ran into a clown – yeah, who was trying to play a violin with all the strings gone. Oh, oh, oh, well, you mean that, that type of clown. Well, all right. Let's see. That particular type of clown, well..."

And you could probably date the thing and you could find an earlier area of confusion and so forth. You see, a door opens there. You get easier processes. Or you could run the terminal on a Sec Check sort of business, or fool around with that. Or you could find out how you wouldn't make the terminal guilty and how the terminal wouldn't dare make you guilty, a negative-guilt run. I can just think of dozens of ways to handle this exact situation. Why? Because it handles exactly as a present time problem handles.

You're now getting rid of goals and terminals with the modifier in there – you're getting rid of them on the same basis that you would get rid of a present time problem. So how many ways are there to handle present time problems. Well, it'd be that many ways to handle a goals terminal. It all becomes – should become at that moment very comprehensible to you.

You know that a present time problem is rough to handle. You know that it's sometimes very difficult to get rid of them. You know very often that they blow very easily. You know several processes that get rid of present time problems. They don't dismay you. You know that they take a little bit of monkeying with sometimes and it takes some two-way comm and so on. So don't be surprised if any of these things went. Don't be surprised if any of these things blew the goals terminal, see. So there's no reason for me to say didactically there's only one way to do this. No. We have just opened a wooden door and found that an iron door was there. And then we opened the iron door, and we're on our way, you see. There are many ways to do this.

Now, the proven way to do this is to assess on the Prehav Scale, get a five-way bracket and do a run. And that is a proven way to do that. So that is the way we will say you had better do at the moment. Because it shouldn't be too long a run. It shouldn't be as difficult a run as you've been doing.

All right. I just wanted to make it plain to you that there are other ways that you could handle the same situation because I think now you can understand what a goal is and what – how goal stands in space, and then, therefore, what a goals terminal is.

A goals terminal is something that epitomizes both the goal and the resistive modifier. That would be the goals terminal you're looking for. It's the thing that epitomizes both of these things in one terminal.

Now, we admit that at one time or another one terminal had the goal and another terminal had the modifier and that there was a collision someplace along the two, and so forth.

We admit that there – you could dream up all sorts of anatomy to all this, but where the pc is concerned, he never as-ises postulates which aren't his own. And we must consider that neither the goal nor the modifier are the pc's if they're still in suspense. They must belong to a terminal, ha-ha. You see that?

Actually, it's just the goal has been hanging out like a little, tiny red flag showing what the terminal was. Now, when we get the modifier, this really puts an enfilade fire on what the terminal is.
In other words, we got two tags on the terminal now. So we can get a more finite, squarely placed type of terminal. And admittedly, the terminal may be later on the track. Admittedly, the terminal may not take care of the entirety of the entire entire. But it'll certainly unbalance the goals terminal modifier – pardon me, the goals and modifier situation. That'll certainly become unbalanced. And as fast as it does, you can expect a blow of that goals modifier situation. And as soon as that situation is gone, you of course are in the position of being able to do another complete Routine 3A. As soon as you can't get a knock on the goal, you can't get any reaction out of a terminal anymore, and you can't get any reaction out of a goal anymore and you can't get any reaction on a modifier anymore, that's it. You test all those things.

Now, how you do a repeat on this thing might prove a little more complicated than Routine 3 because you got to check the modifier and then check the goal. And then check the modifier and then check the goal again, before you give it all up. Because you could be fooled if you didn't.

You check the modifier. Now, the person has blown the terminal but still has the idea. You check the idea and the person looks at the idea and that idea sort of surges. You see, you look at the goal, let us say, and you get a surge on the goal. Now, the goal has surged, so you say, "Well, it's still alive, so we'd better do something else." No, no. It's not. It may not be at all.

You check the goal, then check the modifier, and we get a bang, bang, surge on the modifier. Now, we go back and check the goal, and we find it isn't there. Then we go back and try the modifier, and we find it isn't there. Because they will still stay hung up, and you've got to check both sides a couple of times to get them separated. The pc may still hang onto the idea after the terminal has gone.

You see, the pc's been living this life for a long time. But if you checked it off that way and thereafter couldn't get the goal to react and couldn't get the modifier to react, and then couldn't get the goal to react, and couldn't get the modifier to react; you get all of your rudiments in. You get all these terminals that you had. You check over all these terminals the pc also gave you. Make sure you got all that old terminals list straight. Then we'd better get all the rudiments in like mad and we'd better check that goal again. We'd better check that modifier again. We can't get any tick out of them. We can't get any tick out of any of the rudiments. Then you go into a new Routine 3A. You got it? And you just go right down from the beginning again.

Of course, you use the pc's old list, the first goals list the pc gave you. This has to be assessed again. You will now find that some of those are alive. You naturally add to it anything. But you do the same thing you did, see. But instead of having pc write a goals list, your next run on this is take the pc's original goals list and anything that you added to it in assessing it. And then you add various types of goals to the list – you know, new goals. And then you assess the whole list locating a goal by elimination. And then you go into it again. You ask for modifiers to that particular goal.

Now, when you've found the modifier for that goal, then you get a list of terminals for the goal and modifier. You assess the list of terminals, and here we go again. But I don't think
you're going to be able to do that very much. I think after you get the first one, two or three, all of a sudden you're going to start getting blow, blow. And you'll find the goal and you'll get the modifier and it unsettles the two. And you never get to a Terminals Assessment. And you go boom, boom. And there you're left with empty hands again. And you keep on blowing these things, and I think you'll eventually blow most of the pc's goals list.

I think every one of them had a modifier. Tiny one that was overridden by the fixation of attention on the goal, don't you see. But once the goal is gone, these other ones start getting a little bit live, too.

Now, that's the way you would tackle this picture, and that's Routine 3A.

Now, you get – let's take a case now that has been run with a goal. And let's say that goal was "to be a willow wand." Let's look over here, and we find that some cases will have just a modifier and we will have gotten the modifier before we got the goal. Now, I'm just only prepared to find that. I haven't found it, but I would be prepared to find it.

The person has come up on the goals list with a modifier. And you've got a pc sitting there who has a modifier. Now, you have to find the goal. But the goal will be right adjacent to the modifier and probably be in front of the modifier and not – instead of behind the goal. Let's say somebody has one – well, let's put something fairly factual: "To leave all hospitals alone." And we've gotten this as a goal. And it checked out on the goals list. And that's what we have: "To leave all hospitals alone."

Well, hey! You know, that really sounds like a modifier, doesn't it. So what's on the beginning of this thing? That's what we want to know now. We'd come over and we'd say, "All right. Well, what would you want to be doing which would be modified by leaving all hospitals alone and so forth? What would be the front end of this thing?" I think you'd probably come up with the terminal or some terminal that the pc has already given you. You got the idea?

It possibly is – let's say the terminal was "a willow wand" and "to leave all hospitals alone." Okay? "Leave all hospitals alone," and you want the goal. Well, the pc assessed out on a terminal, "a willow wand." Well, it may be something on the order – you just ask the pc about it and sort it out.

"Who would want to leave all hospitals alone? Why or whatever – what other goal would a person have? What goal would this modifier modify?" You know, ask him any type of question which is just straight on. Explain to them anything that you want to explain to them, but try to get the front end of this thing, and you possibly will find it's "to be a willow wand and leave hospitals entirely alone."

Now, your terminals list is no longer the pc's terminals list. It's going to be different. And you say, all right. "Now, who or what would want to be a willow wand and want to leave all hospitals strictly alone?" And it doesn't make any sense to you, but it'll make sense to the pc. They've been living with it for trillennia.

Now, you'll get a very finite terminal. You get a very sharply defined terminal. It'll be distinctly different and well within the pc's reality of the situation. You should – that's what you should do.
Now, I don't know that that has happened. And I haven't any case histories of that happening at all. I am just prepared for it to have been done. I'm just saying, well, there's a possibility here that after you've done – I mean, in the future not just in the past. And you've worked and slaved, and you've sweated away, and you've gotten your goals list, and your goals list "to always jump out of second story windows." All right. Take it as a goal. And write it down. But remember, it's probably the modifier.

Now, just how you get around to that other end of it will be proved out in time, if we have to face this problem. I'm just facing the problem before we come to it.

And you say, "Well, what else – what else would this goal consist of?" No reason to work hard at it. The pc very well might give you something idiotically simple like "Well! Well, to burn down houses, of course."

And you say, "Well, what would that consist of?"

"Well, to burn down houses and always jump out of the second story window." "Didn't I tell you before?" is liable to be sort of the idea behind all this.

Now, these goals that are total occluders like "and never find out about anything." If you had a goal like that, "Never find out – to never find out about anything." It sounds to me like they were – they wanted to or wanted to be or wanted to have, you know, and never find out about anything. See, that's the whole goals modifier situation. So these things could be found backwards as well as forwards.

As I say, I don't know of these conditions. I've no experience with that at this particular time, but there's a provision for it.

All right. Now, how about the terminal that you are running on the pc right now? Will it do any harm whatsoever to leave it unflat? I don't know of any harm it'd do to leave it unflat because certainly the horribleness of this situation is this: is, that which is unknown to the pc, he tends to dramatize, he tends to be aberrated about. That which is unknown to him and is close to him and influencing him, he tends to be aberrated about. All right. What about this?

Well, if you've got a terminal on the pc and it's "to collect gold bricks," and we audit this pc, and the pc says, "Well, I'm very sad, and it makes me very apathetic" – and we go on auditing the pc and gradually they climb out of this, but every once in a while he mentioned being apathetic about it and they're not quite happy about this and so on – when we get the modifier, we are very likely to find out "and to act apathetic enough so nobody will find out I have them." See, "to collect gold bricks and to act apathetic enough so that nobody will find out I have them," see. That's the modifier.

Yeah, but by having the goal, you've been kicking the goal, kicking the goal, kicking the goal and of course it's restimulating the modifier all the time. So the pc is acting like he doesn't have any engrams, acting like he doesn't have any bank, acting like he doesn't have any anything, don't you see, apathetically. It's all part of the modifier situation. Interesting, huh?
Well now, I think possibly some goals have been found which are the goal and modifier. I think this condition already possibly exists. "To be a willow wand and have everything go crazy." That's obviously a goal-plus-modifier situation.

There's numerous conditions of this, but if you just get down the basic anatomy of it, you're all set. You've got to find a goal. See, you've got to find a goal and that's just routinely. And then, having found the goal, you've got to find the modifier. Or if while doing the goal you got only a modifier and it was only the modifier available, now you've got to find the rest of it which is the goal. You've got to get this package.

And then you've got to get the terminal that fits both. Your pc may have a struggle giving you one that fits both or he may not. But the terminal that fits the both of them, of course, is giving you seven-league boots in the direction of clearing because it's got both sides of the problem. And it's got the individual who epitomizes both sides of these things and you should be able to roll along with it rather well, rather easily. It should be a faster run, in other words. You haven't lost any ground, particularly. You've just won some ground here in this particular wise.

Now, we take – what I want you to do if you have found – if your pc has a goal, well, just enter in here – you've already got the goal proven out – I don't care if they have a terminal and it's been run or anything else – just enter in here at step 4, take that goal, compile a list of modifiers, and go right on down the remaining steps of Routine 3A. You'll find you'll shortcut this situation.

There is the rest of the package is what you've got to find. Instead of running off one-half of this thing to unsettle the goals-modifier situation ... You see, actually, it would unsettle if you just ran off half of the problem. It's a longer run. Let's find the one that unsettles both sides of the thing simultaneously and is contained in one person. And I think you'll find in that all of circuitry the pc's been packing around and all of the hidden standards and anything else will probably be combined in these things.

This is not very hard to do. This is not very hard to do. It shouldn't take you very long. I'll go over it once more. I just – you know what the pc's goal is, and just say, "Well, what would make that goal difficult to attain?" "What would make it impossible?" "What would be the consequences of attaining it?" Any such question as that, or if somebody's heard this lecture, say, "Well, what's the modifier to your goal?" It's as elementary as this, you know.

And then you make a whole list of these things, you see. And when you've got your list done, just assess 'em by elimination. Then you find yourself with your goals – goal plus modifier. And now that whole thing, by the way, will react. It'll react very nicely. You never saw a goal react as nicely as when it's combined with a modifier. Bang! Bang!

All right. Now, take that goal plus modifier and ask for a terminals list: "Who or what would want to be a willow wand and jump out of second story windows? And, you know, who would want to play a violin without any strings? What would? What would play a violin without any strings?" and so forth. And he'd give you a very short list. Doesn't matter whether the list is short or long, the idea is just to get a complete list.
Well, you shake that list down. You shake, of course, the modifier list down. You say, "Well, are there any more modifiers?" You get no reaction on the E-Meter. Similarly, when you've got your terminals, you say, "Well, are there any more terminals that you can think of now?" Well, that's blank.

All right. Do your Assessment by Elimination. Get your rudiments in, of course, frequently and routinely if you want to do a smooth, fast job of it. Do your Assessment by Eliminations, and you'll wind up with his terminal.

As soon as you've got that terminal, the easiest way to handle a terminal and the one that you understand best is to assess it on the Prehav Scale and you will find that there it sits, and put a five-way bracket together or something on that thing and just run it. And it's simple. There's not too much to that.

It requires auditing skill, however, to do this. This is what fools the untrained, relatively, or partially trained auditor. Everything I have told you sounds very simple. And it is very simple. But that is the trouble with it. So many things can be added to it, so many complications. And what people always neglect -- and they won't admit this about themselves -- is good auditing requires a superb auditor.

You have to have good auditing skill -- just the mechanics of auditing have to be excellent -- in order to audit. And you can't do one of these things with a halfway-through-HPA mechanics of auditing. That's all.

I mean, your pc is too far out. Your rudiments are too far out. You're juggling with the E-Meter in one hand and something else in the other hand and trying to smoke a cigarette at the same time with your feet on this window sill. And just somehow or another you just can't seem to get anything to work so you eventually -- and you say, "Well, it's perfectly all right." Don't know the Auditor's Code, you see. You say, "It's perfectly all right. I know what this person's modifier is. I know what it is already," and evaluate for it and say, "Well, it's actually 'a husband.' That's what I ought to be running. Assess for a husband, you see, and just kind of pick out the level at random and put it in the command and run it all."

Yeah, obviously the person has done Routine 3A, only there's no visible result. It's all mysterious. It takes weeks and weeks and weeks to do the Terminal Assessment. They just can't seem to get a terminal, or the terminal they got -- you get ahold of a sheet they did the terminal on, it hasn't got any marks on it. You say, "Well, what is this? What is it?"

And they say, "Well, that's the terminal list."

"Well, what did you do with it?"

"Well, we picked out the best terminal, of course." [laughter]

It's the complications that foul this up, but basically, as a hidden background to all of this type of activity, is superb auditing skill. It is good auditing presence. It's being able to hold a pc in-session.

Why so particularly with this? See? I mean, you can go halfway through an HPA Course and give a Security Check and miss a question, the guy's upset for a couple of days,
and somebody else gets the question and straightens it out, and so forth. And everybody lives, you see. And it's all all right. But what makes this so peculiar?

Well, in the first place – I've been asking this question, you see, myself from the first time it happened that Peter – who I just got through training in running a course in South Africa, and he got well trained running that course and he did very well and the students did well and Peter goes home to Australia and he has a six-weeks course – I think it was during the first week we had nearly all the goals and terminals. We were very upset because there were two or three students that didn't have any goal or terminal at the beginning of the second or third week down in South Africa, wasn't it? Oh, we were quite peeved. And he goes through six weeks, and I don't think he had enough goals and terminals to put in your eye. He had three or four. He made two Clears on a particular unit which was very well done. But he didn't get any goals and he didn't get any terminals worth a nickel.

And it's worried him sick. He says, "Why does everybody take forever to do it?"

And I was sitting down here at the beginning of this summer and so forth and everybody was having such an awful time doing it. Relatively skilled auditors. So we started shaping up auditing skill. That's what we started working on – the smoothness and the skill of the auditor and sure enough, when I finally got down to it just relatively a month or two ago (a couple of months ago) I said – you remember how discourteous I was – I said, "Well, you're in a games condition with the pc, and you just haven't got the rudiments in, and that's all there is to it and find them." Remember? Everybody all of a sudden busily got the rudiments in and bang-bang-bang, everybody had their goals and terminals. Remember?

It's a crime now if at the end of two weeks of two-and-a-half-hour-a-day auditing when we haven't got somebody's goal and terminal; it just seems to be very, very peculiar. And we begin to think of the case as peculiar and we wonder what the auditor is doing, really. And so on. Lots of questions get asked. Well, what is that basically? That's twenty-five hours of auditing.

If it's gone twenty-five hours without this result, why, "What? Oh, don't tell me that case hasn't got his goal and terminal yet. Hey, wait a minute. What's this?" And it's just all based on this one thing: Superb auditing skill. That is all.

Why? All summer long I wanted to know this burning three letter word why. It's because every time you ask for a goal, the modifier restimulates and the modifier is usually a disability. It's as silly as that. So you're walking uphill the whole distance that you're doing a Goals Assessment. But, of course, it becomes dead easy after you've got the goal and the modifier because you're no longer kicking against the modifier.

Let's say we're looking for this goal. Now, we don't know what the goal is. We have a list of two hundred goals and we don't know what the goal is. But beforehand, before we find out what the goal is, let us take a future peek with a crystal ball, and we find the goal is "to be a lute player and hate everyone horribly."

Well, that's fine. Now, we're looking down here, and we finally get down... We've gone across "lute player" every time we turn around and we go three or four goals further than
"lute player," and we found that the rudiments all out. Why? Well, the pc is hating everyone horribly.

Now, we don't know that the pc has got this as a goal and we didn't even know the modifier was there. So as we come down the dress parade, see, we keep crossing this. And every time we hit the goal, we restimulate the modifier. So the pc goes out of session.

Now, in view of the fact that all the other goals on the list have modifiers, too, look at the potpourri which finally finishes up here. Oh, we find this pc ARC breaks with the greatest of ease and we finally find out that we have dug up a goal which says "to be a lute player and hate everybody horribly," and we had "to hate everybody horribly" in full restim the entirety of the Goals Assessment, right down to the time when we got it as a modifier. It's right there.

And you have to be good enough as an auditor and smooth enough as an auditor that this thing never has a ripple to get moving on. It's got to be done perfectly. And when it's done perfectly, it never, of course, knocks. And if it does, you put it straight back in place. And you get down to the end of the list with perfect auditing, of course, you found the person's goal and terminal rather easily.

Ah, but let's look at somebody else someplace who is not that well trained. Every time they drop the command, drop the ball, drop the E-Meter, let the cigarette go out and so forth, and make noises as they remove and take off and put on their shoes, you see, during the auditing session, and some things like this, and just miss, miss here and there, you know, like – well, miss clearing the command and miss starting the session, and, you know, few misses of that character. And what happens?

The pc goes dus-duz-uzz-uzz, you know? Because remember, even though you don't know it, you haven't pushed the pc into this valence. The pc was sitting in this valence all the time from the moment he walked in and got his first auditing. He is solidly in the valence. And the closer you get to the valence, of course, the less he is in it, but until you've got the whole thing, you're living right on a borderline. You see, you're not in it, you're in it and so forth. And if there's a hidden part of it that you're never mentioning, that thing will just start going alive like a small volcano.

And anything you do which crosses the goals-terminal-line mores throws the thing into full panoply. So here we go. And we find him hating you horribly. He doesn't know why.

"Never, never find anything anyplace." Well, of course, this makes a tough, tough assessment. But what do you know? You can actually assess across such a level. You can actually assess across such a modifier.

Now, let's say we had a modifier like "and never to let anyone come close to me, ever." Oh, man, think of what that would do. You'd do a sort of a detour around the goal every time. You'd get down toward the goal – now that it's position is known by the pc reactively – you get down toward the goal. The second that you got on the goal, you'd get an ARC break just before you got to the goal. Or you'd get something going here, and you'd never – the pc'd never be reached. He would have made his modifier. It isn't his goal. It's his modifier.

So you finally get the goal, but the modifier is still there, so the pc is therefore hard to audit. So I can get you to look forward to some much easier auditing. It isn't so difficult to get
the terminal or hold the pc into a Prehav level run if you've got the modifier. That becomes very easy auditing.

Why? Because the fangs are gone out of the situation. You're just auditing both sides of it. The pc knows full well it's "to hate everybody, horribly." And he'll even make a wisecrack at you. You'd better not make a wisecrack at the pc. [laughter] The pc can always make a wisecrack about his own ... There's a little rule in this that's almost a technical fact. The pc can always joke about his own goal or terminal, but you'd better not. [laughter] You get some of the sourest looks. It's quite amusing.

But anyway, there was the trickiness back of it all. But this doesn't say that it requires less trickiness in the future. It requires the same amount or better auditing to get that goal. Particularly if the pc knows you're now going to pull his modifier, and the pc is liable to sit there saying, "Well, let's see. Oh, that's my goal, huh? To be a lute player. Well, that's pretty good. I wonder what the modifier is. Hm, do you suppose it's so-and-so, so-and-so, so-and-so? I hate everybody horribly." Pc is kind of doing a self-audit on it, you know. And you've got to hold him in line and get it anyhow.

So it might be a little tougher to get the goal than it was before on somebody that's aware of this. And it might not be. But some of you are going to laugh madly about the final modifier that appears after your goal because this is the craziest thing anybody ever heard of. It'll be something that makes it just – it's just the complete volte-vis. There you were minding your own business and all you wanted to do was play the violin and so forth. And yet there's this whole long tail on this kite – particularly hit people over the heads with it or something like this, you see. Or "to play a violin so that I will never under God's green earth become God." Oh, that kind of thing, you see.

It's "so I will never become," "so I will not have," "so it will not happen." These are all deniers. Now, the mechanics, the basic mechanics of this, are pretty easy to see. You don't have to say that these things were implanted into the pc. You don't have to say they were. You don't have to figure it out this way – or that the pc implanted it into somebody else.

The pc will immediately realize that this makes quite a game. But in the past, when you started to run the game out, you were running up against the modifier. And the first few levels of the Prehav Scale would find a pc pretty – feeling pretty bad because the modifier was in and it wasn't as-ising.

But the games condition involved with it gives us a great understanding of it. The pc has a goal "to build" or "make violins," let us say. Well, what do you think happens in the course of existence? The person goes on for millennia and he's a good violin maker and he's going to make violins. What do you think'll eventually happen? He'll eventually, certainly, pick up a packaged counter-postulate, won't he? Thetans being thetans.

For instance, we're building a beautiful fireplace out here. People have been coming by making the wildest cracks about that sort of thing. You've got to be awfully careful because it – the estate bricklayer is about to drop a brick or two on their heads, you see. But it's a perfectly nice fireplace. Very effective and so forth. It hasn't got any of its trim or anything, so it merely looks massive. But they can't see something like this happening as a forward goal without adding a counter-postulate. You got the idea? They just can't do it. They're in a games
condition with life, and any degree whatsoever, why, somebody says, "I would like to teach cats to race." Somebody – the least somebody's liable to say is, "Well, it's been tried," or "I don't think it'd be easy to do that." And if you had a mother or a father who was particularly in a games condition with life, everything you said got something of this order, don't you see?

So your overt, of course, is that you've been doing it, too. And one gets into this sort of thing – somebody has an ambition to shoot your head off, you're liable to get a counter-postulate on the subject. And you're liable to say, "No, you shouldn't have such a goal." And you're liable to dream this up in such a way, "Well, only madmen have goals of that character."

And eventually you could see that the person would wind up with a goal something on this order: "To shoot everybody's head off, even though only madmen do it." You see, he'd get the same combo. He'd get – the goal and the modifier would get united to some degree.

Well, that's all well and good, and that would apparently work out all right, but there's this other piece of nonsense connected with this thing. One must have overt on the person who has the goal and modifier. See, it's the other person that has done that, and the overt of the pc are against the person who has the goal and modifier. It's very complicated, isn't it. Somebody else has to have the goal and modifier. Otherwise, if they were the pc's terminals, they would have as-ised. I mean, if they were the pc's ideas or postulates, they would have as-ised right now. But they haven't; they're still stuck there. So the other way of sticking them is to have them in a terminal.

And you get the goal plus modifier in a terminal which doesn't have the postulates that the pc has, see? So the postulates, goal plus modifier, belong to a terminal, and now the pc is against the terminal. And that's the way you get that out. The pc's overt and other rambunctiousness against this terminal and the overwhelmingness of the terminal toward the pc, eventually winds the pc up in this terminal which has this goal and modifier.

We can see how the goal and modifier got together. That's very easy to see. But how did they get perpetuated to this degree so they never got as-ised; well, you put them in a valence, see, and you had nothing to do with the ideas of the valence and of course, they didn't as-is. That's about all there is to the mechanics of the situation. It's not actually a very difficult, mechanical situation. It's more humorous than not, because once you start looking over the modifiers which are actually on the ends of the purest of goals – why, this goal is the purest, sweetest goal you ever saw. You could just hear Brahms playing in the distance, you see. It's just marvelous, but it winds up with something like "and never tolerate anyone if I can kill them first," you know. See, or something weird like this, you see.

"To benefit all children – " I just leave it up in the air. [laughter] What you can count on is that it will be a denyer – there'll be a denyer about it. It'll be something missing about it all. The thing will be worded in such a way as to say it isn't there. And that it will modify the living daylight out of it and it'll give you an entirely different, more finite real terminal picture which is very central to the pc's immediate case and worries.

All this is pretty easy. Do you find anything difficult about it? HCO Bulletin of November 7, 1961 covers all of this data. I've been going over it with you because I want you to
do it now. As soon as you audit your pc again, I want you to perform those actions just like that.

Now, you can go ahead and get these things checked out and go through them as before and so on because they're relatively easy to check out. You think you can do this all right? This thing – this thing looks pretty simple. All right. Might not look simple to you. Does it look simple?

*Audience: Yes.*

All right.

You can see that a funny thing has happened here is: the front end stays as hard or even harder and all of a sudden the routine gets much easier down toward the end. Well, let me say that this thing only works when accompanied by Security Checks.

I was rather interested in a very well known auditor who won't come near anybody for any training. Hasn't for years and years and years and years and years. And he was insisting somebody find his goal and terminal for him. But he wouldn't have it done if he were going to get a Security Check, too. And somebody has actually consented to do a Goals Terminals Assessment on that person on those conditions. I imagine the tail end of that goal is "to get help and kill myself in the process," because he actually would know better than to do something like that – even him. But I think that's quite amusing. So a Security Check must go along with Routine 3A, and you'll find the most fruitful Security Check that you can run on a pc – it requires a bit of an imagination and skill – is to do a Dynamic Assessment on the pc. We've been doing this – you've been getting this in your auditor's report notes and so forth, and I've not said too fabulous much about it. But if you can get a Dynamic Assessment and get the dynamic that is out and then compartment the dynamic – I gave you a lecture on it but I'm just saying you do this off the cuff. You don't need a lot of paraphernalia. And sec check that dynamic smartly on the pc, you actually will pull what the pc considers withholds. You will pull those much more strongly.

And I'd like to add one more note. This is almost enough discoveries for one lecture, wouldn't you say offhand? The Earth shakes when you look at something like this. I actually – I feel a little bit contrite about suddenly giving you a steer to this degree. It was quite startling to me that a piece of the jigsaw puzzle was sitting right there. There was a missing piece of the puzzle right there that was making it much harder and it was making it much longer and much more arduous. Yeah, you can do it by running out one side only, but it is evidently much harder.

Now, there's another piece of the puzzle. That's enough, and I should say nothing more about it, but I can't forbear, as long as I brought up Security Checking, to give you an interesting little discovery on the subject of Security Checking.

The person who will not – I found this out the other evening – a person who will not admit to overt or withholds or react on overt or withholds, will react on a direct not-know question. You know, they don't consider it an overt, really, and they don't consider they have a withhold and the sec check question would be clear, otherwise, will apparently react on a whole channel, particularly on another person with a not-know question.
But it's a simple one. Not the original not-know version that came out two or three months ago, but a very simple version such as – well, let's say we're security checking an employee, and we'd simply say, "Well, what doesn't your boss know?"

Now, you could have said, "What have you done to your boss? What have you withheld from your boss?" and you wouldn't have gotten any reaction on the needle.

But if you say, "What doesn't your boss know?" Or "What have you done that your boss doesn't know about?" You get needle response. That's quite interesting. That's an interesting thing to know. Just this little piece of stuff.

As you go down the line, you'll very often find this girl. She's been very unhappily married for years, or find this guy and he's been having an awful hard time, and you say, "Well, what have you done to your wife?"

And he says, "Nothing." He's never done anything to her? "Well, what have you withheld from her?"

"Nothing. Never withheld anything from her."

And I can put this little slingshot in your hands which is "Well, what doesn't your wife know?" BOOM! Evidently it isn't a crime, but it's an awful reaction because it's a basic disagreement. You're asking for the most fundamental disagreement there is – the reason the trick works. He knows something she doesn't know. And, of course, that's the most fundamental disagreement there is. And of course you're asking right at the center of overt and withhold. And after you've got these off, don't be surprised if he explains it all to you that these are overt and that these are withholds, and you do now get reactions on overt and withhold. Never considered them overt and withhold. Never considered them overt before. But now, after you've stripped this one little question off – just "What doesn't (blank) know?" is the clue to all of this. That's the wording that goes into it.

You're liable to get all sorts of ramifications to the whole thing, but they will eventually come down to needle reaction on it. It's a good thing to know, good thing to use.

All right. Finishing off this data on Routine 3A, who is to use Routine 3A. Well, I would say anybody who has been thoroughly trained at Saint Hill can use Routine 3A. Who else can use Routine 3A? Nobody. Is that plain enough? I think we'd save an enormous number of casualties by just laying it down right there. And of course, having laid that down and having publicized it broadly and so forth, just look at the people you could make guilty when they come limping in and saying, "Well, I went around to Glutz up in Chicago. And they get your bulletins regularly. They're sent in to them by the AMA [laughter] and so on. And they found my goal and terminal all right, and ran me on it. And then ever since that time I've had this – this – this odd – this odd leaping sensation, and so forth." Well, at that time, remember you at least have the solace of being able to make them guilty also, and say, "Well, why didn't you get the cotton out of your ears the time you were told nobody was supposed to use this except certain definitely trained auditors?"

Okay? Well, it's all yours. Go ahead. I'm not going to – probably tonight, aside from one or two, I'm not going to do too much with your reports. I'm going to be very interested in tomorrow night when you've had a crack at all this. Okay?
Female voice: Thank you.
All right. Well, it's all yours.
Thank you very much.
CHECKING CASE REPORTS

A lecture given on 8 November 1961

Now, this is what? The 8th of Nov. 61.

Yeah. A hundred years ago, man and boy, I was just getting out of VMI and joining the Confederate army as a young, dashing second lieutenant. Well, times change! [laughter] Now, we are hitting a beachhead of a different character.

Okay, 8 November 61, Saint Hill Special Briefing Course. And you have never seen me do any of your case reports of one kind or another. And I'm going to go over these case reports. And that's going to step on some of your toes, and that's going to let your pc in on what I think of you as the auditor, and that's probably going to upset the pc because he will say in tomorrow's session, "Well, Ron said ..." [laughter]

But I think it might be a little bit educational to you if you saw how this was done and so I made up my mind that I had better make a lecture on this particular subject at this time. All right?

Okay. Now, usually these things have a Sec Check in them, but the Sec Checks have already been marked and so we're not going to do any Sec Checks because tonight's Sec Check has not yet been done. We are just going to do the daytime auditing.

And this is Routine 3A is what is being embarked upon here and we've got a Routine 3A started on many people whose goals have already been found but who have to yet have the modifier found which may mean some variation or change in terminal, but not necessarily.

Sometimes you get the modifier and you get the same terminal and sometimes you don't. But let's take up some of these reports and see what happened today.

Now, this is a report here, Fred Fairchild auditing Carl Wilson, and he says that, "This modifier was not checked out and the auditor didn't see the notice. And should it be checked straightaway. And pc's attention will now be on terminal."

Well, that all depends on whether or not it is the modifier. And as far as checking out is concerned, it's always a pretty good idea to get somebody else to check something out. See? It doesn't – you shouldn't get this down as a special Saint Hill routine that takes place nowhere else. If you find a goal or a terminal or a level or something like that – not so much a level, but certainly a goal, and in this particular case a goal, modifier, terminal – whether you get them checked out every time you find each piece or before you start in desperation to do a run, get the goal, the modifier and the terminal checked out, all at one time; certainly get it checked out by somebody. It doesn't matter whether you are here or someplace else.

Why? It gives you a certain amount of confidence. Somebody else has taken a look at the thing. It has given you some sort of a feeling that you won't be going off the deep end when you start auditing it. It's a good thing to do, don't you agree?
Now, similarly, every time rudiments cross-checking, see, has been done, cases have made very nice progress. So in an HGC or a center where a great deal of this – of goals running particularly and that sort of thing is going on, if rudiments are cross-checked, why, that would be a very good idea. But to have the Director of Processing cross-check every rudiment on every pc every day is, unfortunately, already indicative of a mess, because the D of P, Director of Processing, never gets a chance to do anything else.

Now, we've already had one tied up in Washington, DC. I didn't realize that they had him strapped to the chair checking rudiments, strapped to the chair checking rudiments. He never got anything else checked. Never got any cases run or anything important like that and his administration dropped behind gorgeously. Well, a much better solution was just to have staff auditors check staff auditors' rudiments, that's all.

The best time to check rudiments, by the way, is midday – not beginning of the day. Why? Well, it works like this: The first auditor the fellow gets that day... See, he's all grogged up, and his basal metabolism is by the boards, and he has got eighteen present time problems, and he is anxious to unload his case, and he hasn't had much auditing lately anyhow – all these things in a sort of a monotone. He isn't too familiar with any of the auditors in this center anyway, and auditor Doakes walks in and sits down in the auditor's chair. That's the pc's auditor for the day, that's it.

Although he then gets up and leaves. You see? You get the idea? In other words, first crack out of the box, all of his anxieties and worries, that he's been thinking up all night are in – he wants to unload these things on the auditor and he's put on wait by another auditor so he can elect that auditor – he can elect that auditor his auditor, and all that auditor is doing is checking his rudiments.

So end of session, or in the middle of an auditing day, or something like that, is a better time to get a rudiments cross-check. In this particular case, the smartest thing to do here, of course, would be to go ahead and find the goal. See? We have no great suspicion of this particular auditor, and just let's let him go ahead. He's got the modifier, the pc's attention is now going to be on the goal – well, there's various reasons why the modifier might not get checked out properly – well, just let him go ahead and find the terminal. And now let's check out the goal, modifier and terminal. Let's get somebody else to check out goal, modifier and terminal before we run anything on it and then we've got a sweeping checkout. That would save time anyway.

So, you could either check them out one at a time as they're found, which of course – if you're operating with very tyro auditors, who are – you know, they're looking at the meter and they say, "Now, let's see. This is the tone arm and when the word 'Hubbard' turns red ..." [laughter] It's a good idea to check out their rudiments three times every session, check out their E-Meter, set their E-Meter so it will read on the proper readings, and hold their hand while they audit. You see, all these things would be there. And to check out the goal when it is found, the modifier when it is found, the terminal when it is found, the Prehav level when it is found and the Prehav level checked every time it is changed. All of these things would be desirable.
But what are you doing? You're adjusting the amount of checking you are doing to the quality of the auditor. Right?

Well, the limiter on this is that before anybody runs anything desperate – you know he actually runs this terminal and so on; any auditor, even me – it would be a nice thing to have somebody else look it over, you know and say, "Well, it checks out! It checks out all the way with me, too." Why? Well, actually, one auditor and another auditor can have different effects upon the pc that can throw the case one way or the other. You see?

Rudiments come under this heading exclusively. Rudiments. Well, rudiments can be in for Joe and out for Mary any day of the week, you see?

So if you have two auditors checking the rudiments of the pc, you know pretty well you're not going to be running the pc with rudiments out. So that has very little to do with auditing skill. It has a great deal to do with a pc's reaction to male, female, auditors with blond hair, auditors with green hair – all these differences, you see. Has a great deal to do with where the pc is being audited, too. It's always better to check a pc's rudiments in another auditing room; but this isn't convenient.

Sounds wild but it's true. It isn't convenient. Of course, you do get him set for the exact auditing room he is in if you check his rudiments in that auditing room where he is going to be audited. But of course, you would detect it much more rapidly that a case's havingness was by the boards if his havingness was out in any room. That point, you could labor far too much.

The point is that on the broad things, before you commit yourself to a long run, you should get checked out the things that have been assessed. Now, whether they're checked out one at a time or whether they're checked out all at once has very little to do with it except this: that inexperienced auditors – auditors who haven't got very much experience – will waste an awful lot of time on the wrong – on finding the modifier for the wrong goal, and then finding the wrong Prehav Scale for the preclear – not the Prehav level but the Prehav Scale; they've got the ... [laughter] It can go pretty far wild. So whether you check them piece by piece is determined pretty well as to what auditor skill is present. And this auditor's skill, of course, is good. So we would just let it go, let him go ahead and find the terminal and go on. So I'll just mark this thing: "Find terminal and get goal, modifier, terminal checked out." [writes]

All right. Now, that's enough for that.

"And the modifier that dropped and react – or reacted most and stayed in: 'But it's someplace else.'" That's a doll. That's an absolute doll. That's a perfect type of modifier. That is a classic case. "But it's someplace else." Of course, a person goes down the line and he gets to this phrase "But it's someplace else" so he never enunciates it. See, that's a nice one.

That's interesting because I was interested in this particular case. I take an awful lot of interest in these cases as pure interest. If you don't mind. [laughter] And I wondered and wondered what this particular goal ... May I say what this goal is?
Male voice: Yes, go ahead.

But I wondered and wondered what was going to modify this particular goal, because every time the pc came toward this particular goal, he kind of – sparks flew out of his ears. He didn't like this one, see? And I wondered and wondered what it would be. It's "to work on radiant energy and field phenomena." And the modifier's – is – doesn't make too much – well, it makes sense, but it – "but it's someplace else." So, of course, you can't work on something that is someplace else. And that's apparently what has been falling and what's made this goal hang up. And you get this, that here you've got an ambition to work on radiant energy and field phenomena, which is counterbalanced with the fact that you can't because it's someplace else. So, of course, this locks up every place the goal is applied because it doesn't have anything to reach, but it is actually balanced. That's a textbook example. That's very nice.

And whether it's the right one or not is – whether it's the right one or not, he said, "He had been telling me that he didn't think anything would happen in the sessions, and I noticed this session he seemed to be more in-session and didn't say this." Okay. Interesting. Were you interested in that particularly?

Male voice: Yes.

All right. Okay, regardless of all that, we've got a terminals list started on this and here we have – here we have now a goal, modifier, and we get a terminals list and we get all three of them checked out. So that's it.

The other thing I always look for: Was there any TA action? Now, you normally look for TA action on the thing during the run. You look down the line here and find out what the TA action was. And because he was too interested in the assessment, the auditor here wasn't putting down very much TA read. Ordinarily on a run you put down lots of TA read and on assessments you sometimes flub it. It's a good indicator. So put down lots of TA reads; only err on the side of – always put down enough tone arm reads.

Says, "It was varying from 2.5 to 2.0." The tone arm was varying from 2.0 to 2.25 on his – beginning of his Terminal Assessment. I guess that's what that is.

All right. Now, this general case run here appears to be all right. I was just looking here. You always look up at the top. You see "Goals: none," you know very well that a pc is running with rudiments a bit out, with withholds, with an ARC break – something like that. A pc who tells you they have no goals for a session, and so forth, they must be sitting in some kind of a bit of an ARC break. [writes] See, so on that adjudication I would write down here: "Get your rudiments in." See? It's very clever crystal-ballin' on my part. Pc has no goals for a session ...

There's certain little rules that you follow along these lines. It's like reading profiles. I can look at a profile and tell you whether or not the pc's havingness is up or down, whether the pc has found the auditor or not. Has nothing to do with the textbook about the profiles. It has a great deal to do with something else.

Okay. The pc, of course, feels a little bit bounced around and is having a little bit of a rough time but I have every confidence that he'll straighten out on it and recover. Okay?
Okay. Mary Sue generally, lately – she used to do these mostly by herself. And she'd sit up till four, five or six o'clock in the morning – that's an exaggeration; it was only three-thirty usually – and she would sit there and do these things all by herself. And as soon as I spotted the fact that we did have a breakthrough here and I could shove your cases and your auditing much, much harder, I started to do these things individually a short time ago. I'd always been interested in them and spot-checked them and kept an eye on it and took them up with Mary Sue. But she lately has been relaxed enough to be able simply to hand me the folders. [laughter] She's very good at that. [laughter]

You know why she's very good at that? Because believe it or not, she can tell me the goal and the terminal and the levels run and what process is being run on and what Sec Check is being run on any case out of twenty-six just like that. [snaps fingers]

Female voice: Very good.

It's fantastic, you know. Almost as good as I used to be. I used to remember every engram verbatim that I ever ran off of a pc. And I could tell them years later, and they'd stagger, you know. [laughter]

They'd come in and they'd – somebody I hadn't seen for years, you know, but I audited them years ago – and I'd say, "How are you getting along?"

"Oh, I'm getting along fine."

Say, "Well, did you ever hear any more about that birth sequence?"

"What birth sequence?"

"You know, the one that I audited, you know, where the doctor was wearing the green hat."

"By George! You know..." [laughter] pc had forgotten it but I didn't.

All right. We had Doris Lambright being audited by Ellen Carter. Well, we've got goals here: "To blow off a headache and confusion blowing around my head," and so forth; and evidently they made the goal some better. "To be able to duplicate tapes on one hearing," "to pass tests quickly and easily," and so forth. Good. "To be Clear and finish the course," and "Finish course by January 1st and get back for the congress." Okay. Very good. Okay. I don't see what this is all about here. Apparently Wing Angel – apparently – audited this pc at some time or another and the pc was hung up in it in some fashion.

The way you'd get that, by the way, is to clip the prior confusion, not the auditing. What was the confusion that preceded this. You know, you find what's wrong with the pc and then you get the prior confusion. You know? You get the confusion before it. Don't go monkeying around too much with this sort of thing.

And I don't know whether the auditor did anything about this or not, but that would have been the proper thing to have done. May have started when this auditor was auditing her. Well, there might have – must have been a prior confusion to the turn-on. It might have been a minute before and it might have been five years before but it's prior. That you're sure of.
So spotting the prior confusion to that would have clipped it out. And you, at your stage of training, could consider this as a fairly routine activity. You find the pc is worried about something in the rudiments, and that sort of thing. And they've had some kind of a somatic and ever since, such-and-so. And ever since their great-grandmother died, and so forth, on the sacrificial altar, or whatever it is, why, they've had this somatic. You can get the prior confusion, you know. Well, what happened before that? Do a little tiny bang-bang-bang Sec Check on the thing and blow it. And you can get very clever at that and if you can get very clever at that, you will pull some miracles off that kind of look wild to other people.

By the way, it's – the British auditor is reaching a new low for me. Do you realize that Charlie Drake, the comedian, lost his memory a couple of weeks ago? Still lost!

Who hasn't been up knocking on his door and doing a Touch Assist on his skull? The easiest thing you could possibly do! Now, a Touch Assist, of course, violates this prior confusion. Those are not hard words; that's just a joke. But I should think that somebody by this time would have gone up to BBC and found out where they could find Charlie Drake and gone over and done a Touch Assist on him.

We did one here just a few days ago – boy was seeing triple, wasn't – couldn't remember very much and was mostly blathering. Did a Touch Assist on him for an hour and a half, I think, or a couple of hours – for two ...

_Eleven voice:_ Two and a half, but it had cleared up on two.

Two hours or ... ? Yeah.

_Eleven voice:_ Two hours.

Yeah, just did a Touch Assist on him. His triple vision turned off and that sort of thing. You can do miracles like this.

Well, that actually is addressing the time. See? That violates this prior confusion thing. But, of course, it's the best thing you can do. And if there's anything left after the Touch Assist, there must have been a prior confusion that is still holding it up, but it's marvelous that a Touch Assist can get rid of as much as it does.

But you at any time – that exact thing, that we did on this workman here – done on this Charlie Drake and his memory would be back, you know, right now. It's not even a hard job, you know, I mean, what the heck. The hardest job would be going to find the taxicab to go over to his house. That would be the toughest job.

But finding any kind of a rudiment out or any kind of a somatic that the pc is desperately worried about or that sort of thing – you can take a slap at it, you know, on a prior confusion basis. You know, you find it out in the rudiments and you decide you're going to do something about it. The fastest way to do something about it is just take a couple of fast sweeps on O/W on the prior confusion and it's liable to blow right now. And it's quite quick; it's quite quick.

All right. Now, we're doing some kind of a Goals Assessment here. Start the Goals Assessment and we've still got that. And we found the pc's confront process, "What's the emotion of ...?" And we're still doing a Goals Assessment and it's carrying on here. And this Goals
Assessment is apparently prepared for very well. She started the session and did goals and then came back to and ran: "Who left a Sec Check question unflat?"

"We found out it wasn't a Sec Check question; it was just a nosy question, just before the pc left home and withheld the answer. Somatics lightened up. 'What's the emotion of that object?''

I don't read this – I don't dig this at all. Why have we got: "What's the emotion of that object?" That's a Havingness process – and then the Alternate Confront? I see; I get it. And this is Alternate Confront. And those two, and checking goals, and they're all null. And then it got Alternate Confront and "What's the emotion?" and so forth. Ah! Well, we've got a rather standard auditor problem staring us in the teeth here: The goals all nullled and the needle is rising and the tone arm is 3.75 and so forth.

I wonder how many auditors between now and the turn of the century will be at this exact desperate point of the track. The goals list has been handed over and the goals are all null.

All right. Well, let's get magical, shall we? Let's get magical about the whole thing. This is very tough.

And, by the way, you shouldn't use these report sheets to write goals lists on. Goals lists go on white pieces of paper and they get clipped together and they don't get separated and left on little bits.

Sheets. Get some long, white sheets; don't use these things. And whenever you have a goals list, clip it together because a goals list is valuable – particularly, the first goals list of the pc is very valuable. Clip it and file it and guard it with your life. He doesn't care about it but you do.

What are you going to do for the second Goals Assessment? Dig in here and find little bits of paper all through the pieces of report? Oh, no, you're not. You clip them together, okay? And make them look good.

Now, you've got a Goals Assessment and they all went null. How many goals have we got? This is also a poor job from the standpoint of the goals are not numbered. The goals are not all numbered! Ooo! And the goals are numbered in two different number sequences. Ohhh, Ellen! This is the kind of thing I say at two o'clock in the morning: "If I could just get ahold of Ellen now ..." [laughter, laughs]

Now – now, you take your goals list, and you better recopy this whole goals list in your own script on a long white sheet. And you better put a date at the top of the thing and you better number every goal consecutively so I could look on here, or anybody else, and say, "We are down to this many goals. And the total summation of goals amounts to 199 goals," or whatever the thing is. Because we just look at the last number on the sheet and we see 199. We know that many goals. We already have enough numbers here scattered around – some numbered goal 60, some numbered goal 33, others numbered also goals 20. There's – I think you have several goal 17s here. I don't know whether you do or not. But auditor bookkeeping these days is – yes, you do have. There are two goal 17s. We don't know what this pc is up to, but I would say offhand that this pc is up to about – you know, anybody's guess.
"Oh, well, Ron can do this kind of thing; so go ahead and do it to him." One – I can – I'm very good at cryptography. This is well written by the way. But some of your auditor reports – I have a little microscope and I get it out and I read – you think I'm kidding! [laughter]  
Well, I don't think this is enough goals.  
Female voice: I don't think that it is.  
No, you haven't got enough goals here. And now, that's a main point. You have to get up to – if goals are giving you any trouble at all, get up to at least a 150, 200. Get up into that range before you start worrying too much about it. But probably this has not been shaken down. I can tell you everything that's wrong with this case. I'll just rattle it off: (1) The rudiments are out. (2) An insufficient number of goals has been taken from the pc. (3) The pc at some earlier time has done a goals list. That's a guess. Is that right?  
Female voice: Yeah.  
Where is that list?  
Female voice: I don't know. I did it one time on a train and I ...  
Where is it?  
Female voice: ... threw it away.  
Who threw it away?  
Female voice: Me. It was never used. It was one I did on a train one time.  
One you did on a train.  
Female voice: Yeah, I didn't have anything...  
You sure it is thrown away?  
Female voice: I'm not positive. It could be home somewhere. I didn't look.  
Yeah. There you are. was my guess right?  
Her goals list was done on a train and has probably been thrown away. Her goal is probably on that list and has never been repeated and will never again be repeated anyplace so we just might as well throw ... [laughter]  
I'm not joking. I'm not joking, really. When they do an original goals list and they write the whole thing out, they're talking turkey. After that, they're worrying. And the primary goal that you're after has the best chance of all goals of submerging and never being repeated on a subsequent list. Isn't that interesting?  
There's nothing you can do about it, so we just might as well scratch the pc. [laughter]  
"(1) Ruds out. (2) Get more goals off meter. And (3)..." Now, you got any suggestion, Ellen, as to how we could do that?  
Female voice: Get more goals?  
No, no, no, no. How we can get over this point (3) of the original list having been destroyed. Is there any way we could get over that?
Female voice: Can see if she can locate it.
Hm?

Female voice: I can find out if she can locate it.
Yeah, but supposing it's been destroyed; let's just assume it's been destroyed: Is there anything else we can do about it?

Female voice: Yes, using the meter to see if I can get her to recall them.
Yeah, that's right. Let's get her to duplicate the list by meter which will be a nice piece of metering for you. "Is there any other goal on that list that you have not put on subsequent lists?" Until you finally get all fall out of it. But to do that you'll have to get your rudiments severely in and keep them in and you will have to get everything that appeared on the original list, okay?

"Get original list off meter." Okay?

Now, I'll put down here: "Sorry to call you to account in front of class. Best, Ron."

[laughter]

All right. In that event I'll just put "Best, Ron." [laughter]

Okay. Now, here we are and we have Constantine being audited by John Sears. And here we have Routine 3A. Right.

I wonder – I wonder if this goal still falls. Does this goal still fall, "To be myself?"
Male voice: Yeah.

Does it check out and fall?
Male voice: Yeah.

What do you know. How long did it take you to get that? Forty-five minutes?
Male voice: Yes, about that much.

Interesting.

Male voice: We had a very short list, too.

Yeah. A very short list.

All right. Now, we've got to get a modifier for this and let's see how far we have progressed in the direction here. And he – he was still running a ten-way bracket and still running a ten-way bracket, and he ended rudiments and so forth. What date was this? This was clear back here. This – here's the 8th. What is this all about?... Yes, here's the 8th. Yup, the goal was to find a modifier and so forth and so on. Modifier. There we are.

Now, he did a list of modifiers here. Where is the list of modifiers?

Male voice: Foolscap.

There – here we are! Here's a nice long list of modifiers. That's actually about three times as many modifiers as one would ordinarily have. Let me see what number this modifier might have been here.
Male voice: Five or six.

Yeah, yeah, yeah, yeah. Was it still shaking down by meter after number five? Were you taking – from number five on, were you still reading the meter, "Is there anything else will modify this?" and see if the meter knocked?

Male voice: Oh, it was from about eighteen on that I was doing that.

Oh, yeah. And you were still getting a meter knock?

Male voice: Oh, yeah, definitely.

Is that right?

Male voice: Very definitely.

All right. And you stripped it down and it got down to thirty-four?

Male voice: Yeah.

Of course, this is brand-new, this type – particular operation. All right. Well, we've got some idea. The meter went null at about thirty-four, huh?

Male voice: No, it went null before that, and the pc originated the others that are written at the tops of the pages.

Oh, I see.

Male voice: From about ...

Oh, it's thirty-eight, thirty-nine.

Male voice: Yeah. That's right. From about eighteen to about thirty on the meter.

Yeah.

Male voice: The others originated.

I see. And the pc originated after the meter went null?

Male voice: Yeah.

All right. Okay. Very good. Well, we find it was modifier number five – which falls within my guess that they give it to you in the first five or ten. And it's, "In spite of other people trying to influence me," which is a perfectly valid modifier. That checked out, did it? Have you checked it out thoroughly?

Male voice: I checked it out, thoroughly. Yeah. It was ...

Doesn't say so here.

Male voice: But the checker who checked it said that it was going in and out.

Female voice: It did not check out; others came alive. Didn't check out.

Didn't check! Didn't think it was. It seemed too reasonable. There's no denyer. One would look at it. I would – don't you dare add this as a modifier, now! [laughter]
"To be myself in spite of not being here" or "to be myself although I am elsewhere." You get the modifier type of the thing. You have to kind of dig for those things. Sometimes they are hard to blow out. That would be a denyer type of modifier, don't you see?

I don't care, even if one of the two I have just said is his, he can't have it. [laughs]

Okay. "Reassess, more modifiers." Yeah, well that was checked out and it was found to be going in and out and some of the others came live. So I would say, offhand, that there is a denyer on this thing that puts it out of view. And this "in spite of" is a kind of a denyer. It is a kind of a denyer, but there might be something else there that has something to do with it.

Now, you realize in checking these things out, something interesting is liable to occur. You're liable to blow the whole goal! Particularly on the second or third goal that you check out with the pc, you repeat the modifier and you repeat the goal. And then you repeat the modifier and you can't find it. And then you repeat the goal and you can't find it. And then you look for the terminal; then you try to get the rudiments in and they're all in. And you try to find the goal and the terminals. It's about time to listen to the pc: He's been saying it's been gone for some time.

So, that is not what occurred here. I'd, tomorrow, check the goal, huh?

Male voice: Yeah.

Check the goal. It's perfectly accurate but check it anyhow. Get how much it's falling and see if you can't get a modifier that falls like the goal is falling. You know, the goal falls like the modifier, falls like the terminal, falls like the level – or pardon me, I should have said "reacts" throughout.

The needle reaction of the goal is the same as the needle reaction for the modifier, and the needle reaction for the terminal is the same as the needle reaction for the goal. The needle reaction for the level will be the same. They all will, more or less, be the same. Sometimes more! You'll find you will sometimes get a greater reaction, but if you have a less reaction be suspicious.

If your reaction decreases and if it's sporadic and goes in and out, we haven't got it. There's something wrong here. Either the rudiments are out or the wording is not quite correct, and so forth.

I appreciate your difficulty in this particular case because you are dealing ... Constantine speaks very excellent English, but his basic tongue is not English. And so when I'm doing one like that I almost always do it in the native tongue of the pc. Even though I couldn't write Greek these days to save my life. Get the idea?

Have him say it in Greek "to be myself," and then try this thing in Greek. Try the same goal, see if it stays in. See, we might be running the English off the top of it. You know something weird might be happening.

All of you, by the way, are language cases. You realize that? You've only been talking English for a very short period of time. Do you realize that? English is sort of a polyglot tongue. There is a civilization – there are two or three civilizations on the track, though, that
do speak the same English that we speak, right now. They're backtrack, way, way backtrack and they talked English. Funny, isn't it?

It's very funny. You get back into that area with sonic, you know, and somebody is saying, "Hey boy, look out," you know? [laughter] Usually it's in lingua spacia or something like that, you know. "Polyga mugal!" "Rrrr."

I like those tongues, though, that are all gutturals. "Ghlk." You know, where that is a consonant – "Glnk."

All right. We got that taped? Yeah, all right.

Never be ashamed to be clever as an auditor. Just remember that, never be ashamed to be clever. Because you're being clever as an auditor, you're not being a squirrel.

A squirrel is doing something entirely different. He doesn't understand any of the principles so he makes up a bunch of them to fulfill his ignorance, foists them off on a pc and gets no place. And you know your fundamentals and you know what you're doing, and so forth, and you don't ever get clever about anything – what a knucklehead of an auditor you will be because you will run into impasses every now and then that – you'll say, "What's the textbook solution?" There was no textbook solution. There are textbook fundamentals but no textbook solution.

They tell an old gag – there's an old song in the Marines about this Marine private who went into the battle with a vim. And his name was McBin, I think, and he went into a battle with a grin because although he got killed, why, he had used the textbook solution. He died with a grin, that was it, because he'd used the textbook solution. Yeah. Well, don't go around dying with a grin just because you used the textbook solution, because that's just an effort to make me wrong.

No, you've got to be clever now and then. You've got to be very clever in checking some goals, some terminals, that sort of thing. You've got to be clever. And this modifier thing requires a certain degree of cleverness. After the pc has said to you, fifteen or twenty times, "Well, you keep asking me but I just can't reach it, you know?"

After the pc has said to you for fifteen or twenty times, ask him – just, you know, go get a big, blue spark and suddenly say, "Well, is the modifier 'that you can't reach it'? Is that it?"

"Well, yes, yes. I want to be a plumber but I can't reach it."

There are all these denyer bits, see. There's another gag you can get the modifier with, is you can run the goal. Run the goal both ways for a moment or two, and the modifier will show up if it's hard to get. You can take the goal and you can say well ... Well, we'll say the goal was "to give myself up," or something like that. All right, the goal is "to give myself up." you run an auditing command something on the basis to "How would you give yourself up?" "How would somebody else give himself up?" Anything like that. Run it two ways just for a little while, and so forth, and then ask for the modifier and you'll come out at the other end with a good – well, a better look at the thing. Remember all – nearly all modifiers are denyers.
There's something else to know about this particular battle front, is – a pc goes into a sort of a numb games condition when he's ARC broke and he won't give up anything but he doesn't have any flexibility or fluidity of mind. In other words, his zones of attention are very short; they're very small. And if you get a pc into a sort of a knuckleheaded, wooden, "Well, I'll go along with it somehow" frame of mind, the amount of success you are going to have in getting that pc to reach anything is going to be very poor.

In other words, the livelier, the happier, the more cheerful, the more fluid or fluent a pc feels, why, the more likely you are to get a goal, get a terminal, get a modifier, you know, and so forth.

Pc is sitting there, glumly, "Well, I'll go ahead and be audited just because you say so," you know? Don't expect him to reach very much because he's sort of not extending himself. And sometimes it's a little bit worth your while to get a pc to extend himself slightly. Instead of just sitting there, a wound-up doll yourself and so forth, why, just have a discussion about all of this, you know.

Of course, in the process of the discussion you can invalidate him, break the Auditor's Code fifteen times and make him worse. If you find you're doing that, it's a better thing not to do anything. A wooden frame of mind is better than a completely gone one.

All right. Here we have Maxine Kozak auditing Jenny Edmunds and I am sure the pc will absolutely die in her tracks at my taking up this particular report because the goal is "not to be found out"; isn't it, Jenny?

Female voice: Yes.
Okay?
Female voice: Yes.

All right. And we don't find anything here. We find the modifier is assessed and we've got several – the modifier: "not to be found out." Well, I don't know how this goes together. What have we got, another goal here? I have been wondering about this. I spent some – I was worried about this, as a matter of fact. How do we take this goal, "not to be found out," because "not to be found out" sounds more like a modifier than it does a goal. Now, did we ask this pc if there was any goal on the front end of it?

Female voice: Today.
Yeah.
Female voice: Yeah.
We did?
Female voice: Yeah.

Was there anything on the front end of this "not to be found out"? You know, "to be a plumber but not to be found out." Any goal on the front end of this? Is there? What is it?

Female voice: "To tell lies."
Yeah. "To tell lies and not be found out."
Female voice: Yes.
So, oh! What you've got written down here is the front end?
Female voice: Yeah!
That's how it makes sense.
Female voice: oh, yes. The whole list is. Yes.
Yeah. All right. You don't say so anyplace, see? [laughter]
Female voice: "Not to be found out!"
No. "Not to be found out" is the modifier. You've got the goal. You did a Goals As-
assessment on top of the modifier.
Female voice: Yes, I realize that.
You see?
Female voice: Yes.
So these actually are goals and we've got the modifier up here: "Not to be found out."
Female voice: Yes.
All right. That's the modifier, and we already had that as a goal.
Female voice: Yes.
See? It wasn't a goal. And now we've got this other goal here. Do you mind if I – .
Female voice: Hm.
All right. She does mind – . [laughter]
Female voice: I tell you, I don't.
Ha?
Female voice: I don't really.
You don't really?
Female voice: No.

All right. It's "To tell lies and not to be found out." And that's your goal-modifier se-
quence. Fascinating. I was concerned with that because I saw that, and I said, "Good heavens!
We've got the modifier end of the line." Now, I held my breath because I didn't know whether
or not we could easily get the goal end of the line. And I'm very, very glad you did. Hm?

Female voice: As soon as you said it last night I knew it was the modifier.
Oh, yeah? All right. Well, I'm very, very glad that we got that pair sorted out. That
was a very good job. A very good job.

Yeah, this'll – there's only two or three here in this particular unit that I was concerned
with and this was one of them. Very much so. And I thought, "What on earth is that one going
to turn out to be?" Well, that was an excellent job.
Now, has it been checked out?

*Female voice: No, it hasn't.*

All right. We'll just say, "Get it checked." [writes] Very nice. Very nice. Well, apparently here, that was — went rather smoothly. Pc tended to have an ARC break here toward the end of session because of the rudiments. Pc was traveling along here all during this assessment at 2.5, 2.25, 2.75, and then all of a sudden on the rudiments went to 3.25, and then went to 3 and then stayed at 3. What was that all about?

*Female voice: It was after the break. When she came back after the break, the tone arm went up.*

She'd been figuring.

*Female voice: Hm. Yes.*

Something on that order. Been figuring or something like that. Do you think that was it?

*Female voice: I asked her what it was.*

Did you get it?

*Female voice: No, I didn't get the tone arm down.*

Yeah, well, I would show that up, wouldn't I, in front of God and everybody.

*Female voice: It's okay.*

When a pc's TA goes up during a break or between sessions, it's a very good thing to investigate it rather thoroughly.

All right. Well, you get it down for the next session. I think that's very nice. Okay. Stop worrying about that one.

Okay. Hm. Yeah. You're having a ball. All right. Now, I'm glad you put this one in my hands because this was the first one that was done and I gave this to Bob to sort out Jenny's goal and modifier.

All right. We had a goal running on this particular case and it was "to be a racetrack driver." And that goal was not — it was doing all right. The case kept hanging fire on the terminal "racetrack driver," and so forth. So I caused an assessment here and this caused an upset to the pc. The pc was quite upset to have another Goals Assessment or something like that done. And while we were scrambling around on it we got in here with this goal-modifier arrangement and the auditor promptly shook it out as a goal-modifier arrangement. May I say what it is?

*Female voice: of course.*

All right?

*Female voice: Sure.*

All right. "To be a racetrack driver, but a racetrack driver couldn't rule." That was what was missing off the end of it. And of course this makes a highly specialized terminal.
Now, what does that terminal turn out to be? The terminal turns out to be – may I say it? – turns out to be Lucifer. Now, just why it does is up to the pc and so on, and we're not interested in whether terminals are logical or illogical or something like that; it's whether or not they run. But the pc couldn't run this – couldn't run a five-way bracket on the assessed Prehav Scale. Couldn't do it, because the pc says, "I'm too much the terminal."

Now, you're going to find that. Now, that you're finding a very finite ... Remember what I told you, I said, "We're heading in for a way of finding the terminal. Well, of course, if you get a very fundamental terminal you get a total association between the pc and the terminal as being almost the order of the day. They don't differentiate between one another at all.

Now, you find terminals on children and you find exactly this condition. You find out they can't differentiate between one thing and the other. So your first auditing commands – this five-way bracket wouldn't run on this pc – and our first auditing commands of a five-way bracket, couldn't be checked out. The auditor very cleverly did not run them. The auditor actually cleared the auditing commands – and possibly the pc's digging in her heels had something to do with it – and found out they couldn't be run and asked me on the report what to do about all this.

Well, what to do about this became very simple. You just treat this as a total closure, that is, the pc thinks of self as the terminal so you limit the bracket.

And I must call to your attention the tremendous importance in the Prelogics of gradient scales. You solve all cases by gradient scales. All things are solved by gradient scales. All auditing is done by gradient scale. And so auditing commands, when they are difficult to do, are done by gradient scale. And you get the simplest auditing command that you can think of and then you go from there on out.

Now, of course, perimeters of attention are so limited when you've got a terminal totally closed with the pc, the perimeter of attention is too tight. They can't get the idea, actually, of another person. You've got the terminal and then you haven't got anything else. You see? You've got the terminal and here's the terminal. Crunch! You see? And you say, "Well, how would you shoot another? How would you communicate to another?" You see? "How would another communicate to you?" This is too steep! This is too much.

But you can ask them something on the order – or should be able to – whether or not the person can communicate with himself or whether the terminal can communicate with itself. Naturally, you could get that. And if you ran those two you'd eventually get a differentiation.

So the auditing commands I recommended were something on the order of (suggested)
"What might you have?" – "disagreed" was the level – "What might you have disagreed with?"
and "What might Lucifer have disagreed with?" See?

Not "What have you disagreed with about Lucifer?" or "What has Lucifer disagreed with about you?" You see? This is just total concentric, singleness. "What have you disagreed with?" "What might you have disagreed with?" and "What might Lucifer have disagreed with?"
We put *might* in there and the person doesn't have to answer very specifically. You see? We aren't asking for the *exact recall*.

You ask a person to recall – all right: "Recall a time when you built your first pyramid. Thank you." [laughter] They can't answer that kind of question. But you can say, "When might you have built a pyramid?" See?

"Oh, well," they think, "Well, then ..." Anytime within that million-year line, see, they might have done it, you see. And they don't even have to say they have done it. And yet it will run very easily and it is quite beneficial. So we put *might* in there; that eases it up. We've got already – it on a gradient.

Now, let's see what we did here. We ran this apparently. Hm. Looks awfully good here. It looks like the tone arm was flying around a bit. Cognition and so forth. Heavy rock slams. Running between 2.6, 2.5. Oh, it took a little while to get going apparently. Yeah, and then it started flying up here to 3.50. This is nice action. And then you got a blowdown, and a blowdown, and the pc made her goals and feels good about the tone arm action, and so do I. A break. Rudiments well in. And then we got – went flying back up to 3.50, down to 2.25. That is very fine action, by the way. That is very good action. 2.25 to 3.5, you would realize, is three-quarters of a division but it's in the Clear range. And that much action in the Clear range is pretty fantastic.

Don't think too much ... You can have a whole tone arm action between 5.0 and 6.0, way over here and it doesn't mean anywhere near as much as a half a tone arm action down around the Clear range. It's interesting.

You get a person up at 5, all he's got to do is withhold the fact that his – the end of his nose twitches and he goes up to 6. You see?

So, anyhow, that was fine. And he got various blowdowns and then some apathy began to come off. I'm glad to see that, actually, because she's been sitting around in it. I've been looking at her now and then saying, "Well, she's swimming through some bit of it." That's right, isn't it? And it was sticking around a little too long, so I was glad we found that.

All right. And she's – auditor's comment is: "Tone arm action fairly active. Pc felt this area was difficult to run because there wasn't much MEST to grapple with. Felt kind of queasy in the stomach since the beginning.

"Says, 'Oh, what's the use,' and sighs frequently. However, she's answered each command without any dispersal. I questioned pc by expanding – about expanding the bracket."

**Male voice: Right.**

"And the pc has certain resistance to running these agreed-upon flows because she claims they don't get at one area and clean it up and she has to hop around too much to do the command in a full bracket." Well, that's perfect. I agree with that a hundred percent. I'll give you the answer to this in a minute. "Which I will have to ferret out and clean up. I suspect it's probably ARC breaks in doing the bracket commands."

No. No, no, no, no, no. No, you're just asking the pcs to fall in over their head a little bit, you know, and they just *zzzttt*. 
And "How do I expand this bracket? Is it Lucifer to others? Pc to others?"

No. The next way you expand the bracket – you can go to a straight five-way bracket. You can, but the theoretical way you expand the bracket is to make an interchange between the pc and Lucifer now.

Male voice: That's what I had across from it.

Yeah. Well, that is the – that would be the next change. It would be the inter- "What have you disagreed with?" "What has Lucifer disagreed with?" You could say something on the order of – you could put the word might in there – "What might you have disagreed with about Lucifer?" or "What might Lucifer have disagreed with about you?" You get the interchange going now. You see, you've got it center-center. All right. Now, let's get an interchange going and don't swing around into "Lucifer to other" or "Other to Lucifer," because that requires a loosening attention. But that's added later. See?

All right. And I think that is going very, very well. But here's – here's some data you're in need of here. The pc's goal. Let's go back and look at this goal, see? "To be a racetrack driver, but a racetrack driver couldn't rule."

Now, this integrates in some fashion with the behavior of the pc. And you'll find out in running a goal-plus-modifier terminal that the pc – this is quite important – may heavily dramatize the goal when they first run the terminal. See? They – that's – well, let's say part of the modifier is "but it is unreachable." And as you run this, they don't tell you directly that it's unreachable; they just feel very dissatisfied about the thing, you see and "There's nothing there," and so on. And they keep feeling like this as you're running it and they're uncomfortable. And don't think anybody is very comfortable running a goal-plus-modifier terminal because this is – we're getting into heavier raw meat with this stuff. And the goal has a tendency to be dramatized slightly by the pc. The goal is not in view and so forth.

Now, I wouldn't expand the auditing command – yet. I would dream up a method of running a two-way flow on the goal-plus-modifier.

Male voice: Hm.

"What racetrack driver couldn't rule?"

Male voice: Hm.

See? Now, how do you get the reversed flow? Well, you just say, "What couldn't you rule?" "What haven't you been able to rule?" "What mightn't you have been able to rule?" Don't you see? "What mightn't a racetrack driver be able to rule?" You know, anything of that character, but slide that in as your three and four. See? You plus self on "rule." Racetrack driver, see, plus self – plus racetrack driver, see, on "rule." Just – that's it. See?

"You, not rule – you couldn't rule." "Racetrack driver couldn't rule." "Disagreed with self." "Lucifer disagreed with." And this thing will suddenly start integrating. You'll see a different scene suddenly. Then you can start expanding it. But I wouldn't necessarily drop the goal out of the line. It all depends on how it runs. You have to kind of run it by ear. We don't have very much experience right here at this moment or much backlog on it. We know we're
dead right and that it is running along fine. But it's just – exactly how you tune up the heterodyne so it will super-receive – we're not quite cognizant of. Okay?

Male voice: Right.

Sounds sensible to you?

Male voice: Yes.

All right. [writes] "Add goal commands to two-way and run." An awfully good job, Bob. Thank you.

All right. This is Marianne Christie auditing Smokey. Smokey? All right if I mention any of this?

Male voice: I don't give a damn.

It's all right? All right.

Now, I suspected that this was going to be a dog's breakfast. Do you know why? Because I think that this was another one of the things where we had the modifier and didn't have the goal, or there was something wrong and I couldn't imagine, myself, easily or readily, what you could add to "Hidden source of action." "To be a hidden source of action." All right, a goal "To be a hidden source of action." How do we modify this? It seems self-modified, doesn't it?

So, I've been kind of – I've been very interested in seeing what came out of this and so forth, and he got a list of modifiers here apparently about – oh, I don't know, maybe thirty, something like that. And all we're getting is restatements of goals.

The goal is "To be a hidden source of action." All right. And all we're getting is "Not unknown," "Could be found," "Somebody could find it." Now, how do we add that in, Marianne? How do these make a goal-plus-modifier – "Not unknown"?

Female voice: It seemed real to Smokey that these would be stopping or make it difficult to get that goal. These were liabilities.

Yeah, but how would we make a statement out of it?

Female voice: Once it got known, it wouldn't be possible to have a goal in it. There'd be no game on it.

No. We want a full goal-plus-modifier. We've got a misapprehension here on what's required. That's what this is all about. I see some sign of it here, "... but to be apathetic," or "To be a hidden source of action would be degraded about not being known. "Well, now, that would make a complete statement – "To be a hidden source of action but to be degraded about not being known." All right. That would make a complete thing. I see here that we have a double check on that. It was still staying in. Did that stay in?

Female voice: Everything has gone ... No, not just now. There are only about four at the bottom there that are in.

These four at the bottom are still in.
Female voice: Yes, but these are relatively new ones added on at the last – at the end of the list – it tended to null the lot, just in the last quarter of an hour.

"To be a hidden source of action with an intention to be found?" That was a more recent one, huh?

Female voice: Yes.

All right. Well, you'll just have to carry on with this. You'll have to also make very, very sure that your pc does not feel that his goal is being invalidated, which it isn't. We don't think it's wrong, we only think it's incomplete. See? So, go along and get that. Pc's riding pretty high here on the tone arm which is not extraordinary for this particular pc. Seems to have done all right, though, and seems to be pulling with you very well. And that's very fine. Now, this pc has already run some of his goal.

Female voice: Yes.

And if I had any more trouble with this at all, I would simply go into it on the basis of running this command: "How would you be a hidden source of action?" Something on that order. And "How would another be a hidden source of action?" And I'd just run this back and forth a few times. See? I'd run this for maybe fifteen, twenty minutes, something like that, and then check out the modifier that came with it, or anything that came up as following it.

As a matter of sober fact, you have a very tough one here because I think it is highly probable that it is the goal and modifier all in one package statement, bong, see? You get the idea?

Female voice: Yes.

It just sounds like it. "To be a hidden source of action." It's almost impossible, you know. See? That forms itself enough problems to make a game from here till Halifax. Doesn't it Smoke? Huh? All right.

But don't go torturing the pc about it in some way. If he can't get a modification to it he can't. And if he can, he can. But these sound very, very promising. "Intend to reveal some source later," "intention to be found," "wanting to reveal source later."

Female voice: There were one or two straight in the middle, too, that sounded very promising, but then they went null.

Mm-hm. Well, all right. But he's getting the classification, clarification of it and I am sure that you will get it. Okay? I've told you ways and means of doing so. Okay. [writes]

Female voice: Thank you.

Okay. I've just taken up some sample cases, to show you what we look at, how we go through it. Maybe you've learned something, maybe you haven't. I haven't shown you the one-two-three of how to do it. And I should add the one-two-three.

First, let us find out if the pc was audited that day. Now, you think that is funny, but by George, if you don't check the time audited you may find that the session has been abbreviated or had to be cancelled out or something like that. You're immediately short-circuited, then, into some other interest. In other words, what is wrong here does not become any tech-
technical question, it becomes some personal relationship of some kind or another. Or present time problems of the pc or something of this sort. So you look over the amount of time the pc was audited that day.

Then, the next thing you look at is to look at the pc's goals that were set for the session and find out whether or not – if the auditor has noted it – that the pc felt he made any of his goals for the session. Pc felt he made his goals for the session, in whole or in part, well, that's fine. That's fine.

And then you check tone arm action. You look down the line for tone arm action. If you're not getting any tone arm action of any kind whatsoever, you know doggone well one of two things is true: The rudiments are out a mile – regardless of what's being done, whether it's Sec Check or assessment or anything else – the rudiments are out a mile or the pc is Clear. And that depends in large measure on what the tone arm is reading.

Then you look on the list. If a process is being run, you quickly check twenty minute periods, down the column for the tone arm reads to find out if at any time this process was flat for twenty minutes and the auditor has missed it.

That's to make sure that you're not getting an overrun on a level. It's very easy to do, you don't have to do it with very great care. Thing says, "3, 3, 3, 3," or there's a whole bunch of 3, 3, 3, 3s all together, you say, "Gee, what do you know, dzz-zz-zz. Is there a quarter of tone arm difference here on this 3, 3, 3 column?" And if there isn't, why, then you might find that you've got some trouble towards the end of the session. And this is easily explained to you. Now, anybody can understand how there's trouble at the end – toward the end of the session. All we've done is flatten the process and then we've overrun the process and then the needle was getting sticky, and the pc is getting very restive, and pc can't find any more answers, and it all seems very stupid and masses are being dragged in on the pc and he's being crushed inexorably under the wheels of Juggernaut, and a few minor things like this might account for the fact that there were some ARC breaks at the end of the session.

And they come out of this area: "Was the process flat for any given twenty minutes in the session?" If it was, why, you yelp.

Now, actually auditors going on noting tone arm reads, noting tone arm reads, noting tone arm reads, just going on down the line, down the line, down the line, sometimes, are so interested in auditing they don't realize that they've written down 3.10, 3.20, 3.10, 3.05, 3.10, 3.20, 3. – . It won't go reading like this long. I mean, it'll now start to do something else. It'll start to climb. You can say that if that goes on for a half an hour – you know, the vast difference of read between 3.1 and 3.15 and it went on for an hour – now you can expect the tone arm to go to 3.5, 3.75, 4.2, 4 – we're getting lots of tone arm motion here, you see? – 4.2, 4.25, 4.25, 4.25, 4.25, 4.25, 4.25, 4.25. They never mention what the needle characteristic is but of course it is rigid as a girder in the Eiffel Tower. Thuuuurh! Chance of reassessing gone! That is exactly what happens along these lines.

You check for that, and then you check the auditor's comments. The next thing you check is the auditor's comments. What's the auditor think about this and find out if the auditor wants any advice. It's whether or not you're going to give him advice gratuitously, whether he asks for it or not, or you found something that you should comment on, or whether or not he
wants advice on the thing, or what progress he's making, and you put down whatever the ad-
judication you have of it.

Now, you can do an awful lot with an auditor's report. It depends to some degree upon
the legibility of the report. Cryptography shouldn't be part of an auditor's report study line. I'm
not good at cryptography. It is much easier for me to come around and read your mind than to
bother with your writing sometimes. But I know that auditor's reports are written hurriedly
and I would rather have an auditor's report which is the original report written at the time of
the session, written during the session. And I don't like copied reports. I don't like a report to
be copied after the session or written after the session. I actually like all the gimmicks and
stuff written during the session. I don't care how many sheets of paper it took, how much
scribble there is to it. Somehow or other it can be made out, because that is a better report
than what you remember after the session. And when it comes to tone arm numbers – copying
tone arm numbers – when you transcribe from a scribbled sheet of note paper over here to a
column, you're liable to make some kind of a mistake.

I like to see the report, as it was written during the auditing session. If it's legible, fine.
But certainly the report that was written during the session, not a copy of the report after-
wards. You'll find out it's much more beneficial.

That is about all you look for.

Now, knowing Scientology as a background of all of this and the various things that
you see that are taking place during that particular session, it doesn't take much of a crystal
ball to find out that this or that or the other thing is taking place during the session. It isn't
very hard to adjudicate that the rudiments are out. Why, I just gave you an example of what I
mean. Karl set no goals at the beginning of the session. Well, he must have felt kind of mug,
you know. I can sympathize with him because I felt that way myself occasionally at the be-
ginning of a session. But usually I didn't think the auditor could audit. I didn't think he was
going to do anything. Why set any goal? You know?

So that's an easy one to adjudicate. You get the idea? You just say, "Well, he's – didn't
set a goal? Poom."

A tone arm – tone arm no action – well, there's something flat.

Tone arm extraordinarily high and stays there and never fluctuates – well, we don't
know. He might be running through a phase of the process; he might be in an awful ARC
break; he might have withholds; he might have a lot of things. But now you get to a point of
adjudication; we don't know what that high tone arm means. There's nothing wrong with hav-
ing a high tone arm. Nothing wrong at all with having a high tone arm. But it can stem from
several things. If a person's tone arm doesn't ever go high, they'd never make any progress.

Remember, that a case that is reading constantly at 3 with a sticky needle, forever at 3
with a sticky needle, will go through 7 before they come down to 3 again, and will spend the
greater part of their auditing career after they get launched in the vicinity of 4 or 5.

You realize that? It's not a matter of trying to keep the pc's tone arm at 2.0 or 3.0. Be-
cause you take someone who's below death and work like mad to keep his tone arm between
2.0 or 3.0, you're going to be spooked all the time, because every time you make a gain he reads 6.5. You make a gain, he reads 1.2.

The other thing is, as you see tone arm reads drop below 2.0, you realize that sooner or later they're going to go all the way around. And as you're following the reports down the line and you see the tone arm has – registers 1.2, it's sort of – somebody has dropped a shoe and you're waiting for them to drop the other shoe. Because that is going to follow sooner or later. If it doesn't follow, the case is not progressing.

I gave Mary Sue one, one night. She was auditing me and she got me to recall something or other, and turned the tone arm all the way from something on the order of 3 through 7, through 6.5 and down to 3 again on the other side. It went on a complete revolution. It just sat there – it went about that fast, see?

Staggered her. She was no good for the remainder of the session. I hardly ... [laughter] The end of the session she told me about this. See, she was stoned. Recall one thing and you get a revolution of the tone arm. All right. This was as fast as she had seen it. But you shouldn't operate on a huge – this is no criticism of what she was doing – but you shouldn't operate on a big withhold from your pc on what the meter is doing. If the pc wants to know what the meter is doing, you let the pc know what the meter is doing.

He asks you what the meter is doing, why, you say, "That's all right," and show him what the meter is doing.

He says, "Well, is that goal still in?" or "Is that modifier still in?" Well, tip the meter over and repeat the modifier and let him see it knock, just once. Don't let him sit there and make a life study of it. But don't deny him information through the session. You see? And sometimes you have to read between the lines because you haven't got all the steps of the auditing session, you don't quite know what's happening in the auditing session, but you sometimes have to look it over from the basis, well, maybe Code breaks and that sort of thing are occurring, or maybe the pc is just being denied lots of information, and so on.

And you only get curious about these things when a pc is doing poorly. Go by this rule: Don't go charging around on a case and throwing smoke into the air ... Well, I can do this once in a while; I think the case could be moved a little faster or something like that. But don't go throwing your weight around on a case that is moving.

If the case is moving it's moving. What means moving? Tone arm action, pcs making their goals, everything seems to be going along and they are making progress.

All right. It's a relatively uneventful picture. It merely means you're getting tone arm action, pcs apparently making their goals, auditor doesn't have any vast questions about it, apparently doing all right. Leave it alone. Leave it alone. Just say, "Fine. Okay. Good. Continue." That's it. You know? Leave it alone.

Tone arm – no action; pc sets ninety-five goals, makes none; we see that the end rudiments took three-quarters of the session, something, you know. Well, actually the thing to do is to get ahold of the auditor or pass him a word or write the report out in such a way that you want information. That's basically what you want. You shouldn't be telling him things to do without some information about it. You want some personal information. The best kind of
information is personal information. You're directing a lot of auditors and you see a report like that and – what the hell, you know? Three-quarters of the session was devoted to the end rudiments. Three-quarters of the session devoted to the end rudiments.

Well, the thing to do is get ahold of the auditor and the pc. It's better to get ahold of the auditor and the pc than just the auditor. Always better, because you can always cross-check the pc. That is to say, you can always put the pc on the meter and you can find out how the pc is going, find out what the pc is reacting to, and so forth.

But this all comes under the heading of checking cases and keeping them running, and I've tried to give you an example here of this – of some of the things I do and look for and think about. I do this every night with your cases, and sometimes I actually miss your presence on deck and I have to sometimes make a wild guess about it. And there you're lying there in bed innocently asleep and so forth. And it's very hard to pick your brains. Very, very hard to do so. And the aura that comes off the auditor's report is usually a bit mucky.

So, the essence of the thing is that cases making smooth progress are the cases that you pay the least attention to. Except to make sure that they go on making smooth progress. What you pay attention to are the hang-ups. And if a case is running well leave it alone. Case is running well, don't change it. If an auditor is auditing a case very well, don't rouse him around. Don't rack him up one side and down the other. See? Lay off.

But if this thing is going by fits and starts, and falling on its face and that sort of thing, well, give them a note on the report but always try to follow it through with some personal information along any communication line which you have about that particular case.

In this particular case, why, most of you whose cases are going badly – auditing somebody whose case is going badly, that is to say – you generally will stop somebody on staff and you will generally tell them all about it. You didn't know that you put a communication line almost directly, straight, dead to Ron whenever you did this. Because that's, of course, what we pay attention to. Want to keep them rolling.

Well, cases can be an awful worry to you. They can be an awful worry. And you get this many cases running all together, it's a case of sometimes holding your breath just a little bit, you know. "Well, is that one coming back on the line or not, you know?" It's like keeping twenty-six plates spinning simultaneously on the end of sticks. Something like this. And they're all different and they all have their peculiarities of operation, but they all follow the same rules.

So I hope what I have given you here might have helped you out at some time. Okay?
All right.
EFFECTIVE AUDITING

A lecture given on 9 November 1961

Thank you. Thank you. This is 9 Nov. – Russian year, 9 Nov. Kapluskov.

I invite your curiosity to the behavior of a needle on the E-Meter. There is only one thing that can make an E-Meter lie, and that is a bad auditor. A bad auditor can make an E-Meter lie.

We had some character running around the States about a year ago and he couldn't read an E-Meter and he was asking everybody if they'd ever been pain-drug-hypnotized. And, of course, each one of these words fell on the meter, he never bothered to compartment the question and it wasn't till I started proving to people conclusively that they had been pain-drug-hypnotized by cats, dogs, mice and so forth, that somebody woke up and said, "What do you know. The auditor has something to do with making an E-Meter read right."

Yeah, he does. And similarly, you cannot get a false goal or a false terminal or a false modifier or anything else on an E-Meter if you know how to run an E-Meter. You just can't get one. You can't push one off on an auditor. You can't receive one. The E-Meter tells you the truth in the matter.

For a number of years we have had difficulty in auditing because auditors were very leery of actually believing an E-Meter. That's because the auditor in practicing his skill uniformly had withholds. And having withholds, of course, he didn't want any withholds off anybody else.

We got a Central Organization right this minute – it's getting all nicely straightened out – but we had somebody in the Central Organization as a – actually, it was an auditor that was auditing staff. Fortunately, it wasn't anybody important. (That's a joke.) And this auditor just kept sitting there and kept sitting there and you know, the needle would knock on a withhold and the auditor wouldn't get the withhold. And finally, why, the staff member was just getting worse and worse and feeling badder and badder about it all.

And so HCO Secretary took a lance out of the umbrella stand, couched it properly, and went at solid charge in the direction of the Association Secretary and said, "What is this?" And the Association Secretary spoke to the Director of Processing, and the Director of Processing mentioned it casually to the auditor. And the next day it went right on happening Why?

Well, that particular auditor and that particular Director of Processing had some mutual withholds from the organization. Not only would the auditor not get a withhold off somebody else, but of course, with her partner in crime involved, the partner in crime would not even force her to get a withhold off somebody else.
So it's, "Let's all be down here in the mud with these nice withholds." That is the motto of all of that. Interesting, isn't it? Whenever you see somebody – I just take this as a forthright thing.

A person refuses a Security Check, they've got withholds, see. A person that won't get withholds off another case has withholds that they have never divulged. This is about the way it looks. I mean, it's quite a technical fact.

This particular HCO Secretary, by the way, had just written me a letter which I received this afternoon begging me to come over here and let somebody give her a one hundred percent run on a Joburg and get all of her withholds off completely so that she would have no diffidence on this particular line and then let her go back and saw into the staff. So that if it started out with just one person with no withholds, you see, this would then get contagious, which was an interesting suggestion. I didn't take her up on it. Because a class member here, very shortly, will be going back to that organization. And they better have all their withholds off by the time they leave and everything will be fine.

You see how this goes, though? You see how this goes? A diffidence is based also on this fact. It is accompanied by withholds because a person wouldn't be this way unless they had withholds. But they are very afraid of what they might hear from the pc.

And when they get very afraid of what they might hear from the pc, they won't ask for withholds. They might hear some gossip about themselves, you see. Well, pcs are always willing to oblige, particularly on an auditor that can't security check well.

You say to the pc, "Well, all right. Now, are you withholding anything?"

"Oh, yes. Yes. I'm withholding the fact that yesterday in a coffee shop, why, I heard three people talking about you, huu-huu-huu-huu. And these people said... and I'm withholding it from you."

The hell he is. He hasn't withheld it yet. There's been a lapse of time of about six hours between the incident and the session. When did he have any time to withhold it? Oh, no. When I hear somebody start that one, I always can get pay dirt. I can always get pay dirt. Because he's about to say, "I heard..."

And I say, "Good. Fine. Thank you very much. Now, let's find out what you have been up to lately."

"Oh, well, that's something else. Ha-ha. Well, no. But I heard. And actually, I won't be able to get in-session, you see, unless I get the..."

"Well, fine. You're in-session. Now, what's the withhold?" [laughter]

Now, you would be utterly amazed how far you can go and what you can get away with in auditing. You invalidate somebody's goal, you invalidate somebody's terminal, you upset somebody on the subject of his auditing progress in some way or another and you deserve to be shot. That's for sure. But – you fail to accept the pc's answers. You do these various things and it's very upsetting to the pc. He feels he can't talk to the auditor and so forth.

But how far can you go within the framework of these rules? Actually, I don't invite you to do such a tactic. But we have been boxing around with a withhold that keeps falling on
an instant read and we can't get it – do you know the pc feels better if the auditor even went as far as, "God damn it, what is it?" [bangs on the table] Do you know that?

The pc says, "Uuuuh! It was a so-and-so and so-and-so and so-and-so."

You say, "Thank you. Now, good."

You see? It's the same thing as you would lay hands on a pc if he tried to blow the room. See, the pc feels under control.

Now, you can ask. You can persuade. You can be quite forceful. You don't have to be angry or upset. I'm just giving you an extreme, extreme, extreme example. But you can be very pressing on these things, you know.

"Yes, yes, yes. I know. I know. That's all very interesting, but what did you do?" [bangs on the table with every word]

And the pc says there, "You know, there's some session control around here. By George, you know, I'd better not look up too much because there's liable to be a controlled session going on here."

You have asked a question. You want to know what that fall is, and the pc doesn't give it to you. Now, the pc may not know. May not know. That is the time to be very helpful. Get your help valence on. And you say, "All right. Now, let's just sort this out. You say you don't know what it is. All right. Let's just sort this out." And now you ask a great variety of questions. A great variety of questions.

"Have you stolen anything from the firm?" And we've gotten a knock and the pc says, "I don't know."

All right. Well, let's just try like mad to help this pc sort it out. Let's don't immediately assume the pc is holding out on us and does know, you see. Pc says he doesn't know. He looks puzzled. He looks a little bit upset. He's actually sitting there trying to figure it out.

Now, you're an auditor, and you can tell when somebody's sitting there trying to figure it out. So you help him out. "Stolen something. Well, could it have been property? Could it have been some item? Could it have been some perfectly worthless item? Could it have been some very valuable item? What could it have been?" You see, "How about paper, stationery, stuff like that." You're watching the meter all the time, you see, "Paper, stat.." Pong! Pong! Pong! You say, "What the heck is that?"

"Oh!" the person says. "Oh, yes. I've – I've been customarily taking sheets of paper home and I never realized it was stealing." They could – must have realized they were stealing, you see, or they wouldn't get a knock on the E-Meter. But there it is. And there it is and you say, "Well, what was it?"

"Well, about – it seems like for a long time now I've been taking sheets of paper home. And yes, the first time I did it was a long time ago. I remember I did have a twinge of conscience the first time I did it." You know?

"Yeah. All right," you say, "Good. All right. Now, have you stolen anything from the firm?" Dead. That's it.
Now, that's one proceeding. You see, you're being very helpful, and you compartmentalized the question. You see – you know, you've moved the question around. That is to say, "Have you stolen anything from the firm?" you know? And we find out that it is just "firm" that is falling. "What's this about firm?" You know? "Have you stolen anything?" is null. "What's this about 'firm'? Firm? What is this? Firm? What else about this firm?" You see?

The pc says, "I don't know." You help him out.

All right. There's another point of view about all this. See, there's another point of view.

You say, "Have you been cheating on your girlfriend?" you know.

And pc says, "No."

And well good, and you say, "There's a fall here on the meter. What could that be?"

And he says, "Well, no. Must be false. Must be on something else." Instant read.

And you say, "Well, have you been cheating on your girlfriend?" Bang! Instant read, see.

And he says, "No. Nope."

And you say, "Well, come on. Tell me about it."

And he says, "No, no. There's nothing there. There is nothing there. No, I have not! As a matter of fact I resent your inquiries into it because it's accusative. And you realize the Auditor's Code doesn't permit you to be accusative."

I say, "Well, the Auditor's Code isn't covered by – for the E-Meter. E-Meter isn't bound by it." I say, "All right. Now, tell me all about it now."

"No, I haven't been and so on. And I think it's very mean of you to ask me and actually you're trying to destroy my reputation. And it's probably something I heard about you and ..."

"Now, all right. That's fine. What is this withhold right here about your girlfriend? With whom have you been cheating on your girlfriend? Tell me!"

"Oh, that – it's just nothing. It's no fair. I mean, you're picking on me. Just taking advantage of your position as an auditor."

"All right. Tell me now. I want to know. Who is it?"

"Oh, [sniffs] Isabel." [laughter]

And you say, "Good. Now, do you feel better?"

"Uh, yes. Well, I am. But you really shouldn't be so accusative."

"What else? What other one?" [laughter]

You see, you're justified there at that particular type of withhold because the fellow has gone into a games condition with you. And he doesn't think that you can do anything about it, and that you won't do anything about it. And he knows you're all bound down, and you mustn't dare talk turkey to him, but it requires some sense. You know, it takes some sense...
on your part. It takes an ability to look at the pc and to estimate the situation. And when you estimate the situation, you have to make up your mind, is this just willful heels? Or is this actual confusion or upset or what is this? Or is it the question which is almost on or it's some part of the question that's reacting? Or is this pc just in a fog from something else that has been going on in the session? What is this all about? The rudiments have just gone out crazily or something has happened here. That's for sure. We know something has happened. And as an auditor we go ahead and take care of what happened.

But we cannot say the blanket solution to every time you get a fall on the meter is to ask the question this way, this way, this way and you do it every time and so forth and it's all here in the rule book and so forth. No, no. It requires you. It requires your participation in the session as the auditor. It takes you.

Now, if you developed a nice, calloused dead mask in lieu of TR 0; if you think that a tremendous deadness, a tremendous woodenness, a tremendous, [in a robotic voice] "I will now repeat the auditing question. One, two, three, four. Thank you. Good. Thank you. The next auditing question is –." See. I sneer.

That is taking a refuge back of a ritual. The ritual is for your use, not for your protection. If you need a ritual, why, go to a session with a bulletproof vest on. You'll feel better.

But it's all under the heading of all you've got to do is audit the pc you are auditing and the technology you have is to assist you to do that. The rituals you have is to assist you to do that. Everything in Scientology is to assist you to process the pc.

Now, for you to just throw your bare chest out against the howling north wind and say, "Here I stand all alone, naked and scathed. Me, personally, processing this preclear. Oooooh, that's pretty adventurous. No bulletproof vest, no protective screens, no pat textbook answer to fit every single turn of the road. No." Well, just get brave. That's all. Just get brave.

And sometime, if you ever have a tendency [in a very monotonous voice:] to just follow the ritual and be very wooden about the whole thing and never do anything off-line, and just go on down the line, down the line, down the line and never get curious about what the pc is doing and just sit there and reel it all out and give them the auditing questions and so forth and the needle knocks and you say, "I'll repeat the auditing question," and the needle knocks and "I'll repeat the auditing question," the needle knocks and "I'll repeat the auditing question," the needle knocks and "I'll repeat the auditing question," and the needle knocks. Do you know after a while somebody, including the pc, will begin to believe that time is stuck at that point. You see how that could be? Well, if you find yourself doing that sometime or another, get a brilliant idea: You audit the pc for a moment.

Maybe your rudiments as an auditor are out. But the way to get them in is just audit the pc. Audit that pc in that instant of time that you are covering right that moment. The pc is going "Boo-hoo-hoo, wow-wow-wow. I don't want any more of this. This is too much, and so forth. I can't face it. Now, I just don't remember anything. And it's horrible. And you're just torturing me," and so forth and so on. And there doesn't seem to be a textbook answer to all of this, you know.
All of a sudden sort of relax and look at the pc and look the situation over. Even if it takes a little time. Pc won't forgive it, but that's all right. He won't give anything right now anyway.

And look it over and say, "What is going on?"

And you know, he's liable to tell you. Because you asked him. You see, you asked him. That's different than a ritual question. Just try it sometime. The pc will all of a sudden wake up and sort of come out of it and think it over and then tell you what's wrong. And you go on and you clear the thing and you'll find your session swings right on in.

Do you know that with one single question which is heartfelt and meant by you, you can put all rudiments in just like that? It's an interesting thing, but there is no substitute for a live auditor. There's just no substitute for one. And this is particularly true in Security Checking.

Now, when I say this to you, it opens you up on – perhaps some of you might get the idea that what I mean is that you should be sweet or you should be kind or you should be inviting or something of the sort. No. No, no. There are times for the mailed fist in the auditor's glove, believe me. It might be a time for you to get human as an auditor and express exactly what you're feeling about the thing. And it might put the reality right back into the session.

You maybe have gone as far as this: "Look, Joe, you've been sitting here now for a half an hour giving me motivators. Don't you think it's time you gave me just one little, teensy overt, huh? You know? Don't you think that'd be a better proportion?"

And you know, the pc is liable to think it over and decide you're right and give you one. And it starts the ball rolling.

Now, the odd part of it is, is you can do any of that within the framework of modern auditing. You don't have to throw all the rules away to suddenly become an auditor. Because actually, if you are really auditing, do you know the rules all go into place click, click-click-click-click-click-click-click-click? That's what's interesting about it. The more and better you know your business, the easier it is to apply your trade and the more human you can be.

For instance, I talk to pcs. Oh, there's no doubt about it: occasionally I go too far. They always come up shining at the other end of the session. Sometimes I go too far, that's for sure. "Look, I've only got another half an hour to get this. I'm trying to get your rudiments in. Now, are you going to help me or aren't you?" That's going a little bit too far. See? A guy could be bowled over by that, you think.

"Well, let's just shortcut this whole thing, and you tell me exactly what you think is going wrong right here, right now. Now, what is going wrong right here, right now? What do you think is upset?"

Pc just, "Oh, uh – well, there isn't anything right now. It's what was going wrong."

"All right. All right. Fine. Well, is there anything going wrong now?"

"Well, no. Well, there was something going wrong."
"All right. Let's just lay that aside for the moment and carry on with this Sec Check."

In go the rudiments.

End of session, of course, you have to go back and clean it all up.

You know, the more you sin, the longer it takes you to end the session. You realize that. An auditor always pays for his sins in terms of end rudiments. But do you know that there are times when you pay for your omissions? You didn't commit any sins. You weren't direct enough. You weren't real enough. You were just kind of wobbling around. "Well, have you ever raped anybody? All right. Thank you. All right. I got a fall there. Have you ever raped anybody? It says here. Uh – you – uh – thank you. All right. Have you ever sung in church? Yeah, have you ever sung – have you ever sung in church? All right. Well, we can skip that." [laughter, laughs]

And you know the pc gets the idea that you're not doing anything? He does. Pc does get that idea. He gets the idea that you're not doing a thing. Which I consider quite remarkable in view of the fact that, of course, you're in there industriously!

You know, you're right in there pulling those withholds. You know exactly what's in the bank. You know exactly what the E-Meter's saying, and you know where these questions are going, and you know what you're trying to do with the pc.

Of course, out of such a session, he gets that idea, doesn't he? Never. He says, "Well," he says, "the mice could accumulate in the belfry, and the cobwebs stretch across the door, and not a breath of air would ever stir the dust in this Stygian gloom." [laughter]

He doesn't even restimulate his withholds. [laughs]

Now, of course, you can be far too overwhumping with withholds. I'll show you how you really overwhump a pc. You say, "Well, have you ever sung in church?" No reaction on the meter at all.

And he says, "No."

You say, "Well, have you ever sung in church?" No reaction on the meter.

He says, "No. No, no. I never have. As a matter of fact, I never go to church," and so on.

"Well, have you ever sung in church?"

"Well, no, I ...

And do you know you can have a pc crying and sobbing in no time if you keep that up? Do you know that? You can get the pc actually sitting there shattered. You can make people stammer. You make people so they can't talk. Just with that kind of idiocy.

All right. You say – here's another way to do it:

"Have you ever sung in church?"

Pc says, "Well, yes, I did once." You're adjusting the meter, you see.

"Have you ever sung in church?"
Pc says, "Yes, I did once."

You say, "Good, well, have you ever sung in church?"

"Um ..."

"What is this reading here? Yeah... All right. We're ready to begin now."

Pc says, "Begin? How about this me singing in church?"

"Oh, well, that was just a test question. It didn't have too much to do with it."

You've set up a withhold situation. You have forced the pc to withhold. See, you can Q-and-A with it so you force the pc to withhold. Well, how? By not accepting any of his answers, so of course it's all unintentional withholds.

Now, I wouldn't break out laughing or something when the pc gives you a thing. As a matter of fact, startled once by an auditor who looked all of a sudden – it had all been going – you know – it was the change of pace that did it, you know. All had been going about "Have you ever poured water down a drainpipe? Thank you. Good. All right. Now, have you ever poured water up a drainpipe? Thank you. You know? And have you ever washed any horses? Thank you," and so forth. And "Have you ever stolen any horses?" and so on.

And I said, "Yes, as a matter of fact, I have. Stole a horse, and ..."

The auditor said, "You did ??"

You know, there was this tremendous gleam of interest, you know. It was all going along – knocked me about five feet out of the session. Last thing in the world I ever expected to happen though. Gradient scales are of use. So if you're going to be interested in the pc, be interested in the pc. Don't fade from complete interest to total disinterest to mild interest to vivid, enthusiastic interest to no interest and so forth. If you're auditing a pc, just audit the pc. Because they recognize these things as quite false.

But you, the auditor, have rights too. The pc suddenly comes up with one that is an incredible type of withhold that you've never heard of before. Nobody asked you to put on a death mask at this point, so it startles you. But don't just leave the pc in the dark about this and then try to put on a death mask afterwards, you see.

The pc says, "Yes. Well, as a matter of fact, I rowed a boat up a drainpipe one time." [laughter] You know?

And you say, "You did? Oh, really?"

And the pc says, "Well, yes. What's so unusual about that?"

And you say, "Well, I was just startled. Did you row a boat up a drain pipe? How did you do that?"

"Well, I did this so-and-so and so-and-so and such-and-such and so-and-so and so-and-so."

And you say, "Okay. All right." And he gets the illusion that he has satisfied this startled curiosity. See, because you've got to be satisfied to the degree that you were curious. You
see that those things are direct in their relationship. I mean, if you're going to say, "Nooooo!" you know – well, at least, get your acknowledgment up to that level of enthusiasm, see.

"Well, all right. Hey, what do you know. All right. Okay. I really got that," you know? Pitch your acknowledgment up to match the other, you know.

You say, [in a loud, excited tone of voice:] "You did?? No kidding!" And then say, [in a disinterested tone of voice:] "All right."

Now, the funny part of it is it takes some auditor to make an auditing session. Some auditors have too much auditor there. Now, the way you have too much auditor there, however, is simply distracting the pc's attention, giving him change of pace, startling things, dropping the E-Meter, fixing the cans while you're in session. You know, if an E-Meter goes out on you, just for heaven's sakes, leave it alone. Don't even move it. Don't bother to look at it anymore, but just leave it alone. Do you realize that?

Your E-Meter all of a sudden is out and your E-Meter isn't registering anymore and by the usual movements by which you regulate an E-Meter – usual movements by which you regulate one – you all of a sudden see that is a very, very deadly meter. Don't even move your hand on it. Don't take the electrodes out of the pc's hands. Go on with the session as best you can. That is it. Not another quiver out of you. Do you hear me? That's very important. Much more important than it would appear to be because E-Meters do go out.

Pcs start gesticulating with electrodes. They can pull the plug out. And they can rip the connections up. They can actually break a wire. They can do something of this sort. And if you pay any attention to it ...

Well, let's say the pc just tears up the E-Meter cans, you know. Just rips them up, rips them right out of the sockets and that sort of thing. And he's sitting there with the E-Meter cans and he all of a sudden notices the E-Meter cans are broken and he says, "What's this?" he says, and so on.

Why, just say, "Well, that's all right." And ask him the next question.

"Yeah, but what's this? The E-Meter's busted."

Just take them out of his hand and put them on the floor and go on with the session, you see.

Don't ever fix a meter. Don't fiddle in a session. Don't fiddle with ashtrays, electric fans, windows, doors, that sort of thing. Leave it alone. If you're going to do something about something, end the session. Just go right on into end rudiments, end the session – even though you do it rapidly – and declare a break. And then go ahead and do what you please and adjust the doors and adjust the people rushing up and down the hall and adjust anything you've got to adjust, you see, and come back into session and open up a brand-new session. You'll find that the break, however, is probably more upsetting than the disturbance.

And your fiddling with the E-Meter can cause that tone arm to go up as much as two divisions. All of a sudden you see the meter isn't working, you see, and you get over here and you start cranking it, you know, and you start balancing it and you [fumbles around with meter noisily] [laughter] – it's just about the worst thing you can do to a pc.
Now, how do you run – how do you run a Sec Check? How do you run a Sec Check – if – with a busted meter on a very tough pc who's got lots of withholds and your meter busts and you're busy sec checking like crazy? How do you do this? Well, you don't. That's easy. And you say, "Well, do you think you have any more withholds on that?"

And he says, "Well, so on and so on and so on."

And you say, "Well, we'll look into that. Right now I'd like to run some of your Havingness and Confront. And here we go." And we run some Havingness and Confront and so forth and finish off the session. Or if there's a lot of session to go, we simply end the session, repair or get another meter and complete the Sec Check. But we don't do it in the full flight of a session. We never distract the pc's attention out of the session, see? Just don't do that. Now, you can put the pc's attention on the auditor with an auditor's interest because he realizes this is with him.

The way you knock the pc out is by irrelevancy. You can be as interesting and as interested and so forth as you please, as long as you are relevant to the session and what the pc is doing. Your interest, your pressure, your that, your what, anything of the sort – as long as it's relevant to what the pc's doing, that is fine; you can do almost anything you please. You can actually get up to a shout, you can get down to a whisper, you can be terribly active, you can be very histrionic without really upsetting the pc because it's all relevant to his case. Now, you'll see this I'm sure. What upsets the pc – what upsets the pc – is an irrelevancy to his case. That's all that upsets a pc.

It is not what you do. It is how relevant your actions are. Now, you start doing things which are not relevant to his case – your watch is run down, so you sit there fixing your watch while you audit him, see, and he'll go blooey. He lights a cigarette in spite; you start to light one. Irrelevant. He'll go blooey. Your attention is patently on the E-Meter, not on him. He'll go blooey.

Something wrong with the E-Meter – you see, it's irrelevant. It's on the E-Meter, not his case via the E-Meter. You can inspect an E-Meter all you want to, you see. "Yes, yes. Huh-huh. Yes? Oh, yeah. All right. Uh-huh. Okay. Let's see here. Now, you say so. Are you sure that that is all there is on that question? I'm looking at the meter here. Beware. Now, I'm looking at the meter when you answer that. All right. Have you ever swum up a waterspout? Ha-ha. There it is. Ha-ha-ha. Yeah, ha-ha. There it is. Ha-ha-ha-ha. All right. All right. All right. Now, you tell me about that. You tell me. It was an instant read, too. Come on, come on, come on. Come on." Never affect a pc. Never in a million years. He'd say, "Ooooh, you know. Waterspout. I did. I did. I did swim up a waterspout and so forth. I did, oh gosh."

"Hoo? When was that? When was that? It's right here. Come on. Come on. Come on. Come on." "Oh. If it says there – it must be there. I wonder what it is and so forth."

"Now, come on. Don't kid me about it. Now, don't monkey with it because I want to know right now. Right now. Come on. Give me it. Now, what is that?"
I'm not giving you this as a model. I'm giving you this as rather corny auditing. It won't upset him – do all of that.

You say, "Well, let's see. What's the meter reading here? I mean, what's the matter with the tone arm? Uh-oh, uh-oh, uh-oh." Next thing you know the tone arm is reading at 5. And you say, "How did it get there?" Well, it got there because your attention was on something else rather than the pc. His terminal demands attention and the only thing a pc will not forgive is not getting any attention from the auditor. And the auditor could practically dance a jig as long as it was relevant to the pc's case.

The pc said, "Well, we used to have these dances, you know. We used to go up and down the temple floor," (this would be horribly corny auditing) and the auditor can get up and say, "Like this? Or like this?" And sit down in the chair again, and the pc would be quite fascinated and say, "Well, it was actually like that. It was actually like that first one you did."

Yeah, and he'd go right on talking and telling you about it and so forth.

But the auditor has danced a jig. See? It isn't what you do in a session. It is how relevant it is to his case. As soon as you learn that, you can shed a few shackles in auditing. You can feel a little less braced, a little less plaster of Paris auditing, you see. "If I twitch my left cheek a little bit, the plaster of Paris will crack. I mustn't permit my eyeballs to dilate more than an eighth of an inch because that's proper TR 0."

I'm sure you could do all that like an Indian. Some of the schools in India practicing hypnosis can stop or start blood from flowing from a cut vein. You know, I heard about that in America one time and I was absolutely fascinated. Absolutely fascinated. In Chicago, they rounded up every doctor in Chicago who even – was inspecting an Indian who could make blood start and stop flowing from his veins. It's marvelous. He could make the blood do this.

But what was fascinating is that America didn't know it could be done. I didn't ever know it couldn't be done. You see, you can get several sides to every opinion. See, I was real startled because I didn't know it couldn't be done.

Now, you're similarly going to get startled someday at the fact that you ever had any trouble with auditing. You know? "What? You know, I had some – I was nervous about it or I was upset about it or I was diffident about it and so on. It's rather nonsensical." And you feel quite natural while you're auditing.

Drink a cup of coffee; audit. I mean, no more effort either way, because you gradually learned what you can get away with and what you can't get away with and you feel perfectly comfortable because that's it. And you say to the pc, "What you think?" As long as it's relevant to his case and isn't a challenge to him. You know, an invalidation.

It's pretty rough on a pc when an auditor starts in on him on the basis, "Well, you've been a creep all of your life. How can you expect to level with me now?"

That sounds awful rough, you know. "Have you ever done one decent action in your whole life? Now, tell me. Have you? Have you? Have you ever? Just one. Tell me one, one, one decent action you've done in your whole life. So you see, you can't." [laughter] "All right. Now, let's get the withholds off." That'd be awful rough on a pc, wouldn't it?
Well, get your order of magnitude. Do you know that it's ten times as rough on the pc for you to get rattled about your E-Meter and start fiddling with your meter as for you to do that? Get your perspectives in. Why? Because any crack you make at the pc, believe it, is attention. That is attention for the pc. You're interested in him.

And do you know that some pcs won't believe you and -- well, Susan Hayward, for instance, hated me like poison for a long while, years, until one night I was in a particularly vicious mood. And she brought up some picture. Her husband was sitting there and her husband looked at me. And he'd warned me never to flatter this girl about her acting or anything. She was very upset about it. And I was feeling in a very vicious mood and said it stunk. The last one I'd seen -- you know, almost that bluntly, you know. It stunk.

And she said, "What did you think was wrong with it particularly?"

And I said, "You were false."

You know, she was my friend forever afterwards? She knew I was sincere. She knew I was sincere. That was her whole measure of whether or not somebody was her friend. An enemy is somebody who flatters you. A friend is somebody who criticizes the living daylights out of you.

We've had people around occasionally -- one or two guys around -- and all I would do would just give them a studied insult. I'd never say hello to them. I would say, "Well, I see somebody has left a door open again." And they'd get this immediate sensation: "He understands me." [laughter]

This sounds mad, doesn't it? But these are acceptance level. Remember the old acceptance level? And a person who's in grief will accept a sad remark. And a person who is in degradation will accept the degrading remark. The only reality is the reality of the Tone Scale on which they're sitting.

Well, nobody asked you to compromise your reality. I'm just calling to your attention that it isn't so much what the auditor does, it is whether or not the auditor is being effective with his attention relevant to the pc. Is he being effective with his attention relevant to the pc's case? And that is all a pc ever demands of an auditor -- that he's effective and that his attention is relevant to the pc's case. And that's what, basically, an auditor violates when he gets in trouble with the pc.

He's sitting there woodenly. He's asking questions disinterestedly. His attention is on something else. The pc is aware of the fact that the auditor has an appointment at three o'clock. And that it's getting toward three o'clock. And that the auditor has a present time problem. And the auditor keeps glancing toward the door and looking at his watch.

Oh, man, if you want to form some ARC breaks, the whole pattern of ARC breaks is actually totally on the basis of the pc ceases to believe that the auditor's attention is relevant to his case. And that is the whole background of ARC breaks. There is no other background.

Now, we're up there. If you remember the Philadelphia lectures, the highest level is conviction. All right. Well, right up there, that is above agreement. That is above communication and mechanics, and so forth. That is a belief. The pc must stay convinced that the auditor
is interested in auditing him and interested in auditing his case, and auditing his case. Not necessarily interested – at that point of the Prehav Scale – but just auditing him effectively. And the auditor's attention is on the pc. And as soon as that has been achieved by the auditor, he gets no more trouble with rudiments. But it's something to achieve. And it is not anything very arduous to accomplish. I assure you it's not arduous to accomplish. It's very easy to accomplish. The first requisite is if you know enough about the mind and if you yourself have enough reality on its mechanics, then you are never debarred by the mystery of it all.

The pc doesn't look to you like a big mystery. He only looks to you like something that can be resolved. You want to know the ramifications of the thing so that you can do something about it.

But if you yourself know the basics of how his mind operates, you aren't backed off to a point where it's all just a total mystery and you go into a disinterest. If you know the actual mechanics of how he operates, you know that he has engrams, you know he's got a time track and you know he's got circuits and he's got valences and you know these various mechanics, you know how he responds to these, you know the overt act-motivator phenomena, you know about goals terminals, you know about these various things; you can look at somebody, they're doing something, well, you can understand what they're doing. It must have something to do with some of these. Well, this brings you immediately close enough to an understanding of the pc to form an ARC with the pc. It's an ARC that's formed. But it's formed by your understanding of the generalities of his difficulty. He has a generality of difficulty.

Now, your attention and interest is on the particularity of his difficulty. The specific parts that refer to him out of your knowledge of the general picture the pc presents. If you were comfortable and ... If you can go down the street and you see somebody gimping along and you know he's gimping along and he's having an awful time there, and he seems to have a great big bandage on his right foot, you know; an uninformed person looks at him and says, "Somebody has injured his foot." You look at him – and don't tell me you don't because I know that you do – you look at him and you know that he's kicked somebody or he's stamped on somebody's toes at some time or another, you see.

You know the basic mechanic – the overt-motivator sequence – and he couldn't possibly have a bunged up foot unless he was a specialist in bunging up feet. See? Therefore, you aren't invited into a supersaccharine sympathy about it at all, but if the fellow were to say to you, "You know, I got an awfully bad foot," you would be very happy to do something about his foot, you know. Even if it was just, "Look at my fingers," you know, and throw some somatics around for him. Why go through the histrionics of, "All right. How did you hurt your foot?"

"Well, foot was run over by an automobile wheel, and it's been very bad, and so forth."

You say, "All right. Stand there and kick an automobile wheel. Thank you. Kick an automobile wheel. Thank you. Kick an automobile wheel. Thank you."

You got some twenty-five percent chance of just knocking it out. Just like that, see? Twenty-five percent. You know, it's a small percentage, but you'll get your percentage. That's for sure.
Give him a Touch Assist. Do this and that. You can do lots of things about this foot. All right. If you can do things about the foot, then you aren't in awe of this foot and you also can be interested in the foot without getting totally interiorized into the horrible mysteries of the foot and how horrible it was that he got this terribly bad foot. And how could he possibly have gotten this foot? Isn't it terrible of the police department to drive the police van right straight across this man's foot. And we ought to change the government, shouldn't we. See, you're not off to the races here; you know exactly what's wrong with the man's foot.

You say, "What's it feel like?"

And he says, "Well, it just – it feels like it's in a boot, you know. It just feels like it's in a great big boot, and it's not, you know, but it feels like it's in a great big lead boot." [laughs] Well, that communicates to a Scientologist. It doesn't communicate to him. You're in the favored position of knowing far more about it than he does.

Now, knowing that, actually, that alone – just without your saying anything or doing anything – that you know about that reflects immediately. It forms a superiority on your part where he is concerned.

You don't have to do anything from that point there on. Somebody who understands life can talk about life, and other people know that he understands life even though they don't know what he's saying, which is a great oddity. Very possibly, some of you at one time or another have been overheard in a discussion with somebody or other and had somebody sort of looking at you kind of... [laughter]

Well, they don't really know what you're saying, and they don't really understand you maybe, but they certainly know that you know what you're talking about.

I had a fellow on an airplane one time, some big company executive, and somebody was chattering to me, some four-striper in the navy. And I was giving him very banal replies. I was not trying to impress him even vaguely. And this fellow sitting across from us, he all of a sudden – it was in the bar – and he was getting very interested and so on. The guy next to him started to get very interested and they said something to each other. And there were three or four people there, four or five people there on the other side. And they'd get talking to him and they'd look over. They were listening to this conversation. They were absolutely fascinated. We weren't talking about anything that had anything to do with the price of fish as far as I was concerned. But this four-striper had problems and all I was doing was giving some offhand advice. You know, hardly anything to bother with. I was trying to explain to him a few little minor things, you know.

And these guys were looking at this, you know. They didn't understand what that was all about, but they knew somebody knew something about a life over there. And finally, one of them, as he left, "Say," he says, "who are you?"

And I laughed at him and went on back to my seat. Left him in a total mystery. [laughter]

But this sort of thing communicates to the pc. Because you're outside the pc's bank and are not being influenced directly by the pc's aberrations, he of course recognizes – even
though you're equally trained – he recognizes that you *could* know more about what he's doing than he does. See, he recognizes this instinctively. It's true, you see.

Now, when you – equally trained or better trained or worse trained or anything else – are there and you are not looking and you are not interested in doing something about it in a session, that itself is an ARC break. Just like that, see. He's been cut. He realizes that you with your skill could get right on down there to the bottom of the pile and pull that bottom overt and there'd be a clinkety-clank of breaking glass all over the place. And you don't do it.

Well, actually it wouldn't matter how you did it as long as you did it. And it's quite interesting. As long as you did it – that's the only thing which he doesn't forgive is not doing it. That he won't forgive. People do not forgive no auditing. People do not forgive being ineffective. They just don't forgive these things.

The best answer for it is to audit the pc yourself and always to some slight degree be effective. Now, you've got enough tools and weapons now to be effective to the end of your days. I mean, you never catch up with the human race with how much you know now. I mean, the human race would never catch up with you. I mean, God 'elp us. There's two billion five hundred million pcs out there right this minute.

There are wise men all over India. There are hakims and sad apples and Sufis and bug-jumps and jujus and AMA doctors, and bums and tramps amongst the witchcraft and so on, medicine men amongst the Indians, all this sort of thing. And not one of these experts knows as much as you do about mind or about life. Not one of them. You give them cards and spades and still whip them every time. Medical doctor says, "Well, there's something wrong. Every time this fellow – every time we examine him, he sits there and he starts to tremble and so forth. And he starts to tremble every time they examine him. And I wonder what this is. Is this a locomotor nerves in the *pocomocus* and so forth? And shouldn't we operate and snap a couple of tendons or something here in order to keep him from going this way, and so on." You listen to some of the wildest balderdash.

Well, he's being the expert. It's quite remarkable. You are diffident about it because you're so schooled to believe that he's the expert, so schooled to believe that the man is interfering.

If you'd have walked over to him, slightly in his lingo and said, "The man's suffering from a psychic trauma. He probably has some reaction to an examination. Ask him if he's ever been an examiner."

And the medico says, "What?"

Oh, but he says "What" very interestingly. You must have said something there. He's liable to be kind of nervous about you, too. You know? But a different – entirely different – atmosphere than what you would expect would arise from the situation, because he knows he is talking to somebody who knows. And that can't be missed. It isn't how you hold your pinky. It isn't how you balance the saucer on the end of your nose. It's just whether or not you know.
And your confidence and skill, of course, is in direct ratio to your certainty of knowledge. You know these things are true. You know they are true, and that's it. You've had it. You sit down in an auditing chair. You look at the pc. He feels this.

And the only other thing the pc demands is attention on his case, not on something else. You start telling that pc sitting in the auditing chair about your case, you're going to form one of the wildest ARC breaks you ever heard of. Try it sometime. Pc sits there in an auditing session and you say, "Well, that reminds me of an auditing session I had once." And you talk about a totally dissimilar action to anything you're undertaking, see – and anything – has nothing to do with his case whatsoever. And carry on for about twenty or thirty minutes in that wise.

Man, if you can get the rudiments back in, in end of session, I'll tell you I'll give you a medal. It's – it's marvelous. And yet you actually have been very polite. You've been very kind. You're trying to reassure the pc. Anything you could put it down to, you see. It still wouldn't make any difference because it violates this little rule.

You've got to be effective, and your attention has got to be on the pc's case. That's all he demands. He'll even forgive tremendous numbers of things if you do those things. He'll forgive things all over the place. He'll forgive dropping the ashtray and everything else. He'll forgive running the wrong process 895 hours even, if you all of a sudden start running the right one on him.

Aw, you haven't seen anybody particularly ARC broke about suddenly bringing up modifiers. I don't think anybody's been cursing about it. I felt a tiny bit chagrined about it that it's taken me some months to find out that there were tails and middles and beginnings on some of these goals, you see, that was holding them up. I know right now why Clears go unclear so suddenly. Just a modifier clicks, just like that. They're all cleared up, but there's that little tag end of disappeared modifier and it has enough charge on it to make the case charge up again.

Well, how do you patch up a Clear who has been Clear and then who has this charge. All you've got to do is go back and clip out the modifier that has been hung up there. This has been quite a mystery because a certain percentage of Clears lapse.

One down in Durban the other day, perfectly Clear, checked out Clear, everything was beautiful, and so forth. Went outside and BOW! You see, the bank falls in. She reads stiff on the meter. The meter up to 5. You know, all just blwaaaaah! Everybody down in Durban being terribly reasonable about it, see.

They're saying, "Well, all right. Let's see, the – the pc couldn't confront the environment, cleared on the first dynamic, ability to postulate, caved themselves in and so forth. And maybe after this, why, the pc was feeling bad about being a Clear and was self-conscious about it and so on. And that caused the environment to do so." See, all the figure-figure going on, see. Some auditor has just been handed a lose. Fortunately, why, the Marines were landing right at that moment. Halfway between here and South Africa at that moment was 7 November 61 bulletin. See, all they got to do is get hold of this girl and say, "All right now. Let's see. First goal you were audited on was to sew socks. Fine. Let's find the rest of it. To sew
socks and... What's the rest of it? Go ahead and complete the sentence. Go ahead. To sew socks and... Good. Complete the sentence now."

"And fill them full of holes. Oho. Yeah."

You know, your needle goes bang, you know.

Now, you say, "What was the goal to sew socks?"

Bang! Big surge.

"All right. Full of holes." Tick.

"All right. To sew socks." Tick.

"All right. Full of holes." Gone. Gone. Gone. And just take each goal they've had right on up the line, bring those tails and middles off of the thing and so forth and they'd settle out straight. Interesting, huh? Might take a little more patch-up work or something like that because it was such a shock to them to go Clear and then un-Clear so fast with the missing link. We've really found the missing link now, haven't we? Yeah.

Anyway, I don't know. Maybe somebody around here said, "Gee whiz. Well, I audited on the wrong goal all of these hours."

No, you didn't. You were on the same goals chain and so forth. But I'm much more interested in your case than I am in my face. And you know that. So you've taken much worse than that from me. But people get upset about my building fireplaces and buying ships. Why? [laughter] You see? It adds up.

Makes a little ARC break. They don't know that I do that on my time. They don't think I have any time. And it's true. I don't. All I have to do is tell them, however, all the time I'm fixing up ships, I'm thinking about cases. [laughs]

And only if that were true, however, only if it were true, would that wipe even that away, you see. You see why this is?

All right. A pc can form a considerable amount of ARC with an auditor. And the ARC, according to some schools of thought, even in Scientology, is only formed by sweetness, kindness and nice, humoresque on the Stradivarius. You can make a pc hate you with that. You're always sweet and kind and understanding and never effective. The pc is going out of control. The pc knows he's going out of control. And you're sweet and kind. I never had a pc in-session so much – or actually ever had any ARC with one pc so much – as I did after I had practically picked her up by the nape of the neck and carried her across the room and set her down in a chair with a terrible thud. With a real thud.

I said, "Let's not have anymore of that right now. Now, pick up the cans." You know, the pc tried to blow. The pc was not ARC broke. This all registered on the basis of: "Hey, you know, he really means to audit me. He really means what he is doing. He's not kidding. What do you know! Hey! What do you know!"

Now, the reason student auditing is often slow is because everybody is studying auditing at the same time they're doing auditing. So all of the auditors could come into the category of "just auditing me in order to learn and practice." So that would modify the definition "ef-
effective and interested in my case," see. They could be effective and not interested in the case and have a hard time keeping rudiments in. You see how that would modify it?

"Well, whatever we've been learning lately has nothing to do with it. What do you think has happened here that you have a tone arm up at 6? Well, just what do you think happened? Well, how come your tone arm went up to 6. It's been stuck here for about two weeks."

He says, "Well, I don't know. I don't know. Taken off the process suddenly, and – and I guess – or something – I don't know. Really. It's true though. I felt different for the last two weeks."

"Now, how have you felt different? And what have you been doing now that's different?"

"Well, I've just felt different and so forth."

"All right. Well, anything went on two weeks ago that you were in violent disagreement with in some kind or another? Were you in a fight with somebody around or something happening and so forth?"

Well, we all of a sudden find a postulate that they're going to keep the rudiments in now, and they're not going to let the rudiments go out so that they can be properly assessed and so that they can go Clear and get out of here. And nothing is going to affect them in any way whatsoever.

Ah, but they give this up to somebody, you see. They give this up to an auditor who is asking about them. Asking about them individually. Not as an example to something else. You know, the fellow wants to know, and he asks them.

I am actually maybe opening the doors on the hordes of hell because an auditor can use this as an excuse just to do anything in a session. You can practically do anything in a session as long as you're effective and interested in the pc's case and your attention is on his case and what you do is relevant to the solution of his case.

Now, that tells you that if you really want to chop up a pc and get the pc overwhelmed, use an auditing session to secure an advantage over the pc. Ah, that's not being effective, is it? And it's not really being interested in the pc's case but interested in using the pc's case. And even though the pc'll go into a kind of a thralldom thereafter, and so forth, man, they're really never quite on your side. You have a hell of a time with them.

So some auditor carelessly goes and sleeps with his pc. "Aw," he says, "well, this will make good ARC." [laughter] Great day in the morning. It'll make good ARC all right. Why didn't he cut his throat. I mean, as far as the auditing session is, it's finished. He's not going to get any auditing done. Not after that. It's quite interesting, isn't it? Because it violates this idea. He's not interested in the pc's case. He's interested in the pc's body. Well, that's not being much interested in the pc.

Women can actually figure it out so that if you're interested in their body, why, you're interested in them. They actually will put this together and make a mishmash out of it. But it
won't work with them in an auditing session. You can always tell a girl going along, "You look very pretty today."

That's fine, she may accept this, she may not. But she thinks of that as complimentary. And of course it is. But in an auditing session, if you sat there and described to them what a pretty body they had and how nice they were to look at, and how well dressed they were, they'd go some little distance with this. Then all of a sudden, it'd suddenly go bzzzzzzzt. And you couldn't quite figure out why it went bzzzzzt. Of course, a body isn't a case.

You're an auditor. Therefore, what you're doing isn't effective. All things just boil down to that. Every skill that you have in an auditing routine – Sec Checking, your elements of Model Session, Problems Intensive, it doesn't matter which or what of these you're practicing, has of course a certain form. This form rather guarantees interest in the person's case. It rather guarantees that. Don't let it ride on automatic because now it sort of compounds the felony.

The ritual is interested in the pc's case, but the auditor isn't. And I think you've seen that, haven't you. The ritual is interested in the pc's case. Well, then, the auditor looks kind of funny, you know.

The auditor asking if it's really all right if he does so-and-so, and the auditor doesn't care whether it's all right if he does so-and-so. And it makes a kind of a lie. And the pc gets weird unreality about the whole thing. No, what you have to do is be interested in the pc's case and determine to do something effective about it. And then, through the media of the ritual and E-Meter, you give him the auditing commands. That's all.

That's – those things serve – they are secondary. They're a very vital secondary. You shouldn't come off of them and so forth. But unless they're backed up, they're as empty as sounding brass in the tinkle of the temple bell. They are nothing.

And in Sec Checking, if you don't get to the pc as an auditor, if the auditor does not become visible or real to the pc, no withholds knock. How do you like that? A little voice in the far distance is saying, "Well, have you ever swum up a waterspout?" Doesn't mean anything to the pc. Nobody there. "Have you ever swum up a waterspout?" the little voice says in the far distance. Hasn't anything to do with him. It's not restimulative.

All right. But the auditor is real to him. He knows the auditor is there. He has an idea that there is somebody auditing him and that this person is going to be effective and is interested in his case. Now, it doesn't much matter what the fellow does – what the auditor does at that juncture – as long as it satisfies those points.

He can say, "Have you ever swum up a waterspout?" And he can get some knock on the E-Meter. But if he's got good presence, he says, "Have you ever swum up a waterspout?" And the – you get a pretty good fall on the meter. You don't get a fall on the meter in direct ratio to the volume of your voice. You get a fall on the meter in direct ratio to your reality to the pc.

So I look at a pc sometimes and I ask him very softly and quietly and so forth, if they have ever swum up a waterspout or sung in church or some other crime. And the needle falls off the pin. I turn it over to somebody; they don't even get a knock. And this is true of assess-
ment. I assess somebody, the needle falls off the pin. Turn it over to somebody to check out. It's gone. It's nulled. But that's because nobody is asking him. It's no more mystery than that.

Now, your presence is as poor in the pc's opinion as you have to keep the rudiments in. An auditor has a direct self-criticism mechanism. Your presence is as poor – not as much as the pc objects to you. That's all balderdash.

The auditor is as real and has as much presence to the pc as the rudiments stay in and has as little presence as the rudiments go out. Because you're using terribly powerful forms. Terribly powerful commands. Very challenging questions, all said from a nobody there. See, there's nobody saying these things. There is no presence delivering these things. And these tremendously overwhelming forms are being thrown at the pc from a nowhere. He hears the words, you know, but there's no music. It's the auditor that's the music that goes along with it. He hears it, but it doesn't mean anything to him. Actually, it can be disturbing to him.

He has just gotten through robbing a whole peach orchard. He knows it was a crime. He not only robbed the orchard, but as he went through the thing he broke off all branches. And then he didn't want the peaches for anything; he fed them to the pigs and the whole herd of pigs died. You know, I mean, this is quite an overt, as we stack it up. And it's all very complicated and intricate of some kind or another. And from a nowhere, he hears, [in a bored voice:] "Have you ever robbed a peach orchard?" See? "Have you ever robbed a peach orchard? Have you ever robbed – ?" It's hard to get that disinterested, you see. "Have you ever robbed a peach orchard?"

Yes, he's robbed a peach orchard and he's scared about it, too. Nothing matches here. There's nobody really interested and you don't get much of a knock on the needle. It doesn't restimulate it at all.

But when you, a living being, a living presence, look at him right in the thetan and you say to him, "Have you ever robbed a peach orchard?" Oh, oh, somebody is knocking on the door. He has a suspicion that he should answer that one. He just better answer it. He just better answer it. And your Sec Checking, goals finding, levels finding, speed of delivery, all become very easy on these bases.

Problems Intensive – you say, [in a faint, bored voice:] "Well, have there been any self-determined changes in your life? All right. That's fine. All right. List the self-determined changes in 1956 and so on, so on, so on. All right. Now, we're going to assess these changes. All right. 1952 change, well, bought a new hat, in 1952 you bought a new hat. And 55 you bought a new hat and 61 you bought a new hat and so forth. And you're going to buy a new hat. And that's the changes in your life."

And you come around and you say, "You know, there's no changes in this person's life?" No? You got the volume of change to the direct volume of auditor. They're "matchly" tuned. The quality of your auditing was buying a new hat, see. Get the idea? You mean, your presence was so faint on the line.

All right. Now, you're interested in it. You're being effective. You're right in there pitching. You want to know about this thing and you say to the pc, "All right. What self-determined changes have you had in your life?"
And the pc says, "Well, what do you mean as self-determined change?"

"You know. You make up your mind to change. Now, how many times has that happened to you in your life, do you suppose?"

"Well, quite a few."

"All right. Now, tell me one of them. A self-determined change in your life. Self-determined. That you decided to change. Now, tell me one. All right. Tell me one now. All right."

"Oh, and it's – yeah, yeah. Well, there's so-and-so, and I decided I couldn't stand my mother-in-law anymore and shot her. Yes. That's a change. And other changes, and I decided this, and I decided to bathe only in borscht." [laughter] "Yes, I've always been mystified about that one."

And you get a wild list. And you get it rapidly. Now, of course, the bank, the pc's bank, is quite responsive to your auditing and is responsive to your presence. And you can handle it, of course, to the degree that you are handling it. You're real to the pc, you can handle his bank. It's odd that you can handle his bank better than he can. And this is what he means by being effective.

So when you never order his bank around, you're sunk. He doesn't think you're auditing him. Nothing happens. You sit there, irresponsible about the whole thing, bang! Nothing happens.

But you say to him, "All right. Now, are there any more self-determined changes in your life?" You're looking at the E-Meter. It doesn't knock. "All right. That's fine. That's the end of the list." It's that easy.

All right. "Are there any more self-determined changes in your life?" is asked.

"Well, are there any more self-determined changes in your life?" It doesn't fall. Couldn't be any more.

And with just a little more presence, just a little more interest, "Are there any more?" And it restimulates and you've got another one. You get the idea?

The more presence you have, the more you get out of the pc. It's quite interesting as a mechanism.

Now, your deadpan auditing asking a pc – or accepting withholds that don't fall, by the way, is one of the wildest things you can ever do. The pc tells you the withhold. And you see this, and nothing happened. Nothing happened to the needle. Nothing happened to the tone arm. This must be about the flattest question there is. You ask him again. Ask him the question again just for form's sake to get off the question. "Have you ever swum up a waterspout?" No. It's null. Off of it. On to the next one.

But you sit there and use auditing form to demand answers to your auditing questions and you'll get all sorts of created universes. Now, the trick is be effective, you see. Only ask for withholds when you see that they are there. Only start pressing when they're obviously there. Only start getting frantic and histrionic when you just can't get them off and it's quite...
obvious that the pc is sitting there with a clenched jaw with his hands locked behind him, won't touch the E-Meter cans and says, "Don't you dare ask me that question again."

Well, what would you do at that point? Well, whatever you do. Do it effectively. If that's your signal for throwing your auditor's pad down on the floor and say, "God damn! I've had just about enough. Are you going to answer it or aren't you?"

If that's what you think you should do at that point and that's the only way you can possibly conceive that you would get an answer to it, why, by all means do it. Because you've come to that impasse situation, don't you see?

Or if it's down to this basis, "Oh, come on, George, come on, come on, George. You can answer it. Come on. Come on. You can tell me. You can tell me. Come on. Come on. It's all right. It's okay. You can tell me."

[through the teeth:] "I don't know if I can tell you or not."

"Aw, come on. Come on. It's all right. Just tell me, and we'll get onto the next question. Huh? Just tell me and we'll get right on to the next question."

"Well, all right. But something tells me I shouldn't." He gives you the withhold. Clean it up the rest of the way, he's back in-session again. But the way to get a pc in-session is to audit him. And that sounds like one of these horrible truisms. There is no way of talking a pc into session. There is no way of wheedling him into session. There is no way of pleading him into session. The way to put a pc into session is audit him. Audit him. Be effective. Put your attention on what he's doing, what he's thinking about and so forth.

You know, a pc would even forgive something as corny as this: "Now, just sit there and shut up for a minute and let me think. Let me think. You presented me here with a rough one and I'm not quite sure which way I'm going on the thing. So just be quiet for a moment and let me figure this out. Shut up now!" [laughter] "Hm. Well, Jesus, you got a rough case." [laughter, laughs] "All right. This is what I'm gonna do, see." And lay something down. I mean, that's awful corny. But a pc would accept it because you were trying to do something about this situation. Pc would sit there for an hour waiting – you figure out something about his case. [laughter] It's actually true.

But beware of mechanical distractions of all kinds. And it's by definition. What is a distraction? Well, a distraction is something that is not relevant to the pc's case and is ineffective. And that serves as a distraction. If you want to knock a pc into a cocked hat in a minor sort of a way, all you have to do is find a very effective process on him, ask him about three questions of that effective process and then change the process.

You're obviously being ineffective. Because he knows the process is effective. He can feel this thing bite. He can feel the fangs go straight in, see. And you've asked him three questions, and you say, "Well, what is not known about a ruddy rod?" And the meter goes bong! and the tone arm swings.

And, "Ooooooh, I don't know if I could ask that. I don't know if I could answer that. I wouldn't ever ask anybody that. What is unknown about a ruddy... Oh, boy! Ooooh. Ooooo. Uh-uhuhuhuhuhuhuh mmmmmmmmmmmmmmm. Got a somatic."
"All right. All right. Okay. I'll repeat the auditing question. Now, what is unknown about a ruddy rod?"

"Well, it's a uhhhh. Uhhh, its length." See?

"All right. What is unknown about a ruddy rod?"

"Mmm. Mmuuuuuuh-kroooow!"

And you ask three questions with that response, and then you say, "Well, I think we'd better get on to auditing your terminal now."

See, it violates that part of the definition of what is auditing in being totally ineffective. This thing is biting like crazy, you see. He's getting action, action, action. And all of a sudden, here you go.

Now, unless you could demonstrate to him that the next process was about three times as effective as the one he was just running, you're sunk. You know, pcs will sit around and mourn about having been audited in 1954 by something or other, and they were run on a process of "Jump over the moon. Thank you. Jump over the moon. Thank you. Jump over the moon." And they really knew that one. It was never flattened, and it really bit. And nobody has ever flattened the process.

And it'll come up session after session after session. You ask for ARC breaks. "When was the first time you had an ARC break?" And they go back to this unflattened process. It isn't the process was unflat. It was that the auditor was being ineffective.

The auditor shifted off an effective process to an ineffective process, and the pc practically never forgives it.

Now, if you think of auditing as an activity concerned with deportment, well, you'd have something vaguely true. It's vaguely true. Yes, it has something to do with deportment. Ladies shouldn't put their heels on mantles while they're being auditors in the auditing chair. There's various things you shouldn't do. You should wash your teeth before you process a pc. At least, wash your teeth once in a while and so forth. And if you don't change your socks often, why, don't take off your shoes and put them in the pc's lap. [laughter]

There's various little courtesies of this character that one should follow. But you notice that they're all irrelevancies to the pc's case and your being effective. That's what makes them irrelevancies, and that's what makes them bad. It's not codes of deportment that makes them bad. It's whether or not they're relevant to the pc's case.

Now, you lay it down to the pc that you're going to audit the pc, he expects some auditing. The pc can be absolutely screaming in a session, just practically screaming, and wind up at the end without hardly any ARC break at all, as long as the auditor was totally effective all the way through the thing. And as long as it just wasn't ARC breaks and irrelevancy that were causing the screams, you know.

Pc says, "Uuuuuh. These bullets are going by and -- oh, wait a minute, wait a minute. You shouldn't be running this process at all. You shouldn't be running this process because you've got bullets going by! Bullets! They're real live bullets in this thing!"
AND YOU SAY, "GOOD. FINE. ALL RIGHT. LET'S HAVE ANOTHER BASKETFUL OF THEM."

[LAUGHTER]

He can think of you as being the most cruel, heartless person he ever heard of and say so, but if you want an ARC break, turn kind at that moment. Become ineffective at that moment and you have a honey. That ARC break will be catastrophic and it'll be hard to find, too, because it's obvious that you did the right thing. You didn't. You became ineffective.

The way out is the way through. The pc was walking in the shadow of death and you, by golly, didn't keep shoving him along. And you said, "Okay. There you are. We will all gather round, brethren, and will sing this hymn." [laughs] It had nothing whatsoever to do with his case, you see. Buuuuuuh!

So you're damned if you continue and you might try to figure your way out of it this way: "Let's see, I'm damned if I go on and so forth. And he'll just get worse and worse and so forth. Maybe I ought to stop because it's too painful." Well, of course, that's just totally ineffective. The only way out is the way through.

No, regardless of how rough it gets, you've got to ride it on through to the other end. There's where your judgment comes in. Run a process that is the proper process that is the right process and runs the pc through as smoothly as possible and you don't get to these points of judgment where you say, "Well, oooooooo, is it better to kill him or cure him at this point?" You really don't come across those things if you're auditing straight and your processes are all right and you're auditing goals terminals and Problems Intensive and doing what you should. It's easy.

Now, in your auditing, then, the one sin which I adjure is not auditing. It all boils down to that. That's the only sin that you can pull.

Now, if a pc is demanding that you audit the pc, you can say no unless you start, see. You can say, "No, no, I'm not going to audit you. I don't want to give you any more auditing I'm – very full schedule, and I can't do anything about it." Well, you'll get some ARC break. That's right. You'll get a mess, a bit. But if you start auditing him and stop, then that becomes absolutely fantastic because you've got the pc in-session and what you're doing now is irrelevant to his case. So you're sunk.

No, deportment begins and ends on the one question of: is there auditing taking place. If auditing is taking place, gains are being made and so forth, then the deportment must, by definition, be perfect.

Thank you.
Thank you.

Aw, I didn't think you'd be glad to see me today after this bulletin change and so forth. Maybe it was Mary Sue you were glad to see. Is that right? [laughs]

Okay. Now, the first talk on Routine 3D, and I'm going to go over the Information Letter with you which is undated because I typed it.

This is now complete except for commands.

Now, let's take up the history of clearing. A tremendously smooth, interested job of auditing in the days when we didn't have rudiments could make a Clear. A tremendously smooth job of auditing, that took up a person's engrams that were quite visible, that brought him into a condition where he could see his pictures and where he could confront his track. And that was a long time ago. A very long time ago. And only me could do this.

Now, the world of psychiatry has never at any time, or psychology, believed otherwise than that I was quite a practitioner. What they don't like is that I wanted somebody else to be able to do it. That was the unforgivable sin.

Well, it was not only an unforgivable sin, it is almost an insurmountable problem. It was, actually, something on the order of except for here and there, here and there – I suppose you could have counted them on the fingers of one hand – an auditor isolatedly would make a Clear. That was somewhere from 1940 – well, others auditing them – from somewhere around 1950 to about 1958. Wasn't that ACC '58?

All right. Now, on that ACC, I did assessments based on a Dynamic Assessment, went down the line and, working directly at circuits and machinery and so forth, assessed that whole class. We got something – I don't remember how many were on that class – I think there were about fifty-five or something like that – it was quite a large size class in Washington and we got fifteen people who went Clear. I didn't do any of the auditing. All I did was some assessment on the thing.

Now, that was a rather fabulous average, but for the first time somebody else auditing had made a Clear. That was the milestone there. But remember I had done the assessments.

Well, time went on and trying to teach somebody how to assess, trying to put into communication, frankly, the various factors, trying to make them relatable, had to bring any knowledge connected with this out of the realm of the intuitive where I was concerned into the realm of the cold, mechanical part well expressed, so that it would communicate. Now, that's been the roughest part of this. And trying to bring about a condition in an auditor where, through training and so forth, his auditing was sufficiently smooth to keep the pc from balling
up on ARC breaks and other rudiments and so forth; trying to develop a technology which would teach and a technology which would apply auditing has been a very tough run.

But if you look at the actual number of years involved, it's not very long. The first auditors I tried to teach was in 1949. That was before there was any Foundation. And they made a dog's breakfast out of it, you know. I mean, they really did. And it began to dawn on me that they weren't doing something I was doing. Only, this really didn't dawn on me at all until 1955 when a chap in the organization in Phoenix had been watching me audit on television and he made a very interesting observation. He says, "You know, you acknowledge everything a pc says." And by George, you know, I'd never thought to remark it. Now, it was that kind of differences.

So we had to get together and assemble all these parts. What did constitute an auditing session, see, what did put this together?

Now, it wasn't that I was so wonderful. It was the fact that I could do it. This was something I could do and trying to find ways and means of getting somebody else to do it was quite interesting because I myself down through the years have enormously improved my own auditing. I am not doing something and then teaching you to do what I am doing. That is not what's been happening.

I've had to find the actual parts necessary to make auditing occur. And then I've used them all myself. As a matter of fact, my auditing right here at this instant is sort of shot. It's in very bad shape because I've been rewriting the end rudiments. And when I do Model Session now, I don't use the old Model Session, I really haven't learned the new Model Session and you haven't even got it yet. [laughs] So that's sort of the way it's been going.

I started this originally on the CCHs. I sat down and tried to do a perfect Tone 40 job to find out whether or not this could be done, if it was doable and so forth and had to retrain myself to this new skill – a Tone 40 job of auditing as done on the CCHs.

And that was quite revelatory to me, because I found out with great personal reality for the first time that I could myself do these things with a definite improvement of my own auditing. In other words, by knowing how to do these things, my own auditing got better.

So as time went on, we developed the Model Session. Of course, the TRs were developed, the Model Session, the other parts of auditing. And frankly, we were learning things about the E-Meter as a short time ago as three months ago, we were learning things about the E-Meter. For instance, the last thing which turned up about the E-Meter was instant read. There's some possibility that something else could be learned about an E-Meter, but I decided about June that we knew practically everything there was to know about an E-Meter, and I wrote a textbook which you have as *E-Meter Essentials* and there's only one real datum in that missing. And that datum is simply instant read versus latent read. And that's all that's missing in that textbook.

Now, I learned a lot about this meter in experimental runs and so forth but, basically, trying to teach people how to use the meter. And it was unbelievably tough. And to this day Instructors do not believe what they see in people learning how to use an E-Meter. And on the US courses, Instructors have developed a mechanism of using – of how to use the E-Meter
which is kind of a drill. And they have an auditor and a pc mock-up session, with the auditor actually asking the pc questions on the cans. And then they have a third student who stands back of the auditor and studies the reaction of the meter. And an Instructor is there and says, "What reaction was that?" And this is a drill which is actually teaching people to use an E-Meter.

They – apparently an enormous percentage of people in reading a meter just don't ever see the needle move. This is sort of buggy. But it is a fact and something that you should remember in teaching people to use the E-Meter.

Now, where you have an instrument of as precise a character as the E-Meter and where you have a thing as intricate as the human mind, you have to have a very skilled operator in order to carry something through, as far as the meter is concerned. The person really has to know what he's doing. And although you could probably get away innocently in earlier years with sitting there watching the E-Meter wobble and being learned about it and not really knowing what it was saying or doing, you had this as a protective factor, if you please: there were no technologies of sufficient bulldozer quality to actually plow somebody up. The technology itself was not up to a total massed battery sort of an action. But today that is different. Now, the technology which I'm about to go over with you here and which you as a class are already using, this technology – this is wild stuff. I mean, it is definitely of a high bulldozer quality.

You realize that if you miss in running Routine 3 – if you miss in running Routine 3 – you could practically bury the pc. What you are using, in essence, is so strong and so heavy, is so powerful that if you choose the wrong items on any one of this sequence of items and then audit the final result on the pc, and then if you don't check the number of levels coming alive and don't find out you're wrong, you can practically plow him under, almost as surely as Roosevelt plowed under pigs. Can practically wipe him out.

The bank becomes more solid. Any tone level the pc is in will get more and more so. It won't relieve. It just gets more so. The pc feels a little bit sad and the next thing you know the pc feels sadder. Not downscale sadder, but more volume at that tone level. And if you keep it up, the pc feels much sadder and much, much, much, much, much sadder. Get the idea?

The whole case is becoming stronger on the aberrated manifestations of the case.

All right. There are techniques, now, which we sought to classify as the relatively unskilled technique. But what do you know? Routine 1, similarly, can cause a mess. How?

The Security Checking. If a person does a bad metering job and misses one Security Check question or one rudiment, he's had it. He's had it. I mean, that becomes a dog's breakfast at once. So Routine 3 itself provided means by which you could quickly spot whether or not the pc was running right because if you got the goal and you got the terminal, assessed it on the Prehav Scale and ran it for a while and then went back to the Prehav Scale, don't you see, and checked it again, well, more levels were alive so you'd better do something and it was wrong.
Well, that was all right as a remedy, but the truth is that the errors being made with it were far more gross than that. One error: run a level only so long as the tone arm is moving well. And as soon as you get the tone arm moving well, you assess for a new level and run that.

And let me tell you. If you do that to a pc, he feels like he's going crazy. He's got two levels live simultaneously, which is quite remarkable as a mental sensation. If you yourself have had that as a mental sensation, you know what I'm talking about. And of course, here you've been rounced off one process onto another and so forth, and sometimes the other process wasn't flat. And for a day or so you feel zzzzzzz. Well, it's much worse than that if you grossly mishandle these things.

There is a whole body of technology, now, lost in the yesterdays which could be applied by an auditor, and we put that under Class I-type auditing. And, actually, a lot of that auditing is relegated to co-audit. And some of you will – as soon as you get the new co-audit processes on which I am working at this particular moment – as soon as you get these new co-audit processes, you'll see what I'm talking about.

But old Rising Scale Processing, if you please, is going to be run in co-audits by the veriest amateurs. They just come in. They sit down. What is a pc? A pc is a policeman. You know? They don't know a thing about it. And here you have it that they can actually get away with Rising Scale Processing. It's quite remarkable what they can get away with.

We will have a whole body of skills there which are still meter proof, pc proof and that won't overwhelm a pc. But what we're dealing with right now, when we moved into the zone and realm of clearing a small percentage of people – that is to say the technique was adequate for clearing a small percentage of people – we were on the edge of things which required only the greatest technical accuracy. And when we have moved into Routine 3D, let me assure you that you are not just on the edge of technical accuracy, you had certainly better know your parts of auditing, your E-Meter and the whole ruddy lot.

And anybody fool enough to permit himself to be audited on Routine 3D by somebody who has to continually fumble with the directions and "Let's see. What do I do now?" and so forth, out in the public, of course he's just trying to commit suicide. I mean, it's at that level of magnitude, because you have here a body of technology which is actually stronger than the human mind.

The pc has no chance of resisting the error. That's something for you to think about. In earlier days, yes you could say, "Well, go ahead and audit anybody on anything you want to. It'll settle out in three to ten days," see.

Well, we've moved into a body at the same time that we start clearing broadly, clearing any large percentage of the pcs who sit down in the pc chair – as soon as we move into that, we have, of course, moved into technology which in itself looks like massed bazookas and atomic rockets, and so forth. That's the way it looks to the fellow in the human mind.

In the first place, he's sitting there in-session. The technology you have just about sessions and that sort of thing puts him in-session willy-nilly. He can't do anything else but to go
into session if the auditor knows his business. And then you go and run this. There isn't any way he can say no.

So the responsibility an auditor takes for the use of this particular routine is very great. His responsibility, however, should not be on the basis of being cautious and trembling and chewing his fingernails and all that sort of thing His responsibility factor should be simply on the side of knowing his business, feeling comfortable in a session, being able to conduct a session in a very efficient and effective way. It's relatively easy to do that today, but it is something to do.

And therefore, I adjure you – when people ask you about Routine 3 or Clearing or shouldn't they use Clearing, you know, and shouldn't they do this and shouldn't they do that – I ask you for your support in telling them quite firmly, quite firmly, "Well, when you are a perfect Class II Auditor – when you're perfect as a Class II Auditor – and when you have studied assessing very hard, why, yes. But right now we're thinking about you being a perfect Class II Auditor. That's what we're thinking about. And if you can reach that classification, you're fine."

Practically any technology that existed from 1949 straight through to, let us say, 1955, 1956 is total bait for a Class I Auditor. Now, if a fellow wants to audit with no training and sloppy and just do it any old way and so forth, remember those techniques were designed in a large degree to be mishandled.

But I want to impress upon you the fact that the techniques which we're talking about at this moment... Even a Security Check can go wrong, you understand. You can upset the living daylights out of a pc by just misreading one question on a Security Check. From that point forward, particularly through the Clearing routines now, we have passed into another world. We have passed into a world of high effectiveness. And your auditing must be as effective as the techniques which you are administering. And the techniques which you are administering are fantastically effective.

All right. The birth of Routine 3D came about on a pressure basis because I could see very clearly that on a lot of cases it was going to require another two months on what we were doing to round them up. And I had to cut that down. And I've been doing nothing since February of 1961 but cut down the amount of time necessary to audit a case and increase the percentage of wins. That's all I've been interested in.

And I had a lot of this data in the background. And when it became obvious to me that having released the modifier and seeing what the modifier had been doing, and how that had actually buried goals out of the way and made the student upset in, you know, in a session. You know it's a hidden thing that tells him to be upset. So he goes on and he's upset. And every time you audit the terminal, why, it kicks a little bit harder and so on. It takes a long time to wear this thing out.

Well, I decided we didn't have time to wear it out and released the techniques about the modifier. All right. The discovery of the modifier was handed on to you very rapidly and you promptly took 12 ½ hours to find a modifier. I never dreamed it. I considered that a modifier would require thirty minutes. You see, there's this slight difference of estimate here.
Almost everything that you complain about in Scientology is based on that same error, however. You should understand it. I'm not trying to hide the error. My optimism is based entirely upon what I can do or what auditors can do who are auditing exactly what I tell them. You know, right under the gun.

And these are out as soon as that technique drifts out beyond this perimeter that I just named, you see, something else happens to it. So we must take very good precautions that that doesn't happen to Routine 3D. You've got to be able to do Routine 3D here, and you've got to be able to do Routine 3D anyplace you go and be able to do it well and with confidence. So there's pressure on the training line.

You're feeling that pressure. You're getting ARC broke by being posted, and if you study twice as hard as the highest student and get five times as many passes as you did last week, if you get the fire company to lift you up on one of their ladders, you will get into the failed category. You know, I mean, this kind of super pressure. That's why you're getting this pressure.

But a lot of you are leaving here in the middle of December. All right. That gives me something on the order of five auditing weeks. I'm going to make the grade in five auditing weeks over my dead body or your dead body. Just so we don't make it over the top of any dead thetans. [laughter]

So therefore, I went to work on this promptly. I studied all the folders involved and found out that here was twelve hours to find a modifier, and some of the modifiers weren't even found, and everybody was busy stumbling around about this. Well, I first thought the best thing to do was just turn around and educate you thoroughly on the subject of Dianetic bouncers, callbacks, denyers, all that old technology, haul it out of the grab bag and reeducate you into the thing, and teach you how to use repeater technique on the pc to wear out phrases and all this sort of thing. But that's not very advantageous, is it?

So all of a sudden I realized that the only reason a modifier was there was because the goal was opposed. Ah, well, let's get a modifier in an entirely different way.

Let's take all of the parts that oppose the individual and get them first and then come back to the modifier and the thing'll fall into your lap. And at the same time you've got the opposition and you've got opposition goals, and you have finally achieved the anatomy of the problem, which is the goal of the pc. He thinks of it as a goal. Actually, it is not. It is a problem.

It is his effort to do something opposed, and those two have hung in balance, one against the other, for eons. We're not dealing, now, with a problem that lasted since last Tuesday. We're dealing with a problem which has lasted, probably, the last hundred trillion years. We've got the goal locked up against all accumulated opposition and they're equally opposed, one to the other. And having that, we then have the whole thing laid out before us as to why a pc is hung up as he is hung up.

The data on prior confusion has unlocked a number of doors on this. That is why you don't have any commands yet laid out for this, because there are some versions of command,
which I am checking out while you find these parts. I know we can do it. It's just how fast can we do it that counts.

All right. So I went ahead and worked out and tested this entire routine over one short weekend. That's fantastic, but it was tested, straightened out, taped, and everything. And at once, into my lap fell the answers as to why only a small percentage of people go Clear. And why in finding a goal you have such difficulty keeping the rudiments in; because, of course, the goal is opposed by an opposing idea and is susceptible to instant invalidation and so disappears like that.

And therefore, we have the hardest part of Routine 3 being the first part of Routine – 3D rather, being the first part of Routine 3D. And it's the same old part of Routine 3, and they have missed, missed, missed, missed, missed throughout this year on doing a Goals Assessment. I have seen some of them just become endless. I've seen people get up to a thousand goals.

I'll give you some idea of how much improvement has been along this line. Right here a very well known Instructor, auditing a pc I am looking at went through weeks and weeks of a Goals Assessment and ran up to some astronomic number of goals and so forth, just this last summer. And with a lot of experience under his belt, that same Instructor got the goal and terminal Routine 3 style on a pc in, I think – from what I've seen on the cable – must have been a weekend. Oh, that's an improvement someplace.

It looks like we've found some of the missing parts already before we moved into 3D. It looks like we found how we actually can do a Goals Assessment. We can do a Goals Assessment by doing perfect Model Session, perfect E-Metering, and keeping the rudiments in, in, in, in, in. If it gets as bad as doing five minutes worth of assessing and fifteen minutes worth of rudiments in, that's the way you'd have to do it. But you can do it now. It is a doable action. So in go the rudiments, and there goes the goal and we've got it.

Now, the first part, then, of Routine 3D is as difficult today as it ever was in Routine 3. But the technology today of exactly how you find them – although it hasn't changed – we know exactly why they can't be found, is the rudiments go out. And it's just that simple. The rudiments go out so the goal can't be found, and a lot of you right here were into that rat race, utterly unbelievable.

The South African ACC, I don't think it took us – I don't – I was around there scolding one day because we had several students – I mean, I think we were almost a week deep in the course or something like that – we had several students who didn't have terminals yet. Didn't seem to me to be reasonable. And poor Peter and Mary Sue said, "Well, we apologized and got to work." And they themselves, then, shoved the E-Meter down the pc's throat practically and straightened him up and got the goal and terminal on a high duress basis.

Poor Peter goes back to Australia from South Africa, and he sits down with a great big class of people and nobody could find any goals. And what had happened? And right here this was happening. We just weren't able to find goals.

And then finally I sorted this whole thing out and came down to just one conclusion: Auditors were in a sort of a games condition with one another, and it was all a matter of ru-
dimensions. If you kept the rudiment in, there'd be the goal, and the goal usually appeared in the first 150 goals that the pc had given you. And the terminal usually appeared in some similar number.

Now, you don't have to find the terminal now that way. But that goal, finding that first goal, requires just that same amount of technology. It requires that accuracy. It requires the effectiveness and efficiency necessary to make the pc just sit there and deliver. And you get the pc's goal. Now, that is the toughest hump of Routine 3D, is finding the pc's goal.

And when you're over that hump, you are on easy street because your next foremost action... It's unfortunate, you see, that we couldn't have it first. You see, why can't we have the opposition before we get the goal? Well, maybe it'd work out, but I haven't done any research in that particular line. And I think all we'd do is key the person in with a thousand motivators is my first idea of it.

I know we can do this other and we've got this thing taped and that that goal is accurate.

Our next immediate step is to find the opposition terminal. Now, this explains a great deal. Auditors floundering around here and there, auditors looking for somebody's terminal have here and there assessed the opposition terminal as the pc's terminal. Very interesting. And there was no preventive for knowing that we really did have the pc's goal and not an opposition goal of some kind or another. That has come up, too.

The auditor has failed to say, "Is that something you, you know, you, y-o-u – sitting there in that head – is that something that you ever wanted to do?" – has just neglected that little tiny part in doing the Goals Assessment. Assessing things the pc really wanted to do and not having met that part, they put down just things that appear to the pc. And the pc can have these implant goals and things like that appear to him, you know, and they just sort of appear out of the blue sky, you know, in front of their face. They suddenly see this.

They get out of bed in the morning – this actually happened – get out of bed in the morning and they sort of see it printed on the ceiling so they know what it is.

Not anything they really wanted to do; it's just something that occurred to them. And, of course, somebody – they come back, and that naturally assesses as a goal. It assesses as a goal because it simply assesses. It's all choked in there one way or the other as part of some implant.

Now, you remember that in Problems Intensive, which you all went through and I appreciate your cooperation on that because we really got that one whipped out. And you know that Central Orgs are getting marvelous results with this thing right now. They're doing marvelously with it.

We were just looking over stacks of stuff upstairs up there. And I'd say, for something new – brassy new in their hands, to do this well with it was marvelous. We notice you aren't doing these. That's because it's merely a key-out. It's a short look. It makes a person happier. It changes their profile. It just does better than anything we've ever had, but it doesn't clear them.
Now, if you noticed there, "a self-determined change" and "don't run the problem" were the two things that we learned at once when you started doing Problems Intensives. Self-determined change. That's all you must list. You mustn't ever list anything but a self-determined change.

The person decided to change and that's all we want because if we take "what changed your life," the person gives us his appendectomy, his tonsillectomy and so forth, and of course they assess his engrams because they are engrams.

We want the highest powered change, not the highest powered engram the person has. And they're making that mistake right out there in various parts of the world right this minute. They're assessing anything but the selfdetermined change. So that mistake can be made on a 3D, too. You can get a list of things that the pc had never wanted to do but that the pc is simply upset about. And then, of course, you don't get the pc's goal because it isn't on the list.

But this will occur to you as you go along – and you will be fascinated with this in running 3D – that the pc's goal, the opposition terminal, the opposition goal, the pc's modifier, the goal's terminal which is the terminal for G plus M and the Prehav level will all read exactly alike on their needle action. They will all read exactly alike. That's not necessarily true in patching up a case. He's got his goal almost gone on Routine 3. We've got that almost out. And all we need are the other parts, you see, to blow the thing completely.

Well, you'll have the goal, see, going kind of tick, you know – a very sick sort of tick. You know? And the original needle action of that particular goal was a rock slam a half a dial wide, you see.

So you get this little tiny tick on the goal "I want to grow apple trees," you see, and you get this "tick." And then you find the opposition terminal to it, which is "termites" or something. And you get "termites," and you get a half dial wide rock slam, see. It's never been touched. It's sitting there virgin. Pong!

And you get this bluthu-bong-bong-bong-bong-bong! And you get down and you get the opposition goal: "termites, to gnaw; to gnaw everyone." [laughter] Something like that. And you get this opposition goal. And it's going bang, half a dial wide. You see crash, crash, crash! It's all registering like the original goal, you see.

You get back in there, you find the modifier, and there that goal goes with a very sick little tick, see? And we find the modifier: "and to never be audited right" – "to grow apple trees and never be audited right." And we get a half dial wide rock slam on "never to be audited right." And for a moment the goal just reads gorgeously; it's just the most gorgeous reads you ever saw. And you say with a huge sigh of relief, you say, "Well, we finally got the goal back in." And then we read the modifier and then we look back at the goal and it's going with a very sick tick.

Then we go and try to find the rest of the parts and we try to assess something and we can't find a rock slam anymore. And we go back and there's no sick tick left. That's it. We just blew the rest of the goal. But there was that part of the goal lasting.
Now, this is why, you heard me a few – not too many – days ago making a crack – I should never make a crack at Clears, but I made a crack – I'd said, "Well, a Clear is a First Dynamic Clear. And you want to know why they act a little bit self-centeredly? That's why."

Do you realize that sitting on every one of those cases to clear up the rest of the dynamic, although the needle is floating, although the person's in perfect good shape and still stable, is all the rest of these parts? They're still there on that case. We're pretty damn clever to get around them that far and have the person walking straight up.

But where the Clear got cleared, got a perfectly free needle, everything was gorgeous, they were in wonderful shape and walked outside and the bank caved in on them – what was it? It was just the modifier or some other undisclosed part, and then they didn't quite know what had happened. Well, what does it take to straighten them out? Well, just run them through 3D on each one of their goals and these things will go boom! boom! blow! blow! blow! boom! boom! out, out, out, out, out and they'll come up to Dynamic Clear. But you got to go through all the steps of 3D with them.

Whether you ever get a chance to audit anything on them or not – like on the Prehav Scale – that's beside the point. Because there are just these little tag ends still hidden in the bank. When you get those things out, then they go up there.

Now, the reason I've used the word Dynamic Clear is simply to bring up that point, not to make Clears feel that they're dynamic people. Just to bring up that one point: Yes, a Clear will be Clear on the first dynamic and can be cleared on the first dynamic, and he'll stay with a free floating needle and be in a bit of a games condition on the remaining dynamics; and that this is a hardship on one and all. The guy is now much more able to shoot you in the eye with skyrockets, you see.

Supposing the first goal that the Clear had was to climb the Eiffel Tower. And somebody ran that and they got a mountaineer or something, you see, and they ran that and the rest of it and it cleared all the way through it and everything else. Still sitting there is the modifier at least, you see, which is "to fire off skyrockets down at them and kill them all." Interesting thing to omit on a case, isn't it? [laughs]

So you see where this is now. You see about where we're sitting. But this is a different type of Clear that we're making here because we're trying to clear this person up on all dynamics. And you'll find as you go through that they will clear up on all dynamics. That works out as an automaticity. Because you go back and start reaching for earlier, earlier goals and all that sort of thing and you'll start picking up the aberrations on the other dynamics and you'll get them worked out. These things will show up more rapidly.

All right. So much for the background music on the thing. Your hardest point is finding the pc's goal. And that must be done with very perfect auditing, and it must be done with all rudiments in and the various laws of finding goals completely unchanged. And oddly enough, those same laws that govern the finding of goals govern the finding of every one of these parts. So actually you're not doing anything new at all. You're just using the same technology to find a different part. You learn the technology of finding a goal, of course, you can always find the technology of finding an opposition terminal and so on.
There's two exceptions to that in here. There's two exceptions: is (1) the modifier doesn't come down to just one phrase. You'll find that two or three phrases may stay in the list and you do a jigsaw puzzle with them and all of a sudden they're the modifier. Makes sense to the pc and clang, you've got the modifier.

The next point that isn't quite exactly the same as your other assessment actions is that the pc – the more you find, the less the pc ARC breaks. So progressive discoveries on the assessment make an easier assessment, each one.

In other words, you're assessing more easily. Once you've got the center pin, the goal, to assess from there on, you'll find much more – much simpler.

Now, but you just go on hammering and pounding these things out and you just do an assessment. Now, all of you are getting some security on the subject of assessing I found out that you can assess, that you do a good job of assessment, that you're occasionally knuckle-headed as hell but you can all overcome it. And then you smarten up and everything straightens out and so forth.

But you aren't having, really, a hard job doing an assessment. So I feel very secure in being able to teach that particular process and people to do it well. You have some command of your TRs and Model Session and reading the meter and know how to keep your rudiments in and know the activities connected with doing an exact assessment, and you won't have any trouble with it. Those things, known, are resulting in a rather easy discovery of goals.

Now, to get an opposition assessment is done the same way. And to get your opposition goal; well, that's done the same way. And to get your modifiers; done the same way. And to get a terminal from the pc's goal terminal plus modifier is done the same way. And your Prehav Scale is a specialized type of assessment, but it's done just as it always has been done.

So although you may look at this as a formidable new package of stuff. "Oh, my God, what has he done to us now?" Oh, pages of it, you know. I've just shown you how you can cut about 80 percent of the charge – about 80 percent of the charge – off a goal before you ever run it.

So the time invested on assessment is enormously beneficial because it subtracts something on the order of four or five to one off of the final runs. In other words, one hour spent on this 3D assessment is worth maybe five and may be worth much more in terms of hours on the final run, so it's all – it all cuts your time back.

Now, assessment can be done rapidly. Assessment should not be done slowly and pokily and sticking your feet in the mud, and so forth. Assessment is something could be done [snaps fingers several times] – one right after the other. Bang! If you just really know that a pc will read ... If a pc's rudiments are in and you say it, your instant read occurs after you've said whatever the items is that you're checking The instant read occurs, bang! right there. And you don't have to sit around and wait for it. And the pc doesn't have to say anything.

And your rudiments stay in – you know, you can just do an assessment on almost a machine gun basis. It's the fastest thing you ever cared to look at – doing an assessment.
So these assessments are backed up by the fact that at first it may look to you, because it takes so long – it takes maybe twelve, twenty-five hours to find a pc's goal. Then the remainder of this may look to you as being equally lengthy. But it isn't equally lengthy. And the more assessments you do, the shorter length of time it does. So, now the assessment becomes this important and so forth – well, we can analyze and break it down and teach you to do assessments on a brrrrrrt basis, you see.

As a matter of fact, I wrote most of you notes in your pc's folders on how to do a rapid assessment. Aw, I can just state those very briefly right now. Just bang!

(1) Get your rudiments in.

(2) I don't care if you have a list already in existence before the session began or you have no list at all. Whatever list you were working with or obtain, you then ... Of course, you don't have to attain a list on an E-Meter. You're just saying, "Well, what would...?" and so forth. Well, don't bother. Don't necessarily make him lay down the cans, but you're not paying any attention to the E-Meter. You just write the list down, you know. Cats, kings, coal heavers, you know. Just bang, bang, bang, bang, write it down, number them. Bang, bang, bang, bang, bang, bang, bang, bang, bang, bang. You don't have to read anything.

And you can note tone arm occasionally and find out if tone arm is wobbling. But that's just a cross-check. If you're on the right track, you got to get a little tone arm motion while the person's assessing. All right. And you bleed that list down, with the meter sensitivity cranked all the way up to the top. And you ask some very pertinent question like, "Are there any more terminals that you feel would oppose growing apple trees?" And remember that growing apple trees is going to react on the meter, so you've got to be smart enough to get your reading off "Are there any more terminals?" No instant read after this – there aren't any more. And that is it. You see? You bleed that meter down.

And you add without argument anything the pc wants to put on the cotton-picking list. No chin-chin about it. Halfway through the assessment and read off, the pc all of a sudden says, "Ooooh. Ooooh. A coal heaver. Oh, yes, yes. We were looking for heavy men, who handle shovels. A coal heaver. I just had this terrific cognition. Yes, a coal heaver."

Well, don't shut him up. It's just – you're halfway through the assessment ... There are two schools of thought on this. Either one is right. Add it to the bottom of the list to be checked later or add it right under what you were just adding. But of course, it goes out of number if you add it right on after what you're just assessing. But the more stylized one and the more perfect one is to write it down at the bottom of the list and give it a number. That's all. As much as that. It's those he adds on. Anything he wants to add on any time, let him add it to anything. We don't care what it is and we don't care when he wants us to add it in.

We're halfway through rudiments and he thinks of another goal. Well, write the goal down and go on with what you're doing there, you see. Never argue with a pc as to what's going to be written down. There's another preventer in here about this, by the way. If the pc in giving you (quote) goals (unquote) is only giving you difficulties, "to get rid of my lumbago," "to get rid of my skull," "to get rid of my stomach," "to get over this terrible feeling that every time I see a cat it's going to jump through my right ear and out through my left ear," and so forth.
All right. Write them down. By all means, write them down, but write them down on a processing goal list. The pc won't object to this. You say, "Well, all right, that's ..." You write it down, processing goal. You say, "We're interested in goals in life and livingness, you know. Look at all these difficulties. There we are in processing, see, and so on. We write that down – when we come to audit, we'll take that up."

The pc is perfectly happy about it – as long as you write it down! The only thing a pc blows up about is you just won't accept his goal. So if you have to split it out here with five lists finally because amongst the opposition terminals he's given you is all the friends he has and all the enemies he has, and it's just a total confused mishmash and so forth, well, write it all down, but not necessarily on the opposition terminal list. That's a good rule, see, because it keeps the pc from getting busted up, ARC broke, see. All right.

The next thing you do is you get that list complete so that there's no additional falls on it. Now, one of the ways of completing a goals list, of course, and a standard way – the standard way of completing a goals list – is to add secret goals, withheld goals, antisocial goals, unworthy goals, discreditable goals, that sort of thing. You know, you're used to asking for all those things.

Well, now remember that on these other parts we also have unworthy things and discreditable things that the pc doesn't want to have there. A person says, "Well, here's this list and there's five – yeah, there's five opposition terminals." Five opposition terminals, huh? Early in the case? Five opposition terminals? Oh, no!

You ask him, "Any more terminals that would oppose this goal?" and so on.

No, no. Actually you don't get much of a fall on the meter either. You have to ask for unworthy opponents or opponents it would be unworthy to oppose. And opponents that would be discreditable to fight. Hu-hu-hu-hu. You find this hulking brute of a man has as his opposition terminal, a baby. He very possibly will never come up with it and tell it to you because it's just not worthwhile. You get some fellow who's very upset on the subject of wives because he kept burying them and shoving them in to vaults where other people were already buried. And that sort of thing. Well, a wife isn't a proper opposition terminal, see? But it is. And you've got to point it out by asking unworthy, discreditable, so forth, goals.

So you shake all these things down on that type of nomenclature. In other words, you don't only get your antisocial goals, you see, sort of thing as the additional type, you see. You get the unworthy or discreditable opposition terminal.

You don't get an antisocial opposition terminal because the pc will tell you they're all antisocial. Ministers? Everybody knows that they're the most antisocial people alive, and so forth. They're all antisocial terminals to the pc, you see. So that you're wasting your time asking for an antisocial opposition terminal. That's silly. They're all antisocial. To some degree or another, they're destructive. Let me put it that way.

Now, we come down the line here and we find the opposition terminals the pc lists, or goal or any other type of assessment. We've got to get the list complete. We've got to make sure that there's nothing he's dodging. We've got to use any kind of wording necessary to
make sure that he has understood exactly what we are doing and what we exactly want and we watch the meter, and we make sure that that whole list is bled.

That meter is just bled of any reaction on the subject of another terminal. We want the instant read on another terminal, not on a repetition of the goal. That's about the only thing that's going to get in the road of somebody. Of course, every time you say the pc's goal, you get a reaction on the needle. Every time you say the pc's modifier, you're going to get a reaction on the needle. Well, don't get it all mixed up with what you're asking for.

Learn to ask for what you want. You say, "Now, on this goal to grow apple trees ..." Of course, you're going to get a reaction. It's perfectly all right for you to say that, don't you see.

"Now, on this goal to grow apple trees, is there anybody else who would oppose it?" Bang! Well, who was that? See.

Well, of course, that "oppose apple trees," let us say, had a little rock slam. And when you say, "Now, on this goal to oppose apple trees," and you're liable to get a little rock slam there, you see. Because every time you repeat the goal, you get a reaction on the needle. You know that, so you don't pay any attention to that. And you just say, "Are there any more terminals that would oppose it?" Oh, pang, see. You get your instant read on the question you want.

Learn to read a meter instantly on the basis of what you want to know. And you learn to stress the word that you want to know and get your reading only on those words. If you're very clever, you can actually read a meter this way. "Now, what would oppose wanting to grow apple trees?" Well, you know darn well you're going to get a rock slam on wanting to grow apple trees – but right there. "What would oppose..." you get your instant read right there. See? Actually, take an interim, middle of the sentence read.

"What would oppose wanting to grow apple trees?" Of course, you're going to get a rock slam over here as soon as you say, "want to get apple trees," see. Naturally. But you just take your read right out of the middle of the sentence. You see how clever you can get on that?

All right. Now, having completed your list utterly, you get the rudiments in. And while completing the list if the pc is upset, you get your rudiments in. But you certainly get your rudiments in at sensitivity 16. Cranked way up. And you really get those rudiments in. Bang! And then you take the thing down to a one dial drop, because that's all you'd want for an assessment. It's too crazy trying to assess with your sensitivity knob too high. Oh, man, it's just all over the place, particularly if some guy's had a lot of auditing, you know. His needle's very loose anyhow. At zero it's a one dial drop. What do you think it will read like? What do you think mine reads like every now and then?

I mean, somebody'll turn it up here to sensitivity 16 and I breathe, you know. Breaks the pin on both sides. You can't read it, see. So you want a one dial drop if you can possibly manage to get that. And then with a one dial drop, you take your long feathered plumed pen in hand – nib already sharpened; you'll – no more delays there, see – and you go straight
down the list. You say, "Now we're going to assess this list ..." or you can say, "Is it all right with you if we assess this list?" And you go right down the list.

And you read three times. Bang! Bang! Bang! Now, I found out that it doesn't much matter whether you read and acknowledge and read and acknowledge and read and acknowledge, or read, read, read and acknowledge. It doesn't much matter which one you do. But in view of the fact that, with technical perfection, each one is a theoretical question, see. Even though you have just said the terminal, you have theoretically asked the pc a question like "Is this it?" See? Only you haven't said, "Is this it?" You've just said the item. But theoretically that registers as, "Is this it?" see. "Is apple tree it?" You know?

And I suppose with total perfection you could lay it down as a bit of a rule that every time you said one you acknowledged the pc and then nobody's going to get mixed up.

All right. And you just say it and acknowledge, say it and acknowledge, say it and acknowledge. Just about that fast.

"Soldier. Soldier. Soldier," [leaves a little less than a second of a pause between each] see, would be the spacings necessary to read it.

So, if you fill the interim in with the acknowledgment it sounds like one straight line. You say, "Soldier. Thank you. Soldier. Thank you. Soldier. Thank you." It doesn't sound like there's any pause there, but of course "Thank you" is not going to get a reaction, but "soldier" is. So the instant read is going into your acknowledgment.

Now, you read all of these things off while looking at the meter. Now, total perfection requires that you lift your eyes from the meter to the pc when you give the acknowledgment. But factually speaking, to the pc to really know whether or not he's being acknowledged, you would have to be in the action of lifting your eyes while you were saying "ank" in order to have caught the instant read before you did so.

In other words, don't go so goofy on this one that you miss your instant reads just to be looking at the pc. You got it?

When you get this real down pat, you'll flick your eyes at the pc or lift your head and say, "Thank you" to the pc directly every time, see. Even though you're picking it up on the meter, you're saying it to the pc.

Now, the funny part of it is, is the pc – your eyes aren't necessarily necessary in order to convey the "thank you" to the pc. And it's not really necessary to go through a lot of gymnastics on this sort of thing. I'm just trying to lay it down so you get a picture of how it looks.

If you can get three repeats of the item in, a thorough acknowledgment to the pc and tell the pc whether it is still in or is now out, and go on to the next one and do the same thing without entering into chitchat, oddities, or anything else or discussion with the pc, and with no time being lost in the middle, I will be very happy with you. If you can get that far, I'll be very happy with you.

Now, I can assess faster than that. If you run it that fast, you've got it made in the shade.

Now, you tell the pc at the beginning, "You don't have to say anything." The pc can just sit there in the most gorgeous state of irresponsibility, as Mary Sue raised it less elegantly once. And the whole assessment's perfectly accurate. Pc doesn't have to say anything.

Pc in the middle of your saying "Soldier. Soldier" ... pc says, "I just thought of another one. 'Gargantua'."

Well, that's all right. That's fine. Good. You got another one. Write it down here on the end of the list, and go back and say, "All right. Thank you. Soldier. Soldier. Soldier. Thank you. Still in." Got the idea?

Now, you get assessing down to this type of a basis, and you're not doing twenty questions a session. You're doing something on the order of a hundred an hour. That sounds a little bit different in the same lick of speed.

Well, all right. As long as we're going to do this much assessing, we might as well learn the most optimum, swift, accurate method of assessment.

Now, why only three times? Well, frankly, if you go over the list more often, you will find out that the number of times you've had to repeat is lessened. Going over the whole list and coming back to the beginning again scrubs more terminals than going – or goals or items – than trying to scrub one out eight or nine times apiece.

We had a slightly different system we used earlier. If after three times it seemed like it was staying in, we went ahead and scrubbed it out. For an actual test, this isn't necessarily useful. You just give it three times, it's still in, and go on to the next one – yes, it'll leave an awful lot of marks down the line that apparently are still in and still live, but you'd be surprised how many of those will disappear on the next pass over. Because in going over the list, you haven't permitted then the pc to sink back on the track.

The pc is still with you, and the pc is still – is as-is-ing more rapidly because the pc hasn't been driven into a point of the track. And restimulating chronic somatics and that sort of thing – which was a liability to the other type of assessing – is avoided. You never repeat him back into the middle of the operation and then try to go on to the next level. Hu-hu-hu. Try that sometime.

So once – thrice over lightly you'll find holds good.
Now, there's something else that I'd call your attention thereto: that it's an equality. I don't care if you speak these things forcefully, lightly or otherwise, as long as they reach the pc with clarity.

If you vary from terminal to terminal or item to item, your volume and expression, you'll throw the assessment somewhat. You have decided, for instance, it's "Gargantua," you see.

And on an exaggerated basis, you can throw an assessment by doing just that.

Now, you're – as you tear down the line, you get this item – this is your next step in assessing – you get the item, whatever it is, isolated. It's the only one left in that's reacting. Now get your rudiments in at sensitivity 16 and check it against the dead items that you've already killed. You just read three or four at random off the list and read this item, and three or four at random off the list and read this item you found, you see. The found item. And read three or four more nulls off the list and you'll find this found item.

Don't be too surprised if there's a slight kick still left in some of the things that you thought were null. Because the funny thing is, as you balance the whole terminal line out, some things will fall out and then momentarily fall back in. Don't worry about that if it does that. Just start worrying about it if what you found falls out. It's somewhere else; it's something else if something starts going in and out on you that way, because they hold it.

All right. Now, having found the thing and checked the thing, you now check another point. Let us say it's the third item you've found here. You realize now you've got to say the goal and note its reaction, the opposition terminal and note its reaction. And let's say you were working on the modifier – or the opposition goal – and say the opposition goal. And now you'll find out that if one did a kind of a Stage Four piece of nonsense, then the next one'll do the same piece of nonsense, and the next one will do the same piece of nonsense. And the whole assessment will fall exactly alike. It's quite interesting. But the whole assessment – every item on the assessment will fall alike.

Now, that is not a final test. You should not throw everything away just because this doesn't happen. Because it is not a final test. You get your ARC up and get the roughness off the session and they will all fall alike, but sometimes a roughness at some part of a session will cause one to go a little bit zzzzz.

And you'll notice this. What you want to worry about is that the opposition terminal is different than the goal and all the rest of the list.

Well, but the goal – you're getting the Prehav that falls the same as the goal, and you're getting the goal plus modifier terminal, that falls the same as the goal. And everything falls the same as the goal, but the opposition terminal. If you check it over, you find out that the pc himself got an ARC break along about that time, and he's kind of hung up, and it's half
pushed out. The second you straighten out, this could come back right in and read the same as everything else, you see, without changing it.

So you see, other things than wrong assessment can make these things go a little bit haywire. But when you've got everything straightened out and all rudiments completely in and all roughness off assessment and any upsets and so forth off, they all actually ought to read alike. It's just a complete parade. That's a perfect textbook solution is the goal and the opposition terminal and the opposition goal and the pc's goal modifier and the pc's goal terminal, and the first level of the Prehav assessed – it's just a bunch of little martinet soldiers. They all read ee-bong, ping-pong. They all do exactly the same read on the meter. They all make the needle do exactly the same thing. Why? They're all part of the same package. They're all locked up together. If one of them is terribly different, it's not part of the same package.

Now, what you want to be aware of in that last checkout is that your goal assesses fine, and then your opposition terminal assesses the same as the goal. And then the opposition goal doesn't assess the same. And the modifier doesn't assess the same. And the goals plus modifier terminal doesn't assess the same. The Prehav level assesses so ... What's this?

Well, it means that where they started assessing differently, you got the wrong one. It's the first one that has the different reaction. And the safest thing to do is to go back and do the whole thing from the point where it doesn't get the same reaction. Because they will go further and further out from the wrong one, see. You wind up nowhere. And that is one of the preventions. This checkout is one of the preventions from running a wrong goal or something like that. It's a prevention. It doesn't so much prevent running the wrong goal, but it certainly prevents running the rest of it.

If you can't get anything to agree with anything on the whole case, you'd better do another Goals Assessment and make sure you had the right goal in the first place because that's the one that'll be out. Nothing falls with it.

Now, when you're doing this cross-checking, invalidation is one of the grimmest things that you can do. But next to that is suggesting. And just never suggest anything to a pc, please. Don't, don't. It's gotten more and more important that we didn't ever suggest anything to the pc. We can have all our own opinions we want to. We can talk these things over with the pc. But we must never suggest anything to the pc. Just nothing. Never suggest a thing The pc says, 'Well, don't you think maybe that to ... Don't you think maybe uh ... ducklings would be a very good opposition on this? Duckling. Can you think of something like ducklings?'

And you say, 'You're getting there. What is it?' Ha-ha-ha-ha-ha. Give him encouragement. Always give him encouragement. Never give him any suggestions. Because you could do yourself more throat cutting and you could mess yourself up more by suggesting an item or two or even seeming to for the pc than any other single way you can do it.

Unless, of course, it's permitting the pc to sell you an item the pc is fond of. If you don't think people learn to do this early, a nine-year-old the other day was able to sell a wrong goal and wrong terminal to an experienced auditor. Isn't that fascinating? A nine-year-old pc sold a wrong goal and a wrong terminal to an experienced auditor. Sold them.
They were just wildly out. But the nine-year-old decided that would be a nice goal to have and that would be a nice terminal to have so, every time came past it, had a little tiny physical convulsion that threw the meter.

So next... First, there's invalidation. That's just out. We don't even pay... This couldn't happen. And then there's suggesting things to the pc. That's a nice big crime. And then there's this next crime, is buying things the pc is selling. We're using sell in the category of having a body convulsion, twitching the little finger. Suddenly finding out that they can get a registry if they suddenly pull their skin tight across their face, suddenly.

"Well, every time you hit that terminal, it makes me pull this surface across my face!" you see. And of course, the E-Meter will get a reaction.

You say, "Well, we're going to check that out without you doing that."

"Oh, but it's impossible. It always does that."

You say, "Well, it may be impossible, but just look around the room for a moment. Now, look at the ceiling. Now, look at the floor. Now, look at this. Now, look at that."

"Bingo!" That was the terminal, see – "bingo." The person will say – belatedly, you know – Ah, he missed. [laughter] Wasn't able to make it that time. A little bit late.

It's a real stupid auditor that will buy a "sell" of this character. That's real stupid because everything then will go out and nothing will check. Now, it's an awfully good thing that when you've found a part to get it checked by somebody. As you get more experienced, find a package and get it checked by somebody.

All right. Now, I should tell you perhaps a few words on what all these things are, but you will find them defined in this unnumbered bulletin. You'll find them all defined at the back of the stuff of what all these things are and so forth. And I don't think I would do you any too much good giving you any more data than you have right in this first page 4, Routine 3D. I think that's quite adequate to the definitions which are on that.

But let me tell you something. The whole theory of it is simply this. It's very easy to sum up its theory.

Observation: The pc's goals are so easily invalidated, they disappear and can't be assessed.

All right. Now, that's an observation. Now, you've got good reality on that one.

All right. What's making this happen? It isn't because the auditor's mean. Because I know you; you're not mean. A few trillennia ago when you were making a specialty out of burning young girls, you had some aberrations alive then, but you've recovered from it. You're not that mean anymore.

How come? How come this is so uniform? Well, it obviously must be that the thing has an opposition built into it that is easily triggered.
Well, what is it? There must be a part in there someplace. And then how come this goal – now that we've learned problems will last forever on the track because they're postulate-counter-postulate and therefore become timeless – what is this goal (if it is timeless, which it obviously is), what is it but a postulate-counter-postulate, terminal-counter-terminal situation. That must be what a goal is. And the goal is the little tag that is visible, but there must be some other parts of it which are missing, which is what opposes the goal, how come it's hung up in the mind.

You see, if you know the anatomy of problems, you know the fellow has a goal, he wants to get something done. And it's right there as one little package and so forth.

Well, you're crediting this fellow with the extraordinary ability to hold onto this determinism without some mechanical assistance for the last sixteen trillennia. You know? I mean, there it is.

What's it up against? Anything? Nothing There's nothing out in front of it at all. There's nothing out in front of this goal to hold it there. Does that seem reasonable? No, it isn't reasonable at all. And by George, there is something out in front of the goal.

All right. So it's a package which composed of... The pc's goal is quite visible because that's usually – even though it's "to be a first-class prostitute" or something – it's quite socially acceptable. Human beings would recognize this as a goal.

See, it's something that can be remarked on. You could mention that. And that's all that's in view. Well, that's all that's available, really. "Oh, yes, well, I wanted to be a – wanted to be a big boy when I was young."

Quite socially acceptable, isn't it?

Of course, when we get the parts, we find it wasn't quite so socially acceptable, but so far so good. We've got to be a big boy.

All right. What's this opposed against? Well, it's opposed against an idea. But let me tell you that the idea is, I think, more difficult to find than the terminal. It's easier to find the terminal and then find the idea than it is to find the idea and then the terminal. The most available thing there is the terminal, so we find the opposition terminal to the goal. Ah, but it's an opposition terminal to the goal, see, we're finding it criss-crossed, see.

So here's this thing: "To be a big boy." "Well, who would oppose your being a big boy?" Not necessarily – this is kind of poor nomenclature. Poor to keep using "your goal" and phrases of this kind where you're asking the person. Why not just ask the person. Well, you found his goal. It's not going to wear out. So you repeat it five thousand more times, and it does wear out. Well, that just clears him that much faster. So go ahead and use these parts. Go ahead and use them in your phraseology after you've found them.

And you say, "Who would oppose your being a big boy?"

"Bigger boys. Uh – cats. Um – fathers. Mothers."

Here we go on down the list, you see. "Who would oppose your being a big boy?" you know. And we get something pretty wild that fits exactly what the case is. And what would oppose his being a big boy, naturally, is machinery. That's what he says, and that's what it
assesses out and it rocks the same as "to be a big boy" and here's "machinery." Ha-ha! Good. We've got the opposition terminal.

Now, let's find the opposition goal. All right. "What would be the idea of machinery?" Now, we get a lot of things.

"Well, the idea of machinery is to run wild and to make dog biscuits, and it's ideas and so forth."

And "Well, what would a – what idea would it have there of opposing your goal to be a big boy? I mean, what idea would it have that would oppose your being a big boy and so forth?"

"Well, huh – well as a matter of fact, that's cutting people to pieces."

Yeah, well, there's that one. And then there's "running wild," and there's doing this and there's doing that. We assess it out, and it's "to cut people to pieces." Ah, well, we're getting very interested here.

All right. Now, we've got machine, and we've got its goal. We've got the goal of the machine. That isn't really the goal of the machinery at all. It's the goal that the pc thinks the machinery must have that directly opposes him.

So, so far we've got the pc's goal, we've got the opposition terminal, and now we got the opposition goal is "to cut people to pieces."

All right. Dandy.

Now, we've got to find the pc's goal modifier. And this was completely out of sight up to this time. But we've done all this assessment work, so actually we've eased up the weight of the invalidation just by bringing it to view, see. So now the modifier should show up far more easily because before we were going through a tough route to find it.

All right. Well, we've taken some weight off of this thing now. So the pc's goal modifier is "to be a big boy or go up in smoke trying and never come down again." Well, that's great. That's great. That's just fine.

Now, let's find what is the pc's goal plus modifier. Now, we want to know: "Who or what would want to be a big boy who would go up in smoke trying and never come down again?"

"Go up in smoke trying and never come down again. Would be a rocket operator. Yeah, and it'd be a horse jockey and a cat whisker and a lion tamer," see. And we get down the line. But all of a sudden we come back and it's "a rocket operator." It's "a rocket operator," all right; that's what we've got. And there it is. "Rocket operator." We've got it right there. And that's our goals terminal.

You'll find out the further you go on the assessment, the plainer the part gets. But out of this "to be a big boy," it sort of looked like we had school days, charm, everything was wonderful, going to be sweetness and light, isn't it cute, you see. And we get machinery and the machinery's going to cut you to pieces and so forth. And it starts looking peculiar, doesn't it? And naturally, all of this is directing us straight in toward the Goals Assessment. And
frankly, if you can do an expert job of assessment, _drdrrrrrr, ta-tat-ta-tat ta-tat-ta-ta_, just sit there, get the rudiments in, get the thing, get the list written, get the rudiments in, assess the list, _brerrrrrrrrrr_ and on down the line; you're going to find out that after you've got the first goal, that finding the rest of the thing is just a lead-pipe cinch.

It all depends on how many times you say, "Ah," how many times you say "Er," how many times you sigh and how much space you leave between items. And that's all it amounts to because nobody's going to say that you must put the rudiments in rapidly. Don't think that is necessary.

I say put the rudiments in effectively. If it takes you a while to get in rudiments, all right, so it takes you a while to get in rudiments. Nobody's going to argue with you about putting in rudiments or time consumed thereon. But I _am_ going to argue with you about "soldier" or "rocket operator." "Mmmmm. How do you feel about that? Hm-mm... Meter's a little bit out of adjustment here. Yeah... All right... Well, here we go. Here it is again. Rocket operator. Hm... Yeah... _Mm-hm_... Rocket operator... Well, okay. That still seems to be in." Of course, it's not doing anything in the world but falling on an ARC break by this time.

Then your assessment is simply boiled down to the speed you can write because that's the lengthiest activity – would just be the activity necessary in simply writing down the terminals which are given. Nobody's going to say that this is a school in penmanship, and we teach you how to write fast. Just get over all those times you wrote the billet-doux to the wrong man's wife and get over those times when you signed those warrants for execution and you'll find out your _ss_ – goes up terrifically – speed just goes right up. [laughs]

All right. Now, I'm going to have to give you more talks on this because we have the whole subject of commands and so forth to go into. But so far as you're concerned, the reason you find all these parts is to make it easier to find in each case the next part with greater accuracy.

Now, that's reason enough for you to find all of the parts, strangely enough.

And later on, after you've run the first terminal or so, you know, off the Prehav Scale, and you're on to your next Goals Assessment, you're going to find you're going to have to get to the Prehav Scale and run that one probably. And then your next one. And all of a sudden, just the finding of these parts goes in a sort of an endless circle. You find the parts, you find a goal and you get it down the line as far as you can get it. And go back and check it and it all fits. And what this basically is best at, this particular thing, besides making things easier, is that it gives you the consecutive release of goals – occurs much more rapidly. So there's, of course, enormous amounts of time saved toward the end of clearing. This hasn't either that – too much to do with it; you're going to clear a lot more people in this particular way.

Now, how are you going to miss clearing people? You're going to miss clearing people by doing a bad technical job or by not auditing them or by not taking enough time with
somebody to find all the parts correctly and so forth and putting it all together and hanging
the thing right. That's about what the thing amounts to.

And we already know that if you find the goal and if you find the terminal that
matches that goal and it doesn't beef up the Prehav Scale and you run that on many levels of
the Prehav Scale and it goes down, down and disappears out of sight – and that a lot of people
go Clear on this if it's done enough and if it was accurately enough done in the first place.

But there's nothing that guarantees the accuracy of the first job. There is nothing that
takes care of a lot of little missing odds and ends of parts. The pc stays very – remains very
hard to keep in-session to a marked degree. And so you get a small percentage of people go-
ing Clear on that particular procedure. Now, this one, you've got all the parts that could make
any difference to the thing. Exactly how you speed it up from there depends entirely on the
form of the command and if anything can be done with speeding up the actual commands. We
could just go on and run these terminals as found on the Prehav Scale, and all would be
lovely. We could go ahead and clear that way. And I'm trying to find out right now if there
isn't a faster way to beef up that particular formation of commands than we've had to speed it
up even more. Because it now lies in the lap of effective commands. The more effective the
command is, well, the faster clearing will occur. Okay?

All right. Well, you've got the package there. I'm sorry to dump it on your lap so un-
announcedly but I would say, after looking it over last night, that most of you had weathered
the storm very, very well, and you are to be congratulated on it. You recognize that some of
the goals are quite null and it's going to take a little while to finish off that particular goal, but
it'll finish off more or less by assessment. And then you'll be out in the clear and onto a new
level.

Actually, some of you don't realize it, but you're very, very close to the point of having
the first goal-terminal combination flat right this moment. So you're starting in with Routine
3D the hard way. Very short way; but it's the hard way because you'll be puzzled why things
are disappearing and appearing and so forth.

And later on when a good, solidly aberrated case comes along, why, you will see it
work much more smoothly than it's working right at this moment. So I don't think there's any
lack of supply of that type of case just at the moment, so that's fine.

All right. Thank you very much. And I wish you lots of luck with it.

Audience: Thank you, Ron.
Well, as you can see, I walk in here, your case is in my hands. [laughter] That's a joke. But not quite so much of a one as you might think.

All right. I suppose you are still in a gentlemanly and a ladylike frame of mind about 3D, and you are wrestling with it. A little later you'll be rassling with it. A little less ladylike perhaps.

The truths of the case is that there are some possible randomities in Routine 3D which could get you into various upsets. But what is this now? This is the 15th of November 1961, Special Briefing Course, Saint Hill, and we have under discussion Routine 3D.

Now, we still have some people around who want to know why are we finding an opposition terminal and all that sort of thing. We ll, what broke down the whole thing was that a majority of people were not going Clear on Routine 3. Now, why weren't they? So I got a small pick and a shovel and began to go into skulls and then I got one of these widow-maker pavement breakers and started going in a little bit deep. And then got an oil well rig and really started going down two or three miles. And I finally found out that the length of time of clearing – clearing would eventually happen – but the length of time of clearing is in direct ratio to the dramatization of the modifier. I found a new piece here, the modifier.

Now, on people who clear fast, it accidentally runs out fast. And on people who are clearing very, very slowly at Lord knows how many hours, it was running out very slowly.

Now, what is this modifier? It is the threat the pc makes if he cannot obtain his goal. Covert character, this thetan, huh? He says, "Well," he said, "I'm going to build buildings." Isn't that sweet? That's nice, isn't it? That's real nice. You know, that's good. That's good. That's socially acceptable. Everything's fine.

And he says, "To build buildings." And everybody says, "Cheers, he's going to be a great engineer," you know. "A great construction man," and so on. And his tutors pat him on the head, and everything goes along swimmingly, and everything is marvelous. And you try to clear the fellow on this goal "to be a great engineer."

Well, what's your – what – this question should be asked. Why do we have to clear him on being a great engineer? This is obviously the sole virtue this character has. Yeah, let's ask that burning question. Why do we have to clear him on "to be a great engineer," huh? Aha. Aha. We twist the moustache at its long waxed ends and look down his throat, and what do we find? Well, I've said, "Well, it must be a problem because it's hanging up on the track. To be suspended on the track, this goal must then be suspended against something which is other-determined to it."
Ah, all right. I didn't look very far. But the first thing I found was this modifier. And that's the pc's, is "to be a great engineer, and if they don't applaud sufficiently when I put up buildings, to have them fall down and crush them into da street." [laughter]

Now, for some weeks, I went around doing a background music study on this thing, and I was quite interested to find in all the works of man, every one of them has got a booby trap built into it.

You tell Homo sap to mow a lawn and it's all fine, but there's just something there, you see? It's not me being critical. It's the fact the lawn is too short or it's too long, or it isn't mowed around the fringes, or they stop the mower in the middle of the lawn and fill it with a gas can and spill some.

We say, well, it's just carelessness, you know. So you say to the fellow, "Well, now, the next time you mow the lawn, why, pull the lawn mower off to the side onto a path, and there fill it with the gas can. You see, and then you spill all you want to, see." And you come back next time, and the wheels of the mower have been spinning in some fashion to cut large ruts across the best place. But he did do this other, you see, but there are these ruts in the lawn now.

Well, I've had a lot of experience with Homo sap. And of course, I've had to live with myself, too. That's taken some doing, believe me. It isn't everybody could have done that. [laughter, laughs] But here we had this marvelous thing going on whereby if you don't quite watch it, why, there's going to be something built there, so the fifteenth step up the tower is not welded.

What are these things? And what are these things? And I asked myself that for a number of weeks. I went around and observed all these things, and so forth. I don't get up in some ivory tower because they're drafty, these ivory towers. It's much better to be out amongst the warmth of humanity if you're studying it. And it's a new thought, you know, in the whole field of philosophy, is go and look at what you're studying. A brand-new thought. Actually newer than you think.

So I couldn't find anything man was doing that he wasn't building a little problem into. And the worse he was off, the more problems he was building into what he was making or what he was doing. And this seemed to me to be very interesting. Well, now, this wasn't, to be very honest with you, bluntly and directly solved by the modifier. It wasn't just one, two, these two studies, one study resulted – of man's errors – resulted in the other studies. It just happens I had been studying this for some weeks, which probably catalyzed my observation of these other things. What I found out was that pcs went downhill as they were clearing and then went uphill. And sometimes they went downhill for a long time, and then went uphill. But they always went downhill before they went uphill. Isn't that interesting?

Well, it violates the rules of early auditing. You give somebody some auditing and he gets better, see? He doesn't get worse and then gets better. So we must have – must be a bug in here someplace. What is this that has gotten around, and we find out on further observation that there was a reservation on the goal. In other words, whatever the person set out to do, he had a little bit of a reservation kicking around. Let's just put it that way. That's the mildest, most acceptable form of it. But it's worse than that.
You ask this person, "Now, you want to be a great engineer. All right. Very good. Now, what would be your answer to constant failure at this goal. What would you add to the goal if you continued to fail in it?" and so forth.

And the fellow will dream up some various odds and ends, and all of a sudden you'll get some that register on the meter.

Well, it's very interesting but it's almost unreachable, almost unreachable. You tried for a week. I could reach these things, but I reached them as a Dianetic auditor. Get the meter, repeater technique. Take the various words. Take the whole list. Take all the bouncers, denyers, call backs, and so forth, out of the entire list that they had already given you. Very interesting. This is quite a technique. Fortunately, I don't think you have to learn it. But it's quite a technique.

You ask them to list all of the things he would use to modify his goal if he continued to fail. He keeps giving you phrases and phrases and phrases and phrases. You finally got pages of phrases now. Then you just go through those. And one or two of you had red marks on the list. I gave you red checkmarks on the list and told you run these by repeater technique on the person, see, because they're in there someplace. He gave you someplace the modifier. But every time he gave you one of these bouncers or denyers or something like that, if it was even close to the modifier, he bounced out of the vicinity of the goal. And the goal read sporadically. Just that. He bounced on the track. He moved in relationship to the thing. And you had to repeat him back into it. And if you were to directly find a modifier, you would have to master these old Dianetic techniques of getting, actually, [snaps fingers] the flash answer to the question. And you get the bouncers and make down lists of these things. Get the list off the pc. Bounce these things back in. Finally sort the thing out. And it actually was already taking you hours and hours and hours and hours and hours to do this. Why?

Well, you're doing it uphill. And if you did it badly, you would invalidate the pc's goal, and then of course the whole thing would go up in smoke.

All right. So I sought a better method of doing this, and ran into the rest of the picket fence. There it was. You see, the goal and the modifier are the pc's half of the idea. What's the other half of the idea and who had it?

Now we had to – have to have two halves to make a problem. And the goal plus modifier is only one half. Now, that must be confronted by something of equal magnitude from an other-determinism to be a complete whole. Otherwise, it wouldn't hang on the track. You've got to have two forces in balance – one against the other – before you get something moving in time in the mind. That's one of the basic rules of it. As you learn problems, you see more and more problems, you'll find out that his problem is to have a happy home. It's not a goal now. It's just a problem. Problem: To have a happy home. And why can't he have a happy home? Well, there must be some other idea confronting it. Now the pc may give you that idea himself, and it may be apparently resident with the pc. But as we chase it back to try to find out where this problem is, he had somebody who was determined not to have a happy home. Let's be as elementary as possible on this thing. This fellow had an idea that he ought to have a happy home. Not a goal to have one, just had the idea he ought to have one.
And he had this opposed idea of somebody shouldn't have one, shouldn't have one. We should have a dog's breakfast on Dog's Breakfast Street. There's two ideas, isn't it?

All right. Now, that is an anatomy of a problem, see? You've got one idea and the other fellow's got another idea, and the two ideas combined run head-on into each other in balance. And if they do that, they'll then drift through time.

Now, there must have been a confusion before that. When you get the confusion out from underneath this, you will find then that – there's something else occurs that one or the other of these ideas unbalances, and this thing sort of misses each other. If you can get the idea of two sticks pushed against each other, they'll stay pushed against each other until you get below them and tap them with your thumbnail or something like that. And one stick will miss, and then these two things won't lock up anymore. And you don't have this same structure anymore.

Well, it takes these two sticks, one punched against the other to get a problem riding through time. That is why the problem rides through time. It's two ideas. It's an unresolvable situation of two ideas.

Now, a problem has this additional thing. The person says, "I want to be a successful wife," and at the same time has the other idea, "I want to go to lots of nightclubs and parties with other men."

And you'll find this in pcs all the time, and they'll come up with it, and that's what makes problems so weird. They come up with this idea, "Well, it's unsolvable, you see. It's unsolvable. My problem is unsolvable, you see."

And you get to drumming it up, and you finally find out that it gets stated on this basis that they want to be a wife and do that sort of thing "And why can't George," you see, "accept me as a successful wife," and all that sort of thing, you know.

And then you get to searching for it. They say, well, they also ought to be going out to nightclubs all the time with other men. And this is in the same pc, you see. And they've accepted one of these as their idea and then they accepted the other one as their idea.

But originally these were two ideas counter-opposed.

If you start plumbing up this problem on a Problems Intensive, you'll find out that there was somebody else around – if you wanted to go this far – insisting they go to nightclubs with other men while they were trying to be a successful wife.

Then these two ideas lock up, and they own both of them simultaneously, and you get a (quote) "unresolvable" problem. One of those ideas was the pc's and then one of them was a later valence.

The situation, then, is you get a lockup in time. And it appears to be what... How you miss it, you see, it appears to be simply the individual himself with two ideas, see? Isn't that what it looks like? He's got two ideas.

Now, if you separate these two ideas apart, you'll find one of these ideas belongs to the pc and the other idea belonged to somebody else. But actually, how did the pc own this first idea? It's usually through a valence mechanism. And the valence mechanism is a simple
mechanism. He adopts the valence, and the valence has the idea. Now, the valence confronts another being, and that being has a different idea. And then the pc gets this valence locked on the first valence, and they're actually in apparent double valence situation. It's like concentric walnut shells, one right after the other.

You've got a walnut, and then you've got a shell outside the walnut. Now, if you can think of the thing of having a shell outside the walnut shell, and then a shell outside that walnut shell, and then a shell outside that ...

You ever peel an onion? [laughter] Well, that is actually the way a pc's bank or being-ness looks. That is the way it looks. And that's why you cry when you – when you ...

Now, frankly, if we were to take this apart in an ordinary and routine fashion, it would be sort of like this. Your ordinary take apart would simply to be to peel the onion skin by skin, and boy, if you haven't got a gas mask, you can't do it. But it does take a long, long time, and it is very tough on the pc, and he gets gains, and he gets loses. And let's say he had a valence as a woman, and that the outer skin to the valence of the woman was the valence of a man. And you process off the valence of a man, and now your pc's acting like a woman. You peel off the next valence, the pc's acting like a child. You peel off the next valence, the pc's acting like a dog. [laughter] What is this all about, don't you see?

Well, there are literally, literally – well, it's some unimaginable figure. It's some astromomic-type mathematics would it take to get the figure, of how many valences are accumulated by the pc in actuality. And it's probably something on the order of – oh, I don't know – binary digits of some kind or another. It's way, way, way up there.

They accumulate as many as half a hundred in one lifetime. And times being tougher in some areas than the others, you say, well, the pc lives ... Let's be very conservative; let's say he lived two lifetimes a century, and half a hundred for each lifetime is a hundred, and that's one per year. And that's for a calm, ordinary existence, you see.

And now we go back two hundred trillion years, and we'd have two hundred trillion valences. Of course, that's a crude way of arriving at it, but that gives you some idea of the magnitude. I'm just trying to tell you it's big magnitude. You ever run into anybody that just after they talked to you they had your mannerisms? Well, they've just accumulated another valence.

Now, it isn't every time they have talked to somebody... because they talk to you once, from there on out they don't just have your valence. They get a new valence from you every-time they talk to you.

Now, have you sneaked up on what the order of magnitude is, see? Well, it's big.

All right. Now, what we're doing is absolutely magical. It's fantastic, and your appreciation of its fantasticity will rise when you realize that we are removing whole onions. Whole onions. It's what's holding the onion together. That's what we're after. We're not interested in peeling this thing endlessly, crying over the dishpan, see?
As a tip to housewives, you peel onions underwater, you cry less. You fill a bowl full of water and peel them underwater. But your hands don't smell any better. Anyhow... [laughs]

But I know of no such ready solution. If it was just a forever situation, forever valences, what would you finally wind up with, you see? You'd wind up with a forever auditing. So lighter techniques tend to do a forever job.

Now, we were accidentally taking this thing apart when we get the engram necessary to resolve the case – we would probably pluck one of these valences when we were being successful. The engram ran easily, and we didn't go back earlier than it or anything, and we didn't have to do anything funny about it. We've accidentally arrived in it.

It's quite interesting that a lot of people who have been running Dianetics go down the track on these new routines and they find the holes in the track that they've already erased by Dianetic procedures. They've contacted that old engram before, or they hardly even noticed that it's been contacted. It makes their case much easier to run because they've already had it desensitized.

You get out here – some member of the public – and you'll get back to the age of fifteen, see? Well, a person who's had a lot of auditing of course goes back earlier much faster. You'd be surprised how explosive this can be.

Now, Routine 3D isn't designed for your case. It is not designed for your case. Your case does not require this much. You could undoubtedly, with me running the tiller on the thing, one way or the other go Clear on Routine 3. With this modifier gimmick, we would have gotten the modifier out. You did it. Most of you are after modifiers. In that one week, you got the modifiers. And you got those things brought out. Well, that was just speeding it up a little bit. But you could have gone Clear eventually on earlier routines.

But this isn't true of the general public. The reason why you're having difficulty auditing the general public is this is so beefed up, it's so highly charged. This is a case that has never had any charge taken off of any kind whatsoever. They don't even know that they remember and have an engram connected with their puppy's death at the age of five, see? They don't realize that's got a big secondary, you see? These cases are highly charged up cases.

Well, now, let's get back to what we were talking about, about these modifiers. Without relieving any more than just the casual, run-of-the-mill problems of his life that you would run into and relieve with a Problems Intensive – that's quite vital – that will keep the fellow in-session. Without doing any more than that, you're actually going to launch this fellow onto the whole track. And now you're going to pick up a modifier. And you're going to pick up the various parts you need, you see, just like the modifier, out of thin air. And you're going to have a hell of a time, that's all. You're going to hold him in-session by strapping him down in the chair. And you can't do that to the general public. And we had to have another method.

So, I could see that it wouldn't be too difficult for us to go ahead and teach this method and find it on Scientologists, but I could foresee that there was great – would be great difficulty in your trying to find this thing on casual public – people who hadn't been audited very much. Why? The modifier will be in there with sledgehammers. You're not going to get near
it. The more charged up the case is, the less secondaries they've had off, the less this and the less that, well, the harder such a thing is to reach.

Now, I anticipated as far as I could into the difficult case. All right. But at the same time I did say that you were having difficulty and there was no particular reason for you to master a relatively difficult, sporadic, artistic technique like blowing phrases out of a bank. That is quite a technique, you know? And trying to hold somebody still while you do it is quite arduous and too arduous for it to be used much on the public.

I saw from time to time one of these things being blown in old Dianetic processing. I remember this airline pilot who came in, sent by American Airlines, I think it was, to the 42 Aberdeen Road, Elizabeth, New Jersey. And the airline company wanted to know what was this Dianetics, sent this guy over and we tried to find out something about him. And actually one of the students at that time, with the idea of phrases and the key phrase on which the fellow's life was pinned – we already had that idea, you see – blowing it just like that with repeater technique and without a meter. Pretty good, huh?

Student took him upstairs and he found the guy's line, phrase, everything else. What was the trouble with the guy – he had failed every time he had had a job out in civil life, you know. Soon as he got in aviation, why, he was more or less all right. And that's because of a continuous phrase his mother used to feed him all the time. And it could only have been effective if it had been the modifier. He had a part of a modifier, and that's what we took off the case. "He was no earthly good." So he could be an airline pilot but he couldn't run a garage.

And this absolutely made the fellow feel marvelous. They just repeater-techniqued the thing into view and out of existence, and that was it. That was it. That changed his whole life.

Another one, a child dying of leukemia, and we shot a phrase out of the bank, "make your blood turn to water." What's leukemia? The blood turns to water.

Shooting phrases out of a case can produce a considerable change in the case, but it's not uniform. It is not something that you sit down with any confidence and do. Because you may do it today, and you may do it in two weeks, and in two weeks, why, you may have the case so steamed up that you can get nowhere near anything. You know, you get the idea. I mean, it's a rough go. You pays your money, and you takes your chance. It's that kind of a thing.

Well, we don't want anything to do with that type of technique if we can possibly manage it. Let's get something which is ascertainable and which runs smoothly. So the answer to getting the modifier was to take the pressure off the other side of the problem. Now, some of you right this minute have been sitting there, while assessing as a pc, and have all of a sudden felt sort of weight lift off of you, particularly on an opposition terminal or an opposition goal. And suddenly the auditor reads two, three, four in a row or something like this, and you – all of a sudden you feel light. You feel strangely different somehow. Something odd has happened to you. And actually they haven't even found anything, you know. They're just assessing the list. And all of a sudden, why, you feel something passing off somewhere or another. Have any of you felt that?
All right. As an auditor in auditing somebody, you don't pay too much attention to a tone arm during an assessment. But you might have noticed a sudden ‘craboom!’ of a tone arm on a pc during a reading. Well now, that is simply the person is losing some weight. What you watch there is a few billion valences going. They're just piling right on off the top of the modifier, you know? They go pfffft.

You're actually not really running anything out on the reverse side. What you're doing is just taking tension off the pc's side. You see, the opposition goal, the opposition terminal – the opposition terminal comes first, of course. And this opposition terminal – "Oh, is that what I've been fighting," see?

And this recognition, "Oh, yes, is that what he's been fighting," you see? This recognition of this, and its ideas is... and he doesn't even have to come close to that one. Just that he's in the vicinity of it starts doing things, see? Similarly with the terminal. I mean, just that he's in the vicinity of what he's been opposing. He feels like somebody's been playing at swords blindfolded in a dark cellar with an Ethiopian for an opponent, you know.

Then here he is; all of a sudden some of this stuff starts coming to view. And it lightens up. The reverse side over here lightens up. You see, his idea therefore doesn't have to be so tightly fixed in because it's not opposed by so much charge. You got the idea?

Now, let's get back to this stick. There's five foot-pounds of energy pushing from right to left and five foot-pounds of energy pushing – foot-pounds pushing from left to right. At the impact point you get a continuous balance because it's five foot-pounds and five foot-pounds. See? There it hangs.

Now, you've got to have at least five foot-pounds, or something like that, of energy to disturb this thing. You could probably disturb it with some other foot-poundage from some other quarter, but it'll be some order of magnitude of five foot-pounds. In other words, you've got to come over here and you've got to push with an additional poundage, or over here and push with an additional poundage. Well, that's all right because you're still – it's not going to unbalance. It's just going to kind of wobble as you put it in on both sides, if you can get the idea. Got it?

And if you push it down this way, well, it might take just a fraction of an ounce to deflect it down slightly. That's why, you see, perhaps that compares to your prior confusion. You find a prior confusion to a problem and nothing much came off, but the problem disappears. It's quite mysterious. Maybe it even follows the laws of mechanics. Who knows?

But anyhow, here are these two five foot-pound forces. Now, your auditing would have to be five foot-pounds – something in the order of five foot-pounds, in other words, to move this thing to left or right or do something about it. You got the order of magnitude here? It's very hard to put this into mechanical terms. I'm just trying to give you some kind of an idea.

All right. Supposing we had some method, you see, not of increasing the force from the left to the right or the force from the right to the left, see? Not of increasing this. Supposing we had the idea of simply, out of thin air, deleting some of the five foot-pounds. And let's
have five foot-pounds pushing in from left to right. And let's reduce this right to left force to three foot-pounds.

Well, something's going to start going, see? Now we've got an unbalanced situation. Do you see how you could do that? Now, you can unbalance this hung in time rather easily by the deletion of force. All other systems, even though they were a millionth of an ounce, would be the addition of force. You would add force.

Well, if you're auditing added force – or had to add force – let's look at this order of magnitude. The balance in this fellow's mind might measure well on an E-Meter, but its original force might have been a space ship colliding with a planet. I mean of that magnitude, which is eight billion foot-pounds versus eight billion foot-pounds at the point of impact.

Now, that means your auditing would have to be of the order of magnitude of eight billion foot-pounds. And do you feel that energetic? [laughter]

Now, if you can take the impact apart, it will simply be on the basis of reducing it down to five billion foot-pounds on one side of it, see? Now, oh, well, let's reduce it down now to three billion foot-pounds on one side only. Oh, well, now let's reduce it down to a hundred foot-pounds on one side only. Something is going to blow up someplace, isn't it? You still couldn't possibly have trapped eight billion foot-pounds versus one hundred foot-pounds. See what would happen? Everything would just go boom, boom, zoom. A lot of energy would be released in various directions. But you have not, then, had to get in there and push harder against this thing, one way or the other, to unsettle it. I can give you a mechanical, as I just have, understanding of the thing. It comes close to that type of thing. It's a study in forces. It's really a study in forces because a thetan's ideas add up to energy which adds up to force.

You ever been in a glare fight? And did you ever have the idea that you might possibly push over that wall if you looked at it too hard. Have you ever had this idea? Or that you might pull it in on you or something like this? Have you ever had the idea that you might move something with an idea? Well, you're pretty careful not to because it can lead to a lot of difficulty, you think.

But in the mind the idea consists of the force. See, you don't have eight billion foot-pounds still residual in the mind. It isn't actually that much force. But it's an idea equivalent to eight billion foot-pounds. It's the idea of eight billion foot-pounds. And there still is some energy, and there still is some force. And there still is some thrust in the mind. And the pc feels this shift, he knows what's going to happen. He knows what's going to happen. Everything is going to blow up. Huh. Did you ever suddenly, accidentally move a mass on a pc? Pc almost goes that way. Did you ever do it? Did you ever have a pc feel he was suddenly splitting in half and part of him flying off into space?

One of these goofball things – it doesn't happen very often – but an auditor gives an auditing command, particularly with a pc who is not prepared for it, the pc's taken unawares. He's a little bit surprised. It's bad auditing. If you've done it, recognize it for what it was. There was no smooth approach to it. It's just after you've had an ARC break. It was just after you changed the process too rapidly. It was just after something. And you got this pc suddenly felt something go, and boy, did he object to it. And after that, he's just holding on, just
like this, you know, ahaa-ahaa-ahaa. You know, just scared stiff something was going to slip now, you know? And sometimes they feel the bank go a billionth of an inch, you know? And they say, "Uh-uh. That's it. I've had it."

You know these guys that only one tech – one technique will work on them, but next time you audit them you have to have another technique? Did you run into that case? It's quite ordinary. The Black Five case is very often this way. Boy, if you were auditing him well on Tuesday and you were just getting along fine on this "get the idea of" sort of process, or whatever it was, and you just didn't have enough hours in Tuesday to make the session totally consecutive to it being flattened – on Wednesday he comes into session and he is not about to get any results from that process. And no further results are going to come from that process.

Every process works once. This is not an unusual case. It's usually the Black Five. You don't notice it because the processes you're running are repetitive in spite of what he's trying to do. He can't stop them. But if he had his way he would, because he gets a little change and the change itself makes him nervous. So he's got the brakes on that process.

Now, you've got to run another process, and you've got to run that. And that will only run as long as he doesn't put the brakes on. So very light processes run on cases of that type give you this aspect if you have to have a process a session. Next session you've got to have a new process. Next session you've got to have a new process. Next session you've got to... You've run into them. I see people from Central Orgs nodding. Yes, they've seen a lot of these guys. It drives a D of P crazy. They're just running wonderfully on Tuesday. We were getting the idea of winning, you know. "Get the idea of winning. Fine. Get the idea of losing. Fine." Those were wonderful. There's nothing wrong with this. It was just gorgeous. But Wednesday he comes back in. Absolutely nothing happens on the same exact process. And on Tuesday it wasn't flat.

Well, this case is so much in balance – it's the high tone arm case – the case is so much in balance that if he feels anything start to shift his idea of the amount of mass that is going to shift and the things that are going to happen are so catastrophic, you see, that he just goes oo,oo,oo,oo,no,no,ho-hoho. Oh! Now what makes him do that? That's because it's his ideas versus the other determined ideas of his life. Ah, well, the idea he's directly opposing is the first idea that you will find. And you find that idea with his goal.

You'll find that idea, and you'll find the first idea he's opposing. You find the goal, and then you can find the goal opposition terminal – the opposition terminal to his goal. And then you can find the opposition idea to his goal. And all of a sudden that stands there all revealed. You got what this is. You know who or what it was and what its ideas were. You know that now.

All right. You had just gotten rid of all but the last hundred pounds of force on the opposition side. And it can't stay stable anymore. Actually, it'll never be stable again – that particular problem. It can't be hung up in time that way ever again because you've taken the thing out on the thing he would pay the least attention to going away.

He doesn't care what you do to the other side. He's agin 'em. He'd kill 'em, man. Most of these opposition terminals you run into, the pc sits there and he isn't saying very much about it. But if you got him to chattering about what should really happen or what he might
possibly have done at one time or another to such people, he's liable to demonstrate a slight amount of misemotion. Have you noticed that, you know?

In other words, he doesn't like that terminal over there. So what you do to the terminal is all right with him. Now, what you do to him isn't all right with him. If he's in a terrific games condition, as your people off the street – your raw meat cases – would be, in terrific games conditions, you know. They're splintered down to about one-sixteenth of an inverted dynamic, see? And the rest of it is totally "them and me", somewhere down the line, you know?

Give a panhandler a sixpence sometime, and if you had him on the meter at that moment of what he thought of you, the amount of gratitude which he actually displayed and so forth, you'd be quite shocked. He's down to a "me" that is against all of "them," ha-ha, rrghhh. So if you want to put him in jail, he's going to object. Or if you're going to take anything away from him, he's going to object. Or if you're actually going to do anything with him, he's going to object. If you just asked him to move over to the side of the sidewalk for a moment, he's going to object. That's all there is to it.

Ahhhhh, but wouldn't he take a great deal of joy as just as he is standing there arguing with the cop, why, you came along and distracted the attention of the cop and gave the cop a bad time. You can just see that panhandler, you know, sort of dust himself off, and, "Haaaa. Haaaa. Serves him right," you know. In fact, you could do almost anything to the cop, and the panhandler would applaud you. Now, the police might not. But the panhandler will. Do you see?

So a pc will sit there and let you gun down his worst enemy with the greatest of pleasure and be very pleased with you as an auditor. And I don't know if you've noticed how pleased the pc is when you're finding opposition goals and terminals. They're sometimes very sour but it's at the terminal, not at the auditor so much.

They feel upset, but that's their areas of least blame of the auditor. You start finding opposition terminals, you won't get many ARC breaks from a pc. You can do anything you want to, to that goal and terminal over there – ha-ha-hahhh. Of course, to this panhandler, the total goal – the total goal for every terminal would be "to do me in," see? It'd be some version of that, see – "to do me in." You know, here's people painting buildings, and they don't even look at him, you know. They'd never even seen him. He could stand in front of them, and they hardly notice him. And they're busy slopping paint on the building, and so forth. But he knows what their goal is – "to do him in," you see?

The pc is backed up against the wall, he's not a panhandler, but he's backed up against the wall as far as the rest of this particular area or session is concerned. You could go over a list here. And you could go over an opposition goal or an opposition terminal list.

Now, here's an opposition list: "A policeman, a father, a meter, a teacher, a tutor, a governess." Got the idea? You could go over this opposition list and you could say to this pc, "Now, would it make any difference to you if I shot a policeman?"

"That'd be pretty good, you know."
And you go down the rest of the way and this is what you would get, you see? They'd applaud on this. It's perfectly fine with them. And of course their ideas are braced into this structure of hostility. Now, you actually aren't tricking the pc. The pc actually can recognize exactly what you're doing. And it's perfectly all right. Because what you're doing is unbalancing the resistance toward his own goal and survival line as he sees them. And you're unbalancing the resistance. So he's winning, see? What is a battle but the person who is winning is winning, you see? And the object of the battle is to win.

Of course, you get a pc "and not to win" as part of his goal, he might be a little bit upset with you if you set him in the direction of winning. But the odd part of it is the technology even overcomes that. That's just another piece of the parts.

All right. So as the individual goes along – as the individual goes along through Routine 3D, you have your best opportunity of finding what the pc has by finding out the things about the opposition.

Now, you can always lighten up the opposition without any resistance from the pc. That's dead easy. And also you can always find the pc thinks the opposition pressure is taken off. You get the rationale? And you'll find out it'll work just exactly on that one, two, three, four from now on, providing you don't go squareheaded on me and start doing your assessments upside down by turning the pages randomly at the last Book of Job or something.

You see, it'll go on just – just – just happening easily because what you do is take the weight off the pc at the point where he couldn't care less what you do to that particular zone.

All right. Now I'll show you a reverse way to do this. This is not the way to do this. This is exactly reverse wrong way to do this. We assess a person very carefully to find out exactly what they're fondest of in life. And we make a list of "Of whom was you fond, Mack ..." Because we couldn't call it auditing, so we wouldn't follow Model Session to do this sort of thing.

All right. And he says, "My grandmother, my youngest daughter, my old dog, and my car." You assess this very, very carefully and we find out that "youngest daughter" wins on the assessment.

Now, you say, "Now we're going to erase all the memories connected with your youngest daughter."

Well, do you think you'd stick to this pc in the session very long if you did this?

All right. The pc sees his goal is a good thing, and he sees his game as a good thing. This is what's idiotic about it all, that it's been getting him into trouble now for the last hundred trillennia is totally overlooked by him. So this would be the wrong way to clear somebody on a Routine 3 type process. Let's get the goal. Let's get the goal. All right, now let's erase it.

Look, isn't that what he's objecting to? Isn't that what he sits there in an assessment and objects to? That you're invalidating him, you're invalidating his goals. That you're doing this. That you're doing that. Well, the rudiments wouldn't go out if you weren't. So when I say faster clearing... There are many other reasons here, but this one should not be overlooked.
Ha-ha. You get this goal, and then you get his terminal, and then you run it on the Prehav Scale to erase it. Oh, yeah? Don't you think you're going to have a little trouble in a session? And you do. You do. You get so many hours deep into clearing and all of a sudden the pc kind of decides he doesn't want to be Clear and he doesn't want to do this and he doesn't want to do that.

And of course the enemy is still on his front doorstep and he knows he's feeling better, but he just doesn't want to go on with this. Well, now, what was this brake? Why did he put on the brakes? That's because you were attacking an ally to the exclusion of the enemy. Now, he wouldn't mind you getting rid of the ally providing the enemy was cared for. You see the rationale?

A bunch of farmers are standing out there with pitchforks and scythes and blunderbusses and they're stretched across the road. And a bunch of regular cavalry come up and say, "What's the matter boys?" And these fellows say, "Well, it's the skirmish line on that other army. And it's been getting real close to our homes, and there have been a bunch of looters and things around here and we just mean to shoot every one of those characters that we can."

And the troopers always make this mistake. They say, "Well, disperse and lay down your arms and go home."

This is how you get revolutions started. A bunch of guys are protecting their homes in some fashion. You tell them to lay down their arms and so forth. You say, "Well, we'll take care of it," in some indifferent fashion, you know. And, "Well, lay down your arms," and so forth.

That's not the way to do it at all. If you want them actually to go home, the best thing to do is go out and find a looter and hang him; and then they lay down their arms and go home. Got the idea?

They do that with the greatest of ease then. There's nothing to that. You see that as a procedure. They know you're going to do something active, and they know what's wrong with them. They know exactly what's wrong with them. It's the enemy. Well, isn't that what they think? It's the enemy. That's what's wrong with them. They know what's wrong with them. Of course, this isn't what's wrong with them at all. It's their own knuckleheaded insistence on having a goal that they then hang a modifier to, that they then apply in some peculiar and particular direction and find themselves a good enemy and then keep it mocked up. That's actually what happened, wasn't it?

But that isn't the way the pc looks at it. And I think that there isn't a pc in this room at this moment that can't look at this analytically, and individually would be resistive toward the whole idea. That couldn't possibly be it because "look what they've done to me."

Well, of course, you know nobody digs himself out of the hole unless you run off what he's done to them. But a pc won't look at this as long as there's an army standing out there that is going to fill him full of bullet holes the second he takes his finger off his number. So he's going to stay fully armed with all of his tricks. He's going to remain a very dangerous person. He's going to remain as fully dangerous as he possibly can because the whole enemy is there in full panoply.
Now, by assessment, you have actually seen a person go a little bit clearer here, some of you on the opposition terminal and opposition goal. You know, they went \textit{zzuhuhuh} off, you know, a little lighter. Because I see in your reports, report after report... I don't know. You're not picking this up from each other because it's just the natural description of the phenomena that report after report I've read — "the pc felt lighter at the end of session." You've probably written it yourself on an auditing report. "Pc felt lighter at the end of session. Pc felt less heavy. Pc felt as if he was winning." Well, he was. [laughter] That's the first and foremost reason why he felt that way.

But the mechanical reason he felt that way is in toward him, facing in toward him, were these eight billion foot-pounds of thrust, and you've reduced them down to only a billion, see, and with just the assessment. And he sees then, because you reduced them to a billion, that they might reduce further than that. And he now doesn't have to stand there fully armed, braced and barebreasted against life, you see.

Of course, you take away — I've said barebreasted, but he's fully armed and shielded against life, and he doesn't really want you to come along and take away his shield, and he doesn't want you to take away the rest of his equipment because he knows what it's facing. He knows it's dangerous not to have those things. And of course, that is the only reason he interrupts clearing.

The fellow is standing there. He's got a lamppost in his right hand. He's got his pockets filled full of tomato gravy. He has his left ear torn in three pieces and he's got lumbago. [laughter]

And you say to him, "Well, now, son, let's straighten up here. You don't have to have your ear torn in three pieces and you might at least empty your pockets out." [laughter] "Very messy."

You know, he doesn't pay a bit of attention to you. He knows that's what he needs. [laughter] He knows that these are the exact items necessary to defend himself in life. He knows those are the items. Those are the only things that make him dangerous. [laughter]

Why does he want to be dangerous? The enemy, of course. And, you see, you're stupid. You never realized this, but you're stupid. You don't know they're there. He doesn't either, but... [laughter, laughs] Yeah, that is the way the mind hangs together. And that's why you're taking it apart this exact way with Routine 3D.

You say opposition terminal. Well, that's good and solid, and he can put his attention on it in a hurry. And the reason you get the terminal before the goal is of course he can put his attention on something solid and then you can materialize the goal out of that solid. And that's easier to do than put his attention from an idea, his own goal, onto an idea, see? That's a little bit harder to do. So the easy way to do it is to find the opposition terminal. Then he knows who or what he's fighting. Oh, that's great.

Now, let's find out what their idea really is from the pc's viewpoint. Of course, it actually isn't that person's idea at all. The person lived with Bessie Bell for eighteen years, man and boy, and you start running him, and you find Bessie Bell is the enemy and wife of the enemy or something like this, or woman is the enemy. And you shake this all down and you'd
be amazed, but so would Bessie Bell, to find out that her total goal in life – this would not agree if you were processing Bessie Bell, you couldn't use this goal – but her total goal from this fellow's viewpoint and so forth, her total goal, actually, is to make a great deal of noise while setting the table and doing dishes. And that's her total goal in life. You don't realize that. She doesn't realize that. Nobody knows that but the pc.

Now, you just try and run Bessie Bell, if you had her as a pc, on "to make noise with dishes." You know, it won't assess.

Now, from her viewpoint – your pc's goal which is "to be a great building builder," or something like that – well, from her viewpoint, why, his is "to track mud all over the floors and to eat biscuits in bed." [laughter] And that's his total goal. Well, don't try to run it on him because it won't assess.

Well, these are just the offbeats of existence. There's a lecture about this already. It is the first congress I ever gave personally in London. The first lecture. It's "Your Ideas of the Other Fellow." That's the basis of aberration, is the aberrated idea of what the other fellow is up to. And it's as simple as that. But this Routine 3D plucks off the foot-poundage of the opposition, and therefore the pc can reach a little further. The pc is a little freer to look. So then the pc is willing to look up and find out what he might do if he failed. Oh, he's gotten a unfixation now to do this.

So you've unfixed him to a point where you can find his modifier which is perhaps "to run away and commit suicide in case I ever run into a Scientologist." You know, he's had it on the whole track for a hundred thousand years. [laughs] But anyway, he's got a modifier, and he'll give up his modifier, and then you can find it. And now, only now, can you find the pc's goal and terminal and be absolutely certain that you get it right on the bat. Because it's got to be the terminal for the goal plus modifier.

And the reasons you used to get such tremendous terminals lists – you know those things, I've seen them run to a thousand and more terminals and so on – it's just because you go on and on and on and on and on and on and on and on and on and on and on, because, of course, you weren't asking for terminal plus modifier. And you were finding, by accident, the terminal plus modifier. That is, it would finally fall out, but Lord, at the end of how much processing, how much assessment? It was very difficult.

Now, we go on to the other thing – pc's goal terminal – and we get the Prehav level for this particular thing. And now we actually, in 3D – and to be very honest with you at this stage of its development – we are in the zone at this point of test. This other up to step 5 is solid as the Rock of Gibraltar.

But I'm still, as I told you before, experimenting with the commands on this sort of thing. I want to see exactly where this thing whizzes in beings. And you're not up to running any commands yet, and you won't be for another couple of days, so I've got a little chance there to do the side research to make it faster when you get to it.

We could run just what we have been running and win on it. I've already had that checked. And it'll be perfectly all right. I just want to see if we can't really get a whizzer, really get a whizzer going on this one.
Now, I already have found out that this process alone, running the ordinary terminal and so forth, will run levels out so fast that you can no longer run the twenty minute rule. That's quite interesting. Your twenty minute rule of running is still under inspection by me. It is apparently out. And we'll go back to the Joburg rules of running which were the original rules. And we actually are looking them up. I will issue a bulletin on them, but they were running to a stuck. You run it to a stick. You actually let the thing stick. There it is. It's stuck.

And then assess again because you're not going to run it for days. I can trust you not to do that. And the reason we left it still wobbling was so as not to make an error. But you'll find that in running this, even on the old way we used to run Routine 3 terminals, that it sticks quite promptly, and goes downscale quite promptly. And you might even find yourself doing two levels a session. That's right. And you run it to stuck. And when you're absolutely sure that it is stuck and it's not going to move ... I don't know what the time limit was. That's the only thing that is out. And we have to look it up. But it's – I'd say it offhand, it'd probably be about – oh, if it's stuck for about five, six, ten minutes or something of that sort, I think I'd come off of it.

But I'd stick it. I'd stick the tone arm. Not the needle. I'd stick the tone arm. And let it go into there chunk. And I'd make sure it was sticking there because the routine behavior on this sort of thing is kind of a pattern for the pc, and you can tell when it's going to stick, and you can tell when it's stuck. And it's a skill which you'll pick up rather rapidly. And after you've seen it two or three times, you'll say well, that's that. There's nothing much to it.

All right. Well, I'm trying to speed up even that. But the data I can give you on that right now is that you run it to stuck. You'll still be all right, because you can still reassess.

In the first place, you've taken enormous weight off the case. Well, how have you taken the weight off the case? Well, you've paid some attention to the opposition, haven't you? And you paid some opposition ideas some attention. And we got a lot of things as-ised here that were still tough on the case before. All of a sudden as we run these, these get easier and easier and vanish and get all floppy, and they're out.

The bulk of time of 3D is probably devoted to assessment, not to running. That's probably the less time – on running on it. I don't know. We can't say that broadly yet, but that's just my preinformation on the thing as I look at it. Yea, I see it certainly does evaporate in a hurry. I've already seen two levels flattened in one and one-half hours of auditing. That's fairly fast, isn't it? And you run them to stuck and they all seem to run on the same old Joburg pattern that they were running on originally, which is the tone arm goes up and sticks. Runs all right for a moment, a little while, and then it goes up and sticks and then it sticks. And then you've got to reassess.

Anyway, looking at this a little bit further, there are ways, of course, to use these other parts, and that's all I'm working with on the commands right here at this moment having a little spare time. I'm just looking to see if there isn't some way we can weave these parts in, in a perfectly optimum pattern that will get a faster run on them, see? I've already got them woven in, but let's get it faster than that.

And that ought to be a whizzer. So we're in the throes of running one which we have solved and improving it before you get to the running of it. Pretty good.
Now, when we have this being run on half discharged and dismissed goals, my pity, my sympathy is with you. You've already run these goals halfway down. They are not reacting right. Nothing is reacting right. This is all being fairly rapid at this time. You're going to save time in the long run. But nothing is reacting exactly right. Goals are going in, and goals are going out, and sporadically this way and over the tin cup that way, and so forth. And you'll get to the end of your assessment on many cases, and you won't have any goal, and you won't have any modifier, and you won't have any opposition terminal. You won't have nothing. You'll just have a handful of air.

Well, the only thing that makes it random is you're assessing against half-run goals. Now, there's not enough time for you to have flattened that and then run them. So I'm just throwing that problem into your lap. And you might as well get used to having trouble with assessment. You just might as well get used to living with it. Because what is the trouble? The main trouble with assessment is the rudiments go out and the rudiments go in, and so forth. But about halfway through clearing, which is not too many hours deep in a case now, you're going to run into this trouble anyhow.

You'll think that after you get the person's terminal and goal all patched up and they're squared away and so forth, and you finally got it all discharged and all, you get onto the second one. Now you're on solid ground. Well, you're only... you're on uniform ground – quicksand. [laughter] And that is just simply on this basis: That you find the person's goal, and the goal goes crash, and goes half a dial, rock slam, and oh, marvelous. And you'll find the opposition terminal and half a dial, rock slam, oh, marvelous. And you'll find the opposition goal, and it's a quarter dial rock slam, and you go back and check the goal, and that's a half a dial. And then you go back and check this, and you say, "Well, I'll go on and finish this anyway," and an eighth of a dial rock slam is the opposition goal.

Well, you go back and find the modifier now, and you'll find a half a dial rock slam. Marvelous. Half a dial rock slam. And oh, that's good. Well, we thought the whole thing was disappearing, you know, and it's easy, now that we've got the half a dial rock slam, and so forth. All right. Now let's get the goal plus modifier, and let's find the pc's terminal. And we've put the goal plus the modifier together, and we've got an eighth of a dial rock slam. Well, this is not so good.

Well, let's go back and check it against the goal and the other parts. And we find out they're all eighth of a dial. Oh, well, let's go on and do the goals terminal assessment anyway. And we go ahead and we do a goals terminal assessment, and we're just about halfway through the list, and everything is going fine, and things are nulling, and things are nulling, and things are nulling, and we jus – looks – looks marvelous. And we go on down to the bottom of the list, and go back through the list again. We go back through the list again, and then we just go – no list.

And you say well, the rudiments are out. So you go back and put the rudiments in, but they're in. And you go back and look at the list, and then you go back and check the goal, and then you check the modifier. And it's gone. There's nothing. There's nothing no place, nowhere. You've lost it all. It's evaporated.
You get your rudiments in. You check everything. You check everything across the
bords. And you make all possible cross-checks across the board. But that goals terminal –
you never even got to the Prehav Scale. So you say, well, better luck next time. We go back
and we find one, and by George, we find a nice beefy goal there. It's a quarter of a dial rock
slam, and everything is going along fine, and we assess it right on down. Everything is work-
ing out perfectly, right up to the moment we find the opposition terminal. That whole list goes
null. The whole list.

We go back and we say, "We've got to check the goal. It's not there. But it is there. But
no, it's not, it isn't there. No, it is. No. I – the – huh – hmm."

Now, the reason I am telling you this is because you could make the most serious mis-
take of your career to drop it at that point. Because the opposition goal is in, the modifier is
in, the goal plus terminal is in, and they will all do a quarter of a dial rock slam the instant
you find them. And no longer.

So, we get something you will have to learn how to do in 3D. You'll have to assess on
everything going out. And this is a marvelous time for you to learn how right now, because
these things that you're running are practically run out or half run out, and they're washing.

So right at the beginning we get the opport unity of learning the hard way because the
hard – the end of this thing can get very rough on you.

Now, you only want an equal needle reaction to each part of 3D, see, to the goal, the
opposition terminal, the opposition goal and the modifier goals plus terminal and the goal-
plus-modifier terminal. You only want equal actions across those and the Prehav Scale at any
given moment.

And if while you were assessing the action is getting less, you'll find it's also getting
less on the other parts.

Now, for instance, you'll find that if the goal – if you – we can find the modifier, but it
keeps going in and out. I'm talking about an advanced run now. This is all data on advance
runs. This person has already been entered into clearing, and so on. And the thing's going in
and out. It reads every third time you say it. Do you know the goal will now read every third
time you say it? See, the goal was checked out perfectly at first. Now it reads every third
time you say it. Every part you have will read every third time you say it. You get the idea?

See, that's how faintly this can be read. They're all going to act the same, and you're
going to get fooled on that because you're going to get so doggone nailed down to the opposition
goal, for instance, and you finally going to find one. You've got the whole list run down,
and there's only one, and it's acting and it's reacting, and it's acting and it's reacting, and it's
acting and it's reacting.

You say, "Well, we've got to do something else. It's acting and it's react ..." Now check
that goal, man. Let's go back and check the goal.

Is it acting and reacting and not acting and acting and not acting and acting and not
acting, too? Like that other one is? Because that would tend to prove it out. There's another
cross-check, you see? Is what you found now acting like the goal acts? Because the goal action can change every time you find one of these parts, the goal can act a little bit less.

The point of reference – let me put it this way – against which you're verifying is itself deintensifying. So of course, that goal is the point of reference, and as it deintensifies, so do all other reactions tend to deintensify.

But where the goal is in strong, and your – the thing you have just got down to and selected as the final part of your list is going in and going out and going in and going out, and you test the goal. You say, "To build great buildings" and it goes *pow!* And you say, "To build great buildings." *Pow!* "To build great buildings." *Pow!* And you say this opposition goal, see, "To eat up timbers," see. You say, "To eat up timbers." It goes *wiggle.* "To eat up timbers." None. "To eat up timbers." Half a dial drop. "To eat up timbers." None.

And you say, "To build great buildings." *Pow!* "To build great buildings." *Pow!*

You got the idea? Huh? "Build great buildings" is still in and still constant and still of the same magnitude. Well, you've just got the wrong item, that's all. Simple as that. You've just got the wrong item. Or the rudiments are completely crazy on the subject of this particular item where there's been an invalidation of this item, or there's something wrong with this item and this list that you are doing. Not with anything else.

You haven't bled it down to the point where you've got every single possible goal that the pc would have for that. You just haven't got a complete list. You've done a poor job technically. That's all.

See, now differentiate between doing a poor job technically – in other words, not doing this one, two, three of get the rudiments in, bleed the meter down, sensitivity 16, set your meter back to a dial drop and then *assess,* you see. Get your rudiments in, check, you know, that kind of thing. That will hold, and it will hold straight through. Well, you've done something there wrong. The rudiments aren't in or you haven't gotten the whole list or something's off.

See, if the person didn't invalidate on the list, the rudiments would be out, and so forth. And there's something technically wrong.

Now, you've got to differentiate between a technical error and a fading goal. And don't you ever dare cross the two because, you see, it'd be very pleasant to be able to say, every time you made a technical error, that there was now something wrong with the assessment. See, that'd let everybody out from under except the pc. I don't say any of you'll do this, but I do point it out. I do point it out quite strongly that that is the way it is.

You're assessing against a vanishing standard. The standard is vanishing, in other words, this pinpoint on which you're referring everything. You're measuring a room, and you've driven a nail in the middle of the room, and you've got a tape. And you take this tape and you measure the distance to every corner of the room and to the ceiling and the floor and the lightbulbs and the fireplace, and so forth. And you've got all these distances, and they're all relative to that pin in the middle of the room. And being relative to that pin, everything is fine as long as nobody moves the pin. Yeah, it's okay. I mean you can always know where to put this room back together again as long as you've got that pin.
All right. And you come back and you look at it. Now, a whole room depends on this pin, see, all your measurements. And you come back and you look at it and you find out it's half its size. Makes you a little bit nervous, doesn't it. Well, actually, it's fine. The case is going Clear, but you come back again, you take a look at this pin; it's a quarter of the size. And you come back and take a look at it again, and it's appearing and then disappearing, and then appearing and then disappearing. Rrrrrrr. And then you come back and take a look at it and it's just a kind of a little mark that occasionally is there, but usually isn't. And that's what you've got as a reference point to measure the rest of the room by.

All right. Now, this would be very difficult if only the pin moved. Actually, because the pin is a standard, everything moves with the pin. The distances go in and out just as the pin goes in and out, you see?

So if that nail gets half the size then, for instance, your goal modifier, when it's finally checked (although the first time you hit it you get a bang out of it) – it'll settle down suddenly and the pin's gone half its size, the goal modifier is now half the size that it would have been. Got the idea? Everything goes down in exact proportions, which is lucky for you. It's just lucky that it does that.

See, it's all part of the same charge, and as it discharges, the whole charge reads the same. And these are all parts of the same charge. So of course, as the pin goes down, all the other things go down, too.

And when it finally blows up, it only blows up if you've got all parts of it.

Now, this sets up a considerable technical problem for you. And you think I may be stressing this a little bit hard, but you'll encounter this problem often enough.

The problem on assessment is how do you continue the list? It's this idiotic problem. You've got a Goals Assessment, see? Now, that's fine. You can make a Goals Assessment entirely independent of everything else and wind up with a goal, see, because that's the center pin from which you're measuring everything by. Why, that Goals Assessment, that's just dandy. You can get a goal, and there it is. And everybody's happy with this as a goal.

All right. Fine. Now we do an opposition assessment. Ha-ha. That's fine. Good. We can do an opposition assessment, and it's all right. And we finally get there. And we get the opposition terminal, and that's fine. And we put the opposition terminal down.

All right. But notice something here. That in order to get an opposition goal, you must have had the opposition terminal. Oh, you need the part in 2 in order to do 3. Ho-ho! And look, look here. You need the parts in 2 and 3 in order to do 4 and find the modifier. And look, you've got to have the parts of 1 and 4 in order to do number 5. And if you haven't got those parts, you can't do the next step, can you?

Now, listen to me carefully. Wake up and listen to me carefully now, because you never dare leave 3D incomplete on any assessment. Now, remember that. Never leave 3D incomplete from parts 1 to 5. You may never get to 6, and that's all right. But never let it be incomplete from 1 to 5. Never. Always complete that assessment.
Well, how are you going to complete an assessment – this is your main problem here – how are you going to complete an assessment that disappears at item 3? Everything folded up at item 3.

You didn't even get the opposition goal. You got close to the opposition goal, and then suddenly – even the rudiments were in and everything else – the opposition goals, the opposition assessment, and the goal itself apparently blew. It just went like a chain of firecrackers. Brrrrrrp. Bang!

Well now, you say, "Oh, well, that's a good thing. Now we don't have to do 4 and 5."

Well, listen to me carefully. If you don't do 4 and 5, you're going to leave this pc with a hidden aberration that nobody from here on is ever going to suspect. And people will be saying, "You know, Clears act peculiarly." [laughter] Yeah, well, this one is acting peculiarly. He's still got 4 and 5 stuck and vanished and totally out of sight. And that's because somebody didn't complete the whole 1, 2, 3, 4, 5.

Now, how can you complete the whole 1, 2, 3, 4, 5, if 3 went? Because you've got to have 3 in order to get 4. You must have had 2 and 3 in order to get 4, right? You've got to have these. They're going to stack up one way or the other. Well, how you gonna get them?

Well, listen to this one carefully. You just take the last item you had active and get the next one. You were doing a Goals Assessment, and you do the last item active or the one on the list you can get to kick now and then, which would of course eventually become the last item that's active because it'd kick now and then before it disappeared, see.

So therefore, every time you read one of these things – . Reading them three at a time uniformly is now a good weapon in your hands because if it wasn't null, you're going to make a mark, you see. And you're going down the line, you see. Then you can tell how many times you've been over the list and therefore how many times that thing reacted.

Even though the whole list suddenly blew up on you and wasn't there anymore and you couldn't find anything else on the list, and you just find your hand full of air, well, you do have, ha-ha-ha-ha-ha-ha, you do have one item which reacted five times. Oh, well, that's very nice. That's very fine. We have an item that reacted five times.

Now, the only time when you ever turn an E-Meter up to sensitivity 16 to do an assessment, you rapidly read them one time each. This time carefully preserving them to keep them from going out. Read them in a soft tone of voice. Go down the list one time each and note the greatest reaction, and do your assessment at sensitivity 16 as long as you can. And then if it all blows up and goes out the window, you still have got an awfully good idea exactly what the item was. Well, that was it. It was firing there for a moment. Now, it's gone.

Use that and go to the next item. And do you know that you can get a whole assessment done on the next item even though the former item is gone? Because the next item will stay in long enough to do an assessment. And now you'll have to catch the next point on the fly, you know, as it goes overhead, in order to get the next item up the line. Got the idea?

That's the only real cleverness that Routine 3D takes. Of course, it takes a clever auditor to audit anyhow, but this is tricky. This is tricky. It's sort of catching the brass ring on the
merry-go-round. You'll find that that list, however, will stay alive until you get close to the actual one, before it blows and things blow before it.

Now, the beauty of it is this: as you get down toward the end, anything nearly approaching accuracy will probably blow it anyway. So as a person goes toward Clear, the death is our penalty accuracy, if we don't hit it right on the head, it's much less. It's much less liability. Try to get it. Try to get it accurately toward the end of an assessment. And you get something – now listen to me – get something to carry on to the next section, heh-heh, please. And roll it on down.

You know, it's this: "Well, now look, I've said something and then you had a cognition. What was it you had a cognition on? I mean, what did I say that you had a cognition on?"

And the pc thinks it over. "Well, it's so-and-so and so-and-so."

Ha-ha, good. Write that item down and carry it on to the next list. Got the idea? I mean you could catch these things no matter how faint they got, but it can require some cleverness on your part.

Now, you could waste an enormous amount of time on a half, threequarters, nine-tenths rubbed out item and list and section and so forth, driving yourself and the pc completely around the bend by just not taking what you do have left. And of course, by driving him around the bend, you'll ARC break it or something of that sort, so that it all does go out of existence, and then it's very difficult to get in. And you've just complicated the whole thing.

So, develop this little habit, would you please, in doing Routine 3D: As you pass on from – down from the goal, make a peculiar mark somewhere on the list as the likely – you don't tell the pc what it is – just mark it down as the likely one.

If you get in the habit of doing this – marking down the likely one before you prove it – as you go later on the case and the case is clearing more rapidly, you will have something left before it vanishes on you suddenly. And you won't get caught adrift on the open sea on a pocket handkerchief. The likely one. That isn't of course what you're going to force on the pc. And if your assessment continues, and you really do get the one, and you notice how far out you are, you will eventually develop a facility for getting just about what it was, you know, right about there.

And of course, as you go on down the list further, the way it's a likely one is the person is giving you the listing, and that sort of thing. And he's given you the whole listing on down toward the end of the listing. And you start to assess the thing, you'll develop some sort of thing as, "Which one of these items sticks in your mind?"

"Oh," he says, "well, to shoot turnips. That's really stuck there. Thought about that for a moment or two. I did, yes. I thought about that for a moment or two." A little tick opposite.

Now go on and assess, see. And we find out that it was probably "shoot turnips."

Now, you will learn to catch these things on the fly before they vanish in front of your face. Otherwise, your main trouble in clearing is not going to be auditing. It'll suddenly be-
come a nightmare to you. Cases usually audit much more easily as they become Clear, you see, than they did before. They're usually horrible to audit right at the "opening gun," you see.

And that's not true of Routine 3D. The case gets more and more horrible the further it goes.

You get into guesstimates of the situation. And the accuracy with which you must perform, a guesstimate of the situation will be quite a contest as far as you're concerned. But always do all parts of Routine 3D. Never miss. Always do them all.

Go back over and sort of select it all out. If everything has vanished, your rudiments are in, and there's nothing else you can do about it, go over the last list that you did have, somehow or another reconstruct the picture. Somehow or another get what it would have been, and put it down on the next list in order to carry on. Because you'll find that list is still alive.

Now, you can do a complete assessment and be perfectly happy. But remember on that one it's going to happen faster than it happened on the one before. You're going to get a quicker blowout. So on that one, well, it's best idea to get a likely – the most likely. As you go down the list, which one stuck in your mind – of all these, which ones do you think would be the most probable of this sort of thing?

And as we're reading it the first time and we suddenly notice as we're reading down the first line, boy, it was an awful jolt there on ... We noticed that the goal jolt occurred for just an instant on number 16.

Now, we read on down the list. That list is never going to be live again. We go back. There it is. Now we got that one. We carry that over to the next one. Then all of a sudden the whole thing blows like a string of firecrackers.

That's your biggest problem. You see how to do it? Now, of course, you realize that I will scalp you, I will scalp you if I find you suggesting that as the one to the pc. That's just a preventive action.

Now, I'm very glad with the work you are doing on this. I want to compliment you, actually, on the work you are doing on this. It's pretty fine and it gives me great heart in the matter. Your assessment is picking up. It's getting more accurate, and so on. You'll be a perfectly safe auditor on this when your assessments are always 100 percent accurate and you're totally cocky about the whole thing. So that's the frame of mind I want you to assume.

Now, in actuality, your accuracy will increase to the degree that your own case makes progress, too, you see? So we've got that one also. So we're working on a very fine front here. There's nothing much wrong with that.

I do feel for you, however, some of you who have had a goal and it flicks, and you have no parts to put down on anything. You're trying desperately to proceed, and so forth. Well, I would frankly much rather have you suffer at Saint Hill than in Bulawayo or Keokuk.

There is no reason to go on and dignify the name of Bulawayo any longer. It means the place where we all got killed. I don't know if any of those from Bulawayo know this, but
that's what it means. And it's because there was an old friend of the fellow down there named it.

Anyhow, we don't want everybody being killed down in Bulawayo because somebody can't assess on 3D.

The progress you're making on this – do you like the progress you're making on this?

*Audience:* Yes.

Do you see where you're going on this?

*Audience:* Yes.

Does it look like an easier trail to walk through than the woods you were in before?

*Audience:* Yes.

All right.

As soon as you get the hang of it, as soon as you see the put together of the thing, and as soon as your own confidence in your ability to assess and keep rudiments in improves, all of a sudden, it'll look just like that. It'll look like nothing to you. And you'll say clearing, smearing – easy. There's nothing to it. *Bang! Bang!*

So that's what I want you to work on: positiveness of assessment, speed of assessment, self-confidence in the assessments that you do. And the accuracy of the final result. And then you will find that the whole parts will string together and you'll feel good about it.

In the meantime, I'll get you some hot commands whipped up on this one. Okay?

*Audience:* Yes.

Thank you.
Thank you.

All right. It says here the 16th of Nov. 61. Saint Hill Special Briefing Course. I'm very pleased to hear that we are getting rapid checkouts. There's lots of people wanting things checked out. It's about time that we got the fire lighted in back of the rocket and took the donkey out of the traces.

This is all about Routine 3D, of course, and the first thing that I would like to remark on is the way people can dream up mistakes, you know. You lay something down and you say, "Well, you put your right foot in front of your left foot, you know. And then, by George – did you know that was only when you used Hessian – when you were wearing Hessian boots? And did you know that was only when the snow was coming down and the temperature was 16 degrees exactly Fahrenheit above zero. Did you realize that?"

This is the kind of – sort of thing I get, you know. They say you do this and you do this, you know. There are no exceptions. There's just – that's it, you see. And then you find out that's only when you're wearing Hessian boots. And you get these weird additives onto the situation and that sort of thing. And anybody could do it. But they just read something that isn't there, you know. Or they just heard something that was never said.

And we've had a couple of you actually reading the whole list, including those that went null. In other words, you list – take fifteen items, so every time the auditor goes over the list, he reads fifteen items regardless of what went null. If it went null on one reading, then we read it again, see, kind of to see if it's still null or something And of course, the pc goes stark, staring mad. A pc will go halfway around the bend. His bank will practically collapse on him because you've got this thing null, you see, and now you've started to audit it. And nothing'll scrub, and the pictures will start collapsing, and bric-a-brac starts flying about, and the rudiments will go out that way, and the pc maybe doesn't spot what's happening, and it is just a – somebody said on a report today – a cow's breakfast. [laughter]

Here and there, there are going to be people who wouldn't realize that that would do anything wrong, you see.

You know how I know this was being done? Because there are exactly the same number of check marks after each read. We get an X and then we get a live read after it, and then we get an X and a live read after it. And although stylized assessment tells us that all we do is put down a slant and as long as it's alive we just leave the slant there and leave it alone, for the purpose of checking, it'd probably be much easier on Ds of Ps if we put a slant down every time it was alive. Some of you are doing that. Then you can see that the item went alive and went dead and went alive and gives you more information. You make a mark every time. The system's perfectly acceptable.

SHSBC TAPES 001-100 1807 04.02.15
Any system you use is perfectly acceptable as long as it's readable. As long as I know – as long as I know what you're doing with the system. You see that? Nobody's forcing that marking system off on you as a system. But let's have the thing discernible as to what was going on. And the agreed-upon one is you make a slant when it's alive. And when it goes dead, you put a cross – you complete that slant and make it a cross.

And now we could tell if this ever happened again if people kept on making slant marks after a cross.

Now, sometimes rudiments go out. And the whole list goes null, and nothing is reading. The goal isn't reading. Nothing is reading anyplace because the rudiments are out. We go through the whole list, and we X the whole list out. Well, it would save us a little work if we made a slant every time that we went through the list and found something alive or out. If we marked it every time it would save us a little work. Why?

Because we only had to go back as far as the rudiments were out, you see. We'd only have to go partially back through the list again. We'd just take those that were still in. We'd see that the rudiments had been out. "There were some stuff alive after the fourth read, and then everything went null, and then something" Well, we've got to reassess again all over. Well, there's no reason really to go back to the beginning of the assessment and scrub it out because we would upset the pc's bank if we did that.

Let's take the point where they all went out and then just back up about two reads, you see? And just reread those and we'll find they're all in again. You see that as a time saver. It's a good idea.

But whatever you do, the only exception – and that's not a full exception to scrubbing them out and Xing them out and leaving them out when you're doing an assessment list – the only exception to it is when everything has gone null and by reason of out-rudiments. And now you don't know where you are at. You get the rudiments in, well, there's no reason to throw the list away. What went out was not the list but the rudiments. And the list ceased to read.

So, you've got to backtrack across all those beautiful Xes, all those items you'd already gotten rid of. You'll just have to move back now into the area where you still had reads and reassess from there on. So in that event, you could see a marking like this: Slant, slant, X, slant, slant, X, slant, slant. That would look very weird, but it would mean that the rudiments went out and everything went null on the list.

But before you got that kind of a pattern, it must have happened that all, the whole list, went null because of out-rudiments. See, you'd have to have realized that. You see what I'm talking about? But just going through, you don't X one out and slant it back in and X it out and slant it in, and in and out and in and out.

Assessment is very remarkable because we are doing basically Assessment by Elimination which at best is a happy accident. I found that auditors were having great difficulty differentiating between the greatest read and the leesest read. And I found out that there was an enormous advantage, and actually helped the case and advanced things and so forth, to
assess by elimination. And I found this oddity. That on Assessment by Elimination, you wind up with one item. And it stays in. Now that was a happy accident.

Well, there's only one list on Routine 3D that violates this one item left. And that is the modifier. The modifier over here, which I think is number 4. Yes. Mr. Modifier can easily be left with three, four or five alive before they all null.

Now, the three, four or five alive combined in some peculiar way gives you the modifier. They don't give you the modifier complete. They usually give you the modifier in phrases. So, one phrase of the modifier was at the beginning of the list and another phrase of the modifier was at the end of the list, and a couple of phrases of the modifier were in the middle of the list. And you wind up there, when you get down in assessing a modifier, and you find you've got three or four still alive, well, just assume that in some combination you've got the modifier. Now, if you combine these around and you take these four ... You know that silly game that they have "Beat the Clock" and that sort of thing, you know, and the girl steps up with this magnetic board, and "a stitch in moss saves nine" or something like this. And she's got some type of thing, you know, and she steps up and she moves these boards over the magnetic blackboard to finally come up with "a rolling stone never has to work" or whatever it is. And you've got – you've got this thing. And they've got to make a cliche. Well, in this particular operation, a similar operation takes place at the stage of the modifier.

Let's say you've got – I don't care if you take five. You've got five final bits. And I can give you an example possibly. But you've got these five final bits. And they're apparently disrelated, you know. "To heave everything overboard" is one of them. "Leave forever" is another one of them. You know, you've asked the fellow what he'd do in revenge or his consequences or his threat or something, whatever you want, in case his goal wasn't reached – what he would add to that goal, you know.

And the list is long, but "just to throw everything overboard" or "heave everything overboard" is one of them. "To leave forever" is another one. And they're disrelated, see; they're a half a list apart. And you get down to the end of the list and you've still got these two alive. And they're very markedly alive, and they both get the same little funny rock slam or whatever it is that you're assessing the goal, and everything else is following through on, on a pattern. And you should at that moment suspect that the modifier "to build" – "to build ships" let us say, was the goal, you see; "to build ships" – the modifier is not just one of these. The modifier is both of them. And your main problem is which one comes first. That's your main problem. Of course, you do that by asking the pc how do these things fit.

Well, of course, you find out it's "to build ships or throw everything overboard and leave forever." "To build ships or to throw everything overboard and leave forever," you see. That's quite easy to disentangle. But some of them are quite esoteric. And what keeps them tied in is the fact that they are denied to the pc.

He's got them mocked up, but now he can't get back at them again because they're bouncers, they're denyers, they're call-backs. It's a mess.

I'll give you a few tips on this. It isn't as crucial now that you're doing 3D. It isn't anywhere near as rough as it was. You'll find that you can sort the modifier out of this long list of
threats that he gives you, and so forth. But for heaven's sakes, write down every one he gives you when he gives it to you because he may say it and bounce, see?

He says, "to leave forever" and that just flicks it and throws it into restimulation and you'll never get it again because he's bounced – he's gone. Now, what do I mean by "bounced"? And if you get the idea of the pc traveling on the time track and then moving off at an erratic angle, he's going from a consecutive moment to moment to moment to moment, very nicely, but he hits moment thirteen, and he goes at right angles. See, he doesn't move up the time track and down the time track. Actually, he just moves at right angles to it. He just leaves that area. And you actually get some of the wildest phenomena.

You'll be auditing along, you'll be trying to find a modifier, and all of a sudden the pc will be in present time. Actually, sometimes in auditing a goals terminal that has a lot of modifiers in the goal that are bouncers – you'll be actually running the goals terminal, and the pc will be sitting there all of a sudden, suddenly, you see, just he'll be sitting there bright-eyed, wide open, and so on. He's looking at you, very alert, and you'll notice there's something strange that just happened and so forth. And he'll say, "Well, I – yeah, it was a long time ago. Yep, well, that's a long time ago. Well, it sure feels better to be in present time. Everything feels better."

You ask him the next auditing question, you know, "What dog's breakfast do you dislike?" And he says, "Oh, I guess I would have liked something or other," something or other, and so on. "But, you know, I think that thing is all erased. It's worked out. You know, I'm not the least bit concerned about it now. Ha-ha-ha."

Actually, what he's done – you don't do anything about it. You just go on auditing him. But you should understand what's happened to him. He's hit the bouncer. And it makes him feel like he's in present time.

Well, if present time was 1 trillion, 765 million years ago, he's in present time all right. But he's gone at right angles, and he's no longer thinking, you see, of what he was thinking about, and it's sort of not any longer in his vicinity. So he's happy about the whole thing. And of course, that's the way he's gotten by in the past. He's hit this bouncer. He's gone off and he didn't have to worry about it anymore. And you'll have a lot of people around who tell you that they have odd things happen to them.

Well, they go on worrying. They can worry just so long. And then they don't care anymore. And they actually are not particularly quoting the modifier, and so forth. They're just – they hit the bouncer. And they've observed about themselves that they just worried so long and then didn't care anymore.

And the modifier would be something like this: "Well, but if I have to worry about it, I will leave forever," you know. And they've hit the "I'll leave forever." Bang! They're out of it. It's quite interesting. It's like keeping track of a ping-pong ball, you know.

Well, there are down-bouncers. "But I will go back and finish it later," see. Now, there is a down-bouncer combined with an up-bouncer. Isn't that nice?

So, of course, when he hits the down-bouncer, he goes down the time track, goes earlier in time. But a split second later will hit the up-bouncer and be in apparent present time,
and you know? And he'll be giving you the modifier list. And you watch. I invite your attention on this.

When you're assessing for modifiers and when you're getting the list, watch the different manifestations of the pc. They get restive, they get twisty, or they'll be very relaxed, or all of a sudden they don't care about it. It seems all right to them suddenly. Everything seems fine. First time it seemed fine for a long time. For a long time. And you'll very often find it's in the next phrase. Exactly what the pc has done one or two phrases ago, you were checking off, you see, is found suddenly in the next phrase to be alive. You get the idea?

You'll hit a bouncer or something and then by your repeating the bouncer, he goes back into this thing, and he changes his manifestation. It's quite wild. And looking for the modifier knocks the fellow all over the time track. The thing is a stuck moment in time. Actually, the goal, the opposing terminal, the opposing goal, the modifier, and the goal-plus-modifier terminal, and the Prehav level are all suspended in one instant of time. See, they had an inception. They started somewhere. And he's nowhere else than there. But the phraseology in it gives him the illusion of elsewhere. And he responds with a total dramatization of the modifier with his down-bouncers, up-bouncers, call-backs.

Now, a call-back "but I will leave and come here, zoooooom, clink, see? Now, those are the, the command. Anything that you could tell a person to do as an order – to go up, to go down, to go out, to go in, to go earlier, to go later – any type of command that you could give somebody who's kind of in an hypnotic trance, you know, make him feel that he was earlier or later, are these bouncers.

Now, "out" actually classifies as a bouncer and a denyer. A denyer is the things which deny knowledge of. And that is "never know it," "never know about it," "can't come near it," – which is a combination of a denyer and a – see? All of these phraseologies which any phrase that you can think of in any language that would deny a person knowledge of something would be classified as a denyer.

All right. Now, the most important of these are the bouncers, whether up or down, the denyer, and the call-back. And that's the "come-heres" in it, you see, and so forth.

Now, classified with these call-backs are the stickers. And you, of course, have been finding stuck on the track ever since you've been auditing And they are stuck phrases in modifiers. "Stay right here and wait no matter how long it takes." That would not be unusual to find in a modifier. It parks the person on the track very effectively.

Now, the oddity is here that these semantics do exist in the modifier and do exist as appendages to the goal. That's an oddity, but they do. And you can count on finding them. The goal, of course, is in plain view: "To build ships." Oh, well, to build ships, naturally – the Queen has crowned him in the past for building ships. He's been complimented for building ships, and so forth. And everything has been going along fine about building ships except one thing: He just never seemed to succeed in building ships. Everything happened but the building of ships.

He wanted to build ships. He knew he wanted to build ships. But he somehow or another never really gets down to building ships. And he gets close to building ships, it's very
upsetting to him. Nobody has ever had a successful career on their goal terminal. They haven't had totally successful careers on that, ever since it became this combination.

There's always been something wrong with the career; and they knew it. It was an unhappy circumstance. They've done it somewhat. They have tried it somewhat. They have always lived with it. And somehow or another it has always worked into the woof and warp of their existence. But they've never succeeded. A person who has a goal to be an actress which assessed out as the only goal and which ran on Routine 3D, you would check back carefully and find that she had many, many, many times been an actress. That's for sure. She'd many times been an actress and gotten shot and stabbed and the theater burned down and producers committed suicide and she committed suicide and everybody in the company who's died, and so forth. And it's just like a Jonah. See?

She had a goal to be an actress. The others were just actresses, see? Actors and actresses, that was all right. But she had a goal to be an actress, you see? Well, why? Well, of course, there's the modifiers. And she's failed in the goal. And as she fails in the goal, she, of course, adds little threats to it to people who shouldn't keep her from failing in it, you see? That's a preventive. The modifier is a preventive. It makes people leery of stopping you along this line.

That's one of the things it does. It's barbed wire, which is hidden under the water. So "to build ships" – this is great, see. "To build ships, and if they don't go down the ways properly, to fix them so they sink at once; because they will be unlucky, and nobody will be able to live with them or know why." Now, we get this bird, and the Royal Navy gets him over here in a dockyard, see, and he's a shipwright. And it's all right as long as they go down the ways properly. This fellow has never worried. But you can see his fellow workers, you know. He says he worries about the luckiness of it, and he wants to know who's going to launch the ship, what admiral's wife, or what politician's wife is going to crack the champagne on the nose, and so on. The funny part of it is there never has been – if you check with him – there never has been a ship launched right. There's always something a little wrong. The champagne splattered too much, you see, or the ways stuck for a moment, or didn't actually bob properly as it went into the water, you see. And there's always something a little bit wrong with it, and eventually you'll find his fellow workmen a little bit superstitious about ever letting him go aboard a ship after it's launched because they sink.

It's quite untraceable aside from the fact that he always goes down and trips over the plug by accident, you see?

But that whole modifier will be effective. But, look, trying to find that modifier. Look if you've got "to sink." Now, a person hits this, accepts this as a literal connotation, of course, goes out of the moment.

And you say, "What was that?"

And he says, "What?"

"Well, what did you just say?"
"Well, I – I didn't – didn't say anything much. I – I don't know what – just a minute. I've got it." There is a comm lag of some kind or another. "It's something here, something here, something here, something here."

And he'll think around for it for a while, and he'll never get it again.

But if you say, "Sink, sink, sink, sink, sink, sink, sink, sink. Now, what was the line?"

"Oh, to sink them."

And he's right back in, and you've got a read back on the meter. Now, the dangers of finding a modifier consist of the fact that they go on and off the meter. Ha-ha. In other words, a person can bounce out of that instant in time and cease to read on the meter.

Now, of course, we've taken the weight, actually, off of the modifier by finding the opposing goal and the opposing terminal. And we've got those things found, so the weight is actually off, and the modifier is more visible. Actually, the case isn't under as much pressure as he was under because you've already located the enemy for him. And it's easier to find the modifier, but you will still very probably get into situations in finding the modifier where the whole list goes null.

Everything else is in, but the whole list is null. You can find nothing. It was reacting. It isn't reacting. It would be the most mysterious thing you ever saw if you don't know the data I'm giving you here. It'll just be a total mystery. And everybody will be able to run Routine 3D right down to step 4. And then every so many cases, they will strike one that is, "Well, I got as far as the modifier. We never did find the modifier. Why?"

Well, the case is very live, and the case dramatizes the modifier so heavily that when it says "leave," he leaves the incident, and it won't read. When it says "sink" he sinks below the incident, and of course it won't read. And when it says "never know about it and nobody will find out," of course, he never finds out.

In other words, he does everything idiot simple that it says in the modifier, which is quite remarkable. A modifier does not also care about spelling. Anything that could be translated through is quite marvelous. He rowed a boat. R-o-a-d a boat, see? R-o-d-e a boat. You very often find him putting to sea with boots and spurs on and think it was quite necessary. Quite in addition to r-o-w-e-d a boat. This is idiot. This is Simple Simon idiocy. And any language the pc gets into, the modifier shortly gets translated over so it's now expressed in the new language. Interesting, isn't it? Because in the first place, the modifier is a thought, and if you believe that all thoughts are semantic, why then, of course, nobody can think without talking.

Actually, this whole thing is conceptual. And you'll get a conceptual line, so at various times of his career, the concept is transferred over into the homonyms and synonyms of the language in which he happens to be living at the moment. And it has different – it has quite different homonymities. I can't think of one in Japanese particularly, but that would be a doll, you know.

Anybody that ever picks up a body in Japan must go practically mad because practically everything means everything. So any concept of leaving would get translated into any
Japanese word that sounds like the Japanese word "leaving." And you'd have homonymity. Well, a homonym, of course, is he rowed a boat. Which "rowed" are you talking about? You see? R-o-d-e, r-o-w-e-d and r-o-a-d. They're homonyms. It's actually, they're close homonyms – sonic homonyms. They're spelled differently which is why I'm trying to use it to get it across to you. But just rowed. Well, in Japanese "to eat rice," "to cross bridges," "to blow your nose," "to kill your wife," is probably all under the – under the same word weh. See, every weh, and that could mean any one of those. You'll see two Japanese in argument and they have to get out pencils and papers and write the katakana characters up in the corner. And they write the Chinese character. And they write the Chinese character down to show it to each other.

"Oh, you're talking about your shipyard. Ah, ha-ha-ha, I see, I thought you were talking about the theater."

What it is, is a very intellectual people unfortunately inherited a melee sort of dialect which wasn't much of a language. And then the Buddhist priests came in and taught them to read and write in Chinese. And so their written tongue is enormously expressive with something on the order of, I don't know, three hundred thousand words in it, all with different Chinese characters, but not pronounced the same as the Chinese pronounce them. But their spoken language is baby talk. And people look at you with awe when you say you can speak some Japanese.

I don't know why they'd look at you with awe about speaking Japanese. Oh, reading Japanese, well, they should look at you as a miracle of all miracles. In the first place, it'd ruin anybody's eyesight as the first and foremost thing, you see.

But that's homonymic. So the thetan would get – would have this thought concept going through – to build ships or sink them if they didn't go all right, if they didn't launch all right. And he'd have that concept through, but it'd transfer into all homonyms in Japanese.

That isn't an important point to you. It's just a little side comment. In other words, he'd think, you know, "building ships, launching ships, sinking ships, and going away," and so on. He'd think this, you see, but it wouldn't be verbalized.

Now, that nonverbalized thing, of course, adapts itself into the language, so he will verbalize it. And probably the first time it ever gets adapted into the language, in some cases in some parts of the modifier, is when you're auditing him. There'll be parts of the modifier which have been dramatized but had never been vocalized. Never have been vocalized, see? He's never vocalized any part of this. It's just remained hidden. Well, the last five hundred languages that he spoke, the modifier actually was never verbalized into those languages either. They were simply dramatized whole cloth.

Well, when you start finding them, you get all these oddities, and particularly those that had been verbalized by him. He very often will use parts of his modifier as a cliche, one of his favorite cliches. Or they will be some kind of a slang phrase in the society which happens to match up to the Englishization of the modifier. We'll see an example of that. Let's see, what's a good cliche?
Oh, "spin in," see? All right, "spin in." Well, there's something in his modifier that is going in circles for the thought concept could go in circles. And he hears this slang phrase "spin in" and it means go crazy. Well, his modifier actually has never meant go crazy to him before, but it'll backflash right straight back into the modifier, and now it means go crazy. You see?

In other words, he can reinterpret this modifier because it's actually just a thought concept which is held suspended in time, which gets translated into the various languages where the person is at work.

Now, you, trying to find these things, are plowing straight at something which he has for eons – oh, well, worse than that – that's a short period of time compared to how long the pc's had this, you know. And he just – there he is. And he just literally – takes it literally, dramatizes it. Anything with the thought concept, there – he'll do it. He'll do it mentally. "Leave?" He leaves. He gets the idea of having left, you see? So the phrase "leaves" occurs in the modifier. He instantly gets the idea of having left. The thought concept "come back" occurs in the modifier. Heh.

You'll see him come back and never know it. "Nothing there. I don't know it – anything about that. I don't know why you keep asking. Is the meter reading? Well, it couldn't be reading. Couldn't be reading, no. There's nothing there." And you in desperation keep repeating "There's nothing there. There's nothing there." It isn't part of the modifier. It doesn't make the needle nick either.

And then I want to show you the next trick. He's given you a long ruddy list, and you've been very, very careful to write down everything he said. A modifier list is, if anything, trickier than a goals list because you must write down everything the pc says very carefully, and you must not lose it.

Don't mislay the scrap of paper, you know. How would he take revenge on people? How would he modify this goal if it failed, and that sort of thing. And, "Well, and when they're launched, yeah. And when they're launched, good. Particularly when they're launched. That's right. Yes, it's a – it's actually 'to build ships and launch them.' It's 'to build ships and launch them.' Yes. Well, that's how I'd modify. I would launch them."

Don't argue with him. Put it down. It's the modifier. You write down what he said it was the first time, see? Because in this particular case he said, "To build ships when they were launched." Get it right, see. But it launched him. Get the idea? So he can't quite come back into the vicinity of the thing again because he's launched. Get the idea?

So he'll give you an – he'll give you an interpretation. So, he gives you the modifier usually right the first time. And then he modifies it. He modifies the modifier.

Now, you don't want the modification of the modifier. You want the modifier. So you write down what he gave you the first time, and don't go arguing with him and don't ask him to clarify it. When you're writing a list, don't ask him to clarify a thing. You just write down whatever he says.

Well, just how else would you – that's a good rule for all assessing and making up lists; just write down what the pc tells you. We just had an example of a goal having been
held up in its discovery for something on the order of about seven months. Not here. A way away from here. And the original goals list was kept in scrap notes rephrased by the auditor. Not one of them was phrased the way the pc gave it. And they were all changed and altered. And they were kept on little scraps, and the piece of paper evidently is written diagonally across corners, you know, and so on. It's just a bunch of junk. And written across the sides, and so forth. And just notes, you know. One word of the goal, you know. Well, he wanted to fly airplanes so whoever it was writing the list just wrote down over here in the corner "airplanes." That was great, you know.

And you know, nobody was ever able to assess that list. And just about ten days ago somebody assessed the list by first getting the pc to give them the goal for each one of these scraps of notes and making a proper goals list of everything the pc said.

And it was such a relief to the pc to get all his goals written down the way he said them, and not rephrased by the auditor, that it practically cleared up the ARC break, and it was only something on the order of – I don't remember exactly – I think it was five hours to find the goal.

And the goal was that close to hand. It was that easy just as long as one did a neat job of listing exactly what the pc gave you. Well, this becomes very crucial in the modifier. You're not going to get anywhere near as many modifiers as you are goals. You might not get thirty modifiers. You might not get fifteen modifiers.

But if you wrote each one down – this is what I wouldn't be able to find out if you did so that's why I'm covering this thing laboriously. The pc said, "Well, when launched – ummm – um – um – um – I'd launch them." You write down "when launched." And write down "I'd launch them." See, write them both down. Write whatever the pc gave you.

Now, supposing this thing is all full of bouncers and call ... I'd be very suspicious of a modifier list that didn't have any of these trick phrases in it.

Very suspicious, because the goal would never hung up – be hung up without a modifier with tricks in it. Nothing is hanging up the goal.

Just as somebody who's used to construction work, you ask him to believe that the roof is standing there with no walls; when you show me a modifier list that hasn't any bouncers, call-backs, denyers or anything of the sort in it, I sort of think of myself as being asked to look at a building where the roof is standing in the air with no walls. I don't think it can exist. I wouldn't bother to walk around the corner and look at it. Something's wrong here. That would be the first – a major thing that could happen.

You'd find out you wouldn't get the person's modifier either, probably, on such a list. There'd be something tricky about the wording of it. It'd be something a little, little offbeat and a little weird about the whole thing. Something like the order "and never be there" and "not know it" and "not find out" and "not have it" and "leave" and "come back" and "go a long time later" and – it's kind of a mess of words that are – that keeps the pc out of the vicinity of the goal.

You see, there has to be tricks like this in a goal line. Otherwise, it would have as-ised years and years and years and ages and ages and ages ago. There has to be something that is
misdirectional. You call these phrases directional phrases or misdirectional phrases. And there's something – there's something about it. And there's usually several combinations of them.

Now, we go down this list that we have written and the pc at never any time says anything that's the least bit weird, you know? It's "to build ships and paint them," "to build ships and make people happy," "to build ships and be happy about it," "to build ships and feel good about it," "to build ships ..." Our luck is out today. That's about what we would think about that time. Our luck is out.

About that time, we would repeat our question more loudly and a little more forcefully. "What would you do to get revenge on people if they didn't let you build ships. Would you do anything like that?"

"Oh, I'd leave them, of course. Heh-heh-heh-heh-heh-heh-heh-heh-heh-heh." Yeah, well, clever that time, weren't we? Crafty, huh? You just back it up to him, you know, and get some more of those, get some more of those. Get all the things a fellow might do and would do. And then go ahead and assess this list, just as such.

And if all of a sudden you wind yourself up with nothing and you assess the list again – you can't wind up with nothing – and you know, you're just winding up with everything null, and it's all out; don't assume that you haven't got the modifier. You've got the modifier, but the pc is dramatizing it to such a confounded degree that he's not there.

You know what you do then? You can take a red pencil and you can go around each type of Dianetic phrase, everything down the whole line, and draw a circle around every, "and come back," "leave them," "and look at it later," "and never inspect," all such types of phrases, all such types of phrases. And now you do an entirely specialized type of assessment on this. You get the pc on the meter, you got that meter sitting there, and you're just going to do this.

Now, I might as well give you this trickery. Now, you don't have to be an expert on it because I've already fixed it up the other way, though in the majority of cases you just get the modifier, bing! But you should know all this about modifiers, you see, because it's a piece of technology, long established. What I'm giving you here is the basis of what I'm giving you in 1950.

Anyway, we take the first one, and that was a denyer, see. "And never find out if I had failed." See, that's the first. "And never find out." We don't care about the "I have failed." That will turn up later. But we do care about this "never find out." What a beautiful denyer, you see? So we got the pc on the cans, we got her right there, and we just chant – start chanting: "And never find out. And never find out. And never find out. And never find out. And never find out. And never find out." Read! Ha-ha-ha-ha-ha-ha-ha-ha-ha-ha-ha. We've got a read. "And never find" – that's gone, too – "And never find out. And never find out. And never find out." Now we got a read, all right. Now well mark that particular phrase with a little symbol to show that we got it to read.

The next one is "leave it out." "Leave it out. Leave it out. Leave it out. Leave it out. Leave it out. Leave it out. Leave it out. Leave it out. Leave it out. Leave it out. Leave it out. Leave it out. Leave it out." Ah, skip it. Skip it. That one's null, see?

The next one we had found – you see, these phrases are masked in the things they had said. And we're just – we're not now assessing the whole thing they said. We're only – we picked out all the Dianetic bouncers and call-backs, and, you know, all that. And we've just got circles around those exact little phrases. You know, it may have been – well, the phrase "and then I would have to get out for sure." We're only interested in the action phrase. The action phrase. So it's "get out." Ha-ha-ha-ha-ha. "Get out." We're not interested in "then I would have to." And we just sit there and we say, "Get out. Get out. Get out. Get out. Get out. Get out. Get out. Get out. Get out. Get out. Get out. Get out. Get out. Get out. Get out. Get out.

And the pc'll all of a sudden say, "Yes, get out. Yeah. Get out. Get out. All right. Get out. Good."

Boy, that really hit 'em. "Get out." See? You've worn it out to a little bit. To a degree. And you've got him back in it, see. You grooved there, see. Whew!

So we mark that one over here as that grooved him in, and we put a fact that that is nice and live. And we go down the list and complete it similarly. What are we doing? We're knocking this modifier's edges off of it so that he won't dramatize it, so that he can read it. In other words, he can tell us what it is.

Now having done all that, we have deintensified all of these command phrases. Some of them were live. Some of them weren't live. But we remember, we had several command phrases here that we did get good live ones on like "get out." See, that was a nice one. And we had a couple of others there – "leave." So we know that "get out" and "leave" and one or two or three more type of command phrases occur in this thing. And we just write those things down consecutively in a line. They're totally senseless.

Now, we'll say, "Well, how would 'leave' fit into this modifier? What would it be about 'leave'?"

And we're getting a read now, you see, on "leave."

"What will – what about 'leave'?"

"Oh, I'd leave them. Ha."

All right. Now, let's take this other one: "Get out."
All right. Now, how would "get out" apply in this – to this goal? Now, where would that fit in? The pc will smoke around about it for awhile. And he'd say, "Well, it'd just be 'or I'd have to get out.' 'Leave them or I'd have to get out'," which doesn't make good sense, but you write it down.

"Well, I would leave them and climb to the top, or they'd have to get out. I'd leave them and climb to the top."

No, it isn't quite right.

All right. You've got another action phrase or two, and you fit them in, and you eventually fit yourself together some kind of a wild modifier whereby he would "leave them cold, never let them find out what he was doing, climb to the top as somebody else, and come back and kick them all out." [laughter]

You get the bzzzzz-zzzzz-zzzzz? Look at the command phrases in the thing, you see? It just shoots him all over the top. Shoots him all over the bottom of the thing.

He's at – out at right angles, left, right and center, see? Get the idea? Well, he literally obeys, in his position in time and space, he literally obeys these command phrases. And he touches them, and then he gets away from them, and it's the auditor's job after he's touched them and gotten away from them, not to just let him sit over there in left field, you know.

"Well, I don't think there's any more to that modifier. I don't quite know why you're doing this particular part of the assessment. I – no – I – there's nothing more to the modifier. There's nothing more there."

And you say, "I wonder if it's 'nothing more there'." Well, you're just kind of Q-and-Aing. He's hit an earlier bounce.

"Nothing – nothing more there. There isn't anything to this modifier."

All right, you start looking desperately, and you say, "What was the last thing we were going over?" And you look down here and it was "get into left field and stay there until I make a proper catch." Baseball goal.

There he is. He went over in left field, and he's just waiting there to make a proper catch. And you're just bothering him. You get the idea? You watch these sudden behaviors. You won't get behaviors like this on any other portion of a 3D. The modifier – assessing the modifier at number 4 is that peculiar.

Now, fortunately you don't have to work too hard for these modifiers. No, why? Well, you get the opposition terminal off the setup, and the person doesn't have to make himself so
right, see? And he has less of a sense of failure here, and so forth. Now you get the opposition
goal off.

"Ha-ha," he eventually says. "So that's what they've been trying to do to me. He-he-he-he-he. Well, I – ho! What do you know? Ho-ho." Azzzzzz.

He also doesn't feel so revengeful because he knows who he's shooting at.

Now you ask him for the modifier. He'll give you a list of modifiers, and you can assess them. But when you start to run into any trouble on the modifier, get your rudiments in very carefully. Look over the list you've already gotten on the modifier. Add anything to that list. Ask him again. Try to assess the thing down. You can't get that thing assessed down, it's doing something like suddenly all goes null. Everything goes null. You're halfway down the list, and everything goes null. That doesn't make sense, does it? The rudiments aren't out. They're in. And yet everything went null.

Ah-ha. You look up there, there's "leave." "Leave." Ha, you hit "leave" and he left. Sometimes in repeating these things to the preclear, you know, like "get out, get out, get out," something like that. He just sort of feels like he's being blown, you know, out of the, out of this whole corner of the universe. It's that powerful, and you start repeating it, and of course you discharge it and bring it down, and these phrases may be quite reactive. And you'll find a pc going this way, maybe, you know. Every time you go through the modifier close up, the pc goes this way, you know. Or every time you get into the goals area, the pc goes this way.

Something like that can happen and be in the modifier. You could actually give an incomplete modifier and it'd still be in there. It'd turn up eventually, but I'd try to get a modifier quite complete. I'd shake a modifier down very well on a meter. And then, if you're just round the bend and you don't quite know what to do about the modifier, and the pc is acting very peculiarly about the whole thing, just take your red pencil, schlooop, and go down any list you have made on the modifier and you just circle every command phrase on this. And you just start down with just those command phrases – deniers, bouncers, call-backs, fixers – whatever it is. Just circle each one and then just start in at the top and start repeating the command phrase only until you get a read. And it doesn't matter if that read is constant or sporadic.

If you get a sporadic read, you take that command phrase and you write it down here on another column. That acted.

All right, now, let's get the next command phrase. Let's see if that has anything to do with it, and we repeat it, repeat it, repeat it, repeat it. It knocks.

All right. We write that command phrase down. That's in the modifier someplace.

Now, the next one. Repeat it and repeat it, and it's nothing. It's not there, so we skip that one. And we get that whole list of command phrases. And don't kick yourself too much in the head if you miss a command phrase, because you sometimes will look at the list – and it's not your bank after all – and you don't interpret one of these phrases as being a command phrase.
For instance, "undermanned." Well, "undermanned," that's not a command phrase so you don't repeat it. But the pc in some weird way, because he's a man, he goes under it. See? So don't kick yourself too hard if you've missed some of these as command phrases because if you get the bulk, the laws of average are all on your side. If you get the bulk of the bouncers and deniers, you can fish the rest of them up. See, now you're working on a winning horse here. You'll eventually get a phrase and it stays in.

Now you take one of these others that's been active, and you get a phrase and get the pc to tell you how that fits around, and that stays in. And you're kind of building blocks here with bricks, you know. And you're building a little wall, fixing it all up. And it's this phrase and it's that phrase and then you shift the things all around and how would they be? And he changes his mind a half a dozen times. And all of a sudden, bang! You've got it.

But I don't know that a modifier contains only one phrase, you see. There may not be a modifier in the world that contains only one phrase. Just – there may not be. I'm not saying that all *modifiers* contain more than one phrase, but I'm just saying on the other side that there may not be one that contains only one phrase.

Because look, that thing has got to have kept the goal fixed up and out of sight. And it's got to have stayed out of sight itself. And it's got to have buried the problem. It's the action that the pc takes which buries the problem, buries the opponent, which gets everything out of view. It keeps this thing from ever coming up but sweetness and light, a nice goal "to build ships." Now isn't that nice? And as a little boy he can remember this. He can remember this. Yes, he's had a goal in this lifetime to build ships. Yes, he can remember this as a little boy. Yes, build ships. And you start getting the modifier, and he suddenly starts remembering other things about building ships when he was a little boy. Because every time any other little boy came around the ship sailing pool that had a ship, he was the first one to take rocks and sink the thing, you see?

And every time he did so that he can now check up on, he came down with a cold or got measles or something of this sort, you know. It's quite a – quite a fantastically random area. At first, isn't this sweet, you know, he wants to build ships. Isn't that nice? Isn't that nice? And you eventually find out he wants to build ships and send them out and have them sink every vessel on the high seas, every place, and drown them all. And never have anybody find out about it. [laughter, laughs] See, that's how that modifier eventually trails out.

It's quite amusing. But it presents this peculiar – the peculiar complexities of assessment which I have just given you. I don't think right this moment you're having any trouble finding a modifier particularly. You shouldn't be. The modifier ought to be well deintensified.

But, always be prepared. And I would feel remiss if I didn't give you the answers if you did run into trouble finding a modifier. That's how you go about it. Make sure that you list everything the pc says. Make sure of that. Make very sure that after you've gotten the whole list down and you've got it assessed, that your rudiments are in very neatly. And then that as you go down the list, its peculiarities of going out or in don't upset you. But when you've gotten down to the end of the list and you've gone through it several times, if you don't find anything, know what's happened on this list only, know what's happened. It's went. The pc has departed from the list. It isn't a question of rudiments out. It's solely and completely –
of course, the more the rudiments are in, the more easy it is to find a modifier or anything else. But it isn't the pc's rudiments are out, it's that you've thrown one of these command phrases into high relief. And of course, he's done it.

And the phrase is in there "or do a bunk." He wants to go to sleep. You never suspect it, you see. But literally, of course, "doing a bunk" would be going to bed or leaving. And he doesn't quite know what to do. Does he go to bed or go to sleep or does he leave? And that's enough of a problem to send anybody to sleep anyhow. So every time you do a modifier list, you – the guy goes to sleep and you keep looking for this. Is this someplace in the list, or "sleep my time out" or anything like that, you know?

There you are suggesting things. You shouldn't be doing that either. And eventually you'll find out as you start to take these command phrases, this – you start running into trouble on this. You start running into real trouble when it doesn't go according to – to the book and it seems to be getting pretty grim. It wasn't too bad to find the other three items before this, but this one's gotten grim. Just know what you're looking at. You're looking at the command phrase obeyed. That's all. And so you circle that. Each command phrase you can find in the whole list that he's given you, and just take them one by one and repeat it. "Leave. Leave. Leave. Leave. Leave. Leave. Leave." He doesn't hear you saying anything. He doesn't care what you're doing.

He's going to react to this, that's for sure. It doesn't matter, see? "Do you mind now if it is all right with me, if you and me sitting here in this auditing room, which I trust is all right with you, if you and me sitting here would find me looking at the meter instead of you and repeating only a small portion of this particular sentence in order to discharge it slightly so that we can get on with it." I'd delete all that from my auditing.

"All right. We're looking for this – this phrase that's here. And I'm trying to find this modifier. And I'm going to go over some of these – some of these words with you – Leave! Leave! Leave! Leave! Leave! Leave! Leave!" [laughter, laughs] Bang! And boy, don't think that these won't have an effect on the pc sometimes because you're going over stuff that's raw meat and rivers of blood. And you start saying 'leave, leave, leave' and the pc starts going ... [laughter] You repeat it a few more times and he sits forward in the chair again. Mark that down as live. [laughter]

But by compiling a sublist of your own of the command phrases, you've actually then got – some of these are going to stay there, some are going to go null, some are going to do this, and some are going to do that.

You can actually take the command phrases and make a separate assessment, and now ask the pc what we can make out of the remainder. And he'll give you the rest of the modifier. Because it's just command phrases, it's only command phrases alone in the bank that prevent you from finding the modifier. It's the phrases in it that prevent you from finding it. And that's all there is in it.

And you take the kick out of those things; you can take the kick out of those things. You must realize that an auditor can handle the bank better than the pc, always. So you take these things, and out they go, one after the other, and you take the charge off of them. All of a sudden the pc says, "Well, of course, didn't I tell you? It's to build ships and launch them,
and, if anything goes wrong to sink them.' Didn't I tell you those? Well, they're right there on the list. Yes, I knew it myself."

He gets very often, in all assessment – this will – this will sooner or later – you'll come up against a pc who will do this to you. You have just got through wearing out several ballpoints and reams of paper, the batteries of the E-Meter have been bled white. And you have finally gotten the goal "to tat." [laughter] And the pc sits back and is very pleased about the whole thing and tells you she knew that all the time. [laughter] Because it's a funny thing about the mind, but they actually do get a sensation of having known it all the time.

Well, of course, after you've known – after you've had something preying on your wits for a hundred trillion years, I imagine you'd get the feeling that you knew it, even if you didn't. But they very often – it's one of the funny little phenomena of the pc that they sometimes come up with something that you've just worked like a dog over. And they tell you, well, they knew that. Sort of like "Well, why didn't you ask me. I could have told you that." [laughter] And they know doggone well they couldn't have. And it's very funny sometimes, a day or two after an assessment, to have the pc acting like, well, he just dug it up, and he knew it all the time, and wasn't anything unusual about it, you know. He can breathe now. He was never able to breathe before. He always went ahhhh-ahhh-ahhh-ahhh.

And it's very funny. As you – unless you complete a 3D on such a thing and deintensify the thing, he does go phases of a false knowingness of some kind or another, you know. He knew all about it. And you almost feel like saying, "Listen, damn it, if you knew all about it, why have you had me working here for five days?"

Big stack of broken ballpoints. Wadded paper all over the floor. Folders grown to a foot and a half thick. "Oh, I knew it all the time. Oh, yes, I always could have told you that – that is basically. I – I could – could have told you long ago. Why didn't you ask me? It was always 'to tat,' of course. Always had that goal. Knew that. What's all the fuss about?"

It reminds you of somebody, you know, who's put a time bomb in the bottom of the building and knocked the whole thing over, and the street is full of rubble and everything else, and he's standing there... [laughter] He's unimpressed by the whole thing. [laughs] That is very funny.

But, of course, the whole goal modifier versus the opposing goal – of course, this whole thing is in one package. And it all contains knowingness. This is what the pc, by the way, in the final analysis, will be found to know most about. Because he's been accumulating knowingness of various kinds on this subject since wooo!

You can do this kind of a trick to a pc. You can take – after you've got a 3D done and before you run anything, you can ask him – you can say, "Well, now, what attributes of a cricket player have you ever used in this lifetime?" He's not been – he's not played cricket this whole lifetime. Every time he goes near a cricket field, he goes uuuuuu, and falls in. Of course, he has a bat at home, and he always has wanted to play cricket. He knows he should, you know, but he just never does, and so on. And "what attributes of a cricket player," and he'll suddenly realize that his clothes are all covertly designed in some fashion or another to be cricket clothes, you know.
And when he laid out a garden, he always lays out a playing field. He never has laid out a garden yet. And all of his various equipment, for instance, if he got a shovel in the garden, the only kind of shovel that really pleases him is something that looks like a cricket bat. You know, it's a little off the ball, you see that? And then he lives exactly the same kind of training regimen that you'd have to live in order to play cricket, you see. And he's married the right kind of a woman to be the wife of a cricket player, you see.

And he's mad at her all the time because she doesn't tell him all of the things that a cricket player's wife should do.

But, he's studied the various things that a cricket player should know. He knows all about lawns. He's often wondered why in the name of common sense he can never pass a seed store without going in and getting a new folder on lawns, you know. Because every lawn that he ever plants, you know, just goes up in smoke. It's a complete mess.

And you just ask him that, and he'll start sorting these things out. And actually a lot of this false knowingness will discharge. You know, he says, "Oooo, wait, there is something to know." It's a way of differentiating, you see. It sounds as if you're checking the thing up or something like that and being professional and so on.

And what you're actually doing is getting him to differentiate a little bit. Not a necessary step. That is just – that's just gilding the lily. It's quite unusual. You'll find out the majority of skills will be on the first terminal. First goals-plus-modifier terminal of the pc, the majority of skills which he is now expert in are that – are the skills of that.

Of course, he is here living the life of a plumber and so forth. And the skills he has mastered are those of the deep sea fisherman. It certainly raises hell with plumbing.

Actually, all he knows of plumbing – actually, all he knows of plumbing is what a deep sea fisherman would have to know in an emergency. And he finds it very easy to carry on with plumbing as long as it goes just to that point. Only somehow or another he never gets along in his trade.

He'll actually push his education, and so forth, to that exact zenith necessary to carry out the goals terminal. Just that. He won't push his education much beyond that. There's no incentive.

Of course, there aren't any of these anymore, it's the chief taster to the king. Doesn't matter what he's doing in this lifetime, his skills will be that, and his study and his zenith, and so forth, will be that of a chief taster to the king.

He'll know all about foods and he'll know all about wines, but to a somewhat limited degree. You'll give him a wine list, tell him to memorize the wine list. He'll go on down the wine list, and he'll tell you there are certain things about these wines. For instance, "Port, very dark. It's not a very good wine. Very dark. It's a heavy wine. It's very heavy. It masks impurities. Poor wine. Now, these light wines, they're much better. You have to be sure they're absolutely clear."

And actually you won't know what this guy's talking about until all of a sudden you know what his goals terminal is, and he knows what it is. He'll know why this is his limit of
knowledge of wine. He never seems to be able to educate himself beyond whether wine could be poisoned or not, see? So therefore it's body, color and transparency. See, it's very funny. It's never occurred to him that wine has taste beyond a heavy taste that would mask a poison. So the heavy tasting wines "are very poor, very poor. You should never have a heavy tasting wine. A wine should be very, very simple. It should be very simple on the tongue, you see. Very simple. Like Chablis. Now, there's a perfect wine. You know, drink water, drink Chablis. Same difference, you know." [laughter]

It's very, very amusing, and yet that will be his knowledge of it. He has just got himself stacked in exactly this educational bracket, you see? And then he screwed the lid on from that point on, and that's it. And every lifetime he goes through the same cycle.

But this brings up another point. This brings up another point: is a goals terminal when found is only the total answer to the current case from a mental aspect basis. It will take care of so much in a lifetime that it would be very easy for you to make a total error on the subject and consider that one goals run of 3D and one level knocked out should resolve the whole case. Now, I want to disabuse you of that particular fallacy. That is not going to do it. That is going to go a long ways, and there'll be so many of these things explained, and the person's ceiling is so obviously the exact ceiling of that goals terminal.

Now, all of this looks so good, and there are so many things that you could add up into all this, that it looks as though the case should resolve when you get down to the end of the first run, and the case will not be resolved. The case will still have chronic somatics. The case will still have circuits. And the case will still have a whole new goal valence chain to get out of the road.

Remember I talked to you about onions. Well, you're just getting off the first series. You're getting off the most obvious, most present, most available series. Now, there's another series back of that, and there's another series back of that, and there's another series back of that. I couldn't give you an adventure – a guess, is all I could adventure on that exact subject, that it would be something on the order of, I don't know, twelve, fifteen, twenty. It's a finite number. It's a small number like that. Now, they resolve the case. They resolve the case – fifteen, twenty – but not that first one.

Now, you see, you could ask him and he'd rationalize everything. And everything in his life would settle out, and he could be perfectly content and happy with this as the total explanation of it all, don't you see? He's perfectly cheerful with this, only for some reason or other he still has headaches. And he still has this and he still has that and he still has something else. He's got some negative qualities sitting around here someplace that he still doesn't like.

Now, here's the danger of you supposing that one run, one goal, one number 1, number 2, number 3, number 4, number 5, and a completed 6, would totally solve everything there was to be solved about the case. Now, if you believe this, then this is the error you would make. You would let the pc try to solve the case through one valence. True enough, this is the valence, this is the only one available. True enough, that explains all of the current situation. But how did he get in such lousy shape that he could get this valence?
Oh, well, that's all – that's all to be continued in tomorrow's episode of "The Perils of Pauline." [laughter] That's another story. But your – now, I'm not remarking on that just in play, because this is it.

A pc will try to make an "all" out of a valence. And that's a very, very important thing for you to notice. A pc will try to make an "all" out of the valence. Now, it's an onion with many layers, and you're taking them off a billion layers at a crack. But – and they're all very fundamental, and they're all very marvelous, and they all have various changes on cases, but remember, there's another layer. There's another series of layers. That's the one you've got to get off.

And you expect all of the pressure that goes against the left temple. Ho! And every time he gets this idea, he gets this pressure against the left temple, you see? It's pressure. And he thinks of the goal, and he thinks of the terminal, and he gets the pressure against the left terminal. Oh, man, he's convinced, you see? And he finishes up running the goal, and you know, the pressure isn't gone? It's only partially abated, and it's not gone, and so on. Well, he wants to run the goal some more, you see, because he only gets the pressure when he turns on the goal and terminal and so on, and it doesn't turn on so much now, so he's not quite sure what it is. But there's supposed to have been a pressure across, and it's not quite gone, he can still feel the thing.

Well, while he's running – this is the only thing that comes to you with any importance – while he is running he will use the valence as a circuit to make it an "end all." And this is one of the little covert points of long goals runs. The reason why they run forever is because the pc is trying to make that one valence do for the whole case. Got the idea?

He actually is going on a via now. He'll answer the auditing question, and then he thinks of something between sessions, you know. "Well, I've often had this little pain, you see, underneath my chin. And I wonder what – what a cricket player – I wonder if a cricket player – I – yeah, I wonder if there isn't some kind – I wonder if there isn't some kind of an incident here where a cricket player might have been, you know, hit by a or fell down on a wicket, or fell on his face on a wicket or fell on his chin."

Next session, he's sitting there waiting for the cricket player to fall down on the wicket. "Fall on the wicket. No, I don't see any pictures of wickets. See, well, maybe next session one will turn up where the cricket player falls down on the wicket and gets this somatic underneath his chin. Well, I'll wait for the next session and see how that fits in."

Get the idea? He's trying to use that terminal for everything. Hell, it has nothing to do with a cricket player. That was when he was a janitor in a castle in lower Slobovia and had made a habit of killing women with knitting needles. And one day one slipped, and he's had this somatic ever since. And it's true enough. It's true enough that for that particular somatic every time he has seen a slender piece of metal anywhere, why, it's upset him. But it had nothing to do with being a cricket player. Follow that?

So in running rudiments on 3D, as the case progresses, you must be more and more alert to whether or not the case is still being audited by you because there could come a time in 3D when the case is no longer audited by you. And that'll be the time you've gone through the 159th level, and there aren't that many levels in the Prehav Scale unless you go over the
Secondary Scale. And you've gone to the 159th level of a Secondary Scale and you want to know what's wrong.

Well, what's wrong is the pc has been on self-audit and using this thing as a circuit and passing everything through that he was told to do – is being passed through this terminal – long since it has ceased to be an aberrative terminal.

In other words, clearing can be prolonged by the pc turning the valence into a circuit and trying to make something out of the session.

The pc continues now to try to make something out of every session that isn't there. He's trying to make everything that has ever happened to him in two hundred trillion years apply solely and exclusively to just this one terminal.

Now, what you want to do is keep the pc under control, keep the rudiments in every session, and find out if there's anything peculiar going on or if the pc is doing anything peculiar between sessions. And get very clever about this and ask, "Well, are you looking at – you have any pictures between sessions, huh? Since I last audited you do you have any pictures? Do you ever see any different pictures?"

Ah, that's a cunning question, isn't it. It's the same as saying, "Are you auditing yourself since yesterday?" Only it's not accusative, is it? Ha-ha. "But did you see any pictures? Do you have any pictures of anything since I audited you yesterday? Oh, yeah. Oh, you went to sleep last night. Oh good – good. Now, what were they pictures of? What were you doing with them? Oh, you're looking for the somatic there in your chin, and so forth. All right. Now let's see."

It's going to be a rudiment out, isn't there, because you're no longer the auditor.

So, it is just auditor out. That is all. Because they're getting anxious, they're pressing, they're getting anxious, and the slower you are, the less auditing you give, the more anxious the pc is going to get and the more likely they are to start this circuitry.

And they start this circuitry. The circuitry keeps going on and on and on, and they try to solve the whole case with a cricket player. God! You've got cricket player, and the cricket player – well, before you got through, the only ruler the world has ever had has been a cricket player, you know.

They've always had ideas on government so they sit around wondering, "How would a cricket player have ideas on government?" you see? "Well, there'd be a cricket player opinion, you see, of that. What would be a cricket player's opinion of... And how would a cricket player rule? I suppose you could become a very famous cricket player. And then somebody..." You know, and somebody comes down, "Oh, yeah, I see how it is. And you pass it on..." And he's got a whole mock-up. It has nothing to do with the case.

Before he decided that he had better not be trusted with anything more violent than a cricket bat, this fellow was Chancellor of the Exchequer. There is no remote connection with the government necessary to resolve the case. Your next terminal coming up after a cricket player is Chancellor of the Exchequer, see? That's one of the covert lives he leads. And its
goal is "to handle other people's money," and the modifier is "and leave them flat broke and then..." [laughter] So of course, he had to become Chancellor of the Exchequer, don't you see.

The only – the only way a crooked banker cannot be caught, you see, is be part of the government or something. That or nobody can – it's – there isn't anybody's money, you see. It's the government's money. So that's very easy to handle, very snide of me. But I'm showing you the – I'm showing you the put-together with this, see? One terminal doesn't resolve a case. It's up to you to press on, press on, press on.

Now, you won't get up to running any Prehav levels in the next couple of days, probably. But if you were to do so, if you were to do so, put a standard five-way bracket together. Just put a standard five-way bracket together. And I can't give you any possible variation from this. This is your safest bet and the tested bet of what will happen.

And just put your standard why, how, what bracket together that makes sense, and then run it to a stuck tone arm. And as soon as the tone arm sticks, get off of it. Well, how – what do I mean "as soon as"? Well, after you are sure the tone arm isn't going anywhere else and before the pc goes crazy, you see – that's "as soon as." That is – exactly defines "as soon as," is when you're sure the tone arm is not going anywhere else, and before the pc goes crazy. That actually gives you a margin of about two days of auditing.

I don't think the pc goes entirely berserk until after the second day of being run on a second – on a tone arm. Of course, nobody can find the next Prehav level, and it's a gone dog now. Now, I think you'll find there's a possibility, there's just a possibility that levels on this may only run for a half an hour or so before the next level is gone. It has to be found. So, watch it. Watch it.

We've just condensed a hundred hours of run down to an hour, see. So, watch it carefully, and don't sit around there. Oh, you can run it for twenty minutes to see if the thing is going to move anymore. It isn't going to kill anybody.

He's sort of getting – the pressures started getting tough, tight on his chest. He's starting to talk something like this gurrrrr-grrrrr-grrrrr-grrrrr.

Well, it's time for you to get very alert and say, "You know, I wonder if – how long has that tone arm been stuck? I looked at it about a half an hour ago, and it wasn't stuck then, or was it? Let's see. It's sitting at 4 now. And it was sitting at 4 when we came into session. I've been auditing two-and-a-half hours. I wonder if it moved, well, let me see. I look over this auditor's report here. No, it's 4, 4, 4, 4, 4, 4, 4. Well, I wonder what's wrong with the pc then. I mean he's complaining about his chest being crushed in."

Well, the reason his chest is being crushed in is the goal-plus-modifier versus the opposition goal are one great big mass. And the more you audit beyond what is necessary to relieve it, the more squash you're going to get. And so you get rising tone arm, rising tone arm, rising tone arm. And some of the tone arm dives, of course. But you'll get a different read on the tone arm. It would go denser, denser, denser, denser, denser, denser, denser. And now you'll notice that the tone arm has stopped moving, but the needle is still twitching. The tone arm is moving, the needle stillwitches. That's a wonderful time to get off of it. You're sure now that that tone arm isn't going to go any further, and the needle is just getting tighter and
everything is kind of sticking up – ha-ha-ha, let's get out of there and let's get another level assessed before we kill the pc.

That is the safest way to do it, but it takes judgment. And I actually cannot in all fairness to auditing, not to you, give you a minute rule for how long you audit it because it's going to vary. And some of these things are going to go fast, they're going to go flat, fast. I've seen one of these things come down the tone arm now. I've seen one come down on something on the order of two hours and a half from the top to the bottom of the scale and vanished. Not much of a run, was it? The right terminal sure bit the dust in a hurry.

So your volume of time is spent on assessment. But you go about it. Just form up a five-way bracket; run it, run it to a stuck arm. You will see the characteristics of the arm. You'll see it, and then reassess. The thing will go up, and then it'll start – or go down, and then suddenly get "stick, stick, stick, stick, stick." Of course, as long as that tone arm is moving around, you go on running it. But it goes up and sticks, goooohm, thud. Mm-mm.

Now if you run a session over that, the pc becomes unassessable. You can't do anything to assess the pc. So you've got to stop it before you wreck the next assessment. That is the whole judgment on it. There is no other – no other judgment can be given you. And you'll see it, you'll see it sooner or later. By the way, the level you're running will still knock, but that's because the terminal knocks. You can still see the level knock, and then you reassess and it isn't there anymore. So don't bother about the level still reading on the needle when the tone arm is stuck after having run that level, because you'll continue to see it read.

Of course, the level is gone. You're just reading pure terminal. You're not reading the level anymore.

Okay. Well, there it is. I'm very satisfied with the way you've been going. I hope the few little remarks I've been making here will make it easier for you to do an assessment and carry on – feel more relaxed about it. And you, I think, should be able to get down here to an optimum assessment. I think the optimum assessment of a complete goals assessment and a complete run through 3D at the first time on a very expert auditor, a very, very, very good auditor who is a very fine expert who knows all there is to know about it on a goal that has never been found on a pc that's never had much auditing, something should be in the neighborhood of about twenty hours. So speed up.

I've only multiplied the factor about four. Suzie – Suzie can do one in 5.5 hours, so you should be able to do it in twenty. Okay? All right. So, tell me that you will do it in under a hundred, will you? [laughter]

I mean the pc Clear, of course.

Thank you.
Thank you.

Okay. Here we are with the 21st of December almost wrapped up. Isn't that right?

You realize you should have been home last week. Oh, no, no. Fortunately, I just remembered. You're saved by the bell here. It's only the 21st of November. Yeah. 21st of November 1961. From the looks of somebody or other around, there's one or two here that look like it – not you – [laughter] that look like they're not going to make it. Well, it's all right. We've been up surveying a burial plot up here on the upper part. [laughter]

Okay. Now, we're struggling down amongst the modifiers and turning fast corners and curves in the vicinity as oppgoals, oppterminals and this and that and you probably don't know where the hell you're at. Ah, you do. You do. You know where you are. Except you. [laughs]

Now, there are five things which make man an incomprehensible being. You'd say any one of these things could make the whole man. Any one of these things could make the whole man and because we're so used to things coming in ones in the physical universe, we don't look for a "personality" (quote) (unquote) – personality, boy, that is the most overused word – to be composed of five separate things. But because it is composed of five separate things, the person is rather unpredictable and incomprehensible. Maybe not to others, but certainly to himself.

Others may have definite opinions on the individual. People tend to categorize. They say, "Well, that fellow is a swell fellow and that one over there is a skunk and she is a good girl and that one is a tramp," you see? But these facts have been well known for their falsity.

We – this fellow goes down and robs the bank and then goes home and is very nice to his children, which isn't covered by his being called a bank robber or a thief or something, see, something...

So man has tended to be very incomprehensible.

Now, I've been on the trail of this for a very long time. What was it that made a man's personality this incomprehensible, this unpredictable? What made human behavior this unpredictable? Was it a survival factor for human behavior to be this unpredictable? A lot of other various things added up along this line, but we finally come to this conclusion: That well, man isn't better off for being a potpourri of five different items. He doesn't lead a better life because of it, and as a matter of fact, the only person he impedes is mostly himself.

These five items are very, very easily listed. You have them on 3D. They are Sections 1 to 5, of 3D and these are the five items which compose a personality:
Number 1: The person's goal.

Number 2: The opposition terminal. What does this person consider an enemy. Now, well, just to go on and list them:

Then there's the opposition goal.
And then there is the modifier of the person's own goal.
And then there's the person's own terminal.

These are five different items and the combination of these five items do not particularly make a new personality. They make five different facets of aberration to the person.

The person is going to do one or another of these five things – going to dramatize one or another of these five things in any given situation – that is not predictable which one he is going to do.

So you don't get one response. Dear old Pavlov, if you were only here now sitting in a back chair there as a student. All right, well, I'm sure that one or two of you are Scientologists enough to process him. You'd say, "All right. What is your goal?"

"To mess up dogs," you'd find out. [laughter]

But poor, old Pavlov, who was really banging his head into this. Stimulus-response, smponse-conce. Who cares! What the devil; what is this stimulus-response mechanism of Pavlov?

Well, you stimulate a dog and the dog woofs. And you stimulate a dog and the dog woofs. Now, that's everything he's – his thinkingness was based on.

If you do "stimulus A always gets response B, ha-ha-ha. Now, we've got it all made, you know. We're all set. And all we've got to do is apply this to man and when we give stimulus A, we get response B, don't we... Ohhh."

The advertising agencies would love to know this, believe me, because they are very certain that if you show a picture of a beautiful girl on a beer ad, you'll sell beer. Not in some localities. Not in some localities. Hollywood? You'd never sell a glass of beer in Hollywood. That'd have to be a pretty boy. [laughter, laughs]

But, even then, that wouldn't be very predictable either. Stimulus A does not get response B amongst men. Only after you've audited one single person and only after the job is done and the package is all taken apart could you then see which of the five responses might have kicked against stimulus A. But in actuality, even then you don't know. It's just one of the five. One of the five is going to kick against stimulus A.

Now, you could figure out a little narrower than this. You'd say, "Well, on stimulus A, 'a kick in the pants.' " Then this person who had a goal, "to stand still in life," who had an opposition terminal, "an elephant," who had an opposition goal, "move," and who had a modifier, "and never fight," and whose own terminal was "lamppost," [laughter] all right, what happens if you kick that person in the pants?
Well, does he consider you're an elephant? Or does he become a lamppost because he's standing still? Or are you his enemy or – what? What happens? Which one goes in? Which one of the five goes click? Well, you've got a number of them there, any one of which could go click and his response is that unpredictable. It's one of five.

Now, we could give a good guess at it and we'd say, "Well, he'd probably keep on standing there and not know he'd been kicked," because of his goal and so forth, you know. He probably could. He probably could. Or he might turn around and scream to the zoo keepers to come and get this elephant, you know. Who knows exactly what he would do?

There's the unpredictability of the situation. You've got five responses to any given action. Now, did you realize that the person, until you've got it sorted out, with equal facility will dramatize either the oppgoal or his own goal, the oppterminal or his own terminal, the goal or the modifier? You just pays your money, and you takes your chance. You throw a dice out and it's as it comes up.

And in any given situation you might get an interlock of two things which are opposed in his element and you get indecisional action or you get inaction. Because he's got two things that key in simultaneously and he could do either one of these things. And they are opposed as far as this stimulus is concerned and there he is. He just stops, you see, incomprehensibly. There is nothing he could do and yet, obviously, if you look it over on the surface, you'd say, "Well, he could have done – obeyed any one of five responses, but two of the responses locked up, so he obeyed actually no responses." You see how confusing that could be?

You understand what I mean? I mean he has an inner conflict, they call it. The psychologists call it an inner conflict.

So you just take your chance. What is this fellow going to do? Well, there is no telling what he is going to do.

Now, in the view of a great deal of bad control in the world, perhaps it's a good thing to respond so randomly and unpredictably that nobody can ever do anything. Now, that's a solution, too: Be so unpredictable that nobody can ever really get around you because he never quite knows what you're going to do.

You know, there's nothing as predictable as an unpredictable person. The only thing it adds up to is a person who is unpredictable. So you can't do anything about them, so it's okay to shoot them. That's usually the government's adjudication. As governments go downhill, they eventually say, "Well, you can't control the people anyway, so you might as well punish them."

So all this combination of the five things winds up is that the person gets – this we can say for sure – gets into a games condition with almost anything. That you can be sure of – that the person will get into a games condition with almost anything. And you will find him denying and being denied and so forth. And if you don't know what the fellow's case is, you wouldn't even be able to predict what kind of a games condition he was in perpetually.

But, of course, after you've taken his case apart, he isn't like that anymore, so there you are. Isn't that an interesting thing, that the moment you find out what man is all about, it
is because you've taken man apart in an auditing session. And of course, if you've taken him apart in an auditing session, he no longer reacts that way.

So the problem of "What is man all about and how will he react?" then dead ends at this point. Yeah, we can say, "Yes, we know what man is all about." In any given case, it then ceases to be of any use to us.

It's fascinating, you know. I mean we know everything that he's all about. All right, at the moment we find out, so does he and he's no longer like that. So therefore it's of no use to anybody at all. He's some other way now. He's on his second goal combination.

Now, these five are in domination. They are dominated by life and are dominating life and it is some kind of a system and a game and they add up to a random series of games that the individual plays that he is no longer capable of playing and that he doesn't like to play anymore.

So they actually add up to a denial of a game. So actually he can't play or relax or have a game because he's in a games condition. He's in an overwhelmed state.

All right. We look at this and we see then, that the low percentage of clearing, the very low percentage that we were getting, you see, must have stacked up to this: that we had a fortuitous combination, almost by accident on the case with Routine 3. It was a fortuitous combination.

We actually did get the person's goal. That we knew. That was real. We had that, that's fine. All right. Now, we might have gotten the opposition terminal for the pc's own terminal and we might have gotten the pc's terminal. And because there's a conflict between these two things, we might have gotten some other terminal. See, we might have gotten some other subordinate terminal to the opposition goal or something. See, we got one goal and then we pick it up and because it acts like the goal is no reason it is the pc's terminal.

If we've got the goal and its E-Meter reading and reaction, there are still four more things to get. Almost any one of these things could produce something that looked like the pc's terminal. That's interesting, isn't it?

Now, you start grinding away and getting desperate and getting your rudiments out or something like that and the pc is no longer in excellent communication with you and what do you find happening. Well, you in desperation are buying anything and in desperation the pc is selling anything, so of course, you're liable to come up with anything under the sun except the pc's right terminal on 3A.

So there must have been a lot of terminals that could be run, but not to Clear. See, lots of terminals that could be run without ... And they're just the terminals that are subordinate to these first five items. But if you've got the wrong one of these and were running the wrong one, the person practically could be audited on and on and on and on and on. And he'd feel better and he'd know that was it and it would make sense to his case and everything. And he'd just go on and on and on, that's all.

So your percentage of actual Clears coming out of any given body of people would be a low percentage. What it is, I don't know. Maybe it was 20 percent, maybe it was 15 percent,
something like that. But, you know me and I have never settled for these low percentages. Yes, benefit cases – oh, yeah, yeah, yeah. Well, that's fine. We can benefit cases. The number of cases that we can benefit just willy-nilly from here on out are – it's a very high percentage. We can do an awful lot with an awful lot of cases without knowing anything about the rest of this because we've been doing it for years actually.

But now, when it goes to go for broke and a Clear for somebody, straight across the boards, if we did a terribly gentle, very exact job, perhaps, of sorting out the person's facsimiles – as was done so many years ago under a very, very high level of ARC and a tremendous amount of gradient scales, you know, moving them up the line – we probably would have triggered our way through this without seeing any of the parts, see? We probably could have gone through it without noticing any of the parts. It sounds strange, but we probably could have. But regardless of that, we're taking a tightrope walk these days in Routine 3D across the Grand Canyon, which lies between life as it was lived back then and Clear and it is a tightrope walk.

There is only at this moment one process which could be reliably counted upon to do this exact thing There's really only one that you could just count on like that. Bang! You'd say, well, if we got these parts, we're there, see. We're at that point. And we can count on that process. Now, with clearing under 3 – Routine 3, we could not count on that process to absolutely carry every case away through to Clear. I'm talking empirically now, because look at the number of cases that were started on Routine 3 and look at the small percentage of Clears that resulted. That's the only type of percentages that mean anything to me. It's not what I hope, it is what is.

All right. Now, if we can lift the sights on this, wonderful. All right. Now, Routine 3D – I've already been accused of underselling Routine 3D because I haven't really been making very much noise about it. I have been too busy. I've been too busy getting it checked out, cross-checking and researched and so on. I took a look at, well, past cases for sure and present cases, and realized that we were working against a deadline – only about ten days ago – and I realized that we were working against a heavy deadline. And I had a bunch of background information that I'd been sort of looking at, you know and fitting around and thinking we were getting along all right and so forth and I was not necessarily taking my time, but I just saw this and said, "Hey, wait a minute. A lot of these people are going to be leaving here in the middle of December and some of them won't go away Clear, not at the rate they're going now. Student auditing is not very fast. Little errors get made and so forth. And the way some of these cases are running right this minute, I just wouldn't bet on it too much. It isn't a good show."

So, I went out and got several tons of coal and poured it on the ba – the front burner and the back burner and turned on the blower system, heated it up to about 31,000 degrees centigrade and pulled the rest of it all together and got a fast look at it and Suzie can tell you this; it was a terrible mess weekend before last. And checked it out during the ensuing week. I didn't check it out because I knew I had it by Monday morning. It had been waiting there for a long time. Did spend the rest of the week checking it out and actually trying to get ahead of you on commands and I'm just about that far ahead of you.
And those of you which are marching right up to it right about now can breathe easier. But there's an awful problem that lies on the middle of the tightrope and that is where all these five elements come together in a bunch and you call it the Goals Problem Mass. Technical term; you might as well get used to it.

Those who have run 3D have seen a Prehav level move up the tone arm. Your Prehav level moves up the tone arm. Then you get a new Prehav level and it backs down and then raises up again and sticks. Have you noticed that? That's the way the old Prehav Scale has done on Routine 2 and Routine 3. That was the way it did. Now, the second I got the modifier, it started moving up, clank. It moved up much more rapidly on the Prehav Scale, very rapidly.

And now with 3D, you sometimes don't get more than one or two brackets run before the tone arm goes up and sticks. That's fascinating, isn't it?

As a matter of fact, if you were very alert, you could see it stick on two commands, just like that. Bang! Bang! And it already looks like it's there and it doesn't do much moving on from there on out.

Well, now, that gives you some index of the speed with which we're dealing

On Routine 3, it took hours and hours and hours and days and days and days and weeks and weeks and weeks, sometimes, to flatten a Prehav level until the tone arm went up and stuck. And then we had to get a new level.

You've already seen this in action, remember? Took it quite a while. You – I don't think you've ever even seen a stuck arm because we stopped running it before it stuck. But it took a long time to flatten one of those levels, didn't it?

Now, if you'd flattened the level all the way out, it would have gone up and stuck. Been doing that since February, down in South Africa, one of the earliest observations of this. Well, why is that? Well, some kind of a mass moves in that isn't being as-ised. And you run this level and it as-ises all of that level there is in the mass and then the mass closes in on the pc. Thud!

Well, with 3A, if you've just done 3A and nothing else, you still would have gotten this stuck phenomena and you would have seen it, but it probably would have happened in two or three or four sessions. And now it happens in two or three commands. Now, you get relative speed, see. It's getting awfully fast as far as the run is concerned.

Now, what is this thing? What is this thing – the Goals Problem Mass?

Well, now, I could tell you an awful lot of theory behind this, but I won't bother to. I'll draw you a picture. I won't bother to draw it on the blackboard. Draw it in your mind.

What's a problem? A problem is postulate-counter-postulate, terminal-counter-terminal, force counter-force. It's one thing versus another thing, isn't it? That's a problem.

You go home, you have an argument with your wife. She says, "We're going to the movies." You say, "I'm not going to the movies. We're not going to the movies." All right. There it is. As long as she is saying, "We are not going to the movies," and you're saying,
"We're going to the movies," or vice versa, neither one of you go anyplace. You just stand there and natter. That's it.

So there's your problem and you've got this thing in balance because you've got two forces or two ideas which are interlocked, of comparable magnitude and the thing stops right there.

All right. Now, with these two things, one stuck against the other, you get a sort of a timelessness. It floats in time. Timelessness goes along with this.

We have the idea of democracy in the United States and communism in Russia. Now, the only reason that ever adds up to any kind of a problem that anybody can do anything with, the only reason it never adds up, is simply of course, is because the United States started the philosophy of communism in 1776, and is a sucker for it.

You hear the communist slogans and so forth. All you have to do is go up to the Capitol and just walk through and look at them on the plaques. They're all there: equal rights, equality, socialism, fraternity. All these things are there.

You go over to Paris and you look at the slogans of the French Revolution. You'll find they're all there.

The Russians have always been about 150 years behind the times and they have a hell of a time catching up. Always slow, always slow. They finally learned how to do ballet about a hundred years after the French and they're always late this way, see. It took them some eighty years to pick up communism from a German in the first place. You see, they're late.

And you actually don't get much of a problem-counter-problem. There isn't really a problem-counter-problem. If they all got together and argued about it... A 1776 patriot in the vicinity of Boston, arguing with a 1961 communist in the vicinity of Moscow, would have a hell of a time. They couldn't find anyplace they were in disagreement except the Bostonian would be trying to tell the Russian he was going a little bit too far and he was being a purist about it. That's just about as far as the argument could proceed.

And this would be an interesting scramble. They couldn't find out where they were having a problem and that is the difficulty with world situation today. They really are not sure where they've got a problem. All they are sure of is that there are two forces in opposition. The Russian forces are in opposition to the American forces or the NATO forces or the English forces, don't you see? We can be sure of that.

I don't – the reason why I don't think it'll ever come to much is there's no basic postulate-problem difficulty behind it. For instance, England of course, sowed her seeds of destruction about 1100 and something, with the Magna Carta. If you ever – nobody in England, of course, knows very much about the Magna Carta. They talk about it a lot, but they never look into the background of the Magna Carta. But that was a real wild-eyed Red document when it was first dreamed up. That was a wild one.

And perhaps wisely, nobody ever, you know, kept a copy of it. But do you know that was to turn all the land back to the serfs, and it was all going to be socialism and so forth. And the people that walked up there to that field to push a pistol against somebody's head – I for-
got who it was, gunpowder hadn't been invented yet, but you get the allegory. And by George, they had these—these terrific ideas. It was equality and there was socialism and all of that sort of thing. And there was going to be equal justice for all and everybody was going to be equal one way or the other and the nobles sold them out. The nobles sold everybody out. The nobles settled more or less for their fare. And they didn't settle for the serfs' and villains' side of the picture. But the serfs and villeins were there in the background. And what they expected to hear that day as the final pronunciamento was vastly different than the pronunciamento which was finally signed and read. Because they expected to hear that, "Slaves, break your chains and that is it." And they didn't hear that.

Now, whether this story of the Magna Carta is accurate or not awaits until one of you who were there gives us the dope, straight. I wasn't there at the time; I was busy elsewhere. But I'm indebted to the story of the Magna Carta and what it was all about to the late George Wichelow and he was a great student of human liberty and human rights and he used to reel this thing off by the yard and so forth.

And I don't know where he dug up all this history, but it was sure interesting. We stood up there on that field one day, and he was showing me where they all sat and what they all said and all this sort of thing and so forth. And I could get the idea of old George there, right up there in the front rank, you know, looking meaner than hell. [laughter] He really had it taped.

But, anyway, the facts of the case are that these political philosophies that are being brooded about in our 1961, at the moment, are not particularly in much disagreement. The last political philosophy there was disagreement with everybody went by the boards in 1945 when a certain chap on the other side of the channel over here took the finger off his number. I've forgotten his name. Schicklgruber, I think it was—house painter.

And he didn't get the word. He didn't get the word. The philosophy of pure force could no longer exist in this world. He thought it could and a few million dead men later, why, people decided he was wrong.

So there was an active force and there was war. Why? Because you had an ideology of the superiority of a race and the magnitude and glory of force and "the chosen people" sort of an idea of where the rest of the world was going to be enslaved in some aristocratic feudal system, somehow or another, by the Wehrmacht. This philosophy was no longer acceptable.

Well, I remember the Germans back from Roman times. They—you'd go up there, you know, and they'd be wearing Roman costumes or something of the sort. Oh, they'd be out of date, you hadn't seen them in Rome for a century, you know. They were always behind the times. That's another crew that always—always a little bit old or a little bit late. Old-fashioned, you know. You go up there, the girls are wearing the wrong hats every time. [laughter] And they, however, carried over that many centuries. That's sort of an exaggeration.

But the philosophy of pure force—philosophy of—what the devil was his name? He was some fellow that was sick all the time—his name wasn't Zarathustra, but you get the idea.
Female voice: Nietzsche.

I don't know what his name was. There's no reason to send it down to history because I don't think he could write.

Anyway, perhaps it was unfortunate for Hitler that he could read, but that philosophy had long since gone out. And that philosophy posed against the philosophy of equality and decency to your fellow man, equal chances and equal rights under law, couldn't live because this other philosophy, as I'm trying to show you, isn't Russian, isn't English, isn't these things. It's something that's been around for a long time and actually was inculcated into this part of the world by the Romans.

The Romans had two distinct philosophies in their political network and that's why they were always at war. They had the philosophy of equality and justice along with the philosophy of total dominance – "get thy neck bent over so I can get mine heel upon it, crunch." You recognize that.

The Roman while spreading equal rights under law, Roman justice, the rights of citizenship, the rights of property, the mechanisms of government, at the same time dragged along with him – like the carcass of a rotting horse hauled along back of a wagon – slavery. And it was incompatible. He himself had never digested his own political philosophies and he couldn't live with what he had. And his states he created one after the other, each one went down because there were too many violent counterpoises which could be launched here. And Christianity was a crystallization of the Roman philosophy of equality and socialism and that's why it eventually conquered the Roman state.

Up to that time, equality and decency to your fellow man was rather counterpoised by total cruelty, total barbarism about your fellow man and specialized justice and specialized cliques and so forth. So, you had a problem within the state. You had two active philosophies which are counterbalanced and the Roman, of course, could never settle his political affairs. He might make an empire, but he actually could never do – make up his mind, "What philosophy are we ruling by here." He always had something else, don't you see?

And then the philosophy of Christianity won out and has come down to us and is the philosophy of Russia today; only they call it communism.

Anyway, and we've got another Christian philosophy today, and we don't know what we'd call that. But it's definitely – if you study the philosophy of the early Christian, you will find that community property and all the various things which they worship in Russia today are early Christian principles and actually made their emergence on this planet at about that time of Christ. So the Russian is awful late. God, I wish somebody would bring them up to present time.

Anyway, there's no potential war because there's no disagreement. Now, most Russian practices are subversive. Well, we can disagree with that. We use them ourselves. They use blackmail and they do various things which are not quite decent in conduct of human activities and that sort of thing.

We could argue about some of these ideas. We could say they go too far. We could say the cult of the personality goes too far and that sort of thing. But actually we're protesting
against things which we ourselves, in the western world, have held to be true for the last couple of thousand years. Fascinating, isn't it? We'd be fighting our own philosophy if we fought communism too hard. You notice, however, that the most dissenting voices against communism are those who are – say that pure communism goes too far. Have you heard that? You've heard that? Yeah, it's quite common. That is of course the only real postulate could be launched against communism to make a problem. Because they go too far.

If the fellow's able and gets a name for something, of being a good clown or something like that, why, you have to shoot him or something, you know. That seems a little bit dull. But, anyway, if you extend any socialism just a couple of thoughts further than the existing socialism, you'd find out that's what you'd have to do.

You couldn't allow anybody to have a name. They'd all have a number. I mean we've had a famous English writer here for many, many years. The late H. G. Wells has given us some marvelous things. There's Aldous Huxley, *The Brave New World*, things of this character. There have been more cracks made at the supersocialization of things, don't you see.

So you're arguing by degrees. And do you know that you really can't have much of an argument by degrees. You can't have much of an argument by degrees. You'll see two fellows; they arrive on a corner. One says, "Let's walk half a mile."

And the other one says, "No, let's walk a mile."

And they start arguing about it and they'll walk three-quarters of a mile. Because the understanding is incipient in the difficulty. In other words, we've already got an agreement that they're going to walk, you know. It's just a question of how far. So there isn't much of a war involved. But we get one fellow – we – he says, "Now, the thing we ought to do is stay right here on this corner and that's it and not move another foot."

And the other fellow comes along and he says, "Well, the thing we ought to do is keep running around the block and the only safe thing to do is keep running around the block and always be in motion and never stand still."

Well, these two fellows will – they're having trouble, too, because their point of view is a little bit distant. But nevertheless they'll get into an argument of some kind or other. Each one will wind up saying the other one's crazy and there's no fundamental agreement on what they're doing and they'll be very upset about it.

Do you see that? It takes an argument of some kind to take this. All right.

The wife says, "We're not going to go to the pictures."

And the husband says, "We are going to go to the pictures."

Now, you've got an argument. They can communicate because it's about the pictures. That's the only reason they can communicate in an argument, because it has a common meeting ground.

All right, you go through various things and you'll find these problems come up around gross differences of opinion. And all problems arise around gross differences of opinion or gross vectors of ideas. Vectors of ideas is a better thing here for your understanding of this than anything else.
You've got one fellow who says, "Go north," and the other fellow says, "Go south." Well, of course, they'll walk apart and never meet again and that's all right.

But supposing one is standing north of the other one and south of the other one and they're directly standing in each other's paths and one is going to go north and the other is going to go south, and not – and their modifiers in both cases would be "and not budge an inch out of my path." Oh, you've got a nice problem there because you've got two ideas and now you've added mass against mass. See, they're not just standing and nattering. They're in each other's road.

One is going to go this way. The other one is going to go that way. And if they move in the respective direction where they think they should be going, they're going to run into each other. Now, you've got the idea is different and the mass is going in different directions.

And when those two masses collide, if each one were trying to move at the rate of one hundred foot-pounds forward, they'd just stop there forever. If nothing else unsettled that situation, each man, one trying to go south through the man who was trying to go north and the one trying to go north through the man that's trying to go south and each one of them trying to walk forward at the rate of one hundred foot-pounds of thrust, well, it's going to stop right there. That's it. The trail is ended.

And they get an idea that that time lasts forever because there's nothing ever unbalances it. So it takes the mass and the idea to make a real problem – the only point I'm trying to make.

You can have the mass in some disagreement or headed in some direction and so on and the other mass coming in the other direction, they hit, but there's no ideas around. Of course, there's nothing to make it hang up. It's just a couple of pieces of mass. It happens all the time. Good heavens, stars a thousand times the size of Earth have hit stars in this universe, but nobody around and no planets depending on them or anything else and so the astronomers noted down someplace that there was a big flash. That was it. So, there was a big flash. So what?

It's far more important in this universe that Mamie Glutz has in her mind a force that is going to go north and a force that is going to go south; and the force that is going to go north finds the force that is going to go south in its path; and the force that is going to go south has the idea it's going to go north; and the force that is going to go north has the idea that it's going to go south because that's the way it will continue to be to the end of the whole universe.

And that's what is known as a Goals Problem Mass.

Do you see that? That's two equal lock-ups. Crunch!

Now, let's run a bunch of unsettling factors into the man who was going to go south and into the man who was going to go north. And now, let's add some other factors into these fellows so as to unbalance the hundred footpounds of thrust each one is furnishing against each other.

Now, of course, 101 foot-pounds of thrust will cause the man who was trying to go south to actually back northward and you no longer have a perfectly balanced problem. So the
second that the person who is trying to go south finds himself about to be pushed north, what is his first action? It's to add enough weight to try to overcome the fellow who is going north. So he puts on a 102 foot-pounds of thrust and then the fellow going north tries to – south tries to put on the other 103. And then the fellow going north puts on 104 and the fellow going south puts on 105, and – and so on. And it gets to be a little teeter, see. They're just teetering at each other.

In any mind, on any central issue, there are two different ideas which are available at first to the auditor. Let me qualify it like that because this isn't the whole ideas – of ideas that are in the mind. Actually, there's quite a few of these things in the mind.

It was like I was telling you the other day, there's a thousand skins on the onion, there are a million, billion skins on the onion. You can take them apart a lot of skins at a time. And the first Goals Problem Mass that is available to the auditor for auditing is that one which has the visible goal.

Now, all that's visible of this thing is just the goal that the pc says is his goal. It finally comes out to be by assessment the pc's goal.

Now, if you've ever seen a goals list that ran 350 goals which is a very common pc's goals list, you would see that this goals list might have been, any one of them, the road in. Until assessed, the Goals Problem Mass might have been located by any one of 350 different tags, until you assess it. So you see the number of complexity. Because, do you know the pc didn't know that either? See, the pc was – is in ignorance of all this. He's doing it all and he's in total ignorance of it, which is quite amazing.

So he's trying to do this. All right, we look at this Goals Problem Mass and we find out that it could have had any one of 350 possible roads into it and by assessment we finally find out what it is!

All right, now, all we've got is the pc's goal. Now, that is idea one. That is the fellow with the idea that he's going to go south, you see.

All right. Now, why don't we at once – why don't we at once find, then, the opposition goal. Shouldn't that be number two? No, you've overlooked something. You have a pc's body in the auditing chair. You have already found the gross terminal that has this goal. Only you don't know what to call it yet, see? You've already found it.

So, actually, you didn't find the goal as the first action. The action occurred before the auditing session.

You got a pc and put him in the chair, see? Well, you found something there. There's some mass connected with it. Now, you'd better get some counterbalancing mass in a hurry because you found this person's goal. Now, of course, if you found the other goal – you'll find this in experience, too, as you winnow these things out, you'll find out that it's almost impossible to get the opposite goal before you get the terminal. You've got to get the opposition terminal. We've got to get something that matches up to the pc mass.

All right. And then we find out what is the opposition goal.
All right, now, we've got the clear-cut picture, got the clear-cut picture. A something-ness – a valence actually, undiscovered, but nevertheless there and observable by this time to both the pc and the auditor – is trying to move south with a certain idea of moving south. And it is – something else is apparently present which is trying to move north through the pc. And this something else that is present happens to be an International Harvester. See, that's the opposition terminal, see. It's an International Harvester. We never knew it before now, but that's what it is. It's what it assessed out to be. That's what's trying to move the opposite direction.

Good. All right. That's fine. And now let's find out what the opposition harvester is trying to do and we eventually do a big assessment. And we find out that, according to the pc, its goal is to, of course, just to move south. To move south. That is that simple.

It's going to move south. He's going to move north. All right. Fine. Didn't matter which way it was. They're going to move toward each other and it's going to lock up. One goal is going to lock up against the other goal and one terminal, not yet found, is going to lock up against the other terminal.

Now we go back and find out what little piece did the pc add to overcome the counter-pressure and we get the modifier.

Now, that's the additives. That's the one pound that went on top of the hundred foot-pound, you see? That was his new idea, well, if he announced this idea, then the International Harvester would move backwards, see? Get the point?

So he's walking against the machine. The machine is coming against him and they were both balanced up. The ideas are both balanced. The force they're using is both balanced and at this moment, the pc with wonderful insight adds a little push in that direction.

Now, you know that there's a modifier to the opposition goal. Did you know the opposition goal modifies?

Now, why don't you find it? It's not the pc's goal, that's all. It's not the pc's modifier. You found enough pieces already. And actually it'll go on and on and on. You could do this assessment for modifier to the pc's goal and modifier to the opposition goal and modifier to the pc's goal and modifier to the opposition goal and modifier to the pc's goal and they'd probably go up to something that's looked like the new goals list. And it might go into hundreds because, of course, every time the pc is trying to go north and every time the machine has tried to move south, new ideas were added, to make the passage. But they're just stack-ups. You got to draw a halt someplace or another and where you really have to go is you do have to find the modifier because you need the modifier, otherwise, you're not going to find the terminal. The pc's terminal cannot be found without his modifier. But the opposition terminal can be found without the goal.

But, if you assess too much and too many, if you assess too much and too many opposition, you're going to get the wind blowing.

If you don't believe it sometime, run the opposition terminal on the PreHAV Scale on just one assessment and ask the pc how he feels. Well, that's what? That's a whole seventy or eighty repetitions of the opposition terminal, one right after the other.
Well, it's the found terminal, see. It wasn't odd terminals – differentiation. You're saying to him, "Man going south. Man going south. Man going south. Man going south. Man going south. Man going south."

And after a while, he sort of gets the idea of the *bzuu, bzuu!* He's losing. He actually will start to kind of back up. He can feel the wind go past his ears. You know, uuuuuuh, "What's this, what's this?" you know. Uuuuuuuuh.

It isn't necessary. It'll all run out.

Now, you are indebted to the gross values of auditing. In other words, auditing these days, done well with the rudiments in, can handle an awful lot of additives. You do the simple, central mechanics and the additives fly off like a Roman candle. There's nothing much to it, you see.

If you had to run everything that actually should be run, of course, you would run the entire lifetime of the individual as that terminal against every opposition that he ever encountered and every thought he ever had and every dinner he ever ate and every lunch he ever ate and every breakfast he ever ate and every bed he ever slept in and every time he'd ever hurt his finger and every time he ever wum, and every time he ever wum and wum-wum, and he'd have to know everything there was to know on the whole track all the way along the line for the last 200 trillion years.

Now, how long do you think that would take to clear him? In view of the fact that he can be shot in one second and if he had been shot and you were running it as an engram, it'd take you five or six hours, I'd say the factor was several thousand times the actual time length. That's how much – how long auditing would take.

Let's say it's ten thousand times as long to audit out a wound as to be shot, see? So that'd be ten thousand times 200 trillion years is how long it'd take to run out the pc's bank. Now you get some kind of an idea what I've been tackling here.

The only thing that's got the bank messed up is the Goals Problem Mass. That's all that's got the bank messed up.

All right, enough of this. You walk into the Goals Problem Mass, *clank*. The moment that you ask the pc for his goal, you'll sometimes see a pc's tone arm on some pcs start up at that point and it goes up – *clank, brrrp*. Then come back down a little bit, and you change the thing and *brrrp, clank, brrrp, boom*. Rudiments go a little bit out, up goes the tone arm, *clank*. Sort of sticky. Then all of a sudden you pin the goal down and it sort of frees up. Well, actually you move them closer to the Goals Problem Mass than they had been before. But you moved them closer with more understanding.

So although they're standing closer, they've got a better tone arm and needle. Interesting. But remember, you did move them closer to the Goals Problem Mass and therefore their tone arm will now go higher or lower and misbehave worse and stick heavier. You make an error now on rudiments and of course they – it gets much stickier. Interesting, isn't it?

Now, as we go up the line on this and we find the opposition terminal, we of course, are that much closer to the Goals Problem Mass. *Ummm*. Ah, but because we know about it, he can stand that much closer to it without being burned. We just get our needle disbehaves a little worse, occasionally when a rudiment goes out – why, it all of a sudden ... Have you no-
noticed a pc after you've been auditing him for a while, the needle gets awfully sticky if something goes out and the tone arm sort of misbehaves and goes higher and then usually will go lower and then frees up quicker.

He gets worse and gets better faster. Well, that's because he's standing up closer to this Goals Problem Mass, see? You've got his attention coming into where his attention is really stuck.

All right. Well, he's much better off when you find the opposition terminal, that's for sure of that. Everything is fine. He's also standing another few feet closer to the blast furnace, when in view of the fact that the total fire in the furnace consists of not knowing what's in the furnace, that he knows a little bit about it, makes it possible for him to do so.

And then you find the opposition goal and you move him a little closer to the furnace, closer to the Goals Problem Mass, actually and you can lock up his needle quicker and free it and lock it up and it goes freer and it's been drifting freer and then locks up easier. There's nothing more horrible than somebody who hasn't any idea of what's wrong with him. Doesn't even know that he ever even has any trouble in life. The tone arm is always at 3. Needle never moves much. Give the cans a squeeze and the needle rises. Nothing wrong with him. He doesn't need any auditing. He doesn't know where he is. He doesn't know what he's doing.

Well, with this individual you could just hit him over the head with brickbats and you would never get his tone arm to do anything but sit right there at 3. Right there – there it is.

You can ask him the most challenging Sec Check questions. Never moves. That's your dead thetan case. Now, when you get this guy wheeling along the line a little bit, don't start worrying because he's got a high tone arm. Well, his tone arm will go up, clank! after you've found two or three of these elements in 3D. It's liable to be way up and real stuck. Then the – he looks at the other wall and comes down. I mean that could happen, see?

But actually, it really doesn't happen until you get into the Prehav run, which I am trying to actually cover in this lecture for you.

Now, what occurs? You're moving him closer to the mass. There is an actual mass. It is a measurable problem. It is – does have mass. It does have existence in space. True, it's the pc's space, not the physical universe's space, but it has an existence in its own space. It is contactable. You can measure the density. And that is what the E-Meter is doing, is measuring the density of the Goals Problem Mass and that is all the E-Meter is doing.

Now, I invite you sometime to conduct this experiment. Get some pc who has a sensibility to mental masses. This is the bulk of your pcs. It's not pcs who are way downhill and "Oh, well, I don't think I ever want any auditing because actually there's nothing much you can do." Don't get one of those kind. Get somebody that has an idea and he can see a picture, he can see something of this sort.

All right. Now, ask him something like this: "Have you ever had a problem?"

"Well, yes, I had a problem. I had a problem with my mother."
"All right. That's fine. Now, tell me a solution to that problem. Thank you. Tell me a solution to that problem. Thank you. Tell me a solution to that problem. Thank you. Now, do you see any masses in your vicinity?"

"Oooooh, as a matter of fact, I do. There's ... Yeah, yeah, yeah."

"Well, where is – where is this mass?"

"Oh, I don't know." And so on and so on and so on.

"Well, tell me a solution to that problem."

"What problem?"

"Well, this problem with your mother. Where is the problem now, by the way?"

"Oh, it's out there about twelve feet away from me."

Very interesting. What is this problem doing with a location in relationship to him twenty years after and two thousand miles away.

What is this problem doing there? But, it's there.

You say, "All right. Now, tell me a solution to that problem with your mother. Thank you. Tell me a solution to that problem with your mother. Thank you. Now, where is that mass?"

"Well, as a matter of fact, it's out here about five feet."

You say, "Good. Thank you very much. Now, tell me a solution of that problem with your mother. All right. Tell me a solution of that problem with your mother. Thank you. Tell me a solution of that problem with your mother. Thank you. Now, where is this problem?"

"Well, as a matter of fact, it's right there. It's right on the end of my nose. It's very funny you mention that because it's come right in. It's sort of a mass, and it's right there on the end of my nose."

You say, "Well, that's fine. Tell me a solution to that problem. Tell me a solution."

Now, if you were a psychiatrist, you'd keep that up for the rest of the day. And you say, "Where is the thing now?"

And he says, "As a matter of fact, it's sitting inside my nose. It's back here in my cheekbones and it's awfully tight. There's something tight in there."

You say, "Good. Now, think of a problem of comparable magnitude. Thank you. Think of a problem of comparable magnitude. Thank you. Where is this problem?"

"It's right here at the end of my nose."

"Good. Think of a problem of comparable magnitude. Thank you. Think of a problem of comparable magnitude. Where is it now?"

"Well, it's out there about five feet," the pc will tell you.

"All right."
And you run "think of a problem of comparable magnitude" and he'll finally tell you it's out there twelve feet away. It's out there one mile away. It's out there about two thousand miles away. Well, it's back where it came from. Because you kept running that, providing your rudiments were in, you didn't keep kicking him in the shins or give him electric shocks or back treatments at the same time.

Anway, we got a situation there where we can move these masses in and out. You can actually move masses in and out by addressing the subject of problems and solutions.

That's very important. That's a very well-known and very old datum in Scientology: that you can move problems and masses in and out with problems and solutions. You can move masses. The more you solve the problem, the closer the mass gets. What is more, you approximate the problem the further it moves away.

Unknowns do the same thing. This is about — what was it? I think it was about 1956, late '55, '56. I remember up in London, I remember going over and talking about it at the Coach and Horses one day over a nice steak. Anyway, and the civic planners have now swept all that away and I don't think you can get a steak in London. Well, that's progress.

Anyway, the whole of this mechanism is of vast interest to you in clearing because all you're handling is the Goals Problem Mass. And what is that mass? That's the mass of the pc, the pc's terminal, the opposition terminal, the opposition goal, the pc's goal, the modifier and now, every other force that has been added in to help each other out. And of course, that can add up to hundreds of each item. Hundreds! And until you looked at the thing, you'd have actually thousands of items in a total confusion and you wouldn't know what to do with any one of the items, but it'd be a nice big, black mass. That's all. It's just a conglomerate something or other, see?

And everything is pushing and everything is resisting and everything is pushing in the opposite direction and being resisted in the opposite direction. And it's all just locked up just as nice as anything you ever saw. Thud!

There it is. Nothing is going to go in any direction, and everything is being helped from going in any other direction but the direction it's not going. Pc's personality.

Now, you've got these — all these factors. And if you've got these five factors, you've got the basic factors — the only factors necessary to take a problem apart. But you've got tremendous factors that are added to these fives. Each one of the five might be an army, but it has a — scores of auxiliaries. Each factor has scores of auxiliaries. And if you tried to look this thing over on just a quantitative basis, you'd never tackle it. The pc never has. He's never dared. All the pc's ever done is have trouble with it.

All right. You get too close to the Goals Problem Mass, all sorts of odd things occur. The pc feels like he's getting his skull pushed in. Maybe he was upset. And before you're running 3D, he's going to be plenty upset, at various points, in a sort of a puzzled way. So it takes confidence here and it takes an auditor's smooth auditing in order to get over the jumps.

Because what happens? When you got the five, he feels much better. But he's liable to be dramatizing any one of the five. Now that they're live, he's still close to the Goals Problem
Mass. Any kind of an ARC break on any one of the particular subjects is liable to throw him into a dramatization of that item.

Of course, you've got him at a loss at this momentary stage. You know exactly which item he's dramatizing if you know his 3D. At least you can tell him, "Well, all right. Let's not be a – " whatever it is.

But there's no sense in doing that and it's accusative, it's liable to cave him in and cost you several hours of auditing because he'll eventually come around and tell you, "Well, all I have done is cost myself five hours of auditing" You know?

But he actually can go in and out on these various items and he goes flicker-flack. And he'll dramatize these things and he'll get these tremendous ideas. And he'll get up in the morning – he's got this awful compulsion, you see, to eat cider buns, but they don't exist, you know and ya-uuuuuuuuuh. And he'll realize a few minutes later, an hour or so later, "Oh, well, naturally, a bun vender. They have people who buy buns from a bun vender and my opposition terminal is a bun vender. Oh, well, it's obvious. Well, how silly I am. I wish I could certainly find a cider bun." [laughs]

It isn't in a very high state of key-out. That's because it's closer in to the Goals Problem Mass, so it's actually being enforced at this stage.

It's less than it has ever been. Do you understand? It's less than it's ever been, but that doesn't mean that it never gets dramatized, it can be pretty soon.

It's easier to get a pc into session and easier for a pc to go out of session, just as it's easier to free up the needle and easier to stick it up. You find a much more active picture going on here. It is not so comfortably status quo.

Now, let's say, for the last many thousand years this Goals Problem Mass has been in a marvelous state of status quo. Pc left it alone. It made him dramatize it and it was riding along. It was all in perfect counterbalance. Time, what was the time? The time of it, of course, was the time of it. That was time. There was no other time than the time of it.

And it coasts along forever. It endures forever. Nothing could affect it. There you are. You had an armored citadel. Any given situation, the pc had – had his no choice of doing one of five things, modified of course, by the hundreds of things appended to any one of the five. Fascinating, isn't it?

The pc never had to think, never had to live, never had to be there, never had to enjoy anything. Had lots of fun getting in his own road. Spent endless hours trying to understand himself. The advantages of having one of these things are absolutely uncountable. [laughter]

Every time you decide that you better walk down to the corner and get a little bit of fresh air, why, you find yourself sitting more deeply in the chair.

Say, "What happened to me? That's a funny thing. Oh, well, that's life, I guess. The brain, the brain is what's doing it."

I think the psychologist has got these things so heavily that they've got them inner superimposed inside the skull in some fashion. I think that is why the brain is.
But now I'm not talking and haven't been talking about an imaginary item. The thing is a sensing item. It is an item which can be sensed. This thing can be experienced.

You plaster one of these things all over a pc's chest or face or stomach sometime and then try to convince him there's nothing there. He feels this heavy pressure, he'll tell you about the pressure, terrible pressure. Pressure.

And you say, "Well, there's nothing there really. It's just your imagination. What you should – what you should realize is it is best of all possible worlds where there is nothing but mind and space and infinite mind and there is only infinite mind." Well, you could convince him of this, perhaps, perhaps. If you deflected his attention so that he didn't feel it.

But the next time he was walking down the street, there'd be a slight wind or a car would backfire suddenly and he'd have this right back where it is again and you'd have to tell him with more duress, "Well, pray harder to God." Now, that would work just so far because a certain percentage of these fellows had God as part of the Goals Problem Mass and where you had that, you almost slaughtered him.

See, maybe God was the opposition terminal. And you say – he'd say, "Pray to God. Well, maybe I'd better pray to God." And all of a sudden he feels very degraded, very crushed and degraded and he can't tell why.

"Religion does a great deal for many people and many things and they're very happy about religion. Why shouldn't I be? I guess I just haven't said my prayers right. All right, I'll try again tonight," you see. And he gets up the next morning and feels three times as degraded. Nobody could figure out why.

All right. That Goals Problem Mass is a mass; it does exist. And as you get 3D, you're actually taking apart from a distance the component parts of the Goals Problem Mass as it most intimately relates to the beginning of the onion skins that you're trying to peel off.

That's the first series, and of course, it's much harder to locate. Now, that we can locate it at all is due to the fact that it is an electronic mass. The mental electronics go into its composition. And, of course, when we tick something in it, why, we get a vibration, see and it shows up on the E-Meter. And that's how you do an assessment.

The pc could never live in the middle of it, let me tell you. He'd just fall to pieces. His skull would fall off or something. It's not that the thing is dangerous. But when he got in there, he couldn't tell you what he was looking at because all he would do – would dramatize everything that was in it. And then he'd dramatize all the auxiliaries of everything that was in it, too. Well, but he can stand off and with good rudiments in and good ARC, he can assess like mad.

Now, why do your rudiments go out? Well, the auditor, in some way or another... We've got the various reasons, the things that have to be settled out so that he doesn't experience this, like all the rudiments, of course. You get your rudiments in, why, the auditor is not totally identified with these Goals Problem Mass. He's got it separated out. So the auditor can sit there and audit the pc, until he does something to restimulate the Goals Problem Mass.
And we know the various things that are the most heaviest restimulators on any case. And when these go out, part of the Goals Problem Mass goes in and it can get sufficiently heavily charged or in, that your meter stops reading. And you can't assess, that's all. You just – well, it's something like: "Oh, well, up to this time we were going along fine, we had telephone bell wires and there was a telephone bell wire strung between the Goals Problem Mass and the E-Meter and everything was fine. It was going along and the trickle of electricity came along, and all of a sudden we strung a hemp hawser."

E-Meter won't read. See, you've just mucked the whole thing up one way or the other. You put him out of communication. You've startled him. You've upset him in some way. He can't get in communication with it because this thing restimulates and now he is only "it." So you've put him on the wire. You've put him on – into a position now where he just does nothing but "it" or what "it" says.

And, of course, "it" won't read itself. The only thing that can read "it" is the E-Meter with the assistance of the pc and you. And you're trying to study a piece of coal out there, a mountain-size piece of coal at about a half a mile away – is what you're really trying to do. It's remarkable, remarkable that you can do it. It's absolutely phenomenal. I never saw such a thing. It's remarkable that there's any solution to it.

And you think so when you first start running the pc into it. And that will be when you have all five elements nicely found, all buttoned up and you're all set with your first Pre-hav level and you say, "Here we go, we are now going to run Interest on a waterbuck. How would you interest a waterbuck? How would a waterbuck interest you?"

The opposition terminal is a lion. "How would a waterbuck interest a lion? How would a lion interest a waterbuck? How would a waterbuck interest – ." (Oh – what's the matter with this E-Meter?) "How would a waterbuck interest himself?" (What the hell is the matter with this E-Meter?) [laughter] "Haha. How would a wa- . Did you answer the last question? All right. That's fine. All right. How would you interest a waterbuck? How would a waterbuck interest you?" Coo!

The thing is up there at 5.25 and the needle is getting paralyzed and whenever you say "waterbuck," you get a flicker-flick. And you say happily, because you remember your 36 Havingness Processes and your old Confront Process, and you remember blowdowns and you know that meters can do this sort of thing. Oh, I assure you that this is not going to happen very fast, that sort of thing. It's not going to happen.

A meter would blow down because you were running a chunk off something. Why, you're not going to run any chunk off a mountain. You're just going to run a mountain off a mountain. That's it. You've just run the pc into this thing with a Mack truck. Crash. There's nothing going off of it. It's going to up to whatever it goes up to or down to whatever it goes down to, and it's going to stick and that's all.

Now, if you overran this by 30 commands, now maybe you've probably got trouble. You might have a little difficulty reassessing.

If you overran it a session, oh well, just give the pc a knife, tell him to go cut his throat. It's much less painful. Much kinder. Because you're going to have a hell of a time reas-
sessing. When that thing goes up and sticks, be sure it's stuck and get whether or not it's stuck by watching, in this particular run, the needle.

And you see the needle has frozen up here. It's just stuck up an inch from the set on the meter and it just keeps sitting there. There it is. It's in that same position. It's in the same position. It's in the same position. It's in the same position. It's in the same position. It's just about that many commands, you see, so I'd better start saying, "Well, just a couple of more commands and we will end this process if that's all right with you. Humm-humm-humm-humm-humm. All right. That's fine. Good." And we reassess.

And you'll be confounded when you go across the level you reassessed, you would swear that it wouldn't possibly have flattened in fifteen commands or something like this. Next time you go across the level, you'll say it'll sure fall again. It doesn't. It's just as quiet, just as nice. It's all rubbed. Because that was all the interest there was in it. You got the lot. It won't kick again.

Now, your next level – Withdrawal or something – and you run that and that might last a half an hour, it might last fifteen minutes, it might last two commands. But you run it to a stuck needle. Stuck tone arm and then stick the needle. Stick them both. You're perfectly safe. You can still reassess. Overrun it two hours, cut your throat – be much kinder.

All right. Now, what upsets all this? Now, I think you could run all the Prehav levels there are and find them over into the Secondary Scale and run all these things and so forth and you'd eventually run it down to a free needle. This is a probability and perfectly all right and there's no reason why it wouldn't work.

But the thing you've got to watch is if the number of levels alive increase. You enter the thing with ten levels alive; there's ten levels of the Prehav Scale that you've got a knock on. And the next time you assess, you've got twenty-five levels alive and the next time you assess, you have fifty-two levels alive.

Ah, well, you shouldn't have reassessed that last time at all. You should have quit some time earlier. You should have done something, but check something out because you've got the wrong terminal. There's something wrong with your 3D assessment. You get increasing numbers of levels alive in the Prehav Scale.

All right. So that's pretty vicious. The probability is if you know how to read an E-Meter that you will never do a wrong assessment, if you know how to read an E-Meter and if you don't permit the pc to twiddle the fingers and do other things to sell you on reads and all that kind of thing. If you really know E-Metering, you'll never get a wrong assessment.

Now, as you look over the pc, follow this rule; that increasing levels alive on original assessments, you know what I'm talking about. You read down the seventy, eighty whatever it is, Prehav Scale and you've found that they were ten of them alive and then the next time you assessed, they were twenty alive. "Oh, oh, oh, oh, oh, oh, oh, something is wrong here."

Now, if the rudiments are in and if the pc really ran it, and everything is all right and you've done a fairly good auditing job, the only thing left is that the 3D is somehow wrong.
But if you run into this situation, don't worry too much: there were twenty levels alive and then there are ten levels alive and then there were fifteen levels alive and then there were eight levels alive. In other words, don't worry about that. You'll get a fluctuating number.

But it's quite common on somebody who has been misaudited on wrong terminals to find every level – pardon me, not every level alive, but maybe forty, fifty, sixty levels alive. And there has been a case on record of every level alive. Boy, that was really wrong. So you want to watch that and that is your checkpoint. That is the point you check. That is your best checkpoint.

Now, this other thing will occur. As you run this, later and later on, as you run – it runs on this terminal and with this package of commands. Later on as you run, you're going to get more and more tightness and a greater, faster restoration of flexibility, till it gets like this at about seven, eight levels deep on the run of the terminal.

It looks something like this: Pc is going along dandily. Everything is dandy. Everything is fine and the thing is going high and sticking. It'll keep going high. It'll even get higher. This condition even worsens, you understand, five, six levels deep. Actually it may go higher. It may have only been going to 4.0 but has now gotten into the habit of going to 4.5, and it's now getting up to 4.75 before it sticks, you see. It gets worse before it sticks every time. Feels more frozen too, and it feels more stuck up to the pc.

The pc doesn't like this. The pc doesn't know what this is all about. Pcs don't like this very much, you know. It's fast assessment and fast runs and then the new level and the pc doesn't quite know what they are doing on the new level. And they're just setting down for the long haul and then there all of a sudden, things are getting tighter and tighter and tighter, and – and this is harder and harder to run and all of a sudden they go off and they – you're off of it again and reassessing again. And they didn't even get a chance to find out what it was. And you'll find a pc will get rather confused on this, but that's perfectly all right. That's not half as confused as he has been.

Anyway, you'll find that as the pc looks at the wall or moves his elbow or bobs his head, the E-Meter changes. Well, let's say eight levels deep, the pc's attention is momentarily deflected by a buzzing at the window. And the whole thing blows down to 3, apparently a blowdown and it looks like a blowdown, but it is not a blowdown. The pc went out of session. In session the pc reads 5. Out of session the pc reads 3. Bang! Bang!

You just ask the pc if they wouldn't like to put down the cans a moment and stand up and stretch. Yeah. They stand up and stretch, sit down, pick up the cans again – oh, they are way out.

They're nowhere near the Goals Problem Mass. They've gone zoommm! And every time the thing blows down, you'll find the needle's a bit looser. It's a bit tighter or a bit looser. It's tighter higher and looser down and it finally starts to look kind of floaty.

Now, if we just went ahead and did nothing else but that, we would probably win. But it's a rather arduous activity and it's left in as a main – mainly as a preventer and to keep the pc from going off the deep end while he's got all the raw meat at the beginning run. It's an easy run and it actually softens up the case and it makes things easier and gives you a time to
check the terminal and make sure that it all ran all right and so forth and it's actually advancing the pc toward clearing.

But there are faster things to do to actually obtain a free, floating needle, which is what you're very close to on this first run. You'll – you'll swear to Pete that you must be looking at a... Occasionally, you'll see one come in and go out again running some of these things.

Now, there are several things you can do. I'm not going to delineate these things; it's toward the end of the lecture and none of you are up that far anyhow. But remember now, to watch after your assessment – on your first assessment run on the pc's terminal – to watch it very carefully that you don't run that tone arm up and stick it and keep it stuck for an hour or two. This is just cruel and it is stupid and the case is getting nowhere and of course, violates a moving tone arm. If the case is getting anywhere, the tone arm is moving and believe me, that tone arm isn't going to be moving on the early runs. It goes up and it sticks.

Let it go up as high as it'll go up. Don't check it from going up. Let it go as high as it goes. Fine, so it went to 6.5. Who cares? If that's where it's going to stick, if that's the Goals Problem Mass density, all right. So it's 6.5. It just makes it a little tough on you because the E-Meter won't read 7.

But you know, a constant little rising drift of the needle and so forth, that's not a stuck meter. It's when that rising stops and when everything stops and when everything has been stopped and it isn't going anywhere at all. You get off of that, man. Just get off of it as soon as you're sure.

Now, you've got lots of latitude. You could probably sit there and run it for another half an hour without doing anybody any damage. You'd still reassess and so forth.

The pc would squawk. They'd say things are getting a little bit tight and they couldn't think of answers and they feel uncomfortable and they were beginning to feel a little bit nervous and what were you doing and the rudiments tend to start to go out, and things like that.

But you could run it over a half an hour without getting into severe trouble. I'm asking for you to overrun it maybe 10 or 15 minutes at the absolute outside. It's much more comfortable on the pc. But run it to a stuck needle – stuck arm, stuck needle.

First the arm will stick and then you'll watch the needle stick, too. It won't happen suddenly. It'll go – everything will drift to a slow halt.

Now, you're going to make this mistake. You're going to say, "Well, look, if I say the level to them – Interest, Interest, Interest – well, I still get a bang on this thing. The level is still registering on the meter, so therefore it couldn't be stuck." Well, that's all you are going to get off of it, is the level ticking. You can get a tick off the level, and that is the last motion in it.

And when you reassess the level, you won't find that tick is in the level anymore. If anything, you're ticking off your own auditing commands, which is the probability. But it'll actually freeze up and will still tick. You know, I mean you say, "Interest." And when you first assessed Interest, you got a half a division of theta bop, see, when you assessed it. So you say, "Interest" to the person and you get a half a division theta bop. You say, "Interest," you
get half a division theta bop. You say, "Interest." It has to be a very meaningful interest for you to get a twitch.

But you can still say that to the person after the arm is stuck on running the level Interest. And then come off of it and reassess, and you will find Interest is – won't ever get another read on Interest. That's it, it's gone. See what I mean?

So don't – I'm just telling you, you can make a little mistake. You can say to yourself: "Well, no – . When I say 'interest' I can see that thing going bic, you know. I can see it going – [snaps fingers]. So therefore, therefore, Interest as a level is still alive." No, it's not.

Interest as a level is as dead as the tone arm is motionless, as the needle is going nowhere on the whole command.

You'll see these things really slow down. It's just like sinking a pc into the middle asphalt. Thud. He just walks down to a complete stop. And of course, you've run him into the opposing vectors and that sort of thing. Very interesting, because you'd swear you were killing the pc and you'd think it was a poor show. And you'd think there was no way out of it.

Well, there are ways out of it. The Prehav Scale itself is a way out of it, well audited. There's one more thin strand of rope that goes the rest of the way across the canyon, which is a pat series of auditing commands that will walk out of it.

Unfortunately, there is just one series that walks out of it very easily and very rapidly. Others walk out of it in other ways. And there are many other things you can do. Don't think we've run out of that. But there is at this moment only one auditing process.

We're at this frail point of Scientology. As far as broad, general, thorough everybody clearing is concerned, we have one Routine – 3D – that is that will lead them actually directly toward Clear, not straighten up their lives or that sort of thing. We got Class II techniques that do that. But I'm talking about clearing techniques. We just really have one.

Don't think you still have 3. I wouldn't let you run it. I mean Routine 3. I wouldn't let you run it anymore. It would be senseless. It's too hit or miss.

And we've got one process that finishes up the Prehav Scale. We got one Prehav Scale and after that we've got just one process that apparently does it all. Boy, that's no riches, is it? And if you bitch these things up on a pc, I'm going to give an auditor a process to run on you that'll run you straight into it and that nothing can undo. [laughter]

Because it's something on the order – I will warn you, on some pcs it's something on the – it's scary. It's something on the order of sending a guy to swim the Hellespont with one piece of string to pull him back with, you know. It's a little bit scary.

So do a good job on it, huh?

And that's why you must never, never, never, never, never, never, never let anybody run 3D that isn't a Class II Auditor of superlative skill and who is able to do 3D assessments. You understand? Don't let anybody monkey with it or you'll have more pcs to fish out of the drink. And at this stage at least nothing to fish them out with as far as I'm concerned, because I know nothing now but this tightrope. There's just one rope, one Prehav
level line and one process which salvages it all. That's all we've got. Those are all the riches you've got. You're rich as long as you're skillful, but then who isn't.

Thank you very much.
Okay. Here we are at the 22nd of November 1961.

And there you are. Horrible, isn't it? [laughter] Grim, huh?

All right. Your E-Metering is the sole reason you are having any difficulty making anything work – period. That is it.

Now, gross auditing errors are always something you look for. If you're ever supervising a group of auditors or an HGC or something of this sort, let me call attention to one horrible, horrible fact: the request for the extraordinary solution. Anybody supervising a group of auditors routinely gets requests for extraordinary solutions, and if you don't know this little datum, you will lay ostrich eggs. You will give people the extraordinary solution. It is never the extraordinary solution that is needed. What you have to do is locate the gross auditing error. That is always the case.

I myself have had to learn this the hard way over the years. Staff auditor used to come to me occasionally and say, "Well, so-and-so and so-and-so and we have to do this and we have to do that, and my goodness, and the pc just can't remember, and the cats are running in and out of the bank, and everything is going mad and would you please, please, please tell me some good process to run on this pc that can handle all this."

Well, I'd take what he said, dream up a process for what he said and then go in and run – he'd run it on the pc. All right. That was very fine. But here was all that was wrong. Usually, by the way, the next day he would come in and say, "Well, that didn't work." How interesting. And I eventually learned to be smart enough and clever enough that – I was taught this in California, by the way; I was taught this the hard way – to say, "Well, what didn't work?"

I'd told him, you know, this or that or the other thing, and then he'd say, "That didn't work." And I would say, "What didn't work?" And he's supposed to have run this, you see, within the last couple of hours. "What didn't work?" Well, he's very often fumble with his papers or try to remember or something of the sort. "Well, come on. What didn't work? What were you supposed to do?" And I finally found out that the extraordinary solution was never applied. It wasn't that didn't work; it was whatever was done didn't work. But there was a wide difference between what was supposed to be done and what was done.

All right. That's not apropos of anything. That's the gross auditing error. The gross auditing error is the extraordinary solution which was thought up at such ardor, of course, never got applied to the pc and so, of course, it didn't work, and that was the gross auditing error. Do you see what I mean by a gross auditing error?
All right. Gross auditing error – another example of one: They didn't have a session. See, that's order of magnitude, see? I don't mean they sat there and didn't do it right. I mean the pc just didn't arrive and the audit – or the auditor didn't report. See, that's the gross auditing error. That's why the process didn't make any advance, why the pc didn't make a recovery. All right. The E-Meter was broken throughout the session and the auditor didn't notice it. Gross auditing error, you see?

And your imagination, when you're called upon to do supervision work of this kind, must never be drawn in – as it would be, actually; it's quite natural for your imagination to be drawn in, wondering what is wrong with this pc; because you yourself are an auditor, don't you see, and you know if you were sitting there, you'd be worried about the pc. So when the – when it's reported to you such-and-so about the pc, you of course do a Q-and-A and you start worrying about the pc.

Well, don't worry about the pc if you're supervising auditing. Worry about the auditor. Just short-circuit it just like that, because today, today we don't have flubs. Five years ago? Yeah. Six, seven years ago? Oh, yeah. Extraordinary solutions required every now and then.

But you mean to tell me that somebody can actually have a Problems Intensive run on him right and not have anything happen of any kind whatsoever? You mean to tell me that somebody can have a Form 3 Joburg run on them from one end to the other and not get any kind of a cognition or a case gain? This, by the way, is just not possible. It just couldn't happen if the Joburg were administered, if the Problems Intensive were done. See?

So, now, look at it this way: Nothing happened to the pc's case by reason of having had a Joburg run from one end to the other and a Problems Intensive. And we get the pc's profile, and it's not gone down into a more normal profile from a very, very high one, or it's not gone up from a low profile to a middle-ground one, or something like this; there hasn't anything happened to this graph, and yet for twenty-five hours, allegedly, somebody was supposed to be giving this person a Problems Intensive, and somebody was supposed to be giving this person maybe a Security Check, you see, along with it, or security checking the areas of prior confusion and nothing happened to this graph.

Ah, well, don't blow your brains out because you haven't got technology that works. No, you've got a gross auditing error of some kind or another. And the gross auditing error is of the order of magnitude that I just gave you. It actually isn't even as mild as, well, the auditor hasn't been security checked and therefore he doesn't have much reality on a Security Check or has withholds and won't dig them out of a pc. You see, these are all rationalizations, and these are all true, but they are not big enough to get in the road of a gain. See, that's what you should realize. These little errors aren't big enough to get in the road of a gain. Honest. You can sit there practically cross-eyed and run some sort of a Form 3 and clean up every question on the thing. And you mean to tell me at the end of this thing your pc is not going to be in good shape? Oh, but you could run a Form 3 this way: broken E-Meter, cans aren't connected, break in the wire, thing sits at 2 all the time, still.

"I know," you say, "well, that's impossible for anybody not to realize that."

Well, that's the trouble with it. It is so incredible that it never gets recognized. What is going on is so incredible that it evades your sense of propriety, your sense of the fitness of
things, your sense of what is right and what is wrong. And it is so violated – that sense – you see, that you never see what is wrong.

You may have a whole HGC – maybe new auditors, something like that – and they're all running Problems Intensives, and they're getting no results. Oh, yeah? Well, how fascinating! Well, then, let's look at the D of P. Does he know how to run a Problems Intensive? Let's look at these auditors. Do – what are they doing? Well, maybe using some version or form or something. There's something wrong here someplace. Or they aren't holding sessions. Or one of them is a yogi, and all of the pcs are sitting there meditating for twenty-five hours. Or there's something real wild here, man.

And amongst these wildnesses is not reading an E-Meter. And that's what I'm talking to you about today. Just reading an E-Meter. That's all. I'm trying to make the point here. Not reading the E-Meter is a gross auditing error. That's all.

Now, you cannot afford a difficulty with an E-Meter while doing a 3D. Ha-ha-ha-ha! Ka-wow! In the first place, you're sitting there chanting over and over and over opposition terminals and opposition goals to a pc who is at best in a rather shaky state. And he just feels like he's being totally overwhelmed. And if you don't read an E-Meter rapidly and you don't assess rapidly, the pc just goes more and more sluggish and gets actually harder and harder to read and it becomes more and more difficult to do an assessment on the opp goal and the opp terminal.

Well, what could start this? Some misconception. It isn't anything esoteric. It is just some misconception about an E-Meter. It's just something that the auditor just had not quite had straightened out, that's all.

He's been – well, I've used this example before. The old-time, self-taught pilot was the most interesting character amongst all this. The old-time, self-taught pilot used to go out and get in an "airplane," and he used to take it off, and he flew by the seat of his pants, and he had no bank-and-turn indicator and no altimeter, and he got accustomed to knowing when he was a thousand feet high because the houses were of such and such a size. But, of course, this has never been borne out by an altimeter. And he gets in a modern plane that's all equipped with instruments, and he looks over the side, and he sees the houses are of such and such a size, so he knows he's a thousand feet high. Well, actually, from the day he first started to fly, there has been no slightest check on this particular point. He knows when he's a thousand feet high. He knows this, you see? And he's supposed to be in a flight pattern, and the flight pattern can't be varied by more than five hundred feet either way or he runs into other airplanes. And right away his estimate of a thousand feet high is put to an instrument test, and it is found to be very incorrect. He's always been flying at two thousand feet when he thought he was at one thousand feet, and I mean it's as simple as that.

Now, because he has learned this way, he gets into the habit of challenging the ammeter – the altimeter. The altimeter says that he's at two thousand feet, so it must have been broken, it couldn't have been set back at the last field, obviously, so he ignores it. See, he still takes the size of the houses. And then one day there's a dull, splintering crash in the sky above the control tower and bits of passengers come fluttering down like snowflakes. You see, he
didn't know he was doing anything wrong, and anything that contradicted his basic training pattern, of course, must have been wrong, so he never did a cross-check.

And we have auditors around who are doing this sort of thing. Now, before you feel bad about it and feel that I am chewing you out in any shape or form about it, let me tell you a funny story.

Once upon a time, in 1951, at 910 North Yale, Wichita, Kansas, an instrument was laid down on my desk. And it was a funny-looking instrument: It was black, and it had a dial, and it had some – it had a kind of a needle on it, and it had a – some knobs on the front of it. And so I looked at it and yawned and said, "Well, that's very interesting," and so on. And there was a message with it. It was from old Volney Mathison, and he said, "When you gave a lecture out in Los Angeles down at South Hoover, you said you would give anything to have an instrument ..." (it was – it must have been in November of 50) "... have an instrument that would tell what the pc was doing." And I had meantime been trying to develop all sorts of observational things, you know? You know, if a pc does this or that. I've even run pcs with my fingers on their pulse, you know? "If I just had such an instrument, or if such an instrument could be developed (because it doesn't exist at this moment; the old galvanometers are too bad), why, I would be a very happy man indeed."

And actually he'd gone home and breadboarded one up, and it had taken him many, many months, and he'd finally hooked together this contraption, and he'd sent it to me and there it was. So I thought that was very, very interesting. And I had it taken home to 910 North Yale, and that night, why, I sat looking at this thing, and we hooked it up and put somebody on it and tried to make the needle wiggle, and so forth, and it didn't work. The needle wouldn't wiggle. And – couple of little tiny metal bars – they were only about a, I don't know, a quarter of an inch in diameter. Somebody was supposed to hang on to these metal bars, and they just were not big enough to even wrap your hands around. So I got to thinking about this, and Elliot got to thinking about this, and so on, and all of a sudden, why, got a brilliant idea and said, "You know, I believe a couple of soup cans, if they could be hooked on to those wires, might give enough surface to read." Because we couldn't get a read. We couldn't even tell if the pc was on it or not on it, you see?

And so Jim went out in the kitchen and he took the labels off a couple of soup cans, and he came back in and he screwed a couple of clips onto the leads, and he put these soup cans on the thing, and then we could squeeze them, and, by George, a pc would read and the thing wouldn't be flickering all over the place, and it was – you could read something was going on. So we knew something was going on, and that was what we knew about it.

A projection meter showed up a short time later, but it was the same breed of cat. Wasn't anything you could do with these things. They were very interesting and something might come out of them.

That's why you occasionally hear electrodes called cans. That is the total reason. Because for the first many years of E-Meter history they were always soup cans. And at the HGC in Washington, DC, people have just been stuffed to the gunwales with V8 vegetable juice, for the excellent reason that the American Can Company will not sell a naked tin can. You have to buy it full of something. So the way they got electrodes there, for the manufac-
ture of E-Meters, was to buy V8 vegetable juice, being the cheapest tinned anything. And, of course, they're perfectly marvelous steel cans, and they cut the tops off very carefully and poured the vegetable juice down anybody, you see, that would stand still, [laughter] rather than throw it away. Everybody was sure healthy in those days. And those were the – those were electrodes.

And so fixed was the idea finally in my mind – because I've seen plenty of them. I've seen tea strainers with a strap around the middle of them that could be held in one hand. That's very nice – a tea strainer, could be held in one hand, separated one from the other. It's a little – looks like a little egg. And a can lead to one side of it, another lead to the other side of it, and that held in the hand. They're actually not very good, but they do work, but not very well. And Mathison's got sold on that and of later years he built nothing but tea-strainer-type electrodes, and he didn't get very good reads either.

But anyhow, that's a workable type of electrode. But I was so used to people changing electrodes and so used to the behavior of an E-Meter when operated on a metal soup can that I couldn't shift. I didn't know what I was reading the second we moved out of that perimeter. See, I'd gotten everything more or less trained into that perimeter, until the British meters coming over to be checked out by me all had these aluminum pipes. And I'd look at them, and I didn't know, and so forth, and I'd take the aluminum pipes off and put vegetable cans on and test the meter. And then I would send the aluminum pipes back with the meter and tell them they better use cans, and so forth.

And one day I asked old Don if he wouldn't run a check between these aluminum pipe pieces and tin cans, and he found out there was no difference between the two. Now, actually there is a difference between the two. The tin can gives you a better surge on a can squeeze. And the aluminum pipe being smaller, when the pc closes his hands to get a drop, more skin is touched to the thing and gives you the appearance of a looser needle than is actually there. Interesting. Whereas a tomato-juice can, it's the metal itself which is collapsing, and you're not getting additional surface by reason of a can squeeze. And they're actually a bit better, even today.

But anyway, to go back to old 910 North Yale, for days and days the thing just sat there. I didn't pay any attention to it. And then Mary Sue and I got busy on the thing, and I started sketching it out, and I'd put her on the thing, and then we'd put somebody else on it, and we'd test things out, and we finally got so we could locate incidents. That was very early in 51. And we got so we could locate incidents pretty well and then started to do actual research. And the first skill of the E-Meter was actually dating That was the first skill of the E-Meter: dating – learning how to date something on the track.

And the second we started dating things on the track, we started to find the most incredible things. To this day I can still find a sixteen-dial drop on almost any pc. Did you ever see a needle drop sixteen consecutive dials? Well, the incidents on the beach, the on-the-beach incidents, and so forth, if you locate them just right and you move into them suddenly, will give you a sixteen-dial drop. Interesting, isn't it? That's the widest drops available. All kinds of electronic incidents. We explored all over the doggone place with this E-Meter.
And I finally got so that I could operate an E-Meter. But I still thought the higher it went, the clearer the person was. Imagine that. During all of 1951 that error progressed, and you will see it to this day on Mathison meters.

The old Mathison meter is now built for chiropractors and has fifteen or twenty dials that operate on the front and back, and you have to have both your own feet bare so as to have spare hands to twist dials. It doesn't give you any gen. Chiropractors just get them to impress the patients. They don't read anything with them. But the meter is now totally impractical – that particular meter. But nevertheless, it's – the germ of the E-Meter was in that chassis.

I had to fool with an E-Meter for about three or four months before I could make one do anything. They were just dead ducks as far as I was concerned. They were just a piece of metal. And I'd put it on a pc and I would much – be much happier to take my judgment of what was wrong with a pc than what the E-Meter said. And the first five months of E-Meter experimentation and use, and so forth, were on – right on that basis. I didn't know what a meter was talking about. I had no reality on the meter. And here's something else: For the next three years, at least, any time you put another E-Meter in my hands I had to learn to use an E-Meter all over again. All you had to do was change meters on me. Well, of course, meters in those days were tremendously variable. There were big differences from meter to meter, don't you see? But it would really just take me weeks of fooling around with the meter until I had any confidence in what it was reading at all because they looked different to me.

Now, that's why I insist on standardization. And that is one of the reasons why I raise so much Cain about squirrel meters, meters built to anybody's specification. Somebody says, "Well, I want one with a very sensitive needle." You see? Well, all right. So you build a E-Meter, and that fellow will learn how to use that E-Meter, but that E-Meter now doesn't react like any other E-Meter, so you can't relay data between him and somebody else, don't you see? And if that E-Meter ever falls into another auditor's hands, the other auditor isn't used to it and doesn't trust it. See, it takes a terrific standardization of meters.

That's why I reserve the rights to check out and pass any E-Meter and why we actually are the people who put them together. Because if we – it's not that we maybe put them together better or worse than anything else, although we have achieved some tremendous gains in these things, but we know they're standard. We know we can take this meter here and issue it to you, and it will behave the same as the last meter of this type you were running, see? And I can pick up any meter out of stock and operate with it and it won't operate any different than any other meter. And it's perfectly all right.

Of course, I've gotten used to it to a point where I can actually run these old-time battery meters. We've got some in the electrical shop in there. You ought to see the things. They were the original London meters. They are the weirdest meters you ever wanted to see. They're a little battery-operated meter with a funny-looking circular dial. They're funny. You wouldn't hardly believe they were an E-Meter. And as far as operation is concerned, their sensitivity is that if you had a bull on one and you hit him with an ax, it'd register.

But anyway, on this basis it would actually take me weeks to learn a new meter. And if anything happened to my E-Meter, I would just groan loudly because I knew now that I
would have another meter around and I just had no confidence in the new meter at all. It was something – I didn't know what it was telling me or why it was telling me that, and so on.

So I have a very vivid subjective reality on what an auditor faces when he starts learning to run with an E-Meter.

Now, for a number of years we went along without E-Meters. Now, one of the reasons why, through the middle fifties, we didn't press E-Meters or do anything much with E-Meters, and so forth, is they had become too complicated. And if you leave anything in the hands of Homo sap very long, he will manage to complicate it. He'll put two dials on it where it only needs one, and he'll put three or four variables on it, and then he'll hook some more pinball machines to it, and the next thing you know, you've filled the room full of junk in order to find the temperature of somebody's tea. You know, you've got all kinds of relays and shunts and printed circuits and electric bars and everything else, and eventually you can tell how hot the fellow's cup of tea is when all you had to do in the first place was ask him to sip it. The order of magnitude which they run into of accuracy and all that sort of thing is too bad.

But, auditors, frankly could not run E-Meters easily or well, and it was enough of a barrier to me that I just called a halt on the thing, and eventually in Washington in the late fifties got a meter designed which I was happy with and which was fairly steady and reliable. We're working on that particular basic meter, which was transportable. Do you know the old meters were mains meters? You plugged them into the mains, and you didn't know whether you were going to electrocute the pc or not.

One of the reasons we stopped using Mathison's is because you could get full mains current between the two electrodes, occasionally, and the cases very often shorted. They were not well made, and you put a pc on them, and he's liable to get a bad shock. But more important than that, even when they were working properly, the current between the two electrodes was some high amperage and the pc could feel it. You know, any pc could feel it.

Now, once in a while you'll get a pc on one of these little battery meters, one of the modern meters, and he'll tell you he can feel the current. Well, he's really being very hypersensitive to electricity. It isn't uncomfortable. He can feel a kind of a tickle of a surge and so on. Well, that means he's just implanted too many people in his day, that's all. That's – it's made him nervous about electricity.

Because I don't know what the true amperage is that goes between the two electrodes in a modern British Mark IV, but it is something very microscopic. I haven't measured it so I won't give you a figure, but it's just so tiny as to be nothing.

Now, we've advanced meters to a point, actually, where the shelf life of the batteries in this meter – the old meters, you see, were mains meters. We tried to make battery meters, and then the batteries would go flat in the middle of the session, and you'd have randomness this way. And we finally got a meter here that the shelf life of the battery – that's how fast will the batteries discharge lying on a shelf – and the operating current of the meter is almost exactly the same. And it – frankly, it doesn't matter whether you leave this meter on or turn this meter off; it uses the same amount of current. Isn't that interesting. Now that – that was quite a development. We're indebted to this Fowler and Allen over here for that.
Now, the British Mark IV, of course, has a high degree of standardization. Some improvements could have been made on the meter, such as improving the sensitivity so that you could turn it off further. But what do you know? If you turn the sensitivity down any further on a meter than is on this British Mark IV, the pc never reads anymore. You've got to have a certain degree of sensitivity in order to get the pc to read. And on a full-dial drop at zero, you'll notice the pc reads, if he's about -- well, he's a -- if a pc is a Release, why, he will read then pretty well. Well, if you could reduce the sensitivity, the first thing that would disappear off of it would be the pc. Get the idea? I mean, it has to be a dial drop on a Release.

As a person becomes closer and closer to Clear, although the needle is swinging wider and wider, the surge that the pc puts into the meter is less and less because he's got less and less charge on the bank. So you have to have that high a setting to get the pc to register. And as a person is run through 3D, you'll notice this particularly. You'll notice that you start getting the thing wider and wider swing, and it starts banging around, but frankly the pc isn't reading very much, and you're down there just trying to read just awful hard, and you've got an awfully wide swinging needle, and the pc isn't reading very much. Actually, that little tiny read would have been quite a charge.

Now, when you start out the pc, there is no excess swing. It is all pc. The pc is plugged into the physical universe with soldered connections, you see? And you say, "Well, do you have a present time problem?" *H-wha-a-am!* You see a half-a-dial drop. "Yes, well, what was the problem?" you say, thinking, you know, the bank has been robbed or he's just been disinherited or something of the sort.

And it's, "Well, my -- I don't know. Well, *ug* -- actually, it was my wife looked at me as I went out the door, and uh, I don't know whether she's mad at me or not."

And you look in vain for any more problem than that. But it's a terrible problem, see?

Well now, that similar thing, "Do you have an ARC break?" and you get this little tiny twitch.

And, "Yes. When you came in and shouted at me that you weren't going to audit me anymore." And it's just a little, tiny twitch. See, the pc isn't heavily charged. These things don't have a violent effect upon the pc, but they still can be read. Do you see what I'm talking about?

As the case advances, actually the amount of charge still on the case is less, so therefore you don't get much read. But therefore you have to have a fairly advanced sensitivity in order to read what charge is left. That's the important point on that.

Well, all these meters these days read the same, and that's a good thing. Actually, the British meter reads remarkably similar to the early American meter. All meters from here on will be British Mark IVs. We're cutting out the original American meter. Why? Well, it just hasn't kept pace with this meter, because I've been, of course, working with development on this meter here for another two years beyond the American meter.

The American meter is more rugged and stands up to more punishment than the first British Mark IVs, but we finally got these things so they don't. Actually, the American meter will do the same as a British meter if you do the same things with it. You realize that a British
Mark IV most of the time has been shipped through stratospheric conditions before it arrives at an other-continent destination. And it busts it up. It – that is to say, it'll burst the batteries. You know, subzero cold and all of this sort of thing. A meter going from here to Australia has been transferred between British climate and many, many, many, many degrees below zero as the jet flies, you see, and has landed into smoking hot India, smoking hot Saigon, you see, and has gone from ice-cold to smoking hot to ice-cold to smoking hot to ice-cold to smoking hot and is then put into your hands in Australia. Well, that's what we've had to do with meters: get them so they'd stand that, because ordinary batteries won't stand it. If you – if you, for instance, leave this meter, or any meter, in the baggage compartment – you put it in your suitcase, in other words – and let the people put it in the baggage compartment of the airplane, get it the other end, every now and then you'll find your meter arrives unworking. Why? Batteries are shot. It's been treated to extremes of cold and heat but that is not anything to do with the meter. That's to do with Homo Sapiens's inability to construct a proper storage battery.

I remember in the old days we used to have some batteries, you know? They were some real batteries. Be a little thing about the size of a button, you know, and a little tiny disc, and you could carry a half a dozen to spare, and one of them would drive a car a hundred thousand miles or run an artillery cannon, you know? That was pretty good. You used to shove these things in – that's why you can get these Buck Rogers flying belts and things like that. It's all contained in the battery.

The ability of the mechanics – the electromechanics of any civilization are totally dependent upon source of supply and its portability. I learned that when I was about seven or eight, nine. I was trying to build Meccano set locomotives that would run themselves around on the floor, only I couldn't get a light enough electric motor, and I couldn't get a light enough set of batteries, so the resultant locomotive, of course, couldn't pull the load of its power supply. You keep running into that all the time. Any civilization is limited in its electromechanics – in its cars, its airplanes and everything else – to the engine or the battery supply. That's the whole works.

Similarly, this one has been limited to that. But that's its main frailty right now, is that if you get it too cold and too hot repetitively, why, its batteries burst. But of course, any batteries burst. Has nothing to do with the E-Meter. You can't get a battery that won't.

But the shelf life of the battery is the same as the running life of the E-Meter. Don't faint, don't faint because you come in, open up your E-Meter case and find out you left it on. Turn it off by all means and centralize your center button, but don't faint, because it didn't burn any more on than off. And the batteries in them last a year, a year and a half or something like that and then you dig them out and put a few sixpence batteries in them, and they work the same. All right.

Regardless of all that, the E-Meter has evolved up to a greater constant. You can take one meter, and it works the same as another meter, and so it's safe to learn to use an E-Meter. They're not going to vary, and nobody is going to shift E-Meters on you.

If we bring out another meter, it will be so confoundedly different than an E-Meter in terms of read that you'll have to learn it all over again anyhow, but for another purpose. It'll be an oscilloscope or something of that sort, although our first little timid ventures into this were
– they sort of left a tremendous amount to be desired. They left me with awe for our present E-Meter. Our present E-Meter is absolutely fabulous.

If you don't believe it, conduct some experiments with an oscilloscope and you find out they're all body read. You can't get the mind to read, but you can sure get the body to read. A person gets within four feet of the electrodes, and the oscilloscope starts dancing. In other words, the presence of the auditor against the meter would be probably a greater influence than the presence of the pc against the electrodes. So if the auditor was worried that day, why, you'd get nothing but bounces and crashes. You see? I mean, there's something. It's a rather marvelous instrument.

I notice now that we have pioneered forward and people are now selling pocket lie detectors and toy lie detectors, and that nearly every large psychological establishment is complete with lie detectors. Don't get them confused with an E-Meter. They haven't got anything as good as an E-Meter, and they don't know how to run them.

Now let me come to this other point, help your pride along a little bit. There are thousands and thousands and thousands of cops, bums, psychologists, tramps, drunks, in the United States that have been trained to use lie detectors, and trained up at the Keeler Institute for a year or two to read lie detectors, and they cannot make any sense out of them at all. So don't feel bad about this.

Now, a lie detector has several different facets that an E-Meter doesn't have. It's an electrogalvanometer, and the original circuit of this is about a hundred years old. It's a Wheatstone bridge. And this is so different than the original Wheatstone-bridge circuit and so different than an electrogalvanometer, there's hardly any – they're hardly cousins. They work on the same principle, but you have to know a lot more. And the original is still in an eighteen-thousand-dollar lie detector. They've still got an original Wheatstone bridge sitting there – not a decent E-Meter, you see?

You'll be fooled, because you go in and it's got a nice chromium-plated face, you know? The dial is all duded up, you know, and nice curlicues on the needle and very modern pastel designs, you know? And you'll say, "That's really something." If you took the back of it off, you'd find it's the same thing as Wheatstone built a hundred years ago. They haven't advanced a hair. Now, that is an electrode proposition, but is sometimes used as a footplate, sometimes used as a handplate, sometimes used as an armplate. And one of the ways they do it is put a plate over here on the side of the table and split it in half and make somebody lay his arm on the plate and strap it down. That's one of the crude effects of it.

What they depend on has absolutely nothing to do with the mental currents in the mind. These boys are so sold on meat! Man, you know, you'd think they'd been in the butcher business for years. They're really stuck on this stuff. And they're so sold on meat that they take all of their reads – that they believe – from respiration and blood pressure. In other words, they read the pc with body motion. Don't think there is any difference. This is what they're using to hang men with. Body motion – that's the respiration and blood pressure.

And they take one of these standard – it's the same one that your medico used on you the last time you had a physical examination. You know how damned uncomfortable that was. They wrap this rubber balloon around your arm and they have a pump over here and they
have a mercury stand, and they pump the thing up, see? They pump it up, you know, and the blood goes *svooo, svooo, svooo, svooo, svooo*. And you feel all – feel like somebody is breaking your arm off, and it breaks a lot of the veins in the arm too, by the way. Yeah, you can see the scars of these things for a week or two after they've been on somebody. And they pump it up, and then there's two little pens, and they go along on a long tape, and they trace every pump of the blood and every *uh-ha-uh-ha*, pant, of the lungs. And they put some kind of a plate across the fellow's che-

When they get this guy in there, you'd think he was being put in a jet plane to go on one of these fictitious Russian trips. Man, he's really wired for sound, you know? And he's got this thing, and this looks like a backpack or something, and so he goes *uh-ha-uh-ha, you know*? And that one little pen goes *uh-ha-uh-ha-uh-ha-uh-ha*. And then he goes pump-pump on the blood, and the other pen goes *zzzz-zz*, and actually this psychogalvanometer, as an afterthought over here, makes another trail on a third pen. And they have these three pens going like this, and the operator can sit there with this polygraph, and then they write down the various questions on the edge of it, and the pens go wiggle-wiggle, and if the fellow was tired that day and was panting more than the other they hang him. The error of those things is fabulous. The machine costs eighteen thousand dollars.

Now, they try to train people on these, and out of these thousands and thousands of people that they've tried to train, let me tell you something: There are only two hundred operators in the United States the police departments trust. Two hundred operators, out of the thousands and thousands and thousands they've tried to train. That's interesting, isn't it? And remember that not one of those two hundred operators knows anything about past lives, restimulation, mental masses, mental image pictures, engrams. He knows nothing about the Tone Scale. He knows absolutely nothing about the Chart of Attitudes. He knows nothing about stimulus-response stimulus. He knows nothing about overt acts. He thinks the mind is a piece of meat, and if the person pants he's guilty.

All right. Now, there's E-Metering as it exists out in the wide, large world these days. So don't you feel too bad if you have a little bit of a struggle trying to learn how to use an E-Meter. Because if you can't read somebody's breathing, you ought to quit.

Understand, these are three little pens, and they make a wild, widely different trace. And every time they say "pocketbook" – they've got some pickpocket on the thing, you see – and they say "pocketbook," and the thing jumps, you see? "Ah well, he's guilty. That's it. That's it. Arrest him! Take him down. Shoot him." Boom. You know? Well, you and I know – "pocketbook," for Christ's sakes. Supposing we had a – supposing we put a Scotchman on the thing? [laughter]

Well, there are two hundred of that kind of experts. So you are actually being asked to go way, way, way, way in advance of any of these characters with a much more modern machine, which doesn't have little pens that go *blingety-bling*, and that doesn't give you a long trace.

Now, some chap in the United States invented for us, as a favor, a sort of a polygraph that would give an E-Meter trace, and it gives you the thing on tracing paper and that sort of
thing. As far as I'm concerned, one wasn't built up that I was – put into my hands so that I can
duplicate. But it was designed.

Now, maybe this would be a good thing that as you were assessing, you could put the
number of the assessment question down against each piece of polygraph and then analyze it
later, and so forth, at your leisure, and that sort of thing. But at the same time, you would find
this so gruesome in terms of speed that you would go mad, because you've got to write a
bunch of things over here on the polygraph and do a reanalysis of the whole thing, and you
wouldn't really know what you were doing at the time you were doing it; you would know
later each time, you see? And you wouldn't come up with your answer at the end run.

Well, the way you – the way you've got to do. of course, is to pick off the information
as it occurs, and you are actually the recording medium and you write it down – the informa-
tion that has occurred – or you act on it. But you do something with the information when it
occurs. This is a present time machine. If you get the information you have to use it now. You
take a – you haven't got time to analyze graphs or something. If you're trying to get rudiments
in and you find a rudiment is out, you want to be able to put that rudiment in now. So you
haven't any time to send it down to the laboratory and then after a while everybody makes it
out in quintuplicate and then takes some Thermofax of it and sends it back, and then the fol-
lowing day you have gotten to the second part of the rudiments, you see? You can go on now
because you have found that the room was all right. Doesn't sound very practical, does it?

Now, as a substitute for that, you've got to be able to catch these reads on the fly.
You've got to catch them when they happen. The read happens, you've got to catch it when it
happens, and if you're not sure of it, you've got to ask for it again.

Now, the gross errors, however, in reading an E-Meter – I hate to tell you this to your
face because you are undergoing them right this minute, but of course, to an old, grizzled E-
Meter operator are, of course, laughable in the extreme. They are utterly ridiculous: like hav-
ing to keep the needle at set before it can be read. Where did this come from? See? An E-
Meter operator has actually got to be able to read a needle when it just is flying all over the
place. Well, that it's flying all over the place doesn't invalidate any information you get off of
it. Your read occurs while it is – while the needle is drifting around. It doesn't matter whether
it's drifting up or drifting down. You ask somebody for something, that needle is going to stop
for a minute or it's going to shift for a moment in its pattern, and it's going to change what it's
doing as a response to your question, and because it changed for a response to the question,
why, then, of course, it's a valid read.

But you will find that if we had it here, why, somebody else can run into it elsewhere.
And you find out that people actually believe that the meter can only be read when it's at set
and dead still. Well now, you cannot crank one of these meters down far enough to make it
dead still and still have it read on the pc. It just can't be done. I'm now – I'm sorry if I'm step-
ning on some toes here.

That's why I've told you. Now look, I've been all over the ground on this. I even be-
lieved at one time that the higher the arm went, the clearer the pc was. And you'll find that
marking is preserved to this day on the old Mathison meters. It shows the Tone Scale is plot-
ted over here and that's why you call it the tone arm. It's a total misnomer, and 1, 2, 3, 4, 5 and
6 are plotted against those points – this actually – this numbering is different. This is more reasonable because we've gotten at it. But actually the old Tone Scale numbers that you have on the plus and minus Tone Scale were over here on the tone arm, and if you got over to Tone 40, why, the fellow was totally out the top.

So now I've made mistakes on these meters and I've had a hell of a time reading some meters. And I had a manic-depressive on a meter one time. That needle was shimmying around. Wow, you talk about an unreadable – sensitivity all the way off, and I've never seen a needle like it since, by the way, and it was just in constant hectic motion. It was just swinging about a quarter of the dial constantly, and there was just nothing you could do to shut it down far enough to make it readable. It just was a wild something or other. Why? Well, it was reading all the time. Yeah, but what was it reading? Of course, that was on an old meter; I couldn't vary the sensitivity.

People, you know, often used to go off the bottom of the old meters and off the top of the old meters! This, fortunately, is continuous all the way around. Nobody ever goes off the top or the bottom of the thing, but they sometimes go to 7, and that spot isn't marked on the meter. And because the pot on the tone arm here gets in your road, you can't turn it to 7. But you now and then will front up to this incredible thing that your E-Meter isn't reading, and you – don't be embarrassed if the first time this happens to you, you think your meter is shut off or the cans have busted down or the connections are gone or it's unplugged or something has happened because you can't find the pc on it. Well, the pc lies between 1 and 6, and I call to your attention that on a Mark IV you cannot get the needle to 1 to – between 1 and 6 at the bottom. Actually, he will go from 1 around here to 6.5, 1 to 6.5, 1 to 6.5, 1 – that's to catch the consecutive read. Actually, he's passing through the bottom. It's 1 to 6.5, it's 1 to 6.5. You know, instead of just swinging as you would swing between 3 and 4, you've got to pass around the whole top of the dial in order to get to the other side. You understand? So all of a sudden your E-Meter will shut off and not be reading, and actually the pointer should be down here at 7. So an E-Meter can go to 7.

Little thing like that... All right, if you didn't know something like that, first time it happened to you, why, you'd say, "Oh-oh, there's something wrong with E-Meters. I – I – I – I don't know. I don't trust E-Meters." Well, it's just something you didn't know so you didn't trust it. The meter is unreadable at that time, of course. The needle is doing exactly nothing.

All right. So I've been over all these jumps and I know the various bulls you can make so don't get your – don't be embarrassed. If there's something you don't know about an E-Meter, ask somebody who knows E-Meters, and be satisfied you've got the right answer, because it's the gross auditing error.

How can you get rudiments in if you don't know that a rising needle, stopped, is a read? All you got to do is make it halt just for a split second. You say the guy has a rising needle. Well, of course the needle rises. A rise means nothing. A gradual rise means absolutely nothing. Any kind of a rise means nothing. It just happens, however, that the needle is going over here from right to left. Well, the tone arm would never move if your needle didn't move, so of course the needle is in motion all the time anyhow.
So, up it goes. It's going from over here on the right, up to the extreme left, and somewhere along that line ... It's just doing that, that's all. You ask the pc – you say to the pc, "Well, is it all right to audit in this room?" Well, sure, the only action the needle can possibly have is to twitch. It stops a rise. In other words, it just twitches and goes on rising, of course. Well, that means it damn well isn't all right to audit in this room. That's an out-rudiment.

All right. How about that little twitch? Pretty hard to read, isn't it? You got to be right on the ball there, haven't you? And if you're not on the ball, there you are. Bang! You missed it.

Another thing is it happens instantly, so if you look attentively at the pc and you say, "Is it all right to audit in this room?" and then look at your meter, of course you've missed the read because the read occurred instantly that you said it. The moment the sense got to him, it registered, and it registered that – for that brief instant and was not registering anymore.

Now, a needle swings and moves around, but do you know, we found somebody reading it mostly on body motion, horribly enough. Don't be a psychologist. Don't read an E-Meter on body motion. Well, what's body motion? Well, the only way I can tell you what a body motion is, is to have you do the drill very arduously in E-Meter Essentials. Actually do the drill. Actually get somebody to sit down and go through all kinds of body motions, various classes of body motions. There's respiratory motions; there's fingers off the cans, fingers on the cans; there's this, there's that, and you eventually look at these things and they look entirely different. They haven't any bearing whatsoever on a natural E-Meter read. And as soon as you've seen body motions – you get practice and you know what body motions are – you'll never mistake again a body motion.

But I've seen a very old-time auditor sold with a body motion. I've seen an old-time auditor take a totally incorrect and improper assessment on the basis of a pc selling it. And the pc was lifting her little finger on the back of the can because she wanted that one. And every time that one came by, the pc would lift her finger on the back of the can and put it back on again. And it gave a little, tiny, funny-looking theta bop. And the old-time auditor said to me, "It is a very peculiar-looking motion to the needle, but that's what it is." Oh, and a very short time later realized that the assessment must be all wrong because it was all going haywire, and went back and checked, and the pc just lied like a soldier but finally admitted this; and the auditor got the pc to do it, and they reproduced the motion on the needle and that was what the auditor had been assessing by. It was just a total sell all the way along the line. Very interesting, isn't it?

Well, it's very interesting that a pc will throw a session to this degree. Even an experienced Scientologist being audited can throw a session. Say, "Well, I know what it is. I was up till all hours last night and I was worried about this thing, and I know what it is: It's a soldier. The devil with this monkeying around. It's a soldier, that's all."

And the auditor the next day says, "A soldier," and does something like twitch his shoulder slightly, and it gives a read, of course, on the meter. All the pc has done is practically commit suicide. I mean, it's just as interesting as that. If he wants to really pick up his case and throw it in the sewer – just throw it – try to sell the auditor an improper item, because these items are what they are. But auditors will do it when they're being audited. Even
when they know it, they will still do it. So that doesn't mean just because you're auditing some "old Scientologist," you know, who's been in the business for a long time, that your assessment is always reliable. Oh, no. The older they are, the wiser I get. [laughter] Now I am alert, because this fellow knows how to throw one. He's an expert.

You get a fellow sitting there, and he's trying to cooperate and he helps you out one way or the other – well, if you don't know these various characteristics, you can read them wrong, that's all.

Now, there's nothing very esoteric about it. As a matter of fact, there's a wide, wide difference here. There's a wide difference between a body read and a mental read. They are so recognizably themselves that it's something that, well, it – a fellow feels when he's trying to explain it – as you will someday, even if you don't feel secure about it now – someday you'll say, "Well, how could anybody tell the difference – fail to tell the difference between a theta bop and somebody belching? That would really take some doing." Well, of course, a belch, you're liable to get a rise, and you're liable to get a fall. You're liable to get the proper body motion – the fall and then the rise usually – and it's to a certain distance. But you certainly would never mistake it for a theta bop. You – it'd look like a belch to you, see?

And when you get that, that type of certainty, where the pc could be sixty or seventy feet away from you in an entirely different room and you couldn't see anything that the pc was doing, you could call your shots on the meter – I mean, what was a read and what wasn't – why, you'd be a very good E-Meterer. And I'll let you in on something: I don't think I could do it. I don't think I could be certain every single time that the pc had all of a sudden shifted his finger. I don't think every time, because one of them might be done perfectly, you see? It might be a total fool. It might be the exact read. But to get it exactly very often, no. So you've got to double-check: When you don't know what it is, you ask again.

And you've got the instant read, and a person can never sell you, if you know instant read and can recognize instant read for what it is, because it takes him a moment to hear you and act, but it takes the reactive bank no time at all to act. So the instant read on an actual is very rapid, and the instant read on a sell is not an instant read at all; it's always latent. You're now talking between a tenth of a second, you see, and three quarters of a second, and the auditor recognizing the difference between a tenth of a second and three quarters of a second, that's pretty sharp, isn't it? That's pretty close together. All right. But, nevertheless, you can tell.

Now, if somebody is going to throw an item, here's what you do. You say, "All right, category," they're falling on this word category, you see, and you have to say, "category," and then they go "Dzoooh! That certainly turns an awful somatic on in my head." That's a standard selling tactic, by the way. Pc is doing it consciously or unconsciously – I don't care which; it's still a sell. The pc knows they're doing it, really. Maybe they do get a somatic in their head. So what? Maybe it's on some other goal chain, too, so they'd really get in the soup if you bought it.

But anyway, you say, "category." Well now, the person has to hear "category" himself and put "category" into action, and react, in order to react with a sell on "category." In order to sell you "category," there's always going to be a late reaction. It's not very late, but it's just
a little bit. Now, the reactive mind doesn't have that much lag in it because time is nowhere in the reactive mind, which is what makes it the reactive mind. So you say, "category," and the reactive mind goes – well, you hardly got the "-y" out, you see – "categor-y" – and you've hardly got the "-y" out when your E-Meter has reacted. In other words, it's a much more rapid reaction than a sell. But actually visual inspection: Well, it's a – you could be sleepy someday and not see the difference between them and all of a sudden say, "Well, we finally found out what he's got here. He's a 'category.'" All right. That's fine. You go on and use that in the next assessment. And the next assessment doesn't pan out, and suddenly nothing pans out anywhere, and "Hohh! What's wrong here?" Well, what's wrong here is we didn't read the E-Meter. Something happened in there.

But now the gross auditing error on the E-Meter is not being able to read an E-Meter at all, of course. Somebody walks in off the street into a co-audit, we put an E-Meter in his hand – we don't even let him go through Comm Course – we put an E-Meter in his hands, and you say, "All right, find basic-basic on the Mama chain on this case." He doesn't even know what you mean, you see?

Do you know the fellow will actually sit there studiously – this is what fools you, you know – and he will figure with dials, and he'll look at it, and he'll think that's all very interesting, and he will look at it very studiously. And he'll spend a lot of time looking at it.

Now, if a stranger came along that didn't know much about E-Meters either and looked at him sitting there with the needle, he would immediately think of him as an expert. Isn't that right?

You'll make this error yourself someday. Don't feel chagrined when you do. You will have somebody sitting there who has been through an HPA Course way back when, and they apparently know how to read an E-Meter, and they're sitting there studiously, and they look at the E-Meter, and they look at the pc alertly and they ask questions, and they look back at the E-Meter, and they look just like they're running a case. It's the darnedest mock-up you ever saw in your life, and you can be fooled by it, man.

You have to go back and stand back of the fellow, and all of a sudden you see a little theta bop, see, you see this little theta bop and you say, "What's that?"

The fellow says, "What?"

And you say, "Well, that – what the needle is doing there."

"Well, it will quiet down in a moment, and then we'll get some other data." And find out that the person is reading nothing but body reactions – throws away all reads and reads body reactions. So actually the pc had to move his head or cough or do something in order to get an E-Meter read. Now, that's a gross auditing error! You get what I mean?

But you – don't be too dismayed when you find this. Just be busy and do something about it, that's all. That's the remedy. Just do something about it. Be effective. Make sure. Don't ever take chances on whether or not the auditor can run an E-Meter. Always find out whether or not he can.
I, frankly, for years have been in apathy on the subject. That's why you don't see more industry in all directions, you know? And why I'm not always in there, "Now, you make sure you run that E-Meter right!" – you know, in a calm frame of mind about it. I sort of hope that you'll pick it up right, because it's difficult to read an E-Meter. That's right. It's difficult. It takes a lot of time.

A person should sit down for hours and hours in monkeying around with a case and find out what the meter does and find out what the case does and get used to the thing, get familiar with the whole thing, and then finally find that when he says something that the pc does have, then the pc did get a tick, and he asks and the pc does have that item out. You know? Victory! And chase it along the line and get used to consulting the meter and feeling certain of what he reads, and knows that what he reads is there, and he eventually fades in and he becomes a very easy operator. And all of a sudden – the magnificence of it is that processes, they go easily; he does assessments, and it takes him a few minutes to find this item and a few minutes to find that item, you know?

Well now, from gross auditing error, we get the arduously-worked-with E-Meter: that if we sit on the edge of our chairs and keep our eyes dilated to the proper dilation and watch all the time like a hawk and never take our eyes off the meter really – you know, it's something like there's a snake lying just in back of it or something – take our eyes right off – never really right off the meter, but always kind of ask the pc questions with our eyes glued on the meter, why, we won't miss. You know, that's a sort of a uh-ha-uh-ha, you know? That kind of an attitude. All right. That attitude is more desirable than the faked attitude, see?

All right. Now let's go a little bit further on the thing, and the fellow who consults the meter when he wants to know something, but consults it with – I've been running a half-flattened goal on somebody recently, and boy, that thing is gone; the person is almost cleared on it, see? And, man, you talk about something that is microscopic! I've been wondering whether or not we shouldn't get some magnifying glasses for these E-Meters.

They have an old radar, an old marine radar – Marconi makes them – and they're a nine-inch magnifying glass that they put on a radarscope. And you put it over the top of a dial, in other words, and it makes the thing get huge. Magnified read. I wouldn't be a bit surprised if you didn't see something like that come up suddenly. If I can get a light one that develops easily and that hangs over the top from the box onto the – over the needle area, it might help us out, because, man, I've been getting myopia.

You know? I mean, I've been reading this meter. Did it fall? Didn't it fall? Did it fall? It's just – I'll get – I have to actually set the thing into the set area in order to read it – you'd laugh to see me trying to work on the thing – and measure its motion against those little "set" dashes. You know? And squint down and look at the thing and wonder if it got any closer to the dash or if it didn't. Boy! You talk about hard to read! This thing is weird. This goal terminal 3D assessment was done after the goal was half gone, and it's all panned out, and it's just washing out. I mean, there isn't anything left there, but I've still got to have some more items. And I tell you, I've been panting

That's why you found me – you found (I know you never expected to find it) – that's why you've found occasionally a sympathetic note struck in my auditing messages, and so
forth. Because I actually feel for you trying to – trying to sort some of these things out. And if you yourself are still quesy about how you run an E-Meter or you don't have any very vast certainty on what you're doing, and then you suddenly have to confront one of these microscopic situations of, "Well, we've got to find one more level on the Prehav Scale and somewhere on the Prehav Scale there is a level here someplace. And if we look close enough to the E-Meter we may be able to spot that there is a level here someplace" – aaaaargh! Or trying to assess out on somebody who – well, his opposition goals list went totally null. And trying to get just one of them to kick, "Just once, please! Just once. Just one of them, please. Just one. Haaaah! Well, we can take that one and get on with the 3D." It's fantastic, you know?

Well now, that's very extraordinary meter reading. You should look on it as such. It is extraordinary meter reading. It's not ordinary at all. So you might have been good enough to do a Sec Check and you'll all of a sudden find yourself being called upon to do a 3D assessment on a half-gone goal or something like that, and you find yourself in another category entirely. You find out that there was a – not just a high school of E-Metering, but that there was a college postgraduate course on the subject, too. Well, I didn't even know that's expected. That has to do with having microscopic, magnifying-glass eyes and a few things of this particular character. Now, they're hard to read.

Now, as we look into our ability to read a meter, however, the basic trouble that you run into with a meter is not, however, of that magnitude. If a fellow is smart enough to read a meter when it's doing that kind of thing, he certainly isn't doing all of these other things.

Now, one of the things is sometimes an auditor who is green on an E-Meter – when the needle is drifting around – the auditor has an awful time trying to differentiate. And you've got a sensitivity 16 setting, and the advance from left to right, and so forth, of that arm has to be considerable in order to keep the needle even on the dial.

In other words, you have to keep moving the tone arm just to keep the needle on the dial and readable. And it's moving to the right and left very rapidly. The natural motion of the machine and the pc, and so forth, are all quite rapid, so that you're getting some kind of an action here where your needle is – wouldn't be doing anything quite as bad as that, but it's rises of that sort – that's a sensitivity 16 on a lot of cases – and you've got to pick out of that thing somewhere a read. And you find that it's impossible to do so.

Well, obviously, it's more beneficial to the pc to drag it down to a one-dial drop for your rudiments. It's more probable that you'll be able to read one if you can't read a flying needle. If you can't read a flying needle, obviously it's better to read any kind of a needle, if you'll make less mistakes, right? So you can back your sensitivity down to a one-dial drop for your rudiments, if you can't read a flying needle, or if the needle is flying around too much. Obviously, the thing to do is to get the job done. That's first and foremost.

Now, don't lay aside the E-Meter in trying to get the job done because I can tell you frankly that for the last couple of years it has not been possible to do an auditing job without an E-Meter. It just can't be done. You can do kinds of patch-ups and you can do various things, but to really get somewhere with a case you just can't do it. It takes an E-Meter. All right.
Now, the question is, how do you read the E-Meter? Well, you better learn everything there is to know about learning how to read E-Meters. And E-Meters can be read. They can actually be read. You can catch them as they fly by on sensitivity 16, but if you're not up to that yet, you'd better be reading them at a sensitivity where you still can read them. You understand? And you'd be amazed, because a rudiment that is really out far enough to cause you any difficulty in an assessment will, of course, read on a one-third-of-a-dial drop. If your auditing is anything at all like auditing, you should be able to pick up the rudiment on a third-of-a-dial drop, that is out. You should be able to. You should be able to, if it's going to interfere. Well, that leaves these little tag ends and twitches, and so forth, that you pick up at sensitivity 16 just sort of really smoothing it out, you see? That's the non plus ultra.

But let me tell you something: that if you take too much time to smooth it out, you are laying in more out-of-sessionness than you are getting in. Do you see that? By all of this persnicketiness, you can drive the pc further out of session than the out-rudiment would have driven the pc. By being too slow and too ineffective in handling the meter, and too persnickety about exactly how you're setting up the session, the pc – if you're wasting time at it and so forth – well, you say, "Well, do you have a present time problem?"

And the pc says, "Well, yes, I have a present time problem, and it's so-and-so."

And you say, "Well, how do you feel about that now?"

And the pc says, "All right."

And you say, "Well," again, "do you have a present time problem?" and you don't get any reaction on the needle at a dial drop.

Let's put this now that you had it at a 16, sensitivity 16 drop, and you said, "How did you feel about that now?" and there was a possibility that that needle vibrated slightly. So you say to him again, "How do you feel about that present time problem now?" and in doing so, of course, you lay in an invalidation and an ARC break to some faint degree, and you get a tick. And now you try to clear this tick. Well, you put it there. You see that?

So if an auditor isn't pretty smooth at getting the pc over these little bumps, it's actually safer to get him to get it in at a dial drop. Because he'll start reading his own ARC breaks. Even the faintest flick of annoyance on the pc will read at a sensitivity 16. You know, you would just ask – you've asked the question three times. You asked the question once, and you couldn't get the answer because the needle was flying by too fast at that moment, so just to be sure for your own sake you ask it again. You say, "Well, do you have a present time problem now?" Well, look, the guy just answered you – no, he didn't have – and you've asked him again now. All right. That's allowable, see? You get away with that and you say, "Well, that's fine. Thank you very much," and you go on. But let's say you missed it the second time, and then he said again, "No," and your fight is between you and the E-Meter, not between you and the pc. See, the E-Meter is not a tool; the E-Meter is getting all the attention in this session.

Remember what I told you: You could get away with anything in an auditing session as long as the pc was absolutely sure that your attention was on his case. And if he begins to believe that your attention is much more involved with the E-Meter and much more interested in the E-Meter, and that you are much more fascinated with what the E-Meter is doing than
what he's doing, he's going to ARC break on you, and you're never going to get the meter clean. You see? So there's a point of tolerance in here.

Now, therefore meter reading cannot be separated from smooth auditing. You've got to be able to do a smooth auditing job to do a good meter-reading job. But when we get down to gross auditing errors: The auditor is auditing; he doesn't know how an E-Meter operates. He doesn't know if an E-Meter – that's worse – he doesn't know if an E-Meter operates. He doesn't know what the E-Meter is supposed to be doing, and he can't quite possibly be sure if he does say. So to check himself and his knowledge of the E-Meter, he is always asking the E-Meter again, and he seems to be very nervous on the subject of the E-Meter. You've violated in-sessionness on the pc.

So it goes from gross auditing error, such as can't read it at all – doesn't really know what it's supposed to be doing and saying. We pass from that into a sufficient fumble that we manage to knock all the rudiments out faster than we get them in, you see? And then we pass over into acceptable E-Metering.

And so we start a session. We set up the E-Meter. We're very comfortable about the whole thing. We ask the pc, "Do you have a present time problem?" We don't get a fall. We say, "That was – that's fine. Good." And we go on to the next, and we go on into the session. We start an assessment, and we know where this thing is going to fall and how it's going to fall and what it's going to do, so it doesn't bother us; and we're reading this, and the pc – this is not getting in the road of the session. We're – feel comfortable enough with this E-Meter that we're not getting in the pc's road, and the pc, of course, will just roll these things out just one right after the other. You pick these things up, straighten them all up, just nothing to it.

Now, that's the bridge I'm trying to get some of you across. We're knocking the gross auditing errors out. But the other thing about it is, now we've still got to get the confidence and the roughness – the feeling of roughness – out of the session just because there's an E-Meter sitting there. You know, I mean, all this stuff.

You'd be surprised how difficult it has been for me to do this half-gone goal on the basis of actually not being able to read the darn E-Meter because it's flicking so little. So I've already come up against that problem: trying to read the E-Meter as it flew by on a twitch that might have been there but wasn't, but maybe it was; and then not asking again more often than is absolutely necessary in order to keep the pc in-session, who isn't very interested in it anyway. And it gets up to quite a test of E-Metering. So there's various degrees of E-Metering.

Now, when you leave here, I want you to know everything there is to know about this – the handling and operation and behavior of this machine, and I don't want you to be making any goofball mistakes with the thing. Why? Because you'll pass them along. See? There's only a few ways to read an E-Meter that are right. There are only a few reactions that are right. There are only a few things to do that are right.

The main thing I want you to do is get rid of your additives. You know? Like you always have thought that an E-Meter actually should be set – if the E-Meter was not reading on the Clear reading of the pc at the beginning and end of session, the rudiments were out or
something. I get hints of that every once in a while on an auditor's report: "The tone arm was very high." All right. So the tone arm was high. So what? This is news?

I got this on an auditor's report just last night. Don't anybody who wrote this feel chagrined, but – because it's not very much. But it was this: "I seem to get the tone arm down lower in finding the last two items and in checking the last two items of 3D than I did in getting off some withholds off the pc." Well, look! 3D is, this is something like saying, "The power plant over there that has a hundred-thousand-horsepower diesel engines in it develops much more horsepower than Johnny's little steam engine." Well, of course! You know? But of course. But the auditor was apparently amazed about this, you see? There was some amazement about this, that, you know? He'd gotten so used to getting the tone arm down by getting off some withholds that he thought this would always happen, and that withholds – you get the withholds off, that was the best way to get the tone arm down.

Now, you start telling some people, "Well, the best way to get the tone arm down is get some withholds off." Oh, no. There's a better way of getting the tone arm down, and up, too: 3D. That's infinitely better than getting withholds off. But, of course, getting withholds off is infinitely better than anything we had before that. Well, we've got orders of magnitude here which are not comparable.

I can just see somebody sitting over in Canada someplace at the present moment on a private-practice thing just absolutely sure they weren't doing well with the pc because at the end of the session every time the tone arm did not come down to the pc's Clear read and just worrying themselves sick about it, and just nagging the pc, "Well, you must have another withhold," you know? They got the pc sitting in the middle of the battle of Acre, you know? "You must have another withhold about your wife," you know? "Are you sure there isn't?" Just must have. Why? Because the tone arm is up. You get what I mean by additives?

Now, you know, it's very hard to imagine these additives – for me to imagine them – because it looks so simple. But I know that I myself, in years gone by, have been guilty of additives about an E-Meter, such as the higher the tone arm gets, the clearer the pc is. That's an interesting assumption to make, isn't it?

Well, it's an easy assumption to make because you get – some pcs feel better with a high arm than a low arm. Did you know that? They get that arm up there, and they're in the midst of all of that black, "gooey" asphalt mass, and they just feel fine and – sort of an anesthesia, you know? They're three-quarters unconscious. And you get the tone arm down, and then they move and they can breathe, and it hurts and they don't like it. And you listen to a few of these pcs, you will eventually make that conclusion. Well, it's better to have a high tone arm than a low tone arm. All depends on the level of case that you're busy auditing.

Well, I don't mean to labor the point. I don't think the point can be labored, however. If you're having a hard time with assessment, don't kick yourself in the head. Find out what you don't know about an E-Meter, that's all. Don't put on any brassy front about it, because I've already told you it took me years. All right. Well, it shouldn't take you quite so long, but remember that you have to be satisfied that the E-Meter is operating and that it is reading and that there is something there when it reads. And when you're satisfied with this, of course,
then from that point your certainty goes up, up, up, higher and higher and higher, easier and easier and easier to do, and finally the E-Meter is not a very important part of the session. It's a vital part of the session but not an important part of the session. It's not something you spend a lot of time worrying about or being upset about.

When you've got that kind of thing out of the road and you're no longer worrying about what you're doing, you're not self-conscious, you're not pressuring against the E-Meter about everything you're doing and it's not nervous and all that; you know, you'll be absolutely fascinated at your ability to hold a pc into session with anything. Just be fascinated. Why? Because you can put some time on putting the pc into session. You know the rest of the tools. You see that? So the more attention you actually have free to put the pc into session, why, the more the pc is going into session.

I have been able, while doing all this microscopic stuff, to carry on a rather chatty-type process with this pc, by the way. This pc was tremendously amused at some of the things she was running across. Tremendously amused. Sections of track she'd never heard of before, you know – on a goals terminal – goal-plus-modifier terminal run. And the whole area had been covered before arduously by a 3, a Routine 3 run. But there were areas of the track which were now being disclosed she'd never dreamed of because now she was closer in to them. And she was discussing these things, she was being very happy about these things, and she was saying how nice these were and how amusing that was and laughing about it all. I've been holding the pc in-session, and keeping the pc from comming themselves out so they didn't answer the question, you know – just, you know, talking themselves down too much – still staying very interested, everything going along fine, and at the same time reading this cotton-picking needle. Impossible, you know? Was the thing moving? And watching this tone arm like a hawk, because it – at any time that thing might go up there and start parking, and I didn't want it to park too hard and erase what little motion there was left in the needle. [laughs]

But that comes of experience. I hold a pc in-session, of course, because I'm actually not too worried about this. Of course, the E-Meter is an old friend. I've done more doggone research with an E-Meter and found out more things about an E-Meter. The first thing I had to find out about an E-Meter, however, was did it work? Did it actually register something in the pc? And when it was talking, what was it saying? And how was it saying it? And after I got into communication like that, well, it only took me for – a few years. And admittedly, you're smarter than I am so it only should take you a few weeks. Okay?

But please when you leave here, make sure that you're very expert at this – in your own minds. Be satisfied in your own minds. For instance, if you've had some assessment flubs – if you've had some assessment flubs – don't take it for granted that it was difficult to do the assessment. Don't blame it on the pc. Just start wondering, "Am I doing something odd here? Am I doing something odd with the business of assessment? Am I reading a meter in some peculiar way?" It's just like the old airline pilot. He looked over the side and he always knew when he was a thousand feet high – except he was always two thousand feet high. And it's just that kind of an honest error. And so, make inquiries. That's why you've got Instructors. If they can't answer it, ask me. I can.
I don't think there's anything an E-Meter will do these days that I can't predict one way or the other. And I know very definitely that an E-Meter has a limited usefulness because it only goes to Clear. All right? So there's a whole new frontier got to be developed beyond that point. And that's a wild frontier. But you're having to cope with a meter which isn't reading much toward the end of the run anyhow.

And right now, with a half-run goal, trying to assess it, trying to get Prehav levels for it, all that sort of thing – ha! I feel sympathy for you, because I'm doing it myself. But remember, I'm winning doing it. So, so can you. All right.

But get certain about meters. And if you're ever, ever around supervising other auditors, just because they're sitting there looking intelligent, and you're not getting any kind of results from standard things, what's the first thing you ought to suspect? That all of that sitting there looking intelligent at the E-Meter had nothing to do with handling E-Meters. That there is something wrong with E-Metering, and that's the point I wanted to make in this lecture, and I hope you'll profit by it.

Thank you.
Auxiliary Pre-Have 3D Scale

A lecture given on 23 November 1961

Okay, well now here we go, and this is the 23rd of November, 1961. And you are well on the way; you have been once more rescued by the Marines.

You have a new scale: the Auxiliary Pre-Have 3D Scale.

First and foremost let me make it very, very adequately plain to all those present and accounted for, that: A scale like this does you absolutely no good if you can't read an E-Meter, or if you can't detect a pc selling on the E-Meter, or if you keep asking somebody during an assessment which implant he is now in or [laughs] – or, or, or! You understand?

Now, given a perfect, exact, completely checked-out 3D – in items one to five – everything's perfect now you see. Given that, this applies. But not given that, this is of no use to you whatsoever. This is of no use to you and it's no use to Scientology. It begins where a 3D Form finishes at Step Five.

I received a nasty letter from – the other day from a fellow in California. This is not unusual. [laughter] North Pole, South Pole – it doesn't matter where – South America, Australia, even in the middle of the Boola-boola-boola-boola-boola tribes of South Africa – I get nice letters, saying, "Thank you Ron, everything is going along fine. The data is working." But California, no. No, they have trouble in California. Everybody here from California is arriving at this moment. And what error did I finally find out – much to my chagrin, after I'd shot this fellow off the target rack and he's lying in bits of pipe clay right now all over the floor – I find out that one of the better known California auditors has been auditing him on Routine 3. This fellow is not trained to run Routine 3.

I don't care how long he's been auditing, I've never seen any results. He couldn't, he couldn't do a Routine 3. And frankly what he probably did was run some – he's by the way one of the Central Organization's wildest and greatest opponents out there. He is – he is the burning torch for doing things wrong. [laughs] And what he's doing running Routine 3, I just wouldn't know.

But of course, this letter from this other fellow, I found out belatedly, was in the middle of some kind of a (quote) intensive (unquote), on Routine 3 by an auditor that wouldn't know what he was doing. Of course, the fellow blew up. Naturally he's mad at everybody. Naturally he's very upset. Naturally he doesn't know whether he is coming or going or on a trip to Mars, or in one of these fictitious Russian space shots. He doesn't know where he is at or why. Because he's being audited by somebody who doesn't know what he is doing, and has not been trained to do that.
And therefore, you can here and there and everywhere expect trouble in large quantities – expect trouble, and more trouble, and more trouble – where auditors are sec checking who do not know how to run a meter; auditors are doing Routine 3 where they don't know how to run a meter and you think that's trouble. Well, now there's plenty of randomness connected with that fact. There's plenty of randomness.

I don't have to burn the midnight oil by the way – even the late English sunrise is furnishing me enough light to keep ahead of you. I'm knocking off these days at seven o'clock in the morning, and so forth. Pretty wild! I can stand it if you can.

Anyhow, the point I'm making here is that with Routines 1, 2 and 3 – Routines 1A less so... Almost anybody apparently can run a Routine 1A. I don't know how they do it, but they do it. They just sit down and they just run that one command and it's fine. Actually Routine 1A probably still ought to have a place in our activities, because apparently nobody's gotten into very much trouble with it, except they've failed to flatten it maybe here or there. That's the only trouble you could get into it.

But besides the point, they've gotten into trouble with Routines 1, 2 and 3, and they've managed to make engram running and other things not work at various times. What do you think is going to happen with Routine 3D? Now, just let me ask you that burning question, ladies and gentlemen: What is going to happen when they collide with Routine 3D? What is happen – going to happen with this character out on the coast – who is the Central Organization's most inveterate foe, who is the pc's most inveterate poison and so forth, anyhow – when he finally gets a copy of it and to make a couple of quick kabutniks, he runs somebody on Routine 3D and never gets any part of it checked out and didn't know how to read the E-Meter in the first place, and ... ?

His favorite idea, by the way, is, "Well, let's see, all right. Now, we're going to do an assessment on you. What is your goal? All right, that's fine. What is your goal? Okay, that's fine. Now, let's list some of these goals. Hey, you know, that's a good one. That's an interesting goal. I've been wanting to do that myself for years. All right, well that's your goal. Okay." [laughter]

Now I'm not joking; I'm not joking. Right here I've probably laid in an ARC break today, by just cutting one person off who was doing a 3D items on up the line, just cutting them off, until I can get time to check this personally. Because it is that vital – it is just that vital – that you don't run anything wrong on a 3D. It is absolutely vital.

Now, I tell you from the depths of my dark, deep bin of little known facts, that this one should be pretty well known. You won't get anywhere on some cases and a case will be upset, and well, it'll just go on and on forever. And it isn't too violent, nothing drastic will happen, except maybe nothing will happen and somebody will be rather upset. That is all you can say about it.

But look at what is at stake. Do you realize that with a completed 3D – and you will realize this shortly, and I of course am, after being committed to the action and there is no withdrawing from it, of course, you can imagine that my fingernails have gotten terribly short here in the last few days, watching you and what you were doing with this. They've practically gone down to Chinese fingernails.
The point I'm making is: that with that care, with a careful assessment, knowing how to do your meter, handling your pc straight, getting him right up to the point with each item absolutely accurate; and then launching into the Auxiliary Pre-Have 3D Scale for assessment; that person with high probability, is within just sauntering distance toward Clear, see? There's only one route. It is one tightrope walk. And you get up to this – the running of it, the actual running of it – and he's practically there.

Because the running of this is nothing compared to the assessing of it. You don't even have to do tricky command forms. I mean the command forms are all laid down almost verbatim in advance. You can change from a "Why" to a "What" to a "How," occasionally, to vary the monotony, but it's the same bracket, the same bracket, the same bracket, the same bracket.

And these things assessed properly and those levels run properly, and he's going to come out the other end. But your eyes are going to be a bit round while he's doing so.

I can now tell you, after experimentation on the line, that there is nothing will fish him out of it if it is wrong I have been testing it all. I have been going back over everything I could go back over. And there's only one thing that brings him through and that is: Pre-Have assessment runs on the exact terminal. Nothing else disturbs the Goals Problem Mass.

Now, this is utterly fantastic. I mean, how come I suddenly dreamed up this particular type of weapon? It is the only weapon that works. Nothing else works. You can go back over the years and – and as I have been doing – and taking this item and that item and the other item and trying to combine it up against terminals and trying to get a terminal to run, and trying to do something else with the terminal, besides this activity. Nothing else works.

And this is mostly assessment. It's minimal running and maximal assessing. And now that I have added this many levels – huh-huh-huh-huh! Shudder! Look at all that assessment. Look at that much assessment for a level. Just look it over.

Now true, I've put it into a form where it's relatively easy to assess and will put it into an easier assessed form than this, even this. It'll have the same items on it but they may be slightly rearranged so as to make easy assessment. That however, is experimental and you now have the levels.

So it's more assessment than it is running. You – I say that advisedly, you – because on some brackets you may not be able to get one bracket. You may stick the arm with one bracket with a new level. And then you go back and the new level is flat. That's all there is to it. It's flat. That's it. It's fantastic.

Because, of course, you're right into the middle of the problem. You're not running an engram; you're running a mass. And we're running something new, and I think you could find it on the books of about 1954, that you shouldn't tackle these black masses. We had Admiration Processing way back. I guess that was 53 wasn't it, early 53. And we ran Admiration Processing and I said, "Well, you just better leave those black lines closed."

You can open them with admiration and you can't do anything about them, and nothing works on them. But this chug-chug-chugs right through them. This eats them up, which is quite interesting. All of this is on the basis – just telling you – that given a perfect assessment and then given proper assessment on this auxiliary scale, and then assessment – and then the
running of the level assessed and flattening it and running it properly, and then finding the next level, and running that properly, and so on – if you were very, very rapid, on some cases you're going to discover that you could get in as many as five levels run per session, on some cases. That's quite amazing. Now, not all of them will go like that. You'll be doing probably more like two levels a session or something of that sort. Maybe one level will run a session or two. That is the expectancy of auditing. But there isn't anything else that's going to get them out of it. This is the only thing that pushes them through it. And that is hair-raising, you know? That's like walking across the top of the Empire State Building on a tightrope strung above it, you know, with no umbrella and no parachute, in a high wind. It's kind of hair-raising.

And you think I'm going to sit by quietly while somebody out in the lower marshlands – you know, where that – all that oil is down there, is in San Pedro, where it's all mucky, you know, around San Pedro there – I think that's probably where this person comes from. Anyway, they were spawned there, spawned there, and – I'm not going to sit by quietly while these guys muck this up.

these things all add up to, of course, not getting it done – so you just wash those out and skip 'em. You see the forthright look that it takes.

Because I can tell you, what I have done in the development of this material is impossible. It could never have been done. It's impossible. The last fifty thousand years it's never been done, so why should it ever be done? All right, that's impossible. All I'm asking you to do is do the impossibility of "do it." That's simple, isn't it?

That's a good bargain, isn't it? I couldn't possibly have done it, you can't possibly audit it: I did it, you do it! That a good bargain? It's rather adventurously stratospheric in its viewpoint, but actually that's what it takes.

And you see in a little needle here wandering around... I'm satisfied that we can't build a better meter. I'd be happy to build you a better meter. Years ago I used to tell Mathison... The reason Mathison and I came to a parting of the ways is: every time I'd tell Mathison to take something off of his ruddy meter, he'd put something on it. And it finally got so doodledaddled up, you know, that I couldn't find where to plug it into the mains. And after I'd practically executed a pc or two – there were some people around I happily would have handed a pair of electrodes to; [laughter, laughs] actually contemplated a time or two; ran it out in auditing one day – overt on the meter! Why, he was just getting so complicated.

What I really wanted was something that would flash a light when you had a read. It would just flash a light when you had a read, and you had to interpret no more than a light. Or: two lights, which was a red-green light, something like this, and you got a red-green or you got a green-green or you got a count system of some kind or another. Possibly something like that could be made. The point is, it never has been made and every time I've tried to improve this particular existing meter, I have run into the thing that the mind, after all, doesn't register very much on the meter. It doesn't register very much. And when you start to amplify its registration, you run into the registration of body motion. And you amplify the registration of body motion and the mental motion becomes unreadable.

That's what I've continually run into in this. Now, I could of course, have – could taken some time off and built a much better meter, instead of doing a lot of other things, maybe, but I've been at this – making sure this meter stayed in good shape now – for about ten years, and it's the best we can do. Every time I branch off into some other field to give you a better meter, why, some limiting factor of some kind or another defeats it, and I come back and say, "What a wonderful meter we've got. It's just fantastic that this meter will do these things." Well, all right. This is the meter we're doing it with and I have good confidence in the meter.

Now, amongst us we have people who don't have much confidence in the meter, and quite rightly, because if you don't know how to read a meter, you of course can't have any confidence in the meter. And after a meter has been thrown for you a few times or after you've thrown a meter a few times, or after somebody's missed a withhold on you, your ability to run the meter deteriorates like mad. Did you realize that? You say, "Well, I can beat the meter from where I sit, so therefore the meter isn't very accurate and so forth." Well actually, please realize that you were beating a lousy operator, not a meter. You can always beat an operator. When the operator isn't good enough, you can always beat the operator.
But to watch these little – this little black needle doing little odd dances – and as it swings back and forth to catch the fact that something stopped it for an instant, and to catch that sort of thing – requires, frankly, a rather high degree of skill.

It is an order of skill that Einstein respected, because Einstein has – had written – I don't know where Einstein is now. Has anybody audited Einstein lately? Anyway, he isn't very old. It'd take Mary Sue or somebody like that to audit him.

The idea he had was the idea of the observer. He had the idea of the observer, and it's a very, very good thing for you to know this particular thing in connection with the meter.

He had this concept of an observer. Now, of course, the old man, in floundering around in the field of physics and small currents and that sort of thing, he was limited by the fact that nobody ever got him any data. He also – always had to go out and read the meters himself I suppose, or something like this. And it finally drove him down to writing a paper on this. I wish I had a copy of the paper. I don't. I have never read it. I have only been told about the paper. But his viewpoint, "The Viewpoint of the Observer" is the name of the paper, "The Viewpoint of the Observer."

And what is an observer? An observer is somebody who, without the introduction of an opinion, can look exactly and directly at a needle or registering item, and say exactly what it did, without further introduction of opinion. He doesn't say why it did it; he just says what it did. In other words, if it went up on some meter to 105 and then it fell back to 102, then his ideal on the thing would have simply noted that it went to 105 and fell to 102, and that's all the person would say.

You see, now, psychology, not knowing this, has never given us any data. We have been denied the whole pack of data that the psychologists might have been collecting for us because the whole thing is full of opinion. There was never an observer amongst the psychologists. There are no observers amongst the psychiatrists.

The psychiatrists go in and they don't limit themselves to saying, "This fellow takes three hops across the room and bounces against the ceiling" You see? "And his name is John Jones, and he has been incarcerated here and our classification for it is ceiling bounceosis," and so on.

No, he doesn't do that. He says this fellow keeps leaping about and we have made a very deep study of his familial background, and we find out that there was three and one-tenth percent schizophrenics during the last 1800 years connected with this particular familial line. And we know this to be the case because his skull is cleaved in a peculiar way which is only found in the Cro-Magnon pits of northern Italy.

Oh, what the hell. Do you know that on some half-written psychiatric reports, they give you the whole engram the person is in. And then add something like this: We have tried and tried to disabuse her of this particular opinion and we have not yet succeeded, but we will. Or the patient's comment after treatment was, "Well, it still seems awfully real."

The psychiatrist was just going headlong into pictures. In other words, he was so interested in doing something, he never looked at what he was doing it to or he long since would have found the mental image picture. Do you realize how far we are ahead of these
people? It's hard to realize sometime for a Scientologist, I—just how far we are ahead of these people, and how far we are ahead of existing technology.

Nobody has pictures. What is a picture? A picture has no influence. If they ever mention anything about pictures, it's just vague imaginings. It's really very interesting that they have never done any observation.

Now aside from this point, aside from it and totally, this quality: the ability to observe as a single action, is what it requires to E-Meter. It's the ability to observe as a single action independent of all interpretation.

Now if you take that as a separate action of the auditor, and only when that action is done, only when we have done that action do we then do anything else, you will get the whole problem compartmented properly.

In other words, we don't sit there and worry and stew and fuss. We don't sit there and worry and stew and fuss about what we are going to do if the needle does something, you see. Now, our action is: whatever else we are doing, we are also an observer and we observe exactly what the needle does, and don't wishfully hope it had done something else. You ask somebody for a PT problem. You're all set, you want to do an assessment, you want to get another level, you want to go on and charging down the line.

Everything is going to be just fine and you get into the rudiments and you say, "Do you have a present time problem?" very cheerfully, pressing on. You get a clank and it falls. Oh no! Now we're going to spend the next few minutes, probably, you see, having to handle this and not getting on with our affairs and that sort of thing. Well, its a great temptation at that point to just wish there hadn't been one, and there's not much of a step from wishing there hadn't been one to not seeing it. You see? There's not much of a step between those two points. In other words, you've got "wishful observering". [laughter]

Falls on the wrong level; falls on the wrong goal. We know this person—we know this perfectly sweet, young girl that we are auditing here: this kind, sweet person would never have as their basic goal in life, "to murder men." We know that. So we just skip that, you see? We throw the observation, because it assaults our reality.

But why should the observation of a needle assault reality? Why? Why should it assault reality? And the observation of a needle in its action on a meter is simply an observation and it is something to be noted. It's regardless of whether it's right or wrong or it's against what we're doing or for what we're doing or anything else.

As long as you keep this idea of "the observer independent of the doer," as the auditor, you're all set, see. You're sitting there watching the needle and you're running engrams. Well, therefore—a thetan can do a lot of things at once, by the way—and therefore, well a part of you is simply looking at it and you're asking this and it notes that it falls at that particular point, and so forth. Well, that is the action of an observer.

Now, what you think about that, and what you're going to do about that, are entirely different segments. They haven't anything to do with this fact. The needle acted in a certain way. All right. We observed that it acted in a certain way and that is all there is to it. So, pure observation is a subject that is very worthwhile for an auditor to look over.
Go out and take a look at the trees sometime and just try to observe a tree. It's quite interesting. Just do nothing but observe a tree. Don't think about the tree or have an opinion about the tree, one way or the other, but just look at a tree. Do you understand me? All right.

Now, let's take that up one more stage and look at a tree when there's a wind blowing. And look at what is happening there at that point of the tree. Of course, there you have the tree and the leaves are wobbling. Now, if you can hold this as an observation independent of an emotional reaction, an opinion or a doings, or a summation, like, "Well, its going to come up and and and rain, in a little while, obviously, because the air is rather damp." Well, that's part of a whole new package of observation. You're predicting already, before you have noticed. Now, people get to the point where they predict without bothering to see. And this is a characteristic of the human race. They're always predicting without seeing.

You're just – this time-honored example of these fifteen people who stood around and saw the automobile accident, and you'll get fifteen different automobile accidents. And that is because they've added all sorts of connotations to it. Whose fault was it? You see? A guess at the mental attitude of the drivers; a wonder about the pain of the occupants; estimate of the amount of damages; worries concerning how fast a crash wagon can get down there, or an ambulance can get there, or how long it is going to take to get the road cleared: color the observation, actually color the observation. You had to – it doesn't seem possible until you look it over. Here are two cars and they came together and made accordions out of their respective bonnets or hoods. There they are – daduthng.

Well, what exactly happened there? Now, you ask somebody, "What exactly happened there? Without any other opinion, exactly what happened right there at that point?" And you know, you get all sorts of additional data.

Well, this fellow came down the road and he was in a hurry. See, we don't know that. We don't know that he was in a hurry. We know that he was traveling fast. Maybe when that particular fellow was in a hurry, he went twice as fast. But in any event, we now have hazarded some idea of the mental attitude of the person who was driving one of the cars. And then we hazard a mental attitude of somebody else driving a car and it doesn't take very long to color our own mental attitude. See, what exactly did happen?

Well, two cars came down, they went on an exact certain course. They stopped or tried to stop or didn't stop at a certain place, and thereafter accordion-pleated their bonnets. And that is exactly what happened. If a wheel came off or a hub cap went off, it actually fell off and ran so many feet.

That is a total non-emotional observation. This is exactly what happened. That is what happened. It – what happened is not how much its going to cost to repair the damage. What happened is not the respective property culpability of the participants in this favorite game of Western civilization today. That had nothing to do with what happened. The mental pressures involved could not even be estimated by the casual bystander, unless he were a Scientologist and had the person in session for many, many hours. And now you can get an idea with a 3D, of exactly why he had an accident. But short of that, it's all hazard. So we ask somebody to observe an automobile accident and, "Well, suh and suh and suhm." They never tell you that. They say, "Well, one fellow was coming down the road and there were a couple of girls on
the sidewalk, and they were horrified, and uh ...
"Well, their nameplates were in clear sight, but I didn't read them, see." They were plastered all over on one, "Ford", you see – it was all over one – and "Austin" was all over the other one, but he didn't notice that. That's part of the observation.

A Scientologist has to become – we have talked about this for years. We've called it "obnosis" and so forth – but a Scientologist has to become, as far as an E-Meter is concerned – at least some small section of his attention and his beingness, while he is operating as an auditor, must be of a pure observational character, uncolored by any other consideration. In other words he has to be able to look at a meter and say exactly what the needle is doing.

And that is first things first, and that is the first step in learning an E-Meter: is actually able to observe a single, simple action and say what happened. In a HPA/HCA class, it would be very amusing to go up to the board and take an eraser or something on the blackboard, and reverse it, and then step back and ask the class of new auditing students, "What did I do?"

And get, if there were 20 students, get 20 different replies. You went over to see if the board was dirty. Or you decided to give us an example and ... The fact of the matter is, he went across and picked up an eraser and turned it over. Now, what actually happened is that a person took several steps across the room, extended hand, picked up the eraser, and turned it over, put it down and then took several steps back across the room. And that is all that happened as far as the observer is concerned. Nothing else happened at all.

Now, why did he do it? Ah, well now, we've got the – now, we've got the Scientologist. Why did he do it? What was the purpose behind this? What was he trying to demonstrate? What effect did he have on us? Do you see? Now, we've got the cause and effect, the purpose and the this-a and that-a. And that had nothing to do with the observation of simply walking across the room and turning over an eraser.

And we've got mental attitudes, mental attitudes, mental attitudes and after a while you say to this fellow, "Wait a minute. Did you see what kind of cars they were?"

See, that's maybe only a tenth of his attention, but it still has to be a pure attention. It has to be very pure. Now, he says, "The needle is doing this because... The needle is doing this because..." You see? Now, that's the auditor in him talking. That isn't the observer. The observer has no "because," see. The needle just did that, that's all.

Now, if we take it from that simplicity and move it on forward, it all becomes very easily. And how many people are having difficulty reading a meter because they're trying to read the meter – read the mind before the meter acts, or trying to read the mind and the meter at the same action, and so forth. Frankly, it's perfectly all right to know what went on in the fellow's mind, and you should be able to know what went on in the fellow's mind, when you...
saw the reaction on a meter. But that's after the fact of an observer. That is an analysis of the observation based on your professional skill. That is another action. The fact of the thing is, is it went up here under the words – where the words "fall" are, and it did a little dance that was something like an eighth-of-an-inch wide, and it did it several times, immediately after certain words were uttered.

The words were uttered, "Are you – are you tired of a willow buck?" And the word "willow buck," after it's uttered, and we get this little dance occurring there and the fellow then says, "Well, that's still live." But note that his desire to know if "willow buck" was still alive was independent of this other action.

First, he desired to know if the willow buck was still alive, and then he said, "Are you tired of a willow buck?" See? At the moment there, his voice is the cause, the pc's bank is the effect and the meter is the reaction. All right, he's still a practitioner up to the moment he says, "willow buck," and then this other chain reaction takes place. Notice that this is another action. He's causing an action to occur there. All right. Having done that in something like a millionth of a second, he changes from the practitioner to simply the observer. He is just nothing now but a pure observer. What did the needle do? And for something on the order of eight-tenths of a second or something like that, he is an observer. What did the needle do? And for something on the order of 8 tenths of a second or something like that, he is an observer. And at that moment he is nothing else but an observer.

But for a split instant there, maybe something on the order of an – of a – well, let's say, .8 seconds is what I should have said, .8 seconds, he is an observer – or 1 second, he is an observer. He's purely an observer and he's nothing else in that 1 second but an observer. In other words he is a practitioner, he's a Scientologist, everything is fine and he's doing his job and then for a second he is an observer. And then right after that, he's a Scientologist and he's the cause and effect on the mind and all that sort of thing.

But you carry over cause and effect on the mind at the moment you're observing, and you're inevitably going to carry some hopefulness or some disappointment or some wishful thinkingness or something across that moment of observation.

You know, I have had to swallow an awful lot of bitter pills. I know what I'm talking about when I'm running a meter. I've had to swallow some mighty bitter pills.

Way back when, particularly, I would be absolutely sure, you see, that I knew exactly what was wrong and everything that was happening with regard to the preclear's mind. You see, I absolutely had it taped. I knew the exact thing that the pc was going to come up with next, and it all indicated to that, and all I had to do – I knew it was there, the only question mark was the pc going to have any reality on it, and was there going to be any release or action because of this enormous discovery?

You see, I figured it all out, see, up to this point and then I asked the pc – I asked the pc, and I say, "Well now, how do you feel about a family?" No action. "Family, smamily." Phss! It wasn't right. You see, all this skillful figure-figure all added up all of a sudden to nothing. No reaction of any kind.

"Oh, I feel fine about a family." Nyeh.
All right, but for a moment I never forgot how to be a pure observer. See. I did observe it, even though it was against my most fond hopes. And in the next moment be back again figuring it out, see. Thinking it over. All right. And then all of a sudden, "Oh, have you ever beaten a dog?" Oh well, I got a reaction that time, so it's all right – come on.

But on some pcs, in trying to figure it out, when you didn't know all you had to know on the subject and which way they were going, phew! You know, you'd get it pretty well taped and you know exactly where you're going and then – oh, you just know exactly now what will just blow the whole thing up and you say it, you know, and you put it to the test, and your hopefulness doesn't cause you to misread the meter.

And maybe that is where I excel where other fellows have fallen down. I am not so fond of my own ideas and theories that I must have them right. I can always get another theory.

Now, one of the things that's defeated research work is some people get so fond of some theory that they've had, one way or the other or they're trying to prove out. It looks so logical and looks so wonderful, and we know now fitted so well with their goal, modifier and opposition goal, this is all so handsome that they never let go of it. The weight of evidence can be delivered to them with large iron bars. It could be delivered to them in trucks; the evidence against this theory, you see. The whole countryside gets stacked up by built-up models to show them completely and conclusively that the thing never works and they haven't got a single model anyplace to show that any shadow of the theory has any truth in it of any kind whatsoever.

And they still hold on to the theory. In other words, all evidence has disproved it and they have no evidence that proves it in any way, shape or form. Long and arduous study on the subject has not borne out any part of it and they still hold on to it. Theories are so marvelous. After all, they're theirs. They're theirs, you see. The evidence there, well, it would be pretty unsafe, you see, to let go of one. Because we might never get another one.

Well, you know very well, in looking at a pc when he gives you a list of terminals, or something like that, which is eighty, ninety – oh, all right, one of them looks pretty good. But you'd be amazed. I usually find out that the one it actually is, is better than I hoped for. The right one – the right one is usually much better than I'd ever hoped it would be.

You know, I've got this guy totally taped and I get ideas as to what this thing ought to be as I look down the list and it help and sharpens my perception, but I never permit that to overthrow me as an observer. At the instant I observe a meter, I observe the meter. I don't observe it hopefully, I don't observe it pessimistically, I don't observe it any other way than I just open my wide blue eyes and let happen what happens at that moment.

More than anything else, and the fact that I very seldom go to sleep as an auditor, and very seldom fall out of my chair and drop ashtrays and that sort of thing – the capability of actually keeping my mind on what I am doing and being interested in actually auditing the pc and being able to observe purely as an observer at a split moment – I know now is what gets me my results as an auditor. And they're worth – they're worth reaching for, because they are very rapid results. But there is an instant there when there is nothing but absolutely pure observation.
And if that observation disproved to me completely that every theory I had stacked up was absolutely wrong, it was still an observation and I would – still would observe it. Oh, I might check it and observe it again, and I might check it and observe it again, but if it wasn't there it wasn't there, and that's it.

Now, that I recognize as – is a skill of sorts. It is – is a skill all by itself. It's to be able to suddenly become an observer for one second, and then cease to be an observer and become an auditor. That's what it takes, but that's what E-Metering takes: uncolored observation. What happened is what happened. No matter if it shatters our fondest hopes, what happens to the meter is what happens to the meter and that's what happens to the meter. And that's all we're observing and there's no alter-is connected with the observation, no alter-is of any kind whatsoever.

And you'll find consistently and continually, that where you have a bad assessment – where you have a bad assessment, it's hopefulness has entered in or pessimism has entered in. And neither hopefulness nor pessimism should ever enter into the moment of observation. You read right down the line, clank, that's what it is, that's what it is; that's what it isn't, that's what it isn't.

Oh, I have actually often suddenly grabbed a pc practically by the collar and steered him into the chair during a break, all of a sudden, you know, or something like this. Or out of session – well somebody I was auditing regularly. All of a sudden get ahold of them practically in the hall and say, "Come here a minute," you know. "Sit down," you know. And put them on the cans, you know.

And I've got – I've got what it exactly was, you know. I've got it perfectly, you know. And I know exactly what it was. It was elephants. That was what was missing in that engram. There must have been elephants in that damned engram. Got it all figured out, you know. Put him on: "All right. Good. You're all set now? All right. Now, just shut up and be quiet now. Good. All right. Elephants. ... [laughter] Thank you. Go ahead, get your coat now." [laughter]

It is simply, not actually the willingness to be overwhelmed by an E-Meter, but it's actually the willingness to put something to a pure, reliable test, and then abide by the decisions. The reason we have law courts – man can't do this very easily – the reason we have law courts is nobody ever abides by the evidence. That's what makes law profitable.

You have fifteen people see the accident. I remember practicing law here a century ago, up around Reigate and so forth. It was absolutely fantastic. But I was always taking cases on the absolute outside impossibility. Everybody would come along, but they'd say, "But – but – uh, the ship down in Portsmouth steamed right into the harbor, cut the other ship absolutely in half. It sank and the captain was at fault. The insurance company, everybody agreed! What do you mean, you're going to take this case? With your reputation, you're going to take a case like that? Ooh-ho, you're silly!"

"Oh no, no, no, no, no. I'll take the case. Yes, I'll defend that ship that came in, and cut the other ship in half. Yes. Happy to do so." The whole Royal Navy could have been lining the beaches and to find one reliable witness for the other party would have been nearly impossible.
I could shake any witness anybody else ever had for anything. They could stand right there in the wide-open corridor of a public building, seen the fellow, recognized him, and pulled out a knife, killed the other man dead. Take the case? Hell, yes. What's evidence got to do with cases?

We're dealing with human beings and they can't look. They never see. And furthermore, in court, they have opinions. The Lord Chief Justice sitting up there, impartial, wigged, and so forth. All the other fellows around there, of course, I'd been in that category myself a time or two. This is not a major line of mine. It's something I do when I'm broke. [laughter]

They were all of the opinion that justice was totally impartial and that he was impartial. Oh, no. He was a family man; he had kids, and so forth. And they've got this burglar – maybe I was the Crown Attorney or something – and they've got this burglar and he burgled into the home and he's took this and that, and they're going to let him go free to burgle into more homes, and so on. And impartiality finds absolutely no evidence of the fact – no absolute witnesses to the fact that he broke into the home. Of course he did, we all know he did, but we haven't got the exact legal formula that adds up to evidence.

No Crown Attorney in the world could have sent the guy up. Everybody is rather despairing. It's about the fifth time he's been arrested. I'd stand up in court and say, "Well, now when you climbed in this window, Blackfoot Joe, now when you climbed in this window here, did you stumble into the baby's crib in any way? Mmmm? Well, did the child wake up?"

He'd say, "No-no-no, never near the home, never near the home, never near it."

"Well, did the child wake up? Is that why the child had bruises on its face the next morning?"

The Lord Chief Justice says, "What is this? You mean the fellow broke into the home and beat up the children?" You see. "And tried to strangle the children?" And so forth.

"Well, I was never there, governor – never was, never was, honest, I was just never near the place. I was, as a matter of fact, was up at a pub in Piccadilly and we were just having a pint of beer, me and a couple of pals, and we were up there and I can bring them both. You've just heard them both in court. They said I was never near the place."

"Well, now, we're getting back to these things, now the toys. Now, the toys. Did you break any of the toys when you were climbing out of the window? Now, how would you go about silencing a child's screams that was terrified in the middle of the night by somebody coming in the window?"

About that time, why, Lord Chief Justice or the magistrate or something or other turns around to the jury and says, "Bring in a verdict of guilty or I'll have you all booked." [laughter, laughs]

The guy had a button, that's all! The great impartiality of justice on the magistrate's bench had buttons. He just couldn't stand the idea of children being terrified in the middle of the night, or being abused by burglars and you never tried the case. You tried the emotions of the justice. You never tried the case really on any line except you were fairly sure that nobody ever saw anything happen.
All of these factors entered into what they laughingly call "law." I very often take time out for a lifetime and just do a total relaxation – just like other people read comic books. So it's not at all surprising to find even the more intelligent people amongst the ranks of auditors – and auditors are a more intelligent people, that's for sure – falling from grace and failing to observe. Because it's the one thing the human race does worst.

Honest, you turn the – you turn the weathercock around three times on the top of the steeple, while you've got half the town marshalled up to make sure that they saw it, and ask them what happened on the top of the steeple. And some will tell you that the angel Gabriel flew in and out of the belfry, and they'll go on and on. But there'll be some honest carpenter out on the outskirts and he'll say, rather grumpily, "Well, he turned the weathercock around three times. That's what you did. And I'm not quite sure what you mean to accomplish by that, but we can tell you, it won't do any good." [laughs] He might have been able to observe, but he had to go and write script after the fact, see.

Now there's your point, not to belabor it, but there's the power of observation. The power of observation actually does not couple with knowledge of the subject of Scientology. These things are entirely different. Why it is happening has nothing to do with the fact that it is happening.

Why it is happening and what it indicates is the business of a Scientologist, but observing it is simply the business of an observer, who need know nothing about the mind or anything else. He merely need know that a needle wiggled. He merely need know that the tone arm was located there and the needle wiggled. He's got to be able to observe that fact. And if he can't observe that fact in that split instant, independent of all other actions, he will very often color his observation. So it's a learned skill and it's something you should learn how to do.

Just for an instant, just note what is happening That's easy – it's very easy. It's just – it's so easy you just keep missing it, see. It's just, "What happened in that instant?"

"Well, the thing theta bopped."

"Well, the thing theta bopped in that instant?"

"Well, the thing theta bopped and that meant so-and-so, he's got charge on the subject. See, that thing ..."

What happened in that instant is succeeded immediately by the observer, and he is the unseen silent person. He simply looks at the thing and he sees the needle go ... And then he becomes the auditor again and he says, "Well it theta bopped."

But for a moment there, he had to observe the thing acting, totally independent of all other action, totally independent of all other thinking, totally independent of all judgment. That's just it; he simply observed it.

It's actually a very easy trick, if you know that it is a sort of a trick. You should try it some time. Try to observe something purely without an opinion. And you're liable to set half the circuits in your bank going whiz, you know.
Now, all of your 3D comes up to – each part of it comes up to the final role. The final role in the thing, as far as the test of it is concerned, requires an observer to be present. The reason you have these things checked is you hope the checker will be – serve as an observer, that somebody will observe this thing from another quarter. But actually a pure observation could be done by anybody, couldn't it? Did the needle wiggle or didn't it? Did it fall or didn't it? Did it rise or didn't it? You see? That's all. That's all you have to know, at that particular point.

Now, in assessing this particular scale, you could foul up like fire drill, because it is almost totally an observational reading action – the running of this scale. You read the level and then see whether or not that level – not the attached associated words to the terminal or something – whether or not that level produced a reaction at that moment.

Now, you have to do this observational stuff rather fast. You're a reader and then you're an observer, and then you're a stenographer. You note down what happened. You're a recorder. A reader, an observer and a recorder; that's one, two, three. That is actually the exact actions which are undertaken at that moment.

You say to this person, "Would you have faith in a waterbuck?" And you have to know that the reaction didn't occur on "waterbuck" because of course the needle will always react on "waterbuck," as a charged subject. So you merely want "faith in," and you observe at the second "faith in," the observer comes in, observes what the needle does and then you say what it did as a recorder. And that is the action. And it's a very rapid action. It's a very rapid action.

Now, here and there you may have trouble with a pc who insists on talking while you're assessing. I'm going to talk to you about how to actually brightly, smartly do an assessment. And you may have a pc who is going, "Gab-gab-gab, walla-walla-walla-walla-walla-walla-walla." 

Well, I always handle that. I always handle that. I handle it diplomatically and I never get any ARC breaks either. I say, "Hold the cans quiet in your lap and shut up; I'm about to read the list." [laughter] That's just about the way it is, too. Do you realize why that isn't an ARC break? He's getting all of your attention, man. You're doing it all for him. He doesn't expect you to be polite while you're ministering to him.

Oh well, the way to produce an ARC break is give all your attention to the meter and say, "You know I had a meter last year that read much better than this meter." Well, that shows there's no attention on this fellow's case and you're not giving him his attention. You're violating what his goals terminal should have, which of course is attention.

But you can tell him almost anything within the perimeter of getting the job done and he'll take it. Well, if that's what it takes to get it done, well that's what it takes, and so on. You, by the way, are learning that rather well. I've heard a few cracks coming through doors, something on this effect, and so forth. "You want to find your terminal, don't you? All right, well stop wiggling around. Sit still."

This, this of course doesn't produce much of an ARC break. It doesn't produce any, as a matter of fact.
All right. Now, you want the pc silent. Now, he might not be as silent as he might – as a tomb, while you are assessing other lists. Oh, as he assesses his goal, every once in a while it makes him think of something and he asks you to put down another goal or something of the sort. Or he didn't understand or his attention is hung up; he's still thinking about something; he says something about it. You say, "Well all right, yeah?" He says something about it. And you say, "Did you want to add another goal on that, you want to modify that goal? You want to change it in some way?"

"Well, I think I ought to change it," and so on.

You say, "Well all right," and you just put it down at the bottom of the list. By the way, the best thing to do is to add it to the bottom of the list. Because it's kind of a Q-and-A to put it in afterwards and he gets the idea he's running the session, I've found out. So, you just add it in to the bottom of the list of goals, go over here, seven pages, wherever it is and put it down, write it down. That's the way it is. And you say, "All right; thank you," and carry right on.

However, you do tell the person, even in those assessments, "You do not have to speak while I am assessing this. As a matter of fact, we will get it done faster if you do not." That's it. But in assessing this Pre-Have 3D Scale, particularly, you haven't got time. Look-a-here, man! Look at the number of words that are in this scale!

You think you've got time, for heaven's sakes, to sit around and gab about how wonderful it would be if you were having absolutely no effect on waterbucks. Wouldn't that be interesting! And we could have just an old ladies' tea party going here, you know. "Well, would you have no effect on a waterbuck?"

"Well, now, I don't know whether I would have an effect on a waterbuck or not, because a waterbuck might have effect on us and it might not have effect on us. But waterbucks are what waterbucks are and actually my attention is sort of stuck on 'faith in.' "

"Well – oh, it is, huh?" [laughter] "Still stuck on 'faith in waterbucks.' Oh well, maybe I'd better repeat that, uh, the ..." What a dog's breakfast! And you're going to do this – it'll be two sessions for the assessment, five minutes for a run, two sessions for an assessment, five minutes for a run. You get the idea? Nonsense!

So you have to really start getting slick the moment you get down there to your – to your final runs and assessment on the Pre-Have in your 3D. You've got to be slippery. And at this time you can admit of no conversation. Now we get down to no conversation. Just let the person sit there in a total state of giddy irresponsibility. We don't care whether he's thinking about the levels or not thinks about the levels, or adds them up. We don't care if he hangs up on some level while we're going down to later levels. We do not care what he is doing at all, as long as he will sit there like a good boy and hold those E-Meter cans, amen.

That's all we want him to do. That's all that's expected of the pc. Once you start the assessment line, that is all he's supposed to do. And you make sure we do that.
Now, the pc says, "You know, I'm still rather hung up on – I'm still thinking hard about ..." You'll hear them say this; this is about what they say, "I'm still thinking hard about Disperse. I can't quite get my mind off Disperse."

You just say, "Well good. All right. Thank you." And go right on with your list. If they do say something, don't hit them; [laughter] but don't engage in any conversation with them either on the subject.

Now, the mechanics of it are these: It doesn't matter a bit, a bit, a bit, a bit, a bit whether they are thinking about it or not thinking about it. You are not reading this to the pc anyway; you're reading it to his reactive bank. And it doesn't matter whether his mind is hung up on the title or the date of the HCOB – you don't read that when you read the list, by the way – but we don't care whether his mind hung up on that or nothing.

Do you know, you are saved by this fact: No power on Earth could keep the E-Meter, practically, from registering on the exact level he's stuck in for that terminal. We don't care if his attention is analytically somewhere else or not. We're going to get a reaction, as long as he's sitting in the same room and the rudiments are reasonably in. We're going to get a reaction; that's all there is to it.

Now, pcs will try to fool it, you know and they try to hang up somehow or another, see. And they try to say, "Oh gee, you know, I know what should be run on this thing. Actually Faith is way overdue because I keep saying to myself, I caught myself last night at supper, and I was saying faith in this and faith in that. Obviously it's Faith that should be run."

So they sit there and they say, "Well, if I think hard on Faith," you see.

And you say, "Do you have faith in a waterbuck?" And you get a little action. Well, your final – your only action on it actually is just to make a mark. So you make a mark and it doesn't take you any time at all till you're off on the next level. That's just split seconds later that you're saying the next level. So they're still sitting there, Faith, Faith, Faith. So what?

You're down here. Probably their level at this particular thing is Withhold, or something. When you get to Withhold, they will no longer be thinking about Faith, I guarantee. "Withhold! Ooh, ooho, huh!" They shut up. [laughs, laughter]

Now, there may be many, many assessment systems brought out, but – I mean on a list assessment of this character – there may be many systems that could be followed; maybe some will work better than others. But they will all be based on this: is get the maximum number of levels for the minimum amount of time with the minimum restimulation of the pc. Maximum number of levels, minimum period of time, minimum restimulation for the pc. Now, that's what you're trying to accomplish in any assessment and you want to go off on a machine-gun basis b-r-r-r-r mit speed yet. It's got to be fast.

Now, let us take the type of assessment we were doing. It goes something like this: (And they tell the person we're going to assess and this – meter's set up and all that.) We say, "Would you have faith in a waterbuck? Would a waterbuck cause things for you? Would you prevent a waterbuck from knowing?" Something like this. And you would catch those marks as you went by, actually, just about that fast. That is the type of assessments done. The reaction, if the level is going to be live, is going to hit as you say the level. You say the level, you
get the reaction and you're out of there, don't you see. You don't wait until you've said it and then wait for it to react. Because it's going to react when you say it anyhow and if it didn't react when you say it, well the hell with it. And of course if it does react, why, there you are. You mark it, that's all. That's your total action. You just mark it if it is – acted. And of course if you don't know whether it acted or not, you mark it. That's – you don't sit there and study it and read it three times and so forth.

Now, under the heading of "minimum restimulation of the pc," you don't keep repeating, repeating, repeating a level. You never run repeater technique on a level on a – on an assessment of the Pre-Have-type scale. Never run repeater technique. You just go down, one read – bang-bang-bang-bang-bang-wang – one read each – bang-bang-bang-bang-bang-bang-bang. It read or it didn't read and that's all you'd want to know.

Now, as far as acknowledging the pc is concerned, oh yeah, fine. Say, now this is a good slow way to assess, probably a very thorough way and probably a way that would give you lots of certainty as to whether or not you had the list, was: "Would you have faith in a waterbuck? ... Thank you... Would you cause a waterbuck anything? ...Mm. Thank you. Ahhh, hmm. Thank you. Ah, How would you prevent knowing a waterbuck? ...I don't know. You know it seems to read on every level. You know every time I say 'waterbuck' it reads."

And now, perhaps, if you'd sort it out at that rate of speed – and maybe you'd have to go at that rate of speed if you didn't know quite what you were doing – you probably would wind up with something like an assessment at the end, perhaps. Take a session to assess, five minutes to run, session to assess, five minutes to run. You get the idea? All right.

Nobody's going to say speed up faster than you have certainty on what you are reading. See, nobody's ever going to tell you that. People are going to say, speed up, speed up, speed up, but included in that remark is, of course, have certainty on what you're doing.

Now, after you have read the whole list from bottom to top, you have marked each one that reacted. You have only read the level once and after that you marked it or you didn't mark it, and of course it's just not marked at all if it was null. You leave it alone. And if it did react in any way, shape or form, you put a mark after the level.

Now, that leaves you, when you finish up down to the end of it – you finish up down to the end, you have a number of levels which have marks on them. Now, you don't start in at the beginning again. You start in at the end, right where you finished up. And you go back only over those items which are now marked with the symbol of the assessment. You've put a mark there, so you only read the ones that you marked. On the first run down ten were marked, so on the back up one, you only read ten, and that is each one that is marked. All right. That's the second one.

Now, each one of those that fell on that particular reading, you take your pencil and you mark that it did or it – or if it didn't, you don't mark. If it fell or reacted in any way as you went back over these ten, you of course gave it an additional symbol, and it is the same symbol that you use coming down, but it's just a second symbol.
Now, you've got four left and you're now back up at the other end of the list, so you start through and only that four do you read, and each one of those that is still alive you add another symbol to it.

And now you've got two and these two now have three marks after each one. You read one of them and it says, "to own," and you've got a mark after that, and the other one is "to make amends"; so you read "own," and you and that it is null, and you read "make amends" and it is still alive. And that is all you do.

You now have "make amends," and that is it. And that is your level. You do not check it any further than that. You do not do anything more about it than that. That is it, period. You have done your assessment.

In other words, it's a sweep down, mark anything, one read each, mark anything that is productive of a needle action. When you get to the bottom of the list, all the way through to the end of the list, where you see my name, you stop and turn around and go back up and only read those that were live coming down. Only mark those that are now live on the second read. And then you come back the other way and you only mark those that are now alive and you'll wind up with the other.

Now, sometimes you'll get into a situation like this: This is perfectly acceptable. Approach. Get out of. All right, you've got four marks after Approach, you've got four marks after Get out of. Which is it? So you say, "Get out of. Would a waterbuck get out of things?" Mark it. "Would you approach a waterbuck?" Ha-ha. That's live, too. Now you got two of them.

So it's perfectly all right for you to say, because you are right on the pc level and it is very close to one or the other of these anyway, it is all right for you to say right after that, "What would a waterbuck get out of? What would you approach?" They're still both live so you go back over it again, and all of a sudden there is nothing on Approach. "Get out of" is live, you take it. That's it. And that's all the checking that you do on it.

Now, how about reading this. You get a variation. You read these things two ways in order to get a two-way flow. "Would a waterbuck have faith in you? Would you cause a waterbuck something?" Now, remember you are saying "you" and "waterbuck." Now, waterbuck is certainly charged as you go through the whole thing. It's charge, charge, charge; paragraph, paragraph after paragraph, level after level after level you're saying waterbuck, waterbuck, waterbuck, waterbuck, waterbuck, waterbuck, waterbuck, waterbuck, waterbuck, waterbuck, water – water – waaa-waaa-waaa-waaa-waaa ...

That's an awful lot of talking, isn't it, for all this level. And what if you acknowledged the pc for every level. The pc doesn't talk, you see, you acknowledge his not-talkingness. There might be a better way to do it. You might say, "Would a waterbuck have faith in you, cause you, prevent you, have no effect on you, affect you? Thank you. Would you obsessively can't-have a waterbuck, make something of a waterbuck, create, think about, peculiar interest in, disperse a waterbuck? Thank you. Thank you. Would you intend not to communicate to a waterbuck? Badly control, betray, collect for, substitute for, withdraw from, duplicate, enter a waterbuck? Thank you." You get how you could eat up levels if you did something like that?
Well, it depends to a large degree on how your pc can be in-session. How consecutive their wits are. That's – is their attention on you? Because actually you're not blanging their attention every time in to the terminal, don't you see? They're only getting the terminal about every ten levels. And they still know what you're doing So it depends on your presence as the auditor and your ability to keep somebody in-session, whether you use one level every time and acknowledge it and say the level and read just that level and then reverse the flow for the next level like, "Would you have faith in a waterbuck? Would a waterbuck cause you things?" See? "Thank you." And then go, "Would you prevent knowing a waterbuck? Would you have no effect on a waterbuck? Would a waterbuck have an effect on you?" See? It would depend on how you wandered back and forth. As long as you're keeping that flow going both ways. All right. You could take it one time.

You see, you got several variations here. You could read it twice and acknowledge once, so you get two levels with one acknowledgment. You could have one level, one acknowledgment. You could reverse the flow every other level. Or you could reverse the flow every two levels, but using a waterbuck each time, see.

"Would you have faith in a waterbuck? Would you cause a waterbuck? Would a waterbuck prevent knowing you? Would a waterbuck have no effect on you?" See? "Thank you." Now you've read four levels and one acknowledgment. See, you could do it that way.

Or, if you really had presence and you thought the pc was in there and that you weren't going to miss anything, you could sail down five levels. "All right now." (Yeah, that was really depending on him.) "All right now. Would you have faith in a waterbuck? Would you have no effect on, effect, obsessively can't-have, make something up, create, think about, peculiar interest in, disperse a waterbuck?" He found a level, so we mark it.

All right, well, we had the flow going that way, didn't we, so we now – we're going to come back the other way. That isn't necessarily down to a mark, it's just so many.

All right. Now, "Would a waterbuck intend not to communicate with you, badly control you, betray you, collect for, substitute for, withdraw from, duplicate, enter, inhibit, disagree with you? Thank you." You get that?

It just depends on how good you are. It just depends on how much altitude you are as an auditor. Don't miss any levels, because it will fall on it. Person's attention is on a waterbuck. The person will be – his attention will be on a waterbuck. All you do is have to say somebody's terminal to them hard; all you do is have to say "willow wand" to somebody whose terminal is "willow wand," "willow wand," his attention will be on willow wand for some little time now, you see.

You know these wind-up toys, you know, that have these traction wheels, you know, and you get the wheel running real fast and you set it down and it runs. His attention will be on it for several levels before it's jarred in any way. Well, you take advantage of that fact.

Now, you could cover it that way. Now, I haven't and actually don't lay down a standardization because frankly some auditors would have an awful lot of trouble trying to keep
somebody's attention in that long. The pc's attention, sort of nervous and upset and his attention usually isn't on anything. You're liable to start just reading random levels.

Now, if you were covering the gross level in that particular character, if you were covering the gross chart in that particular character, you would still come back to the one read for the second run. You've only got ten left so what are you winning. You're winning nothing. See? The second – you got – you've covered the whole thing in that fashion, many five levels let us say, three levels without saying the terminal or getting a flow. And then you got three more going the other way and then three more going back again, you see, with the flows. Or five, as far as that's concerned, levels before you flip-flopped the flow or said the terminal again, or something. That's perfectly all right.

But on the one back, you've only got ten levels live, you would take every one of them on the basis of: "Have you failed to interest a waterbuck? Would a waterbuck fail to help you? Would you destroy a waterbuck? Would a waterbuck propitiate you? Would you survive a waterbuck?" See. You'd take every one on a cross-flow.

I'm just advancing these ideas to you for just this good reason, is this is an awful mouthful to assess on this Auxiliary Pre-Have 3D Scale and you've got to have some way of getting over it more rapidly, so study it over and see how you'll get over it. Actually you want maximal – you want accuracy, you want maximal speed and minimal restimulation to the pc.

The way to get maximal restimulation and minimal speed is to assess this way: "All right. Now, we're going to assess a waterbuck here. All right, you all ready? All right. Thinking about a waterbuck? Are you thinking about a waterbuck? All right. All right. Okay. Think, think about a waterbuck now. Uh, let's see. Would you have faith in a waterbuck? It's live. All right. Would you have faith in a waterbuck? Would you have faith in a waterbuck? Would you have faith in a waterbuck? It's still alive, you know. Would you have faith in a waterbuck? Oh, it went null that time. All right, that's good.

"All right. Would a waterbuck cause you things? Oh, you know, that's null. Would a waterbuck cause you things? That's null, you know. Would a waterbuck cause, cause, cause, cause; would a waterbuck cause you things? Cause things to happen? Would a waterbuck cause, cause everything? Now I'm getting a fall. That's better." [laughter]

Do you know actually there was an – were some assessments done that way here back in July, before we caught it. They were erasing every level. Now, I don't think that would be possible with this kind of list. But sailing down the line on this, you should be able to get your assessment in and get it in fairly rapidly, and with you satisfied with the accuracy of the assessment.

Now, this Auxiliary 3D Scale, given the fact that you're reading a meter, getting in the fact that you're trying to get the level well and expertly and that you've got the thing right on the front burner anyway. It's got a lot of new beef in it. There's a lot of stuff in this that is raw meat.

The earlier Primary Scale was delivered up on an idea that wasn't too successful. It was supposed to move over into a Secondary Scale. Now, you have a scale which is an Auxiliary Scale which is all one in itself, and you have murder, kill, maim, tear to pieces, exhibit,
bury, pain, wound, antagonize, bore; you've got all kinds of words in it which are your major action words.

The formula of any such thing, by the way, is reach and withdraw. They are the words which reach and enter, and withdraw and leave. And that is your formula for putting together one of these scales. And there it must be all action words; they must all be doingness words and there must be no stop words because you cannot run a stop. You can try to stop. "What would you do to stop a..." Yes, you can run that. But you couldn't run "Now, get the idea of stopping a waterbuck. Thank you. Get the idea of stopping a waterbuck." Well, that's just dandy. After a while at the end of the session, the pc has nothing but waterbucks from his face to the wall. He did what you said.

But you'll find this scale is very useful. Now, this scale, of course, comes to us in the nitch of time because we are already starting these runs and we have one pc who doesn't look quite so good today, and I think it's because she didn't have the scale earlier for her session. You might have found something much hotter on the scale. But you'll find it tomorrow and it will be something like, "How would you sexually satisfy a waterbuck?" [laughter, laughs] I say it's a raw-meat scale.

Well, anyway, this scale, this scale could go on forever, and it might even get a few words longer, however, you'll notice there are quite a few words missing on the Pre-Have. That's because nobody ever fell on them. And by deletion we've lost a few words but we've added a tremendous more.

I will ask you that if you have somebody flat on this entire scale and it becomes necessary to you – either here or anywhere else – and it becomes necessary for you to look up in Hartrampff's Vocabularies or look up in a sheaf of the old Secondary Scales and find a new level or two that you don't have – if it becomes necessary for you to dream up a level for the pc because all these levels are run – would you please, please remember to send me the level you had to dream up. Okay?

And in that way, we will eventually, down the years, exactly crowd them all in, one way or the other; anything that any case would fall on. And if you will carefully, carefully, carefully preserve these Auxiliary Pre-Have 3D Scales, one for a pc. Put it in the pc's folder and use it for the pc, and use different symbols for each time you assess – different symbols, I don't care what they are there. You use a little half-circle, a half-circle open at the top, a half-circle open at the bottom, a half an X, a full X and there are several alphabets you haven't used for words; there's cuneiform – and if you'll preserve those and when it's all washed up, I will be able to lay my hands on some of these, we'll find out if there are any null levels in this thing. Are there any levels nobody has ever gotten run on? And then of course we can delete those and it will shorten the list.

It's in your interest to have the list as short as it can possibly be kept. Okay?

All right. Well, we got this out at the break of dawn; use it from here on. Don't use your old 3 – your old Routine 3 and earlier Prehave Scales. Just abandon those things because they're – they're not dangerous, they're just not complete. And you'd do much better with these.
I may be able to compartment this at tone levels. I may be able to get it into various tone levels so that you only have to – after you've gotten rid of a section of it, you don't have to reassess across that section again. You know, segment it somehow or another. Get rid of parts of it. I don't know quite how I'm going to do that. That's all in the future.

Right now you've got this and it does work, and you've got 3D and it does work. You've got E-Meters and they work. And your Instructors and me are going to make doggone sure that you work them. And as we used to say in innumerable wars down the last 200 trillion years: We'll be out of the trenches before Christmas.

Thank you.
HAVINGNESS

A lecture given on 28 November 1961

Okay. Well, amongst those present we have people who have from time to time heard me make this lecture. It always comes as a vast amazement that this particular item gets forgotten. Havingness. What's the date?

Audience: 28th.

All right. You're up in present time, thanks for bringing me up there. It's November 28, 1961 and this is a lecture on Havingness.

Now, I can see one or two or three or four or five who have all of a sudden have heard me over the past six or seven years all of a sudden say, "What! You mean you've forgotten Havingness?" It's because I have, of course. And then I bring it to your attention with a thud that Havingness has an enormous importance and that you must run enough Havingness on pcs and then we go into a big spurt on the subject of Havingness and then in very short order everybody forgets Havingness. I forget Havingness. You forget Havingness. They skip Havingness. And there we are.

Unfortunately, in the first Saint Hill, we allied Havingness to Confront. And the two have been together. Havingness and Confront have been together. They don't belong together. Havingness belongs all by itself when you're running something else because the something else is the confront.

Now, that's the first point that you should remember. If you're running a subjective process upon the pc, the objective process is Havingness. In other words, it isn't true that Confront is the only subjective process in the world.

Havingness is the adjunct to any subjective process and Havingness is itself. It is itself and it belongs hand in glove with all subjective processes.

Now, I've just glanced at somebody right now who hasn't had enough Havingness run and it's one of those jump conclusions. You all of a sudden say, "Now, let me see. Let me see. Let's see." And I figure out extraordinary solutions, you see. And we figure out what is it now. "Is it this, it's that," and so on.

And for many years, it has always come back to, "What? Havingness! Nobody's running Havingness. Uhhhh. What do you know?" And then things go along smoothly for another month or two. Until we forget it again.

Actually, we keep havingness in, I suppose, for about six months before it evaporates again. And then it usually stays evaporated for something on the order of about six months to a year before we bring it up again. It's quite interesting.
I wish to call it to your attention that havingness keeps going out in processing as well as on the pc. In the technology of processing, don't you see, we ourselves get so interested in the subjective difficulties of the pc that we run our own havingness down. That is to say technically as the auditor.

We sit there, you see, and we say, "Now, what is this modifier?"

"Oh, it couldn't possibly be, but here it is. Ho-ho-ho-ho."

And we're just getting in there, you see and we're very interested about the whole thing and everything's going along marvelously and the tone arm's pretty stuck, but that won't bother you much fixing that. Now, let's see now. All right. Now, let's get that G plus M. Ah, that's the thing. Let's get it there, you know. Boy, I don't know. Can't read the E-Meter, but otherwise everything's going along fine, see.

Why can't you read the E-Meter? Why is it stuck?

Well, there's two reasons it's stuck. ARC brrreaks can get so furious that they do not register on the meter. And thereafter, nothing registers on the meter. In other words, the auditor loses his command value over the pc.

All right. We take some – here's the example. Now, this is about havingness, but it's also got to be about ARC breaks because these are the two things that go hand in glove.

All right. We have two people standing there and we have a pc. Now, neither one of these two people is the pc's auditor, see. Neither one. One is the fellow who stole his wife. Ha-ha-ha. Years ago, you see. And stole his wife and busted up his marriage and he's always detested him ever since. That's one of these fellows, you see. And the other one is a good friend of his. Now, we have the third party on the E-Meter. And the fellow who stole his wife says to him, "Are you withholding anything?" And we get no registry.

And the fellow who's his best friend says, "Are you withholding anything?" and we'll get a registry.

The fellow who stole his wife says, "Have you told me any lies?" and we get no registry.

And the fellow who is his friend says, "Have you told me any lies?" Same tone of voice, see. And we get a registry. You see that?

Now, the pc who has a severe ARC break – a very severe ARC break – hasn't got a friend in the world including the MEST universe. Everything has gone out. And Havingness is a wonderful entrance point in for an ARC breaky pc because he's always in a games condition when he goes into this condition. He won't let anybody else have any command value over him of any kind whatsoever.

He is in a games condition. He has ceased to be part of the group. And the first and foremost part of a games condition is not permitting the other fellow to have anything. So frankly, all you would have to do, basically, to get an ARC situation mended up would be to run Havingness. Isn't that interesting?
Well, it's a – it's a wild mechanism because, frankly, if this fellow who stole his wife were to run Havingness on him for awhile, he might run it. And if he did run it, you'd get a registry on the meter of some sort or another. He might even come to the conclusion she was no good anyway. See? He might even come to an agreement.

But let's look at this again. Here we have the fellow who stole his wife. And here we have his best friend. And here we have the third party on the E-Meter. And the E-Meter will not register on the person who has no command value over the pc. You know, you could just roll on the floor with laughter at the thinking of all of these cops who have been training like mad up at the Keeler institute. The Keeley institute, you know, is the one where they cure drunks, you know. And the Keeler institute is the one where they teach lie detecting and make them.

A Keeler lie detector costs $18,000. It is 1/1,000th as good as your E-Meters. But they have thousands and thousands and thousands of graduates. And the lie detectors don't work. And courts have learned this. They've hanged enough people now and jailed enough people who didn't do it to find out that the lie detector in some hands is very unreliable. Horrible joke.

It won't tell any lies. It does nothing but tell lies. Who knows what it does. It frankly just doesn't register. There are two hundred cops in the United States operating – they are actually ID men, usually very, very highly paid specialists, who can operate one of these great big Keeler lie detectors. two hundred men. And they think it is a peculiar knack. It's a knack.

Well, the psychiatrists – you know, they – no psychiatrist will argue with you about the fact that I can probably process people – psychiatrize them. Because I have a knack.

I always argue about this thing called a knack. If anybody's got a knack, it has mechanics and it is understandable and it is acquirable. It's a good safe basis on which to travel and then you won't go around thinking about knacks. It means that two hundred cops have the ability to go into ARC with criminals. And that's all it means. And that, of course, becomes very understandable to you. Naturally, there are thousands and thousands of cops that can't go into ARC with anybody. And really, actually, it's a rare cop that could go into ARC with somebody. So naturally they only have two hundred, two hundred operators out of the tens of thousands they've graduated out of that institute. Becomes understandable, doesn't it? Because these fellows who can make it operate have a command value over the person they're testing.

In other words, somehow or another, they can get into ARC with them and they don't know how it's done. They know none of the mechanics of it. They don't know anything about the mind. They think it registers the brain and perspiration. And there it is. There's two hundred of them can make a lie detector operate and there are tens of thousands of them who can't.

Now, that tells you something about the E-Meter. The E-Meter has a hole in it. And the hole in the E-Meter is simply this: It will not operate in the presence of an operator who has no faintest command value over the person who is on the machine. That is it. And that is the hole.
You could come along to somebody that hated your guts, put him on the machine and
you could say to him, "Well, have you robbed any banks? Have you eaten any pork sausage
lately? Have you told me any lies? Do you dislike me?" Even that one. No reaction on the
machine. He's talking to a blank wall.

Every faculty which this person has is alertly in present time dedicated to just one
purpose: not being under the influence of. Got the idea? Only it's ridged and it's reactive. And
the reactive bank itself is just duuuu. And the analytical mind, duuuuu. You – don't you get
the idea? I mean it's raining in Siberia. So what? No, it just means that little to him that – the
fact that this operator would ask him a question who isn't in ARC with him. See, no ARC, no
operation. That's all. So that's the hole in the meter.

So when you ask somebody, "Do you have an ARC break?" you might as well be
whistling "Dixie." If the person has a very severe ARC break with you as an auditor, you
aren't going to get any registry at sensitivity 16. Why? The person has ceased to regard you as
having any command value over him of any kind whatsoever.

So what could you err in there? Ho-ho-ho. How could you err, huh? You could say,
"Well, it doesn't show on the meter, so he doesn't have one." You could even go so far as to
say, "Well, the meter is clean. You couldn't possibly have an ARC break with me." And
there's how the E-Meter gets invalidated for people.

If you've been over a rough course of auditing and have had a rough time with an audi-
tor, the possibility is that this might have happened to you. The person says, "There can't be
an ARC break because there's no reaction here," and proceeds as though there isn't one. When
you know doggone well there is one and the meter isn't registering it. And you're liable to turn
around and say, "Well, the meter's at fault." The meter isn't registering something that's there.
Well, that is one thing the meter won't register. An extremely severe ARC break is not regis-
terable on an E-Meter. That's what it boils down to. Bang, it's not there.

So at that moment, your humanness must take over. You have to be able to look at
somebody and tell whether or not they have an ARC break.

Now, if you're of a disposition that will not permit anybody to have an ARC break
when "you are doing a good job", you're never going to be able to assess a lot of people. I
mean it's just – a lot of people sit down and you just never get any assessment on them at all. I
mean you can read everything. You can read lists, you can do it all right. You can have your
little finger cocked in the right direction, your pencil at the proper angle, E-Meter set up prop-
erly, everything proper, only you just never come up with an item. Why? You don't have any
command value over the pc. Because the E-Meter wouldn't tell you he had an ARC break and
if your disposition is such that you're damned if this person's going to have an ARC break
around you. And if you're – well, actually, old Joe – the only thing that was really wrong with
this man's auditing, he went into an absolute panic. All somebody would have to do is just
shed one tear. It didn't even have to be a very moist tear. And he'd rabbit. You'd just see him
going down the track, man, with the greyhounds baying behind. He was out of that session
faster than any rabbit ever got out of the box. Actually panic. Just practically turn white.

Well, you'll probably run into this phenomena amongst some auditors maybe at one
time or another. They – the idea that the pc has an ARC break – this ohhhhh – "he'd better not
have a misemotional ARC break. No. No. No. No ARC break. Thank you very much. Now, we're going to go on with the session and keep it all calm." You get the attitude?

Now, if a person had that attitude he, of course, would never detect humanly the fact that the pc had an ARC break.

The pc is sitting there glowering, not confronting – these are some of the symptoms – won't confront the auditor. He knows a pc with an ARC break always looks somewhere else. Won't set any goals for a session. That is not an invariable test, by the way, but it's – it's something that you should investigate. Glum, gives very shorthanded answers. And is getting no tone arm action no matter what you run or just gets a climbing tone arm which sticks.

Now, that's a bad thing for me to say because all levels at an early run of 3D – on a 3D terminal – stick. But you would get this other phenomenon moving in on you also. Tone arm's at 5. It'll stay at 5. Why?

Well, the meter's inoperative, that's why. Meter's inoperative because the pc has an ARC break. So you get no tone arm action. You get no operation of the process, your rudiments are apparently all in because the meter isn't registering on any of them. If it won't register on an ARC break and there is one, then it won't register on present time problem, room, nothing. It'll register on nothing. You see? It just goes out.

So the humanness of the auditor is necessary to check on the point of whether or not the pc seems to be cheerfully in-session – is pc seen to be audited. That's why you're going to get a shift of rudiments on this particular line. Why it's coming right up. But that's a human detection point.

Now, if you've detected that point and resolved that point, then your E-Meter operates, see.

Now, a person can make another error. A lot of people, a lot of people have already gotten the idea that they know more than the E-Meter. They sort of feel that they know more than the E-Meter. They have an idea that they can tell better what the person's terminal is or something than the E-Meter. You understand?

There's a resistance in this particular line. Well, I'll tell you exactly where that resistance is born. They know that there is something they know better than the E-Meter knows. There's something they know that the E-Meter doesn't know and they have never rationalized it out to themselves. And there is something that they know better than the E-Meter knows. But if that is squared around – that is to say they know – they know better than the E-Meter; they know whether or not this human being that they are auditing has an ARC break or is feeling cloudy or is feeling upset or is willing to be audited or not willing to be audited, they can sense the atmosphere of the session, in other words, and they know it isn't right.

Now, these people have sometimes asked the pc for an ARC break and got no registry of any kind when they knew darn well the pc had an ARC break and that the session atmosphere wasn't right. You follow that?
And so the natural conclusion is they know more than the E-Meter. Absolutely correct. They know more than the E-Meter. On a human situation of that particular character, they know more than the E-Meter. Right there on that one point of ARC break.

Now, it'd be an error for an auditor then to suppose that the E-Meter knew more than he did about an ARC break. That would be an error. But it would be an equal error to say and a dangerous one, for the auditor to believe that he knew more about what was the right terminal than the E-Meter. See? The E-Meter is rightest in its sphere and the auditor is rightest in the other sphere. Got the idea?

And if you differentiate those two things, why, life will make more sense as an auditor. You see how that is? If you have no command value over the pc, of course, the E-Meter will not operate because the E-Meter depends for its operation on your impingement upon the pc. And if you can make an impingement on the pc and you have some command value on the pc, well, the thing operates, but if the pc doesn't know you exist, you get that nonconfront that you'll see during the middle of an ARC break. The pc will look away; will not look toward the auditor. He will look up, he will look down, he will avoid the auditor's glance. Have you ever seen this?

Well, the E-Meter's right there with him, looking up, looking down and avoiding the auditor's glance.

So this person who considered they were smarter than the E-Meter, absolutely right within that sphere; they're smarter than the E-Meter. They can detect an ARC break when it exists and the E-Meter very often cannot. But if they carry that over into thinking they know more about what is the right goal and terminal of the pc than that, we get a situation which I'm having posted on your bulletin board that recently happened in California. An auditor that always knows better than the E-Meter out there found a wrong goal and terminal on somebody who was – kicked up one awful ruckus. They were busy running the wrong goal and the wrong terminal and everybody was very happy about having the wrong goal and the wrong terminal. And it was just the pc's knuckleheadedness that made him upset.

Oh, there were no casualties involved beyond the pc was practically blowing his brains out and splashing stuff through the correspondence lines and was very, very upset and another auditor, St. Hiller, got ahold of him and straightened him out. And bing, that was all set and they straightened him out and he smoothed out and everything's going along fine now. But it was hell while it happened.

And I happen to know the auditor who did this always knows more than the meter. He chose the terminal and shoved it down the pc's throat. You got the idea? You know.

His list – "Looks to me like 'a goat' is your terminal. Is it goat? We're going to run goat." God help you if anybody ever did this to you.

I can tell you because I have actually been audited up to total levels alive on the Pre-hav Scale. There wasn't one level that wasn't kicking. They were all reacting on a wrong terminal, somewhat as a test. And I'm telling you I've got a very good subjective reality on it. Er-uhhh. You don't feel like you do in 3D. 3D, you feel, well, it's ghastly – as you get the runs
it's ghastly. But there is some possibility that if it – somehow or another if I don't die in the
process, I will come out the other side.

Well, in this one you don't feel like that. There is no explanation of why you feel that
way. You haven't got any faintest notion of how you feel that bad. It's just the roofs are going
in and you're dizzy and you're this and you're that and you're the other thing.

Well, every level alive on the Prehav Scale. No, thank you. We turned around on the
other one and cooled it off to 50 – down to 57, down to 22, just bang! Bang! And that was all
right then.

I went around like that for two or three days, by the way. Coo. It should happen. I'd
been noticing this along the line, you know and it had seemed to me to be a bum show to get
the wrong one, but I didn't know quite it could be that bad. It is very bad.

I don't wish to scare you about it. The way to be relaxed about it is simply do a good
job. But don't, for heaven's sakes, ever develop a careless attitude on that one subject. Or
you'll have somebody just climbing the wall. It's very hard to pull them back, too. You can,
bu to that point, that point, Level III auditing incorrectly done is very poor show. Class III
auditing has to be done by an expert. There's no doubt about that. The fellow really has to
know his business and then everything goes along pretty well. Not otherwise.

All right. Back on this ARC break. How could you do anything else in desperation but
get the wrong terminal and the wrong level on the pc if the meter wasn't operating well.

This final desperation. You just say, "Oh, well, to hell with it. He's a goat. Bang! Run
a goat. All right. We'll run a goat. Goal: to clobber the auditor. Okay. Who would clobber an
auditor and not – and bleat? That would be obviously a goat, so we'll just run a goat."

See, if you just took 7,642 hours to get an assessment, you would long before that, you
see, have gotten in the frame of mind, well, let's find something even if it's a false thing. I'm
one who can understand this quite easily.

So it has been – it's been an important step here to put together the mechanics of ex-
actly how things don't get found. And the way they don't get found is there's an ARC break,
the meter goes out of operation because the auditor has no command value over the pc. That
would be the piece of missing nomenclature, missing technology and missing bric-a-brac that
would stand between you and a rapid assessment. You haven't detected the degree of ARC
break.

Now, in the first place, you're dealing with Homo sap. And let me assure you that
Homo sap is a very ARC broke bloke. That's how he got here. You run into some bird and
he's nattering around about auditing "You talk about auditing all the time. Oh, you Scientolo-
gists make me sick. The idea – bla-bla-bla-bla-bla." He's just saying, "I got an ARC break. I
got ARC breaks. I got ARC breaks." What's he mean. "I can't talk to anybody about my case.
And you better not talk to me about – about my talking – talking to you about the case be-
cause I know I can't talk to anybody about my case. And I've never been able to talk to any-
body about my case. And I'm not about to listen to anybody else's case and therefore, I'm in
perfectly good shape. I have to be because I'd never be able to talk to anybody about it if I
weren't."
That's what you're listening to when somebody won't listen to auditing or Scientology. That's really the whole situation. He's simply saying, "I can't talk to you about my case. I can't listen to anybody about their cases. No difficulties must ever come my way and I'm not going to tell you about any of my difficulties."

The way he phrases this of course, is, "What is Scientology? Isn't that some kind of a racket? What are you trying to do?" You know.

You could shut off such a person. We every once in a while come up with pat shutoffs. But supposing you ran into somebody and he was saying, "Well, I can't talk to anybody. You people. You people, bunch of frauds," you know and so forth. What he's really saying is, "I can't talk to anybody about the case, you know. Oh, you people are a bunch of frauds. And what are you doing with this, I mean, trying and so on. Some kind of a racket isn't it?" and so forth.

And if you just suddenly say, "Why can't you talk to anybody about your difficulties," you'd sink him, you know, just like, just like a 16-inch shell salvo into the side of a small, unprotected and unarmored tramp. It'd just stop him. Try it some time.

Somebody starts sounding off and telling you all about how bad you are and how you shouldn't be asking him any such ridiculous thing about auditing – just ask them bluntly, "What can't you talk to anybody about your difficulties?" Make them answer the question. They go half crazy on you, you know. I mean, ahhhhhh, it never occurred to him before.

Of course, what is this, first step of auditing, he had the fellow in-session.

All right. Along with this, the ARC break realization about the meter, has come another rudiment lineup which simply asks the basic definition – this is old processing by definition – just ask the fellow bluntly if he's in-session, by saying what? "Could you talk to me about your case?" Of course, that's the package statement of definition of in-session. Definition of in-session is willing to talk to the auditor and interested in own case, so you just combine them in the two questions. I thought I was pretty clever when I finally figured that one.

"Would you talk to me about your case?" You're just asking him those two things in one sentence. "Will you talk to me about your case?" Bang! If he's got an ARC break, that's the last question he will answer. He can't answer that. He won't answer that.

That is the one thing that he won't want anything much to do with.

Now, you've got along with this another process that if he doesn't answer this positively, you can run this other process and you're all set. In other words, this person will go into session and the meter will start functioning and that's it.

All right. You have to run all four questions. You can't run two. We ran two or three 2s and they were – they ran all right, they ran all right but not for a real long run.

All right. Now, that area you can consider pretty well taped. You see the sense of it and you'll get a reality on it and you'll see it start operating for you. And I'm sure you'll see something on this order. You'll get a pc and you'll say, "Well, do you have an ARC break?" and so forth and there's no registry. And you're going down an opposition terminals list.
They're dangerous, opposition terminals lists anyway, you know, to a session because you're quoting and chanting every enemy the fellow ever had in his life. Hold somebody in-session while you're doing this is quite heroic, anyway, you know. And you're saying – well, the fellow's a housewife and you're saying "tradesman" you see, "children." Anything you could think of, you see, that could get in the road of this sort of thing.

You sort of dimly might possibly appear sort of an enemy yourself after you've been chanting this list long enough. Particularly if you didn't find it on the first go.

You understand that finding anything – a Sec Check question, a 3D item – finding anything on a case is more easily done the more rapidly it's done. That's one of these things. They – as the error lengthens, the difficulty increases, you know. The length of time necessary, if it is increased, the difficulty is greatly increased.

Well, so you're noticing there that you're getting just little ticks. You know, just little ticks and so on, about the width of one of these "set" dots. You're getting one of these little ticks. It's going dut, you know. Dut. When you find a live item, you know, a good, hot, live item, you know. "Do you want to kill a policeman?" Dut – dut.

Straighten out their ARC breaks. Straighten them out with the ARC Break Process 1961. Go down the same list and watch the reads. The reads increase. Well, why do the reads increase? Well, the auditor now has command value over the pc's bank. So you get an increased read, of course. Simple as that. I think you can observe that and I think you will observe that.

Now, the reason we have to talk about Havingness, the reason we have to talk about Havingness is the greatest little chewer-upper of Havingness you ever heard of is the ARC Break Process. And the greatest chewer-upper of Havingness you ever saw in your life is 3D. Oh, this has no peers. Running levels on 3Ds for Havingness – chomp, chomp, chomp, chomp, chomp, man.

I saw a Walt Disney cartoon once of a goat that somebody had. He was a small goat and he ate up everything in sight. And he ate up the farm and he ate up the fields and he ate up the fences. And finally this farmer got real smart and he took him out and he put him on the railroad track – the railroad that went from his farm to San Francisco – and headed the goat in that direction, the goat eating up the railroad track as he went. And that's kind of the way it is as far as Havingness is concerned. Man, it really gets chomped up.

In the first place the fellow doesn't want this mass that he has. But it is mass and you know a thetan's motto is: anything is better than nothing. But this mass is an introversion mass and the more you run the mass the less he's got the physical universe, so even if the mass didn't increase or decrease, if the mass just stayed the same, it is introverting him. And the more a pc introverts the less universe he has. Simple, isn't it?

So he would get the feeling of losing havingness by simply contacting some introverting thing. Something that introverted him very badly would give him the feeling of no havingness. He wouldn't have had to have lost any mass. He is surrounded by the physical universe, he's got just as much bank as he had before. It's always been there kicking his teeth in. Every time he ever got sick, this mass that you're now running out, of course, was what
moved in on him. Anytime he got pneumonia, anytime he ran fevers, anytime he did this or that or went off the rails in some other direction, it was the mass which you are handling which did it to him.

Don't be too amazed if in running 3D or something like that, you put your hand on the hot brow of the pc or – why it would seem a little bit warm. Or if you put a thermometer in his mouth you'd find he's running a temperature of 102. Don't be amazed about this. The thing to do is to handle it smoothly. Because nothing is going to happen to the pc at all if it's even vaguely well handled. It doesn't have to be perfectly handled, you understand, it just has to be vaguely well handled. You'd have to do something like, he says, "Well, I'm stuck in all this mass."

And you'd have to get up and say, "Oh, to the hell with you. I'm tired of auditing you. That's the end of the intensive as far as I'm concerned." And hit him with the chair. It'd take something of that order of magnitude to completely wind it up. Or running him on the wrong items. Running him on the wrong items would really fix his clock.

So, introversion. Well, I'll give you an idea. The person's walking along saying, "What a beautiful day. What a beautiful day. Isn't it a lovely day." And he's looking around and here's all the birds and orioles and crows and airplanes singing in the sky. And you walk up to him and you say, "Uh – what are you worried about?" And he loses it, you know and he says, "Argh. What the hell do you mean what am I worried about? What's the matter with you?" You know, ror-ror-ror-ror-ror-ror.

Now, if you were – had some method of measuring his concept of his havingness – immediately before you asked the question and immediately afterwards – you'd find his havingness would have dropped. See, he's lost the beautiful day. Well, the beautiful day hadn't disappeared. It's just his idea on whether it's there or not or whether he can keep his attention on it.

Similarly, you find this fellow sitting on a park bench and he's worrying and he's just wallowing, you know, he's worrying and he's worrying and he's worrying and he's worrying. Walk up to him and say, "Look at the beautiful day." You get the same effect. Pc's havingness at the moment is his worries, see?

So all you had to do... The formula, the formula – which I think is employed here and there – is "Anything the fellow has at the moment, tell him he's got to have something else." Anything a person's attention is on, put his attention on something else. This is an educational activity. This is how – actually it's a much more effective method than brainwashing

It's a good thing no Russian wants anything much to – I know no communist in Russia wants much to do with Scientology. It's a good thing. Because they could really brainwash people, just on the theory – now, anything the fellow's thinking about, make him think of something else, see. You wind up brainwashing somebody. In other words, the person's attention is very contentedly on his bank, why, make him look at the wall, suddenly, see. Suddenly make him look at the wall. He gets zz-zz-zz-zz. See. Or if his attention is very contentedly on the wall, suddenly make him look at his bank. You got the idea? So a sudden shift here. Now, this is one of the defeating effects of Havingness.
But, when you're running a person's ARC break and he's all out of ARC with you, he wants to go out of the session. He's thinking about – well, at first he starts thinking about he isn't getting auditing and then the next thing he's thinking about – he sort of thinks he probably ought to put his attention on something else. And then the next thing he is thinking about, is actually, physically leaving session. He thinks he ought to just pull up himself by his coat collar and walk out.

If you could catch him at the point when he just thinks he ought to be thinking about something else, to run Havingness, you of course are complementing exactly what he is doing. He's looking around the room. Well, show it to him.

The second you did that, you would get command value on the meter and could therefore straighten out what's wrong with him.

I mean, he's already looking around the room thinking he ought to leave session. That's a very extreme case, you see. Well, if you ran Havingness at that particular time, you would heal the ARC break. That's a very smooth way to handle it because of course you've taken over the control of his attention and he moves right straight back into session very nicely because he actually runs out what you were doing.

Almost any pc run long enough on Havingness will get all of his rudiments in. Isn't that fascinating. The earliest rudiment process, by the way, at the time they're called rudiments was "Was it all right to audit in this room? Was it all right for me to audit you?" That was more or less the gist of it. That isn't the exact wording.

And we're right back there again. We've moved back all those years back to 15th Street in Washington. And just on that, what is a rudiment? Well, of course, we're not asking it with that degree of simplicity. But we are asking, "Well, is it all right – would you talk to me about your case?" and we're going to find out how his havingness is. See. Or we're going to find out how his havingness is and then going to say, "... talk to me about your case," you know. That probably is the proper order.

Person's attention is on the physical universe. Bring him from the physical universe down into the session, rather than flick it out of the session.

Now, what's this amount to? This amounts to this: that Havingness is that activity which is run when needed and when it will not violently deflect the pc's attention.

I'll give you an example of that. Pc's sitting there and saying, "Wow, you don't really suppose, you don't really suppose I – hey, you know, this is pretty bad. I thought I've been going down all through the years being a good boy and here I actually find – no, I don't know."

And, he's dealing with the possibility he might have shot somebody or murdered somebody at some time or another, you know. And he's just all intrigued with this and uh ...

You say, "All right. Look around here and find out something you could have. Thank you. Look around here and find out something you could have."

He says, "What? What?"

Too heavy a shock, flick of attention, see.

Similarly, the person is running, all of a sudden, very well on Havingness; they're just starting to find out that there is a room there and the mass is releasing and you say, "All right, now, let's get to the bank."

See, both of those are errors. Person is looking around and saying, "Well, I could have that piece of fluff. And I could have a corner of this piece of paper and I could have the end of my nose."

And you say, "Squeeze the cans," he does. Looser. You say, "All right, let's get back into session now. Let's – let's get going on this other thing."

And he had just at that moment begun to wonder if there was a room there, don't you see? And he never gets a chance to complete the thought of "Is there a room there?" He wouldn't have completed it for another three or four commands, at least, you see.

So observing these factors, Havingness can do some marvelous things, but neglecting them, it can really, really upset people. But of all processes – don't let me startle you about Havingness or say it's dangerous in any way – of all processes, the safest process to run on anybody, anyplace at any time is their right Havingness Process. And that is the – always the safest process to run.

You can always run the Havingness Process on the most ARC breaky and upset pc. You can always run a Havingness Process on somebody who was almost totally spun in. You can run a Havingness Process on somebody who was badly injured. You can run a Havingness Process on somebody who hasn't eaten, hasn't slept and is going psychotic right in front of your eyes. You could run a Havingness Process on anybody almost at any time. And it is the safest process to run.

It cannot be overrun. Don't ever be cautioned into believing that it can be. It cannot be overrun. I'll tell you what overrunning and underrunning a Havingness Process is in just a moment.

But let us take the situation of – the pc comes into session. He has bounteous and peculiar present time problems. They are all there, all ready to leap up on the meter and give you one God-awful mess of a time. His rudiments are wildly out when he comes into session. He has ARC breaks. He doesn't know whether he's going or went. And you're going to sit him down and you're going to go all the way through the rudiments. You're going to straighten out every single rudiment on its own merits. Wouldn't you love a better way to get this out of the road? Huh? Wouldn't you love a better way to get this out of the road? Or, so when you did hit them, they blew. Wouldn't that be nice?

Well, ask the room question first and your humanness – consult your humanness, not the meter. Ask the room question first. Aw, let him set some goals for the session or something like that, anything, you know. And at that moment decide whether or not this pc is in
any kind of shape to be audited. Decide that at the moment – decide that right now, you see, at that point. And if he's not in any kind of shape to be audited, by your adjudication, your humanness – you say, "Ah, set goals for session?"

"Ah, I guess so and so on."

"Would you like session goals for life and livingness?"

"Well, I guess no, I don't set goals for life and mmmmmmmmmmm..."

Or, "Do you want to set some goals for life and livingness?"

"Yes, I'd love to. If I could think of any." Or something like this, you know.

All right. That's your indicator to run Havingness. Not the ARC Break Process, Havingness. Clank. Why? How did it all get caved in on him anyway, huh? He's been going around thinking worry, worry, worry, worry, worry, interiorized, interiorized, introversion, introversion, introversion; of course he's got more, more and more and more PT problems, of course he's got more and more of them. He's been looking inside until he's cross-eyed. See, looking in and looking back under his ear and he's been looking under his right eyelid and been peering into the dark abysses and masses of it all and so forth. He's badly interiorized.

Well, the probability is he's interiorized on things that have nothing to do with what you want to have happen in the session. He is worried about his wife and his terminal is a riding master.

The opposition terminal of a riding master is a fox. And we're going to run wife on him, are we? Not smart. We have a present time problem? "Yes I have a present time problem. Yes, I was up all night arguing with my wife."

Now, we're going to say to him, "Well, all right, okay. How do you feel about it now?" Clank. Oh, Christ, here we go up in smoke. Why? It's his wrong terminal. It's his wrong everything. He's having an argument with the wrong terminal.

You say, "Now look, during this intensive, for God's sakes, please only get into fight with foxes." [laughter, laughs] "If you've got to beat somebody, beat a horse, so we can run it out. But knock off this beating your wife. Just for the duration of the intensive." I don't think you could do that. I don't think you could do that.

Anyway, no, a smart thing to do is never collide with this PT problem at all. See, just never collide with it, never pay any attention to it, at this time. Sets his goals, we decide, well, rudiments are out, we decide, our sensitivity, our swamishness, our ability to telepath across vast distances, all of these various things. That's – here we go. They're out, something tells me.

Or just for the hell of it or just because you were running a lot of introvertive stuff last session, see, doesn't have to be any very pat reason, but you just say, "Well, we're not going to go down the rest of all those rudiments and run into all these problems and straighten that out today. Today we're going to get something done." And the way we're going to get something done today is the moment the pc says, "Oh, well, goals for life or livingness, ohhhh, can you think of any for me?"
You say, "Well good, all right. Now, look around the room and see if you can have anything. All right. That's fine. All right."

And the pc's Havingness Process is "Throw – get the idea of throwing mud at that wall. Thank you," you know or whatever it is – first command right there, see. Didn't matter whether the meter reacted or didn't react. Because you're way in ahead of your ARC Break Process, you haven't even brought up the subject of ARC breaks. You just decided they were probably – they probably existed. They probably would exist, you decided your meter probably wouldn't operate well or you decided that the pc was getting too darned interiorized and you're tired of that tone arm going up and sticking that heavy every session. Anything you decided, it didn't matter what.

And you just run Havingness. And you go ahead and run Havingness. And that's what I want to tell you about in this lecture, with all these other things that have come up newly, I should tell you something "oldly," which you might very well have handsomely managed to park under the wrong brain cell, mislaid it.

Havingness ain't run against the can squeeze. It's run against a pc's ability to have large objects in the room. Havingness is tested on a can squeeze. You don't need a meter to run Havingness beyond testing to find out what is the pc's Havingness Process.

Now, once you can find the pc's Havingness Process, you're all set. It's whether or not the pc can have large objects in the room. And this again, we're up here in the human equation. You always run Havingness till pc can have a large object in the room or many large objects in the room.

And you don't stop running Havingness when the pc says, "Well, that little spot of paper there, I can have that. And I can have a corner, well, that's pretty big, I can't have that. I could have the shimmer on this screw here on the E-Meter. Uhh-ahh, I could have that sigh. I could have the back of my head. I could have sensation in my toe. That's about all. Oh, yeah, I think I could – yeah, I've got a slight toothache, I could have have that, have a toothache, yeah."

"Well, squeeze the cans. Good. Oh, that's looser now. All right, we'll go on."

You see, when you were running Confront – this is why I'm telling you Havingness got mixed up with Confront – when you were running Confront, that is all the Havingness you needed, to run Confront. Now, the old rules of Havingness have gone astray because of these Confront Processes. And when you're running Havingness independent of actual, the companion Confront Processes, you don't run it this way at all. You run it against the largest object in the room.

You want to find out if it's the right process and you want to check that every now and then. But by every now and then I mean once or twice or three times a week, let's check it somewhere in the session. Let's run a few commands of it and check it. "Oh well, his Havingness Process is still working." You got the idea? That's all you want to know.

Now, the workingness of the process, in actual handling of Havingness, is whether or not he can have large objects in the room. That's it. There is no other thing. That is then
enough Havingness. Now, you can leave the process. And don't leave the process until he can have large objects. And that's the rule of large objects on Havingness.

Now, when you're running it with regard to confront, you actually could practically, you could run large sections of case with the Have-Confront, you see. That Have-Confront system is a marvelous system; it's all by itself. It is a system. It – and havingness got loaned to it. Remember Havingness isn't residual in this system. Havingness is itself.

The old HCO Bulletin October 6, 1960 took these all together and put them together as Havingness and Confront. It still gives you all these Havingness Processes. But when I'm talking about running Havingness, I'm not talking about running Havingness and Confront. I'm talking about running Havingness, just itself, only. And yes, you've got to have the right Havingness Process for the pc. Yes, you've got to test – you've got to find it by can squeeze. It's got to loosen the needle on a can squeeze. If it's not, if it doesn't, why, it is the wrong Havingness Process and will wind up with him looking inside of his skull. It won't wind up with him looking out at the room. So you find it by can squeeze.

You don't find it by also testing the Confront. You just find the Havingness Process. Now, having found it and having used it a session or two, the smart thing to do is run three or four commands of it and test it again to find out if it's still working. But, you understand that running with this, only a few commands of it were necessary to get the individual to have the confront work again. This is a different system. That's a different system. This havingness is itself.

So, all right, we start the session, we "Look around the room, see if you can have anything?" The individual says – we don't care what the command was. We look at him, we find out he's sort of out of sorts, he doesn't look too good to us. He looks rather secondhand.

All right, what a wonderful thing to do right away is just don't even start a long series of questions about it. Set his goal for life or livingness, "Well, yes. Still be here at the end of the session." [laughter]

"That's your goal for life or livingness. Any goals for life or livingness?"

"Well, no, I guess not then."

Well, that would be a very extreme case. Your next action, smile brightly and say, "Well, now. All right." You got to know the pc's Havingness Process: "Throw mud at the wall. Thank you."

So you say, "All right, now. Going to run a little bit of Havingness here. All right. Throw mud at the wall. Thank you. Throw mud at the wall. Thank you. Throw mud at the wall. Thank you. Throw mud at the wall. Thank you."

Well now, running that process we can't tell very well whether he can have any large objects or not, unless we occasionally ask him, "How much wall are you hitting?" [laughter] And you'll find inevitably, he'd say, "Just a little piece."

And when he finally says "the whole wall," well, all right, that's fine. All right, that's fine. That's enough Havingness. Right then, that's enough Havingness.
Now, you can tell if a Havingness Process is working because the tone arm goes up on this type of havingness run and blows down. It goes up and then blows down. And that's the original where you got blowdown, where that -- where that term came from, is by running Havingness. You can always get a blowdown with Havingness, if it's the right process. Of course just before it blows down, sometimes, the pc feels like he's being killed slowly between two gigantic bricks, but it will blow down.

By running the Havingness, you know, the bank is sort of... Tension is coming off of things and things are changing and he feels very uncon -- and he "what wall" and he's fooling around and then all of a sudden, why, immediately he all of a sudden says, "Oh, well, yes, I could have the whole ceiling." Bang, it blows down. Pow! That is the behavior of a tone arm on a Havingness Process, if it's the right process. Quite valuable to know, isn't it.

Well, on some of these processes, how you are going to follow the rule of the large object is up to you, because I'm not going to sit here and give you a pat solution for every one of them. In the first place, you'd never remember them. But that isn't the real reason -- is I never would. I'd never remember the solutions I gave you here because I don't need them.

When I see a pc who doesn't have his havingness up, I don't have to consult any rules because he looks like somebody who doesn't have his havingness up. He behaves in that fashion. There's nothing very esoteric about it. He is picky and choosy. And a person who's havingness is up is bangy, see, all pow and pow and pow and pow and pow. And the person whose havingness is way down is -- cautious -- maybe -- I guess. There's a vast difference in the attitude. It is a wild difference. It's not hard to detect at all.

Individual gets a certain look in his eye when he starts looking around to have things. That's not the time to stop the process. But he starts sitting back and relaxing a little bit and he's not much worried about his case and so forth or anything and he feels he's in good hands. Along about that time -- that feeling generates the same time, "Well, I could have that bookshelf and I could have the fireplace, I could have the chimney, I could have the wall, I could have, have the room."

Well obviously, he could -- little, big, big, big, bigger, bigger, he could have quite big objects. All right, he can have a large object.

"Okay, is it all right with you if I give you two more commands and end this process?" Pang-pang-pang. He's happy to have you do it, there's no ARC breaks messed up in it.

Now, you should know a few of the facts of life -- is that havingness runs the bank. And the reason why you don't run havingness to any large quantity while running the thirty-six processes in the preessions, is because the confront was running the bank and you didn't want the havingness running the bank if the confront was going to run the bank. You understand?

This was senseless. The confront would run the bank much faster than the havingness would run the bank, you see. So it was silly to run very much havingness with it. You just ran enough havingness with it to keep his attention flexible and so forth and went back to the confront to get something done.
Well now, the havingness I'm talking to you about comes directly, intimately and immediately out of this list of thirty-six new preessions. It's the Havingness Processes and they are all by themselves. They are themselves. And they are in order of frequency on pcs.

The confront, scratch it out. You're not going to use it. You're not going to have anything to do with it. Why? What are you using for confront? You are using Sec Checking, using Problem Intensives. You're using 3D. For heaven's sakes, you're using all kinds of assessments that are reaching into his bank with red-hot pokers. Why do you want a confront? That's enough confront for anybody.

I'll tell you, the pc in the first throes of confronting his terminal goes between rage and extreme pleasure and horror and he vacillates, man. He's got enough there to confront without you saying, "What could you confront?"

He'd tell you every time. You've just got through assessing a ditch digger on him and he says, "Well, I could confront. I could confront a ditch. I could confront a digger. I could confront a ditch digger. I could confront a – a ditch, a ditch digger."

That would be about the way it is. But you're asking him to do all this and you're asking for all these Confront Processes anyway.

No. The depth of reach is accompanied by a reduction of havingness. That is, his awareness and so forth is being shifted so that it requires a rather heroic remedy. And it requires a real remedy. Just as it is extreme in the degree of what you're reaching in the reactive mind, so it requires an extreme remedy.

And that is you've got to run havingness just as it's supposed to be run. No, no hunt and punch. If you're going to start running havingness on the pc, run it to the rule of the largest objects.

There are large objects in view, when the pc can have those, why that's it. Well, how you are going to determine whether or not he can have it with some of these things, I don't know. But that's your problem. You think for a while. You've been wearing me out the last eighteen days, so – I'll just leave you that one. You can figure that one out yourself. How you can apply the rule of the largest object to "What beingness around here could you confront?" you know. Pretty tough. Actually that's not a very good Havingness Process unless you're auditing in a mass room – with masses of people or you're auditing it by a window or you're in the middle of a railroad station, there it's a good one. But sitting in a room all by yourself on a desert island, self-auditing it, it wouldn't be very workable.

All right. But it's enough havingness. Now, it's going to run the bank. Now, don't get upset about this, it's going to run the bank. The pc is going to go out of PT and back into PT. And this is signalized by what would seem to you to be dope off, but isn't. The pc can see, but not look, if you could imagine this.

You make mistakes with this just on this basis: the pc looks like he's a gone dog, so you stop the process. Pc's sitting there and the pc's going, "Btha-btha."

You say, "What wall could you confront?"

Pc says, "Btha-btha."
And then pretty soon the pc – you say, "What wall could you confront?"

Pc ... he looks like he's out cold.

You know, he'll get madder than hell at you if you stop the command. Because he's
doing it. He's doing it. He's doing every command.

You'll get some guy on the basis of what could he have, well he could have the hair on
the back of his head. He's answering, sort of. He gets so totally interiorized while doing the
process, don't you see, that he can't see even as far out as his eyeballs. And he can actually get
to a point of where he can have a sensation inside his neck. Or he can have a little something
inside of one temple. He can't have that wall. You're demanding too much of him.

So you just keep on running the process and the rule is, it's a very clean-cut rule, that
no matter what happens to the pc during a Havingness Process, you keep running the process
until he is back amongst us. You always continue to run a Havingness Process. That's the sec-
ond most important rule in it. One is the rule of the largest objects. Large objects of the room.
You've got to have the large objects. Pc has to be able to embrace them or see them, experi-
ce them, do what he's doing with them.

And the other one is, you must continue to give him the Havingness command at the
same rate that he has been answering it as before. But the rate is not as important as the fact
that you must continue to give him the Havingness command, whatever it is, no matter what
the pc does with his eyeballs.

Now, a pc can somewhat get into trouble, sometimes on havingness, by having things
he can't see with his eyes. He is facing in this direction and he keeps saying he can have
things in back of him with his eyes sort of glassy. Well, I don't quite know what to do about
this, to tell you the truth. Because I've had it happen, I've run that way and so forth. I've never
had anything very desperate happen. But if a pc looks too much without looking, you know,
he's having things he can't see, there's a possibility that he's having bank. And when he's hav-
ing bank, his havingness goes down, not up.

But it's a lesser chance. If it happens that the pc's havingness apparently is decreasing
while he is running the process it may be because he's simply having bank. He's having things
behind him – you can tell all the time what he's doing – or he's having things in the next room
or he's having things on Venus or he's having things in London and he is being audited in
Brighton. And, ware shoal. Don't necessarily stop the pc cold, but just become wary.

Because pcs do this: you won't believe it until you've seen it. The first time an individ-
ual runs into this one and knows it for sure, it's a shock. To know that a person can actually
have been going around in life, this whole lifetime, without ever having seen any part of the
physical universe. That is always a shock. When you get a – when you get an actual reality on
it and you know that that's really true. Pc never sees that shelf over there. He puts up a picture
of the shelf. Which is a varied shelf, by the way. And he sees the picture of the shelf and he
never sees the shelf.

It's a shock. It's a hard thing to believe. This fellow's been driving cars. The state has
issued him licenses to drive, everything else. He's never seen a road. He has always a picture
of the road under the wheels of the picture of wheels, you see, while he holds on to a picture
of a steering wheel, while he picturesquely picturizes down through the country lanes, at 90 miles an hour. It gives one to think.

It's worse than this though. Is how in the name of common sense has he ever had depth perception. Well the truth of the matter is, he hasn't. He hasn't. He's always reaching for the ashtray two inches short and then correcting himself. He sort of – you'll see by his actions. You'll see it, it's very often, very plainly marked. I turned on a person's sight one time who was blind. They were blind, but could get a hazy picture of things. And I turned on this person's sight so they could see quite well and it didn't take them but a few hours to get it off again. It was too unnerving. They could see a faint shadow of things and then they could see the thing. And it was much safer to see a faint shadow of it than to see it.

But it threw their depth perception all out and they didn't know which one to reach for because they were in different locations. There was the faint, faint shadow of it, you see. They were blind for all intents and purposes. But there was still this faint shadow. And they'd been very dependent on this faint shadow and it had been very, very safe. It had never fallen in and knocked their eyes out or anything of the sort. There it was, it was very safe, little tiny faint shadow.

All of a sudden why, see, the thetan, the person as a thetan, started seeing. And started seeing things actually and it scared them half to death. See, that wasn't safe. That was why they were blind, of course. And I didn't run out the reason why the person was blind, I simply turned on the person's sight. I've done it to two or three blind people. They, by the way, get their sight off within an hour, two hours. They'll see brilliantly they – what? and they're – you know, go around and then all of a sudden they'll decide that the wall is too white or the curtains are too red or they will decide something else about the whole thing and they pull the switch. So if you think there is – and they get real nasty about it afterwards, too.

There are no medals to be won in restoring sight unless you have restored first the willingness to see.

So, where the individual is running a Havingness Process, they sometimes discover this. And the reason you have different Havingness Processes is there are different degrees of perception. And I'm telling you just one of the bugs of perception. In other words, the wall is never there but a picture of the wall is there. They see the picture, they never see the wall.

All right, such a person obviously runs very poorly on a sight havingness, but would much – do much better with a tactile havingness. You know, feel the wall. You improve their havingness. "Look around here and find something you'd be willing to feel." And have them walk around and grab ahold of things. Repair their havingness.

But you could detect, now, something else about this, you could detect that if there are thirty-six of these things, there must be a lot more. Dick and Jan, after class, we were putting together peoples' Havingness Process and so on and they'd come in and I'd suggest Havingness Processes to them and they'd rehash them over and they'd remember old processes we had and something and I'd – we'd write them down and so forth and issue them and so on and test them out and they'd work on some and they wouldn't work on the others. And we had quite a ball.
And it was a very valuable piece of work that was done by that particular class. They've never really gotten the credit for it. But it was valuable. That was the 1st Saint Hill.

Now, if there are thirty-six of them, there are probably just as likely to be a hundred and thirty-six. We've not found it necessary, however, to use many of these. Do you know that there are quite a few of these on the end of the list that are simply on the end of the list because they have never been needed. There's hardly anybody doesn't find his Havingness Process before he gets to the end of the list. And we've never found it so. So as a result, why, there it is. I've forgotten where it starts, but it starts rather early. I think it's something on the order of twenty or twenty-two or something like that. And we've never used the rest of them to amount to anything, but because we never needed them.

But as you go down the list, by testing the various Havingness Processes on the pc, you will find something that will remedy the pc's havingness. Well, now the next time you test the pc – that Havingness Process goes out in use and we have to have another Havingness Process, well don't necessarily start at the point you left off or start at the beginning, just find a Havingness Process out of this list and if you ran to the unimaginably unimaginable thing you could dream up some sort of a Havingness Process that would still remedy havingness that had to do with the room and the environment and so forth, that would remedy the pc's havingness.

The easiest way to do it is to take this – an awful lot of research work went in on this particular thirty-six Havingness Processes and the easiest way to do is to go down the list and you test each one. And you only give the command about five times, something on that order, very few times. And you just get the person into session and – indifferently into session – and then you just say, "Well, we're just going to test Havingness Processes here," and you just have him squeeze the cans, hold the cans relaxedly in his lap.

Always make sure that the tests are made with the same can posture, because with these – with these small aluminium cylinders, a person's skin can be off of them and when they're tightened up, the crush-back of the skin on can be different every time you test and you'll go mad, you won't know which is which and so forth.

The American tin can has an advantage over these things, just in that respect only.

So, anyway, you go down the line and you just run it and of course the most obvious and the oldest one, "Look around here and find something you could have," is of course number one on the list. Not because it's – not because it's always going to be it for your pc, but because it would be so nice if that were it because it will stay in a long time and everything is fine.

So you just give that to him, "Look around here and find something you could have. Thank you. Look around here and find something you could have." You see, you've done a can squeeze, now you've run this five times, now, you ask him to put his hands in his lap and squeeze the cans again. And you've loosened the needle.

Well, if you've loosened the needle, why you've got it right there. You're all set. But you better run a check, better run a check. Let's run it twelve commands now and see if it still loosens the needle. Run a second check on the thing.
All right, you say, well that's dandy and we've got it and we've got it nailed. That's the pc's Havingness Process.

But if it tightened the needle, that is to say if you got less of a drop the second test, you of course would go on at once to the next one. Now, don't go lingering around waiting for it to tighten the thing up to a coiled spring. This again is most successfully done the most rapidly done. The faster you find it, the easier it is to find.

So you ask for a can squeeze, you give him five commands. You ask for a can squeeze. That's either it or it's not it. It's it if it loosened up the needle. That is to say, the needle dropped further the second test of can squeeze than it did the first time. That is all. The first time it dropped a fifth of a dial. Next time it dropped a half a dial. Oh, man, have you got it. That's the Havingness Process. That is all there is to it. Do a check out on the thing. Mark it down on the report. That's the pc's Havingness Process. You've got it right now.

All right. Can squeeze only gives a fifth-of-a-dial drop and you say, "Look around here and find something you can have. Thank you. Look around here and find something you can have. Thank you. Look around here and find something you can have. Thank you." Five times and you say, "All right. Squeeze the cans again." Eighth-of-a-dial drop. You say, "Thank you very much." No randomness here, see. Don't put any randomness in at that point. Particularly don't put any in. Because you're on dangerous ground. You just run his havingness down with the process.

So you say very rapidly, you say, "Well, thank you very much." You don't ask him for another can squeeze. You already know it's going to drop an eighth of a dial, see? You go right on. You say, "We're testing another one now. Point out something in this room you could confront. Thank you. Point out something in this room..." You go on and give him that. "All right. Squeeze the cans." Clang. Sixteenth-of-a-dial drop. You say, "Well, that's fine." Don't look dismayed at that point. We'll run you sometime on, "What dismay have you suppressed?" [laughter, laughs] "To whom could you show and exhibit dismay." A professional auditor process.

Now, you look at this next one and you say, "Well, hell, there's only us in the room. Skip it." You get the idea. And you get the next process and you just test it out like that, see, it's very rapid. Can squeeze. Process. Can squeeze. Process. Can squeeze. Process. Can squeeze. Process. Can squeeze. Process. Can squeeze. Ha – process, a-ha. Check. That's it. Now, we got it. Dandy, dandy, dandy. And we mark that thing down. And then the next time that we are confronted with any randomness of any kind whatsoever – such as loss of havingness toward the end of session or something of this sort – we got the process.

All right. But supposing you were checking for a Havingness Process and you found a Havingness Process and your p – and it checked out and everything is fine. What would be your next step in an actual session? Because you've got now time to burn in the session. This is a practical consideration. That is to say, you were going to do something else, too, in this session. Well, I would now get the session started. You know how I would start the session? I don't care whether you set goals before you did the havingness test or not. But if you've got the goals, you're going to run havingness. If you haven't got the goals, you're going to set goals and get the havingness. In other words, that's all. And you're going to run havingness.
And run it to the large object rule. You're going to get this pc's havingness right on up. Because if it was difficult to find his Havingness Process, then you can be sure that his havingness is shot to hell. And that the fastest, easiest thing you can do to get rudiments in across the board is to run his havingness.

All right. After you've got the pc's – in any session now – you've got the pc's havingness, anytime you get the session whizzing with the Havingness Process, you go in and go through the rest of your rudiments. And you say, "Well, could you talk to – do you feel you could talk to me about your case?" Or whatever the rudiments question is. "Good. Do you have any withholds? Do you have any present time problems? All right, this is what we are going to do." And the funny part of it is, you're going to find very few of them. You won't find any ARC breaks. It's no use asking for them, anyhow. Oh, you could ask for an ARC break. Don't forget it entirely.

But the point I'm making here is, you've minimized the number you are going to get. The pc is in a games condition with you because his havingness is down. That's simple. If his havingness is down, he's going to be in a games condition with you. Well, why should he be in a games condition with you? All you do is put his havingness in and he's not in a games condition with anything, so therefore his rudiments are in. This is a very fast, simple way of getting rudiments in. And now rudiments can be checked with care. Rudiments can be easily checked because your meter registers better.

Now, of course, if the pc said, "No, I can't talk to you about this case." You just remedied his havingness and so forth. I think it would be very rare. I just don't think it would happen, he would suddenly say to you, "No, I couldn't tell you anything about my case. It's very, very secret and it's very, very private and it's very, very this and it's very, very that." Well, of course, you've got your ARC Process.

Now, the ARC Process is very demanding of havingness. So when you see that the pc's tone arm is getting pretty confoundedly cotton-pickin' sticky, let him cycle into PT or let him have a good cognition and acknowledge hell out of it and run some havingness so that you run it at a point you won't give him a bad start.

See, don't put him way down the bank someplace with the ARC Process and then all of a sudden, "Hah! Here's a good chance to scare the hell out of him. Look at that wall!"

He'd be, "What? What? What wall? There's no wall here amongst us infantrymen."

No. Wait till he cycles up to PT. Wait till he has a cognition. He frees up a little bit on his attention. Or he's all of a sudden – appears to come out of something for a moment or he appears to be regarding you in some peculiar way that he hasn't before. Some change has occurred of some sort or another and you think it is safe to shift his attention off the bank to the room. Run some havingness and you'll get a blowdown of that tight tone arm and you can go on and make the ARC Process run much longer and much better and much faster.

This becomes important to you in 3D because you are going to be doing it while running terminals on Prehav levels. You are going to watch your havingness very carefully. And you are going to use it when necessary during, after, end of session, beginning of session and so on, you are going to watch your havingness carefully. You're practically going to blow
your pc out of the water, too. If you've run for quite a while without running any havingness, then all the somatics the pc has been accumulating will suddenly go zing! The pc is liable to go out colder than ice. And the only mistake you can make is not going on and running Havingness Process.

Of course, you feel kind of silly the first two or three times you do it. The pc's sitting there – the pc's sitting there, you know, dehh. Well, Mary Sue used to have a test for this. She said well when a pc started snoring, she knew he wasn't doing the process. That's the time to kick him in the feet and get him up. Get him around. But you can – you'll get so you can tell this.

And the – you'll finish up a half-an-hour run with the pc sitting there like this, you know or something like this. And going in and out and going u-h-h-h, like this. You go on and run the Havingness Process. Ask him at the end of the line, "Well, did you do all the commands?" "Well, I did all I heard. There was one time when you didn't give me one for quite a while and that upset me a little bit."

The pc has never even been able to signify that he's executed the command. And you must not expect the pc to tell you that he's executed the auditing command. It's no part of the auditing command, either. You'd have to add that. "Do the havingness command and execute it. Thank you. Here's the havingness command. Good. Now, execute it. Thank you."

Don't you think that sounds clumsy? So actually the pc does not have to tell you that he has executed the havingness command. He usually goes uhhhh, or nods his head anyhow in havingness. He's kind of – he never has much to say running a Havingness Process unless he gets a cognition and then God help you. But there you go. The pc will go on doing the thing with his eyes shut, out cold, as far as you can see and the only mistake you can make, the only way you can err, is not go on giving him the havingness command. Because you are now running havingness to a complete havingness remedy, objective. You are not running a limited pickup. Run for the largest object.

Now, when you've started the session, you've got the pc's Havingness Process, let us say and you've started the session, you've run liberal havingness, you're going to be amazed: some of the pcs you are auditing could have the head of the pin, providing it were not present. It has a lot to do with ARC breaks. I got ARC breaks pretty well taped. I got the meter taped. I found this hole in the meter. I've got that pretty well anchored down. We know about what it is and what it isn't and what we can do about it and we've got that solved. That's easy. Right along with it, just as an extra shovel full, we'll throw in this havingness proposition and we'll find out the pcs will have a much easier time of it.

Remember that havingness runs the bank. As you're having him look at the walls he's got pictures going by and he's got this and that and so forth and how intriguing it is for the auditor to take these all up. What process are you running? You're running some Confront Process, aren't you, suddenly, if you suddenly take up all these pictures the pc has and everything. No, let them fly by with wild abandon. Who cares what happened to these pictures.

He said, "Well, what do you know, what do you know there's – there's a – a picture of an albatross that just went by."
And you say, "Well, that's good." You don't say, "Could you ever have been the Ancient Mariner?" [laughter] No, you just say, "Fine" and give him the next havingness command. If anything, a little more rapidly than usual.

Now, it'll run bank. It'll run him anaten. It'll do all sorts of weird things and it'll give him wild somatics. Now, you don't have to run the somatics flat on a Havingness Process. But if a pc gets wild somatics on Havingness – the Havingness Processes that you're running or the process which you're running on him – it is simply indicative that the pc is on the goals-terminal chain of one character or another and it is disturbing the mass of the goals-terminal chain. That's the only importance that it has. And that you shift his attention, of course, causes the bank to shift which, of course, gives him awfully bad somatics. So what. That's fine.

It is not either really beneficial or unbeneﬁcial for him to have the somatics. This has nothing to do with it. He'll probably run into them again some other time or he may never run into them again. Who cares? Only thing it is, is actually you're replenishing his mass and the more you're replenishing his mass and the more ARC he can have and the more beef he can have on the situation, the better oriented he is and the better concept of havingness he is and the more he can run. And the more willing he is to give up a few of these ...

You know, a fellow who can only have a pinhead if it isn't there as his objective havingness, is not likely to give up a single scrap button of an old decayed picture that is in the bottom of a nonexistent crushed mass called a trunk. He wouldn't give it up if his havingness is down. You've got to get him in some kind of a state of realization that there is other havingness. Because the common denominator of all games terminals is games, all goals terminals are games and the common denominator of all games is can't-have. And that's for sure. Whatever else happens in a game, everybody's being sure that nobody else can have. You've got to keep that remedy or you're going to get a games condition.

So, here are a bunch of ways of keeping a pc on an even track. If you haven't got your pc's Havingness Process as you're running on down your assessment, no wonder you're having difficulty. Don't use your Confront Process along with the Havingness Process. Don't use that confront. Because what are you doing with 3D Assessments, Sec Checks, Problems Intensives, anything else that you're doing, you, of course, are doing a Confront Process. Much more violent a Confront Process, by the way, than any Confront Process listed here. Okay?

All right. Well, we got a lot of things solved and we got a lot of things squared around. Develop a sensitivity to know when a pc's Havingness Process is down. Develop a sensitivity to know whether or not your pc has an ARC break and you won't have very much trouble with pcs and your meters will work like startled deer. You can go down a list and the meter's banging there, banging a division, where before it banged an eighteen-thousandth of a micromillimeter. Which is very small. Very small. Large to a microbe but very small. Okay.

Well, I hope that helps you out. And thank you very much.
E-METER TIPS

A lecture given on 29 November 1961

Well, here we are. What's the date?

Audience: 29th.

Twenty-ninth of November, AD 11.

Year drawing to a close, drawing to a close.

Well, the process of going Clear is a new technical term. It has to do with after you find the terminal and you are feeling fine and so forth, then you go the rest of the way and that is a process known as being pushed through the knothole. [laughter, laughs] And, frankly, it's pretty ghastly, pretty ghastly.

Well, we're really not going to talk about that tonight. I'm going to talk about E-Meters. Your particular tool of the trade. This is not a comprehensive or broad review of the E-Meter. This is a bits and pieces, "How can you be that stupid?" sort of lecture, you see.

I have just learned why there aren't any Clears over in America. I received a cable and you know the old American meter that was – the old blue meter that was made prior to '58 – that's all right. But they haven't been since. They haven't been since. None of them give an instant read. Meters made in '59, '60 and '61, not under my supervision, give a sporadically noninstant read. They've got a delaying, damping action in them that sometimes operates to do weird things. That's very interesting, isn't it? So sometimes it happens at once and sometimes it doesn't. But basically what happens is, is that you don't get an instant read. There's a delay and it's different apparently from meter to meter.

So I think that's all very interesting and that's why I cancelled out that particular type of meter construction. And we're using this Mark IV.

Now, actually I've got lots of Mark IVs coming up the line. So it won't be too bad. They'll be easy to get hold of. They're cheaper than an American meter. But basically the thing will read and that I can guarantee. It will read. And that's all we require of an E-Meter, is that it read. We don't require that it has hot and cold running water. We simply require that it reads.

Now, where you get a lot of squirrel meters around or a lot of oddball meters or a lot of non supervised meters and that sort of thing, you apparently can guarantee nothing. This has been quite a shock to me. I just received it by cable. I have now handled it. I was getting a checkup on this. Actually I didn't ask him for a checkup, but he sent me one gratuitously. And it means that America, where we had floods of offball meters and where we had this more modern American meter which wouldn't read – we haven't got any Clear in that area – don't have nobody, see? So that's a weird one. Oddly enough the last Clears, for what it's worth – it
may not even be a well-coordinated fact – were made with the original meter which Breeding
and Wallace and so on and myself were sweating the midnight oil over and I was keeping
Breeding from changing it and Breeding was keeping Wallace from changing it [laughter] and
so forth.

And that was the last batch of meters. Actually we got a stack of those still back in the
FCDC – should still have them. Well, those are very reliable E-Meters and apparently every-
thing since that time hasn't been on that same order which is quite interesting.

And in England here, we have, frankly, hardly any standard meters of any kind what-
soever. We got an old potentiometer that somebody got off of a Spitfire and it's connected up
to a couple of radial props and it stirs up the pc from behind or something of the sort. And it's
sold at a cut price but of course you...

Reminds me of a story, you know, of the old pitchman who was selling watches down
in New Orleans. And was a perfectly good watch, a beautiful case, beautiful case. And you
hold this watch up to your ear and you could hear it tick and it had a marvelous solid gold
case and it had hands and everything was fine. And he was just selling these things like hot-
cakes, you see. But the trouble is the things ran down after a few days because the cricket he
put in them died. [laughter]

So that's kind of the way it is, you know. This Mark IV has this liability. If it is
shipped to you by air with its batteries in it, in these new stratospheric jet planes, your bag-
gage goes through a hot-cold cycle. Every time it lands it's hot, you see, because of the vari-
ous air routes usually, particularly the Commonwealth areas. And then it goes straight back
upstairs, you know, and drops to 30, 40 degrees below zero in the baggage compartment be-
cause it's not warmed like the passenger cabins. And the batteries burst – which as I've told
you before in a lecture are just a liability of that. So, if you're going to ship it in your suitcase,
for heaven's sakes take the batteries out of it and put them in your pocket and put them back
in when you get at the other end. Nothing else is going to happen to it, just the batteries are
going to burst. And it'll be unworkable at the other end, possibly, for that reason – unless
somebody put it up against a container of uranium being shipped to the Atomic Energy
Commission's advance headquarters in Australia or something, why, you've had it, you see.
Of course, you've had it then, too, because at the other end it's radioactive. [laughter]

But we've now got these things down so that they have a simple battery which is eve-
rywhere procurable and it's very easy to put the battery in an E-Meter.

There's a – the newest issue of these Mark IVs are supposed to have a design under-
neath the little lid. And you lift it open with a... If you don't have electronic equipment, why,
go to your wife and get her nail file or pick out your own nail file or buy one for a change and
unscrew the top plate on the little battery compartment which is right underneath the can
compartment. But if you get those batteries in backwards it won't operate. And it's a very
complex way the batteries go in. They had to be plus-minus, minus-plus, and I've never been
able to do it myself. I always send it back to the factory when I... [laughs, laughter]

But I'm trying to get the battery design doing it. So if you have to open up one of these
meters to change its battery, why, when you take that wooden plate off of the thing, sketch the
pluses and minuses. See, just sketch it, don't touch the batteries, just sketch exactly where
they lie in it. Draw a picture and show even where the dial is so that you won't turn the picture upside down and put the batteries in reverse end to. You got the idea?

So draw this little picture and when you put the batteries back in, fold up the piece of paper and shove it in underneath the cover and you'll always have it. And you'll be able to get the thing straight. It's very easy to change batteries in one.

The way you test for batteries in the thing is a switch over here and it says "Test." And if your E-Meter is functioning, your Test brings it right straight over to the pin. See? All you do is turn this thing over to Test and it goes over to the pin. Now when that needle on Test – you turn the meter on and you swing its other button over to Test. And when you do that sometime and you find that this needle here is not in this little last test range – you see there are two lines here in the last test range. See those? All right, when it's not inside those your meter won't function. It hasn't got enough juice left in it to drive the pc. Something's got to drive the pc so make sure that that needle is well within the test. And frankly, when it gets to about "T" on Test you ought to be going down to the drugstore and investing four or five six-pences or some vast sum or forty cents or something and buying yourself some new batteries for the thing and throwing them in; because it's not going to read well after that. And when it's completely outside those two bars, well, it just hasn't been operating for some time and that was why you didn't do much for the last pc you were auditing.

But you can suddenly look up with a start and wonder what's happened to your E-Meter and in view of the fact that the batteries are changed so seldom – that's one of the difficulties of this Mark IV, you almost never change the batteries in it, you see – that you get out of the habit of testing for it and then you one day swing the thing, "I haven't been having good luck lately. Pcs have been blowing, you know." And you find out when somebody else gets one of your pcs that them rudiments were all out and the pc had many missed withholds. Well, that's about the time that you took this little black button down here to the right of the Sensitivity knob and turned it over to Test. Because probably it'll come up to Set. And the battery – the thing will appear to be operating, you know, but it just doesn't operate. There just isn't enough juice in it.

Now, there's no reason to put a red light on it to show that it's always charged up, because it would consume more juice than the whole meter. So there is no way to put an additional indicator on it except this test switch.

Now when you carry this meter around, put it over here on Transit. And actually at the end of session, if you really want to take care of your meter, turn your meter off and turn your Set over to Transit. In other words, vertical knob. In other words, you have to do those two actions to turn an E-Meter off. Mainly just turn it off and then turn it over to Transit. And that keeps your meter from being jumped up and the needle banging around and so forth, that's all that does. But it's easier on the meter doing that. Actually you should do it at the end of session even carrying a meter downstairs; E-Meter will last longer.

All right. Now, another tip on this meter is setting the meter to exact Clear read. Now, this one, quite by accident, since you saw me fiddle with the knob a moment ago, is sitting here very nicely at Set. You turn this to number 2 sensitivity dead-on and you turn it to number 2 on the tone arm dead-on, exact. And then, you take this little knob down here at the bot-
tom and this thing is called the Trim knob and you bring the needle to Set. And you bring that needle right to Set. And that is with the cans unplugged. You actually can have the pc on the cans and set up your meter. But in order to do that you have to pop out this meter connector just halfway. It can still remain in the socket.

In other words, if you want to test this thing suddenly, all you have to do – you're sitting there, the pc is on the cans.

Don't ever fool around with the meter or set it up after you've got a session started, by the way. Just leave it alone! Thing busts, why, sit there interestedly and finish the session. You really need the data of the meter to finish the session – which you normally do – then just run end rudiments paying close attention to a busted meter and end the session. And during the break get another E-Meter, borrow or something, or bang it against the radiator or something and make it work. But don't go fooling with a meter. So a can leads breaks during a session. Well, that's just rough. Just leave the pc sitting there holding a broken can. Never even make a gesture toward repairing it, fixing it up, nothing. Because it is a serious error when a pc particularly is running a process or he's deeply interiorized – he's very much in-session – all of a sudden the auditor's interest is on the meter. And the second the auditor's interest is visibly on the meter, the pc knows that the auditor's interest is not on him; the auditor's attention is no longer helping the pc plow through his bank and it yanks the pc straight out of session.

I don't care how the pc said he didn't "mind" it. Look at your tone arm reads, if you could. Or fooling around with a busted meter, suddenly shaking it, you know, and saying, "Oh well, what the hell is so-on-and-so-on," you've had it. Your pc is – you've just laid in a nice juicy interruption of session. It can be far more important than you realize. So when your meter busts, your cans break, anything of this sort of thing happens, if you can carry on the rest of the session without an E-Meter, why, just do so, come to a normal conclusion of the thing, run your end rudiments with your eye on the pc and – you know, keep an eye on him, glance at your meter if you want to, don't make a fake out of yourself. And bring your session to a close. If you can do anything about the meter, why, do it during the break, see? Don't monkey with the meter during session ever. That is just a hallmark of a nervous auditor who just doesn't know his business, because smack, the pc's attention comes off, blang, the bank goes in on the pc, boom! And it's a cruel thing to do.

Now, when you're testing for Set, then, the pc could have been given the cans. But you couldn't possibly have started the session yet. Well, the least commotion you can make, if you notice the jack that goes into the side of Mark IV, here, is quite long. Well, all you have to do is pull the jack out just to that degree that it isn't connecting. You see? That's very short in, see? Just – it's just not connecting. There's only maybe a half an inch of jack shaft showing. And that is plenty in order to set your Trim knob. In other words, you just pull that out till you feel it unsnap. That's all you have to do. And bring it over here to 2, and then bring your Trim knob down here and snap that jack in and it's functioning right this minute. Got the idea? So to test, you just feel that thing unsnap. Don't take it out just when you test the thing. Just feel it unsnap. And now you can set the thing to Set. Now snap it back in. It's a very fast action that you can take there. It doesn't take very long.
Now, these Mark IVs are the first meter that doesn't have drift. This is the first meter that doesn't have drift. The Mark III, the Mark I in the progress of a session would go off as many as four or five dial marks. It would drift. Those Mark Is would drift that far off. This isn't important of course, unless you're testing for Clear. But you've got to have some kind of idea of it. If you're auditing somebody who's getting blowdowns and that sort of thing, you've got to have some idea of what that thing is, accurately, session by session. Otherwise, your tone arm reads are all different. Session by session your tone arm reads are different. But in the course of an hour or two, the 1957 American meter by warming up and – there is some slight warmth that goes into the transistors in spite of this. But the American meter, of course, burns much more juice than this Mark IV, enormously. This thing will run for a year or so without any battery shift and that other one, actually, if it's used – if you happen to leave it on accidentally overnight, why you've probably had it.

Anyway, to get back to what I was talking about – when you set this thing up, it will stay that way. Because the Mark IV is the first meter which has got a counterbalance. Now there's a way to set this up so that it will never drift. But this is sort of taking a micrometer caliper, you know, to measuring a lady's dress. You just don't need that – quite that much accuracy. There are two separate components which set up the trim on this. It's a very tricky little arrangement on the thing. And I knocked out the first one. I would not okay the first arrangement. It would have driven you mad, because you turned on one knob and set it and then waited for a minute and then trimmed it with another knob. And it had two trim knobs. Well, that for sure never, never would have drifted. It was there with a clank. But it's just like measuring a lady's dress with a micrometer caliper. It's just too much precision.

This one has solved that situation by putting both of these components into the same trim knob. In the first few seconds that your meter is on, you're going to get drift because your current is adjusting through the transistors. That's just the first, very short period that the meter is on you will sometimes see a bit of drift. You'll see it expressed by the tone arm. It has to be shifted. You put the pc on the cans – are ice-cold and it's really the pc gets the cans warm, more than it is the meter. But the moment that these aluminum cans adjust to his hand temperature and the transistors got that first surge of juice through them, the Set then remains.

Now, even up to the Mark III you had a condition occasionally where the meter audited itself. And it would develop a rock slam all by its lonesome, without any slightest assistance from pc, auditor or anybody else – which I think was pretty smart. But it was anticipating things a little bit and so on.

Well now, what that's all about is dust in the pot. Now, these terms are not my terms. They are terms from that unlikely race called electronics men. And this unlikely crew managed to name things F2-4Rs. If you ever have any complaints about Scientologese and its nomenclature and so forth, get into electronics sometime. That's really a ball. Listen to a couple of hams burning up vast amounts of electricity talking to each other from Canada to Panama. And one may be talking with an English accent, and one may be talking with a Spanish accent, but inevitably it will be, "Well, I've fixed this rig with an F4R now and it condenses far more better, but there's a leak going through the six-seven." I listen to it by the hour because it's sort of – there's a wonderful fascination to listening to total gobbledygook. [laughter]
There's no end of these terms. I thought, well, after you've been a ham for a while, you see, why, you could run off maybe fifty, sixty of these terms, you know. And you just had it cold and you could lean casually up against the set and say, "Well, ya know, I've just transferred the F4R and the six-seven is operating very smoothly." I thought you could do that. But holy cats, there's six-sixes, six-eights, and six-nine-and-a-halves, but there is no six-nine. You know, I mean it's…

They sure have a good time. I mean, you can turn them on here if you can get them on the air on your portable radio. And you can listen to them sawin' away about their six-sevens and F4Rs. It's all they ever talk about. The whole area could be burning down, in total flood, and thousands of people dying, you see, for lack of communication, and they'd sit there and say, well, their six-sevens did not adjust now well with their F4Rs. It's marvelous.

I've had a battle, by the way, in progress with an electronics operator on my end, as my talker to combat craft that were in action. And all they could ever talk about was, "I am hearing you, Sail One. How – how am I coming through? Have you adjusted your six-seven?" [laughter] and so forth.

And I'm trying to tell him, "Listen, are you talking to that guy at all?"

"Well, my 4R is at…"

"Listen. Are you talking to him at all? Can you hear him at all?"

"Oh, oh, yeah, yeah. Well, not very good. We haven't got it tuned in."

"Can you hear him at all? Can he hear you?"

"Oh, well, yes, yes."

"Well, goddamn it! Tell him 'right standard rudder' and get out of there! He's about to be sunk!"

"Oh, well, okay. Well now, my six-sevens are…" [laughter] Poor coxswain on the other craft. He doesn't even know anybody's trying to get in touch with him.

Now, I've had a time with this sort of thing. Undoubtedly developed overts in one lifetime or another on this subject.

So anyway, I always consider that a bit out of my province. I've had enough overts on it so I've kind of backed out of it if I was ever in it.

But anyhow, the thing is called a pot which sits underneath this tone arm. And this is a pot. And they have carbon pots and wirewound pots. And carbon pots wear out. And God help you if you've got some squirrel meter with a carbon pot. It's very hard to get wirewound pots. They have to be specially made, and they're very specially made for these Mark IVs. They're wirewound so that the component parts of the thing don't wear and loosen. On earlier American meters, as I understand it – and anybody should forgive my ignorance in this particular line, because I just designed the thing, I didn't make it. I didn't really design it either. I just made sure that whoever designed it followed his first ideas. You know, that sort of thing, and then made sure that he redesigned it so that it worked, too. I did the sjambok work on it.
Anyway, the pot here can – on a carbon pot, which you get on a cheap meter – is wearable. It wears. Then dust gets in it. And one little, tiny particle of dust in that pot, which is the pivot and set capacity here on this sunk-in area – one little particle of dust in there, and it won't connect straight. It has interference in its own lines so you busily set it up here and you get wobble, wobble, wobble, wobble, wobble, wobble on your meter. See, you got interference into the pot. Furthermore, the dust gets into it – as I understand it – because of the wear. If they're ordinary carbon and nothing but carbon, the wear factor is great enough to permit dust to get into them. And if they're wirewound you don't get that much wear and you don't get this same dust interference. In other words, that "audits itself," apparently comes out of this pot.

Now, there is a way to take an old meter and stop it from auditing itself. You take some lighter fluid and squirt it down here on the pivot, underneath this tone arm, and work the tone arm rapidly. But sometimes in session if it started auditing itself – one of the old-type meters – if you simply shiver the tone arm this way, it'll stop rock slamming. And sometimes won't. But some lighter fluid squirted in there on that sudden rock slam – there it is. Now the way... would fix it up.

But the way to find out if a meter is working is not to leave it hooked in. Don't leave the meter hooked in and so forth, on the leads. If you want to find out what's happening with the meter – if it's the meter's fault – just snap that lead out.

I'm not recommending you do this while you're auditing a pc. This is during the break. You just snap that – just unsnap that thing and then set the thing over here to Set. And if it's doing something weird and if the meter itself is off and is wrong, why, of course the pc isn't connected to it now and if it goes on rock slamming or goes on doing something peculiar it must be the meter because there is nobody else on it. It's a gremlin in it that's being audited. So that's your first action if you want to find out if your meter's auditing itself or something of that sort or if it was the pc. Just disconnect this thing over here. Just disconnect it. Disconnect it and you then have your pc off of it and if the meter is doing something, why, there it is.

Now, the first thing you want to know about an E-Meter and this is a serious – this is actually such a simple piece of stupidity that you wouldn't think anybody could ever do it. But I've done it, and for sure you can do it. Every once in a while you will – because the more reliable a meter gets, the less attention you pay to the actual meter. And every once in a while you pick up a meter and you put the pc on it and you won't realize that you're auditing the pc on a broken meter and just nothing happens and the last thing you look at is the meter because it doesn't happen very often, you see. So you want to know first and foremost, at the beginning of every session, if the pc is reading on the meter. Do you have the pc hooked to the meter? That's what you want to know. And that's about the end of the test.

See, is your meter sitting there quietly with no pc on it? Well, you learn that when you put the Trim knob to Set. Until you set it up here with sensitivity 2, tone arm 2, bring it over here to Set with the Trim knob – bang, bang, bang. One, two, three, see? And of course if you had your Transit in the proper place, you turn your Transit to Set, click the meter on, on the Sensitivity knob, put it to 2, put the other one to 2 and then trimmed it over here to Set. All right.
Now you can understand that's not hooked into the pc. See, you haven't got that lead snapped in. So if the meter is dancing or the meter is wildly swinging or you're getting a marked rise, or something else is going on on the meter, well, it must be in the meter because the pc isn't hooked to it. See, that's your first adjudication. So if that's just part of your drill, why, one, you find out the meter's all right. It is sitting there quietly. If you wanted to make doubly sure – except it isn't worth testing except very infrequently – you just swing it over here to Test. Bang! and it goes way up.

By the way, you know, I made a mistake in the original drill-out on this when I was testing this. I gave the manufacturers of this thing – they've been in conference after conference – they consider me a very trying fellow and so on. And then one day I got one of them on the meter and I showed him reactions on the meter and I audited a black area he was stuck in and moved him with a tremendous sensation of speed. That is to say he had this fantastic sensations and they've been very respectful of the meter ever since – that they do a good job now. But they consider I'm pretty picky, picky, petty. I want leads that don't come off the cans all the time and other petty things, you know – hardly worth it. The last wire they offered me for testing before we went into the present production run, by the way, smelled just like a hospital. [laughter] You could smell it all over the room. It was some new kind of plastic. Wouldn't that have been lovely to audit anybody with and so on. You no more than break out your E-Meter, he goes into the engram of the operation. [laughter] I don't know where they got that plastic wire. I made them knock it off. They did so, but it was very petty of me. Who'd mind an odor like that?

Anyway, they're good fellows. They got this thing into a state of steadiness and somnolence and all of that sort of thing. And I tested it out and then accidentally left the meter on, because it was just a test meter and I wasn't doing anything with it. Didn't mean to really test it, and left it on for a day or two or three, and all of a sudden its – well, I'll show you what it is. Can't make this one do it. They fouled me up. I can't make this one do it. No, they – this one's too live. The original model of a Mark I – they gave it to me – and after the thing was over here at Set, you could turn the Trim knob and bring it down off the Test area. If your Trim knob was totally out, in other words, the meter would test as though its batteries were flat. Got the idea? You could shift the Trim knob so that you'd get a zero battery charge. You had no battery in it. Obviously, the batteries were run down. So I said, "What the devil! How much stuff is this thing consuming?" You know, and big ruckus, you know, about it. Peter handling the correspondence on it, you know, and calling up on the phone calls. And back and forth, and so forth.

"Meter is wearing out," you know. "Batteries wear out in this thing in twenty-four hours. It's no good – pile of junk, you know, that's why. We got to cut down its battery consumption." Well sometimes, of course, you'd turn it on and it would show full charge; but then because you could vary the Set position with the Trim knob, of course, your Test over here could be varied, too. And I notice now on the Mark IV, they've disconnected it so we can't make that mistake.

Anyway, so they left one on for weeks and weeks and weeks and they couldn't get it to run down. So we were having a terrible argument. I was sure the thing was running down and they were sure that the thing was lasting for weeks. And then we finally found out what was
going on: The meter was being set up in a certain fashion that its Trim knob could vary its Test over here.

Wonder if there's any way under the sun I can make that do that now. By George, you know? Ha! Pretty smart fellows. They fixed that up so it wouldn't do it. They said, "Well, if the old man can do it we better do something about that." And they did, by golly! It won't make that mistake.

Anyway, just to get on with this, you'd snap it over here onto Test, see if it landed, for a full battery charge. See, make sure your batteries were charged by the needle going on over and being in the proper area. Bring it back over here to Set, adjust that Sensitivity knob to 2, adjust the other one to 2, bring your Set up here on your Trim knob to Set, and then – that's halfway out theoretically – snap it in and then tell the pc to squeeze the cans. He thinks that's for him. That isn't. It's for you. You want to see how much he's dropping, you set him with a third-of-a-dial drop. Well, if this meter is out of operation and it isn't connected to the pc, you're not going to get any needle behaviour when he squeezes the cans and you'll never make the horrible error of running a pc on a dead meter. See, you'd never make that mistake. It isn't likely to happen with these new meters, but it sure was likely to happen with the old ones and it could happen again.

Now, there you are cheerfully sitting there being an auditor left and right and center and somehow or another the pc is – seems to be over here around – he seems to be – he uh – hmmm… Huh-huh. Where is he at? Or the pc gets no reaction and no tone arm action so the process must be flat. Process must be flat. I mean, there it is. See, that could be disconnected. Just look-a-here. But supposing you just sat there and you audited something on this order. And you just went on auditing. You just went on auditing. You just went on auditing. You just went on auditing. Yeah, I know the can isn't plugged in.

Female voice: What if you've got your jack partially plugged in?

Well, you see, you'd even get some motion occasionally. [laughter]

See what you could do. And it wouldn't have anything to do with the price of fish, you know. You'd say, "Well, I don't know. I'd never get that down. Oh, yeah. Actually getting very live." [laughter] "There we are." You go nuts, you know.

So frankly, if you were going to make a thorough drill that would never get you in any kind of trouble of any kind whatsoever [laughter] – what you do, you see, is just plug it in. You just take it up to Set here very nicely. True, true, true. Then snap it in and tell your pc, tell your pc to squeeze the cans.

What's the matter with this meter? Hmmm! Meter's off – it isn't reading at 3 with me on it. Anyhow, I must have been working hard today.

But anyhow – no, it isn't off. The first action is, is the meter working? And the second action, is it working on the pc? And if you keep those two things in order and always keep them in mind, you won't make some silly mistakes occasionally as almost any auditor sooner or later has made. One, is the meter working? Well, of course, that's easily told because you set it up here for Set, 2, and so on.
Now, just look at it a moment, don't you see? And say, "Well, I don't know. Is it doing anything peculiar? See, is it racking around? Is it doing anything peculiar?" No. It's just sitting there being a good meter. Furthermore, battery test. If you wanted to do something like that, that would tell you even further that it was charged up. Except I assure you, it's not going to run down but about once a year, if that. You know you can leave this thing on day and night in the box? It burns up just about the same amount of current on that it does off. That's one of the most fantastic things. I wouldn't have believed it. I wouldn't advise you doing this because it – cans might be shorted or something out, you know? If you did this, I'm sure it would burn more current.

Supposing we had this, see? That's great. Now, you got your cans together, that's a dead short. Well, of course, that's going to consume more current. But with your cans apart, as far as it goes, with the cans apart and your lead unplugged, the thing will just sit there. Actually, with the cans connected to that degree, the thing will just sit there endlessly. It won't burn any more current on than off, which is a remarkable fact. Then you'd make sure your meter was okay, and then you turn it over to the pc here. You put the pc on the cans and you'd say to the pc – it's off the same way – and you say, "Squeeze the cans," see? And all right, to the degree that he squeezes the cans – you got the idea, see – to the degree that he squeezes the cans coordinates with the meter. In other words, you see the meter act when he squeezes the cans. You know, you see him squeeze the cans and you see the meter act. Well now, you are absolutely certain that the meter is reading the pc. And that's for your own assurance. Now you say, "Fine," see? Do something like adjust the pc's chair and get the rudiments in. But that is the end of your meter worry. Now, you don't worry about that meter from there on. And if the meter suddenly does something weird, goes utterly flat, one of two things can be wrong The meter can read at 7, between 6 and 1; 7 is located between 6 and 1. Because of the construction of the meter itself, it won't go to 7.

Actually, a person can read at a Clear read of about 2 and be a totally dead thetan – get your E-Meter Essentials – and when the case starts to improve, he improves by going down to 1.5, 1, 7, 6.5 and you occasionally, in running people, will have a meter which has to be caught between 1 and 6 and 1 and 6 and all of a sudden the pc isn't on it anyplace and you think the meter's busted. It'd be very rare, probably won't stay there more than half a session or something like that – blah-da-de-bleh-zzh – where is he? In order to keep the meter at all you were probably going like this already, see? And then all of a sudden, uh-uh-uh-uh-uh-uh, pc cannot be found on the meter. The pc is at 7. He might stay there for a while. He might stay there only for a few minutes. He might stay there for a while, but it's apparently a very rare position. It's very difficult to maintain. That much density is very hard to master. And it's almost an intolerable position, so he won't be there very long.

I think it's happened on this course once, hasn't it, Suzie?

Female voice: Yes.

Yes, and an auditor was sitting there going batty. Who was that? Somebody – they were sitting – she was sitting there going mad because she thought her meter was out. You see, that's a one chance in years of auditing it happens, because it's a very hard position to maintain. I don't know how – people can evidently maintain a 1.5 on the sensitivity – on a
tone arm. They can maintain 1.5 and just sit there. They can get to 1.2 and that's all right and get down here to 1 or a little bit below, and it becomes very unstable. They become unstable. That is to say there's too much density. They can't tolerate it, and their next stopping ground is about 6. But they can, very, very rarely get hung up on 7. You'll think your meter isn't operating.

If you want to check your meter, just check it as a meter. Unsnap your jack over here and is your meter operating? See? Meter's operating. And all of sudden, you put him on, you won't be able to get him on the dial with the tone arm, see? But he shouldn't stay there very long. It'll happen to you very rarely.

If your meter's gone out of operation, you're usually aware of it from other sources and causes. The thing is still on in some fashion and so on and just isn't operating. But the chances of the meter going out in the middle of a session are quite rare. The meter is usually knocked out, not by sessioning. A meter is knocked out by being dropped, sat on and used to eat ice cream with. And somebody pours a quart of wine into the thing because they haven't got a cup, or to oil up the works during a drunken New Year's Eve party, or something. Of course you'd have to run it as an overt afterwards.

You've got a bad situation with the meter normally when it's out of use. And the meter is usually in far more danger out of use than it is in use.

Very seldom does a meter get beaten up very badly in a session. But just casually you put your meter back with your baggage in the back end of a car. You don't know what that meter's doing during that trip. That meter might be shifting away from the suitcase and it might be going up against the spare tire and maybe it's sort of hitting the edge of the spare tire and bouncing onto the rim and off, you know, during the whole trip. And you get at the other end, your meter isn't operating. Well, you'll catch that before the session begins.

The other thing is, is they don't half break. A meter never half breaks. It either – it's a kind of a yea or nay, it works or it doesn't work. Well, there's no reason to hold your head in your hands over whether – is the meter working? And don’t develop any big anxiety because I think I've only run one session in my life where a meter started doing something weird and that was with an old American meter with a carbon pot and about the middle of the session the pc started to rock slam and rock slammed continuously no matter what I did and I finally got smart enough to realize there was something wrong with the meter, turned the meter off and finished the session. And that was when I first learned about lighter fluid. And that fixed up the dust in the thing and it operated all right afterwards.

Now, in other repairs – in other repair factors or detection factors on a meter, you've got this, this to consider. Once in a blue moon you will see any meter drift. It starts drifting. Now, all of the old meters drift, and you just can't do a thing about it. In other words, with the cans unplugged here, and with the thing on Set properly, you'll see that needle start to depart in a reverse rise. It'll start to go away from Set toward Fall. It's unplugged, see, and you haven't got anything plugged in and it'll just start going in the direction of Fall. It looks something like this. Oh, much slower than this. And it's very even. It just starts drifting up very evenly in the direction of fall, the word fall there. Just evenly drifting. And it'll just go on drifting. It's all unplugged and so forth. That's because its transistors and so forth aren't well equalized and
it won't settle itself down. Maybe it stops it after a couple of minutes, at which time that's all right. In other words, the old meters – the old Mark Is, Mark IIs, Mark IIIs and the old American meter and Lord knows what the last three years worth of meters – American meters – do or don't do. But here is – this thing will always drift.

You turn them on, the cans are not plugged in, the jack isn't in and it'll drift. Well, don't worry about it. Don't worry about it because that's just normal to the meter and it's going to drift for two, three, five minutes. And if you want to do a Clear checkout you've got to reset them, and if they haven't got any reset on the thing, well, the best thing to do is to get a 5,000 ohm and a 12,500-ohm resistor and plug it across the cans and find out how much your meter is off and re-mark it with a piece of sticky plaster. That's all you can do. You can find out what is the resistance across the two cans – 12,500 ohms, you just plug it. Plug a resistor across and then set the tone arm here exactly where it's supposed to go and then 5,000 ohms across the two cans and set the tone arm where it's supposed to go. Mark it in those two positions and it will give you the Clear read for that particular meter. You can get these resistors. They look like a little piece of lead or something with a couple of clips on the end of them. You can buy those things. They cost you practically nothing at an electrical shop. They have resistors like mad. Electronics men deal mainly with resistors. And so you got lots of them.

Anyway, you can set one of those old meters. But it's going to drift. Don't think that it won't. It's going to drift. That isn't serious. Well, now listen. When one of these British meters starts drifting, when a Mark IV starts drifting, get it to somebody to fix it because there's something wrong with the meter. There's something wrong with the meter. You dropped it or it's got a transistor shaken loose or there's something gone wrong in the meter. You notice as I sit here this thing is not drifting. You can turn it off, cool it, that is, it goes totally cold. Turn it back on again, it'll be right there, bang. But my own personal meter, which you can imagine gets some of the roughest of use as far as auditing is concerned, was a Mark III and that was pretty well adjusted. And a few weeks ago I looked at it and it was drifting. I sent it back to the manufacturer and had it fixed up. And well, it's just – it had aged. It had aged. It had lived a long and active life and it is no longer keeping its Set mark. But there was something wrong with it. There was a disconnection inside of it.

Now, how do you get a missed – one of these things repaired? Well frankly, we've had to send them to the Commonwealth areas so often, that we have, pretty well, a full set of specification of what gets wrong with them, because the Commonwealth areas have had to make these up. And Joburg, for instance, has a whole rundown on what gets wrong with this meter. They know far more about what gets wrong with all the old Mark Is, Mark IIs and Mark IIIs than the manufacturers did, because they had to take them down there, and whenever they'd repair them, why one of the instrument people in the immediate area, they gradually assembled this information. They got its circuits from the manufacturer. They checked it out and they finally got so they could snap a meter back into action faster than scat.

But I'm just trying to tell you that repair manuals for an electronics man someplace or another will be in existence and at the moment are obtainable.
Your easiest method of getting one fixed – usually you send it to Central Organization. They've already got somebody all contacted to fix up the E-Meter with a snap. Or HCO WW, we send it to Fowler and Allen with a sneer. There's always a sneer enclosed with the return. You send it to us, we put the sneer in, and send it back to Fowler and Allen, you see? And they can fix them up. They're good boys.

It's taken them quite a while to get this meter so it can be shipped, so it can be dropped, so it can be kicked and booted around and arrive at other ends of things.

One of the major things that happened to the Mark I, II and III, for your own interest, is the little transistors in the things became disconnected in shipment. Actually, extreme heat or cold or something – it had something to do with the solder they were using or something. But actually it popped out. They'd arrive at the other end with a disconnected transistor or a break. But they were not in proper packing at the time. And they now come to you in a very sleek latex or cardboard, pressboard, form fit cover, when they're shipped airmail.

Your first action on receipt of one of these things, of course, is to put the batteries in it and so on or get some batteries and put them in. We, of course – HCO WW will always put batteries in your meter for you free of charge. We couldn't care less. That is the wildest manufacturer's guarantee you ever heard of. Not that we're manufacturers, we're not. But you could always make this kind of a claim. Because you put in maybe one shilling worth of batteries every couple of years. That doesn't seem to be much of an action. We said that early when we were putting in an odd kind of battery. But these new kinds of battery are very stable.

But I'm just giving you some odds and ends of background. Maybe it's interesting to you. Maybe it isn't. But it has been quite a fight trying to get a meter and trying to get it stable and trying to get it so it can be shipped and trying to get it so it can stand up to some of the pcs that look at them. And you need something that's quite close to indestructible. And this meter takes quite a beating. And we've gradually worked those bugs out of the thing just in time, too, because apparently we'll have to replace nearly all of the meters in Central Organizations in the United States, here in England and so forth. We've got to get rid of the rest of these meters. The old ones, because they won't clear anybody and they apparently don't operate sufficiently accurately on a Sec Check.

Well, you ask somebody, "Have you ever murdered your wife?" He's just got through with it – the grave dirt is all over his shoes, you see – and it falls by the time the next question is asked, you know? "Have you ever powdered your nose?" That's an exaggeration and a dirty crack, but you can see that your instant read law doesn't apply to them.

Well now, the use of the meter depends mainly on the operator. This particular meter cannot be influenced by looking at it or putting pieces of energy into it. I do have a meter, however, that is right here. I think we have a meter, the beep meter. And I'll have to break that out and show you all about how you can influence a meter, because you really can influence a meter. You can't influence this meter to make it read or to do something peculiar, but don't think you cannot influence another person's body with energy. That is – once you get the knack of doing it.
By the way, a non-Scientologist just can't do it. You can give them all of the understanding they possibly can have; you can make them do it all right. They can follow all the directions, but they just don't have enough horsepower. And it's called a beep meter, and you put it up against somebody's cheek – it detects pain. Chiropractors used it. And you can put it around and where a fellow has a pain – or on his spine or something, you know, old piece of beer bottle's lodged in the spine – I don't know quite what theory they go on. But anyway they have pain, and you put this beep meter over the area of pain, and – if it's tuned right – and the exact area where the pain is – the patient is feeling pain – you put the meter on it, and the meter says, "Beeeep." And you take it off the area of pain and the meter ceases to beep. Fascinating. It's an interesting piece of electronic mumbo-jumbo.

Well, that's fascinating because the first time I started playing around with one of these things – back in Phoenix a long time ago, I took a look at one of these things – and I wondered what made it do that, you know. And I absentmindedly – it was against somebody's cheek – and I just absent-mindedly said, "Well, that ought to be well connected, you see," and it went "Beeeep." Well, I went around for several days, you know, thinking I was the only one who wore ostrich plumes, you know? And I showed some of the boys around the place all about this and so on. And they got very interested. And they'd grunt a few times and grit their teeth a little bit, and all of a sudden "BEEP." They could turn it on on anybody else. In other words they take this electrode, and Mr. Doakes, having nothing to do with the person who was performing it, puts this little button against his cheek. He could feel a tingle of electricity in it, but the meter's dead null. Now, the operator is over there several feet away and at will can make the meter turn on by connecting this to Mr. Doakes's thetan. Get the idea? And he'd connect this up and make a current go through it. You know, he's several feet away and he can look at him and just go errr, hmm, click, you know?

Actually, what you do is turn any black area you see white. You know, you (quote) "see" the black area or "see" the barrier, (quote) (unquote). And you just see it and then just turn it white, you know. And you make it connect, see. And the meter will go "Beeeep." And you can turn it off and then turn it on and turn it off and turn it on and finally even you realize you're doing it. The first moment that you realize you're doing this it makes you quite nervous because you're not even near the meter and you're not even near the person who is holding it and you're not in him at the moment. And yet you can turn that thing on and off, on and off, on and off.

So since then, subsequently, I have shoved this beep meter at a lot of people who were not Scientologists. I've tried to show them, you know, I'd turn it on at will, you know. I'd have to move my hand, you know, saying, "Well – " I make the thing beep along with my hand and so they realized what was doing it, and they couldn't – "What?" you know. And I'd say, "Well, you go ahead and do it. All you do is look, you see. And you just connect the thing through, you know. It's an easy trick. You just connect the electrodes through to the person, you see?" They'd say, "Yeah. All right." And they'd grit their teeth, you know, and they would grunt and ohhh. The beep meter sits there quiet as a mouse. Won't do a thing. Just won't do a thing. It's quite interesting.

I also ran into this on testing corn, on testing the liveness of plants and that sort of thing.
Newspaper reporter can actually come along and take the leaf of the plant and crush it in his hand, bap it, touch it, so forth, and nothing happens to the meter that's connected to the plant. I walk by the plant and the meter goes boom! Just touch one leaf with my little finger, you know, just "tchk," and it goes "zmmm," See? The meter reacts. And you could do it. I suddenly realized that this was something Scientologists could do and people couldn't.

That was my first detection that we must be of a different crew. But people actually cannot turn this beep meter on unless they themselves are in fairly good shape. It's not that they're into a trained skill, they just have less horsepower. They can see these things. Yes, you can show them to them. Yes, they can see them and they grunt and they grit their teeth to get it to connect, to get it to connect and the meter sits there.

You come along, you glance at the electrode, it goes beep! Master's voice. [laughs] We have that meter. I'll have to bring it out and set it up for you. Practically electrocutes you. It's a Mathison. If you want to – that's not a dirty crack necessarily. That's a hallmark of all of these mains meters. Not only do they vibrate as well to the elevator going up and down as they do to the pc, but they also vibrate very splendidly, very gorgeously to any slightest interference inside the meter itself. And they make the pc very nervous because they throw – I don't know, 340 or I'd think it's about 240 volts go through the electrodes. You can really tell they're on. And the more you're processed – the more you're aware of things in general as your awareness goes up – of course, these things become almost intolerable. I hate to hold them myself. It's all right.

I was holding 240 volts the other night. I had a dryer in the darkroom on some pictures I was making, and it decided to short out, and it – 240 volts. I didn't mind anything but the force involved with the thing. It's quite an amount of force in that much dead short. But some pcs, it actually feels that bad to them on some of these mains-connected meters. And this thing – you get a burning sensation off of the electrode. There's just too much juice going through it. We never were able to cure the manufacturer of pouring the juice into the pc, not into the valves. So, probably could be sued for libel for saying so, but I would prove it in court. No, he wouldn't dare sue me for libel. I'd put him on one of his own meters. [laughs] And say, "Is it actually true that you have an overt against us?" you see? "Now, whom have you shocked with electricity?" And of course he'd get the – just restimulate the motivator because he wouldn't ever give me the withhold, you see? And then he'd multiply the amount – say, that's a pretty good idea, you know? Any one of these days I'll go back to practicing law. Anyway, it's an easy life. You never, never really have to do anything.

Anyway, not just to tire you out on the subject, the meter itself is uninfluenceable from a standpoint of looking at it from the back and sitting there and making it read like an E-Meter should read. You understand? Making it read like an E-Meter should read. Therefore, you've got to do body motion drills, and you've got to know what an E-Meter looks like when it's reading on a pc. You understand? It's a – requires that kind of view.

Now, Ray made a film several months ago, and I finally reviewed the thing, which is a training film on E-Meters. Just an experimental film. He didn't intend anything more than that for it. I learned quite a bit from the technical manufacture of the film – what we'll have to do in order to square it up and make it read. One of the things I learned that we don't dare use: a
faked read. We don't dare use animation, in other words, to get our E-Meter reads in the train-
ing film. They look like what they are – body motions. And if you learn to read a body mo-
tion – if anybody were doing this which is quite unlikely I assure you, but if anybody were
doing this – they've got the back of the meter to them, so it's very difficult for them to find the
needle. There's no sense in going into the guts of the thing and pushing currents around in the
guts of it. That's silly. When, really, the way you can influence it and make it read, you can as
a thetan knock the needle with a beam. And it looks just exactly like a body motion. And
you – see, I'm using my finger to show you – but you actually get this thing in some kind of a
state and you just knock the thing back and forth.

No more force and you can actually make it tick. But it's a jerky tick. You know, it is
you, not your body, but it is you and you can actually put a beam on the side of the needle and
slap it. You can make it go click, click. And I've practiced on it quite a bit. I can never make it
look like anything but a body motion. I can't even make it look like a good, healthy rock slam.
It'd never fool an auditor. It might fool somebody who doesn't know much about E-Metering,
but it would never fool an auditor.

First place, I wouldn't use it to fool anybody. I'm just trying to find out about moving
around objects. And one of the easiest objects to move around is the E-Meter needle if you
stand back looking at the dial and make it go \textit{ting, ting, ting}, don't you see? That's an easy
thing to do. But it should never fool you as an auditor because it looks like just what it is
which is a mechanically influenced motion.

Now as far as influencing the E-Meter is concerned, you don't have to worry about the
pc influencing the meter if you put in end rudiments, "Have you influenced the E-Meter?"
That should take that off of your mind. Now factually, for any read that you're going to get
consistently on the thing, for somebody throwing the E-Meter so that an experienced auditor
couldn't tell it, he'd have to be pretty smooth because he has to get to the same speed of reac-
tion of the reactive mind which is instantaneous. And you always get latent reads on an influ-
enced meter. So you never pay any attention to them anyhow. The fellow has to hear "willow
wand" then he has to think, "Oh yes, that's the terminal I want. Oh, all right now, I will wiggle
my toes." And the way it looks to the auditor, of course, is "willow wand" ... click, see? "Wil-
low wand" ... click, "willow wand" ... "oh, that was the one," – click. And it doesn't look like
an instant read. And furthermore, it always looks like a body motion.

Now, I saw a very experienced auditor fooled with a body motion one time, fooled
with a body motion. You talk about influencing the meter. Actually, pc said, "I cannot keep
my hand from trembling when you say that word," and was flickering their little finger on and
off the can, see? Knowingly, see, flickering their finger on and off the can, you know? \textit{Dah-di-
dah-dahdah}. And you'd say, "willow wand" or "waterbuck" or whatever it was and you'd say,
"Willow wand" and, "Well, there's – there it is. You know, I just can't keep my hand from
trembling."

When the auditor finally detected it, "Your hand's trembling when I say that?" "Well,
yes, I just can't keep it from trembling." And do you know that the auditor actually told me,
"You know, it's a funny thing that she can't keep her hand from trembling whenever I say
that." Three or four or five sessions later, when additional assessment had been made on this
pc, it all of a sudden came up as a withhold. They had knowingly been trembling their finger on and off of the can while "their hand couldn't be controlled." Get the idea?

But you will get a latent read because they can't hear it and put the thing into action as fast as the reactive mind hears it and puts it into action, you see? And it's always a bit late. Therefore you shouldn't ever monkey around with a meter with latent reads.

Now there's a damping action put into most offball, offbeat meters. No meter I have ever okayed has ever had a damper in it. I've found a lot of meters that had dampers in them. The old green and gold English meter had a damper in it so that it was guaranteed to read one and one-half seconds late. And before an ACC got going I had a poor electronics man around there with a pair of snippers taking these dampers off of them. And, man, there was wire lying all over the floor when they finally got loose, but those green and gold meters always afterwards, providing I had – they had gone under my notice at all, had no dampers in them. And they would read instantly. But there are many meters that this has not happened with – there are many offball meters, and nearly all of them have dampers in them. So you say, "Waterbuck." ... Read. "Have you ever burned down a house?" ... Read. Maybe. All right. Now, the latent read would be, "Have you ever burned down a house?" ...... Read.

You just haven't got that much time. In other words, you couldn't even assess with one. You could go down an assessment list and by the time you would hit the second read, you would get the first read. See, you would say, "Waterbuck," "Waterbuck," and you'd get a read. Only it's the read for the first waterbuck you said. Got the idea? So you wouldn't know what it is.

Now let's look at the additional complication. You would say, "Has a waterbuck shot you?" You know, that's your test question. All right. "Has a waterbuck shot (read) you?" Oh, it was "waterbuck" that read. If "shot" was alive, it would have come in well after "you." So you would have had, "Has a waterbuck shot" – read – "you" – read. See? And all of a sudden you don't know what's reading.

And if you notice in your Prehav assessing you have to carefully say – and if you hadn't realized this, you realize that your terminal is active and that the activeness of your terminal interferes with the Prehav level read. You notice that? So you've got to have an instant reading meter and you've got to have the Prehav level distinctly read different than the terminal. So you say, "Has a waterbuck" – let the read get out of the road, you see – "shot you?" Well, you actually don't have to pause after "shot" because "you" is not charged usually. So you say, "Has a waterbuck – shot you?" Well, that lets waterbuck's read get out of the road before we run into "shot" you see? And when you're assessing like that, you have to pay attention to that because you get a sporadically reading terminal that you say – you test it out in the first place – say "waterbuck, waterbuck, waterbuck, waterbuck," and you'll see that it reads, see? All right. That's a constant read. That's fine. You could always tell that, but "waterbuck" read, "waterbuck" no read, "waterbuck" read and of course your terminal is getting weak at this time and it's fading out and it's not reading well and you're trying to assess for the thing. So you wouldn't quite know what was lagging and what wasn't lagging or if it wasn't or isn't, so you just put in the pause anyhow and you have to have an instant reading meter.
You cannot assess on the Prehav Scale – and nobody has ever been able to assess on the Prehav Scale – in the absence of an instant reading meter. Now do you see why I say American clearing, English clearing, could very well have gone up the spout just on these factors? You could never have assessed the Prehav Scale. "Has a waterbuck shot you?" Read. "Oh, well, 'shot' is alive." Oh, no, hell, it was waterbuck that read way over there. And you never could have disentangled them so that you always would have been running the wrong Prehav level; the least that would have been happening on the pc.

As far as Security Checking is concerned, they just don't security check. I've already tried to security check on an offbeat meter and have laid an egg and made one of the most serious errors I think I ever made in auditing, trying to do some kind of a Security Check to get rudiments in and get the pc in communication and I just missed like mad. Why, I had every reason to – I was using one of these old, wooden potentiometer pieces of junk, a DC Decca voltmeter, practically nothing more than soldered leads into both sides of a potentiometer, you see. And I didn't know that in that particular one the electronics man had built in a damper. Not only was it a lousy meter, but he had also built in a damper so that you would ask your question and you say, "Well, has a waterbuck shot you?" ... read. And it read like that on all of these questions and I couldn't sort out the read on the thing – I didn't quite know what was the matter with it – but I couldn't sort out a withhold. And not having sorted out the withhold, I muffed on that pc. I just couldn't get the withhold, couldn't get it straight, I couldn't get what the pc was all about because sometimes it was damping and sometimes it wasn't damping. It was never instant reading but sometimes the damp was sufficient to take all the read off the question so I would think it was clear, you see. And it would ride like that for four, five questions at which time I was perfectly happy to let go of it, see?

Subject comes up again in another five minutes, I ask the question and it's still live on a lag read. And I finally got wise to the fact that the confounded thing – it isn't that the pc is reading sporadically on this at all, the pc is reading wildly accurately on this – but what the hell it is I can't find out because the meter is only registering the pc now and then. Ooooh, that was a nightmare! I never did get the pc straightened out or in-sesison.

Anyway, I'm just giving you a little background music and a little data on this thing and try to take the pressure off your brains at the present moment because the pressure on your brain must be considerable. Some of you are running terminals which are going up to 8, and it isn't even on the tone arm dial so that must be very rough indeed.

But where your handling of an E-Meter is nervous, I can tell you just as a summary here, it's because you're not familiar with the thing. You're not familiar with it. You haven't slept with it. And you haven't eaten with it. And you're still handling it as though it's a strange cat. And just reach and withdraw from the meter, I mean that, just reach and withdraw from the meter for a while. Just say, "What is this thing" and all of a sudden it will seem more like an old friend.

The next thing is, is you're not sure it's registering the pc. Well, all right. Be assured of that by making the pc squeeze the cans and then you'll find out that at least it's registering his body motion so the probability is it will register something else. At least assure yourself of that. Does it read the pc? And if you're nervous – ever get nervous about meters, it's because
you have never reassured yourself that the meter is just sitting there idle; that it doesn't do anything itself when it's not hooked into the pc.

So if you take your drill and on the basis you pick up the meter – I don't care if you give the pc the cans or not; he hasn't got anything to do and he'd rather you be handing him the cans than him be sitting there while you fiddle with the meter, see? And just don't plug it in, just put it in a little bit, into the jack and then, if you want to be very thorough, click it over here to Set, click to Test, click it back to Set, turn the thing on here, up to 2 – set it right on 2 – turn this over, set it right on 2, come on down here, set it there and sit there for just an instant and look at the meter. Is it sitting there quietly? All right. Now, squeeze it in and tell the pc, "All right. Would you please squeeze the cans?" And then have him squeeze the cans enough time for you to be absolutely sure you've got a third-of-a-dial drop or a dial drop – whatever you're fishing for that time.

Now, you know that the meter reads null with the pc on it and you know now that the pc registers on the meter. You know the meter is set up right and at that moment you can forget any nervousness about the meter and just go on about the business of reading the meter and that's all there is to that. You just simply go on about the business of reading your meter and if your meter goes out and it all of a sudden wildly rock slams and you can't explain it and you can't get the rock slam off or something like that, you can always surreptitiously disconnect that thing halfway and throw the tone arm over here casually while carrying right on the session, distracting the pc not at all. And if that thing is disconnected and your meter is rock slamming – it'll only be doing this on some old meter – but if your meter is still rock slamming, just slide it back in casually and forget about it. That is your safest action.

You can, however, on some of the old meters, jiggle this tone arm two or three times here, but now you're liable to be distracting the pc. If you jiggle it two or three times and your meter now doesn't rock slam, don't be at all sanguine that it won't start in another three or four minutes, you see. So the safest thing to do with the thing, you slip that thing out, smiling sweetly at the pc the meanwhile and you look at the thing and while it's disconnected from the pc set it over here so that it's near Set with the tone arm. It's rock slamming, heh, heh, heh, heh. It's rock slamming. Just slide the thing back in, go on, carry on your session. If you're assessing, well, God help you. Say, "Well, that's fine now. Well, we made pretty good progress on this list. We got three level, we got – well, we got three items straightened out." "All right. That's – that's fine. Now we're going to run – now we're going to run some Havingness. Now we're going to run some Havingness. And here we go." We run some Havingness. "Now we're going to run end rudiments and some more Havingness." Well, guess you got through the last forty-five minutes that you had left of that particular session.

But don't get through the last forty-five minutes by shutting it off suddenly, and just say, "Well, just a moment, I'm not going to end the session now because this isn't going to take very, very long. I wonder what's the matter with this thing? I've never – " and so forth, and go rushing down into the other office, you see, and so forth. "Joe, have you – have – do you know what's wrong with this meter?" and so forth. Skip it. That one action – that one action has cost more pcs their aplomb than anything else I can think of.
Now, another thing is we've tried to get these cans fixed up so that pcs can direct orchestras with them. [laughter] But by George, it's a hard thing to do. You notice on the old ones, however, that the lead can be split further than they ever split them. Have you noticed that? You can always pull that lead a little bit further apart when the two wires are lying close together. But on new ones with a solid cord all the way, you can't do this and sometimes they're too close on. So you have to split them, somehow, some way, split your wire down. Get it far apart. This meter, by the way – this particular set of cords – if I were using this meter and making it my own instead of just the lecture meter down here... There we are. Now, you notice here that I have that that far apart. Do you realize that is not far enough apart because a pc... [laughter] see, he gestures out with one hand with the other one in his lap, and he can't make a full gesture.

The width you want this thing apart is enough to make a full gesture, you know. And it's exactly right. It's exactly the right width, if with one can in the pc's lap, the other can can be held at arm's length by the pc – and now you're not going to get into any trouble. But if the pc ever goes like this [shows arm position], you're not quite there again. So if you've got a pc who commonly stretches with the cans or something like that, split the thing a little further. You might not notice that it is the shortness of the wire from the V split that gives you all the trouble of the can coming off of the end. The cans will never come off the end if there is enough wire on each independent can. You understand? That's the only real trouble you have with that. I've recently made the wire quite malleable in these particular leads so that it's not a brittle wire.

Also, the original British electrode was soldered. And that was no good because I could see my pretty girl auditors every once in a while getting this thing torn out and not having a soldering iron in their pocket like some of the male auditors had. [laughter] So these things, these little – on the electrodes here – this screw you find on the electrodes of the Mark IV and the little nut that you see inside is not a crude manufactured item. It is practically over the dead body of Fowler and Allen. They don't want to put them on like that. They want a nice, neat, electronic job. And I want a job so that when the pc yawns – a six-foot, eight-inch pc yawns, you see, and tears the thing apart – at least you've got a session break at which time all you have to do is take your nail file – notice the width of that screw? That's nail file width. You can take a nail file, you can open that thing up, you can skin down the wire very easily, put a new coil of wire around the nut, holding the nut inside with your index finger, screw it up again with a nail file and you have done a fast repair job which is quite a permanent repair job. So those things I insist on. I insist that you be able to reconnect your own cans because if this thing is going to break down, well, let's have a point of repair where it's going to break.

Some of the old meters and cheap meters have malleable wire which is – pardon me, nonmalleable wire. It's brittle wire inside these insulation areas. And the friction of the wire, you know, friction of the leads, will sometimes make it break inside the wire. And your leads won't connect to the E-Meter or connect sporadically and so on. And it's just lousy wire, that is all, it's just bad wire in the E-Meter leads so we insist on that being nice, soft wire.

But remember that can still happen. Somebody can come down on that with the heel of his shoe exactly right against a concrete floor or something like that and manage to practically sever one of these wires or sever one, and you would never notice it, you would just never
notice it because the insulation is still sound and whole, but the wire inside the insulation is broken.

So if you got to a desperate state as to why the meter didn't register on the pc – if it sits quietly all by itself and the lead, it's – when plugged in, won't do a third-of-a-dial drop, it's in these leads. You very often just grab yourself off another set of leads, plug it into the same meter and you're off to the races. But, remember, because I insisted on repair, do-it-yourself repair is possible on these electrodes, you can always – because this is a very simple jack here – you notice how simple that jack is? You can always get yourself another piece of ordinary house-wiring wire, preferably soft copper, preferably covered with plastic which won't go brittle on you right away and you can fix up one of these jacks and one of these leads very easily no matter where you are. You can always get a piece of wire. If you're in a hotel room someplace, why, just reach into the molding, you know, and get some of the telephone wire and snip it off and so forth. Might even tell the management about it when you leave.

Anyway, that is – these are nonsense points that don't have very much to do with anything and you possibly haven't learned very much today, but I just wanted to talk to you about the gimmicks and nonsense of the E-Meter and give you a few tips.

By the way, I will say, before I close the lecture, there is something I am sure some of you do not know. This is the older model, isn't it? These things – when these leads get loose, you can always tighten them up and you should. Or you can also get little lock washers and put on these things, little tiny lock washers and so on. I love British manufacturers. It's marvelous. The only place it ever falls down is lock washers and gasoline lines. They don't like lock washers and gasoline lines. I always have to take a whole car apart and put lock washers in everyplace and put in a new gas line. I'm joking now. I never take them apart. I have somebody else do it. [laughter]

But you might not know that this meter is a self-propping meter. It's just a chance that you might not know it. These things come down and go over this pin. It's never been done with this one so therefore it's all completely haywire. Did you see that? Did you know that a meter did this?

Well, the meter makes a little tent all by itself. I'm sure you knew that, but also I'm also sure that someplace or another somebody doesn't know it. That's a little invention. That's one of these inventions I do by the process of telling people to do it in a very firm tone of voice. You know, "Fix it up so it will stand all by itself for an auditor." And they say, "But how?" I say, "That's your job. After all, I can't have a total monopoly on all the thinkingness in the world."

So anyway, somebody else dreamed this thing up and I think it's a pretty nice rig. These meters stand up better than any other meters I've seen. And sometimes these little hooks get off. You can buy those hooks at any hardware store or dime store where you can buy these nuts and bolts and put them back together again if somebody treats your meter too rough. Okay?

Well, those are the nonsense parts of the E-Meter and if you ever get stranded in the middle of the Gobi Desert without an E-Meter, don't try to clear anybody.
Thank you very much.
PARTS OF 3D

A lecture given on 30 November 1961

Thank you.

Now, this is the 30th of Nov. This Russian month is about to end. The month of "Nov." And we are about to let you in on some of the secrets of life, unraveling the case that has been run on Routine 3 and is being run on 3D and cases which will be run on 3D by you and the data which I am about to give you, you may not see anything of again, so you'd better unplug and tune in and get off the wavelength of Arcturus and onto the wavelength around here and I'll give you some dope, okay?

Now, not that you don't but, I mean, this is very serious, what I'm telling you. I'm very serious about this. You are going to be unraveling cases. Now, I don't care whether the case was run on Routine 3 or has been run on Khrushchev or somebody on 3D, you understand – I couldn't care less what case it is – you're going to be in the business of unraveling cases that have been misrun on existing procedures.

So you must know how to take apart a case and run a case that you get right straight off the street – the Glutz case – and in comes Miss Glutz. And Miss Glutz is seated in the auditing chair in the HGC and the auditor goes down the line popeta-popeta-popeta-popeta, bangety-bangety-bangety-bang, and he gets all the 3D items rather easily.

Now, you may very well be the one who is called upon to verify these items. And there's certain data which you have to know in order to verify items; not just sitting down and looking pretty and seeing if it falls on the E-Meter. You have to use your noggin on it. It – 3D goes together like a jigsaw puzzle. Tell you more about that in a moment. But that's one case. That's one case. That's the easy thing for you to do. That's a pipe; there's nothing to it. You can learn that. You can learn that. You can learn to do that standing on your head.

All right. Now we get the other thing. It wouldn't matter whether these are – techniques are released now or ten years from now, there'll always be some boob in upper Keokuk who will have got hold of them and while holding the E-Meter balanced on the tip of his nose, will have knocked the pc eighteen ways from the middle with the process.

Now, the very process that you're to use to clear the person has been abused on the pc. How are you going to unsnarl it and unravel it? Pretty interesting. Now you're getting into very, very interesting mental gymnastics.

All right. Let's take the least of these cases. Somebody comes in, says, "Well – uh, well uh – uh – uh – uh – an auditor up in – in Alaska found my goal and terminal for me about three years ago. And he ran it for quite a while, but uh – because I got sick, we couldn't continue the processing and so on."

You say, "Well, where's your goals list?"
"Oh, well, I don't know. We – goals list? Oh, that – that thing he had me write down up there. I don't know. Oh, I don't know where that went."

"Well, has there been a subsequent goal list?"

"Well, there's only that one that was done by an auditor down in Mexico when I was down there."

"Well, what happened to that goals list?"

"Well, I don't know."

"What was the auditor's name?"

"Well, I don't know. His name started with an H. He kept putting his thumb in pie. He – he said he was – couldn't get back into the United States anymore, but we don't have any goals list from that."

"Well, all right. Okay. Well, we'll start from scratch."

Now, it's horrible, you see, because the case in a nonrestimulated category can give you a fairly straight list of goals that got lots of tags on them, but after they've been run criss-cross for a little while, the tags disappear.

And you should understand what a goals list is. Between us girls, a goals list has nothing to do with the ambitions of a pc. We ask for the ambitions of a pc, we ask for their desires and they give them to us quite earnestly and honestly and they think these are their desires and that is all very wonderful. But that isn't what we have asked for and that isn't what we get. We have asked for: one small, little, red flag fluttering in the breeze, telling us the route into the Goals Problem Mass. That's what we've asked for. We've asked for the biggest chunk of case that is visible and available at the first glance. That's what we've asked for and for some reason or other, the pc goes around waving this one, although it leads straight into hell's deepest inferno.

All right. So it's – it's merely a signal. That's all we care about. Of course, everybody loves this. They think this is wonderful. They say, "What did I want to do in life?" Well, we sure want to know what they wanted to do in life, too, but we get all kinds of misnomers.

Well, the fellow who wants to make cars: "Always wanted to make cars. Yes, I've always wanted to make cars. Everything's wonderful and I've always wanted to make cars. As a matter of fact, I was up in Detroit, studied automotive engineering. So I worked in Detroit for a very long time and so forth. But just never made a go of it, you understand, but I've always wanted to make cars and so forth," and this checks out to be his goal.

Well, by the time we get down to it, we find the modifier is "crash." Who is the opponent of him making cars? Well, for some peculiar reason, the opponent to him making cars are – are horse drivers or something. We don't care what and their opposition goal, you see, is to – it wouldn't be to wreck cars – but their opposition goals is to keep cars off the road. Well, this gets very interesting because if the opposition goal is to keep cars off the road and his object is to make cars crash, he's got an awful lot of agreement, hasn't he, with his opposition? You'll find this is always the case. There's a tremendous amount of agreement sub rosa with the opposition. What's this mean?
Well, it means that our pc is going to dramatize at times the opposition goal and they always do. A pc will always dramatize to some degree, sometimes, the opposition goal. So it's part of his makeup and personality. He'll dramatize the opposition goal.

Now, the chances of his giving you the opposition goal as his goal in the first place is quite rare, unless it is something he suddenly thought of as he woke up in the morning because it was written on the wall.

Hence, we have this proviso: "Is it something you really wanted to do in your lifetime?" We for sure must ask him that. Otherwise, he will give us the opposition goal which is stacked up and we'll assess out the opposition goal. And of course, the opposition goal will assess out as neatly as anybody else. There have been some examples of that. We have to ask the pc – there have been none in this unit. We have to ask the pc, then, "Did he himself ever want to do this thing in his lifetime?" That is how we make sure it's the pc's goal.

"Oh, well, yes," he says, "I wanted to do this. I just wanted to do this. Uh, yes, I wanted to make cars. I went up to Detroit. As a matter of fact, one time took a correspondence course in automotive engineering. Never finished it, but I took it and so forth and I worked up in Detroit until I embezzled some f... I mean, until I got fired and uh ..." He'll get all kinds of oddball things, but he wanted to do it.

Now, the opposition goal is something that occurred to him suddenly. He sort of, however, at times has done it. You get the difference? At times he has done this. He never really wanted to do it, but he has done it. You follow this out? He's done it. He didn't want to do it. He didn't have any actual ambition to do this thing. He didn't have a desire to do this thing, but he did find himself doing it occasionally, after he thought of it. See, this has never really occurred consciously to him at all. He's thought of it.

I'll give you an example of that. "To find." Here's an example: He's thought of finding things. He's thought of going and finding things. Occasionally, he's found himself finding things, don't you see. But actually, he gets mad every time he tries to find anything. So you'd ask this person, you'd say ... Well, he comes in and he tells you, "Well, I just got up in the morning and there were these letters across – you know, across the front of my mind and it was 'to find.' And that's – I know that's my goal. I know that's my goal." Sell, sell, sell, sell, sell, sell, see.

You say, "Well, did you ever have a desire to do this?"
"Oh, well, yes, I've done it many times."
"No. Did you ever plan to do this thing?"
"Oh, well, no."
"Well, what happens when you do that thing? How do you feel when you are finding things?"
"Oh, mad as hell."
You say, "Fine. That's good." You can write down in a little side note, "Probable opposition goal, 'to find.'"
"Now, all right. Now, what have you wanted to do?" You go on with your listing. You go on with your listing. You go on with your listing. Oh, put "to find" in there if you want to get yourself in trouble, that's all right, but remember to use your head. The analytical tag of the reactive bank is that goal that the pc himself has wanted to do and remember there are many other tags and there are many other terminals and there's many other everything else in the reactive mind that can pop up and hit you in the face and can register and all that sort of thing. You understand? There's lots of things. But something that the pc really wanted to do.

It's more simple than it looks. It's just that after you have listed everything the pc said he wanted to do, let's make absolutely sure when we're checking the thing out, that it's something he at some time or another has planned to do, has actively done and how he felt about doing it. Because if he were emotional about doing it, that is to say if he were just screamingly angry every time he tried to find something – doesn't sound like much of a goal to us, does it? The fellow who wants to make cars was never screamingly angry when he went to Detroit, when he went into the shop. Maybe he couldn't make cars. But oh, he thought that was nice. He thought that was nice. You understand? That was nice. You understand? That was good. That was a nice thing to do and that would please everybody. You get the conditions under which the goal is? Why? You want a high-toned attitude toward his goal, if you possibly can get it.

Now, I'll show you. A Prehav terminal comes in, pardon me, a 3D terminal or an old 3 terminal comes in high on the Prehav Scale, the old numbered scale. Serene, marvelous, wonderful, beautiful, see. The terminal comes in. It's "a dirty skunk" is the terminal, see and it's – "dirty skunk" is serene. It's quite fantastic.

He's in marvelous communication. He has interest. You see? Well, that just shows you the overwhumpingness of the terminal, don't you see? The higher toned the terminal is, the lower toned is the pc. The pc himself, although he – this – he's a combination of all these things, he's practically out of sight. And there he is, stuck underneath all of this beautiful, high-toned beauty and serenity. You see this even on your graphs. The thetie-weetie case: Everything is lovely. You kick this person in the teeth, this person will say, "Thank you. Isn't that sweet."

You've got to watch this pc on an ARC break because you practically never know they have one. It operates the same mechanically because down deep the thetan knows he's got an ARC break. But the dramatization after you have said, "What the hell are you doing sitting down there in the chair? I told you to stand up. No, I mean stand – I mean sit down, stand up, uh, uh – don't sit down. Uh – uh – . Well, you don't have to pay much attention to that because it's just because you have a lousy temper this morning." [laughter]

Anyway, the upshot of this thing is, is the pc has an ARC break. But you ask the pc, "Do you have an ARC break?" and the pc says, "Oh no, of course not. Forgive and forget, I always say." And yet you run ARC Straightwire or an ARC Process 1961 on this pc and he goes all over the dial. "Uhhhhhh, wow, wow, horrible, horrible, horrible," don't you see. I mean, they run it and run it and run it. You find they can't really talk to anybody, but it's all nice anyway.

Now, when you start running the terminal that lies at the other end of this goal, you'll find out that terminal comes down the Tone Scale and the pc, if you could assess the pc, just
assess "you" on the Tone Scale – you never do this – you'd find out that the pc wasn't even there at the beginning of the assessment and then came up the Tone Scale little by little by little by little by little and eventually appeared. And this terminal is going down scale, down, down, down, down, down, down.

So, all right. The terminal declines on the Tone Scale, the pc rises on the Tone Scale. At the point where they cross, the pc and the dramatization of the terminal is a chromium-plated bitch. And the terminal, you see, is a bitch and the pc is a bitch and everything is messed up and they are very unhappy, and everybody is cross with everybody. You got the idea? It's some kind of blaaaaaa. "How horrible life is!" you know. Because they've always been dependent on the beautiful serenity of being kicked in the teeth to bolster them up and that isn't there anymore. They have to make up their mind about what it is to get kicked in the teeth. Very well.

You've got this mechanism. The pc as a valence comes down scale and the pc as a being goes up scale – the actual pc, the thetan. Well, that occurs in terminals and so, therefore, it must occur in goal tone. And this fellow says, "Oh, I've always wanted to make cars. Isn't that interesting, making cars." Interest? You know where interest is?

"Oh, yes, I'm very interested in making cars. I'm always talking to everybody about making cars. Cars, cars, cars, cars. Oh, yes, yes, very nice. That's a lovely goal." That is a worthwhile thing to do and you'll find when you've got a real goal by the teeth that you can depend on and set your sextant by from there on out – which is what you're doing in 3D – that it is a fairly high-toned attitude toward that goal.

Now, when you have a low-toned attitude toward the goal, it'll come along with the fact, "Did you ever want to do this, really?" and the person says, "No, I just do it." Well, haven't you asked for a prima facie dramatization? Has he ever wanted to do this? Is this ever something he wanted to be, to have, or to do? And then this is capped by the question, "How do you feel when you do that?"

"Oh," he says, "I feel good when I do that." You're all set.

Now, he says, "Well, as a matter of fact, whenever I – I don't know. 'To find things'? How do I feel about it? Well, I try to find things – try to find things. I don't know. Find things, some way. You know, it's a hell of a nuisance having to find things! You know they get lost? People purposely misplace them on you? And you know every morning I try to get my cuff links and somebody has purposely misplaced them and so forth? I almost go out of my mind trying to find that sort of thing. And people shouldn't ..." It sounds awfully motivatorish, doesn't it, and so on.

Well, you can take – that is a nice final check on whether you've got the person's goal. Is it something they had an ambition for or is it something they have done, "Damn it!" See the difference? Because the one they've done, "Damn it!" is probably the opposition goal and they will both check out. They will check out gorgeously.

Fortunately for you, you almost never get – it's very rare that you will get the opposition goal on the pc's goal list if you simply ask for "things which you have wanted to do,"
"ambitions you've had," "things which you have desired," "secret ambitions you've had," that sort of thing. Oh, that's fine. That goes right along, and you get the list.

But if you were to ask generally, "What ideas have you obeyed?" you see, you'd also get all the opposition terminal goals. "What ideas have you obeyed?" That isn't what you're asking him, so the very questions which get you the goals list weed out this thing and the probability of your getting an opposition goal is very small, but is not impossible. You must remember that: that it's not impossible to get the opposition goal.

Now, when you get the opposition goal, your 3D is all upside down, of course. You look at the 3D form, you look at the items on it – well, you're trying to assess the opposition and the pc won't assess worth shucks. In other words, you can get the opposition goal, put it down as the pc's goal and then of course you're going to get as the pc's terminal, the opposition terminal.

Then what are you going to have to get as the pc's terminal? You wind up, of course, in trying to get the pc's terminal ... Well, you've got it! It's the opposition terminal for the goal you've got and you see the thing is all backwards, isn't it. But it can still be worked out. And this is all I want to teach you in this lecture about 3D. It doesn't matter how upside down and backwards the thing finally comes. Certain errors or difficulties that you encounter in assessment serve as diagnostic points for you.

So we – the first test, as I say, is it something the pc wanted to do, wanted to be or wanted to have? Was there a desire back of this? And if there was no desire back of it and if the pc's attitude toward it is very suspicious and very upset – oh, yes, you've assessed something. Yes, yes, yes, you've assessed something and actually could work out a full 3D from it. You've assessed the opposition goal. Remember, it'll fall equally with the pc's goal.

Why will it fall equally? Well, get the idea of two tractors meeting head-on in a field. One is driven by the opposition goal – the idea is the driver there – and it's the opposition tractor and the other one, idea, is driven by the (quote) "pc's idea" and it is the pc's tractor. And in trying to pull these two tractors apart, if you don't pull the pc's tractor off, the pc will practically blow away in the resulting winds of bluuuuuhh. You see? In other words, the opposition tractor has the quality of spraying with poison gas the pc's tractor. You got the idea? But the pc's tractor doesn't have the same thing because the pc won't suffer.

You can do almost anything you want to to an opposition terminal except treat it as the pc's and when you treat it as the pc's, the pc will look like he's getting his head blown off. He actually will. His face will press in, the wind will go across his face and to give you a subjective reality, after you've got a 3D formed sometime, don't get it run, but ask your auditor, "All right. I'm game for anything. Assess my opposition terminal on the Prehav Scale please." And that single action, if you get somebody to do it for you – won't hurt you any; leave you upset for an hour or so; it doesn't matter – you'll learn from that the terrific sensation you get off one of these opposition – working constantly with the opposition terminal-l-l-l-zzz. You're being blown away all the time. Honest, it's like some kind of a little electronic windstorm going on. There is something happening. If you've really go – if that's the proper opposition terminal, somebody assesses this thing on the Prehav Scale for you, just the constant repetition of it and trying to find its level and putting the action in it will give you the same sensation a
pc would get if he were being run on it accidentally. It almost blows him away. It's something on the order of having a big electric fan in front of him, going at about a thousand foot-pounds of thrust. It's sort of something that doesn't want him there.

Now, if you've got the pc's tractor in this smash, you can pull that tractor away and take it to the garage. But the opposition tractor, you have really no control over at all. So it is necessary to get the pc's goal and the pc's terminal and run it as the pc's goal and the pc's terminal. It is necessary to have the opposition goal and it is necessary also to have the opposition terminal. But remember, that one can't be towed away. It isn't the pc's.

If you're going to take the problem apart, in other words, the half that is called "opposition" doesn't audit well. You audit it a little bit to keep it restimulated. Otherwise, you won't keep the pc located at the goals-mass point. See, well, every once in a while you say, "Hey, start up the engine of that other tractor." Brooooom, brooooom, brooooom. "That's enough. That's enough. That's enough." [laughs]

Now, you can start up its engine so thoroughly that if you have the same number of commands containing opposition terminal as you have pc's terminal, you'll lock the pc up right there. It makes for terribly fast, very uncomfortable run. Brrrrr! Both tractors are in gear, going forward, both accelerators are on the floorboard.

Now, if you want to really have a mess, run a five-way, ordinary, run-of-the-mill, garden-variety bracket. If you really want to have a mess, run some old command that was perfectly easily run on some Dynamic Assessment terminal and didn't do too much. Try to clear up a 3D Goals Problem Mass with some old process of that kind. And use the opposition terminal in it to the same degree that you use the pc's terminal and you will see exactly what I am talking about.

Both engines are in full, but all wheels are skidding But the amount of friction which is coming out of the bumper-to-bumper situation would make people deafen for miles around, because they won't move it. Nothing will move. Actually, you could probably audit it for years on one of the old-type things, and you would never get anyplace. Tone arm would simply go up to about 5.5 and stick and eventually all you'd have to do is say to somebody either his opposition terminal or his goals terminal, either one, and the tone arm would promptly fly to the stick point. Pang! It'd stay – it might stay there an hour; it might stay there two hours; it might stay there two weeks, but it would go right up to that stick point. Bang! Because you've got a head-on crash and that head-on crash is what keeps the reactive bank reactive and what keeps it there and which keeps it poised in time. And that's what makes it a reactive bank. And that's how come it can stay with the pc. And that's how come the pc dramatizes it and all the other things that we've been studying for years are contained in this Goals Problem Mass. They're right there. You don't have to run engrams. Run these two masses; you've got it all set.

Because the pc has this overwhelming ambition – modified slightly – and the opposition has an equally overwhelming ambition – modified not at all and these two things are head-on.

All right. Now, in sorting this out, the North Star, your Polaris, in the navigation of this particular problem, is the goal. So please get the goal. Whatever else you do, get the goal.
Now, if you get something from a goals list, which assesses out beautifully and continues to fall – just routine assessment. Assessment is not hard. You'd think, to some auditors, it was terrible, but it is not hard. But assessment becomes as hard as you're knuckleheaded about what you're trying to assess.

We've got the pc's terminal over as the opposition terminal – I'll give you an idea, see – we've got the pc's terminal over as the opposition terminal and now we're trying to find the pc's terminal. How long do you think we could go on?

We've already got it on the 3D sheet. Nothing else is going to fall on the 3D sheet, but we keep asking him for sweetness-and-light terminals to put down as his own terminal.

Well, this opposition terminal is a dirty dog, see and he isn't going to ever admit to being a dirty dog, but he is one. It's his terminal. That's quite interesting. How long do you think we could assess for this terminal which is already down under the heading, "opposition terminal." It's already there. And we're going to keep on assessing for it to put it down as the – we're trying to find the pc's terminal. Well, we found it. It's overlisted under the opposition terminal. That's where it is. And what have we got as the pc's goal? We've got the opposition goal, that's what we've got. So we've just got two sections misfilled in. You got the idea?

From that point on, everything becomes unworkable. So that's why the lodestar of the goal has to be so clearly defined as something the pc wanted to do. We want a high-toned, beautifully serene, "Wouldn't it be lovely," "Everybody would love us desperately," "This would heal all the problems of Earth, that is for sure" – that's what we want. He won't put it that strong ordinarily, but you say, "Well, did you ever want to make cars?"

"Oh, yes, yes, I'd never thought about it before, but you know, I do. I've always – yes, yes."

"Well, how do you feel when you start making cars?"

"Well, I get very interested, and so forth and very nice, and so on."

"Well, you ever talked to people about making them?"

"Oh, yes, yes. Talk all the time about making cars," and so on.

Oh, hell, you've got his goal, man. I mean, there's nothing to that. It's high-toned. You must have his goal. There it is.

All right. Now, we get something else. We say to this pc ... All right. We go down the list and we got this goal "to find things." And we say to the pc, "All right, now ..." We checked it out. We got it. We know it falls, we know it's perfect. See, you realize that all five first parts and actually the Prehav level, all six parts of a 3D fall equally. And they stay in equally. And they're assessable equally. You've just got to find out which one is which. That's all.

And we say to this fellow, "All right. Now, how about 'finding things,' now, we've got this goal here." That's – we didn't find any other goal; we just found this one goal. "To find things." And we'd write this down and we've assessed everything off and we finally wind up with the thing, "to find things."
And we say, "Well, where did this come from, now? Did you ever wanted to find things?" is what you really ask the pc.

"I've gone a lot of places to look for things."

Well, you say, "Good. Good. Have you ever wanted to find things?"

"Well, as a matter of fact, I have. I – I – I – I've studied an awful lot of – of – of ways and means of locating."

"So, have you ever wanted to find anything?"

"Well, it goes without saying. Of course. Naturally."

"Well, how do you feel when you're looking for something?"

"Oh, well, how do I feel – how does anybody feel? You feel like hell when you're looking for things, of course."

Well, you've got a piece of 3D. Don't kick that out. You've got a piece of 3D; that's for sure. But please recognize that it's probably the opposition goal.

Now, if you were – if you were the person standing between the bumpers of these two tractors, you might not know which tractor you were. They're sort of grinding and champing, don't you see? And there's a lot of shouting and swearing going on between the drivers and you might get disoriented at this point and you might not really know which was the wrong tractor. And you might appropriate equally both tractors; they'll both assess. The Fordson tractor will assess equally with – as far as it's concerned – just another Fordson tractor. They're all Fordsons, aren't they? It's this kind of an assessment as far as the E-Meter is concerned.

So you look over into this situation and you put it down. You have assessed something. You don't invalidate it. You don't tell the pc what it is or anything else, but you know where to put it, and you don't put it down as the pc's goal, if you please. You leave it in abeyance. And then we try to find the opposition goal to it. Smart, huh? Try to find the opposition goal to this thing.

You get a whole new list and the pc somehow or another ... And if we very carefully – if we've suspected it this far, we don't say, "Your goal of," because that's an evaluation. We just say "the goal of." See, "What would oppose the goal of finding things? What would oppose that goal?"

We get a whole new goals list. The pc's goal will appear on it. And we finally, just by assessment, we get one of these items and there it is, bang. There it is.

And we say, "All right, have you ever wanted to do this thing?" And it's "to get lost." Well, obviously, the noble thing to do is to find things. And the ignoble thing to do is to get lost. Everybody agrees on this.

And the pc says to you, "Oh, yes, I'm always trying to get lost. It's so interesting."

"Well, have you ever talked to anybody about getting lost?"
"Well, yes, as a matter of fact, I wrote a book on the subject one time." Very high-toned. Oh, yes, everybody would be interested in getting lost. See? Bang.

So we've got, "to find things" on one side and the opposition terminal, of course, is "to get lost." The opposition goal is "to get lost," as far as he's concerned or we were concerned – unless we know what part we're looking for. We found the pc's goal backwards. Simple. He's low-toned about the opposition goal and he's high-toned about his own goal. That's what – that's a rule of thumb.

When the opposition goal is chanted to him, he kind of feels a little bit overwhelmed and he starts sort of leaning backwards and he wonders if the high winds of space haven't started to blow. And you start chanting at him his own goal and he says, "Isn't that wonderful?" He feels so relaxed about it. Of course, it's the source of his ulcers, but he feels it's real nice. It's real nice. This whole thing is real nice. Made him feel better.

And you say "to get lost," "to get lost," "to get lost," "to get lost," "to get lost." And this winds of space idea of blowing his head off or something of the sort just diminishes and lessens and goes away.

So we could just watch the pc. We're going to get the same reaction on the E-Meter. The E-Meter does not know friend from foe. It doesn't. It doesn't know which side it's reading And we couldn't care less. Just as long as it'll read and tell us that it's in the fight. That's all we want to know.

The E-Meter will tell us it's part of the fight. Aaaagh-guuu. We could actually go ahead and almost blindly find the parts of 3D and jigsaw them together, see. We could find a goal, and then we could find a goal that opposed that goal, and then we could find a terminal for one of the goals and a terminal for another one of the goals. And just by gradual lessening and discussion with the pc, we would eventually – the pc would all of a sudden say, "Hey, that's me. And that other one, that's them." And man, I don't mean – mind telling you, he won't change his mind after that.

Yeah, he knows which side of the fence he's on. It's somehow or another with a little abashment sometimes, hell tell you, "Well, actually – headwaiter – an uptown swell. I've never been an uptown swell. I've just been a headwaiter. And my goal is 'headwaiter.'"

Well, you can check it out easily enough. You don't have to bother with too much guesswork on the part of the pc because he's, of course, mixed up. He's not a reliable judge of this situation. You just sit there and say, "Uptown swell. Uptown swell. Uptown swell. Uptown swell. Uptown swell. Uptown swell." The pc's head's going back and "th-th-th-th. Uptown swell. Uptown swell. Uptown swell."

He'll never do that with "uptown swell." You'll never see him pat his top hat on his head. You'll just see him lean backwards. He cannot dramatize successfully the opposition terminal and has never been able to.

He's tried. Every once in a while, he'll try. I guess a guy caught between the bumpers of two tractors with unlimited horsepower, each one driving at each other, I suppose he – he can't quite make up his mind what to try. But that's about the way the pc is.

All right. Let's look at this then. You've got, now, an opposition terminal and an opposition goal and a pc's terminal and a pc's goal and then we've got a modifier. And we're not going to bother to modify – the only goal we're going to modify, of course, is the pc's goal.

We could also modify the opposition goal. We can find modifiers for it, too. We can go on and bat our brains out, but after we've found the modifiers for it, so what? Maybe someday we'll find some use for it and I will tell you, "You know that lecture I made back there on the 30th of November on the subject of never find the modifier for the opposition goal? Well, as a matter of fact, we need it. Process Zed is absolutely vital that we have this." So take a rain check on it, if that's the case. But right now we have no particular use to find it.

All right. This thing is going to make a picture. It's going to make a picture and the pc knows. The pc is never really going to argue seriously about his own terminal. But the pc'll be awful queasy about an opposition terminal when it's handed to him as his own terminal. He doesn't think that's quite right. Because every time he thinks about that being his terminal, the winds of space start going.

"I don't know if that could quite be my terminal."

He thinks about his own terminal, and all he gets is a horrendous, horrible headache. That's much preferable to being blown off the cliff, see. You get the difference between these two things?

All right. Jigsawing these things together has got to make a story and it's absolutely vital that it make a story. It's got to make sense – to you.

Now, never suggest anything to the pc. But when you've got the elements, what they are, you will have to sort out. And if they have all checked out nicely and you know there are all parts of it, before you run this pc, you make up your mind if it makes a story to you.

For instance, does the opposition goal really belong to the opposition or is it the pc? And that's an easy test. "What have you really wanted to do?" chanted at the pc – it blows his head off, it's the opposition goal. Fine. He – he really wanted to do it. It's his goal. He – he gets mad when he tries to do it, why, that's the opposition goal. You got the idea? So that – that's easy to sort out, that one is.

All right. Opposition terminal. Now, this requires a little more sense. The opposition terminal must be somebody who would have a goal of that type who would actually be opposed to the pc's goal. It mustn't be "a kangaroo catcher in southern Andalusia." The pc's terminal has gotten to be an uptown swell, you see. "Uptown swell and a kangaroo catcher and ... Doesn't sound – there's something wrong here someplace."
The way you straighten it out is by thorough checking again. Just check it out again. See? Just – just make sure it's right at that point. Just check it out quietly. Because you're going to find that it's got to look like a fight. For instance, what locks a problem together? What locks a problem together? "To find things," "to lose things."

They must be opposing ideas, and the ideas must be quite clearly opposing. And if they're not clearly opposing, you do a recapitulation and if you don't do your recapitulation of the thing, you're in trouble, because you'll be running something that is off beam.

Now, it can happen that it doesn't sound that way to you, but it makes sense to the pc. Well, I buy that right up to the point it doesn't make sense to me.

Oh, come on, wake up, don't be so serious. It's all right for the pc to say that it makes perfect sense to him to have, "the uptown swell" and "a kangaroo catcher in southern Andalusia." Perfectly makes sense and for the opposition goal to be "to catch kangaroos" and the pc's goal to be, "to light cigars." This is fine. He says, well, it all makes sense to him and I take that, I buy that, I say that's just fine, right up to the point where I can't understand it. If it doesn't look like it to me and if it wouldn't sound like it to a screenwriter and if it wouldn't be understood by the general public if put in a short story and a bunch of other things like that, I have now learned by experience that it won't stand up on a run.

I've learned this by experience, because pc after pc now, on 3D, has said, "It makes sense to me" and it didn't make any sense to me – not to me, it didn't make any sense. And every one of them – you can ask Suzie – I've said to Suzie, "That isn't it. Nah-uh! Somebody's skidding their wheels someplace. That isn't it."

And sure enough, on checkouts and runs they haven't made sense. It wasn't because I think they've got to be redone. If we didn't redo them, somebody'd get killed in the process of being audited. That's all. Do you see what I mean? And it's just coincidental that they – the right ones when now relocated make sense! The terminal agrees with the – with the guy I know that the pc is, see? It agrees with his past and background and he does these things. Yeah, we know this. And he has these goals, and yeah, boy, does he hate this other item like mad, you know. He wouldn't have anything to do with that. That's obvious.

And that other item wouldn't have anything to do with the pc's item. And, yes, this goal does confront the other goal. Oh, yeah, that's fine. And the modifier – yeah, we'd suspect something like that about this pc. It all makes sense and you say, "Now we know!" See? And if the auditor can't say, "Now we know," he'd better keep fumbling with pieces of paper. That's all I've got to say.

He never suggests anything to the pc. It's up to him to find more items and to try to straighten this out until it makes sense and suddenly, like a crash of lightning, he's liable to get something on the basis of – from the pc – "Oh, well, yes, I ... Hu-hu-hu-hu. Oh, yes, I don't see why I ever tried to sell you the idea that I was a Canadian Mounted Policeman. I – I don't see why I ever tried to sell you that idea. Yes, it's absolutely true. It's absolutely true. I was a sausage maker in Vienna. That's right. I always have been. I always wanted to make sausages. Yeah, that's right. I don't think I ever told you this before, but as a matter of fact ..."

And what are we getting? We're getting the upper strata of the Tone Scale. We're getting a pc talking. We're getting a pc talking about it, a pc interested in it. We're getting the whole upper
Tone Scale about all this and worse than that, it fits. Makes sense. Makes sense. There's been a pc or two around where nothing made sense, you know?

Sometimes it doesn't make sense until you get all of the pieces and all of a sudden you'd say, "Of course. Naturally! Well yes, all right!" Up to that time, you only had four items. They didn't make any sense.

Maybe one was "a juggler," and the other and the goal of the thing was "to shoot clay pipes," and just all the buttuh and all of a sudden you get the fifth item, you know? You know, like the pc's terminal and it'll all of a sudden will go, clank! You know? All goes into place very nicely. You say, "Yep, that's the pc. Yep, that's this and that's that, and that's the goal, and that's it – boom, boom, boom."

You never argue with the pc on this subject. You just either test it out, get more items, check it out, look it over, know what's gone before and all of that. That – that's what you do. That's how you handle the situation basically. You know what's gone before. That is your best bet.

And it makes sense to you finally and until it makes sense to you, keep assessing, keep moving things around and don't get so confoundedly set – just because you wrote at the top of the piece of paper that these were opposition terminals – don't get so fixated on the idea that they absolutely become opposition terminals. They might not at all. It can check out 100 percent and appear as the pc's terminal. Just because you've assessed for the opposition terminal and found something is no reason that you've found the opposition terminal, at all. But given any couple of parts of 3D, you can always straighten it out. You can always ask a cross question that gives you the other parts, which is quite interesting.

Let's say we knew this pc was assessed at some time or another and somebody found a goal on him and it had been run and evidently fairly successful. And we had the terminal on the thing and it appeared to be his terminal and so on. And that was all very well. And it did check out and as a matter of fact still bangs. And we can still get a bang on this thing on the meter. Well, just because he said it was his terminal, is no reason it's his – isn't his opposition terminal. See, you've got a piece of the puzzle and now I'm talking about putting cases together, see?

Well, the easiest way to put a piece – a case together, of anybody ever run on Routine 3 – the easiest thing in the world to do is just take "What goal?" "What terminal?" and then conditionally put the goal down as the pc's goal and conditionally put the terminal down as the pc's terminal.

Now, find quite noncommittally, an opposition goal – ha-ha! – and then find an opposition terminal and check those things out on their list, which now leaves you with four items. You're not committed yet. One or the other of the goals you have found is the pc's goal. One or the other of them is the opposition goal. See, you've assessed it out and the assessment checked.

One or the other of the terminals is the opposition terminal and the other one is the pc's terminal. Well, you're – this is pretty easy now, by this time. Your test is – all you have to
do is chant it at him; if it blows his head off, it's the opposition. I mean, simple. I mean, you can even subject it to actual mechanical tests. It doesn't have to be by your opinion.

Now, the opposition terminal, goal; opposition anything, opposition level – these things all start the winds of space. They start blowing the pc's head off and that's for sure. This you can count on – starts blowing the pc's head off

It isn't that things get more solid. Don't use that as a test, for God sakes. They'd better get more solid, but you've got that. You actually get a current. It's actually a current starts going. I mean, you're talking about winds. You're not talking about mass.

You chant the opposition, you can start up a sort of a mass wind. You start up a wind and you start up the – the pc's goal or terminal and it just kind of gets more solid and he feels happier and he feels kind of less there and foggier. He doesn't feel good, you understand, but it's fine. It's fine. It's interesting, it's at a high communication state, it's fine. And the other isn't. The other is misemotional.

After you've assessed and run, now you really start getting the dope. You start running the opposition terminal as the pc's terminal and you promptly have an awful mess on your hands.

Now, here's about what happens: The pc comes in low on the Prehav Scale. That is to say that your first levels that the pc gets alive will be relatively low levels. That's – gives you a probability of opposition terminal. You're running his opposition terminal by mistake.

The pc runs kind of – doesn't know anything about what's going on; knows nothing about what is going on and can't tell you anything about what is happening and cannot do it very well and so forth. Well, it's not necessarily the opposition terminal. It's just probably the wrong terminal. I can tell you how you'll find it's the wrong terminal, in any time and case. It's very simple. It runs this lifetime and runs everything the pc has run into before in processing. Isn't that nice?

It runs mainly this lifetime and it never goes into any past lives or any nasty things like that and it runs all of the things the pc has already had run. See, the pc's had this and that and the other thing run on their case down through the years and that's what the pc contacts again.

You have found a lock. The terminal you have found is just a lock on the actual terminal and checked out sporadically and was detectable from the first. It was just – actually, a bad piece of assessing and checking. That you can count on.

So when a pc starts to run and they give you the answers... They're pretty hard to answer the auditing commands. That's about the first thing you run into. Oh, there's something wrong with the auditing commands here, but can't really answer any of the auditing commands. It's always difficult to answer anyhow, but, you know, just can't quite answer any of the auditing commands. They don't really apply somehow or another. And the incidents they get – well, they get last week and they get tomorrow and they get their childhood and they get their family home life and they get the garage they worked at and they get their childhood and they get the class and they get eating dinner today and... You better make up your mind.
You're just running a lock. You're not running any terminal that's ever going to do the pc any good, because you haven't contacted the Goals Problem Mass.

There aren't any clear pictures in a Goals Problem Mass for a nickel and a collar button. After you've run it for just a few levels of pictures – picturesmictures – there's a little fragment of this and you get a far impression that over there someplace there might be ... And it's all sort of dark down here, but you get the idea of a fragment of a toy on the floor, you see.

And then that's – that's pictures. Well, what kind of pictures would you get if you put an art gallery between two bulldozers? Well, that's the kind of pictures you'd get, that's all.

You don't get nice, clear – this is on early runs, of course – you don't get beautiful 3-D pictures. You – the pc's terminal is a waterbuck and we get – we think it is – you see. And we get this beautiful stream and it's all in 3-D and the tone arm stays down and the tone arm just stays down and the tone arm never goes anyplace and nothing ever happens. But you get these beautiful pictures of these 3-D situations. It's a nice picture, too. It's sweet. There's nothing happening in them.

No, they're not stuck. And that actually will be the characteristic of some lock terminal. You'll find the terminal. It's probably on the original list. When you find the terminal eventually, you will be able to connect it to the terminal you were running. So you're running a late terminal, that's all. It never goes anyplace. And of course it's got pictures. What do these pictures depend on? They depend on the Goals Problem Mass like the – a ship depends on an anchor, you see? And you've got – after that, you've got pictures on the subject.

No, it's like running head-on into a brick wall. Clearing, actually, is not nice. And if you're looking for some nice, sweet procedure, why you know, be an art critic and don't get audited. Spend all your time in the galleries where it's quiet and serene and nothing ever happens.

No, you start running an actual terminal, on its proper Prehav level, against its proper opposition terminal. And you run it properly with the pc with his own terminal and the opposition terminal being that one over there, not running the pc on the opposition terminal with his own terminal over there, you see. That's even worse; and it's just a dog's breakfast anyhow from there on out. And don't think because there's something happening and the arm – tone arm is sticking up, that you must have done something wrong. No, it's quite the reverse. If the tone arm stays down and nothing happens, you've done something wrong. That's all.

But even if you're running the pc on the opposition terminal, something's going to happen. The pc eventually gets a part in his hair, eventually gets a hole through his forehead. He's running straight into the currents of the – of the actual magnetic fields that surround this confounded thing. It's quite fascinating.

All right. Patching them up after they've been run is something you'd better be cognizant with, because frankly, there have been four people in this unit assessed and run on Routine 3 who were run on their opposition terminals as their own terminal. And you go back and look. That's why Suzie is scolding – we really had – I was really looking over – over early auditing reports, and it says, "He squiggled kabub. Ran rrrr-mmmm." "Process. Process." Next auditing report, "Process." Next auditing report, "Process." You go back earlier. "Process," it
says. So what process? Let's go back three or four more days. Were they running the terminal at this time? "Process." Go back three or four more days. Blank.

And you finally find over in a corner someplace, it says, "Hmph-phll-hmm-hmm." And you say, "What in the name of God was that? Where is that? Where is that?" And you break out – actually did – break out magnifying glasses and so forth and try to read the damn thing. Finally found most of it, too.

Because if it was the pc's terminal – now this is a rule – if it was the pc's terminal, it must be run from the first level it was assessed, onward. You must pick up the first level it was ever run on. And you mustn't skimp one. And if you've skimped one, you've had it, Henry!

I found a nice one last night. I found somebody that was being run on their right terminal clear back in September and who just would have done gorgeously, but the auditor never ran the terminal the pc was clearly assessed upon, but ran something else as a terminal and that pc has hung up ever since.

I was sitting down here in the training office at 4:30 A.M. this morning. And I was tearing through the records and that is what I found. You talk about a flub. The pc would probably be Clear by this time because we had the right terminal, it was all running okay and the auditor just assessed the first level and then said, "It must be something else." The pc even said – the pc is terribly interested in this level – and ran something else from there on. And the first level found on the Prehav Scale on this pc has not even been run to this day! I trust the pc did or will run it today, much to the surprise of the auditor, who is probably...

There are three of – several auditors here today opened their folder – pc's folder with great confidence and aplomb, thinking they were going to get on with the show and were suddenly confronted with running a terminal and had the level already in front of them to run now on the pc and probably expressed their consternation by not running them.

Anyway, they were all set up. We needed the rest of the thing. You actually needed the rest of the picture. You had to have the rest of the picture or otherwise you would never have gotten any part of it.

The original terminal on which a pc was run, was not however, necessarily the right terminal. It was not necessarily the opposition terminal, you see? It was not necessarily any of these things. But it's whether or not it checks out and makes sense, whether or not originally it did run, whether or not it fits it, whether – you know, all of these other considerations were there.

For instance, I'll just give you a quick flash through here now. Talking about patching him up.

Let me say one final word about putting together a 3D. It's a jigsaw puzzle. It fits together and it makes a perfect picture after you've got it finished, that's it. That's the way it works and so forth. And it tests out and checks out and that's the way it looks to the pc and that's the way it is.
Now, you needn't be terribly worried about having done a reversewise assessment and all of a sudden run the pc on the opposition terminal. The pc is going to feel very bad and you're going to feel – everything's going to feel very upset, but of course the pc's going to feel bad and upset anyhow on an early run. So that's not a test. It's whether or not you suddenly wake up to the fact that this pc has been sitting there with a high wind going across the front of their face for the last session. It's about time to say, "Well, wait a minute, is this the opposition terminal or isn't it?" And you suddenly look into the folder and say, "Does this make sense? Well, hell, this has never made sense. This just has never made sense. Well now, how would it make sense?"

And all of a sudden we move it around, we swap the terminals or swap the goals or we swap any of them or we find "Well, gee-whiz, last year you were assessed on – you were assessed on 'a buggerboo.' You never told me that."

"Oh, well yes, I had 175 hours of run on a buggerboo. Didn't I ever tell you that? I never did."

You have been running as the opposition terminal, "a boss." "A boss." "A boss" is the opposition terminal. And the only terminal you could find on the pc was "a little fairy." And then we find out that last year he was assessed as "a carpenter." Of course, that's his terminal! Checks out now. "The boss," "the carpenter." Yes, what is the goal of a carpenter? You get the idea? It was – had to be a Routine 3 goals terminal type of run and check. Yes, yes. It ran. And everything was fine, but just somehow the pc is not interested anymore and he neglected to mention it. That's the kind of things you'll sometimes run into. You have to be alert to this kind of thing in patching them up.

Now, in view of the fact that people who have been run on Routine 3 have been badly assessed or well assessed, you've got to reprove-out the whole situation. But if they can remember their goal and if they can remember their terminal, for any given run you can work out the rest of the 3D like scat and then try and make sure that the goal wasn't an oppgoal and that the terminal wasn't the oppterminal. You got the idea? Find the rest of the items of the 3D and you've got the person set up for a run. Fill him into your commands of 30 November and commands of 28 November.

There have been three sets of commands: 27 November, 28 November and 30 November. Thirty November can – is your best issue because it gives you a choice of whether or not you're going to run straight on into the tractor or you're going to fool around a little bit before the head-on collision.

I could explain more to that later. You don't particularly need the data at the moment. But you can so write up the sixteen-way bracket so that it's a head-on collision. How? By putting more oppterminals in it. You put the oppterminal into more commands. When you put the opposition terminals – the more opposition terminals you're going to put into more commands, the more the pc is going to run on, head-on into it, the more difficulty the pc is going to have, the more headache the pc is going to have, the faster they go Clear.

So you just pays your money and you say, "Well, how fast are we going to get this fellow Clear or how slow are we going to get this fellow Clear? How much fooling around are we going to do before we walk in to the middle of the bullpen?" And, of course, you can just
take and throw him into the middle of the bullpen. All you have to do is run it the way it is issued here on 30 November. "Tell me a problem, oppterm." is number thirteen. And number fifteen, "Tell me a problem you might have had with an oppterm." Of course, that's you versus the oppterm, ha-ha; you versus the oppterm, ho-ho-ho. Zzuhh. Of course, you've never been really versus the oppterm except as the term, and huwwoooooo. The winds of space will start to turn on at that moment and then you catch it the next command. And you're right back there – terminal, terminal. But there's more terminals here than there are oppterms. On 27 November you'll find there's the same number of opposition terminals in the command bracket as there are terminals. I will state to you in passing that it took me a couple of weeks to finally settle on this and discover irrevocably that we have never had a command big enough, beefy enough and tough enough to run a Goals Problem Mass. We had never had one. Except this and this is big enough and beefy enough and tough enough. And if it won't run and the pc can't do it, it's just because you, knucklehead, haven't clarified the level with the pc or gotten the intensity of the level, knucklehead. So that's all there is to that.

Let me catch you running. "How might 'failed pinch' have been a solution to the problem?" The pc at the time you first brought this up was saying, "Failed pinch. Failed pinch? Failed pinch. How do you fail a pinch?"

And you've said, "All right. Now, we got to clear the rudiments and here's the first command."

And the pc says, "It was failed pinch, failed pinch, failed to pinch. I'm finding it difficult to answer."

Well, one of the reasons they find it difficult to answer is when it's not their terminal. When it – when it's the opposition terminal, they also find it difficult to answer. When it's the wrong terminal, it's always difficult to answer. If it's the wrong Prehav levels, it's difficult to answer and when it's the wrong intensity – this is a whole new subject on the Prehav – the wrong intensity.

How might slapping have been a solution to that problem? You're all set, see? "Slapping" is what the Prehav level is. There isn't such a level, but you say, "Slapping. That's what we assessed, you see. Slapping." So we say, "Well, all right." We go on and run the command. It doesn't run.

And you say, "Well, all right. Now let's get smart on this thing and let's get the intensity of it. Slapping, hitting, beating, smashing, slugging, crushing. Crushing, there it is, heh-heh-heh-heh, crushing." Or we got "crush" on the Prehav Scale, but we try to run the thing and it's "tapping".

"Tapping. Yes, tapping would be a solution to the problem. But crushing; no. Too brutal." You get – you get the whole thing. The pc will have the level all right, but the intensity of it is wrong.

I'll give you an idea. We get "dislike." And for some reason or other, "dislike" falls out of the hamper. And we try to run "dislike." We never clear it with the pc or ask him what the intensity of the – the word is. He says, "dislike."
"Dislike a man," she – this girl says. "Dislike a man. Well, yes, I suppose so. Dislike a man."

"How would dislikes" – and you ask them, "How would dislikes solve a problem about a man?"

"How would dislikes solve a problem about a man? Hate. Hate. Hate. Yeah, oh, yeah. Hate. Ha-hah, yeah."

Just put the two side by side. "Dislike," "Hate." "Dislike" promptly disappears as a read and "hate" is right there as the Prehav read. Oh, yeah. Well now, that'll solve all the problems about the man for the pc. You get how – what I mean? Intensity? We've got "timid," "fear" and "terror." See, that's just intensity of the same thing – timidity, fear and terror.

You can clear those across sideways. You don't change the sense of the thing, you see; it's just the intensity of it. "To tap," "to slap," "to slug," "to jolly well smash his 'ead in." You got the idea? But you wouldn't use all those words.

Well, how – he thinks – any problem he thinks of, this is the automatic answer. If you've got the right intensity and it's cleared with the pc, it's actually almost a silly question, because you've had – you've told him the answer.

All you're trying to do is get him to look at the answer he used in the solving of that problem, because you're actually running out backtrack problems.

This is based entirely on this one basis. The Prehav Scale are the things the pc has used to solve problems and that is the definition of the Prehav Scale and that is why only this command series works.

You can knock problems out by taking the times the pc has solved them and racking those up or by taking the prior confusion. And after I've seen some of your skulls becoming absolutely flat and I've seen you look like frying pans through this crush, you see, of it all – now we're going to find the prior confusion and just blow it all, are we? Heh-heh-heh. The hell we are.

I can do it by taking a bit of the problem and dating it and a bit of the problem and dating and a bit of the problem and dating it. I can get the problem you've had and then date it and get a problem you've had and then date it and get a problem you've had and date it and gradually dissipate the mass. It can be taken apart that way. You don't know how to date. You never have been able to. Never saw such knuckleheaded dating in my life. That sounds more severe than it is. But you get all mixed up – one gets all mixed up in A.D. and B.C. and years ago and that goes into the middle of implants. So it's a pretty slippery job. If you want to learn how to date, fine. I'm not going to demand, however, that you know how to date. But you can take a Goals Problem Mass to pieces by dating.
And you say, "Tell me a problem you've had with a female. Cheers. All right. When might that have been? Do you suppose that ever had any real location in time?"

"No."

"All right. Well, was it a hundred thousand years ago? Was it a hundred million years ago? Was it a hundred billion years ago? And so on. Oh, all right. Well, is it less than a hundred trillion years ago? Well, is it ninety-nine trillion years ago? Was it less than fifty trillion years ago? Ah. Is it more than fifty trillion years ago? Is it less than fifty trillion years ago? Ah. Is it twenty-eight trillion years ago? Is it more than twenty-eight trillion years ago? Is it less than twenty-eight trillion years ago? Oh, it's more than twenty-eight trillion years ago. All right. Is it more than thirty million years ago? Less than thirty million years ago? More. Was it more than forty million years ago? Less than forty trillion years ago? Was it less than forty trillion years ago? Oh, all right. It was less than forty trillion years ago? It was more than thirty trillion years ago?" Guess what? It must lie between thirty and forty trillion, mustn't it? "All right. Is it more than thirty-five trillion years ago? Is it less than thirty-five trillion years ago?" This is dating.

And you finally nail it down and nail it down and nail it down and all of a sudden it goes *splayng-splayng* and it gets more and more solid and the pc kind of undercuts it and maybe sticks with it and maybe it blows. But you've got a piece of the Goals Problem Mass in your hands.

You could ask somebody casually, "What – tell me the prior confusion to your Goals Problem Mass." You see? And you get a basket and pick up the pieces. Honest, if you ever want to knock anybody's head off, why, just start ferreting in and driving home that question, you know.

You say, "Well, let's see. It was quite a long time ago. What – what – what do you suppose – how come, you suppose, you ever got in trouble between a streetcar passenger and a streetcar conductor? Now, between a passenger and a conductor – now, what do you suppose might have happened before that whole thing became a terrific mess to you? You know, I'm talking about all the times, all the times this ever became a mess to you. What do you suppose you were doing in life that got you in that kind of a ... ?" *Ha-ha-ha-ha-ha.*

Honest, you'll get some somatics you never heard of before. Not even the medicos have ever heard of before. It probably could be done. Probably the pc would come up right on the other side of it. It's quite amazing. But you could certainly take bits of it and date it.

But if you don't do those two operations, one or the other of those, you've got these – this command series here of 30 November to carry you through. And it's a bitch. It's frankly a bitch. If the pc does not run into the Goals Problem Mass head-on, if the tone arm does not go up and stick, if the pc does not begin to feel mass, if the pc does not begin to feel very uncomfortable, if the pc just sits there comfortably saying, "Well, yes, I remember my childhood," and so forth.

"What are you looking at there?"
"Well, there is a big picture of our living room at home. And yes, yes, yes, and there's my first job and so forth and so on." And the tone arm goes down and goes up a little bit. And it goes down and it goes up a little bit. It goes down, it goes up a little bit. And there it is in it's nice quiet range and we're all having a wonderful time.

Something is wrong. Now, if that condition exists, it's simply the wrong terminal, that's all. Bang! It's just the wrong terminal. It's not even that you've got the opposition terminal or anything like that. It's just the wrong terminal. You just run some kind of a lock on the actual terminal, that's all.

All right. Another condition: The thing goes up, sticks up and the devil himself couldn't get it down and the pc is sitting back here and feels like he's about to be driven through the wall, and doesn't feel any mass where he is. The mass seems to be out there someplace, but isn't quite where he is and it all seems sort of difficult. The possibility is you have the opposition terminal and you were running the opposition terminal as the pc's terminal.

Now, the other factor is the pc is sitting there and the pc is getting popeyed, because you push anybody hard enough in the chest or push – take a battering ram and put it against their stomach and then lean on it hard, their eyes kind of get popped, you know. The eyes will pop out eventually. Even a frog's eyes will and they get more and more solid and everything is getting more and more solid. And they're interested, but they're a little bit suspicious of the auditor and they're suspicious of what's happening and suspicious of the case and they're waiting to see something. But it's just getting all black and mucky and it's all kind of dirty nyaaaah out there and there's nothing much anyhow going on. It's all just difficult somehow and the somatics are against their back or against their forehead or in their noses or they've got headaches and they're aware of an increasing mass which is very uncomfortable and they don't like it. You're right. You're right. Beware, beware, beware, if the pc throughout all the sessions never says to you sort of bravely, "Well, I guess we'll get through it somehow." If a pc never says that to you, there's something wrong.

Now, that's the least that would happen. A more average happening is, "Oh, my God, we're not going to run that again, are we? Well, we're not – that's pretty -. Well, all right, I'm - I'm game for it. Huh-huh-huh-huh, I'm game - go ahead. We'll have the session. Will you tell me where the tone arm goes?"

"All right. Okay."

"You know, all these somatics I'm getting are all brand-new. I mean, I've never had these somatics before."

"Well, all right. Okay, well here it is." And you see a sort of a grim gritting of the teeth on the part of the pc. It's just as though he's going to have a dental operation of magnitude or something of the sort, and you utter the first command.

The weird part of it is if you've got it all right, the pc will work at it till hell freezes over and actually will – will be happier to overrun it usually, than to underrun it. The pc will keep on running it. It's a sort of a masochistic sort of an attitude. It's like the fellow – the fellow cutting his fingers off, one slice at a time, you know.
So don't expect that what we expect out of a 3D run is the pc sits there and every
command looks brighter and cheerful and the E-Meter frees up and he's just getting clearer
and clearer and the needle is floating better and better and everything is all looking better in a
gradient scale, from the first moment you start it till the end. You see, you've been – you've
led the pc to expect something better than he is now getting.

The pc felt wonderful when you first got his first item. And then he felt awfully good
when you got his second item and he was very nice and happy about the third item and then
you got his modifier and he didn't feel so good. But that's all right. Somehow or another he'd
certainly like to find his terminal. That will explain a great deal to him. So he finds his termi-
nal and well, that's him all right. That's good. He feels very happy about that in a sort of a

But, it's all fine, you see. He knows this is all right, and it's just because it's – it's be-
cause he didn't take any aspirin. Because he's being audited, of course, he didn't want any as-
pirin. And it's all right. It'll work out. Everything is fine. And then you assess the first run in
the Prehav Scale and the pc is all full of hope and looking very alert. And then you start this,
and the pc feels good; these things kind of run off automatically and everything goes along
fine. It's very easy to think of these problems for some reason or other. Maybe he gets even a
picture, too – several pictures as a matter of fact. He gets a lot of pictures – things he never
thought of before. Never had that particular reality. Gets a lot of cognitions. The pictures –
they're kind of gray. They're kind of foggy, the pictures are. They're not very good, but that's
all right. They'll improve, won't they?

So the pictures get worse and worse. And his headache gets worse and worse. And the
pressure against his backbone gets worse and worse. And it gets harder and harder to answer
the auditing command. And the auditor continues to insist that he do it again.

Zhuhh. And he comes out of session and falls against one side of the door and then the
other side of the door and falls on the other side of the hall and then sits down and then sits up
again and holds an E-Meter and tries to sit up in a chair, and tries to see through his eyes, but
somehow or other they aren't in his head. And then he runs the next one and the next level and
the next level and the next level and the next level. And it's just horrible and it's all awful and
everything is ghastly. And he knows it's getting somewhere and he has faith in Ron. And it's
getting pretty grim and it's pretty horrible and then he finally gets up and so forth. And he
said, "Well, thank God, we're through 'withdraw,' 'hate,' 'clam up'. " We're through these vari-
ous levels on this thing; we're all set."

And then one day he sits down in the chair and the auditor says, "All right, now we're
going to run this level – 'hate,' 'withdraw' and 'clam up'."

"I got through all that. I got through all that once. There's no reason to go over it again,
is there really?"

"No, no, no reason at all. Well, here's the first command." And he runs all the levels
again. Because you can run these levels over and over. And if you've run about a dozen levels
– here's another tip – if you've run about a dozen levels, and the tone arm has never come
down, just go back to the first level you ever ran and just run it all over again, because there's
been something left on the levels, but by running them, has freed up. You can rerun levels
about three times as long as you keep their exact sequence. About the fourth time, this begins to get stupid.

You run them each one to a stuck tone arm, you can run them quite thoroughly. But it isn't really necessary to scrub them out utterly, with a wire brush across the pc's nose. For – because frankly, you can always go back and run the run again.

A good test is, is after the pc's tone arm has come down, you ask the pc – you just say this phrase to the pc and you don't get any reaction. You know, just this same Prehav level question that you would have asked in the first place – you just say that to get it originally. You just say that to the pc and you don't get a needle reaction, you're all set. You can leave it like mad.

But if the needle sticks, then you can start expecting some trouble on a later level. When a level isn't well cleaned up, your later levels hang up. But that doesn't mean you can't go over and over levels. You can indifferently flatten, as long as you run them an hour or so or half an hour or hour – run them to a good stuck arm – you could flatten a dozen levels, to a good stuck arm that's only stuck for about five, three – well, it's stuck for five or six commands. Still needle, still arm. You could pass that up and go on to your next level. And then pass the next one up and go on to your – and do the same way and then do the same way, and do the same way. Reassess and do your next one. Reassess and do your next one. Reassess and do your next one.

Keep them. Keep them to hand, because if you're auditing that way, sooner or later you're going to have to go back to the first one and run the whole gamut again to get the arm blown down.

But you will notice, that if a pc is getting better on the run, the arm sticks less longly at the top of the stuck. Sticks less longly. It finally gets to the point where all the pc has to do is kind of take his attention off the session and wonder if it's raining or something outside and you've got a Clear read. See? It finally gets that bad. But you approach that by gradients.

You take a break. The pc's tone arm early, early in the runs is sitting at 4.75 and you give the pc a moment's break and so forth. And you come back and it's sitting at 4.75. Well, a few runs later, of Prehav levels on the same terminal on this particular commands – these are not true of earlier commands; it's only true of this set – and up it goes. It goes up fairly rapidly and sticks. And then you have a break and the pc walks up and down the hall or something like that. And you come back in and the pc is reading much lower. And then you keep running it and it goes on up again.

And then that finally approaches a point where the pc is running it and it goes up and boy, does it stick. Thud! It just sticks very nicely and then the pc wonders what's happening outside, you see. And it goes down to Clear read with a wildly loose needle. And then you utter the command a few more times and it goes dzzu-dzzu-dzzu-zup and you'll get a tight, tight motion and the arm is tight and everything is stuck and the pc's stuck, and it's irrevocable and he'll never get out of this mass again – which is more or less the keynote of it.

The auditor is sitting there saying, "God, will I ever get him through this?" And it's a good thing to say. It's better to say the auditing command, though. And the needle's stuck, the
E-Meter's stuck, everything is stuck. It's all in sticky plaster and glue and the pc wonders if he hears any birds singing, he listens for a second and the needle is totally flop.

He thinks of the terminal, it's totally stuck and then it's totally flop. And then the next thing you know, he – not necessarily on just this one run or just this one terminal – but this kind of a repetition of affairs keeps happening and after a while you can't find him on the meter. And the way that "can't find him on the meter" begins is the tone arm rises and sticks and won't come down; to the tone arm rises and sticks and is down the next day; to the tone arm rises and sticks but during the session break comes down and then it goes back up; to every time the pc shifts his attention slightly on something else, the tone arm comes down; to the tone arm won't stick up; to the tone arm won't read, won't – needle won't read, nothing will read.

Kick the pc in the shins and try to get the meter to work. Won't work. Only that Clear won't slump. Why? You've handled the Goals Problem Mass.

Now, the reason why you're charging head-on into it this way, is you're solving the case for once and for all and you're not adding up to a slump situation. You're trying to clear it up on all dynamics and it works out.

It's pretty remarkable. The pc stays terribly interested, maybe for the first two, three, four days in their terminal. They stay very interested in this situation. It's very, very interesting, but of course the terminal then comes down to what? "Failed boredom" or something, you see. And they're not interested in their terminal. They don't want to hear about it. And if you ever listen much to the pc on how they feel about it and what they want to run, you'll lay an egg every time. You have to make up your mind independent of that, because they're an incompetent judge of what should be done with their case.

In running 3D remember this – that the pc is always an incompetent judge of what should be done with his case. He is caught in between two sets of bumpers and bulldozers and he can't quite make it out. Well, it's liable to be this or it's liable to be that. And he says the terminal – and this is – but you can listen to him, maybe something on his opinions about this and that. That's fine. Always listen to the pc anyhow. But don't let it swerve your judgment. But you – he says, "I'm no longer interested in it and I think it is flat."

Well, now that's the way you put the pennies on a dead man's eyes. It's not flat. The pc – the oldest mechanism known in Dianetics has moved into existence. The engram has moved up to boredom; the pc has come up to boredom. In this particular case, the terminal usually has come down to boredom and it decides it doesn't want to be run anymore. [laughter, laughs]

Well now, there's the behavior of this, and there's the patch-up of this. Now, I called in all these papers – and Mike will have to take them back up again afterwards, but I'm just showing you here – here's a stack of case histories. It's very, very interesting that out of this tremendous number of case histories that you see lying here in front of you, that there are only, I think at the outside – maybe when the final roundup is through, there will have been five errors in terminal – just five in this whole number of people. That's pretty good. That's pretty good. But that's with me on the job, see? So it's five errors in 3 – Routine 3 assessments, you understand? Just five, on things I was watching very closely and ready to catch
them if they fell through, don't you see? And I myself am not checking these things out. I'm not following them all the way through on their runs and so forth.

Nevertheless, that is five out of twenty-five or one-fifth, as a close figure. One-fifth error? Pretty good, huh? And that's why we abandoned Routine 3. Because we could have a one-fifth error. One case out of five would be improperly assessed and mowed down like mad. There's no cross-check on it. There is no check of any kind on Routine 3. That's why we have stopped running Routine 3.

And that's why we're running 3D. Because 3D can be cross-checked, it can be reoriented, it can be put back together again, it makes sense, it polices itself, you can always fix it up if it goes bad. You're going to be in a position of having to patch these things up; remember that you can find any part of 3D if you know exactly what one part is. If you can just establish one part accurately as to what it exactly is, you can find the remaining parts.

So 3D – we're not making this many errors with 3D. Right at this present moment, I've got it a 100 percent on the road. No mistakes on 3D, because I'm not permitting mistakes to be run because they're observable mistakes. You get the idea? So even with me on the job with Routine 3, you could fall on your head all over the place.

All right. You've got to get up with Routine 3D so with me not on the job where you'll be auditing, you'll never fall on your head. But I'm telling you that it is easy to do. And you yourself will be able to see that it is easy to do.

[The recording of the lecture ends abruptly as did the original recording.]
Thank you.

You'll be happy to know the heat will be on tomorrow afternoon. [applause] You'd be surprised how many hats I wear. [laughter] It's absolutely uncountable and from every viewpoint each one looks like a full hat to the people who have that particular line, you see. They say, "Well, he does nothing else but this and that's all right."

All right. Today we're going to tell you about 3D. And this is the 5th of December. This is the nautical month, 5 Dec. [laughter] 1961.

It is the nautical month, too. I missed out on buying a boat. I only had two and you can't hardly get along with two boats, you know. And by George, I got a call at two o'clock today, and we had traced the Royal Navy's sale of a 1958 built motor torpedo boat that I was trying to get, to a scrap merchant. And he let me have it for the price of scrap plus 10 percent. It's a £156,000 vessel and I bought it for £3,000. [applause] So that's why it's 5 Dec.

Actually, you know, people get upset when I get interested in other things. But, frankly, that's not much of an interest in other things. It hasn't anything to do with my goal-terminal line, by the way. [laughter] What I've been trying to do is get a couple of vessels and put them into some kind of condition, but get a third vessel that I could fix up and sell for enough money to let me have those first two boats for nothing and let me have a proper school here at Saint Hill built up on the line.

And I've been trying to pull off this trick and it – and I was really kind of in the dumps on this because, you see, it kind of all gone skid, when the scrap merchant overbid me in the Royal Navy, you see. So this makes a bit of a difference to you, too. It's basically a financial action.

And in an atomic war, I think we ought to have a little transportation around somewhere. It might be a good idea. So that's what this is all about. I'm trying to build a school. Now, all I've got to do is get through the architect, get through the town planning, get through the this and get through the that and that sort of thing.

So you're in the position of being able, some day, to look back to those "good old days" before Saint Hill was such a set proposition. This is ... What we're doing right now is the direct ringer of 42 Aberdeen Road, 1950. Exactly the same. Old 42 Aberdeen Road was just a private house and there were people stuffed in, in all quarters and coming out all the windows. That's the way it was and it's a funny thing that started a long haul and this Saint Hill proposition, which is about the same view, starts the thing out all over again, complete with furnaces that go out and British weather that blows. [laughs]

All right. Regardless of all that, our concern here is with 3D.
Now, I'm going to start out with an idea that you haven't got a clue what you're doing with 3D. Of course, that is wrong. [laughter, laughs] Now, I have known of the existence, not by name or by composition, of the Goals Problem Mass for many, many years. Around 53, 54, you find the first mentions of black masses in the bank and that comes out with Black and White Processing and you can do some things to these masses with that and so on.

Now, as the years went on, it didn't seem to me that everybody had these things. And you dropped – there was no concentration on it to amount to anything. Other activities were engaged upon. A high point of result, by the way, was during the days of Concept Processing. And if you're ever in doubt, you want to do some monkey business with some case, you don't have his 3D on, you can always do some Concept Processing of one way or another and probably get away with it.

But that is your best stunt, not to go off into terminals and not to try to handle masses. Because this 3D mass is practically unhandleable by any other route than 3D.

Now, having known of the existence of this mass – . (You wonder why I'm standing up, today; I'm getting into practice for the Washington congress.) [laughter] The mass factor in a case is often not recognized by the case itself. The case goes in at no lines, no mass, no nothing; a nowhere and as you pull the case up the line – this is the old Reality Scale, I think, of the 17th ACC – you come upstairs to being able to see lines and you actually will have people who will suddenly tell you there were lines going all over the room. There are big, massive tubes of energy that go all over the place and so on. Well, they move up to that, being able to find the terminals that are – and the masses that are on the ends of these lines. That's the next point up on the Reality Scale and they can recognize and see these masses.

Well, we were actually inhibited for some time. Because of the existence of the Reality Scale, I didn't think anybody or – I didn't think everybody would be able to find these masses or collide with them and so therefore I didn't have too much concentration on this particular point.

But now we move into clearing. Now, clearing is in two categories. One is a Key-out Clear. You key them out and they clear and they stay that way for – we don't know – they certainly stay that way for some time because I've had people that I had in a – a beautiful state – 47, 48, 49, 50 – who had never relapsed. I couldn't tell you what their meter responses were because there wasn't such a thing as a meter in 1947, but they were in a very beautiful state.

Their banks were all straightened out. They could see pictures. They had excellent recalls. Why, their worries and troubles had faded away and this was basically getting them to confront things like pictures on a gradient scale and so forth. But a very delicate-type of auditing. It conditions the person to be able to confront, is actually what it does – on a gradient scale, and that is your first clearing. And if that is done smoothly and done very well and done very expertly – it takes quite a while – the person keys out.

Now, you must realize that this sort of thing can exist and that this sort of an activity can exist, that you can actually get somebody to confront on gradients, get him to confront, thoroughly, pictures of now and get him to confront this and confront that. But I'm not using the word confront as the process by which it is done. It's not a Confront Process that does this.
It is just getting the person nerved up to confronting it all. Because remember, it is the Tone Scale of the thetan which causes him to make that particular setup of pictures.

See, if he's in apathy, he makes apathetic pictures. If he's in punish, he makes punish pictures. If he's in anger he makes angry pictures. If his button is torture, he makes pictures of torture. Do you get the idea? So all you have to do, actually, is change the state of mind of the thetan and he makes a different breed of picture. Quite interesting.

That's, by the way, 1948 – the first recognition of this, that something was making all this and something was in agreement with all this. Well, how come we had thetan A and picture B in agreement, see? But I didn't know or wasn't thinking in terms of thetans at that time. I was just thinking of the beingness of the person. I wasn't thinking of it any other than just a very loose way.

This – this question occupied my attention, I remember, for many days back in 1948. I went around in circles looking over this particular aspect of – of the mind. Why was it that this type of picture was made by one person and that type of picture was made by another?

And I had a fairly good recognition at that time that they were making them or at least keying them in. If I remember rightly I was thinking, if all these pictures existed, why are just these – the pictures of this particular type keyed in by this person or pulled in on him? I wasn't thinking of the person creating the pictures. That came later.

But why this particular type of selection? Well, of course, it is the picture that the thetan would make in the state he's in, you see. That's the picture he'd make. He feels apathetic, he makes apathetic pictures. Because he's creating them all, actually, it's a question of doing something with his left hand that his right hand must never find out about. And he makes these pictures, but they're – they're the same tone. In other words, the tone of thetan, the tone of the picture, you see.

And when you change the thetan's tone, why, of course, he makes a different setup of pictures. Well, so early clearing was totally concerned with changing the tone of the thetan. And you have the ne plus ultra in that in processes in old Rising Scale Processing. If you really want to work hard with Rising Scale Processing, you can do some remarkable things with the bank. It's quite remarkable what you can do. It actually was never given its innings. It was never really given a good chance.

But what does that do directly? It gets the thetan to change his mind. Of course, the second he changes his mind, he makes a different kind of picture. So you could actually boost him up scale by getting him to make different kinds of pictures and he'd have a different bank, wouldn't he?

Well, now, you must recognize that as a whole school of thought. That in itself is a whole package of thought which has nothing to do with anything else. A thetan who is – feels mean, makes mean pictures, see? It is the condition of the thetan, you see? It's the condition of the thetan that makes the condition of the picture.

And looking at it in this wise, you get the earliest entrance of Scientology when it first departed from Dianetics and that was we treat the thetan in order to make the picture different. That perhaps was never well articulated, certainly never as well articulated as I've just
articulated it, because there's nothing like these six-foot rearview mirrors, you know – six-foot rearview mirror and a little tiny peephole in front.

You're looking through a pinprick forward down the highway, you see, but you've got a six-foot wide mirror that tells you everything to the rear. Those things are marvelous. And it lets all kinds of people say, "I told you so," and "I knew it all the time" and it – so on. Marvelous mechanism.

Anyway, that's a whole package, a whole package. You change the thetan, you change the bank, see? That's a whole philosophy all by itself and you should look at it as such and recognize that it exists. There is that whole picture. There is that whole field of Scientology. It has to do with concepts.

That's why I say use Rising Scale, use concepts. If you want to pull something off with somebody or other and you want a 50, 60 percent chance of making it, use Rising Scale Processing; use concepts. You know, it's just hunt and punch sort of stuff and you're going to audit him for three hours and you're not going to do very much about it all; well, it's worth putting your chips on that particular point on the roulette wheel. Because you've got a pretty good chance of doing something or other spectacular.

If you remember that you're – don't pull in the rest of Scientology, see? Just work with changing the thetan's mind, see? Change the thetan and change his mind. In other words, get him to run concepts, Rising Scale of various kinds or another. Run pluses and minuses – things of that character – and he all of a sudden is liable to come up with something which is quite remarkable. You know, the whole bank shifts.

Now, this in effect, don't you see, keys out all the nasty, dirty, mean pictures he's been making. He stops making them. You see, they're there because he's making them.

All right, so that is a whole field of research and endeavor and that occupied our attention for many, many years. And you might not realize to the extent that that has occupied our attention. Many, many years that has gone on. There's always been a thread of that – get him to change his mind.

You yourselves, you all have heard of this, except some of you. And you get the – you get this whole view. You get the thetan to change – it's attractive, isn't it? It's a – it's a – a lovely – it's a lovely, lovely view. This fellow has banks being stamped all over with elephants and kicked in the teeth by destroyers and planets have rolled together and smashed him flat and he's just fine. And you know, he's standard Homo sap, walking around, falling into the lampposts and doing his job backwards.

We get hold of him and we get him to – we get him, directly, to change his tone. Now, that would be a much more effective state. And we get him to change his tone. And we do that with something like Rising Scale or something like that. And he changes his tone and he stops making pictures of elephants stamping all over him. He starts making other kinds of pictures. You see where this would come from?

Terribly attractive, awfully ineffective. It's too bad. It's too bad. It looks so pretty. And that has been with us since 1948. It is still with us. You can still do it. But, at the time we started clearing, February of 1961 – actually, the earlier ACC we had already departed to a
marked degree from that lineup with the rock and that sort of thing – but effectively clearing, so that we were clearing very broadly and very – very definitely – there was a fair percentage of cases sent that did arrive at a state of Clear, whether they were there a night or a month or a year, see? There were – there were still some sent which did arrive and that was February of 1961.

All right. Now, that – that is a departure. That's definitely a departure. It's a departure from this other frame of mind. This says the fellow has to be able to go through the bank as he is making it. Just like that and he has to be able to handle the bank he himself is making. And I am sure you will find out on the long run that this brings about stable – a stable state.

Obviously, if the man is capable of making this bank and is afraid of the bank he's going to make, then at some time in the future your change of his tone may reverse as a change of tone and he will again make this bank that he is afraid of. Do you see how this could be?

If you can change his tone by a concepts or by Rising Scale or something, the tone can also shift back the other way, no matter how good he feels. You see that? So that's what you saw when you saw collapsing Clears. When a Clear collapses he changed his tone back.

Now, a Keyed-out Clear who has not handled all those things which are the bank – he's cleared because he's keyed-out; he's usually cleared on the first dynamic – is capable, actually, of doing a double shift and going into an automatic make-up of a bank that he himself knows damn well he can't handle and because he can relapse – you could say, stable, well how stable is a hernia operation? Well, it's stable as long as the guy lives. It's stable for a few years. We don't even know what this word stable means in terms of medicine or psychiatry or psychology or something like that. These fellows never get as bad as they were. They never get as bad as they were. They never go all the way downhill and worsen. But they do lose some of the ground they make.

And we don't want that. We don't want that. We want somebody – we want to be able to pick him up and put him up on a higher plane and then he is now totally cognizant of the kind of bank he was making and what he was doing with it and cognizant of the fact that he can handle it.

Now, that's a different kind of a Clear. I'm not trying to give you a sales talk on this sort of thing. This is the head-on collision-type of clearing. And we've been doing some version of it since February of 1961. We said, "All right. There's your bank, there's the goal, there's the terminal. All right. This is what you've been doing obsessively. And instead of changing your tone so you won't do this anymore, we're going to fix you up now so that you don't want to do that anymore. And you can do that if you want to, but you don't have to."

So we found the goal and we found the terminal and then we ran the terminal on the Prehav Scale and that straightened out the various oddities which the fellow was confronting. And in a good representative number of cases – it was, it was a nice percentage – they went Clear. But they were still keying out this other black mass.

In other words, they were just laying it aside. They were sending it off into the far distance and that was fine. Now, their – how Clear they were depended on whether or not that
black mass returned. That's how Clear they were and they would be as Clear as long as it didn't.

Well, now, my initial discovery in the matter is simply this: I didn't know that everybody had them. This I didn't know and now I find out they all do. That any Clear cleared by a key-out trim-around-the-edges, send-it-off-into-the-far-distance — whether he ever contacted the Goals Problem Mass or not — still has it and it is something he has not confronted. It is something he has not taken care of, something he is afraid of and something which can key him back in again.

So that puts a stability limiter on clearing. Then the case, of course, would be as stable as it didn't key itself in with a Goals Problem Mass. So you could run — have run the fellow down to a pure floating needle, you would have a Clear. You — you have a Clear. There's no change of definition. This is just it. Clear floating needle and he's fine. His track is wide open. Everything is fine. Life is going along beautifully. He feels wonderful. Everything is just dandy, and so forth. That's it. That's your Clear.

All right. What have you got to do to keep him that way? That's the second question asked and to keep him that way, you have to clear him in a certain peculiar way. You have to drive him, evidently, head on into a brick wall. You have to drive him into whatever it is that is liable to key back on him again.

And we have to front up to the toughest, meanest, roughest part of the bank and go straight through it. Now, I don't mind telling you that this is quite a trick. One, it was quite a trick to find out what it was and it was seven times the trick to find out how to get a case through it.

That has been the trick. Finding out about it — well, anybody can discover something. A fellow can go out here and find a floating island in the middle of the Pacific Ocean and say, there it is. And everybody pats him on the head and so forth. Yeah. Yeah. Well, how about — how about somebody getting an island to float or sink. Or how about somebody getting an island to mote itself across the Pacific or something like that.

That — that's your comparable magnitude, don't you see, of finding it and doing something about it. These are two different things. Doing something about it — this is the rough one. Anybody in the field of the mind or research or philosophy or something like this, has come up to a point about a lightyear from where we have approached it and have said, "Well, ha-ha-ha, something, ha-ha-ha-ha and so on. There must be something... We adjudicate, and so on, therefore nothing is... ha-ha. And can't do anything for anybody anyway."

Why? They chickened out. They didn't themselves have enough nerve to confront their own difficulties in this particular line, don't you see? In other words, they started to confront this difficulty in somebody else, confronted it themselves and ran. That's about what it was — all amounted to. I'm not saying this with any plaudits for myself, and so forth. I don't consider it anything to stand around and look and know what you're looking at as being much of a trick. Other people seem to find it so, but I don't.
So, anyway, it amounts to this – it amounts to this: This thing exists; Goals Problem Mass. You'll find it first mentioned under Admiration Processing. And I said, "Well, there are certain avenues of the mind which are better left closed."

Well, that is because nobody knew how to go through them. Nobody knew quite what they were. Now, you can run admiration at one of these – one of these particular masses and you could admire it. You could admire it and you could admire it and you could admire it and you could admire it. And it sort of goes all soupy around the edges, you know? And you could admire it some more, and admire it some more and not admire it some more and then admire it some more and it gets all soggy. It's quite interesting. It's quite interesting.

And it stays right there, soggily. Admiration won't get you through it. But there was an awful lot of that stuff – research on this particular line, late in the year of 1952, here in England. And you'll find it in, possibly, some of the old HASI records.

Don't let anybody run Admiration Processing – I think it was out for twenty-four hours before it was recalled. That's long run, long run. I was getting away with it all right and it was working all right for me, but then all of a sudden people started to melt. The mind sort of melted around the edges and a couple of auditors got into severe trouble with it – didn't have enough sense to cut and run or do something about keying it out or something like that.

So it was one of those things that you could do but hardly anybody could handle. That's the difference and that's what causes it. That has been the source, the main source, of our drawbacks or withdrawals of material and that sort of thing, is, yes, it's true – nobody contests the truth of what happened – but can it be handled? And whenever the answer became obvious that the – it was "No, it can't be handled," why, you heard me hurriedly invalidating it and getting it back under cover again and saying skip it.

The final test, of course, is any process – of any process or process [pronounces the word first in an American way, than in an English way], lies in your hands, not in mine and what I can get away with and what you can get away with may not be very different in order of magnitude, but there is a difference. There is a difference. It has to do with command value on a meter. You'll see that show up and if you're looking for the spook point of how come, try and run levels, sometime, with your rudiments out, 3D.

Just get your rudiments good and out, have your pc with a nice present time problem, let him have a couple of withholds, preferably an ARC break, then run a level. It's not going to run. I mean, the tone arm just goes up, clank, in one command, something like this. Bang, there it is – stuck, dnth-thuu. Nothing happens. Rudiments are out. It's as important to have the rudiments in.

Well why – why do the rudiments have to be in for you? It's basic command value. You don't have the command value over the pc to run a pc with the rudiments out. That's the difference, see? In other words, getting the rudiments in permits you to have command value over the pc. You should recognize this.

And if you were – you had seventeen times the altitude and fifteen times the umph, you could run the pc with the rudiments out and it wouldn't make a bit of difference to your processing. It's a fact. Rudiments are a question of altitude. But you better not try it, because
on 3D I find that it is very difficult to run a case with the rudiments out and I find it far too
difficult to do myself. So I don't think you're going to get away with it. My prediction of the
future has been based on that.

I don't mean to be cheeky about all this, but I'm just telling you some facts that have
come up over the years. So the final test of any process is whether you can do it. That's the
final test. And I'm happy to tell you right now that better than 35 percent of this particular
class is running very successfully on 3D. So you can do it. So, hence, we better really start
lecturing about this thing and pushing it home and showing you everything you can do about
it.

It wasn't that it was experimental up to this time. I would have had your – your eyes if
you hadn't made it work, because you didn't have any other chance. You got the idea? There's
just no other chance. It was a matter of: there is a canyon. Yes, there is a roaring river in the
bottom of it. Yes, you have to swing from rock to rock in the most gymnastic imaginable
fashion. It has bends and turns and there are sudden spring floods that overtake you and it is
the only road out. And I'm sorry, I didn't make the human mind and it just happens that that's
the only road out.

I could say, of course and be very scientific... Science in its present state of sacred-
ness, always not-ises itself. "It is the only road out that I have so far found," would be the sci-
entific modification that makes one sound, sound and conservative,

you

know? It's the nice

thing to say, "– that I have found so far. Of course, as we go along the years, we are liable to
find another road out, you see, that will be much easier and so forth and we couldn't possibly
have found everything there was to find at this state." That's all the implication. You see that's
a nice, modest, conservative, scientific statement. So I'm telling you, of course, that it's just
the only road out.

All right. Here or there, one or two – having one hell of a time getting into some kind
of condition so they can be dragged to the mouth of the gorge. That's about the way it is, see?
Just be dragged to the mouth of the gorge, regardless of making it down the gorge. We find
that people have limped and gimped to a state where you can't get them up to assessment level
without doing an enormous patch-up job. And, of course, it's almost impossible to do the
patch-up job because they've got all the other stuff wrong with them, too. Well, perhaps there
is the sphere where Concept and Rising Scale may be functional.

You key it out so you can key it in again. You see how you – there might be some
roads by which you can get them up there. But in the final analysis the only way they're going
to get out of the valley of death is through that particular gorge – through the knothole. It's
rough man.

Because at any time in the future, the thetan can go into his basic valence. It is after all
his basic answer to everything. So he runs up against an imponderable that he feels incapable
to handle, so he immediately takes the ready package. He readjusts his tone to grab hold of
the ready-made package which you call 3D. It solves all of his problems for him. It's a solu-
tion to living through which you can perish miserably.

Now, there is 3D. I have just shown you – I've – we've known about this goal, er, this
black masses and lines and that sort of thing in the reactive mind since 1952, so this is not
very new. But I thought for a long time, very hopefully, that all we had to do was change the fellow's tone, he'd cease to make them. And we have keyed them out, we have operated without them, but it has cut our percentiles enormously and it's actually made the auditor's job much harder.

The easy way out is the way out, not to walk around the rim of the canyon fifty thousand times and never leave. See, you can keep walking around the canyon, around the canyon, around the canyon, without ever going out through that gorge, because, you say, "That's too rough!" The second the pc gets near it, all of a sudden his body masses start increasing, to give you some of the liabilities. The winds of space sort of turn on and he all of a sudden – well, actually, little Quentin, the other day, getting assessed on an opposition terminal – it was very funny. You talk about a classic case. He was sitting there in the chair and he was going further and further back, and he was finally clear back almost out of his chair, getting the opposition terminal. The winds of space, you know, were just blowing his head off. You know. And he kept saying, "Well there's something. It's my eyes. It's the Coke I've been drinking lately." And he had explanations for it all, you know. But it was just that he had the oppterm and he was on the wrong side of this problem, you see and it was blowing his head off. So you will find this is pretty general. I wasn't auditing him, his mother was. And it's pretty wild.

Now, this – this thing exists. These things exist. And you'll become more and more amazed at how this has been an answer to living, how one has used a 3D combo as an answer to living and all of these hidden standards and present time problems and everything else that we've been trying to get rid of are sitting right straight on top of the 3D. There they are. Stacked up. They blow out all the way on up – you start running this. You say, well, there it is, you know. There it is.

Well, I never thought in terms ... I – I think in terms of the factors of the mind are the factors of the mind, and somebody who wants to go on researching forever could say, "Well, we haven't examined all the two-billion five-hundred million human beings on Earth, so, therefore, we don't know that all of them have a 3D."

Well, the first – first person who says that to me, I will give the assignment of going out and finding out, by getting a 3D on all of the two-billion five-hundred million, so you'd better watch it. That's a pretty good assignment, because they'd have to do it all by themselves. I'll ask the rest of you to lay off till that person gets it done.

Because I haven't yet found anybody who didn't have this combo and remember I have tremendous backlogs of cases. I've been walking into cases of every shape and description and by God, a 3D explains them all.

Somebody's been acting in a weird way and they've had a weird thug ... Have you – have you ever tried to argue with somebody. You say, "Please, now don't throw your hat down in the sewer because it'll just have to be picked out, you know." Or "Please don't drink that other half bottle of gin." Or "There is no reason, Mother, for you to clean the whole house by Saturday, because there's nothing going to happen on Saturday." And you – you've seen these things and you've explained it all to them and it seemed so reasonable and logical to you...
and then they threw their hat down the sewer, drank the other half bottle of gin and cleaned
the whole house by Saturday. Practically kill themselves, you know? And it just didn't matter.

And eventually you begin to distrust your powers of persuasion and oratory. You say,
"There must be something about my persuasion and oratory that is a little bit off, because
these people keep throwing their hats down the sewers, drinking the half bottle of gin and so
on."

It's very difficult for them to see reason. No, it isn't difficult for them to see reason.
They had a different idea in mind than what you had. Only that idea was so fixed – it was an
idea fix of such magnitude that when you eventually find it, it almost blows their head off,
you know? And if you were to run it wrong way to, it would. You'd just be left there with a
bloody stump.

So there it is – 3D. You might as well face up to it because there it is. Now, an as-
essment all by itself, nothing but an assessment on 3D, can be considered an auditing activity
with an end goal of simply finding out and assessing. Now, that's the first thing you should
know about 3D – that there's considerable benefit just in assessing.

Now, if we were to handle something like this – if you were to say, "Well, we're going
to complete a Form 3 Joburg and maybe a Children's Security Check and a Problem's Inten-
sive and get the person's 3D elements and combine them properly." And if you were to call
that a whole package of auditing, you would have done more for the case than we've ever be-
fore done. You'd find out this was pretty interesting and this stayed fairly stable. This was a –
this is an interesting activity to do. People feel a lot better. They're – they're not so much in
the mystery of it all.

And they suddenly begin to realize that, "Oh, that is why every time I start thinking
about International Harvester it blows my head off." Yes, well, that's something to know,
isn't it?

There is this point, that simply an assessment and naming the elements has value –
getting the final story of a 3D. So the 3D breaks down into three stages. One, preparing a per-
son to be assessed. That's stage one. Now that consists of everything that you call Class II
auditing skills. Those have value. There's great value in doing that. All right. Then stage two
is assessment and finding the 3D items. That's this other activity.

And there's a third stage on this, is running them. That is a different activity. That is a
different activity.

So, for an auditor to do a great deal of good for a case – we had the old Class I audit-
ing skills and Class I takes care of everything right straight up to – well, to the first introduc-
tion of the routines practically, except for those things we found are dynamite, like Step 6. In
other words, anything that has been developed in Dianetics and Scientology up to the intro-
duction of Prehv Scales – that's Class I auditing skills. Then Class II auditing skills have to
do with the proper administration of a Security Check and the handling of a Problems Inten-
sive. That is Class II auditing skills.

Now, it takes a Class III skill to run – to find, assess, locate, itemize, build up the story
and run a 3D. Now, that's a Class III skill.
That's how they break down in terms of what auditors can do it. Because, let me tell you, that although it seems to be a very simple activity and there's somebody right now in upper northern Cape Town, of southern Bulawayo, or some place – there's somebody right now saying, "Oh well, that's kindergarten stuff like running a Security Check. I want to get into real auditing." They've got – they've just got it backwards.

A Security Check is real auditing. For instance, I will be talking to you more about Security Checks and you can pull more bloomers doing a Security Check than can be found in a modern gymnasium. They're innumerable. For instance, the little datum of the person – . You ask the person for any unkind thoughts, and then, you knucklehead, don't ask him for the overts that makes him think unkind thoughts. You don't recognize that on a Security Check that's just a trap. That's just a trap question. The person admits to saying – thinking some unkind thoughts. Don't spend an hour letting him get off his unkind thoughts. What good is that going to do to him? They're all overts, every one of them. Uttering them is an overt.

No, they got a big overt back of this, man. They've got a big overt back of this. But you've got to remember something, that it may be the overt goes all the way back to their goals-terminal line. Of course, if you could pull that as a simple overt, why, I would pass you as a Security Check. [laughter] But that's – there's lots of tricks to security checking and if you really want to upset a pc, why – oh, you – running a pc into an engram, leaving him stuck in the middle of having his head smashed because the executioner didn't put his head all the way through the stock on the guillotine, you know and the blade turned sideways as it came down. It was getting old and rickety and it smashed his skull in and he didn't spit in the basket properly at all and the populace all laughed. Get him right to that point, see and then don't audit it any further. Go off for a Coke or something like that.

And you frankly won't have done too much to the pc. In a few days it'll key out. Some auditor will trace some flub back to this someday, maybe. He'll trace it back as an ARC break. That's nothing.

Leave a security question unflat – now, you've got trouble, because from here on out this person goes around nattering. They go around – they feel real mean. They're real upset because you've actually slammed the auditing door in their face. We've got a staff member upstairs, a non-Scientologist, that I'm going to have to take one of these days. Somebody who left a security question unflat on the person; the person's been upset ever since. It's been going on now, for, oh, a month and a half, something like that. She's upset. She's upset. Interesting, isn't it?

So, apparently, fooling around with – with Security Checks contains far more dynamite than throwing a person down on a couch and saying, "Give me the engram necessary to resolve the case. Oh, getting your head cut off in the French Revolution. That's all right. Well, let's just go right into the moment of it. Let's not waste any time in preliminaries. Right in the moment there when your head's being cut off. Oh well, that's all right. Well, look-ahere, this is the end of session time."

Well, that could upset somebody. But not as thoroughly as missing a Security Check. Do you get the order of magnitude?

So that's – that Class II skill is not a skill to be despised.
Now furthermore, the elements of 3D are sufficiently tricky that they require very, very sharp, expert E-Metering, very, very good E-Metering and if a person isn't good enough to run a Security Check, I tell you for sure he's not good enough to assess a 3D. That's for sure, for sure, for sure.

Now, a 3D assessment is a remarkable activity and now we get into some things you didn't know. Here's some news. Now, I released, first and foremost, some procedures of assessment and how you did it and you'll find out these have been remarkably little contradicted. There's been very little change on this sort of thing. I changed the commands around two or three times because I was trying to adjust how rough it could be on you and I also found out that you had to hold in the Goals Problem Mass, so therefore you got the 28th November commands changed from the original handout. You had to hold in the Goals Problem Mass by using the opposition terminal in the command.

But for two weeks, I just sweat it out. I wasn't saying anything to you, but I was just sweating it out, testing commands, testing commands, trying to find out how the hell – now that we had this thing; now that – now that this thing was sitting on the middle of the table, ready to spring – how did we ever kick anybody through it? And I didn't put you on it till I had that pretty well whipped. Then I finally said, "Ah-huh. Here is a set of commands that goes through." Those were first issued on the 28th November command series, refined on the 29th and reissued on the 30th.

Well, if you'll notice the only adjustment is how often do you put in the opposition terminal. It's just how often. And you toughen it up on the pc in direct ratio to the number of times you put in the opposition terminal. Fifty percent of the commands can carry the opposition terminal without killing the pc. In other words, there can be one for the terminal and one for the opposition terminal, to a degree of 50 percent, without knocking the pc off. But if you exceed and say, 60 percent opposition terminal and 40 percent terminal, why just call the undertaker practically, because after a while this is just going to get too rough. It won't run out. Because you see, the allergy to the opposition terminal is resident in the terminal. It's the terminal that is upset about the opposition terminal and the only reason you have the pc running the opposition terminal at all is to hold the Problems Mass in. It's sort of an action of holding the Problems Mass in while you knock it to pieces. That's the only reason you use it at all. If you use it – use the opposition terminal not at all, your pc has the most comfortable Routine 3 run he ever had and goes no further.

He just keys out everything beautifully and you'll get up to a floating needle without the Goals Problem Mass having been touched or run out. So, one, I had to have commands that went through the Goals Problem Mass and that was asking for plenty because the person's valence is sitting, usually, resident inside their own body and it is a beefy mass and it is just full of random somatics.

It starts out, the first available is the package that the pc has always complained of as their standard somatics. And if you realize that a pc can actually exist in processing over a period of years complaining sporadically about the same set of somatics, you will recognize that no process you ran on the pc in all those years ever fazed the Goals Problem Mass.
They always complained of the same set of somatics. They were always coming up saying, "Well, I get this pain up here in my medulla oblongata and there it is. Yeah, well, I've really – I've been audited an awful lot, but this lumbosis stays with me and I'm worried about this lumbosis. And no auditor will ever listen to me about it."

This is so ordinary and routine. That's part of the Goals Problem Mass and the Goals Problem Mass makes that lumbosis, when it really starts to run, makes the lumbosis look like a mosquito landing on the back of a hand, you see? It really takes off and you've got many, many, many more combinations of somatics than that. Now, the lower off the pc is the longer it takes him to roll on up into the – the mass on the original run. But you'll get him on the – to the mass area and it starts to influence him and affect him and he'll run into it. There's no doubt about this.

You have all been bearing it out. This – this is very remarkable. It's just running off like a clock. It is just going off like a well-oiled tick-tock. It – that was the way it was mapped and that's the way you're running it and that's the way – direction it's going and that is what is happening. And what kicks it through is what kicks it through and that is all there is to it. This is quite remarkable.

So, obviously, in the sheaves of papers issued beginning latter part of November and issued straight on up through to the – yesterday's issue on this, which is December the 3rd, a little more than two weeks of paper issues – the only thing that you find necessary to change about any of this is the paper that has to do with the commands.

All right. Now, let's talk for a moment about the difficulties of 3D. The first and foremost difficulty of 3D is having an auditor who is not an expert Class II. The first difficulty is with the auditor, not the pc – in all cases, with the auditor, not the pc – he has to be a very definitely, pretty confounded, cotton-picking good on an E-Meter and with Model Session and getting rudiments in and straightening it out before he will ever have any luck with a 3D.

Because those little flicks go in and out so fast and he's got to be so much on the ball. He's got to feel real familiar with what he's doing before he can also handle a pc's bank. Now, he can sort of be differentiated from the pc, don't you see, if he's doing a Security Check. He – after all, he's over here bullying that fellow over there. Well, not so, not so, you see, in a – in an assessment for a – for an item in 3D. He's got to be pretty well in there pitching with the pc. They – they've got to be on the same side of the team. I mean, there's got to be some cooperation here.

The pc has to feel very free to talk and various other factors enter in. So if the auditor at this stage of the game is not an expert and is still going through a fumble and then turns around to the pc and says, "Is this meter turned on? I can't quite tell which is the knob," the confidence is damaged.

At that moment, the pc doesn't feel quite that safety and trust and security that he should in the auditor. Actually, the pc has to be perfectly free to think about his bank, otherwise he can't be assessed. And if his attention is pulled out of session on the auditor and the inexpertness of what's happening to the auditor or with the auditor, why, the assessment is a poor show.
Because it's going to be in, it's going to be out and it's going to go null and it's going to go this way, and it's going to go that way and you're going to have to reassess and so forth.

All right. The second difficulty with 3D lies with the pc. The pc is sitting there with his load of sin and guilt. The pc is sitting there with all Westinghouse brake shoes locked, not about to go anywhere. Because if he does go anywhere then the auditor will find out that the pc was in the habit of taking little children's candy right out of their mouths throughout his entire life. You see, some serious withhold like that is liable to have to occur and "So we just can't give, you see, we don't dare talk; and we're not quite sure why we don't dare talk to this auditor," but there it is, there it is, you see? So the brakes are on because of withholds. All that sort of thing is going on.

So, as I say, the second difficulty in running a 3D lies with the pc. The first with the auditor and any inexpertness he would have in getting the pc into session, getting the pc to talk to him. The second one is the pc's unwillingness to talk, because of modern problem, the pc – of course all his problems go back to 3D items. But they can bother him so much that he can't even think about 3D, you see? And all his withholds and the pc's havingness is pretty shot, and – well, think back to the days before you had anything to do with Dianetics and Scientology and look at the mucked-up condition you were in. You get the idea.

Supposing somebody had come along and all of a sudden run an assessment on you. You know, kind of a "what wall?" proposition, you know. You'd be much more worried about the fact that you were worried than whether or not you were being looked in – somebody was looking into your whole track which you knew nothing about – "Whole track? What whole track?"

The fact that you might have been a water buck at some time or another would have been so thunderstrucking, you see, you'd be – everything would have gone unreal at that point, you know? You'd have had tremendous numbers of ideas in collision, don't you see? And furthermore, willingness to talk, that sort of thing – poor show. I'm not saying that so you won't think your time in Scientology has been wasted. It hasn't been wasted.

I get very bored with people that tell me auditors are harder to audit than other people. I get very bored with this, because it's just a commentary on the person making the statement. They are harder to get gains on lower processes because they've already gotten those gains. That's what that amounts to. There's a lot of tricks of the trade you can run on raw meat off the street that don't any longer work on a Scientologist because they long since have been flat. You know, there's that sort of an aspect on it.

But, now listen carefully, because you're going to need this in your business. This you're really going to need. If you're ever a Registrar in private practice in your organization, in HGC, you're going to need to know this fact and I'm delivering this fact to you, not with any idea of persuasion. We're not trying to give you a sales talk, but it happens to be true.

If you assess somebody on 3D items for seventy-five hours and the person was not even vaguely ready to assess and the person was all blocked up with fantastic withholds and they weren't in-session at all but were halfway out of session during that entire seventy-five hours, the bulk of the seventy-five hours would have been wasted.
It would have been far more economical to have simply sat down and done a Joburg and maybe a Children's Security Check and done a Problems Intensive and straightened the person out in general, found their Havingness and Confront, patched them up on all sides, because you would have gotten something done in the seventy-five hours. And listen, seventy-five hours of assessment which winds up with no assessment, doesn't get anything done at all. Because now you're going to have to run the Joburg and the – another two or three Security Checks and a Problems Intensive and the ARC Process 61 and general O/W and – and – and. In other words, you're going to do all these preparatory processes because you realize at the end of seventy-five hours that you flubbed. The person was not ready to assess.

I have to tell you this because this is what's going to happen to you. Aloysius Doakes bursts in your front door and says, "Well, I've got to be – I – it's understood that there's a thing called assessment and I want you to find all of my 3 – 3 I think it is or 3X or something. It's a routine – and I think you have to find all of those items before I can be cleared and I'll – I'll – I'll – I'll let you process me if you'll just find those items and that's fine."

You'll say, "Well, I don't want this fellow to go away and he is here to be processed." And you weakly sit down and start nothing but an assessment and the hours go by and the flubs pile up and you'll find out in the rudiments you're trying to do a fantastic amount of things to get rudiments in and it's very difficult to get them in and nothing will hold in, one way or the other and you're trying to assess in the midst of all this thing and seventy-five hours later you've made no progress at all.

You're going to have to tell them flatly, "Yes, I will be happy to find these items we are talking about and clear you, providing you will agree to go through the preliminary steps of clearing and you should be able to understand that it's for no reason under the sun but your own sake that we give you the preliminary steps to clearing. And when you've gone through those preliminary steps, I'll be very happy to then find your item."

And somebody's going to be very impatient and there'll be somebody down the street who will happily find his items all wrong, without anything and mess him up like a fire drill, but that's man's willingness to commit suicide, but you can warn him about that sort of thing, because it's frankly true.

Now, if you – if you are the only one around that can do any assessment and you've got a lot of people around who can do other types of things, a case can be prepared to be assessed.

You could have the case prepared to be assessed and then, when you were absolutely sure that none of the Form 3 questions reacted, that a good job was done on this, that this thing was pretty well cleaned up, the person's ARC processes were all flat and all that sort of thing and their general O/W and things done, then you can sail in and brrrt-boom-boom-boom. Get your rudiments in and bang-bang-bang-bang. You'll all of a sudden find that 3D will fall out in your lap.

But it falls out to the degree the case has been prepared for it and this is going to be a very hard one to sell, I'm afraid, because here and there, there is a case that is ready to be assessed for 3D, that you could just sit down and get all of these items, just brrrt-brrrt-brrrt-
"brrrt-brrrt," see? Here and there, there is such a case and that will tend to give us all the lie, don't you see.

But usually the case is in that shape because they've been processed for the last eight years. Processed very successfully and everything is fine. Of course, they're ready for that sort of thing.

And then, of course, there's some starry-eyed person off the street that hasn't gotten much in the way of withholds and they're just sort of okay anyhow and you get the 3D items in seven or eight hours and so forth. That makes a liar out of this thing, you see? But they're not in the majority, I'm sure you will find. And the majority of them, if you don't demand these initial stages, wow, you're just going to just break your heart. That's all there is to it. You're just going to break your heart trying to get these items.

The reads are very tiny and they – they – everything goes null. And then you get them in again and then they all go null. And then you get them in again and they all go null. It's all on whether or not you can keep rudiments in on the pc, you see? That's the only thing it counts for. If you can keep the rudiments in easily you can do a fairly rapid assessment.

If you're going to have any difficulty keeping the rudiments in on a pc, you shouldn't be assessing them. You should be preparing them to be assessed. And that'll save you a lot of time.

Now, what would happen? At the end of seventy-five hours what do you wind up with? You wind up with a case prepared to be assessed. Ah, but if you assessed them for seventy-five hours, what do you wind up with? You wind up with a lost seventy-five hours, because you're going to have to do all the preparatory work before you dare run them, anyhow. Because the rudiments have got to be in on a run. If anything, it's more important to have rudiments in on a 3D run than it is on a 3D assessment.

Of course, it's more visible to you that they must be in on an assessment. But wait till you – wait till you've seen somebody's 3D tone arm go up and stick and then you change level, you run some Havingness, you're going to run the next level and the tone arm doesn't come down and nothing happens, and you realize what's going on there – the rudiments are out in some fashion or another. Something's happened. Pc has had a PT problem or something is wrong here, definitely wrong It causes the 3D to hang up and it causes more duress than it should. Now, it does – it doesn't mean, you see, that all the duress in a 3D run is caused by the rudiments being out. This is not true. The duress in a 3D run is caused by the 3D items. But the more able the pc is at the time he is running them, the more easily these items are handled and the less duress the pc goes through.

Now, you could ARC break a pc, make sure the pc had a big present time problem and make sure the pc's havingness was out the bottom. Now, having made sure of those three points, we plunge into the middle of a level run. That pc's going to have about – magnitude of somatics two and three times over what they would have.

It doesn't mean the somatics would be light in any case. It just means they're tougher. See, you're dealing with an area there that is so tough anyway, you're liable to get careless. You say, "Well, it half kills him anyway, so that's that. You know, so what?"
It's marvelous, though, how they'll sit there being half-killed. That's what's interesting. You always know this about a working process. If the process is going to get anyplace, the pc will go any – through anything to complete it. You know, I hadn't had anybody offer to blow yet on a 3D one, except a person who had been run backwards. A person whose oppterm had been run on an earlier 3 – on an earlier run – the oppterm had been run for the terminal and they were sort of thinking of blowing. But they were – what – what was really blowing around there was the winds of space.

Now, let's make some – a few comments here on assessment before we finish up this thing. Let's get in something very practical at this stage.

One: The auditor has to know what he's doing with the E-Meter and know what he's looking for and so forth. Given that fact, you can always get a 3D set of items. There's one item been added onto this, not because you need it. You don't need this item, except to get the story. You probably will never use this one item I'm just about to tell you about, but sometimes it is the pc's goal. So you always get the oppter m's goal. Not its goal in relationship to the pc's goal, but the actual goal of the opposition terminal.

Let us say the opposition terminal was a dog. Now, we've asked, "Who or what would oppose your goal of saving bones?" And we eventually will get the goal, you see, of the dog. "What would be a dog's goal?" and so forth. Well, "to save bones." And this is very difficult and so forth and we looking this thing over and it appears rather peculiar to us. "Let's see, her goal is 'to save bones'." This doesn't always occur to us right away. So, we get a dog's goal. You see, we've got the dog. Now, we get the dog's goal. Not in opposition to anything, but let's just rack up and get a dog's goal. It doesn't take us long to get the thing and we've got it. And in some cases, why, we'll find ourselves sitting there looking at the pc's goal. Ha-ha-ha-ha. It doesn't add up the other way; it adds up this way beautifully. The pc's goal was "to save bones." And the dog's goal was "to save bones." What do you know? Isn't that interesting? We didn't have the opposition terminal at all; we had the pc, see?

So by asking for the goal and getting the actual goal of the opposition terminal whenever it turns up, we occasionally wind up with the fact that our 3D is backwards. Now, the thing to do with a 3D is to get all the elements, regardless. And that is an additional element that you don't need in eventual runs or anything but it helps you sort it out. So you just – any time you get an item on 3D, why, get everything in relationship to that item and you'll eventually get the whole story rather easily. You won't be fumbling in the dark for it.

You can enter a 3D series of items on assessment anywhere. You can enter it anywhere. Given one item you can get the remainder.

Now, let's say – this is very handy to know – somebody has been cleared and they're still keyed-out beautifully and they never get any needle action and everything is fine. Only you happen to know that they were run on some goal that they can't remember but the terminal was "a whiz cat." That's the earliest record we can find of their first terminal. That's very important to find out. It's worth metering and sitting on their heads and cabling auditors and doing everything else to find the first terminal this person was run on and the first goal. Well, maybe we had no record of the goal but we have a whiz cat. We can always put the goal back in, don't you see?
Now, we get the opposition terminal to a whiz cat and it'll react beautifully. And we get the opposition goal, don't you see. And we can patch it back up and even arrive back at the pc's goal and then we'd know whether or not the thing was still balanced up. We'd get a modifier and we've got the lot. But it all entered in from a whiz cat, the original terminal. Of course, the terminal has been flattened, see? It doesn't exist anymore. But we've got to assess our 3D from the first terminal run on that case. And you'll find out there's plenty of kick in the opposition terminal to a whiz cat. That's still jumping. That's still live, see? You can find that rather easily.

All right. Let's say we could get the goal but we couldn't get anything else. We couldn't get the original first terminal or something like that or we didn't trust the original first terminal. Let's say a case ran a long time and didn't run clear, and we had the goal and the terminal of the person but the terminal was run for a long time and we don't know anything about that.

Well, we could take the goal and we could get an opposition goal; not a terminal that would oppose that goal, but we could just get an opposition goal. What idea would oppose that? And we make a list of the ideas that would oppose it; assess. We wind up with the oppgoal. All right. Very good. Now we take the oppgoal. Now, let's try to get a modifier to this oppgoal. Wherever it came from, let's try to get a modifier to the oppgoal.

Now, that sounds like a funny thing to do, but it will wind us up with a very easy, fast route in to getting the opposition terminal. See, whatever it was. In other words, we just keep adding parts. Any kind of a part that you can get ahold of, why, add all of the additional parts to it that could possibly be checked out.

See, all of its opposition, all of its complementary parts – if you get a goal of any kind, try to get a modifier for the goal and then a terminal for that goal and modifier, and you'll wind up with the proper short run to a terminal. All right. Now that you've got the terminal, now you can get the opposition terminal to that terminal and of course, you've got the oppterm now. And now does this check back across to the goal, see? And we find out very often that we have the whole thing backwards after we've got it all figured out.

But unless we’ve got to – the additional parts we don’t know that we’ve got it backwards, you see? That’s how it finally proves up. All of a sudden we just find ourselves sitting at it if we’ve got enough data.

For instance, we've got the pc's goal. Pc's goal: "to bury bones." Opposition goal: "to sing beautiful songs." It doesn't sound right to us. Opposition pc's goal: "to bury bones," you see? Opposition terminal: "dog". Goal of the dog: "to sing beautiful songs." Pc's terminal turns out to be "cat." To bury bones. Cat. To bury bones. Ha-ha-ha-ha. No, let's take this up with the pc. Let's go into conference on the thing.

Has he ever really wanted to be a cat? Has he ever really wanted to be a dog?

"Well, I never thought of that before, but you know – ahem, I – ahem, hm – hrm – hrm."

Well, we've gotten items all right, but they haven't come in the proper order because... Remember we're getting them out of somebody who is caught between two tractors, see? He's
caught between the bumpers of two tractors and he is scrambled. He doesn't know which tractor's which. See, he will happily put the opposition goal with the pc's goal and – he'd put them together as modifier and goal, if you left it up to him. And you get through at the other end... sometimes the test on it is simply to chant what you think is the opposition terminal at him.

You say, "Well, you uh – now, you say you uh – you've often wanted to be a waterbuck – wanted to be one. All right. That's fine. Waterbuck. Waterbuck. Waterbuck. What would a waterbuck be doing? Would a waterbuck be doing a lot of things?" Just watching the pc, you see. "Would a waterbuck be doing a lot of things? What would a waterbuck be doing? Waterbuck dance or anything like that? Waterbuck drink water?" and so forth. Just watch the pc.

Is the pc going backwards on the winds of space, see? Is he getting something wrong with his eyes or getting a little sensation?

And then take "tiger," see. And you say, "Well, all right. Now, what would a tiger be doing? What would a tiger be doing?"

And the pc says, [in a growling tone of voice:] "Well, not sure. Not sure what a tiger would be doing, as a matter of fact." [laughter]

It becomes very obvious to you that the pc is very comfortable as a tiger and very uncomfortable as a waterbuck. There's something blowing his head off every time you say "waterbuck." Well, waterbuck obviously is the opposition terminal, regardless of what the pc thinks about it.

And more often than not, you operating independently, with nobody riding your heels, you're going to find opposition terminals which are actually the pc's terminals. You're going to find goals which are the opposition goals. You're going to find it all backwards.

So I'm just pointing out to you that you're given any part of a 3D which checks out. You've got just one part of a 3D. You've got a terminal. And you weren't quite sure of the goal; it was flickery and everything was sort of weak. But eventually we got down to a terminal and oh, man, this terminal is really it. I mean, it reads well and it's strong and the pc is right in there. Boy, it really is some kind of a terminal, of some kind or another. It belongs someplace to something.

Now, it might not be the terminal at all, but you can criss-cross. You can find more parts. You can find things that suddenly do add up and all of a sudden it all straightens out for you. And you find the terminal was a terminal, but it was the opposition terminal. You assessed from the opposition terminal as the pc's terminal. See, it didn't make sense until you got all the parts.

So just make this reservation about a 3D assessment. If you can find one part, then you can find any other item. Not necessarily in order, don't you understand? It's not in order. But you can find some other item. It doesn't matter what rotation or what order you find the item in; you got one item. Let's say you got a – you got a name that serves as a terminal. All right. You can certainly find a goal for it; you can find an opposition terminal; you can find a lot of items for this terminal. Don't you see?
All right. Let's say you have a goal. You can certainly find the opposition goal and then the opposition terminal, see? Then we could find a modifier. We could find another terminal. You see? It – it's sort of like the wheel of fortune. If you find any point on the spokes, you can find some other spokes, and eventually it turns out to be a wheel. And you thought it was a square soapbox all the time.

And the other point is, is never make up your mind about the story until you've got the whole thing. Always just sit there, cheerily, cheerily, cheerily, agreeing with the pc on anything he says, but reserving yourself the fact that when we've got all items found, now, we're going to make this up and make sure that it all fits and we've got it all straight in all categories – that the pc is this terminal, that this is not the opposition terminal. Because the time to find it out is before you run the first level, not afterwards. So your various tests, and so forth, that are applied, are applied in that order and direction and that's the way you do it.

But given any item on a 3D – any single item; it doesn't matter what it is – you can find the rest of the 3D from it. Not necessarily in order or sequence, but you can patch it together from that point and you finally wind up with maybe two or three extra items. Well, you have to decide if they're extra, you know? You're often winding up with extra modifiers; how about someday winding up with an extra terminal. That would be embarrassing, wouldn't it? But it might happen; it might happen. You might have a terminal from a second goal and it might be checking out just gorgeously. I've already seen it happen. Only it checks out with an entirely different pattern of needle motion. It doesn't follow the same pattern of needle motion with the pc's goal.

Pc's goal rock slams and this other one theta bops very nicely. One terminal rock slams, one terminal theta bops, the pc's goal rock slams, so that's the terminal you take, of course, between the choice between the two. The other one belongs to some other goal chain.

You can get more than one thing to hang up on a Goals Assessment. But if you've got any doubt about it at all, just go ahead, find more items. That's the rule. Criss-cross it and find more items. Just say, "Well, we were never too sure of this terminal. We never knew quite what this terminal was all about. Let's find some opposition terminals to it. We never knew whether the pc was it or something else. Well, let's find some opposition terminals to it. All right. Let's find a goal for that opposition terminal now. Not an opposition goal, but let's just find a goal for it."

And sure enough, all of a sudden the thing falls together. But keep working with the 3D until you are sure that it makes sense. That's the rule. Don't just add up, well, five items and there we got five items so therefore in the item we put them down it makes that kind of sense and we'll run it. Because you'll have a lose, sooner or later, doing that.

You'll have the opposition terminal, which is actually the pc's terminal and the opposition goal is actually the pc's goal. And you can actually have the pc's goal matched up with the opposition terminal. The pc's terminal is the opposition terminal. The pc's goal is his goal.

The pc's terminal is listed by you as the opposition terminal and the opposition goal is the goal of the terminal you found for the pc and you won't notice it right down to the last moment. It looks almost right, you know? It just looks just fine, except it really doesn't.
There's just something a bit wrong here someplace. We just can't imagine a wood pigeon – a wood pigeon being overly excited and so forth, about drill presses. Somehow or another the two don't quite match.

And what you – the way you resolve it is not sitting around scratching yourself bald. The thing to do, of course, is just find some more items. See if you can find any item cross to any other item. We've already got all five items.

All right. Now, just out of viciousness, find the goal for what you've got listed as an opposition terminal. It's the sixth item. Not an opposition goal; it's just a goal. Let's find that.

And now, having found that goal, if we are still doubtful, maybe we can find a modifier for it, of some kind or another. And then we find a terminal for that goal and modifier but we've already got two terminals here. Let's see if we find a third one.

Ah, well, all of a sudden the thing makes sense across the boards because it's mixed. In other words, you can keep finding items and keep cross-checking till it all goes straight. And you're happy about it and the pc's happy about it and everybody is cheerful about it and there is love in all directions, right up to the moment when you come up to the first stuck tone arm and the pc says, "My head feels like it's bursting. What is happening? I have some terrible somatics."

And you say, "Good, thank you," cheerily and start in with another level.

The pc wonders whether or not this will ever deteriorate, if it will ever go away.

At that moment, much more than an assessment, does he begin to wonder, "Am I in safe hands? Because I never before had a process that pushed me through a wall and cracked the bricks and I'm sure the bricks behind me are cracked."

I've also had this type of reaction: "No force could be as great as the force which is being experienced in that ridge at this moment. There is no force that great. And if it just goes just one little eighteen-millionth of an inch closer, why, that will be the end of everything" And, of course, it goes half an inch closer and it doesn't end everything – anything. But the point is, the pc has to have very high trust and this is no time to straighten out a 3D, see?

It's the wrong time to straighten out a 3D. I can see it now. You've got the winds of – of space blowing madly, the pc's eyes are two burning holes, you can practically look through the back of his skull with them, you know? He's blowing to pieces and you say, casually, "I wonder if I have these items right." [laughter]

I don't think that's the – I think it would cause an ARC break. But it is quite interesting that before you run the first run or assess for the first Prehav level, how endlessly a pc will take all these items up with you. They're still very interested and they'll take them up and sort them out and sort them out. And just by the basis of sorting them out and discussing them and so forth, why, all of a sudden the thing will right itself, for them and for you and so forth. It doesn't matter much whether it rights it for them or not. It's the auditor that counts. That's a fact. It's the auditor who must be satisfied, not the pc. The pc – I've seen pcs with such glee run the opposition terminal that I don't wonder at the number of suicides there are on Earth.
It's – it's just marvelous. They say, "Oh my, that's just gorgeous. Yes, there is no doubt about it." It's touched their pride, you see? It's touched their pride. You say, "Oh, I've always been a tiger. Yes, I remember very vividly. Always a tiger, always a tiger. I've always been thinking of myself as a tiger." [laughter] Back goes their head and that's it. They're a water-buck.

But they've – they've almost taken the – the push through, don't you see? They've almost – they've almost handed in their chips and accepted the opposition, you see, as a brother and partner. It's just like the Laborite government here. It's almost accepted Conservatism as its level of action; they've been fighting it so long.

Well, there is some notes on 3D, some material on 3D. I hope it has increased your understanding of it.

One other thing: I don't want you to be afraid of 3D. That is the one thing which I would like to impress on you. Don't – and I don't want you to worry about a 3D, doing a 3D assessment. It is not a matter of worry. I'll tell you what it is a matter of.

You're assessing some pc. Your amount of worry on it isn't going to do you any good, whatsoever. What is going to do some good is getting a list and assessing it and doing it expertly. Getting – you – get your rudiments in. Get a list for some item and assess it and wind up with one.

That – that takes a mechanical action and that's the action which you must be able to do accurately. Don't worry about it, because if you have entered upon the edge of worrying about it, the way to undo your worry is just get some more items, get some extraneous items.

Say, "Well, let's see. We've got a terminal here and we don't know whether it's the terminal or not and we don't know whether it matches the whizzits or not and we don't know what this was all about."

Well, you've never asked the pc this burning question: "Who would oppose that terminal? Who would oppose it? All right." And take a long list of the things that oppose it and assess the list. Well, you've already got his opposition terminal, don't you see?

Or we take his opposition terminal. We say, "There's something wrong here somewhere." Take his opposition terminal. Say, "What would oppose this? Who or what would oppose this terminal?" And get a whole new terminals list. Well, we already got the pc's terminal, but to get a whole new terminals list. Assess the thing down. You'll come up with either another one or the pc's own, or you'll come up with the fact that they are reversed. You'll come up with different data. In other words, you can develop this data and you can prove it out by further assessment any time you want to.

There's no sense in worrying about it, because in the final analysis it is not ever equivocal. It's something that you can recognize vividly.

[The recording of the lecture ends abruptly as did the original recording.]
How are you today?

Audience: Fine.

Like you're not surviving. Too bad. Too bad. As a matter of fact, you know, with one or two exceptions, which are usually exceptions, you're starting to put a glow up. You're putting a glow up. Even you. [laughs, laughter]

Okay. This is 6 Dec. 61. And I'm of two minds. I don't know whether to talk to you about Security Checking or talk to you about 3D running. And let's see, the people running Security Checks look worst [laughter] or the ones running 3D look worst? I think it's definitely a Security Check day. Definitely.

All right. I'll give you the opening gun. It is stupid to try to assess somebody who has not been squared away on the basic and fundamentals included in Class II.

Item two: It is stupid to try to get somebody to assess who has not passed the basic skills of Class II. So what we're – the hill we're trying to climb is 3D, but to get the hill climbed, I'm afraid you're going to have to climb another hill first.

I recall there's been troops in this situation at numerous periods of history. They get an order to "scale the rampart." And they go ahead and valiantly try to execute this order, but it has been neglected – one little point has been neglected in the battle plan and that is only this: they haven't taken the moat. And if you don't watch it, you have a lot of people drowning in the moat. And that's about what we look at here.

Now, the penalty of your getting the latest and most is the fact that I can be absolutely counted on to do my level best for you. Unfortunately, that's a fact. I could give you a very nice, smooth curriculum that would carry forward a lot of very smooth, routine things and it would all be very smooth and very routine and awfully difficult, but the curriculum would be very smooth.

Or you have the other choice – the other choice. You get what is known at any instant of time as well as it is known at that moment of time and you pursue it and use it. That, of course, has a tendency to keep your training much more up-to-date. But it also has a tendency to learn what you yourself don't know in order to achieve your objectives. Do you understand that?

It doesn't matter how smoothly I lay out a curriculum. You're always going to find something else. And I've just given some of you a present time problem, I'm absolutely sure, in suddenly sliding Class II your way last week. But you pay the penalty for my being honest because I'll tell you what I don't know – can be counted on for that.
And it amounts to this: There is emerging from the stygian dark of the vast whirlpools of chaos – which is what your reactive mind looked like a short time ago – is the fact that the more aberrated a person is, the more "only one" he is, he moves in toward clearing from the outer dark. He moves in from his lonely vigils on cloud sixty-nine where he has been keeping the watch for the last many trillion years against all comers and on which post he learned, oh, too well, never to take any orders. And then you step up with your E-Meter and in effect give him an order. And he is so armor plated that you get no response, of course.

In the first place, the symptom of extreme aberration – and never make a mistake in this as an auditor, it is a symptom of extreme aberration – I don't care where you find it and I don't care if I step on your toes in telling you so – is a total unwillingness to receive any help.

Now, you are fooled in that, in that occasionally some person or some country will say to you, "You must help me." And by not looking it over and seeing what they do with your help, you're fooled into thinking they wanted to be helped. They're using a sort of help as a trap.

"You must help me. And only then can I show you how stupid and ineffectual you are. Hu-hu-hu."

That's help as a trap.

India is in that state right now. If you were to try to assist India, you would be in fabulously deep swamps in no time.

I was in India a year or two ago. And I was interested from the standpoint of the fact that several Scientologists had gone to India, and they've all fallen on their heads. Dear old Muriel, for instance. Now, she might have thought that she finally gave up the ghost and had to pick up another body – dear old Muriel; we'll be seeing her again one of these days – because everybody was mean to her. But in actuality she had nothing but disappointment after disappointment after disappointment at the hands of the Indian government.

She would go out there and the Indian government promised her the sun, moon and stars all on a silver platter until she tried to collect one tiny moonbeam and it was untrappable. There was no way she could lay the moonbeam in her hand.

They would keep promising her help, promising her help, opening all the gates, opening all the gates and then it all just sort of – she was somehow suddenly wrong. Get the idea?

You'll find that in insane asylums. You'll have patients come up to you, begging you, saying, "Oh, you must help me. You must help me. You must help me."

And you walk into their cell and they hit you over the head with a stool. That's the modus operandi. Any possible method of getting a thetan to walk into a trap, of course, will be used by a very aberrated person.

All right. Now, let's look over this view, and let us see: did that person want to be helped or not? Let us see if that person didn't want to be helped, actually, that person was using help for some other purpose, and so forth. So that rather obscures the view.
Now, you'll find a person on post somewhere in some large administrative activity – take one of your large companies – and he's got to do every scrap of everything himself. The desk – you can't see over it, you know, because it's stacked up in all directions.

He's emptying all the wastebaskets, although there's somebody hired to empty wastebaskets. He's sharpening all the pencils and there's somebody else drawing pay to do that, don't you see? And if he makes a telephone call, why, it never goes through the switchboard, you see. It goes over some route.

There was one company that I think is one of the most remarkable companies I had ever heard of; it had sixty-seven salesmen. And the boss and owner of the company was dealing in war surplus material – and this out in Los Angeles – and he was dealing with these vast square miles of bombers. And these vast, vast square miles he was selling off left and right. But he had sixty-seven salesmen.

And the fellow never came out of his office or talked to his sales force or anything and these salesmen would just beat themselves until they were haggard and gray selling off half a square mile of airplanes or something, you know, only to find out that the boss had sold it last week and he hadn't told anybody.

The only things ever sold by that company were sold by the boss. Not so he could get the commission, you see, but because he might get helped. You see? And he had to prove it conclusively that he must not be helped in any way, shape or form.

Now, you look over an organization that is running fairly smoothly, you're liable to find the head of the organization – see, although he's wearing lots of hats – actually able to breathe and everything else because basically what's he do? He basically makes policy decisions or something like this or draws a map and says, "Well, this is the way we're going to go," and that's it. And somebody comes around and asks him for a little help on something or other, why, he gives it to them.

And you never find him sharpening any pencils. You'd think he lived the life of Reilly. You know, you think this would be the most lazy existence you ever heard of, you know? He just never sharpens any pencils, never empties any wastebaskets, doesn't make any of his own telephone calls. You get the idea. He can be helped.

Well, frankly, although he's not in very much of a panic, a rather large activity can run, don't you see? Because he doesn't interfere with everybody around in doing their jobs. He can be helped. He'll help them. And although no organization on Earth could help – ever to run smoothly... Don't think that it could, I know that's not in the cards. Not until we have dealt them, anyway.

The fact of the matter is that it's a cooperative activity of some kind or another, and beingness is granted on both sides, and nobody's in a big games condition with anybody else, and everybody's willing to do his job, and maybe do a little bit of the other fellow's, too, but nevertheless he's willing for the other fellow to do his job, and it all runs off smoothly.

Well, when you're auditing pcs who can be helped, that's kind of the way it goes. That's sort of the way it goes. That's more or less the way it goes. The pc is somewhat coop-
erative, and you're cooperative with the pc. It doesn't have to go smoothly along these lines, you know, but auditing can happen.

Now, when you've had this fellow out there in that lonely watchtower on the end of the black nebula, when you had that occur, this fellow cannot take any communication from you. He doesn't know you're alive. He stands outside the perimeter not only of the human race, but all races. He's not in communication, and you're not going to make any effect on him. This is what he's going to make very sure of: He is highly suspicious; he is highly alert.

His ability to be hurt is so enormous, his ability to be injured is so great, he thinks, that he has to protect himself with all sorts of barricades. And amongst those barricades is: "No help; you mustn't help me."

Now, even though this individual is willing to be helped, we go to a higher range. Can he be communicated with and can he communicate?

Let's say he's willing to be helped. We've overcome that barrier, and he's not using help as a trap to pull you in and knock you on the head and that sort of thing. The communication barrier is the next barrier that opens up and that is the barrier by which you can talk to him and he can talk to you. Until that barrier is knocked apart, you will not find your meter effective.

And it just comes down to one of these confoundedly simple operations. Is your meter effective on the pc? That's all. It is just this: does – is the pc willing to talk to you? See?

Now, you can read a meter with a microscope on him and your responses go in and out because sometimes he's there and sometimes he's not there; and sometimes you're in communication with him and sometimes you're not in communication with him. That kind of a situation is a very bum one in which to do an assessment because your assessment depends on the communication factor staying relatively the same during the assessment of an entire list. It depends on that factor being present and continuing to be present. Therefore, you have rudiments.

Now, we take somebody who is not even vaguely in communication. We take that person and we're going to assess him to discover something about him. Well now, if there's very much left in the makeup of this person to the effect that anything you find about him is going to be used against him – you know, that's one of the standard modus operandi by which he operates and always has operated, you see. "Anything they find out about me they will just use to shoot me down." You see, and you're trying to find the various parts of a 3D assessment, why, good heavens, what are you going to wind up with? You're going to wind up with a total defense. He'll just bury, bury, bury, bury everything if he's not in any kind of communication with you. Right?

So your first effort in clearing anyone is to get that person into communication, not only willing to talk to you, but you effective to the degree that when you talk to him it means a little something.

It isn't that you must put him in a state whereby you can impress him or overwhelm him easily. This is how he interprets it. No, it must be so that when you speak to him, you're
not talking to him through the cast-iron armor plate of a reactive bank. In other words, something happens. He is there. He can be talked to.

Now, that we can sort a person out at all is quite miraculous. Look at the order of magnitude of things. Don't say, "Well, we need bigger and better E-Meters." No, you're not going to get bigger and better E-Meters because there's a limiting factor involved in all this E-Meter thing.

The solution was put to me once by a man of science. The only trouble with the men of science, so far, is they have not had any humanness about them, and so there's been no human science. But this chap gave me the rather extraordinary solution, which I thought was terribly amusing.

This chap gave me this one solution which he thought was fine. And that was to get a proper meter operation, you put the electrodes into the person's brain. And this was just such ordinary conversation and this was the best way to get this straightened out.

Now, you go much further than the E-Meter which we have and (1) you run into an exaggeration of body motion and (2) you run into the necessity to stick the electrodes and tie them onto the ends of the neurons, or something, you know? And it's uncomfortable. [laughter] Not so much for the pc. We'll take the scientific attitude, and we'll say, "Well, that's nothing." But think of the auditor. He'd have to put on rubber gloves and anesthetic mask and all that sort of thing and audit in that kind of a costume. And you'd have to get the auditing rooms always being cleaned up and mopped up and deodorized – because blood is odorous, you know.

And it just sounds to me to be too much work – too much work, to take the scientific attitude. That would limit it all by itself, you see.

But you have other tools.

It was interesting to me once that somebody operating in Washington was trying to get a chronic alcoholic who had just – very raw meat; had just been grabbed in, you see – was trying to put him in some kind of session with "Help." And finally, he was actually able to get a help factor established with that alcoholic. That was the effect. Yes, the alcoholic could actually help the auditor. He could actually help the auditor. They could go get a bottle and a couple of dames and go get drunk.

But I was quite fascinated, you see, at the level that Help entered. But up to that time – it took some three hours – and up to that time, up to that moment of figuring it out and getting on to the Help level, of course, "No, you couldn't help me. What do you mean? You'd just betray me anyway," and that sort of thing.

The fellow had been psychologized in a prison at one time or another and it had stuck with him ever since. But it took three hours, but he managed to break through and get something like a help factor established on a conversational medium.

Now, I don't say that the E-Meter would be inoperative on this person. I would say that you would be able to pull withholds off of a person like that with an E-Meter, providing you knew the questions to ask. You would make an E-Meter react on this person if you hit
him on the exact buttons of withhold and so forth. It would be operative, but not for assessment.

Remember, there's no charge on assessment. There's no charge on this. He's not trying to withhold anything from you violently. He's not trying to give you anything violently. He just isn't helping. He's just meat.

Yeah, it's a different view. So we take Security Checking. We find that the only place the meter has a hole in it is the ARC break and we could handle that on the basis of just looking at the person, finding out if he had any willingness to talk to us at all and somehow or another repair that even though we only used Fernando's methods of finally working on the fellow. And finally the best answer we might get out of the person is, "Yes, well, you could help me and I could help you. You see, I could get a bottle, and we could get a couple of girls and ..." I mean, even it was this low order of help you would have broken through.

And after that you'd find that there'd be some operative factor involved in your E-Metering as far as rudiments are concerned. Now, you can get the rest of your rudiments in and that sort of thing.

In other words, you'd be on your way. But that isn't good enough for assessment.

You see, a Security Check can be effective on people that an assessment isn't effective on. That's what you have to face up to. The person has to be in pretty doggone good communication with the auditor to get an accurate, rapid assessment; or the auditor has to have such fantastic altitude over the person that anything registers. Now, given that altitude, of course, even the person had a (quote) "ARC break," you'd get a registry and you'd get an assessment, you see? Altitude.

But let's take two students. They haven't got any altitude. They've got the altitude of one has been studying longer than the other, but it's not very much altitude. And they get snorty with one another and teach each other classes in sessions, and all sorts of odd things go on. But it's not altitude. And one of the bug factors emerges here and we suddenly see this thing with great clarity: I put you on an E-Meter. I ask you what your goal and terminal are and so forth and I get your goal and terminal. I wrap it up and put it – write it down and so forth.

Well, it's done from a basis of altitude. And I turn around – now, I'd be really somebody to turn around and say to you, "You see, I can do it in an hour and a half. What is the matter with you that you can't get the parts of 3D. Pc registers all right on the meter. What's the matter with you?" See?

Well, you can hold it up to some degree. I can say, well, you can do better than you are doing, but you're not operating on that particular pc from the basis of altitude. And you're going to be fascinated when you get back, having been here, auditing a pc someplace who is a Scientologist and all of a sudden you're going to see his meter bang all over the place and your own – your friend who has been auditing him for some time, can't get any assessment on him. See, you've been to Saint Hill. You've got altitude.

And you ask him, "All right. Now give me the component parts of your opposition terminal." Rappety-rappety-rap, happety-bappety-bappety-bappety-bap.
And he tells you all, and you bleed him down, and you say, "Any more?"
"Well, I guess, there's three, four, and here they are," and that's it, and so forth.

And you go back over, and you read down the list, and you go ba-ba-ba-ba-ba-ba-ba-ba-ba-ba-ba-ba-ba-ba-ba-ba-ba, bang. There it is. "Oh, that's fine. All right. We got your oppterm. All right, now, let's get the oppgoal."

You, of course, are liable to turn around and say, "Well, what is the matter with you?" to your friend, you know. "You've been working for sixty-two and a half hours on this person and you haven't even got his goal. What's the matter with you?"

Well, you can say rudiments are out, but when you say rudiments are out, you must always add for whom. See? Rudiments are out, but rudiments are out for this person and not out for that person. You got the notion? Yes, from a standpoint of, is a person assessable?

All right. You check over the rudiments and you find the rudiments are in for this person, but this person can't assess. Well, it just means the meter isn't registering for that person, that's all.

Now, we take another person. We ask them if the rudiments are in and, no, we find the rudiments out. What do we mean by that? Rudiments out means the meter was registering for this other person.

This is not spooky once you get this down. It's the basis of altitude. What command value do you have over the person? Well now, this fellow that's been out in this lonely watchtower on the other end of the black nebula has never been a member of anything since the year zero, is being very careful never to be a member of anything and receive any orders from anybody because of anything. And he just simply sits down. And it wouldn't matter whether you had altitude or smallitude. It just wouldn't matter. His meter would not register. He is not part of the human race.

Now, that's the person I'm talking about. You get these other variables. Yes, you have altitude with one pc where you don't have it with another; you can always improve that altitude. You can always put it into the run. But basically, the first barrier to be crossed is the barrier of getting him somewhat into communication with the human race.

Now, some people can do that faster than others, but it is a factor that has to be crossed. And that factor does amount to this: it amounts totally to whether or not the individual is totally armored against everything you're trying to do with the individual.

This is important. Speed of assessment is totally dependent on an individual's willingness to communicate to the person who is assessing him.

All right. Now, let's take on the one hand, a student that doesn't know one end of the E-Meter from the other. He's been running "pretended know" with an E-Meter for some years maybe, but frankly, he can't make that E-Meter talk worth a nickel. Doesn't know too much about it.

All of a sudden he's pitched into a Security Check under the eyes of people that really know how to Security Check. And they find him leaving stuff missed and, you know, and
doing this and that. He never knew they were missed before. He never knew there was ever anything there to be found.

Well, we pressure him up and goodness gracious, he finds out there's an E-Meter – this E-Meter can really sit there and sing. It really does operate. It really does function. It really does find withhold. It finds out-rudiments. It does that sort of thing. Well, it's something like teaching him to find huge white boulders in a black field, see?

That's great, you know. He finally gets cocky. And oh, boy, he can really find these withhold now and so forth. He's got good confidence. Now, we send him out to find these little, tiny black pebbles in the black field. That's a 3D assessment. Oh, it requires a terrific command. Because in the first place, he's got to have good confidence that he can operate his meter and his tools. If he does not have that confidence – if he does not have that confidence – the pc can smell it.

The fellow sits down there and he says, "Well, now, let's see, uh... All right. Uh – is it all right with you if we begin this – this session now?" You know, he sounds confident. He sounds right there, you see?

Of course, what did the other fellow do? The other fellow just assigns his altitude at that point. He gives him altitude rating, minus zero. That's the end of the assessment. It ceases right there. Why?

Well, he hasn't – he's demonstrated that he isn't anybody to have any command value over the other person, that's all.

So if we just took somebody and gave him a one-hour review of how to run an E-Meter and then set him to assessing a 3D, he would find out that he doesn't get anyplace. That's all. And he would go on not making it for seventy-five hours, at least. You know, he'd just go on stumbling and fumbling, because he's looking for these black pebbles in the black field and it's really a lost city he's on the route of.

Well, that's not very economical, then, is it? Not economical in terms of time. You've had a person sitting there as a pc with an auditor who is inexpert. The pc is not in communication with the human race and the auditor is not in communication with the E-Meter. And the end of this is a debacle of seventy-five hours of accumulated ARC breaks that we can do very well without during the assessment, right?

Well, this is what I have learned: that it is much more economical to security check a person for seventy-five hours and put him in communication with the human race than it is to assess them for seventy-five hours – using the auditor as a constant.

Let's say this auditor is no better and no worse during the seventy-five or the next seventy-five and so on. He's a constant. Well, let's just take the pc. Well, it'd be better if the pc were given Security Checks and Problems Intensives, ARC processes and rudiments in twice a session for seventy-five hours than to assess the pc for seventy-five hours. Because you're going to wind up with no gain.

The pc is just going to feel like he's blowing his brains out at the end of the seventy-five hours, but if you give him that much Security Check and so forth, fairly well done, why,
he'll come up at the other end and he'll be feeling better. He will have some confidence. He will have benefited.

All right. Let's take the next stage. This person's got to be put in that kind of shape before he can run 3D levels anyway, so if you did, by some necromancy, manage to reach into the electrosis of his brain and discover these various items in that seventy-five hours, you'd still have to run all the Security Checks, the Problems Intensives and everything else and get the rudiments in endlessly and square him all up before he could run the 3D levels. Otherwise, they'd be too rough on him.

So what's the profit here? So what's the profit? Well, if this person wants to waste seventy-five hours, all right. I can just see it now. A person comes in the Central Organization, he says, "I want to be Clear."

"All right. That's a very fine goal. All right. That's swell."

"I want to be Clear."

"All right."

"And I want to be assessed now."

And I can just see a very, very obliging Registrar saying, "Well, all right. We'll put one of our best assessing auditors on you at once."

And see the first week blow up in smoke, the second week blow up in smoke and the third week blow up in a roaring bonfire. Yet, everybody was being very obliging. See, they're being terribly obliging. They said, "Well, if the person wants to be assessed on this new clearing process, why, naturally, we should assess them."

Oh, they've taken an irresponsibility. Their responsibility is very low, because the person's in no shape to assess. Now, well, you're going to have some kind of an assessment running like this. You're going to have three quarters of each session spent on the rudiments using non-strong processes which might very well better be good, heavy, beefy rudiments-in-type processes, you know? Security Checks, General Overt/Withhold, Problems Intensives. Let's sort this person out from one end to the other. Let's get this person talking and squared away and so forth. And if you really know how to security check, you can do it.

Now, we do that for seventy-five hours. The person says, "I want to be assessed on 3D."

And the Registrar says, "All right. We would be happy to assess you on 3D and you had better get going at once on the preparatory steps." That's the proper answer.

"What preparatory steps?"

"Well, the preparatory steps to being assessed on 3D, of course."

"Oh, all right. What do they consist of?"

"Well, they consist of getting you sufficiently in communication so that we don't have to waste your money and auditing time fumbling with the thing while we're assessing it."
Actually, you have to put up some kind of an argument on the basis of it's more economical for the person to be in some kind of condition before they're assessed than to just start endlessly assessing and wind up with an equivocal or an upsetting or an incorrect assessment or no assessment at all or – you see? That's the kind of thing that you're bargaining against with this sort of thing.

Well, that's going to take a lot of subjective reality on a lot of people's parts before they finally got that in because there'll be lots of people who will come in and say, "Please, I want to get some auditing from you," whether you're a field auditor or a Registrar or HGC, D of P, anything.

And he's going to say this, and you're going to say very obligingly, "All right. I'll assess you."

Nah, it's very uneconomical. Maybe with your altitude, you'll get away with it. Very often you'll get away with it. You'll get away with it often enough to disabuse you of the datum. But you're reckoning without this factor called altitude. You've got altitude. And so the reckoning of the datum is that every now and then you will get a full assessment, you'll get it very rapidly, and so forth.

One of the things that will also upset your calculation of this is the fact that the person you're assessing has probably been audited a great deal. And they're probably in some sort of shape. But remember those points. Remember those points. I'd say if you couldn't get somebody's goal in a matter of a couple of sessions, you're wasting your time.

I'd say from there on out you're wasting your time. I mean, just to give you some kind of a little yardstick, not a very accurate yardstick, but some kind of a little yardstick to go on. I wouldn't even make that kind of a test. I'd learn to add it up in the first place. And I'd also learn to have somebody around that could take that kind of work off of your back if you're the only one in anywhere – in any area that can do any 3D assessment.

You don't want to be running Security Checks. You want to be able to teach people to run Security Checks and you do assessments. I mean, that's easy. Then that works out. Then you get a lot of people cleared. That's a practical solution.

Now, as far as auditor training is concerned, an auditor who has not got the familiarity and experience of doing a Security Check just has got no business sitting on the working end of an E-Meter. That's all.

He's just got no business doing it. Because he's going to miss the falls, he's going to be looking up when he should be looking down, you know. He doesn't know which end of the list to write on. It isn't the mechanics of the thing. It's just the fact that he just isn't looking. That's all.

He doesn't know what ought to read like which. And this is a waste of time – give him assessing, because it's liable to break his heart because you can't read assessment reads like you can read Security Check reads.

Oh, you get some fellow and you ask him, "Have you ever killed anyone?"
And you find out he murdered somebody or something like this or thought of murdering somebody and needle falls off the pin and little lights light up, instrumentation plate lights up, little bell rings someplace, arm comes out of the side of the E-Meter and taps the auditor on the head and say, "Hey, look bud," and points a long metallic finger. It's almost that wide and big a reaction, don't you see? Can't miss it.

But on assessment, it might not be that much of a reaction. Probably never is that much of a reaction. So you're training an auditor in the direction of loses.

Now, the longer you assess a pc, the unhappier a pc is liable to get if the assessment is being done badly. The longer you assess a pc, the harder the item is to get. That is a stable datum on which you can absolutely count. The longer it takes, the harder it is to do.

So you don't want an auditor going in with a wide, wild fumble. No, let's let him get the use of his tools and then he'll get his assessment faster.

Let's say we have one hundred hours to expend. I would tell you right off the bat, spend seventy-five of them in setting the person up and twenty-five of them assessing and getting his 3D straight. Your hundred hours will wind up with a person with all his items in condition to be run on 3D levels. That's a nice win.

All right. Given a hundred hours to expend, person comes in, we do no preparatory work. We use all the assessment sessions to try to keep his rudiments in. And I'll show you the hundred-hour mark with no items, an ARC broke pc and no setup of any kind. And even if you'd found them in those hundred hours, the pc not in any kind of shape to run 3D levels.

You see, what's economical? That's, see – what's practical? What's the effective thing to do?

And ordinarily speaking, the effective thing to do would be to run the person over the jumps on all standard Security Checks. Run them through a Problems Intensive. Do what you could to knock out some of their hidden standards and upsets and worries and so forth and get them in some sort of shape so that they could be audited. And they'll feel fine. That's done more for them than anything else has done, so it's good effective processing. So that person feels fine now, and then you set them down on the cans, and you say, "All right. Give me your goals list."

And it goes off brrrrr-bow, and you get that, bang, and you get your next item, boom. And you get your next item, bang. And you get your next item, bang. And you get your next item, bang. You got your 3D. Find your level and run it.

Now, that's the way it goes. Now, the only reason an auditor starts worrying about an assessment on 3D is he himself is assessing somebody who doesn't have very good reads. And he has not recognized the fantastically mechanical nature of an assessment.

The only thing in a 3D that requires any judgment of any kind, whatsoever, is how do the parts fit right. After you've got all of the data, the judgment is required, now, at the point of who is what. In this game of the cowboy in the white hat and the cowboy in the black hat, who is the cowboy in the white hat, see? And you'll get some fantastic, oddball curves thrown at you there. You'll find the oppterminal is the pc's terminal, but the goal that you found is the
pc's goal, you see? But the pc's terminal that you found is unfindable because his terminal is already in your 3D as the oppterminal.

You just strike this kind of thing. Where do the levels fit? What are you finding? What have you got? This requires judgment. There are various mechanical tests that can be used, but none positive enough to overthrow judgment.

We have "black grasshopper" as the opposition terminal. "Black grasshopper." And as the pc's terminal, we have "chorus girl." Doesn't make sense to me. And if you run it, you won't make sense in the running either. Pc will say, "Oh, yes, I can see how a black grasshopper would frighten a chorus girl." You'll get three answers on a 3D problem-type command run. That's all. He's out. He's finished.

No, that requires judgment. The rest of it is a totally mechanical operation. Start realizing that point. And then what I'm telling you about preparatory steps, and so forth, will make a great deal of sense to you. It's mechanical. It is the mechanics of getting your rudiments in, getting somebody into session willing to talk to you about their difficulties and so forth.

All right. Now, there is a little bit of art connected with that, but from there on, bang! You get, "Give me the goals list." You get the goals list. You bleed it down for antisocial goals, withheld goals, secret goals, anything else, you add it to the bottom of the list.

You get your rudiments in. You get them in very, very, very carefully. You square it all around. Remember, your pc's got to be in some kind of shape they – that you can get the rudiments in on this pc. Remember, that's a necessary adjunct to all of this.

The reading of the meter should be of no concern to you, whatsoever. You should just know that cold. When that meter talks, it talks. That's it. And you know what message it tells you. And it's just cold. I mean, the list is either in or the list is out. The goal is there or it isn't there. That's all there is to it. And it's there to the degree the rudiments stay in. You should realize when the rudiments go out and your whole list, all of a sudden, goes null.

Take a goal that was just alive. Go back and read it again. "Bark, bark, bark. Thank you. That's out." Ow, ow, ow, ow, ow, ow. That thing was just alive as paint just a few minutes ago.

You came right down the line reading right down the line past that goal, and it went clang as you went by it, and you marked it as in, and you went down to the next one, and it marked something or other. And something tells you that something has gone to hell in a balloon around here someplace or the pc is acting up or the pc is talking in the wrong places or laughing at the wrong comma marks or something of the sort or just kicked the back of the E-Meter with his foot.
But just go back and read a goal that you've just gone over and you know it's still got kick in it. Just read it once. Stop the run. Get your rudiments in. See, you've got it proven that up there they were in. And now they — somehow they aren't. Get them in, squared around, and keep your list going.

In other words, as you go down to the end of the line, if your rudiments are in, if you keep your rudiments in, you'll wind up at the other end with the list you got in the first place with the pc's item on it. I mean, that's all there is to it. It is so mechanical, it's more mechanical than painting a wall. Painting a wall you have to make some judgment on the basis of the color of the paint. There's no judgment of color involved with that.

You just wrote down everything the pc said, and you bled down till the meter was null on any more and you've got the complete list and then you get the rudiments in real good and you know they're in. And then you go down the list and you null it out. And you'll be left there sitting there with the item.

All right. That's just a straight, mechanical action, and you do that with item after item. And you'll get good enough sometimes so that you consider putting a 3D together rather mechanical, too. And you get the oppterm. You get the oppterm from the pc's terminal. And you get the modifier on the basis of getting an opposition goal to the oppterm. Or something of that sort. You see, you can do it backwards.

You can take the opposition goal and you say, "Well, what would really happen to this person if he didn't (goal)?" see – opposition terminal's goal.

"Well, he'd be dragged down and wiped out."

All right. That's the modifier.

You can learn to do these things backwards and ask for different items, but that has nothing to do with the mechanical action of writing down the list of items, assessing the list out.

The reason you think it's complicated at this particular time is you're going over cases that have been assessed and on whom the assessment has been changed.

We've had some cases here that were running Routine 3 very nicely and very sweetly, and everything was going along beautifully and all of a sudden "Ron! Don't dare have an overt on him because I'd have to run it in a Sec Check session."

But anyway, we had to get the rest of the 3D items and it stopped everything. Oh, well, all right. So there's been a change in middle stream. You're going to find equally there will be an upset with the pc. He's been sitting there saying, well, he's a teddy bear. He's being all smug on the basis of being a teddy bear. [laughter] Always loved teddy bears, he did.

And you have to gently break the news to him, at the other end of the line, that he's a snipe. That's not so good. That's not so good.

The pc says, "I am?"

And you know, sometimes it stays as an ARC break. It's interesting, but then it'd mean that you're giving him the 3D and straightening up the 3D has caused rudiments to go out.
Well, you have to get them in again and you've got weapons with which to do this. All you have to do is get the invalidations off the thing.

Now, worse than that, you've had cases that have been assessed slowly. That doesn't mean that all the cases in the world that ever get assessed will always be assessed rapidly – so this is something that applies very broadly. But you've assessed some cases slowly, you knucklehead. See, that's a real knuckleheaded thing to do. You know, sit there, and fumbling with the meter, you know, and so forth. And saying, "All right, now, let's see. Let's see, the Instructors say I had to look at the meter – . No, I look at the meter while I read the goal, and run TR 0 – . No, that's not the right order." You know?

And you've assessed slowly. That's all. You've taken this list which is a very simple list. All you had to do is look at the list, look at the meter while you read the item – *pang, pang*. You can do that.

And you said, "To – pick – goose – berries. Oh, I'm sorry. I must have missed the instant read. To goose – . Excuse me. To – to pick goo-o-o-ose-berries."

You get a fall, of course – ARC break. So you write down, "That goal is in."

It's just a totally inaccurate job of assessment, don't you see?

I mean, there're all the parts, they all fit and it's all being done clumsy. And you're sort of trying to fix a watch with mittens on. And you've done a slow assessment. And you've had ARC breaks, and you've patched these things up. Of course, the assessment drags out. It's an hour's worth of assessing and it's dragged out now to three hours, to three sessions, to three weeks, same list. But all this three weeks you've been reading for the oppterminal.

And the pc gets to resemble – hardly a pc, but he looks more like a blank wall, you know? He's gone now back as far as anybody could possibly go. He's walking around like this, you see, all the time. You chant an oppterminal or anything on his chain of oppterminals to the pc, and he'll actually practically get blown away. You have to get in and out and get that one fast. If you don't get the oppterminal in the first couple of hours, you really ought to get another item that's on the pc's side. Get the modifier. That's at least blowing the other way. See? This is just good sense.

And try for the oppterminal again. We miss on the oppterminal for some reason or other. We'll get the pc's terminal, because now we've got the G plus M. Get it blowing the other way again.

All right. Now, that – we're just gathering data that's on the pc's side, and we finally wind up with inevitably the other side of it will fall into our laps.

And sometimes these things are all backwards, you see. The pc has given you the opposition goal. And he himself has given you the modifier of the opposition goal as his own goal. That's all split up. And the things all read differently and backwards, and they all get a read. But where do they belong? You're always left with a 3D with a jigsaw puzzle on your hands. That's where your judgment comes in. But it isn't judgment that comes up to the point of assessment. That is not judgment. It is a mechanical action based on good sense of the factors I have just enumerated to you.
Your auditor with experience in Security Checking and some idea of assessment or getting things in, and so forth, with experience on the thing, familiarity with a meter – he does the job rapidly enough that, well, there isn't anything to it. Because it becomes a mechanical job.

Now, given a pc who has some of the basic elements flat on him that puts him back to at least the outer ghost perimeter of the human race, he's got one toe inside the perimeter of the human race by means of Sec Checks and all that sort of thing. All right. Now, that pc becomes assessable.

All right. Given that and given an auditor who is rapid and accurate in doing it, and actually knows how to read a meter and so forth and assessment's just bang! Just like that.

Now, that is what you should be trying to attain. But auditors who worry about assessments remind me of a mechanic who is walking around and around a car wondering what is wrong with it without ever opening up the hood, you see? Never lifts the bonnet, see? Worrying about a pc? You don't worry about a pc. Hell, man, that's just an open and shut proposition.

The pc is either in shape to be assessed or is not. Well, that's told at once as to whether or not your pc is responsive on the meter.

All right. The assessment is done by simply listing the items and nulling them out. That's all. That's totally mechanical. And if you can get up to a point where you look on this as a totally mechanical action, you all of a sudden will have a long sigh of relief and you won't care who you assess or how many. But somebody will sit down in the auditing chair, and you say, "All right. Do you have any ARC break? Do you have any withhold? Do you have a present time problem?"

You get no reads of any kind. And finally, why, you say, "Well, what's been your goal in – some of your goals in life? I'll write those down now." The tone arm just sits there; the tone arm never moves. No tone arm motion on a goals listing? Oh, no, man. Let's not go assessing that list. What are you, crazy?

Your meter's not responsive. You've sat there and assessed opposition terminal on some pc that didn't move off 2.3. And you've gotten the whole list with the pc just sitting there at 2.3 on the tone arm. No tone arm motion. How do you suppose there's ever going to be any needle motion on the list? There's no tone arm motion on the list.

He gives you all of these things that he's been fighting all down through the trillennia and he's not going to get any tone arm motion? Oh, hell, give that guy an application blank for the human race or for the auditing session. There's something wrong here. I mean wrong, man. That's not faintly out. It's a nonassessable condition, just staring at it right in the face. It's nonassessable. That will require Security Checks. It will require General O/W, it will require ARC Break Process, it will require some kind of a Problems Intensive. "Something you wouldn't mind forgetting," run for several hours. All of these things, you see?

And then all of a sudden the fellow can remember this lifetime somewhat. You're not asking him – putting him in very good shape. You got a pc down the line here right now I could probably assess, but – not here in this unit. I could probably assess this pc, but, boy, it'd
just be from a basis of altitude and breathing down the pc's throat and almost energizing the pc's reactive bank myself.

Because this pc can remember nothing. Yesterday fades away. It's gone. It's the automatic solution: Remember nothing. This pc would give you a list, and they wouldn't know what they had given you a list of, for, what or why. Well, it's all right. You could do an assessment of some kind or another. You'd probably find a forgetful person. Well, it's probably all explained when you get to the terminal.

Let me point out something to you. This person can't remember long enough to remember they're in session. They can't even sit still. They're in bad shape. And you've forgotten how bad shape Homo sap is in. You deal to a large degree with Scientologists, and you audit people who have been in PEs, and people who have had a little co-audit, and people who have had a little patch-up auditing here and there, an assist here and there. You don't see the degree that they've been graduated up.

Not until you get this garage mechanic that would walk around the car and wonder and worry about what was wrong with it and never lift the hood to find out, never even sit onto the driver's seat and push – try to push the starter button, you know. He'd just walk around the car and worry – something like that.

Well, you get this guy and you sit him down in the chair and you say pick up the cans and he says all right and he does and you start assessing a 3D.

Well, he'll be interested. You can run his goals, yeah. Funny part of it is you could get away with a list of goals. He'd probably give you a list. He's not interested in anything as much as he is that. But when you'd finished the list of goals, then he would want to know something or other or something and he would have – and you would suddenly realize that this person didn't have the faintest idea of why they were there or what they were doing or what you were doing or how this had anything to do with their life or anything.

And this person may be sitting there with some screaming present time problem of some kind or another. You wouldn't know. You know, just some howling problem of some kind like, well, he hopes you will tell him when the session is over because, you see, if you didn't tell him when the session was over and tell him to go home, why, anything might happen. He might forget where he was and so forth. And he comes into session and he isn't feeling very well and you don't cover it very thoroughly. You ask him if he has a present time problem and you don't get any reaction on the thing. He doesn't know what even a present time problem is.

But you say, "Well, what has happened in the last day that has been worrying or upsetting to you?"

And if you asked him that question for thirty minutes, with variation, he would tell you that he was very worried because all morning he had been walking around his room believing fully that he was about to go insane. Not a minor thing he was up to, you see.

But after a half an hour of questioning, you finally get this fact out. Now, you find out he does this every morning, or something like this.
Why don't you just say, "All right. Get the idea you can reach but can't reach. Get the idea you can withdraw but can't withdraw."

And he does, and in a gleam of insanity or something, you do something with him, you know. Zzzzzz. And he says, "Hey, ooo, that's better," and he comes back. "Man," he tells you, "that's all right. I only woke up at six this morning and I only worried about going insane for just about a half an hour. That was pretty good. It was pretty good. It's a lot better."

But the guy's whole life is a present time problem. He never sees a wall. He sees a facsimile of walls. You get the idea? I mean, that's the kind of people you're liable to be dealing with. I don't care if they're holding down positions as premier of the land. Position has nothing to do with it. It's quite the reverse. It's when you start getting them going up in position, they're liable to start going up the pole, too.

No, you haven't any guarantee, whatsoever, that this fellow has enough balance to sit there and just sit there, see? That would be a high skill to him – to be able to sit there for an hour, see? The basis of a high skill, you know. He doesn't know how he could do it. And all the time he's sitting there, he's worried, "Will I be able to sit here for a few more minutes. I don't know whether I will be or not. Will I be able to sit here for a few more minutes? No, I don't know whether I will be or not. Am I willing to sit here for a few more minutes?"

You don't know what trouble these people have, man. There's hardly anybody out in the society these days, and so forth...

Well, take a bunch of college kids. You'd think they were in awfully good shape. Or take a bunch of children out of some earlier school. You'd say, "Well, they're in fairly good shape."

Ah, you get down to pitch with these kids, and really you take the half an hour to find out how it is. Wow! It'd be hard for one imagination to paint any part of the randomness that you would discover. See, these people are worried. These people have problems. These people are upset one way or the other. And if you haven't cracked any part of that perimeter at all, you're going to assess it? Aw, no, no, no. You're not. Mm-mm.

See, if a person's problem is can he sit there for a half an hour or an hour or something like that, how can he tell you anything, see? It'd have to be a damn strong E-Meter that would give you the reads that you were capable of arousing on this person on some subject or another.

Yes, you could get him interested. Yes, you have all the tricks by which you could do all this. But wouldn't it be kinder to security check him and find out why he was so worried? Because the basis of his worries are all contained in Security Checks.

If you want to find some reason somebody is worried about going mad, just find the people he's driven mad, that's all. I mean, it's quite, quite simple.

You got somebody who is just terribly worried about nervous indigestion and ulcers and that sort of thing. You find out that his father has nervous indigestion and ulcers, and he has nothing but O/Ws on his father to the word go. He's got them by the thousands. And you're going to cure up his nervous indigestion by just some passing the wand over him?
Well, you're not going to cure it by getting off the overts on Father, but you're certainly going to take his mind off of it. These things are all the subject of overts and withholds of one character or another.

So the kindest thing to do about anything like that is take the weight off this life before you send him back eight trillennia. How can a guy ever get back there? He doesn't dare leave present time, not with a pink elephant stepping on his foot all the time, which you never hear about. You see how all this – all this – this fits together?

A fellow who has constant and continual worries, who is nagged all the time in all directions, has to have them alleviated a little bit before he can get anyplace. Well, this tells you, all right, well, how about this fellow that's just so spun in on his terminal and his opposition terminal and his goal and all the rest of that, that he's just so spun in, the only thing he could possibly do would be to relieve these things.

No, that isn't true because all of his overt acts are locks on his goal and you're doing a job of unburdening when you're doing the Security Check. You're just unburdening the things that he's been into. Along about the fifteenth level on the second rerun or the third rerun or something like this, this person will all of a sudden look at you very fixedly and say, "Tha – That's why I drink water in the morning."

"What's this about drinking water in the morning?"

"Well, you remember – remember several weeks ago I told you that I always woke up with this burning thirst and my throat all raw, and so forth. And then we took that up and we did something about it. Well, actually, the truth of the matter was – the truth of the matter was that this terminal I'm running here, a mermaid, you see ..." And pfft, the thing blows, you see. He won't get down to the heart of a thing. But you can always unburden things.

Frankly, that is the anatomy – unburdening is the anatomy of the Goals Problem Mass operation that we're doing – unburdening. We're taking the solutions off the top of the thing. It's very interesting. You can deal these solutions off the top of it and of course, it deintensifies as a problem because these terminals and things are as much as a problem as they had been solved.

The big trick, you see, is to solve it without solving it. And the only way you can solve it without solving it – because if you solved it again, you see, you'd bring it in on the person.

Medicine and psychiatry have been solving these things for a long time. And it just dumps the person into it.

So your solving, of course, has to be done without solving. And, of course, how do you solve without solving. Well, you solve without solving by taking off the solutions. Well, then that leaves it unsolved. Well, that's where it should have been in the first place.

The only mistake your pc ever made, who has a terminal of a waterbuck, of course, was obsessively solving problems about waterbucks at the expense of tigers. How do you solve problems about waterbucks? Well, you solve problems about waterbucks because of tigers. And that's the problems you solve about the waterbuck and waterbuck problems. Waterbuck problems – solve, solve, solve, solve, solve, solve, solve, solve, solve, solve, solve, solve,
solve. Till you can actually work it out – as I told you several years ago – you can actually work it out so that the whole physical universe is just one cure after the other. And if you look at anything in the physical universe, it's there because it cured something. Well, what's the difference between cure and solve? That's the upshot of it.

All right. The other factor that stands in your road – and it stands there good and strong and looms up in front of you – is your pc is not at all sure that anything can be solved. Any pc as he enters in at the lower rung of things is just a little bit hopeful, but he's not at all sure that anything could ever be solved.

And he's sitting there in a total insecurity about his own case. What case? He's sitting worrying; he's saying to himself, "Scientology work? Does Scientology work? Does Scientology work? Does Scientology work? Does Scientology work? It couldn't possibly work. It couldn't possibly work. Couldn't possibly work."

And you say, "Alright. Give me another goal."

"Well, spitting on trees." "Does Scientology work? Does Scientology work? Does Scientology work? Does Scientology work?"

Yeah, smart thing to do is make a citizen out of him. Yeah, oh, you can always do that.

You can say, "What are you having trouble with? What are you having the most trouble with now?" You spend a half an hour trying to find out what he's having the most trouble with.

"All right. Well, who had that trouble? Who had that trouble?"

Now, this is the most elementary Problems Intensive you can give anybody.

"Who had that trouble now? Who do you know had that trouble?"

Well, all right. Spend another half an hour, hour, two hours, three hours getting him to remember his wife. And he finally says, "Oh, oh," his wife had that trouble. Yes, that's right. His wife had that trouble.

"All right. Well, that's fine. Now, what was the dirtiest trick you ever played on your wife?"

"Well, I never – ." *Clang!* You know? "I never played a trick – ."

"Now, what was that?"

"Well, I've had some very unkind – ."

"Ah, you've had some unkind thoughts about your – . Ha-ha! That's real good. Well, now what have you done?"

"Oh, I da-da-da-da-da. I didn't want to do anything to her except beat her. Just beat her. Oh, I remember one time I felt very bad. I beat her and she hit her head against the kitchen stove and it both burned her and bruised her at the same time. I feel different somehow."
That's your inevitable conclusion. That magic is always available in your hands. It's always available. You can make it work from one corner if you don't make it work from another corner. You can always find something.

So this guy is sitting there, and he's saying, "Nothing works, nothing works, nothing works, nothing works."

Well, Q-and-A with it. What the hell.

"Did you ever know anybody else who didn't think anything ever worked?"

Well, let's just assess it out until we finally find somebody for whom nothing ever worked.

"Anybody in your whole life that you know of that's just totally apathetic all the time. Did you ever meet anybody like this? Did you ever run into anybody like this?"

Of course, that's his terminal, but we won't worry about this. Let's blame it on somebody else for the minute.

"Oh, well, yes." He says, "By George, I had forgotten all about her, but Miss Binge, yes. My first-grade teacher. You know, I hadn't remembered her for years."

He'll finally unbury this, you know, dig it up like an old bone. And you run O/W on Miss Binge. He's going to brighten up, going to feel better, see? You can always count on whatever the pc's complaining about as having been present in another person and having been keyed in by the fact that he did O/Ws to the other person. And you can also always count on it that it's also on his own goals line. It's always his own terminal or the oppterm, see. That for sure, in the final analysis, is where it is.

But you can always go on this little excursion and unburden the thing. And sometimes you're lucky and get it at once, and sometimes you're unlucky and take quite a little while to get it. But you can do it. You can do it if you're in there with a Security Check program that's adequate. It's a piece of magic that is always available to you. You didn't handle that part of it, well, handle something else. But try to handle something for the pc. That's one of the first ways to get your meter to read. You handle something for the pc, your meter will read better. Check me out on it. You'll find out that's true.

Person comes in and he isn't anywhere in the perimeter of the human race. You know, we're not trying to make a Clear out of this person before we assess him. We're just trying to get the person to sit in the chair unworriedly with some small amount of confidence that something will happen. That is all we are trying to do.

Well, it takes quite a bit of doing with some people to get them into that state of mind, but that's the state of mind you're heading for. They're going to be able to sit in the chair for the whole length of the session. They are fairly confident that something will happen before the session is over, you see. They have these points of view. That's all you're trying to do. You're not trying to make them well.

This guy had his head cut off in World War II, and you're not trying to grow a new head for him. You're not trying to do anything stupendous like that. You're just trying to get
him so that he's easy in his mind sitting there. He has some confidence you maybe can do something.

Well, it's – you'll find out – the more you work with raw meat, you'll find out, you'll get almost contemptuous of it someday. It's so easy to do. It's so easy to do. We were doing it in 1950, only we did it on a different route. We expected it to key out just by the pc remembering it. You could always find something the pc could remember that would key something out, oddly enough.

Pc's worried all the time about this throbbing pain in his head. You say, "Well, who had a throbbing pain in their head? All right. When was that?" and so forth.

We expected it to leave. Now, you don't expect it to leave. The reason that skill folded up is because only about 20 or 30 percent of them ever lost the pain in their head. You get the idea?

I mean, it was too small a percentage to play with. There was some other factor, because it would key right in on them.

I remember old Burt one time. I took something away from him with a one, two, three and then asked him to remember it again, and he went straight into it like a head-on torpedo collision. That was at old 42 Aberdeen Road.

And the next step to that, of course, would have been to run O/W on whoever he had elected. See, and that would have finished it off and straightened it out. Not to run the engram of the occurrence, but to run O/W on whoever he had elected. Whatever had been wrong with him – and he said, well, that was his Aunt Minnie, or something like that, you see – and it didn't fly away, all you had to do was run Aunt Minnie on O/Ws, you see. You just run O/W on Aunt Minnie.

Of course, you can always run a person for a little while as a terminal. Not very long May be his opposition terminal. You never know before you got at 3D what you're auditing. Whether you're auditing tigers, waterbucks, willow wands, or what.

You yourself may be sitting there as the opposition terminal to the pc. Don't be too surprised when you get a 3D done, if that were the case. On the contrary, think of your auditing skill as rather tremendous that you could get a 3D while you were the opposition terminal. See, you're a girl. The opposition terminal is "pretty girl". You actually were able to sit there – this pc was rather ARC breaky with you and so forth – but you could actually sit there and get a 3D on this person. It means that you're pretty clever.

You're going right into the teeth of the pc's worst aberrations. Every time you sat down in the chair, of course, you keyed the pc in. Auditing will work over the top of that. That does not make an impossible situation at all. As a matter of fact, it's a rather ordinary situation.

So your job in handling a pc is to get the pc to sit down and have some confidence and read on a meter. And then is the time to assess. Well, how long does it take you to get him into this state of mind? Well, you had to be rather effective in getting him into this state of mind. It may take you up to seventy-five or more hours to get him into this state of mind, but it's all well spent because you're not going to get anything done until that state of mind exists.
And if – certainly you're not going to get anything run until that state of mind exists, don't be so impatient. See, what's the hurry? He's been crazy for the last hundred trillion. Sometimes, you know, it's more economical to take a break than to audit. Did you realize that? Sometimes it's more economical.

I've seen people auditing past ten o'clock, for instance, that learned that to their sorrow. It would have been much more economical because the following day they patched up the ARC break of having been audited two and a half hours over their session and not been able to keep their appointment with their girl.

It not only was totally wasted on the night before, but it was actually totally wasted the next day, too, because the two and a half hours he was being audited all the time up against the present time problem of having to meet their girl.

And so next day you have to audit out the present time problem. Well, it would have been better just to have knocked it off at ten o'clock. Then you wouldn't have had the two and a half hours of ARC break followed by the two and a half hours of cure of the ARC break. See, we gained nothing. In other words, we fell down a well. And we climbed up our two feet and fell back five. So that was no good. And these are all adjudications on the subject of auditing.

All right. Now, when auditor training is concerned, definitely it is better to confront a pc in an assessment with an auditor who has a degree of confidence and expertness and knows what he's doing. Because you're going to get – the confidence of the pc is going to multiply at once, isn't it? The pc's confidence is going to go up. Therefore, you're going to get something like a 3D.

All right. So it all works itself out for us fortunately. Fortunately, works itself out. It's just a matter of the pc is being run on Security Checks and the auditor is getting familiar with the meter at the same time and we trust that that auditor isn't going to miss too many Security Check questions.

It's always economical when you're security checking on a training basis – in other words, we're security checking and we're security checking for blood, but we're not too familiar with the meter ... You get some student that you're training sometime, not too familiar with the meter, and so forth. Have him put into his end rudiments, have him end every Security Check session early. In other words, let a half an hour be the time for end rudiments. And he's going to make that up with the pc's havingness or this other burning question which is added to the rudiments in addition to any other rudiments question, you see, is: "What Security Check question has been missed?"

You're going to make him keep that rudiment in. Well, that's the only safe thing to do because he might have been looking out the window whistling "Dixie" when the Security Check question was falling off the pin. Or it might have been a withhold that he has, see? And very often people won't ask about their own withholds. Quite interesting.

But if you say, "What Security Check question has been missed?" then the auditor, you see, doesn't know that he is asking for his own withhold, see? He knew it when he was asking the question "Have you ever raped anyone?", you see? He knew that he was asking for
his own withhold, so he said, [speaks very hastily:] "Have you ever raped a woman? That's fine. Thank you very much. All right. We go to the next question now."

Now, he comes down to end of session and the end rudiments, and he says, "Now, has any Security Check been missed?"

He gets a reaction. So he says, "Well, what Security Check question has been missed? Well, all right. What one has been missed?"

Big inspiration, you see. Knew what to ask right that minute, see? "What Security Check question has been missed there? There seems to be one."

"Well, I – I don't like to tell you."

"Well, what security question has been missed here? Which one was it? Which one was it? Was it early on the list, late on the list. Where ..."

"All right. I'll tell you. It's have you ever raped anyone?"

And the auditor says, "Oh, well ...[laughter] All right. Who'd you rape?"

See, you can catch this one two ways from the middle. Anyway, not being snide about it, that's the safe thing to do on all such things and keeps your pcs from getting upset. You'd be amazed how upset somebody could get from having a Security Check question missed.

You can actually also be amazed how upset somebody gets if you never plunge for the withhold. You should realize that critical thought questions – by this time, you should realize that all critical thought questions are simply trap questions.

The individual says, "Well, yes, I thought some critical thoughts, some critical thoughts, critical thoughts, critical ..."

Well, let him get off a few. So what? It won't hurt him.

And now you say, "Now, what did you do to (blank)? You. You. What did you do to (blank)?"

"Oh. Oh, nothing." Clang.

"Well, what was that?"

"Oooo, oh, that's juicy."

Then all of a sudden we get the source of all critical thoughts. People go around thinking critical thoughts have committed an overt. That's all there is to that. The overt is against the terminal or is associated with the terminal rather closely. Another thing, you'll find that following out instant reads only is always reliable on a Security Check. You never plow along on latent reads.

The only example of this is when you tell the fellow to think over that area, if he tells you he can't remember and you see the needle bang suddenly. You could overdo this trick, by the way. You can say, "Well, now, what did you think of just that moment?"

And the fellow will tell you what he thought of just that moment and that will be the withhold that you're looking for and it'll even surprise him.
This is not, however, a latent read. You're not reading a latent read. You're not asking a question getting a latent read. You've asked, "Do you have a withhold" or some withhold question and you get a reaction. You know, you get an immediate reaction.

Well, you get a latent read on the thing, leave it alone. Don't bother with it. But the other way to use this thing is you just sort of set the fellow thinking, "Now you say that you haven't ..." so on, so on and so forth. The idea – the implication is, "But you – you obviously were falling on something here connected with this. Now, what do you suppose that was?" And the fellow sits back and thinks for a moment or two.

Of course, he actually runs off the track of your Security Checking, so you get the instant read played back – basically what it does. You can always ask for the played back instant read because you asked for it to be played back.

Jumping down people's throats all the time with, "That's it, that's it, that's it, that's it. What's that, what's that, what's that," all on latent reads. "Have you ever raped anybody?" Clang! Well, that didn't – that was an instant read, so we avoid that one. "All right, let's see, what's ..."

"No."

All right. You say, "Have you ever raped anyone?" Clang! "What's that, what's that, what's that? What is that? What was that one? What was that one? What – what – what – what was that? Which way did it go?" [laughter]

And you're going to find something about rape. Hasn't anything to do with the case, and it has nothing to do with a withhold and, boy, can you just run a Security Check out to the longest possible time that way.

But setting a fellow thinking about something – "All right. Now, you just think over this family, here. You're telling me you don't have any more withholds. I want you to just think over this family of yours about withholds, and so forth. Are you sure you haven't done anything more to them? Now, just think it over for a moment." Something like that. I don't care what wording you use. It goes clang.

You say, "All right. Now, what did you think of just then?"

"Oh, well, that. I had been meaning to tell you about that, but uh-hah."

And you got the withhold. I mean, there's other ways of attacking this thing. But the point I'm making is you've got an auditor with some confidence on Security Checking, confidence in handling the meter, he knows the tools of his trade. He can put up a good show and he's rehearsed a bit on assessing and that sort of thing. And he can go in on the pc and get an assessment done providing the pc has been set up. So it works out rather optimally.

If you don't set up the auditor so he's skilled enough to do an assessment, you won't get one. If you don't set up the pc well enough so that the pc reads on the meter, you won't get an assessment and that's all there is to it.

Now, a valuable datum was turned in by somebody in the class and that is the invalidation of a goal is liable to read like the goal. I appreciated that very much when that was turned in.
You get the goal and the terminal will get a certain read. *Tickety-tac*, whatever the read is. The invalidation of it will also read *tickety-tac*. Interesting datum. If you're looking for an invalidation of somebody's goal or terminal – this I give you conditionally; I haven't checked it too closely – but it goes the same. You get the same read on the invalidation, apparently, as that you'll get on the goal.

In other words, the goal thetaopped eighteenth of an inch wide, why, you possibly will get an invalidation on it that thetaops an eighteenth of an inch wide. And it's interesting to be able to differentiate this between that. You'll probably also get a fall and some other things, but – in addition, but this has been turned in as a – as an observation of what goes on.

So therefore, you could miss an invalidation of a goal because it'd read like the goal when you were mentioning the goal.

And you say, "Well, has anybody invalidated your goal?"

And you get a read which looks like the goal's read and you think the person thought of his goal and therefore it read and that wasn't the case. He thought of an invalidation and it read just like the goal, so that you could pursue such things down.

And you can always get invalidations off using various tricks and mechanisms of one kind or another. You can always straighten these things out, providing you're expert on an E-Meter. But the time to be expert on an E-Meter is during the assessment, not after you've goofed one, see? Because it's unfortunately true that – you were insufficiently expert to do a perfect assessment, the probability is you'd also be insufficiently expert to do a proper patch-up, see?

So the time to do an assessment is when you can do one.

Now, therefore, I recommend to you, very thoroughly, in handling auditors and so on, in training auditors, that you don't let your better judgment get overswayed by their tremendous anxieties, that you keep a practical hand on the thing and that you say, on the one side, well, when an auditor can run a perfect Class II examination and he's perfect in his Class II and he can run Security Checks and he knows all of that very well, we'll start to teach him how to run goals – you know, how to get assessments on goals. That would be a smart thing to do.

And on the other side of the thing, somebody comes charging up and somebody absolutely has to have the 3D items now because the world, you see, is going to end tomorrow morning. They've been like this eighteen trillion years, but the world obviously, just by pure coincidence, is going to end tomorrow morning, and they've got to have their 3D now.

Well, there could be such circumstances. For instance, there could be some kind of a circumstance where a guy wouldn't have any time to get audited and wouldn't get audited for the next eighteen years, or something like that. Yeah, you might do something, and you'd be sorry if you did it. But there might be some reasonable arguments; but you'd be sorry every one that you'd bought.

Not to prepare a case for an assessment is the equivalent to just wasting auditing time by the barrel load. So on the one side, prepare an auditor to assess up to the level of Class II.
Prepare him so that he's got all those skills perfect and then teach him some assessing skills because you're now not teaching him basics. And on the other side, prepare the pc up to a point where he can be assessed. Between these two things, you're looking at a high, old time ahead. And if you neglect those two items, you're looking for mud up to your neck. And that's going to be rough. It'll be rough all the way.

First action I would take in going back into an area, if I were one of you going back into an area, would get somebody by the scruff of the neck... And not tell them everything you had learned at Saint Hill in the first morning. Get them by the scruff of the neck and I would say, "'You' rhymes with 'two', and therefore you are going to be a Class II Auditor, and you're overdue as one."

Because it would be very much to your benefit to have some people around that could do all the preliminary work. And then you could run a lot of pcs, and your skill would really count, you see?

And of course, it works out for them, too. If they're doing a perfect job as Class II, why, if you've got some confidence in them, then bringing them along and teaching them to assess, and so forth.

So everybody wins.

But this isn't really on the basis of everybody wins, so much as, as far as I am concerned at this moment, there is no other way to win. If I knew of a royal road to geometry, I would tell you. But there apparently is none.

Okay. Well, I talked to you about Security Checking, didn't I? And I talked to you about clearing, didn't I? Well, that's a good thing because I expect some of these people that are being run now – we got – it's coming up toward – it's moving up toward half the class on levels now. Ha-ha-ha-ha. Half the class on levels. It's getting right in there toward that. It's past a third now, and at any moment – at any moment, you will be saying, "My God, what do I do now?"

And I just wanted to give you some confidence. I know what you should do then, so don't worry about it.

What you should worry about right now is getting all the levels run that you could run on your pc to the best of your ability straight on through. And when you get a dozen or so of those levels run and good and flat, and the tone arm stuck very high and everything gone to hell in a balloon and so forth, I'll show you what you do then. It's really pretty easy.

We're going to make some Clears here. We're going to make some Clears here. Going to make them in rapid-fire short order, and, basically, we're going to make some because you actually have been very patient, and you have learned very well. And I'm actually – where a great many of you are concerned – am quite happy with the way you are doing, quite happy. And the way with the others, why, we won't mention that just now, because I'm in a benign frame of mind. [laughter]

Thank you.
EXPECTANCY OF 3D

A lecture given on
7 December 1961

Is there a heater on there? All right.
How are you today?

*Audience: Fine.*

*Audience: Seventh.*

It's the seventh. All right. And I think you just had a sheet handed out here. Well, now, you've had an experimental sheet handed to you. There have never been any runs on this sheet. It is simply handed to you as a trick pattern of command structure. It has to be tested. Maybe one or two of you will be run on it. But there's nothing very deadly about it. But let me point out to you here that you have an opportunity to clear with the pc, problem, situation, difficulty, confusion, MEST trouble (whatever it is), and what he considers the solution is – solve, made okay, cured, finished, ended, "that's-that-ed" or whatever he considers the thing is, you see.

And then you've got a thirty command which is fifteen bracket. Thirty commands with fifteen brackets, which is pretty good because it covers just about everything, and so on.

Now you'll find that some pcs will hang up a little bit if you don't have "others" in the run and so forth. This is a very comprehensive coverage of this particular thing.

And I would say offhand that if you could run it with "confusion," it probably would run faster than with "problem" on quite a few people. But this gives you an opportunity to clear it all up.

This is no – let me point out to you, this is no change. There isn't any change here. This just gives you – this is all possible elements that you could run on 3D commands with all – all effective brackets. There's even "you and you" in there. There's a bracket in there, "Tell me a problem you have had with you." [laughs] That's for those people amongst us who have valences. [laughter, laughs]

All right. Well, that's just a – it's just a tricky command sheet. I handed it out to you more or less for your curiosity more than anything else. And yet we will run it, and probably do something with it. But possibly, it'll be refined before it is generally issued. I thought you might like to be on the upper end of the assembly line for a moment. Okay?

*Audience: Thank you.*
Well, I've practiced enough for the Washington congress, so I'll sit down.

This is 7 Dec., still a nautical month, and we have the Saint Hill Special Briefing Course, and we have some people who – that look wonderful and some people who look horrible. [laughs]

I'm going to make to you just a few random comments today. I haven't really very much to talk to you about. You're all doing perfectly. There's no possible improvement that could be made either on your cases or your auditing. You will recognize that. Except in a few instances. A few instances your auditing could be improved, and in a few instances your cases could be improved, you see. But on the whole you're all perfect except "you." [laughter, laughs]

All right. You're not getting – sitting in the – way down in the bull pit – you might say, with a pc, you're not getting a broad view of the working of 3D, and I might tell you something about this.

You're getting a one-pc view of it, and your coffee-shop comments. And that's – that's a little different. So what are the expectancies of the thing? And I'd better give you some idea of the expectancies of what would happen with a pc on 3D. And I'll just take one through from start. Okay?

All right. These are broad expectancies, and these expectancies have been routinely borne out. When these are not borne out, there is – it's nothing. It's – the assessment is wrong or something is goofy. When you don't run into the phenomena which I'm going to list to you here, why, something is wrong.

All right. This person staggers in, see, and hits both sides of the door and sits down to get audited. And we put him on the E-Meter, and we say, "Well, what were – what did you have to eat for breakfast."

And he says, "What breakfast?"

And you say, "This morning."

He says, "What – what this morning?" that sort of thing.

Well, he is not in a position to be audited with an assessment on 3D. You wouldn't assess that person.

You ask this person various questions about life in general, and the person seems to have a tremendous amount of worry in present time. I've already told you that present time – an elephant stepping on your toe here and now, even your little toe, is far more important to you than an elephant who squashed your whole body a few million years ago. You – you recognize this, see.

A peanut which you are not able to procure right now is far more important than an empire which you failed to secure several trillenia ago. Let me point this out to you. The havingness – the further it goes back on the track, why, the more unlikely it seems. And the importances of a case must be concentrated, to some degree, at least over this lifetime, and can't be concentrated in the last three minutes of life.
Now, if you find a case that the rudiments are very hard to keep in on, you're finding a person whose life is a constant problem. Unless you can do something for this, it isn't likely you will ever get his attention off this constant immediacy onto what might have caused the immediacy. He's not so much interested in what caused him to go broke. He's interested in the fact that he hasn't got a sou.

Well, that he hasn't got a sou is what's worrying him, and that the causes of his decline and going broke are the least possible interest to him. The fact of the matter is he's broke, and this is all he can concentrate on, you see. There he sits a mental bankrupt, and he hasn't any – any margin on which to operate at all.

In other words, his mind cannot play even easily over this lifetime. You see, he sits there and he says, "Well, when I go home this is going to happen, and when I come back this is going to happen, and then – then I'll go, and so on. I wonder what I'm going to do and-and-you know, it's terrible, and isn't life horrible right here and now?"

Well, you try to get him a split instant off of "now" and of course, he has to at least have the idea of going "then" somewhat before you can get an assessment, even though the assessment is in right here and now. You understand that?

He – he doesn't, however, appreciate that the assessment is in here and now. He would much more easily have you take the elephant off of his little toe than to remove the empire off of his back, you see, because he's not very aware of this empire that's off – on his back. But he sure is aware of that elephant that's stepping on his toe, you see? He's very aware of that.

So, this person is not in an assessable state because his concentration is, well, on the auditor: "Is this fellow going to do me in? Isn't he going to do me in? I don't know. I was audited by somebody out in California one time, and that's enough for anybody. Uh… God, isn't that terrible, and is he going to fix me up or isn't he, or – or is he really? Or is he just in it for the money or is there anything to Scientology? We don't know there is anything, and uh-yuhr-uh-rrr" – automaticity, automaticity, automaticity, automaticity.

And he's saying, "Well, I don't know whether I'll go home or not or whether I've got any money and car fare or whether I should take the bus or whether I should take the car. I wonder if I should buy a car and… uh-nahnah-na and so on. Should I eat breakfast? Should I have steak for dinner? Or shouldn't I? No, it's very expensive. No, I shouldn't have steak for dinner because I might have… Better have beans for dinner. Uh… so forth. I wonder what they'll think if I do have beans for dinner. I wonder what beans…" [laughter] And that – that's just somebody with the rudiments out, see. [laughter]

Well, the process of getting rudiments in can be begun at that point. And if you regard it no more than just getting the rudiments in, you'll see what we're talking about, because it may take seventy-five hours to get the rudiments in.

All right. From that point of natter, natter, present time elephant on my toe, don't know what I'm going to do – from that point for the next seventy-five hours he gradually gets back to a point where he can look at this lifetime, where he can sit in the auditing room, where he can look at the auditor, and keep his mouth shut while you're reading a list to him.
Now, in other words, you're – you're into a condition here where the individual can be fairly relaxed in a session, and therefore you can get the information that you want for an assessment.

So that is the usual condition of a person as he moves into the perimeter of auditing. In other words, he doesn't know, and it's this way. And then gradually, over a period of time, particularly if you are doing something very effective, like Sec Checking, Problems Intensive, racking around one way or the other, curing up his bad memory, anything you can think of that makes him easier, gets the rudiments in, gets some of his overts off, gets him into communication with the auditor. During that whole period of time, you should be getting a more and more responsive meter.

Now if you read it always that the meter action should be loosening up, you are going to make a mistake. Because a meter action can get – get looser and tighter, and so forth, somewhat disassociated from the response of the pc's mind on the meter.

There's a difference there. The pc comes in feeling very relaxed and – physically – and feels very relaxed physically and actually does get a fairly decent dial drop, see. Feels pretty good. Well, actually, it doesn't really not follow, and it doesn't really follow that his mental response to your questions is better. It doesn't immediately follow.

The response of the meter to the question is not necessarily independent of this other, but it is itself – it is itself. How much is the person reacting. Now, I'll – let's give you an idea. I might just have been auditing this person, and I straightened them up, and they feel fairly comfortable, and they've got a dial drop on the can squeeze, you see. And the following morning an HPA student from a Central Organization fumbles with the meter and asks him a few questions, and so on. He'll get a dial drop. He won't get any response. You get the difference here?

He'll – he'll still get the dial drop, but he says, "This is different than what happened to me yesterday," and he's, of course, got a present time problem. He – he says, "I don't know," and "I – I'm not sure," and "What is this all about?" And he's thinking about this, and the meter response to the auditor is the factor there which doesn't necessarily coordinate with the drop of the can squeeze. Do you follow that?

In other words, your meter might be responding if somebody were making it respond or if the pc accepted who was making it respond.

Now, your job in the first seventy-five hours is getting the pc to accept the meter responding, see? He – he accepts your communication. He feels that it's better – it's – it's all right to be audited by you.

Now, this is a hard bridge for an auditor to cover during that particular period, and it's something that you should put your mind to. This – this is something that you should know as – as an auditor.

Yes, you can goof up. Yes, you can make mistakes, but your auditing – even the worst auditor in this unit at the present moment, perhaps with one or two exceptions – is better than most of the auditors in – practically all the auditors in 1954. See, there's – there's – here's a difference of auditing here.
We can't go out on the basis entirely that it is quality of auditing. Let us assume that the auditor does a halfway interested, technically correct job on the pc.

All right. Now, let's just take auditor A who is doing a halfway interested, technically correct, more or less, job on the pc, you see. He's not doing a perfect job. He's not doing an imperfect job.

All right. We have him, in rotation, audit fifteen pcs taken from different strata. This is the same auditor. And then without allowing those pcs – without allowing auditor A to do any advertising, without allowing him to tell them how he is a good auditor or any propagandizing at all – we take these pcs, and without permitting them to talk together, we get each one's opinion of this auditor. We're going to get fifteen different qualities. Going to get fifteen different opinions of the same auditor. And if these people are unaudited people by and large, you're going to get fifteen bank expressions to something that had nothing to do with the auditor.

Auditor was wearing a yellow dress. All right. Very good. Pc number one likes yellow, so it's a good auditor. Pc number two doesn't like yellow, so it must be a bad auditor. And it'll be something as oddball as that.

During the first seventy-five hours, you should actually not take to heart any opinion the pc has of your auditing. You should not take it to heart at all. Because it has nothing to do with observation. Nothing to do with it at all. It's just his various reactivities reacting. And I've noticed you, as auditors, worrying far too much about what the pc thought of you in the early stages of your auditing of the pc. Well, the reason you're worried about it is because your rudiments aren't in.

Well, your rudiments wouldn't be in. It wouldn't matter what you did or if you had changed the color of your hair and wore a funny nose, you'd have the same opinion exactly on the part of the pc of your auditing. And if the pc… Well, let me give you a better example.

Did any of you ever have your parents get acquainted with you? No, you see. Well, this had very little to do with you, but had a great deal to do with your parents' ability to observe. They didn't observe very deeply, and so they didn't know you very well. That's about the way that adds up.

The pc's ability to observe during that first seventy-five hours of getting straightened up is negligible. His powers of obnosis stink. He could go down the street, and you ask him – I'm not talking now about a strange off-color, neurotic personality. I am talking about Homo sap, average issue, school tie and the lot, see. And we have him walk down a street one block and then ask him at the end of the block, "What have we just seen?" and you would be amazed. You have either seen nothing or you have seen something else, or the people you have passed have been entirely different people. His obnosis – the power of observing the obvious. The ability to observe the obvious. It just is not present.

So you actually should not feel bad or be influenced by this preclear's opinion of you at all, up until the time you've got 3D levels about three-quarters of the way run. Because, you see, he can't observe. This – this is something you should keep in mind. It's quite important, because I've seen a pc who was sort of bad off, curse and swear at one of the finest, smoothest
auditing jobs I've ever seen. And I've seen a pc who was apparently in fairly good condition, and so forth, totally satisfied with one of the lousiest auditing jobs I was ever punished to witness. There's just – the pc had nothing to do with this.

So what you do, you see, is you be satisfied with yourself. You see? "Am I turning in a representative auditing job? Is my interest in the case adequate, and is my technical accuracy, as I work with this case, is that adequate? Am I turning in a representative auditing job? Is my technical skill there?" And that's it. Now, if you have that confidence, you'll never get rocked. Otherwise, you will continue to get rocked always because your job could be utterly perfect, and you would still get your eyes clawed out by some pcs, and your job could be horrible, and you would still be kissed on both cheeks by other pcs, you see. "Oh, my auditor's a wonderful auditor. She gives me such good advice between the auditing commands." [laughter] Could get pretty wild, couldn't it?

So it's actually up to you to hold and maintain a standard of auditing. You have to know what is – what does a session look like? And what should it look like? And then just hold that standard, that's all. As best you can, hold the standard. Just turn in a good job of work on the thing, one that you won't be ashamed of, and one that you don't think I'd be ashamed of, and you'll – you'll have it made, you see. That is what counts. It is your belief in your auditing job.

Now, that belief, of course, can be enormously influenced by the pc, providing you are not sure whether or not you're turning in a technically perfect auditing job. As soon as you become sure of that, no pc in the world could shake you. It's only when you are doubtful about what you can do, doubtful about your skill and doubtful about your technical accuracy that you can be shaken.

Now, you just go ahead and hold a standard. That's very easy to do, and so on. Because the first long run here is not going to be done before a reliable judge: the pc. He is not a reliable judge.

In the first place, he's – he's even further introverted during a session than he would normally be. So he is frankly less capable of observing because you're trying to make him observe himself. So his observation of you, of course, is very poor. So, don't pay any attention to that. Do you hear me on this? Might practically save your bacon some day.

Maybe if I'd told some auditor this earlier, why maybe we'd had a few auditors who wouldn't feel so bad about some of their failures or something like this. If somebody had ever told me that, I know I wouldn't feel so bad about some of mine. So this is the way it goes because that first seventy-five hours may, if your technical accuracy is good and if you're doing the things and using the tools the way you should – remember those tools are well put together. Don't – don't think those tools aren't.

You're going to see a little change in beginning and end rudiments adapted to Security Checking or adapted to 3D, you see? You're going to see a little variation between those two Model Sessions, but the bulk and body of Model Session is unaltered. These things are not altered. Your Security Checks, they're very set. Your Problems Intensive, that's very well set. The packaged processes which you have, they're very well set. These things are not variables. And you are not dealing with variables.
I could give you a table, and I will try to compile you a table, of what to do in almost any – with any type of pc – a very simple table, using exactly the tools you know how to use.

But those first seventy-five hours, well, you just do them.

Now we get up to a point where the pc has needle response. I don't say that it takes seventy-five hours. And I don't say that you, graduated from Saint Hill and really knowing your stuff, will not be able to get enough altitude over some pc who is sitting there kind of wide-eyed and overwhumped anyhow. And you say, "Give me your terminal," bang! You got it, you see. I mean… Crash, the meter goes. You get tremendous meter reads, you see, because you got altitude. Don't count on other auditors you train having the same altitude, and don't make the mistake that I continue to make. Please profit by my mistake. I make this mistake continually.

I can sit a pc down; I know my business. I have altitude with the pc. Even when I don't have altitude with the pc and know my business, I can get command value over the pc very rapidly. I can really make a meter read. Can really make it read.

All right, so then I expect you to do the same thing. That's not a proper – proper thing for me to do.

But over the years, over the years I have finally learned this fact: One, that I don't know what a process will do until it is done out of my sight. See, I don't know what a process will do. And the other one is – is that I have every reason to expect comparable-level auditing from everybody who audits. Oh, you thought I was going to say the reverse, didn't you? No. You can audit like that because I found out I audit the same way you audit except I just know what I'm doing, and you don't know what you're doing. And that unconfidence that you sometimes display at those crucial points on the thing is your only fault. Now, all you've got to do is get that confidence, and you've got it made.

I'm not saying then that a pc, raw meat, could not be assessed on 3D. You've got tremendous altitude with this pc. And you sort of overwhump him, and you hold him like a frozen halibut in-session, and he responds. And he hasn't any choice. I'm not saying you cannot do this. At the same time, I'm not advising you to do it. Not that you couldn't get it. Not that it wouldn't be fine. Not that the pc wouldn't get tremendous gains. Not for those reasons. But because you're not going to get that even a run of it. The bulk of the pcs which you sit down across from will not be in any shape to audit, and you'll be wasting your time on Class II skills when you should be assessing. That's all.

So that you – you should have enough nerve, either yourself, to set up somebody you care about a great deal as a pc, to set them up perfectly for assessment and get the rudiments in, or turn them over to somebody to be set up one way or the other so that you can assess them. That's what you ought to be doing with it.

All right. Now, what happens at this point of assessment? Well, you've got a needle response. Now, don't expect the needle response to stay constantly good. You've got these rudiments in sort of on the basis of mounting a couple of toothpicks on the side of the Empire State Building, you see? And there's a high wind, and toothpicks are frail, and they're liable to fall off at any minute.
Don't expect, because you have invested seventy-five hours, that they will stay in. All you've done is guarantee that you can get them in. That's all you've guaranteed with all of this. Actually, the pc will feel better; he'll live a better life; he'll think things are wonderful. You've actually done something to change his way of existence; he'll think this is fine; he'll have more confidence in you. These are all factors. He'll think these are gains. You, under your future experience, will learn these aren't gains at all. They don't amount to a hill of beans. But they amount to something to the pc. They're more than the pc could get anywhere else from anybody else.

All right. And you've just brought him up to a point where you can get the rudiments in. That's – that's about all you could say.

You brought him up to a point where at the beginning of session you have some guarantee that you can get the rudiments in and that they will stay in, probably, maybe, throughout the session. See, probably, I guess. Mm-hm. Maybe, you see. But it's no more positive than that.

Now, you couldn't have gotten the rudiments in on him seventy-five hours before. See, so that's the single gain that you can expect to have made: that you can get the rudiments in on the pc after the pc has been well prepared. It isn't now that the rudiments will stay in on the pc. They won't. But they will be much, much better, much easier to keep in. You won't find yourself coming into session and having to take up two hours of the session with a present time problem. See, you can get the rudiment in as a rudiment.

You've got him to a position now where you can call – he tells you he has a present time problem, and then you say, "Well, what's the prior confusion to it?" See check it a little bit, and it blows, and you can get on with the session. Do you understand?

But every session – every few sessions you may find yourself confronted with some upheaval in his life which requires that you spend a whole session putting him in some kind of shape – every now and then, even though he's been prepared.

You've just given yourself the fact that ordinarily you could get the rudiments in. That's all you've done. After all that period of time.

All right. Now, we don't care whether the pc feels much better, whether he thinks Scientology is wonderful or whether he thinks it's now horrible. We care nothing about his opinion. We just hope that he is in a bit better communication with the auditor. That is all we hope for. This pc is going to keep telling you constantly, "Well, you know, my left eye still twitches. Hm-hm-hm-hm-hm-hm. My left eye still twitches. Hm-hm-hm-hm-hm-hm. You know, when you ran that Problems Intensive it didn't do my left eye a bit of good. Hm-hmhm-hm-hm-hm. You can kind of touch the head of the arm so that it'll play the next groove. But that's about all you can do about it. Because I can tell you frankly his left eye twitching is buried in the middle of some kind of a wild Goals Problem situation that you couldn't have got to with an oil-well rig, you see. So, just pat them on the back and say, "That's fine."

---

8 This refers to the old record players which sometimes – when the record was damaged – sprung always back into the "same" groove instead of going forward.
And they come in and they tell you, "It is so wonderful, so wonderful. I feel so free. I feel so marvelous. You know, my chest no longer hurts. All these years, my chest has been hurting. And my – chest doesn't hurt very much. And I... Achmmmmmm! It's marvelous what you've done for me. I'm so happy about the whole thing."

You say, "Thank you. Thank you very much," and get on with the game because you know very well his chest is going to turn on in full before it turns off again. See, you frankly haven't – you – you haven't done more than key a few things out.

All right. That's fine. But, if you expect to do anything horrendous for him, you see, in five hours of Security Checking and so forth, disabuse yourself of the idea. You're not. Whether he's happier or unhappier, we couldn't care less. It's just whether or not we have to do that five hours of Security Checking while we're assessing or do that five hours of Security Checking before we start assessing. And it's always smarter to do it before we start assessing. That's – that's all there is to that.

All right. So, we get him into assessment. Now, we spent – there's time been spent on this pc. This pc is in pretty good condition. Sleeps, oh, almost every now and then, you know. [laughter] Sleep is much better now. Sleep on the job all day or something like that. And he's eating. Pc's eating now. He's eating now. He's graduated from eating only nuts to being able to eat bread and nuts. You see, all these great gains, you pay no attention to these things at all. But he's got all these things, see. He's all straight, everything is nice, life is going to continue out now at a high climb, and everything is going to be wonderful. And then you start assessing.

Well, during the goals, he's very, very interested, and everything is fine. Now, during a goals run, a pc is very interested, unless you start goofing and losing his goal, and invalidating it and so forth – he'll get upset. But even then you can bring his interest back. It's marvelous. Their interest is right in there with goals. And they go right on with this very nicely. And they just do fine under a Goals Assessment. And nobody's ever happier than a pc when he finally finds his goal. And that's quite understandable because he's been looking for this thing for a long time. If anybody had come up to him three or four years before and say, "What do you intend to do in life?" it would have thrown him into the awfullest confusion he'd ever heard of. And now he can say to them, "What do I intend to do in life? I intend to knock the tops off buildings," or whatever goal you found on the pc, see. That's fine, see? All right. But he feels good about this. I'm not making light of that point because that is a tremendous point. He feels fine about this.

Now, the reason Routine 3 is so attractive and why you're going to find people backsliding and trying to do Routine 3 is just this: You can find a terminal, and the pc is very happy to find his terminal. So now he's got his goal, and he's got his terminal. You can also run this terminal, too. And it makes the pc happy to have it run. That's all dandy.

Now, that route, he'll stay happy. The other route that you're going to follow, he's not going to stay happy. So you just make up your mind to it.

Now, he's very happy, and he found his goal, and he was so happy to find his goal. And he's very cheerful, and he's got this big gains of now he can sleep all day on the job, and he never could sleep a wink before. And he now eats bread and nuts, and he only used to eat...
nuts. Now, you got all those big, tremendous, forward strides in life. On your very next action, you're liable to lose all of them.

He's liable to backslide on any one of them because it's something like you getting in with a stick and stirring it up. Now, the pc will stay with it, but your technical accuracy and the rapidity with which you do it measures how well that pc will stay with it.

Well, I don't care what part of 3D you find next. You can't find the terminal because you haven't got the modifier. You could find the modifier next as in 3A. That's a hell of a fight trying to find a modifier when you've got no oppterm or anything of the sort, but it may – keeps the pc a bit happier. The pc really does not get terribly unhappy. You're still fighting on his side, you see, when you find the modifier.

No, I'm afraid it's a little bit better, however, to just run down the 3D exactly the way you're doing a 3D. You look for the opposition terminal. Well, no telling what you'll find. You may find the guy's terminal, but you might not have found his goal in the first place. That might be the opposition goal. This thing is liable to go all topsy-turvy before you get through. The point is have it right. That's the main point. Don't have the pc happy about it; have the assessment right.

And if your goal is to make the pc happy while you're assessing, you're being very foolish. You should keep the rudiments in while you're assessing, and the devil with whether the pc likes it or doesn't like it, you've got to have enough ascendancy to make him sit still while you get the rudiments in and while you find the next item. And this pc is going to go over the rolly coasters.

The process of finding the oppterminal – well, you're asking the fellow to confront an enemy he has never confronted. He just had never confronted this as an enemy. He's never even identified the enemy. It may be his best friend. You might even be it. Who knows? Who knows what this oppterm is going to be? The thing to do is get it before he has a chance to wake up and inspect it. That's always fastest. In other words, let's get the thing and write it down, and three days later on the comm lag, he says, "What do you know? Opposition terminal – a building. You know, I'm in them all the time." You know? I don't care. Just find it. You can find it before he finds out about it. If you – if you do that, that slippily, you'll get it for sure and get it very rapidly and easily. I'm not saying to be covert about it because you can get it head-on, too, with his full cooperation or without it.

All right. Getting his opposition terminal is going to upset him because you're going to turn on the winds of space. He's going to feel that backflow. He's going to feel that he is opposed. He is going to feel that you are no longer really his friend. And if, at that stage of the game you've got – he's got overt on you, that you haven't pulled, by God, you can't hold him in-session worth two nickels and a collar button, don't you see? He's just not capable of sitting there.

Well, actually, you're sitting there chanting at him when you're doing the assessment list. He's a cop, and you're – you're saying, "Robbers, thieves, murderers," so forth, and you're going on over every enemy the cop has. It's very easy for him to associate you with a deadly enemy at that point. See, if your rudiments are out, he will, too. Why? You obviously are
connected with them because you are saying these things. These are dirty words to him, really.

Pcs will get some of the most remarkable actions on having assessment lists read back to them again, or getting them checked out. One has even informed a checker that he shouldn't use such dirty words. The most remarkable reactions occur.

Well, don't expect them to be sensible reactions because you're dealing with the bottom rung of his aberration. Now, he may be a nice guy and sensible at all times except when being assessed. And then while he's being assessed, of course, you're playing around with and stirring up all of his worst, meanest, most viciousesses selves.

Now, doing an assessment is sort of like taking a pomegranate apart. When you first looked at the pc, these things were not separate. These were all identified, and by assessing them, you separate them. Don't think that this separate item was sitting there separately. No, it is the piece of glue to which all other pomegranate seeds are stuck. And it's quite a trick because it might be any of the pomegranate seeds, you see. It might be any of them. But in actual fact it's just one of them holding the rest of them together. And everything will come off except the last seed. And that's the glue. Only that isn't part of the pomegranate. That's the bank.

You've now got your hands on the bank, and the rest of this that you were pulling off of the thing, you have simply been causing the pc to differentiate.

So, the case is coming apart in your hands while you're assessing. So therefore, if you do a crude job of assessment, it is very comparable to doing a very bad job of auditing. You see, if you aren't handling the assessment well and pulling this pomegranate to pieces rapidly or skinning the onion or whatever you want to compare it to, you're doing a kind of a slow, painful auditing job on the fellow. Because it's really auditing. It really isn't searching. You see, you're pulling those seeds off one after the other, and so forth, and you may pull out the center seed and put the whole pomegranate over here on the right and say, "We're through with that." And you will do that often. That's no great blunder. You've missed it.

After this, you keep – all of a sudden there's nothing sitting at the table in front of you at all. What happened to the pomegranate? See, it's gone, and we have to get back and get the original list. That's why you always preserve original lists. Because it might have the one piece of glue that was holding this thing together on it. You see?

There's only one, and there it is, so you've got to have that. And in taking this apart, the pc gets a tremendous feeling of relief when you finally find the one piece that was holding the rest of it to pieces, and you identify it.

Now, he doesn't have to agree with it at all, and in a lot of the cases he won't verbally agree with you. He won't verbally agree with you. He will say, "Oh, well, that couldn't be it, and I just gave you that in the first place. I was actually just throwing a red herring. I this, I that, I… that..." so on and so on. Because a pc can always be counted on to do himself in if you restimulate his opposition terminal, because that's what he's trying to do in. And he will do in what you will find if he's been trying to do it in in life. Yeah, after you've found it, he will try to do it in. This you can count on in a large number of pcs. After you've found it, he
then explains to himself how it couldn't be it and you couldn't be it. See, he will do this. This is in some number of cases.

The thing which you will see most generally is the person will be just, "Well, of course, yes, that's it! Well, of course, yes, that's it, that's it! No, that couldn't be it. Well, I sure doubt that, yeah. Well, that's it! Of course, that – that's the one. I – I really realize that. That's just exactly what I've been doing. That's just exactly. I don't know how you found that thing. Don't know how you found that thing. Couldn't be right." He's liable to be of some kind of a reversible frame of mind here very easily, so you don't pay too much attention to it.

All right. You go on and find the opposition goal. Now, this is cruelty beyond cruelty. Having turned on the winds of space on the bird with the opposition terminal, you're now going to chant opposition goals at him. Well, if this pc were very touchy, of course, it might be a smarter thing to find the modifier before you found the opposition goal. It doesn't matter what sequence you find the remaining items in, but this is going to turn on more winds of space, but also it's going to make things much better when you finally have it. So it's sort of a choice at that point.

And then when you finally get it, he feels better, he feels worse, he feels better, he – but in general feels better.

Now, you're going to find his modifier. And of course he doesn't believe that, although he says, "That's what I do, all right. Yeah, but… uh… Yeah…" That's what he does. They – they have a tendency to accept their modifier pretty well, except if it's terribly discreditable and they have given you a terrible time finding it. And if they've given you an awful time finding it, of course, they've got overts on their own modifier. They've got overts on you now, and they can – liable to get all balled up this way.

Well, you go across now having found the goal-plus-modifier and knowing what it's against. You can find the G-plus-M by simply getting the opposition, "What would oppose the opposition terminal?" That's easy, isn't it? Or "What would oppose the opposition goal?" See? You could take it from there or you could just take the goal-plus-modifier and "who" and "what." There are many ways you can assess this thing. If you wanted to be sure, you would assess it several ways and find out how many parts you have and then check the parts out and you'll find some of them are null.

So you could get more parts, apparently. For instance, if – if you got the G-plus-M, the goal-plus-modifier terminal, you just got a list of these things, you assessed them, and you got a G-plus-M – you don't like it. You – you don't think this is quite right, or you just want to be sure, or for some reason like that. You could turn around now and you could get, "Who or what would oppose opposition terminal?" Same assessment, isn't it? But "Who or what would oppose..." You get another list, and you find out nothing occurs on this list that occurred on your G-plus-M list – Where are we going now?

Well, that's fine. Assess it out and write it down and don't worry about it too much, but try to find some new ways to find parts, you see? See if you haven't got some excess baggage here someplace. Find the opposition "actual goal," the actual opposition goal which isn't the opposing goal at all. It's – it's what the opposition as a person would do – person or being would do. Find that. Find this and find that.
Well, the aspect of the pc while you're doing all this sort of thing is – because you don't seem too confident because you're finding two or three additional parts or you're trying to sum this up or add this up, and he, of course, is withholding like mad on these things, and all of this – is an upset aspect. And all these beautiful gains are liable to just blow up in smoke through that period.

Somatics turn back on again, the pc becomes apathetic, the pc becomes very upset, the pc becomes this, the pc becomes that. The only thing you should worry about is when the pc becomes something so they won't have a session. That's the only thing you should worry about. But those beautiful gains might be all wiped out, right on up to the time when you've got a proven-up, settled assessment.

Just before that assessment is finished, you can expect this pc to be an absolute "blank." The "blank" doesn't mean he's blank; it means a dirty word. Pcs before a 3D assessment is finished, can be expected to be bitchy or upset or unsettled and worse off. They don't like it. They're in a terrible confusion.

You've thrown them into the midst of tremendous numbers of parts and haven't found the parts they – that fit. And so they react to this confusion and they are very, very upset. And there may be no worse period in their whole processing time, in any processing session, than they go through twenty-four hours a day during a 3D assessment. They do not look good or sound good when they're going through the ends run of a 3D assessment. Goal? Fine. Opposition terminal? Well, all right. Opposition goal? All right. Modifier? Well, we're not quite sure by now. And by the time we get down to finding the terminal, oh, God. Life is too horrible. They're liable to become very dramatic. They're liable to become much more dramatizing. Anything that they would naturally do by reason of their valence they now do twice as hard. Not commit crimes, but they're liable to be very, very hard to get along with during that particular period.

I've noticed this as a recurring phenomenon. And just before a 3D is finished up, God help everybody. So that's not necessarily a beautiful vista. And all of a sudden you finish it all up, and they say, "Of course," and if it's absolutely right, they relax. And some of these gains we had before, but which vanished during assessment, return. And that's a good thing that they now have recovered confidence because they're about to get them all back again the second we start a run.

Frankly, that is the aspect of a pc right up to that point. You can expect that.

All right. Now, during the first assessed run, we can expect the pc, during the first part of the run, quite ordinarily – it all depends, on a long run – if a person's been run on the terminal before the first level, flattening of the first level, is pretty – pretty easy. They don't mind this too much. Or they mind it terribly, or it could be quite variable. But ordinarily, your first run, the pc's willing to sit there and take what comes and so forth. And you run the second level, and – this is in a fresh pc that had never run the terminal before – and – and you get them where they'll sit there and, "Well, and there's the next one. That's all right. I'm not quite sure about all these somatics. Is this quite right?" This couldn't be right because he never had this many somatics before. And they're sort of used to the somatics which they have, you see, which is a severe pain across the throat and a hollow feeling in the stomach. That is life.
"How do you feel?"
"Well, I feel a severe pain across the throat and a hollow feeling in the stomach."

They would have told anybody this for years. And now all of a sudden their best friends are gone. They have a horrible pain in the middle of their back, and their right leg feels paralyzed. This hollow feeling in the middle of their stomach has become much more hollow, and their throat isn't there. And this is a totally unfamiliar view. Well, what's happened to them is the Goals Problem Mass is moving in. You have whistled it up and you've said, "Well, all the way. Come on." And it's moved on in.

Actually, it hasn't moved at all, but their perception of it has changed, and they finally will focus on it, and when they – if – if it isn't a correct terminal, they never get the goals-modifier terminal inside their own body. It's out there someplace.

But eventually, after two, three, four, five levels have been run – certainly by that time they should perceive that they have been living in a double house, and that where they stand, something else has always stood. And where the body is, something else has always been there.

Well, the somatics that they get at this particular stage of the game are very changeable, they're very harsh, they are very upsetting, and they go clear around to the back of the head. They make them feel like the back of their head's going to fall off. Actually, they're frankly not too worried, but they sure hurt. They don't like this particularly. They're liable to complain, and you're liable to believe that something is wrong. Yes, there's something wrong if that doesn't happen. There's something wrong with your 3D if that doesn't happen, because that is routine.

All right. Now, what's the routine behavior of flattening a level? Somewhere from – it all depends on how strong a level you found off the Auxiliary Pre-Have Scale. And it might even – you might even get a stuck TA with only two or three commands. And then it takes you the rest of the bracket, and by the end of the bracket, it's obvious that the needle has been still for half of the bracket. Well, that's – that's getting too tough. That's awful still. That's awful stuck. But normally the tone arm, if the assessment is proper, can be expected to go up and stick. And then the needle sticks. First the tone arm sticks, and then the needle shows a little driftiness, and then the needle sticks, too.

When you're first running across these runs, that needle can stop with a clank. You can almost hear it clank. It is just not about to move anyplace. It is in brass. After a while, on later runs, you'll find it just sits there. It doesn't necessarily sit there at screaming attention. But it's still stuck, and it's still stopped.

Now you can expect, then, on this first level, for the tone arm to go up and the needle to stick. And that happens. And when that happens, you don't overrun that. You do another assessment, and between them, if you had the right havingness, and if everything is going well, and the rudiments are in, and so forth, the person should come down off of that before you run your second run. It doesn't matter much if they don't, but they actually should come down off of that. You should be able to get them down off of that, just by virtue of their not running it for a few minutes.
And you run the second level, and it goes up and sticks. The tone arm sticks and the needle sticks. Both of these things stick. And they stick very solidly, and you don't want to overrun that too far because assessment will be very difficult to do. So you come off of that, and you do it again, and it just – just keeps happening. Up goes the tone arm and sticks. And the needle sticks. And that is all that happens.

And you go on, and you run level after level after level after level, and that's what happens on every one of the levels. And the pc's somatics, however, abate after a while. They get less severe. After you've run four or five levels, why, the pc's somatics are – he's getting used to them. There are still sticky masses inside of him. The mass picture hasn't changed, and so forth.

Now, during this early run and even very late in the runs, you cannot expect the pc to get clean, clear pictures. There – everything is fuzzy. He won't even see probably a picture of the terminal until you have run something – if you count running a level as also rerunning a level – until you have had about twenty runs on levels, he may not even get a dub-in picture of the terminal. And he'll eventually collide with a dub-in picture of the terminal in some phase or another. This may puzzle the pc, but of course he is it. How can he see himself?

The pictures are all smashed in on him, and they're all fuzzy and mucked up and they aren't really engrams. They aren't really pictures. They shouldn't be in 3D. They probably aren't in color, there's probably nothing very startling about them. He gets impressions of them. It's a sort of there's a picture over there way over to the right someplace, and he gets something about that. There's a steady picture is liable to occur and reoccur out in front of him that he can't quite make out. Black ridges occur inside of his head and around him, and he's not sure what these things all are. And that's quite ordinary. Quite routine. Nothing to that. If he had a clean track, he would have been able to inspect it, and he wouldn't be there. And he wouldn't be in that condition, obviously.

So, all right. Now, what is the – that's – that's one of these aspects, that the needle goes up and sticks, and tone arm is... Pardon me, the tone arm goes up and sticks, the needle sticks, and that the pc has no pictures. Now, after you've run ten or twelve levels or something of that order, you should rerun all of your levels. You just take them up in sequence from the earliest level through and rerun them.

Frankly, you should rerun them by assessment, but it's not the same kind of assessment that you do on the Prehav Scale. You just mention – you take the first level and you mention it, and you don't get any needle reaction, so you take the second level, and you mention it. And you get a needle reaction, so you run that level on its same original commands again. And you'll find there's a little tone arm motion left in it, and it goes up and sticks, and as soon as it goes up and sticks and you're sure everything is good and stuck for a few commands, and so forth, you come off of the thing. And you mention the third level to the pc, and that, of course – nothing on that. And you mention the fourth level to him; there's nothing on that. So you mention the fifth level to him, whatever it was, and you get a tick or a sudden stick.

All right. You rerun that level. You rerun it again. And so you go over these things.
Actually, you go over all of them a third time just this same way before you go on up above – certainly above the level of ten or twelve. Before you find ten or twelve levels, let's get all of the early ones cleaned up by passing over it at least three times on this assessment basis that I've just talked to you about.

Now, the pc during this time has not lost the mass. The mass is still observable. It is much lighter. By the time you've done the second or third run, you will find – you know, across those levels – and before you're ready to do new Prehav Assessments you will find that the pc isn't really bothered by these things, except occasionally they get a sharp pain or suddenly be sitting there thinking about nothing in particular or somebody will be talking to them, and their oppterminal gets mentioned or something like this, and they feel a sort of a zhuuuuuu. They feel kind of winds of space hit them for a minute, or they had a hell of a pain in the back of their head or – or their chest will start acting up suddenly, and then they forget about it and so on. It actually isn't too uncomfortable to them. It's probably sharper but actually not as bad as some of the illnesses they have had.

Now, they're liable to believe during this period that they're going to get sick. That is to say they're liable to throw up, they're liable to get very – thing – or they're liable to develop a fever, or they do develop a fever between sessions. But their sicknesses for the trillennia have all come out of this Goals Problem Mass. How do you expect this person to do otherwise than react to it?

As a matter of fact, I did the anatomy of how a thetan feels pain, and they actually feel it through a Goals Problem Mass. You have to have a valence and a valence in order to – for a thetan to have this sensation of extreme pain. You have to have a double-rooted whizzle to collide with a whatnot, you know. You have to have two things colliding, and then he believes he isn't one of them, and believes he is the other one, and – and you get that. And then these two things will come together, and then you get the pain registered. What you're doing is pushing the pc beyond the borderlines of extreme pain. He will not be able to feel extreme pain when you figure – when you get one of these things flat.

All right. And of course that's very bad news to a pc who is so overwhelmed that he thinks pain is delicious.

Anyway, along about the third run or something like that, or sometime during that period, a pc is liable to suddenly develop the symptoms which used to tell him he was going to get sick. And this will worry him.

Well, I'll give you an idea. The person gets a – gets a bad throat, bad throat. And they knew at one time or another that when their throat felt that way that they were coming down with a sore throat and tomorrow it was going to be worse. Well, frankly, this was the somatic in the Goals Problem Mass which, when it moved its few inches further on to the rest of that particular engram, was the sickness which they used to suffer from, see?

And you've caught them at this point which is the warning point. And they've always used this as a warning point. They got so that they noticed that when their throat got dry, they then went on and got sick. What they didn't realize was what was making their throat dry was always – also what was making them sick. And it was simply a cycling through an incident of some kind or another which was totally, flatly worn on the body.
So they get this, and it gives them an idea they're going to be ill, and they go around thinking they're going to be ill. And they don't get ill. It's very puzzling. And it upsets their considerations with regard to these things because life has been pockmarked and predicted by these various sensations, and their map is disappearing, you know?

"When am I going to feel sick at my stomach? Well, I'm going to feel sick at my stomach when I get this small feeling in the back of my neck. Everybody does, you know. Before you're sick at your stomach, you get this funny feeling in the back of your neck." Or, "I know something terrible..." Here's a more familiar one: "I know something terrible is going to happen because I have this terror feeling in the pit of my stomach. And I know that will—probably something bad is going to happen tomorrow." And all of these signals turn on, see? These are superstition signals that the person has used.

And of course, they wake up in the morning, and by God, they've got that terror stomach. They know something bad is going to happen today. It always has happened. In the past, every time they woke up in the morning, you see, and felt that way, why, something bad was going to happen in the rest of the day. That's for sure.

So they wake up in the morning, and then their stomach feels bad, so they know something bad is going to happen in the day. And then they get up out of bed, and it disappears. So they suddenly remember it was the level the auditor was running on them yesterday, which was "worry" or something like this, you know, or "terror" or something, you see? And it evaporates. They don't mind all this. It's just what's going in and out.

Now, as you go on and run Prehav levels from that point on, you get a slow gain. The pc is not really going to raise hell with you and not going to complain about lack of progress particularly, but they are going to natter that it doesn't all happen at once.

Well, now, you're running a problem, and the pc suffers from all of the illusions given to anyone about a problem. A problem is everywhere at once, is hung in an instant of time, and time doesn't move. These are all the illusions given to one by having a problem. And when he has a hell of a problem, he always knows time is not moving. And he'll talk to you about why isn't it happening faster, and I wish it could happen faster. And this is all this—this stuff which is resultant from this—from being up against the central problem of their whole track, is what you collided them with—with a crash, you see.

And this runs out slowly. I hate to tell you this, but it runs out slowly. It does not run out rapidly, because you're running it out on the basis of socking the pc into the problem. You're not taking any chances on this thing going off and getting keyed out and then keying in again in a few years. The best thing to do is throw him in the middle of the whirlpool and get rid of it.

What's going to happen here now is that he is not going to notice his improvements. This could upset an auditor. It is quite common. The pc does not notice his or her own improvements except on a comm lag. They notice them on the basis of about three days or four days or something. They suddenly realize they haven't had any trouble sleeping.

Well, for years, you see, they've had a lot of trouble sleeping. They can't even spot what this was or why they stopped having trouble sleeping. They just don't have any trouble
sleeping now. They go to bed, clonk! You know. And they wake up, thud! You know? And they say it's never happened to them, you know? That's fantastic.

And this problem about bread and nuts and that sort of thing, well, they – they're just all set about this and so on. It gradually comes over them as they're sitting there; they're eating this great big steak, and they're chomping into it, you know, slop, slop, slurp, slurp, you know, gulp, gulp, gulp. Suddenly, comes up, "You know, I've never eaten steak before!" You know? Or the following day they suddenly remember that they have never eaten steak before, you see? Something goofy like this goes on.

And some of the things that they suffer from get worse. They've always had a bad itching back. Their back has always been itching. And every time they've ever sat in company, you know, they really felt like doing this all the time, you know, but they didn't dare. And so they get a sort of a suffering look on their face, and they… And you'll see them sitting in the auditing chair and they'll be going grrr, and so forth. And actually their back will get much, much worse. Much worse. And it'll itch and itch and itch and itch. They'll complain about it and complain about it.

Well, they're headed in forwards into a Goals Problem Mass, and the last part of them that gets affected is, of course, the rear. [laughter] That's all – that's all there is to that. And they – they – first just turns on, it turns up and up and up, and it becomes far from unbearable. But it… They complain about it and complain about it and complain about it. And then one day they're coming into session, and they're complaining and complaining about their cold feet. And they're complaining and complaining about their cold feet.

And you say, "What's the matter with your back? How's your back today?"

"Oh, well, that. That was nothing. That was nothing. Don't pay any attention to that. I don't know why I ever worried about that, that's gone. Why are you worried about that? I'm not worried about that." That's their main answer.

You'll see them fly up a flight of stairs taking three steps at a time, you see? Zip! You know, come up to the top, and then fly down the flight of stairs. Just thud, see? And they come down to the bottom, bang! No breath shortage. Nothing, walk along, not panting.

He used to go up the stairs four at a time and then, pant! pant! – you know. They don't appreciate your calling this to their attention though. They say, "Of course. That's the way I am." Or they'll explain to you with a perfectly straight face – perfectly straight face – that if they were – their terminal's a waterbuck, well, that's the way a waterbuck is. [laughter]

And their social conversation – they give people long lessons on the subject of this and that, and it's really terribly interesting to listen to. But they are prone to do this. It's terribly interesting. But it's rather interesting to have somebody give you a dissertation on the subject of… It must be hell on waiters. That's all I really…[laughter, laughs]

This fellow says, "Well now, you see, in the seventeenth century, violins weren't made that way, you see – these violins. I remember a violin I made one time and – back there, and uh…" About that time you can just hear the waiter's neck creak.
"Well, I don't think they should have come across the sunken road at the Battle of Waterloo. I was down in the middle of it there on a cavalry charger, and it was not comfortable. You see, cavalry chargers have to be very carefully disciplined." And here we get – here we get the – the know-how on the subject of the handling and training of cavalry chargers. Or "Books aren't printed that way in the upper galaxy. They don't print books that way at all. They have electronic beams, you see. They have this big machine..." It's very educational.

But the person's thinkingness, you would think at this time, is being far more – this is the mistake you can make – is being far more colored by their terminal than it ever has been before, or that their views are far more colored than they ever had been before.

This is not true at all. Their views are much less colored because they know now what they are talking about. And they are very conscious of the fact that while they are talking about that, they are being a waterbuck, you see. They're very conscious of this fact. And they're also conscious of the limitations of a waterbuck. And it begins to dawn on a pc about this time that the terminal was the limiter of the things it pretended to extend.

In other words, if their terminal was a swimmer, at first they're of the opinion of "That is why I have succeeded," and this lasts quite a while into auditing "Well, I have succeeded as a swimmer because I have a terminal as a swimmer." And then, eventually, as they get the thing run, they start remembering all the races they've lost, you see, all the swimming races they've lost. And they find out they've lost practically nothing but swimming races. And then they suddenly realize that in order to be a successful swimmer, they'd have to get rid of this cotton-pickin' terminal. That would be the way to be a successful swimmer.

In other words, the terminal appears to be valuable up through a certain strata. And then the pc all of a sudden starts to fly on his own and realizes that the terminal itself is a limiter of ability, and that the pc realizes eventually that he has these abilities himself, and the terminal never had any abilities. But all the terminal did was specially channel the abilities in such a way as to make the pc relatively ineffective in executing these abilities. That's all.

For instance, if we had somebody who was – had a terminal "a gigolo," you know. We'd find out he's been a dreadfully bad gigolo, terrible gigolo, you know? Never asked an old lady for a sou if he could possibly get out from under it, you know. And he – he just never really was a good gigolo. And we get him all straightened up, and he goes out and chucks an old lady under the chin, and she at once reaches into her purse for the hundred franc note, you see? Pang! You know? I mean, just – just like that. It's – he's gotten rid of the terminal. You see, it was in his ability to be a gigolo, but as long as he was being a gigolo on a dramatizing basis, of course, he never could be a gigolo – not really. He couldn't be a good gigolo. It's very interesting.

There's a certain sense of freedom, then, begins to emerge, and that actually begins to emerge somewhere toward the end of about the third rerun of the first twelve levels. And the person starts coming out of this feeling of "I'm good because I was a..." They don't come out of it very thoroughly. Then they sometimes very wisely realize that it was because they were probably pretty well educated at one time or another into being a "..." that they have so much data on the subject. And they begin to realize that they are data wise.
Now, I told you one time that if you cleared a cannibal, you'd have a cleared cannibal. Right? Used to say that fairly often. Now, the truth of the matter is we have exceeded this definition of Clear with a Dynamic Clear. And this is where we're going and why we're going in that particular direction. If you clear a cannibal you no longer have a cannibal – today. And furthermore, this person will also be able to learn to do something else or will resurrect the data which enables him to practice something else, and so forth, at the same time, while not depriving him of the ability to dine succulently on human flesh. But he doesn't have to do it anymore. And he also has sense enough to realize, as he looks around the civilized community, that hardly anybody in there is eating any bodies. So it isn't done here, so he doesn't do it. And he wouldn't do it until he got someplace where it was socially acceptable again, you see? In other words, you have judgment on the subject.

Now, what crime is, is action without inspection. And this is what you've restored. And you restored it fully. Action without inspection.

A person will begin to realize while he's – why he's holding himself down while running these things, too. Some of the most unlikely cognitions will start turning up. He's holding himself back so that he won't cannibalize. He has to have all these things. He doesn't dare move out around the grounds for fear he might start dining on human flesh, you know? Because he's got reprehensible – not all terminals are considered to be reprehensible, but there is not one terminal any pc will ever run that doesn't have its reprehensible side. They are – there are no terminals that are free from all sin. See, it's impossible, because they never would have been a terminal.

All right. Now, let's look back at the review of this, and let's find out that it – what this was all about. Now, how did the pc get into this mess in the first place? Well, he objected to the activities of the terminal, so he attacked the terminal, and then he accepted its enemies. He attacked the terminal, interiorized into it and accepted its enemies. He accepted its enemies before he attacked the terminal. He accepted its enemies after he attacked the terminal. And they were both the same enemy.

In other words, he chose this thing as something to attack. This was something he objected to in the society at large. So he decided to eradicate it. And he got enough overts on it, and they were mostly failed overts, and failed withholds, and while attacking it, he lost often enough, and he finally became this thing. And now ever since he's trying to get rid of it because, of course, he hates it.

So, therefore, people commit suicide, cut their own throats, fix themselves up with unsuccessful lives; of course, they're still trying to get rid of this terminal.

All right. Now, the individual's freedom, of course, is tremendously restricted as long as it is totally patterned upon the terminal and its opposition. Because the individual will continue to go to the opposition to eradicate himself as a terminal, and so we get this weird explanation of human behavior. He'll continue to do this always. It rather explains human behavior. It's why they behave this way.

All right. The individual, as he comes up the line, then, improves on runs very gradually. He approve – improves gradually. He doesn't improve suddenly, flashily. And it would be a bad thing if he did improve flashily. He wouldn't know himself from day to day.
But he starts straightening out, and you can be very, very disinterested from a professional viewpoint if suddenly some pet somatic of his—oh, you've run now—you've run twelve levels—twelve levels three times through, you've gotten all of those flat, and the pc is still sitting there with one of his favorite chronic somatics. Don't worry about it. Don't worry about it. These things go away slowly, they don't go away rapidly.

Now, a pc can run level after level after level without a single cognition, and it's sort of like—he'll get several cognitions running his first level or his second level, he may. And then he may run several levels without any cognitions whatsoever. Just grind, grind, grind, grind. And he may get the same problem over and over and over and over. He may get the same circumstances over and over and over. And he may get the same scene over and over and over. It doesn't matter a bit. You just keep running it. We don't care what he's getting; and it doesn't matter at all because all of this thing will shake out sooner or later. And then he'll spend a session and he'll just have cognitions, cognitions, cognitions, and he, "Oh, is that what that's all about? Is that what it's all about?"

Or late in the evening, he was sitting down taking his socks off, and an hour later he's still poised there with one sock halfway off, you know? A whole string of cognitions have suddenly cut loose and started going off like skyrockets, you know. And he'll try to take up the whole next session and give you the cognitions he had the night before. Well, you want to fix him up with new cognitions, not review old ones.

But anyway, there's—there's your expectancy at this particular stage of the game. And if a case does these things, this is a poor show: A case runs nice, big, beautiful 3D pictures, doesn't get into anything for three or four sessions, gets into nothing, gets into this lifetime only, doesn't really tangle with anything, and the tone arm does not go up, and the tone arm—and nothing sticks, and so forth; well, you just got a lousy 3D combination, that's all. It's just bum.

But if the tone arm goes up and sticks, and the pc seems to be alert, and the pc to you looks better, and the pc looks less like they're being smashed against the wall, the chances are that you're running the right terminal, you see, and that you're running the right oppterm, and that the 3D is okay, and everything is fine, it's going along—providing the tone arm goes up and sticks, and the pc has collided with a mass, and so on. All these things are the expected things.

Now, you could have an oppterm slightly off and have a pc run oddly. If you run the opposition terminal as the pc's terminal, it's going to be odd, all right. It's going to practically blow the pc's head off. The pc is just going to sit there, and there's more and more pressure on the front and less and less happening about it. You've got him in the ranks of the enemy. But that they get pressure is a foregone conclusion. They will get this running their right terminal, you see.

But I'm talking about it's—it—they get blown in on. Everything's blowing at them, you know. And their face is sort of disappearing, and their chest starts disappearing, and ye-owwww: And that's running the wrong side of it.

If more levels start going alive... That's why you must keep up your 3D forms. You must keep up these 3D forms. List your levels. And every time you do an assessment on the
Prehav Scale, put down after it on the 3D form over there, "Anger: twenty-seven alive." See? And you'll come back to it next assessment. You're thinking about other things, you see, and you put down, "Jeopardize: thirty-seven alive." Well, that's a bit dangerous. All right. And then you run another level, and you put down "Hate: seventy-six alive." Well, it's about time to put the pc on the plane to Saint Hill or – or something, or – or be sensible and do another 3D, or something of the sort. Or look the thing over, inspect it, try to get some more terminals, try to get some more parts, check out what you've got, and so forth. Because you're running a wrong terminal if that's happening. You're not just on the opposition side of it. You're running a wrong terminal.

Well, the oppterm – I can't quite tell you what goes wrong when an oppterminal goes off. You're running the right – pc's right terminal, and you've got the wrong opposition terminal. If you have that, the thing is going to go awry, but at this stage of the game I can't tell you because I haven't observed one. So I wouldn't know.

But I don't think the Goals Problem Mass will come up and hit the pc in the face. The Goals Problem Mass will hit the pc in the face if he's on the opposition terminal. See, you'll run him into the Goals Problem Mass with a thud. Well, with far too much in the way of air currents, things don't get solid to the pc, they get blowy. You know, winds of space.

If they're on the right terminal, they get plenty going on in front of them and inside of them, but it's getting solid. It is in the level of solidity. And they have an outflowing aspect. Although they're being smashed in, they still have an outflowing aspect. They sort of feel like "Wooooo, it's uuuu... Well, it's out there, and I'm here, and – and so forth."

If you want a subjective reality on how it feels, how it feels, or how it looks to have the oppterm goal, why, as I told you several times, just repeat the opposition terminal to the pc several times. This pc's terminal is waterbuck; opposition terminal, tiger. You say, "Tiger, tiger, tiger, tiger, tiger, tiger, tiger, tiger – tiger – tiger – tiger – tiger – tiger – tiger – tiger – tiger – tiger – tiger – tiger – tiger – tiger..."

Pc... He won't be able to help it. You'll see – see him going back. And you say, "What did you feel at that time?"

"I don't know. It's something You know-and-it – well, something. Ha-ha-ha-ha. And it sort of – I don't know. Currents moving or something."

And then, of course, be kind enough to restore it. Say, "Waterbuck, waterbuck, waterbuck, waterbuck, waterbuck, waterbuck, waterbuck, waterbuck, waterbuck, waterbuck, waterbuck, waterbuck, waterbuck. Well, what does that feel like?"

"Well, it's getting kind of solid, ha-ha. That's right. Solid."

So it's the high wind versus solidity. The high wind, of course, is when you're running the opposition terminal. If you ran the pc as the opposition terminal, he can't get into it because he isn't in it, and he'll get a sort of a frantic idea of getting into it.

Now, those are some of the things you can expect out of a 3D run. It's very gradual. The improvements – they're not very spectacular. But as far as improvement is concerned, they are much greater than you would – could expect out of ordinary, old-time auditing.
They're much greater than this. It's just that the pc is not as vocal about them. They're considerably greater.

All right. Now let's take another aspect of this situation, and that is, how long would it take? Well, that depends on the accidental combinations of the Prehav Scale. That depends upon the density of the mass, the ferocity of the situation. That depends upon the auditor. It depends on how well the pc's rudiments stay in, how well the pc's rudiments are put in. And I won't give you any kind of an estimate. I won't give you an estimate. I don't know. It is much too variable. It looks to me like one of these very variable pictures.

But, I don't think you're going to get anybody in going real Clear, in five hours or ten hours. I know that won't happen because, of course, you are not now keying them out. You could only get a fast Clear with key-outs. You could key them out and clear them fast. And they'd register Clear. But you're making a different type of Clear, and your expectancies of this, of course, are different. But they're not infinite. They're very far from infinite. It's not a worrisome length of time. It's not even a bad length of time.

The biggest change your pc will get – just to recapitulate – from the viewpoint of the pc, is of course in his Sec Check and rudiments in, and so forth. He'll think this is quite a change. And then he'll say that the biggest change and the – the… You – you won't be able to observe much change in the pc except he's a little more friendly. That's about all.

But you will now start to observe a considerable change in the pc at the time you get his 3D parts. When you've got all these wrapped up, why, there is a great change in the pc. And this is an enormous shift on 3D. And when you run the pc from day to day, you will be able to see the changes in the pc, and the pc won't.

Now, it starts out with the pc seeing marvelous changes that you can't observe. That is on Sec Checking and all that sort of thing. And then it starts in on big changes that you can observe, and the pc definitely observes, and the pc is very excited about. And – and it's sort of "Wow," or "Damn it," or "Isn't it horrible," and it doesn't matter what their tone of mind is, you know. But it's change, and they're really getting a shift. They're finding exactly what it's all about.

And then after that you're the one who notices it. You've done just a complete reversal on the situation. The pc's sitting there, and the pc is looking brighter, and the pc is looking healthier, and the pc is looking more active, and you say, "Well, are you feeling better today?"

"No, as a matter of fact, I'm not. I have a pain here in my side here, and so forth. I'm kind of worried about it, you know." The pc looks about five years younger today than they did yesterday, you know. So it goes into reverse look. Of course, it is what it is, and changes are what they are.

All right. Well, I've tried to give you some kind of a – a recapitulation of how 3D looks over broad numbers of cases, and what I would look for as being right and what I'd look for as being wrong. And it might have occurred that some of you – you already have, by the way; you've all helped me do this one way or the other. I never saw such frantic comments in my life as I've had on the subject, you know.
"The pc can't get any pictures. The pc just can't get any pictures. I mean, it's just all masses out there one kind or another. Well, yes, of course, you know, and so on and so on." It's one reaction. Another one is "The tone arm just goes up and sticks. I can't make it do another thing." And the funny part of it is that I'm giving you these remarks because an auditor apparently gets worried about all the right things. See, the right things about 3D are what the auditor gets worried about about 3D. And there's the tone arm going up and sticking. And the pc can't get any pictures, and black masses, and terrible somatics inside the body, and the feeling like the pc is going no place. Nothing is happening of any kind whatsoever in the pc.

Well, something is happening, but it feels like they're going no place to the auditor. The auditor says the pc is always complaining about somatics, and so forth. The auditor never thinks to ask the pc, "Are these somatics different than the somatics you had yesterday?"

"Oh," the pc will say, "the somatics I had yesterday. Let's see. Oh, yes, quite, quite different. They're different than the somatics I had this noon, as a matter of fact. As a matter of fact, they're different from the somatics I had at the beginning of session. As a matter of fact, they're gone. As a matter of fact, they're much worse at this particular moment that we've been talking about them."

So you're looking at a – you're looking at a giddy change rate here, see. And an auditor's expectancy is geared up to very slow shift of somatics or something of this sort of thing. You'll see the way it goes.

If a 3D is wrong, why, you will be able to tell it from the winds of space phenomena which I keep describing it to you. You see, the reason I call it the winds of space is because, of course, there is no air there to blow, and there isn't anything to have any current except maybe electronic flows. Only these electronic flows probably don't exist, so they must come from someplace else. And, of course, out in outer space there are no winds. So there are no winds there, and yet there are winds there. The pc can feel them.

The other thing that would be very dangerous is levels living up. But if you're doing an accurate assessment, if you're doing a very, very accurate assessment each time, of course, you wouldn't even make a mistake on this. And if levels are living up, that is a dangerous symptom. It isn't that you should come off of 3D. It isn't that you should do this or that or do something desperate or fantastic or something like this. What you should do about it is just check the thing over and find out if there's anything wrong with this, and find out if the levels still react, and – and find out some little odds and ends about all this 3D. See? That's all you're interested in.

And then you're satisfied that the thing is right; run another level. Find out if that one came alive. Maybe that one will die out. Maybe much – many less levels alive. Maybe you're going across some kind of a peak. Maybe the pc wasn't quite doing your auditing commands. Maybe the rudiments were out, you see? There's a lot of odd, obvious auditing errors could have been occurring that would have – might else have accounted for it. It's still a dangerous symptom.

The pc can't somehow come to grips with a Goals Problem Mass, and yet the pc seems to be running their own terminal; I would probably suspect the oppterm as being off, and I'd reassess for an oppterm. You'll get another oppterm.
You might have gotten an oppterm that was almost it and would last for a little while, see, but it wasn't quite right. I normally can see these things a mile off because if it doesn't add up to me, that there'd be a conflict there, I know it isn't enough for a person to have spent a trillennia in agony over it, you see? You wouldn't have a canary bird and – you wouldn't have a canary – you'd have a canary bird and a cat. Yeah, you could figure that one out. See? Natural game.

All right. But you wouldn't have a canary bird and old boots. Old boots, canary bird. Oh, no, no, no. He might have an incident where a canary bird got caught in some boots, but I don't think it'd happen very often. That's not the kind of game we're – we're shooting these days – old boots.

And I'd just – I wouldn't throw the assessment away or suggest anything to the pc. I'd just work it over here. What's right? What are we sure is right. All right, let's take that point of departure and then let's reassess and check everything there, making sure the old item is also on the list, and we use the old list, and so forth. Let's just do a rapid check on it and see if we come out with something else this time. Ah, there was something else showed up. And something else all of a sudden was going bing, bing, and that looks much better now. And then it'll settle down and run as a pattern.

But what is a pattern run? Well, I just described it to you in this lecture. Gruesome as it is, that is a pattern run. Heavy masses, heavy valences, hidden bodies inside of bodies, aches, pains and somatics, pc acting like they're on wire.

There's one phenomena I haven't mentioned to you. After the first few runs, you'll get this: you'll be trying to make things stick, and then the pc will twitch their elbow or lean back in the chair, and you get a blowdown. After this thing gets freed up, after a 3D level sticks, it more and more rapidly goes free. It won't stay there. It won't stay stuck. Sometimes it stays a bit stuck, but mostly it'll get more and more impermanent.

In other words, your stuck is up there, and the needle is stuck, and it was for sure a stick. And three days ago this would have been like a truck running into a wall, you see? But it's real stuck, and there's no doubt about that. And then the pc takes his attention or her attention off of the thing, and puts down the cans and picks up the cans, and is reading at Clear read. They were reading at 4.5; now they're reading at Clear read, see? It – it just comes down rapidly. That sort of thing should increase. If it isn't increasing you're running with the rudiments out.

If the stuck TA is not more rapidly coming down and returning to Clear read more rapidly and more rapidly – and if you say why am I introducing Clear read, well, it starts to go down to Clear read and stay there except when you audit the Goals Problem Mass.

If this isn't happening more easily and more rapidly the more you audit, I would suspect you were auditing with the rudiments out. And that there were a lot of levels that you've covered that haven't been cleaned up. Or there were auditing levels back there that the pc couldn't answer and never told you about, or there was something goofed up here in the – in the auditing itself – not in the assessment; there's something goofed up in the auditing.
Okay? Well, I hope that's been of some assistance to you. And those of you who have not been over this ground are under no obligation to follow this exact pattern. [laughter]

Thank you very much.
SEC CHECKS IN PROCESSING

A lecture given on 12 December 1961

Hey! What do you know? There's two or three live people in here today. [laughter]
Hey! What do you know? That's pretty good, huh?

All right. This is what? The 12th of Dec.? Still the nautical month, AD 11, Saint Hill Special Briefing Course. And if I were in a fine fettle, boy, would you get it. [laughter]

I've heard it said that there are states beyond despair. Your Instructors have reached them. [laughs]

Well, by and large, I think you're all doing fine. And if you improve five or six hundred percent in the next twenty-four hours, it'll be all right.

Okay, well, I want to talk to you today about security checking and some other things but first I would like to make a mention of what an auditor who can really audit should have. I'd just like to mention this in passing.

He should have a good security on his ability to audit. He should have a British Mark IV E-Meter. He should have somebody to take care of appointments, receptions and do those nasty things connected with money and he ought to have at least two understudies: two auditors who have had good HPA training and who need some real brush-ups up to Class II. That's what he ought to have. I would consider that an absolute minimum for an auditor auditing – an absolute minimum. Why?

Well, he's not going to get any auditing done unless he has these things. Let's look at the present setup. Let's look at the way it is.

Are you – the only person in your immediate area who can do a 3D Assessment accurately – are you going to spend all of your time, upwards to seventy-five hours a case, getting all the Security Checks in line, getting this person up to a point where he'll respond on a meter and so forth? Because you're not going to do it. That's the answer to that. You're not going to do it. You're going to go in and you're going to try to get a 3D and you're going to fall on your heads, and then you're going to get in and try to get a 3D and then you're going to fall on your heads, and then you're going in and you're going to try to get a 3D and you're going to fall on your heads. Why? Because you haven't got time to set a case up properly. And so you're going to make a lot of bulls. That's about the way it is. You're going to make a lot of flubs. I can just see it on the wall.

Now, you better get a couple of people by the scruff of the neck who have some good Central Organization Academy training and you better gun 'em up to being good Class IIs that can do a reliable Security Check to set up cases for you to assess. And it takes about two to
one minimum, more opportunely about five. That'd be a better number. But it takes at least two to one.

In other words, you can run a 3D accurately off in perhaps half the time that it takes to set a case up if the case has been set up. So you would be auditing one for one with two auditors doing Class II skills.

Now, what about this other? What about this other? All right. A couple of very good auditors left here and they went down to an area, and they've written some letters about technical matters since, but no administrative matters. Boy, are they off the lines! Are they in a mess administratively. Somebody comes up apparently and waves some money under their nose and they shove it in a vest pocket or something of the sort. And then they audit this person one way or the other and try to keep their appointments straight and are going straight out of communication. Their administrative records must look like a cow's dinner.

And they're going to get so lost in all this mess that they will feel that they are terribly pressed and confused. Why do they – why would they feel they are pressed and confused? Why? They're not being pressed and confused by auditing. They're being pressed and confused by administration. They're being pressed and confused by Mrs. Glutz who is calling up who must have their appointment changed on Thursday. And they are all mixed up because they haven't got time to sit down and do their income tax because they can't have an accountant do their income tax, because they themselves don't have any records, so they have to do the records before the accountants can pick up the income tax in order to do the income tax. You get the idea?

So you're going to get all mixed up about how arduous it is to be an auditor, when as a matter of fact you will not even vaguely be concerned with auditing. It'll be terrible. It'll be absolutely awful trying to keep up with the administrative end of it and auditing at the same time. And the next thing you know, everything will look all confused, and you won't know which way you're going; whether you're going or coming. That's what it amounts to. And that's what anybody who has an advanced skill in society ought to be doing.

Now, I hope you're high enough on the level of Help to be able to be effective in this particular direction. Can you accept help to this degree? Yes, we know you can help people, but can you accept help to this degree?

All right. Now, I can give you something that if you put it in a newspaper, would get you preclears. It's something on the order a Central Organization should put it in: "You can always talk to a Scientologist about your difficulties." Interesting, isn't it? And that I think you'd.... Not been tested, but I'm sure you'd find that about the hottest response button that you could possibly get.

"We will talk for you to anyone about anything." That had an interesting run wherever it was done, but I would think you will find that this will enormously exceed that one.

Just – it's on this basic theory, "You can always talk to a Scientologist about your difficulties." You want to say, "Well, you can always talk to me about your difficulties." You've got about the same thing, with your address and phone number. You get pcs.
Now as far as that's concerned, there are plenty of pcs in any district, just in the field of Scientology itself. And you've got – you yourself know of a bunch of cases that have fallen on their heads or haven't quite made it or this or that or know some situations that you could straighten out.

All right. If you've got somebody that could handle money for you, you can always say – you can always say to this person, "Well, I'll straighten it out," and this other person plucks their sleeve and says, "For so much." But if there's nobody there to say, "For so much," then you go ahead and you help people ragged. And let me tell you that the world is full of people who have to be helped; have to be helped. And they never outflow anything at all. So you could rapidly put yourself in a position where you couldn't help people – very rapidly put yourself in a position economically where you couldn't afford to help people by simply having no administrative person who would take money off people so that you could help people.

Now, starting up practices and that sort of thing isn't so much the question. Most of you people are known one way or the other or you're going back to a Central Organization, but I'm just giving you a piece of advice off of the – off of the bat here: Don't go plowing yourself in and feeling how confused it all is simply because you lack a basic ingredient, which is a little tiny bit of organization.

Now, you're so used to thinking of yourself as you, so used to thinking of yourself as one person – perhaps, perhaps standing alone and dauntless against the world [laughter] – that you don't realize that all you have to do is just say to somebody, "You can help me," and you immediately have all the help you want.

The only reason you don't get personnel is nobody is telling people that you need help, see, and so on. One of the basic things that – one of the basic things that has been difficult in my experience in the last eleven years – I won't say it's too much help. No, that isn't true. But I will say it's trying to adequately handle people who want to help so that they are not dead-ending with their offers of help. That has been my main problem. It hasn't been the problem of getting help. It's been the problem of making very sure that if help was offered some way or another, it could be utilized if at all possible. And this has been a very tough problem to solve. Now, if you can get yourself into that category, you're all set.

As far as economics are concerned, you've got the world. What more do you want? It goes from pole to pole, from a Sunday-Monday line straight around to the Sunday-Monday line. There are several pounds of earth here; it weighs quite a few pounds. There's quite a bit of distance around it. Of course, I realize it's a twelfth-rate sun and a second-rate planet around a twelfth-rate sun. Nevertheless, it is a planet, and the truth – truthfully speaking as of this moment – it is yours. There is no doubt about that at all.

You let any advanced technology forward which can accomplish its ends in a finite period of time and can predict its accomplishment, and you have the area you are in. That is all there is to it. I mean, that's it. If you went into this technical society and you could just make better screwdrivers than anybody else, why, if you had any acumen at all, you eventually would make some kind of a minor success of the situation. But we're not talking now about screwdrivers. We're talking about the stuff of which life is made: life itself. And any time you
get a technology of that character going forward, and you have a grasp of that technology, you cannot help but win. You don't even have to try to win. People will come ahead and present you with large sections of Earth. That is all. I mean, it can't help it.

For instance, right now we've – I've told them occasionally, from time to time, they'd never get into space without us. I've told them that from time to time. Well, what do you know? Cape Canaveral just sent for a Scientologist. They won't get into space without us.

And then some psyrologist is going to try to copy all this, and some psychiatrist you d... Can you imagine any of these boys being able to do a 3D Assessment or even a reliable Security Check? Look at the state our technology is in at the present time. It happens to be a self-protecting mechanism.

I, as a matter of fact, occasionally held my breath and said supposing it came out so simple at the other end that all you said was, "woof-woof," and somebody was Clear, wouldn't that be nice? And you've all said, "Wouldn't that be nice?" But let me point out something else: If you let this much technology that can be that easily done, loose, you're in for trouble.

Technology which does not require a skilled applicator is what the world and this universe mainly suffers from.

You put out an atom bomb that any government official can press the button of, and what have you got? See, you've got it all set. All you have to have is one button. You push the button. They got a button up here at Brize-Norton. Very interesting. It's a big thingamabob-shielded area, and I think one key is held by a British officer and one key is held by an American officer, and frankly, the front-piece on the thing says "war and peace." And when they turn the key, it turns to war. And all they do is, they both insert their keys and they go click, and there goes the A-bombs and the H-bombs. There it is. That's all they have to do is – is that. That's it. It's that easy. Of course, it takes some airplanes to deliver them maybe or something like that, but I think they're even cutting that down to a zero.

Now, there's what happens when technology of a very powerful nature requires no special skill, because you can never build an ethic into it. Then it can be used for anything.

Let me tell you that an A-bomb release button or an H-bomb release button does not ask whether the presser is a communist, a democrat, a Kennedyite, a Presbyterian, a member of the Bach-Bach we Kill Them All Society of Southern Jungleosis. Doesn't care who, see? Doesn't care who presses it at all. And you have an irresponsibility of some magnitude.

That's what happens when the technology.... I may exceed your grasp of this thing very often. And you say, "What? You mean, it's a good thing that we have to sit here at Saint Hill and shiver out in the – in cold rooms, and – and – and – and get up in the dark and go home in the dark? You mean, it's a good thing we have to sit here and sweat?" Yes, ladies and gentlemen, it's a good thing. It's a good thing you do.

All right. For one moment, then, with that one out of the road, let's take an – look at something else. Let's look at the – at what we're walking into forwardly.
The broad program on which we are operating is a very broad and a very concise program. We have Central Organizations and offices all over Earth. It's no exaggeration they are functioning; ways and means are always being implemented to make them function better to get up their units and that sort of thing.

What they suffer from mainly is lack of technology. As soon as that technology is secure, why, you'll be in a very fine position. Supposing I were in a position now to tell somebody in northern Quebec – and I said, "Now all you have to do is go down to the New York office and get yourself a Class II rating and go home. You'll be able to take care of your wife all right." And supposing I could say that with fantastic security. Supposing I could say that with such security, that I knew very well that the message passed on to the New York office would actually pull the person in when they got there; would they be adequately and rapidly trained to the exact degree of skill or audited to that exact degree of skill and rundown, which would produce that exact result. Be fabulous; be utterly fabulous.

All right. Now, therefore, we're working right now on establishing a technical superiority and security in every one of these Central Organizations. And it's proceeding with considerable speed. I mean, we're doing all right with this.

It's going rapidly enough so that right up till two weeks ago one Central Organization was falling on its head; didn't know whether it was going or coming or what to do with its property, or who was fighting it or otherwise. It had been enturbulated for about two or three years with rather poor handling and all of a sudden got all of its organizational rudiments in and got things pretty well squared away, and suddenly got the idea that our business is Scientology; started doing Scientology and had their first thousand-pound week since February. Just bang; just got their house in order and started making money again and everything seems to be falling off.

Now, that's because it was running on a pattern. It went back o running on pattern. It's never been on pattern before – that particular Central Organization. Interesting.

My policy with regard to Central Organizations and City Offices is to build in self-reliance. Self-reliance, initiative, the ability to act and operate under a fixed pattern with considerable aplomb so that they can take care of what goes on in their area.

We don't want a situation where every time they want to buy a new teacup, they have to send a cable to Saint Hill. You get the idea? Nah, that doesn't ever work.

Well, it depends to a large degree – having an organizational setup of that type – on the technical accuracy and results of the application of technology. If you can do these things – if you can train people well and you can process people well and if you follow a set pattern – people know what they're doing, you can't help but win.

All right. Now an extension of that, we have franchise holders. And these people routinely and regularly are trying to put up a standard and it falls in on them, and they try to put it up and it falls in on them, and they try to put it up and it stays up for a while, and then it falls in, and then they try to put it up and it stays in for quite a while, and it falls in. And they'll – that's about the cycle they've been going on. But remember, that they have been much less
accurate on an average – field auditor auditing results – have been much less accurate and much less high than Central Organization on an average.

Most field auditors don't believe that, and I myself might not believe that if I myself had not long examined the records. Now, of course, there have been exceptions in the field. There have been exceptions and these people have all – have all done very well, but I'm talking of the broad average.

Do you know why an HGC was ever started in the first place? What was the genus of the Hubbard Guidance Center? What was it? It's because field auditors could not audit pcs to results. They couldn't. So we had to set up some kind of a unit that took care of this. Up to that time we were only interested in training. But that was why an HGC got set up and that happened right here in England. And the results were too chaotic. And we got better results in the HGC than were normally gotten elsewhere.

Well, there's various reasons for that, but the basic reason – let me put your attention on this for a moment. The basic reason is because there is a more severe discipline in operation in an HGC, and that's just about all there is to that.

Even though I may lead them over hill and dale occasionally and get them onto this and get them onto that and so forth, and try to get some results in spite of it all, nevertheless, they do get better results with all that.

Now, the Central Organization, as long as it's impoverished or feeling bad or feeling upset or something like this, tends to combat other activities. It tends to go into a games condition with other activities.

You get two Central Organizations on either side of one continent, they'll go into a games condition with each other; or on two different continents, they will. And they do tend to go into games condition with, let us say, field auditors. And the field auditor goes in games condition with the Central Organization.

Do you know what this is? This is simply lack of success. That's all.

It's very funny. When pcs are scarce and everything is scarce and it's all running on a high scarcity, you'll get a games condition. The havingness is inadequate. And so the Central Organization tries to pull in all the pcs and keep the field auditor from having any pcs, and the field auditor tries to pull in all Central Organization's pcs, and so forth. Well, what is this? This is just scarcity.

Scarcity is repaired by technical excellence. The better job you do, the less scarcity there will be. That is all there is to that. And I always look at a Central Organization or a field auditor who has gotten into a games condition as an organization or a person who aren't getting results. That's just as simple as that. It just goes one, two. If they're in games condition with everybody in sight, they're not getting results; that's all.

All right. This course here at Saint Hill was instituted and instigated for one purpose only. It wasn't because I didn't have enough to do. If you'll look over my roster, you'll find it has – I have a couple of odd jobs. This was all in the direction of getting the highest possible level of technology which was attainable.
Now, I've tried to stabilize the technology which was in use and we have stabilized it, remarkably well. It is stabilized right up to a point of – well, I think about the last third of 3D is possibly subject to variation right now. There may be some method of running a case off faster after the case has run a lot of levels. I've already informed you of this.

But let's take what is basic. There are going to be some little changes in beginning and end rudiments, but otherwise you've already had those changes and most of you are using them right this minute.

Model Session is stable; the Auditor's Code is stable; the Code of a Scientologist, the Axioms are stable. The basic processes of rudiments actually exist in too great a number at the present moment. There are too many effective processes and I'll have to shake that down so that we have a few less processes that you can do rudiments with, and then we won't make any mistakes on this and we'll get the rudiments in better. That's a little point of variation. You always expect those points.

Security Checking: Man, that is stable like the Rock of Gibraltar. That is the way you security check.

Reading a meter: Boy, I don't know. Every time I go into researching anything about advanced meters, I always come back and say what a marvelous instrument this Mark IV is. It's just marvelous. Because advanced meters of various kinds tend to do something else. They tend to read too much body action. And the body reactions become too great, and this becomes too great, and that becomes too great. And every time you increase the sensitivity of the meter, you double the response of body action and get what – a one-third gain on the mental action. In other words, when you increase the sensitivity of your meter, your mental action increases just that much, and your body action increases that much. So, of course, the responses of the meter then are lost in those body reactions.

I'm talking now about advanced experimental meters of one kind or another. No, that's a very stable meter. And I work hard to hold it stable and to continue it that way. You might be interested that the reason other meters which have been built from one time to another – why, I invalidate these meters now – is not because you might not have a good one. You might have a good one. You might be lucky, you see? You might have a good squirrel meter. But – you might have a good American meter. But on the assembly-lining of these things, some of them were built with cheap parts and some of them expensive parts, and some of them were finished by electricians who knew nothing of Scientology, who protected the action by putting in damping mechanisms. But it isn't just a damping mechanism; because they put in the damping mechanism, they changed other parts of the circuit and that was right there on the assembly line as meter number 15, and 16 was all right, and then 17 and 18 are damped, and then 19 – somebody found some cheaper component some place or another – so 19 is built out of cheaper components.

You get what's variable about these meters? It is not that you yourself – in having a meter that was built somewhere in the field or was an old American meter or something like that – it isn't that that meter is necessarily a bad meter. It may be that that meter has an instant response; that meter has a proper gradient; its linear curve for the potentiometer is all good – maybe that's all right. But the one right after that, that isn't all right. And the one right after
that is probably in the hands of some poor Joe down in Tucson that is trying to clear somebo-
dy and he gets nothing but lags, and he hears about instant response and of course he can't get
one and that sort of thing

So this is all in the – in under the heading of stability. Security Checking is very
stable. The construction of meters is tremendously stable. The various parts and things which
you are using are very stable. I don't think the TRs have been changed for years (you haven't
learned them either). And the... Now, I packed up on a Problems Intensive. We're not asking
anybody to do Problems Intensives here to amount to anything, but nevertheless it came out
in a bulletin, it's all just brrrrt, and that's the way you do a Problems Intensive. And I don't
think there is any other way to do a Problems Intensive.

So these are stability, stability, stability, stabilities. The assessments, processing on
3D, Assessment by Elimination, how you find the parts of this thing: There aren't new ans-
swers to these things. The old answers followed, give you the result.

Maybe one day I will get extremely bright and I will find out some way some – and I
will because we need it – I'll find out some way to figure out which is the pc's term and which
is the oppterm, absolutely reliably, bangbang, so that you never make the slightest quiver on
this thing. And that'd be a good thing to know. That'd be a good thing to know before you
start running a lot of pcs backwards, because on some of them, unless I myself sat down on –
with an E-Meter, I wouldn't know whether they were running frontwards or backwards. I
frankly wouldn't right this minute. I'd have to watch the pc for a session or two.

This is on a secondhand basis, not me auditing, you see? That's you auditing and me
watching your reports. And I'm saying "Ohh, is it? Isn't it?" You know, sort of hold breath
two, three sessions. Well, this is running all right and then I forget it. That's all right.

Another one – well, we don't know. We don't know. Well, all I can tell from your ses-
sion is at least the pc isn't getting into trouble; but at any moment, prepared to shift over the
opposite way to. So we need a better – a better gimmick, a better test right there.

Now, all of these things – the form of a ses-
sion – these things are all stable as the de-
vil. And we're ready, we're ready just now to push off. I'll show you some of the things that
have defeated us in the past. Remember old Step 6? Well, do you know Step 6 would work
today? It was never done, and that is very true of practically, well, 99 percent of the stuff.
Step 6 was never done. Do you know what you had to do with an object before you had the pc
make it bigger and make it smaller, and solider and all that sort of thing? Do you know what
you had to do with one? You had to find a null object on the E-Meter. It had to be a null ob-
ject, and wherever it beefed up the banks, you didn't find a null object.

Well, let's look at that with relationship to the Goals Problem Mass. Of course, if you
had any object that quivered, you'd be onto the Goals Problem Mass and wouldn't dare do
anything with it.

But you could take something not associated with it, which wouldn't register, and you
could do something with that. And therefore you could exercise the pc – it's an interesting
idea, you see – you could exercise the pc on creating and mocking up without antagonizing or
messing up, particularly the Goals Problem Mass. And you could stay off of that and come off
of that theoretically, and then the pc with some of the automaticity – this is theoretical – some of the automaticities of mocking things up off, of course, could then have had the Goals Problem Mass evaporate. That's theoretical. That's theoretical. If he wasn't close to it, it could have been knocked out by exercises in creatiness.

We have one pc right now, whose auditor is quite concerned, who is running Create on a level. I think you're the only one in the whole unit anyplace that has hit Create as a Prehav level. And of course, this is giving this pc fits because it fits the terminal perfectly and it's just about to run forever.

Well, why is it about to run forever? Well, it's the basic button of the reactive bank, of course. What else could it do but run forever? It's going to go on and on and on. Of course, the more he creates, why, the more – the less bank. And it's doing something to the Goals Problem Mass all the time, so he isn't running into it. You say, "Well, that'd be a good idea. Then we ought to run all pcs on their terminals on Create." Go ahead. You'll spin them in. It was just a fluke that this pc hit it.

And if you'll notice, your pc is running for a long time on the level that exactly fits the terminal. You notice that? If you get the exact level, see, that just fit that thing just marvelously, see.

Well, here's – here's a terminal. Let's take a terminal, "a little boy" and if we had a level, Play. Now, how long do you think that would run, see? It would go on and on and on – if it were hot on the case, which it might very well not be, see?

But you'd run level one, level two, level three, and all of a sudden you'd hit this one, Play, see? (This is a cross-example because nobody has hit it.) But there it is, see, and you're running this one. Well, of course, it'll run and run and run and run. And you say, "Where's the case, where's the case, where's the case? And it – this one won't pile up the Goals Problem Mass because the Goals Problem Mass is practically totally made out of that level.

So every time you start to rassle with the Goals Problem Mass, it thins out and pieces fly off of it again, see. So up goes the tone arm and down goes the tone arm and up goes the tone arm. So instead of a lot of levels pulling the Goals Problem Mass apart, you have one level pulling it apart, because it's a basic level that fits the terminal. You could expect that to happen.

But there's something else you can expect to happen with regard to the Goals Problem Mass, is any time you're running a pc with the rudiments out, you're going to run forever. And the way to test it, is test the terminal when you're in the rudiments stage of the session. Just ask. Just say the terminal and see if you get a needle response. If you get a needle response on the terminals, your rudiments are sufficiently in to run it.

Of course, you go through the rudiments and clean them up. But if you don't get a terminal response, don't run the level. In other words, run rudiments till you get a terminal response on the needle and that is the sure test. That means rudiments are in.

Now, I'm quite interested in this other factor. You are running a double command, particularly on the 7 December, thirty-command bracket. You're running a double command. Did
it ever strike you that it could run forever on the odd-numbered commands, without the level being introduced?

And later in a run – I can add this to your know-how – if you can't get it to flatten, realize please that it is running only because of the odd-numbered commands. And the even-numbered commands which contain the level on them, are ineffective. And the first chance that you would notice of this is the pc starts telling you that the level doesn't fit the problem he has just thought up. He starts telling you this.

Oh, he can tell you once, he can tell you twice during a run. That's normal. He'll hit one or two that don't match. But all of a sudden he starts saying, "Oh, well, let's see now. Here's a waterbuck and uhm – problem about a waterbuck. Well, how to get some water."

All right. And the Prehav level is Devastate. All right. And you say, "Well, how might Devastate solve that confusion?"

And he says, "Well, it wouldn't. It doesn't."

Well, it has previously. He's hit similar problems. "Devastate. Oh, well yeah – oh, a waterbuck would just devastate the surrounding countryside and the rivers would all run, and he'd get water, you know, before going on.... Devastate, ah...."

Hm. Well, you have no choice but to have him contrive some way it would do so. And he goes on to the next one, and "How might Devastate resolve that problem?"

"Devastate. Who ever heard of that word?"

You see, what you're doing, you're getting your motion on the case – the motion on the case is occurring – purely and entirely because you're asking him for confusions which would give you tone arm motion.

You're saying, "Tell me a confusion. Thank you. Tell me ..." or problem, or whatever word you're using "Tell me a trouble. Tell me a trouble. Tell me a trouble. Tell me a trouble. Tell me a trouble." You're getting tone arm motion, but no longer is the odd-number – the even-numbered command functional.

And the way you do that is – one of the symptoms would be – it suddenly doesn't fit anymore. Oh, you got tone arm action, and previously this case has been going up and sticking, you know, and everything's fine. Now, it goes up and sticks and falls off and it goes up and sticks and falls off, and the pc can't answer that – those even-numbered commands.

You had better ask the magic crystal ball – the E-Meter – whether or not that level still has any action on it. So you say, "Devastate. Devastate." It's not a prayer. It's a faintly rising needle, you know, and you say, "Devastate. Devastate." It doesn't stop it. There's no quiver. "Devastate, Devastate? Devastate? Oooooooo-oooh, all right. Very good. Thank you very much. We're going to do another Prehav Assessment." Be about the end of that. "Give you two more commands and end this process then. Is that all right with you?" (After you've done it.) you see how that would be?

You can actually get tone arm action on the odd-numbered commands independent of the even-numbered commands – and you should look at that. Because a case starts going bluuueew.
Now, it is true that if the level is right on the case's button, that is that case, you see? "Waterbuck. Swimmer." See? Swim. Swim. Swim. You see, it just runs on and on and on and on and on. "Swim, swim, swim, swim. Swim solves everything. Everything is solved by swimming. Swimming. If you get into trouble, you swim. If you get out of trouble, you swim. If you want to have some fun, you swim. If you want to get even with somebody, you swim. Swim, swim, swim, swim, swim, swim, swim, swim." And then all of a sudden after he's run from this maybe two or three days, he's very fit, you know. You've already done a lot to the Goals Problem Mass with this thing, you see. You chewed it up enormously.

And then all of a sudden you ask him, "All right. Tell me a problem about a waterbuck."

And he says, "O-o-o-h, a waterbuck getting across some trees. Getting cross some downed timber. How to get across some downed timber."

And you say, "How might 'swim' have resolved that problem?"

He says, "Swim? Swim? Who ever heard of swimming?"

And you say, "Well, think of a way," you know, just to get the question answered. I've used this myself. "Well, give me an answer just so we won't have an unanswered question, please?"

And the pc'll answer it some way. Try it again, see, because it might have been a fluke, you know?

And you say, "All right. Tell me a problem a waterbuck might have with a tiger."

And he says, "How to escape a forest fire and a tiger at the same time."

And you say, "Good. Now, how might 'swim' have resolved that problem?"

"Swim? Swim have resolved the problem? Let's see, swim. Swim. Do waterbucks ever swim?"

What you've done is run the top of the automaticity. Don't you see?

And then's about the time you ought to say, "Swim, swim, swim, swim." Not a quiver.

You say, "Well, that's very fine." But this is only after a level has been run long and the tone arm has stuck usually on other levels, and a lot of action has been going on on this particular case, and you have gotten the rise-stick phenomenon to occur. You get the idea. That has occurred, and so forth.

Well, you got this other phenomenon. So remember that it can occur that a pc can be absolutely flat on the level and be getting tone arm action like mad on the odd-numbered commands, "Tell me a problem." And as I say, the remedy is to check the level for reaction. The level no longer reacts: get off of it.

It's things of that character, little points of that character that you run into.... You'll still be getting points of this particular type clarified as people run into difficulties. You're not going to run into peculiar cases. Don't worry about that, man. I've audited too many cases. I know how they're put together, but you are going to get into peculiar questions. Usually these
stem out of an irregularity of technology. You should realize that your peculiar question ordi-
narily stems out of some additive of omission you have made from a routine lineup. That's
something to remember, and that's really something to remember if you're ever teaching audi-
tors in an Academy. Because, man, a new auditor can think of more things to do wrong than
you can catch up with all morning and all afternoon.

And if you were to take this verbal from them – meets you out in the hall and says,
"Well, this case doesn't get any tone arm action of any kind whatsoever on Security Check
Form 4," your immediate response is – you've assumed you see, that this auditor is actually
auditing and that it's all set and all square, and so you say, "Well, your rudiments are probably
out. Check your rudiments."

He goes in. He comes back in a little while, he said, "The rudiments – the rudiments –
there's no reaction on the rudiments."

Well, extraordinary solution, if you were inexperienced, would be your next step, and
you'd say, "Well, change the Security Check to a Child's Security Check."

Next day there's no tone arm action on a Child's Security Check of any kind whatsoe-
ver. And the rudiments are in because there is no response of any kind on the meter. Now,
you could really get an extraordinary solution. "Well, try the CCHs." Well, probably this
would be better because a close examination demonstrates that the student does not know that
this pin goes in this side of the can.

You'd be amazed! You'll be amazed. You'll be absolutely amazed.

Now, the other one is.... I know you don't believe that. That that can happen. That can
happen. It's the weird things like that – well, they hadn't got the meter turned on or something
stupid like that. There – that's what can throw you. It's wild departures that you couldn't even
envision. You sit back, and you sit back and you think and you think and you think and you
think, "What could they be doing? Now what are they doing? ... I'll bet.... You don't suppose
they never go to session?" And that would be closer to the actual answer than the one you will
think up with your own background of training. It'll be that – it'll be that type of thing. It won't
be the type of thing that their Model Session wasn't perfect and their TR 4s weren't perfect,
and so on. It'll be the fact they don't know the E-Meter plugs in or that they read only body
motion. They read only body motion.

I saw some experimental shots taken of a – of an E-Meter, just as an experimental film
basis, and the person making them had used nothing but body motion. And any trained Scien-
tologist – they look at this and they say, "Well, all right. So the pc's moving," you know. Just
a picture of the meter. "So the pc is moving." See, they were trying to make a rock slam look
like a rock slam. Didn't look like a rock slam to anybody that was trained. So the pc was mo-
ving is about all that particular shot would have taught anybody.

But these little distinctions are not present at a lower training level, so you really have
to reach for it.

Now, I was going to say some more about Security Checking, and I am. You should
be terribly, terribly interested, then, with the material which I have been giving you here or
talking to you about. You should be terribly interested in getting people up to Class II. Not
only will your life become livable, but your PEs will make gains if you are terribly interested in making Class II Auditors – if you're terribly interested in that. And your life will be as peaceful as – as far as technology is concerned – will be as peaceful as the person who is turned over to you for assessment has had a perfectly accurate Class II job done on them, and then your assessment is possible, and accurate and swift.

I know you don't think you can ever do a two-and-a-half-hour assessment, but one has just been done. Two and a half hours of assessment was done in Cape Town. This, by the way, was a patch-up, one of these patch-up assessments, you know. Two elements had already been found and run. There wasn't enough action left on the meter to bother with. Yet the person found the other elements of the 3D in two and a half hours. That doesn't seem believable to you at this stage of the game.

Let me tell you though that people leaving here find this rather easy. Why? Because you're operating from an altitude. Here, you're a bunch of schnooks. [laughter] There's nobody going to…. Who'd respond to his command value? For the last two weeks he's only had two passes a week. [laughter] You're used to reading 3D with a microscope, you know.

And you ask Miss Glutz of upper Burbank, "What terminal would oppose this?"

"...That could only – only represent a cat." Half-dial drop. Your reaction is a half-dial drop. "Cat" drops a half a dial for you from there on out. You ask her – she had no choice but to tell you because you were you.

Yeah, but some student – nyah. "Give him a list of 442 terminals. Let him sweat."

[laughter, laughs] Big difference in attitude then.

So you should get terribly, terribly interested – not in just becoming a good Security Checker – but in what it takes to make a Security Checker. In the first place, we probably should stop calling it "Security Checking" and start calling it what I've started to call it several times, which is "Processing Checks." Those are much more easily explainable and we will – you'll see "Processing Check" in literature going out, so don't let it throw you. I'm talking about Security Checks. But anyway… [laughs]

But you go ahead and reap the whirlwind by taking some person who has had some HPA training three years ago, and you're going to make a Class II Auditor out of him. You indifferently say, "Well, they can sit there and hold the E-Meter balanced well on their lap, they look appreciative and alert, and so therefore we'll classify them as Class II," and after that go blow your own brains out because that's just about what you're doing.

You're going to be assessing a 3D after this person someday, or you're going to be patching a case together after this someday, or you're going to be holding the hand of some fellow auditor someday who has just been trying to – or this person himself feeling this cocky about it all, has now done an assessment and what is worse, run it. He knew how to run it: If it didn't react on the meter at all, he knew he had the right one, see. He read Step 6. That's what we're doing, isn't it. You know?

No, you're just setting up trouble for yourself. And when you carelessly rate an auditor, you basically set up trouble in your area today – or in an organization or wherever you're operating – if you carelessly rate an auditor, you're setting up grief. There will be trouble from
there on. Make this classification amount to something and you won't have much trouble with regard to it.

And I'd classify people Class III away from Saint Hill when they had a beard – even the girls – down to their toes. Oh, man, I'd really make them come through for a Class III, man. I mean, I'd really make them sweat. But certainly, make a good Class II. And then you have protected yourself.

Now, a Class II must be able to security check so that no Security Checks are muffed. That's the first thing. No questions are muffed. No withholds are missed. And that is your criteria.

Now, if the rudiments are in, in the session, of course the person will get the withholds. But if you come along with greater altitude right after this fellow and get an additional withhold, don't think it's because the case improved. It was because that Class II Auditor didn't have altitude enough to run the case with rudiments out, and you will have, so rudiments were out for him but in for you. They knew better than to tell you a lie, but they knew they could lie to him. See? This is the difference. So actually your criteria has to be very high to get around that sort of thing so that they will get all of the withhold; so they will get everything.

Now, the fastest way in the world to upset a case and reap the whirlwind is to miss a withhold. Take it from me; that's the fastest way. I've had more trouble with this single item. What trouble I have had – actual, out in the field, and here and there trouble, in the last three months – than with any other single activity anywhere: missed Sec Check questions. That has been way up on the graph.

Nearest approach to it ... Well, it just didn't approach it. It's something like the order of measuring a grain of sand and the sun. They just were not of comparable magnitude. I've traced every single upset I've had back to missed Sec Check questions. Initial – initial withhold setup, one kind or another, caused a randomity in the area. But where the randomity was tamed down by somebody and they missed a Sec Check question, the randomity doubled. It wasn't so bad before that, but the whole roof was falling in now, you see?

So that can really cause an upset. So I better tell you just two or three very brief little facts of life about this sort of thing.

When a pc starts to curse you out – these are little maxims that you could use – when a pc starts to curse you out, find the missed withhold. That is a rule of thumb that you will never, never, never, never miss on. When the pc starts to curse you out, find the missed withhold.

Where did this pc miss? There is a half-truth or a completely missed setup there. You won't believe this until you've got a good subjective reality on it as an auditor. And one of these fine days as an auditor, you're going to run into this – right here on this unit. And the pc's going to be sitting there saying, "Well, what ther-rrr! Why don't you rraoww! Wow-wow! And I want too much to do with that anyhow, and so on. And why don't you study your TRs a little bit? Your TR 4 is certainly terrible, and so forth."
Well, maybe it is, but they would never have commented on it if it weren't for a missed withhold.

Now, of course, you chop into all of this suddenly. "Now, what was the missed withhold question?" You see? You throw your rudiments out at the same time. So you've got to go into it smoothly. But you can always find it. You could always find it. And there is something here which has not been aired to the bright, fresh sunlight. There is something still floating along in the stygian dark. That's an interesting one.

And until you solve one like this, you won't believe how much fury can come out of it. It's as though you've suddenly charged up the machine with a pressure pellet of some kind or another. Like you've suddenly thrown ether into a petrol engine. This thing is really going to go on a higher roar and tear, and finally it's going to fall apart. Then you suddenly get bright all of a sudden and say, "You don't suppose there could be a missed withhold here? Well, let's just check it out to see."

And we breeze over what we were doing, and we bridge it in, and we get it into a position where we can do a little bit of withhold asking, and we just ask for any withholds we've missed, or any half-truths they've told us – which is the same thing. And all of a sudden, why, there you've got it. The pc is just sweetness and light. And at the end session, end rudiment – you're getting in your end rudiments – and you say, "All right. Are there any ARC breaks or upset in the session?"

The pc sits there, "No."

"Well, how do you feel about that mess that we had at the beginning of the session?"

"What mess? Oh, oh, oh, that. Oh, well, that's nothing. I was probably being very hard on you. No." This is really goofy, you know.

Well, the liabilities of Sec Checking... The reason Sec Checks are difficult lie in the 3D items. So a Sec Checker is always sec checking over the unknown identities of the 3D items. He doesn't know what mores the pc would violate if the pc had a withhold. See, the mores of the terminal – the oppterm – these various combinations are what established the moral caliber of the pc which gives you the mores on which the pc will or will not operate. So a Sec Checker is always able to do a much better job after a 3D has been found. And then you don't have to do any. Isn't that interesting?

Just the time you've got all the data to do a perfect Sec Check, you don't have to do it anymore. I think that's something or other.

But isn't it odd that if you don't do a very fine quality series of Sec Checks before you assess, you don't get the 3D at all. So the Sec Checker actually has to be tremendously skilled because he's going up against an unknown. And this unknown won't become known until the pc is assessed, and the pc can't be assessed until some Sec Checks are done. Now, how do you like that? You always enter the case at the hard end. The longer you audit a case well, the easier a case is to audit.

The best auditing must always be at the beginning of the case. The most skilled auditing is always at the start of a case. So don't get any ideas that a Class II Auditor should be a
bum; that you can get away with something as a Class II. You can't. Because it requires the smoothest TRs and the smoothest metering and the smoothest Model Session that will be performed on the case are needed at the beginning of the case while those first critical Sec Checks and so forth are being run. If any upset occurs during that period, you of course, are messed up on an assessment later on or the case just never gets up to being assessed. So the person at the open gate is actually the Class II Auditor. He's the seneschal because he can shut people out entirely and completely. Until they get past him, they're never going to be assessed.

And all he has to do is miss some Sec Checks questions. All he has to do is ARC break the pc. All he has to do is run the wrong preparatory processes. All he has to do is muck the case up, and of course he's finished the case because the case won't come through to assessment. Case will blow, leave for Alaska, get a job with the United Nations – which is the most suicidal activity I can think of right at the present moment. Pc's liable to do anything, in other words – any low thing. So that's not an unimportant zone. That's not an unimportant zone.

And I'll give you another maxim, is: A Q and A puts the withhold in to stay.

Now, let me give you a very precise thing; a very precise example of Q and A:

"Have you ever stolen any umbrellas?"

"Yes, I stole my father's once."

Auditor: "How did you come to do that?"

At that point, an Instructor should set up a militruse on the one side and a rocket launcher on the other side and pull both triggers. That is Q and A of magnitude. Changed the subject, didn't it?

You ask for a withhold, the guy gives you a withhold and now you ask him about the withhold. No, you asked for a withhold. It is enough that he got off the withhold. Now the only question is, does that withhold still register? If it still registers, there's another withhold.

So, here's a maxim: Any additional registry that you get on a withhold question stems from fresh, undisclosed withholds – not from the withhold he has given you.

That'll keep you from doing any Q-and-Aing, and it'll do – it'll keep an awful lot of auditors you train from Q-and-Aing. That's quite important.

This is proper:

Auditor: "Have you ever stolen any umbrellas?"

Pc: "I stole my father's once."

"Okay. Thank you. Have you ever stolen any other umbrellas?"

"Well, no. No, no, no."

"All right. Thank you."
Now, look at your meter and say, "Have you ever stolen any umbrellas?" Instant read. So you look at the pc and you say, "All right. When is the first time you ever stole an umbrella?"

"Oh, well, I'd forgotten that one. Ha-ha-ha-ha-ha. Just slipped my mind. Yes, as a matter of fact, I was two years old and we were out at a garden party, and I saw an umbrella with a silver handle, and I dragged it out on the lawn – and they teased me about it for a very long time afterwards – but I really didn't mean to take it."

"All right. Okay. Well, have you stolen any other umbrellas?"

"No, no. That's all."

"Okay. Thank you."

Get a hold of your meter. "Have you ever stolen an umbrella?" Remember, that was the auditing question. That was the question that made it fall. Well, that's the question you're trying to clear! You're not trying to clear whether or not this person is related to umbrella manufacturers in the Marcab Confederacy! You're just trying to clear whether or not they ever stole any umbrellas. That's all you want to know and any other material to that is simply assistive. Any other questions you have is assistive to clearing that exact question. That's the only question you want to clear. That's the only thing you have any interest in.

Now, the reason you vary the question is just to get more withholds and that's where you go astray.

The Instructor says, "Well, vary the question. Don't keep saying, 'Have you ever stolen an umbrella? Thank you. Have you ever stolen an umbrella? Thank you'. " Because he won't get anyplace.

You have to ask him, "Well, did you ever – did you ever pinch one? In restaurants? Did you ever take umbrellas accidentally in a restaurant?"

You know, you're helping out the pc.

"Did you ever – did you ever take any out of offices? Did you ever take any out of homes? Did you ever take any out of shops? Shops, shops" – watching the E-Meter. "Did you ever take any umbrellas out of shops?"

"Er, I'd completely forgotten that. Ha-ha-ha. As a matter of fact, me and a pal ra – robbed an umbrella store one time when I was sixteen."

"Oh," you say, "Good. All right. Now, have you ever stolen any umbrellas?"

That's the question you're trying to clear. That question must follow immediately after, see. "Have you ever stolen any umbrellas?"

"No."

There's no instant read and you're off of it like a startled deer and on to the next question.

Now, providing you routinely check up to find out if there are any withhold questions that have been missed, and providing this always occurs as a question in your end rudiments
of any Security Check-type session, "Have I missed any withholds on you?" you will never miss. And you'll find it all goes off like hot butter.

Now, let me give you another horrible example of this.

"Have you ever been mean to a pc?"

"Oh, yes, as a matter of fact, I was mean to a pc. Yep, I was mean to Eleanor when I was auditing her."

"All right. Where was that?"

This is just – from here on, see, we.... This is the blow-the-brains-out type of an approach.

"Oh, that was in Washington."

"Mm-hm. Well, what were you doing in Washington at that time?"

"Uhm...."

"Is that so? Mm. Did you ever ride any horses? Do you like cats? How've you been feeling today? Do you think it's going to rain?" I mean, all of these questions are equally relevant to what you're doing. "Do you happen to know the exact figure of gold production in the Rand area during the past fortnight?" would just be about as pertinent to the case, you see, as any of this other bunk, you see.

You want to know if this pc has ever been mean to any pcs or mean to an auditor, or whatever the question is, see. That's all you want to know. And you set out to find this exact package fact, and that package fact is the only fact that you were trying to find out.

Now, if you suspect that this question may be related to some other questions, which are also withhold questions, you add these as though they were also Security Check questions. And you clean each one of those, and the proper way to do it is not sit there and clip them off the end of your bat. The proper way to do is sit down and write them down and clear them as though they were a complete list. Otherwise, you're going to wind up missing some withholds.

Now, that is the severely proper way to do it. But don't ever monkey with these Qs and As. That is a Q and A. The pc says something, so the auditor says something, so the pc says something, so the auditor says something "And what is the price of gold do you suppose in upper Tibet or was it on March the 9th, 1913?" That has just as much to do with auditing of the case, don't you see? "How many photons fall per minute on the head of a pin in latitude 0, 9 minutes, 11 seconds, north, longitude 167, west?" Well, that had nothing to do with it. See?

So in Sec Checking, be pertinent to what you are doing. Be pertinent to what you're doing. If that's what you're doing, do it. Don't wander around about it.

Now, if a burst of misemotion occurs on the part of a pc during a Security Check or a Class II activity, it is turned off by what turned it on. And that is true of all secondaries. Now, that's particularly true of an assessment, running HAVINGNESS, or a Security Check question. What turned it on, will turn it off.
Well, what turned it on? Getting a withhold turned it on. What's the withhold that's still keeping it powered up? That's the mistake you make, you see, is taking up the secondary. You don't take up the misemotion in any other way than what turned it on. You get what I'm talking about? I mean, you turned it on with a waterspout, you'll turn it off with a waterspout. That's all there is to that. It's the same thing. Otherwise, you're guilty of mopery and dopery and misdemeanors on the high seas. The point I'm making here is you're running Havingness on this pc and you're saying, "Point out something. Thank you. Point out something. Thank you. Point out something. Thank you."

And the pc says, "Whaaawoo, terrible and so forth."
"Point out something. Thank you."
"Oooooh, it was terrible."
You say, "Thank you. Point out something. Thank you."
"Wooooooowowwow." 
You want to ask him what's wrong, you say, "What's happening?"
And when he says, "Ooooo-hoo, I just remembered. Oh, it's terrible, and so forth," you say, "Thank you very much. Good. Point out something. Thank you. Point out something." Why?

It is complete cruelty to stop the process that turned it on and say, "Oh, poor Bill. What are you crying about, Bill? Well, let's run that as a secondary."

You idiot, you're running it as a secondary. The process that's running it is "Point out something." Do I make my point clear about this? See? It's a cruelty to do it otherwise.

Even though the pc just begs you to be sympathetic, you can go ahead and be kind and half-kill the pc. Because you will.

All right. Let's take the middle of a 3D run. "Think of something, or – Tell me something – Tell me a problem you have had with a waterbuck."

"Well, wooooow! My God. Oh, gee. Ooooh-ooh, terrible."
Now, this is dead wrong; this is utterly dead wrong, see: "What happened? Oh? Oh. Well, what happened just before that? ... Well, what was the waterbuck doing just then? ... Mm. Oh, yes. When do you suppose that was?"

You're going to park him. You're going to park him just sure as hell. He goes wow! Crash! Terrible! And so forth.

Well, what made it go wow, crash, terrible? It was thinking of a problem that a waterbuck had. All right. What'll settle it down is, "How might swimming have resolved that problem?"

And you say, "All right. Tell me a problem a waterbuck might have had with a tiger."
"Oh, well, so-and-so and so-and-so." You get all around it and you come back to it again.

And you say, "All right. Now, tell me a problem you might have had with a water-buck."

"Wow!"

It's the same problem. He gives you the same answer, see. Still charged.

You get another level. It's not going to flatten on that level. I'll let you in on something. He's got several million incidents of that type. Only you just happened to have hit one that he was expressing. The way to handle it is to go on auditing the pc. You will be tempted, on many occasions ... 

Now, on a Security Check question, you say, "All right. Have you ever stolen any umbrellas?"

"Woooow! Oh! Gee, why have you brought that up? That's terrible, and so on and so on."

"Well, have you?"

"Yes." [laughs]

"All right. How many?"

"Oh, lots of them, lots of them, lots of them."

"How many times have you stolen umbrellas?"

"Oh, lots of times. Oh-ho, lots of times." [in a tearful voice:] "Think of all those poor people out there in the rain – umbrellas stolen. How mean of me to do this."

"Okay. Thank you. Now, have you ever stolen an umbrella?"

"Ooonoooh. Gee, you keep asking that question. My God!"

"Good. Have you stolen any other umbrellas?"

"Well, yeah. You put it that way – yes. Yes. I used to collect them out of the whole faculty at my prep school."

Now, that's what the grief is coming from. The grief was coming from a withhold. See? Because the withhold had the incident charged up.

Now, if the incident remains charged up, there must be another withhold.

See, if you can set off an incident by simply getting off a withhold, you must realize that if it keeps running, it's only half set off. So there must be something else there, so there's another pin to pull. An unkind thing to do is to run it.

I can tell you this because I've watched this over quite a period of time now and the only safe thing to do is remember vividly that what turns it on turned it off. If you want to turn something off, with what we're using today, well, just keep on running some of the same, and you'll get it off – but that's the only way you'll get it off. Because the other processes of
Two-way Comm and this sort of thing are so much weaker than any other process you happen to be running now, that they don't come up in order of magnitude.

So you're running Sec Check question, Sec Check question, Sec Check question. My God! I've seen the – practically the dead get up and walk if you ask the right Sec Check question! And you're going to all of a sudden run, "All right. Think of a time you were happy. Thank you. Think of a time you were happy." Well, think of how many times you've run some such inane process on a pc and nothing happened to the pc. You sat there and sweated for an hour or two. You knew it was the exact process to fit the case. You knew he should get up and walk, but by golly, he never did. Have you ever had that experience? You run some mild process.

All right. Well consider it as though you were all of a sudden running a 155 millimeter process, you see, and it's going boom! you know, in salvo. Boom! And then you all of a sudden – the pc says, "Oh, thud. I've been bracketed."

And then you suddenly say, "BB gun, BB gun, BB gun, BB gun, BB gun." You – of course, you leave the pc right in the middle of the woooooouh. The only thing that could possibly boot him through it was what you were running.

3D Process? Absolutely fantastically powerful, that process is. Sec Checking? Very, very powerful process. Extremely well done, a Sec Check can do almost anything with a pc. Havingness? Tremendously powerful process. You think you're going to get processes all of a sudden out of a – out of your hip pocket that are suddenly going to outrank these three processes? No, you're not.

So if they turn something on, believe me, you're not going to get it off by getting a Kleenex and wiping the pc's fingernails or something. It's going to take more of the same. See? So that's something for you to realize.

Now, in training Sec Check people – in training people to sec check – you should recognize that their first tendency will be to be kind, and in that lies their greatest cruelty. In auditing, in kindness lies the greatest cruelty always. You're being kind. And by that I mean the pc is crying, so you say, "Well, we better not keep the session going because it's getting the pc too upset." Huh-huh-huh. Slit your throat; you just did.

Another instance of being kind: "Well, the pc was too upset in the session yesterday, so I'll let him get rested up a little bit, and we won't have a session today." Cut your throat; you just did.

Pc is always getting angry every time you approach Sec Check questions in the rudiments, so avoid them. That's the kind thing to do because it makes a nice, smooth session in which nothing ever happens, ever.

You could audit him for thousands of hours and nothing would ever happen with the case. Case has obviously got withholds.

All right. "Because the pc might get upset pulling the withholds, we won't approach Sec Checking on this particular pc because it's very kind. The best thing we can do for this pc is to run a 3D Assessment very, very rapidly – without any Security Checking, without any
Problems Intensive – and just get it very, very rapidly, and hang it all together again, and so forth, and then run him immediately and rapidly on a 3D level. That'd be nice, because he wouldn't then be upset at all that Sec Checking and all that wasted time, and it'd be the nice thing to do." Cut your throat; you just did.

Case is in no – might have been in shape to be assessed. You might even with altitude have gotten by and through and finished with an assessment, but let me tell you something. You'll never – never get him through alive at the other end of a 3D run. See, even if you did do the assessment, you would never – they – they'd just probably wind up practically three-quarters of the way dead at the other side of it.

If you haven't noticed – I think some of you have noticed 3D runs are a bit tough. They have a tendency to have some somatics connected with them. Have you noticed that? You noticed there was something to a 3D run. [gives an artificial cough] Indeed.

Well, how would you like to go into a 3D run with the entirety of a Joburg loaded and undisclosed? Isn't that kind of gruesome? Completely out of communication with the auditor and liable to ARC break with the auditor at any moment and go out of session so the 3D run is left half flat. Oh, that'd be great, wouldn't it? Wouldn't that be ducky? That's just exactly what the doctor didn't order... That's what the doctor would order.

I ran a pc one time – I learned my first lesson on this. I ran a pc halfway through an incident. Pc turned on an actual, registrable temperature of a 102. Medical doctor observing, took the patient's temperature and instantly stood up with great heroic gestures and said, "The pc must at once go to bed because the man is obviously very, very ill."

And I said, "The doctor must at once sit down because I am in charge here. You're not."

He sat down looking somewhat cowed. And I ran it through at the other end and in a incredulous fashion – it was only fifteen minutes later – he takes out his thermometer and puts it in the pc's mouth, and by God, the pc's temperature was normal. It had gone from normal to 102 to normal in the matter of a half an hour.

I said, "You want to see it go up and down again, Doc?"

"No," he said, "No. No." He said, "That's all I want to see now."

His whole concept, you see, of what turned on temperatures had been turned upside down.

All right. Seeing somebody suddenly in duress and agony, the doctor's response was, of course, to do something heroic and different. And that would have been the one thing that would have dished the pc. That would apparently have been the professional or the kind thing to do, but for a Scientologist that is neither professional nor kind – very cruel.

Pc gets upset and we don't drive the pc through to the other end of it – it's cruel. Never kid yourself otherwise. It's a cruel thing to do to a pc. No matter how a pc is upset, we know how he got upset and we know why he's upset, and I'd straighten it out.
If we had a Sec Check question half-flat in the last session and we approach this session, we can't get the rudiments in, do we spend the rest of this session getting the rudiments in? No, we do not!

We get the rudiments in somewhat in this fashion: "Room, auditor, withhold, PTP? Thank you very much. Now, the question is: 'Have you ever stolen any umbrellas?'" See, pc's all upset. Well, that's where we left the pc. That must be what he's upset about. And you'll find out it'll usually work out that's exactly what the pc is upset about. Now, the pc goes out of session reading at 3.0 and comes back in session reading at 5.0 on the tone arm, we ought to notice this. Something has happened in the interim. It might be – not considered socially marvelous to go around and inquiring after everybody's private life. And it might not be the accepted thing, but it's a cruel thing to start a session without having noticed that. Tone arm's gone up two divisions? What did this pc do between sessions?

Now, we're going to try to get the rudiments in. Ah, well, it's going to be a very rough job – unless we're terribly specific. We say, "What have you been doing?" We don't even get a session started. You look at this and it's on the E-Meter, and you just got him on the E-Meter. "All right. Start of session. Thank you. Now, what have you been doing since yesterday afternoon? What has happened?"

"Oh, well. We don't want to go into that."

"Well, I'm afraid we do. Now, what's happened? What happened?"

"Oh. Well, I've got a ..."

"Well, that, that – that you see right there. What – what has happened? What – what happened?"

"Well, I don't want to tell you, and so forth. My third wife arrived. You see, I've never – I've never bothered to get divorces from my first two wives. And she just got into town. And I didn't mean to tell you, and ..."

Tone arm goes down, clank! Now, you spend the rest of the session discussing this? No, not unless it shows up as a PTP.

You say, "Do you have a present time problem?"

Pc is very often – is trying to sponge a session off of you or something of the sort. You're getting registries, see. You're getting registries on the meter, the meter isn't null because of an ARC break, see. If you can get registry on a meter, you know, the pc hasn't got ARC breaks to the point where you don't get a registry. You recognize that – that some people are not going to.

All right. And your registry is right there, and very nice. Everything is fine, and you say, "Do you have a present time problem?" You don't get any response of any kind whatsoever. You couldn't read it with a microscope, you know.

The pc says, "Oh, well, yes. I mean I have terrible worries. And I'm awfully worried about Aunt Agatha and Aunt Bessie and all of that sort of thing."

And you say, "Well, all right. Now, how do you feel about that now?"
"Well, I feel terrible about it."

"Well, all right. Good. Good. Thank you very much. Okay. Now, is it all right if I ..." You're off of it.

Sometimes it'll ARC break the pc, but it'd only ARC break the pc if you missed the withhold question that went immediately ahead of it.

So if bypassing a PTP upsets the pc, you go back to the withhold question. That's the mechanics of the situation. Pc has been trying to tell you something, and he circuitously wants a present time problem run or something like this. The pc wants something else done in the session. Well, the way you keep the pc from dictating what's going to be done in the session is return to the earlier rudiment. That just mechanically is good sense, but it's also Scientologically good sense because the pc didn't get upset about this unless he had a withhold of some kind that you missed when you went by the withhold question.

All right. There are these little maxims of one character or another, and I could go on about these things for some time, but I've given you the principal ones right here.

It is actually not a very difficult job to do a Class II, but it is sometimes very, very, very difficult to get somebody to do only a Class II. They want to do eighteen other things, too. You've got to blow a lot of confusion off somebody.

The person is sitting there and he doesn't know whether you're supposed to look into the top of the case or the bottom of the E-Meter or the pc's shoes simultaneously while... And how can you possibly read the question off because at the moment you're reading the question off, of course, the E-Meter might be moving on the instant read. But at the same time you have to do TR 0, but your TR 2, you see – that might be poor, and the pc might not quite be getting that either, and – and it just looks like a big mess to the person.

Now, if it looks that confused to the auditor, the pc of course, will get very upset. So, actually, the pc is sort of trying to stay in-session and make a session out of it and is eight times as hard to audit. See? So, a confused auditor – a pc is much harder to audit. In actuality, the pc does not behave properly for a session because the pc is reacting to the confusion of the auditor. So therefore an unskilled auditor has much tougher pcs than anybody else. That's – that's the horrors of the – of the truth of the matter.

Now, your next point is: that because it is all so complicated – the auditor who's learning this routine – of course, doesn't see anything wrong with throwing five or six more complications in on top of it. So he starts doing all kinds of additives. And it's frankly not so much a job of teaching somebody something; is trying to teach them some "only" things. See, it's not so much trying to cram all this stuff down their throats, is keep them from imbibing all of this useless gutter water along with the drink of wine, you see. And it's sort of you go on "onlys" on this type of training and you will win. You know, "onlys." Figure out something very simple. Figure out something very simple.

How do you hold an E-Meter on your lap? And get them to do that one well. And then for a while, just get them to read an E-Meter on body responses or something. And then get them to do something else like read a Security Check question. You know, no meter around, you know. Get some dummy Security Check question, and let them fire that.
"Have you ever been a horrible person?" you know. Something like that. Something you would never miss. "Have you ever been a horrible person? Thank you. Have you ever been a horrible person? Thank you. Have you ever been a horrible person? Thank you."

You say, that isn't the way you audit a Security Check question. You ask the person pointedly, "Have you ever been a horrible person?" And, admitting that they have said, yes, they have been a horrible person, now let's ask them if they'd been a horrible person any other time than that. And let's just keep plugging the idea of a Sec Check question on a horrible person on this thing until the person runs out of answers on it. And let's do it that way.

All right. Now, let's get registry on the meter of these things and let's see if these things register on the meter.

In other words, any way you want to plot it up. I'm not giving you the ideal combination. I'm just giving you an idea that you teach them they can do these things, and it's not really a matter of upending a bucketful of facts over their heads. It's trying to keep them from upending a bucketful of facts over their heads. You know?

See, they're thinking all the time, "Let's see, the potentiometer, and I wonder if one tone arm – do you supposed to get a tone arm motion while the needle bops... Is – is – is there any data in here about – about rock slamming. If it rock slams, if the sensitivity is high, maybe – maybe as the rock slam turns on if the sensitivity's too high, maybe if you turn down the sensitivity, wouldn't have a rock slam. Maybe that has something to do with it. I wonder what – if you have to read the proper name of the Security Check off to the pc before you start giving the Security Check. That seems to me to be awfully important.

"Uh – let's see. This is a Form 3. Uh – I don't know why it's called a Joburg. Uh – that's – that's not very good auditing presence, but – and so forth. Oh, I have to remember I have to keep my TR 0 in. Keeping your TR 0 in is going silent and motionless like a cigar store Indian for forty-five seconds with nothing happening."

When a person starts to learn these things, he looks like a juggler, you know, with fifteen Indian clubs and eight cubes in the air and all of them about to hit him on the head.

The thing to do is to show him there's one Indian club, and that is an Indian club, and really get him to a point where he'll actually go out and tell people, "This is an Indian club," and think of himself as a great authority on the subject.

Now, if he can do that, he eventually gets this one thing. You know, I learned this from a psycho girl one time. She was really crazy. And I saw her turn sane – just like that. And she was never crazy afterwards. It was "Look around here and find something real." You know? "Something that's really real to you" is, I think, the wording of the old one. And this girl picked up one sugar bowl and all of a sudden clutched the sugar bowl to her bosom and said, "It's real! It really is! It exists!" I couldn't get the sugar bowl away from her. I never did get to flatten the process.

And that happened to other auditors, too. All of a sudden, somebody would – "No!" you know. And then the process didn't seem to work anymore after that. They'd made all the gain that the process was capable of making. Well, that's kind of the way training is. If you went over... You could actually train a person on an E-Meter this way. You could name off all
of the parts of a Class II Auditor until you got a fall. That one would be real to them. Get them to learn that one. Sounds weird. And get them to learn that one real well, and you'd find in practically no time at all, they'd become a complete authority on it.

Now, go over all the remaining parts of Class II on the E-Meter until one fell and then get them to learn that one. You could do it this way – I'm just *reductio ad absurdum* – but I'm trying to give you the idea that if you can teach them an "only," not an "all" – the "only" approach, not the "all" approach is what wins in this, because the pc is already snowed under with the "allness" on it. "Oh, my God, here I am actually sitting here tampering with somebody's mind and didn't I learn 5,685,000 years ago that tampering with somebody's mind was my downfall? And I wasn't supposed to do that – and oh – I must keep my TR 0 in.

"Yeah, now let's get on to the E-Meter and so forth here. I wonder if you reduce the sensitivity if the rock slam comes off. Mm, TR 0."

So it's rough, man. I mean, you can practically hear the brains wheel when you're doing this kind of thing so it seems very easy to you after you've done it a lot. It seems very simple to you. You'd say, "Oh, well, I can do this. Why should anybody else ever have any trouble at any time" and so forth.

And now I come in and tell you that as soon as you get back to where you're going in a Central Organization or otherwise, you should tap two people on the shoulder and you say, "Many are called, few are chosen." [laughter, laughs]

And one of them says to you sneeringly, "Oh, I've passed Class II skills. I've already been passed on it. Huh-huh. I've already passed on it."

Check them out. They won't get to the first paragraph of the examination without falling on their heads. Then you start in from scratch and make a Class II Auditor out of them. After that, if you've got to assess somebody, you can always send somebody to that auditor. You've always got that auditor to lean back on.

You better do that – because you're going to need help. You're going to need it, but not in the way you think – not in the way you think you will need help. The way you need help is to keep an assembly line going, to keep people getting audited with the skill that only you can provide. Other people can provide the more basic skills, but of course, you have to know those basic skills much more perfectly than anybody you will ever teach. So get busy.

Thank you.
All right. This is 13 Dec. AD 11, right?

Oh, dear! How sad some of these people are and how bright some others look. Well, they go up and they go down and some go up and some go down. And it hadn't anything to do with the auditing. Well, anyhow ...

I want to give you a little more data here about putting a 3D package together.

Now, at the time I'm speaking to you, there is no cinch. Nothing on this criteria should be taken as a lead-pipe cinch in this stuff I'm about to give you. These are indicators. And as soon as we've got a lead-pipe cinch figured out, why, I'll give you the lead-pipe cinch. But until that time let me give you what thinking there is on it.

A 3D package is as good as it is assessed. And that's all it is. It's as good as it is assessed. You get an assessment on a pc which is well done, you – you get your list, you bleed down for any other items on the meter. You make sure there are no further items on the meter and you make sure that the reaction on your question, "Are there any more items?" is not an ARC break. You know, more people have gotten hooked with that. You know, they can stack up to a thousand terminals with the greatest of ease by simply saying each time, "Are there any more terminals?" and the pc is ARC broke, gets an ARC break reaction on the needle and then flounders around and digs up some terminals. And the auditor never says, "Is this question an ARC break?" at which time he would find out, yes by God, it sure is! And then, you get your list null. That is that the meter, then, is bled down. The only thing that gets in the road of that, however, is that ARC break reaction.

Therefore, you get a complete list – be sure when you've bled down the meter that your list is complete and that is your complete list. Now, your pc from time to time will want to add another item or two. This is fine and if he wants to add them, you put them down. Now, as you assess this, it assesses quite mechanically. If your rudiments are in, you will get reaction. And if the rudiments are in, you will get the item. And it doesn't take any long Egyptian dream of eternity to assess the thing out. It just brrrrrrr-pang! And you're taking much – you must adjust your viewpoint of how long it takes to get a 3D item.

The longest one is the goal. Why? Because you have nothing in view. Nothing. It is just a wide desert and you are staring across this uneven, monotonous plain. This is life. And there's nothing showing and until you get a goal, you haven't got a handle onto the Goals Problem Mass. But as soon as you've got a goal – now, it may turn out to be the oppgoal. But you've got a goal. You've got something that reacts. You got something that stays in.

Now, get that, make sure it's the only one, make sure it's right and take off from there. Get your next item. If this item does not pan out rapidly and there seems to be a lot of trouble
concerning this particular item and it seems to be all tangled up, try for another item. Just don't keep beating the pc to pieces. Well, look, you've got a – you've got a goal – we don't care what goal it is – let's get a goal in opposition to it. Terminal unknown.

If we can't get the oppterminal, let's try to get the oppgoal. All right. And maybe we couldn't get the oppgoal at a lick and a promise and quickly, you see? We can't get that oppgoal either. It – apparently, every time we speak of opposition to this pc, the pc goes zzzz. See? Well, let's get something on the pc's side, then. We've got a goal; we're fairly sure it's the pc's goal; at least at this stage of the game we can assume that it's the pc's goal. So, let's get his modifier.

And finding his modifier is a very simple proposition. If the pc is bogged down on finding his oppgoal or oppterminal, he will pep up on finding his modifier. And if he doesn't pep up on finding his modifier, you've already got the opposition goal; that's why you couldn't find it. 

So, anyway, if we've got his goal and modifier and we haven't got an oppterm and an oppgoal yet, do you know we can find his terminal and then find the opposition terminal to that terminal. See how many ways we can weave this thing? We don't care how many ways we're going to weave it. Don't get the idea that you can spend session after session after session after session looking for a 3D item. This is balderdash; this is complete nonsense. It does not take very long to find a 3D item; it takes about one hour once the goal is found.

So you just might as well settle your sights on that particular target and realize that if you can't get a full 3D package on somebody, after you've got the goal, if you can't wrap this up in about ten hours, that you certainly are bucking the tiger in some way or another. And the usual way it is, is because you have been too optimistic and you have taken the pc before the pc was prepared for an assessment. That is the first biggest fault.

Your next fault on the thing is that you are looking for items you've got. Now, that's the next biggest error that auditors are making; they're looking for items they already have.

Now, how is that? They have found a goal, only it turns out to be the opposition goal, so when they try to find the opposition goal they've got it! So of course they can't find it. See, they've got a terminal. But they keep looking for the opposition terminal to the goal or something of the sort. Only they're looking for it on a bias, you see.

They've got the oppterm, they haven't got the terminal. So, you look and look and look and look and look for an item if you already have it. And you won't find it. It's there! You've already got it. It's – there it is. You see what I'm talking about now?

All right. Now, you play this thing crisscrossed, in other words, and if something starts giving you trouble, you find something else and it'll start clarifying. But remember, you're taking apart a piece of black porridge that's full of string, that has been made with the best quality glue. And it's a horrible mess and it is just lucky as the devil that the goal sticks out. That is just lucky, because that's the only handle you've got.

That's why you must try to get the original goals list of a pc, the first one he ever wrote. That's why you must take any terminal that ran well earlier on the case – the first terminal that ran well on the case and assess from there. That's in patching up cases and getting cases
that have already been run on Routine 3 and so forth. You must *use* these items. Because you aren't going to find another one; you're going to find another subordinate package that will never collide with a Goals Problem Mass. And you can run the pc practically forever if you're not using the original items.

That's something to know. So when patching them up, you say, "Well, what was the goal found on you? To shoot cats. All right, that's fine. Now, what was the terminal that was run? A cat shooter. All right." That, so far as you're concerned, is the entrance to the 3D package. That was the first goal and the first terminal. That was the entrance to the 3D package.

This has been run on somebody, don't you see. This person's already come up to free needle with a Goals Problem Mass still floating around in their vicinity, ready to key in somewhere up the track, see? So those are the things you use and you try to put a 3D together.

Now, you will find that most of your Routine 3 cases which failed and which did not go Clear, were being run on their opposition terminal, possibly with the opposition goal and this must be a great number of them. Must be a lot of them were found wrong way to. All right.

Therefore, although you've taken the person's goal – this person has been audited to Clear. Let's go that extreme. Or not audited to Clear; we don't care. But he's been previously assessed and audited. Let's take those items which have already been done on the case ... of course, if he's gone Clear, it's prima facie evidence the fact that you had the right goal and the right terminal. Now you've got a goal and audit it so as to find a Goals Problem Mass. So you've got to have the oppterm and the oppgoal and the modifier and the rest of this package. And you're liable to wind up here with somebody who has had a beautiful floating free needle and just about the time you looked for the modifier it all went *clank* again.

In other words, you keyed it in, you didn't stand around waiting for life to key it in. So it goes *clank*! So now you're going to find the Goals Problem Mass and you're going to shoot it full of holes and this person then will come out at the other end, if you do any kind of a good job at all and the needle will go free again and this Clear will stay stable and he won't be Clear on just one dynamic, you see?

All right. Now, the person who has been audited endlessly on Routine 3, but has never gone Clear – ah, this is another proposition. By the rules of the game, just a fluke, you might have his right goal and his right terminal, but somehow or another it hasn't stacked up right or something or other or something or other. But the high probabilities are that you were auditing – they were auditing the wrong side. But you still take it, because it's probably part of the 3D package.

Now, you don't take it as complete evidence that it *is* the 3D package. See, you don't – you don't take that as complete evidence. But you know the person was audited on it. And maybe it was a bad job of assessment and maybe it's a lot of things and maybe the reads aren't very big on it and maybe there's going to be a lot of trouble about it. Well, that's – you're an auditor. That's what you inherit – trouble.

All right, so this situation then, integrates on the basis that you take this unsuccessfully run 3 case, Routine 3 case, and those are simply conditional. Those are nothing but condi-
tionals. It was the probable goal. It was the probable terminal. That's all. And then try to check out a 3D from there. Well, now, you could crisscross a 3D from there; you can probably arrive at the Goals Problem Mass and you will eventually perhaps even lose the original terminal they were run on. How do you do that? You find the opposition terminal, the opposition goal, and then you find a modifier and then you go back and you find – you take their terminal. And now you try to find an opposition terminal to it and if it's not the one you found for a 3D package, it wasn't right. See? So, you could check this thing out.

Now, you can do other things. You can take the terminal, find the opposition terminal to it and then find a goal for the opposition – opposition goal for the opposition terminal or a goal for it. Check back, find out if this matches against the goal and then find a modifier and then find a new terminal. The old terminal disappears. It was simply used as a leader. Do you see how you could do that?

But when you finally get through, you should have all five items of the 3D package checking out uniformly. They all ought to tick the same way. Click, click, click, click, click. And incidentally, for your amusement, your first Prehav level ticks exactly the same as the rest of the package.

And if you haven't got a package on 3D that goes click, click, click, click, click, five times, there is something wrong with it. So what do you do? You get the rudiments in, you straighten it all out and you check it across. It isn't that the whole package is wrong. Some of that package is probably right. But some of the package will null and some of the package will stay with you. So you take the package that stayed with you and you get crisscrosses, you get "What would oppose a cat shooter?" you see, and then you put in a new terminal. You do a new assessment there and get a new something-or-other in there. And you keep working it on a cross-play, don't you see, until you've finally got five items that will stand up and stay in. And then you've got a 3D package.

But even then you're not sure the package is in proper ordered. Now, having a 3D package and having one all arranged for the pc, are two different things. You can have five items and they all stacked up beautifully. You've got them all assessed, all the items nulled, they all read the same. But you haven't found yet who is the pc.

Now, when I first entered into this, it seemed to me to be a very easy thing, because I simply asked the pc and there was no one doubt in the pc's mind as to which one the pc was. But since running it and since it's been in your hands, there's apparently considerable doubt and argument as to which one the pc is. So, a piece has gone astray here, so we need a regulator for this thing.

Now, once you've got the package, that simply means that all the parts of the package check out and there isn't one part of it going null and coming back and going null and coming back.

Now, mind you, you can get a bouncer modifier. The only thing that is wrong with all of this is you can get a bouncer modifier that'll make the whole package flicker. If you had a modifier "but always be late," you're liable to get the whole package on a quarter-of-a-second latent read. Did you know that? That's quite amusing. I mean, the package is obeying the modifier. So there isn't any great certainty there. But look, the chances of your getting five items
that all read a quarter-of-a-second late are so remote; it is the package. See? The modifier has a lot to do with the behavior of it.

Now, if you want to get rid of a modifier, all you'd have to do is deintensify it. Just chant the bouncers and deniers and so forth to the pc. A very crude operation, but it can be done that crudely. "Leave, leave, leave, leave, leave, leave, leave, leave, leave, leave everything, leave everything, leave everything, leave everything – ." And all of a sudden the thing will read. Of course, it won't read very long, because you haven't pulled the bottom off of it yet and it'll charge up again. But you can at least get it discharged to a point where you can make it read and if you can make a modifier read that way, you can make a whole package read for a short time. Interesting, isn't it? It won't be until you run it that you actually get charge off of it.

Now, those are criteria of selecting a package. It does require a bit of auditor skill. But less skill, ordinarily, than you would imagine. It's basically – selecting each one of the items is a simple mechanical job of getting the list complete, and then getting it all null with the rudiments in.

Now, I'll give you a check to find out whether or not the rudiments are in. At any given time, if you have a proven part of a 3D package, you can say that to the pc. If you get a reaction, the rudiments are in. If you don't get a reaction, the rudiments are out, period! Very quick way to find out if your rudiments are straight. Very, very quick.

All right. Therefore, if you've got a part of the 3D package that has been proved out, why you can always find out if the rudiments are in or out and you can always find out what the rest of the package ought to look like. Well now, will you please get clever and when you're nulling a list down, look for the reaction of the proved-out part of the package. Where is that reaction on the list? Don't be a knucklehead! See? The thing has a tiny rock slam and when you're busy nulling a list, you notice there's a tiny rock slam on this and you notice there's a tiny rock slam on that and a tiny rock slam on that – you bleed down the list very carefully, "Are there any more items? No, there are no more items." So, therefore you've got it; it's in one of those rock slams. Go ahead and null out the list, but you know what it's going to be before the pc finds out.

Then you're proving by nulling. You're not finding with nulling. You give me the original list of a couple of 3D items, I can run down them with an E-Meter, with – if I've got one proven item and I can tell you what it will be. It'll be that one or it'll be that one and that's it. Won't be any of the others. One of these two is locked on the other one.

Sometimes you're unfortunate enough to have a pc who's so jammed and he's got five, eight, ten items locked on one. Of course, they're all locked onto the Goals Problem Mass. But you have to be awfully close to the middle of it to get an actual, exact reaction to the goal. You got the goal, the goal is a small theta bop, let's say – they seldom are, but we'll say it's a theta bop – and you're going down this list and you see the – "a rat." That goes and "a cage" goes. Well, use your head. Rats have cages; cages will blow off, leaving a rat.

You usually know the 3D item before you've assessed it. You go down that list once – pang! – if you know what your goal reaction was. Now, you don't force this on the pc. This is
just to make you sure. You don't force it on the pc. You don't bother to tell the pc anything about it at all. It's none of his business, after all, it's just his bank.

All right. But there's ways that you can spot this thing. And if you can't wind up with five items, all of which have an identical reaction on your needle, you haven't got a 3D package and that's all there is to it. But let us say we've gotten to that stage by the standard assessments which you are doing and we now find ourselves in this interesting position: Who is what? Which is what?

Now, in some large percentage – much, much better than three-quarters of the cases you audit – you will have no difficulty with this whatsoever. But the remainder have the opposition terminal, is so close to the terminal and the opposition goal is so close to the pc's goal, that these things flip around like a merry-go-round. There's always something happens to destroy the serenity of our ways and that is what is happening at this particular moment.

Therefore, as I mentioned to you in the last lecture, I have been on the track of this and I've gone a little bit further onto the track of this and what I'm – what is not absolute about this lecture is about what I'm about to give you right this minute. Apparently this is the way it fits. Here is a test you can make: You can take the probable terminal of the pc and the opposition terminal, the probable opposition terminal, and you put them down on a sheet of paper and you write down, "You. Term. Oppterm." You see, whatever they are. See, "You, water-buck, tiger." All right.

Now, all you have to do is say to the pc, "How would you – or what would you do to solve problems, or what would you use to solve problems?" And – I suppose, "What would you use to solve problems?" or "How would you go about solving problems?" or "What would you do to solve the problem?" And you write this down under "You," see. And you write down – he'll give you four, five, six, seven, eight, ten of them; we don't care how many.

All right, and then we take the terminal and then we say, "What would a waterbuck do to solve a problem?" or "How would a waterbuck solve a problem?" Whatever registers so that you can get Prehav level-type words out of the pc and we make a long list: eight, ten ways the waterbuck would be solving problems.

And then we take a tiger. Now, "How would a tiger solve problems?" And we make a long list here of how a tiger solves problems.

And then we've got three lists. We ignore "You." That simply made it interesting. We put it in there so the pc will start differentiating amongst these things, don't you see? This is – it's a very good auditing action. It's one of these little one-shot things the pc says, "Hey what do you know!" You know? That's the end of it. I mean, it doesn't go any further than that. You don't use these things for anything. You're not making up your Prehav Scale. Don't do that. Because he would never think of the proper words to solve problems. If you ask a pc at any given moment, if you made him memorize the Prehav Scale and then rattle it off to you, he would leave out all of those levels on which he should be run, see? We've tested that. It was very interesting. Peter and Mary Sue – first time I came down with the Prehav Scale for the – for the course down in Joburg – I handed it over to them and they'd remembered it, you see, from something I'd given them the night before and they told the students all about it and they
both left out Protect. Isn't that interesting? Both had left Protect out of the thing and Protect was hot on both of their cases.

So this is no action, then, by which you get a Prehav Scale. You could probably blow it up to that point with a meter bleed and you could be very, very upset. And I imagine some place if you found yourself in Arcturus and you didn't have a Prehav Scale and no textbooks and that sort of thing — you did this to several people, and bled them — a meter down each time or strained at it terribly, you would finally wind up with something like a Prehav Scale — an auxiliary Prehav Scale. That would be one way to get one.

But let's look this over now and let's find out that the pc's terminal is the lowest on the Tone Scale; not the highest, but the lowest.

Now, the earliest work I did in Routine 3 is quite interesting in the way the assessment is done and you still have a relic of this in some of the early descriptions of assessing. And it says you go up the scale until you start to get a rising needle. Remember this one?

*Audience: Mm-hm. Yes.*

You go up the scale until you start to get a rising needle and you come back down again because there's no sense going any higher.

Now, that one is quite interesting. Because the oppterm is always higher-toned. The tiger, to your state of mind, is a ravening, treacherous, lousy, verminous tramp, see? But to the pc, the tiger is knightly, charming, beautiful, sleek, lovely ... What would a tiger use to solve problems? Diplomacy. [laughter]

And it, frankly, will be at such variance with anything. You might have a proper picture of the beast and you also might have a proper — improper picture of the beast. Who cares? But it's just very high-toned.

Now, I found this out empirically. I've looked around and I've — I've gotten some of the reactions on it and they're always very high-toned. The oppterm is high-toned. That's very interesting, isn't it? I'll tell you the why of this in just a moment. But it's really crazy.

You have the — it doesn't mean that it's a higher-toned terminal. That is to say the oppterm might well be a drunken bum on skid row, see. That doesn't prove anything by the name of the terminal. But a drunken bum on skid row — how would he solve problems? By being sweet to everyone, by being friendly, by being interested in other people's problems. And it'll be a wild show, let me tell you, man. It's going to be high-toned. This is an empirical guesstimate right at this time, about how this thing goes.

All right. And the pc's terminal, a waterbuck — a waterbuck uses treachery, meanness, sets traps, is socially unacceptable in general. How does he solve problems? How does he solve problems? By being vicious. By biting tigers. [laughter]

Now, you'll be peculiarly struck by the fact that these three lists are so different. And that is really what makes the Goals Problem Mass, a Goals Problem Mass. Because these terminals, as you first look at them in the pc, are in violent disagreement and remember that a meter reads disagreement. So a Goals Problem Mass, of course, is piled up because "you" doesn't agree with a waterbuck, because a waterbuck doesn't agree with a tiger, because it's all
a complete mishmash mess. And they use – and the first indicator is, is they use entirely different mechanisms of solving problems, so of course there's no agreement amongst them at all and you'll see that mirrored in those three lists. It's a – quite an amusing action.

It is sufficiently amusing that the beginning of your next session I'm going to ask you to do this little action, just for fun, if your pc is being – has got a 3D package or even if the pc only has a terminal and an oppterm as part of the package. Do this one and you will see what I'm talking about. It'll sound goofy, even to the pc.

So there's the methods of solving problems.

Now, the pc's terminal is the one the pc has the most reality on. Now, this has gotten mixed up over the years and some of the data given out by Routine 3 about the terminal being highest-toned should be interpreted this way: The terminal is higher-toned than the pc. We don't know what the pc is.

We haven't got a clue what he means by "you." And he sure hasn't either. "You" is just something which is just up in seventh cloud nine. It – it's a some kind of a combination of terminals or something or other, but it certainly had nothing to do with the thetan. It doesn't mean "you a thetan." It just is "you." Lord knows who "you" is. It's some kind of a crisscross combination and a mishmash and a saintly idea of what he should be doing or shouldn't be doing.

But the thetan actually is on the minus Tone Scale. Otherwise, he wouldn't have a false identity sitting in your auditing chair, called Bessy Ann or something like this, see? That thetan wouldn't have a false identity, if he weren't on the minus Tone Scale. He would be standing up throwing flitter around the room. That's about that.

A thetan who could be interested would be pretty close to visible. That's very high, see. A thetan, who all by himself without any dependency on any MEST or anything else could exert control directly, hasn't been seen on the track since Merlin. See, so your pc is lying actually, as a thetan, is down in the minus Tone Scale. And the pc goes up scale as you run the Goals Problem Mass out and the pc's terminal goes down scale and the oppterm tends to remain more or less the same. The oppterm is simply the oppterm and it doesn't have too much to do with anything. Except it sure has an influence on the Goals Problem Mass. Now, we'll go into that in a moment.

I'll give you some more of this conjectural material. The height on Tone Scale, then, is we know the thetan is going to be on the minus Tone Scale, so we're not going to worry about "you" because that doesn't mean anything. But as far as the terminal is concerned, it's going to be fairly low on the actual Tone Scale. The oppterm is going to be fairly high on the Tone Scale.

Somatics: If you run 3D levels on the pc and you are running the pc properly, as his own terminal, you are going to develop somatics. Somatics are going to develop – rough ones, bad ones – enough to make any pc cut and run. It may take him a long time to move up to the point of feeling that much, but he's going to feel them and they're rough. Well, why are they rough? Well, that's the reality of the case. That is how come the terminal is fixed there.
The terminal is fixed there because any time it shifts, it hurts. So the pc doesn't let it shift. So he holds it in place. Because if it ever moved, it'd hurt.

Now, in view of the fact that he doesn't want this to hurt, some pcs would rather not run their own terminal. You get a condition there of a pc rather protesting against this and not really wanting to run his own terminal. Because it hurts. He'll scream like a banshee on the thing.

Now, the somatics are developed out of masses and these masses may at first be invisible to the pc or not really directly sensed by the pc, but are actually resident inside the pc's body, because they surround the thetan. The thetan is a mass of energy and mass. That's why he can't go anywhere and why he can't do the things anymore. He's in a trap of his own making and this we call a valence. But it is a mass package. And as you run the person, this somatic area should move closer and closer in to the body and finally take up residence in the body. It gets worse before it gets better. Believe me, running a Goals Problem Mass always gets worse and worse and worse before it gets any better. The pc, then, healthwise, does not necessarily appear to get better at all, but on the contrary, appears to get worse, but they're more cheerful about it.

All right. Now, that is an indicator. Now, if you're running – if you've chosen the opposition terminal and you're running the pc as the opposition terminal, the pc appears to be blown upon. The pcs sort of – well, their eyebrows sort of tend to vanish, you know and they sort of so on and they get watery-eyed and so on. It doesn't mean that they won't get roughed up running their own terminal. They're going to get roughed up badly. But it's a peculiar – peculiar set of things. A great peculiarity is connected with this. Because it's something out there which is pushing them here.

The winds of space – a very good, descriptive thing. Because this could be – well, it starts to make their body disappear. Let me tell you – let me say that. The front of their body starts disappearing, as far as the sensory perception goes. I know that occurs. Instead of getting somatics in their body, their body starts to vanish. There's a different sensation involved in the thing and when you get some reality on it, it's better than my describing it to you.

The next thing is the Sec Check responses. Oh, you didn't think that one would come up and root. If you look over the old seventy-five hour Sec Checks of the pc, the pc is always answering on the mores of his own terminal. That is a little law: When sec checked before 3D is run, the pc only answers on the mores of his own terminal. And you can look that over and decide whether it's the – whether the – you've got a waterbuck. Well, has the pc been giving you the mores of the waterbuck or has the pc been giving you the mores of a tiger? And you can look that over. You could also differentiate the goal and the oppgoal the same way. These – this requires judgment. But it is a check. You can check up on this and you'll find it is an interesting thing to check up on.

You'll find that uniformly, this pc has been telling you now, "I'm a tiger! I'm a tiger, that's what I am, of course! Us tigers – us tigers always are very, very rough people and I am a tiger and there's no doubt about this." ... [laughter] Well, if you miss the fact that his head is being pushed off, backwards – if you miss this fact, because it might be missed by you – you
can look it up on his Sec Checks. Have his crimes been the crimes of a tiger? Or have his crimes been the crimes of a waterbuck?

You'll find that it's very hard pickings and so forth, but once you get the pattern and once you get the thread of it, now that you know these two terminals – you wouldn't be able to make any sense out of it before that. But you know you've got two terminals. You know you've got one as an oppterm and one as a terminal. If you go through their old Sec Checks you'll find that their Sec Check answers agree with one of the terminals. And that is the pc's terminal. That's quite fascinating. If you look that over and I think you'll find out that's – that's more or less correct. [laughter] Quite amusing.

They would be giving you the kind of answer, while they were being sec checked, that that terminal would give and they won't ever give the oppterm kind of answer. They just won't ever give it. You just don't see it. I'll tell you why that is in a moment, too.

Next: The pc doesn't like his terminal. This is quite normal. At first the pc is very intrigued and very interested, and thinks this is fine. But on a careful check of this type of terminals, you will find there've been periods in his life when he didn't like this terminal. That is fairly true. Now, more importantly, as the pc is run, the pc will get into a giddy hatred of the terminal. They will think that terminal is just something they want nothing to do with. That terminal is just no good. That is the end of that. The terminal just isn't worth beans or buttons. They don't like it.

Now, it depends – the degree of overwhelm has a lot to do with this, but sooner or later, either at the beginning, with very little overwhelm, pc says, "Well, all right, so I'm a waterbuck. All right, yeah! Well, that's very interesting. Waterbuck. Well, thank heavens we got it straightened out. Yeah, I always have been, sort of prancing around." [laughter] "Yeah, yeah, I always have. Always – always was interested in a waterbuck," so on. It's fine, fine, fine. He'll run it. Everything's fine.

Session – first session, "Well, I don't really think much of a waterbuck, you know. I never have, you know."

Well, the auditor could be shaken at this one. Says, "What? This person is a waterbuck and doesn't like waterbucks. Well, that doesn't make sense." But he goes on and he runs it.

Few days go by, at the outside with any terminal and the pc says, "This is a lousy terminal, you know. It is just no good! A waterbuck – this is no good! They go around drinking water, drinking water, drinking water. I don't think they're so hot, myself!" He'll finally come up with this as an adjudication.

Now, it sometimes runs through from the beginning and sometimes sets in after several sessions. But at some time or another this one sets in and it's quite normal for them to have no real reaction toward the oppterm. The oppterm is just something that is there. It is – just is. But they have no real emotional reaction. Oh, they've been mad about oppterm; they've been upset about oppterm from time to time. "Yes," they'll tell you, "that's my whole trouble – the oppterm!" and then never amplify it at all. It's the most amazing thing you'll ever listen to. "Yes, that's my whole trouble and that's all the trouble I had been in and, yes, I've been ter-
ribly emotional about this oppterm. Tigers have just been the bane of my existence since time
immemorial. That's right! Okay!"

You put it in the auditing commands, they never make any comments on it at all. You
get some kind of an auditing response like, "Tell me a problem with a – with a tiger (the opp-
term)."

"Oh, how to find a place to sleep!"

"Well, how might you solve that problem?" You know, whatever it is. "Thinking
about it," or whatever the level is. That's it, that ...

There's no emotional adjustment over here in the area of the oppterm. But the water-
buck goes up and down.

"All right. Tell me a problem about a waterbuck."

"How to kill one of the goddamn things!"

"All right. How might thinking about it solve that problem?"

"Well, I'd get him thinking about dying and he'd die! He-he!"

"How would a waterbuck – what problem would a waterbuck have?" Whatever it is.

"Um, well, sitting feeling lonely someplace and how to have friends."

You're getting emotional changes on the terminal. So you can – you're running a pc on
the wrong terminal, you're going to get – you tend to get a monotone response. You know, no
– no real change of emotionalism on the subject of the terminal. All the same kind of prob-
lem, all about at the same emotional tone. That's just a tendency. But, the terminal – the opp-
term doesn't shift around. But the terminal sure does.

All right. The next item here: If you're running the pc on the oppterm, you get nothing
but motivator, motivator, motivator, motivator, motivator, motivator. You just get
motivators, nothing but motivators. They've never done anything. They've just been run over.
You're running this guy on a tiger and I tell you, tigers have just been eaten up by waterbucks
and they've been shot by waterbucks and they've been scalded by waterbucks and they've
been dragged all over by waterbucks and it's just terrible what those waterbucks have done.
That waterbuck is just the lousiest brute that you ever heard of and he's specially mean to ti-
gers!

And that's kind of going to be your response level. Now, that isn't any lead-pipe cer-
tainty, but it's an indicator if you've got that responses.

All right. Now, why would a pc give you the wrong terminal? Now, let's get into the
guts of this situation. Why would the pc give you the wrong terminals? You got the oppterm;
he says, "That's my terminal." Well, the pc attempts to withhold his terminal and there is a
large secret contained in it all, it all, it all and that's why you find the terminal last. It's best,
actually, to find the terminal last. Because the pc tends to withhold his terminal and I'll go
into more on that.
Isn't withholding the oppterm, but is withholding his terminal. This is why Sec Checks are so vital as preparatory maneuvers. It tells you at once why you should have Sec Checks, because, what is it? It's giving up withholds, giving up withholds and if you've got a person who's obsessively withholding, they will cover their terminal.

All right. Now let's go into a long, drawn-out story of what it probably is all about, huh? Well, once upon a time there was a thetan and he – trying to do something or other and had some kind of an activity going. He got tired of standing outside certain types of clouds looking at the change of light colors in them. He began to think that was dull and he found there was something wrong in the universe. And that's his terminal. So he up and decided to make that thing right and he decided to eradicate that thar item and he decided to make nothing of it like he was and he decided to abolish that terminal.

Now, there's probably a little prior step to all this. Before he started to abolish it, he probably had a common goal with it. He probably had some association with it of some kind or another that was a very pleasant association, before he decided it was all bad. That got him pinned in good. But we won't bother with those – the early history of that for the moment. We will just say that he did decide, because man is basically good, that this thing was basically evil. And that he must end it. So he went on a career and he has had a career ever since of ending this terminal.

And, of course, the more overts he got against it, the more he got away from it, the more he snapped into it and he eventually wound up with a complete O/W package and a total interiorization into the terminal.

Now, it works like this: That thing which you have overts against, you must originally have had some basic agreement with. So you were pals with this thing at some time or another, but you weren't it. But you could coexist with it very nicely and then you developed a bunch of overts on it and differentiated from it and you committed overts to ensure your differentiation. You began to be worried about being it. You decided this thing was pretty evil, so you developed some overts and you did overts to differentiate, so that you could get away from it.

You decided this was the bad thing to be, you didn't want to be around it anymore and you decided to kick it off and skip it and so you developed overts. You didn't just do this, just accidentally, for the hell of it. You really started developing overts and that made you move away from it. And that, at one time or another, on the past track, was the method how you didn't become something. See, that's how you prevented yourself from becoming something. You developed some overts and you withheld from it and that differentiated you from it.

Well, that, of course, was a cure. And as we always have cures for cures for cures, what happened after that is, is after a person had done sufficient overts and sufficient withholds, he snapped into it and became it. And that is the exact cycle: agreement with it, overts and withholds against it to differentiate and when differentiation could no longer be totally established, snap into it and become it.

Now, that is the condition the pc is in with regard to, apparently, his own terminal. It is the one thing that he has the most overts against on the track. Man, there are times when he has walked up and down Main Street of Hooklaville, carrying banners, saying, "Down with
waterbucks! Down with waterbucks! The trouble with this whole civilization is totally assignable, only and entirely to waterbucks! I can prove it to you conclusively. In fact, we've got one in captivity over here." So he goes over and tortures it to death. "Bum, bum thing, these waterbucks!" He's going to fix everything up!

Well, so he's gone on a kind of an in-and-out cycle on this thing. And it depends totally on the individual how often he's gone into it and how often he's come out of it and how often he's decided, "Now, if I – if I pick up a body in Northern Mongolia where there aren't any waterbucks of any kind whatsoever and if I carefully don't think of waterbucks at all, I will be all right. He'll get to that stage, you see. And then the war comes along and somebody drops a magazine out of an airplane and there's a picture of a waterbuck, see? There's all – and suddenly he feels sort of strange; he feels sort of more massy than he did before. But he can't tell what it was. Hadn't anything to do with that, see. It's a totally unknown situation.

See, his withholds against it amount to withholding it. He's trying to keep this thing from operating. So he's withholding it. So he's withholding it from operation in life. He's withholding things about it. He's withholding things against it. He's doing overts to it. He's differentiating from it. And eventually he gets to a point where he withholds it and he doesn't even remember it and is it, all the time. Some kind of a horror story, you know. You could – this thetan has finally wound up – the one thing in the universe he wanted nothing to do with, he is. Quite a game.

So, anyway, at the other end of the spout, you ask him for this thing. One of his first reactions may be to withhold it. So "I'm a tiger. Us tigers, us very noble tigers, who are so calm and serene and who are always right." Well, now, why does he do this? The oppterm is actually the ally of the thetan in the destruction of the terminal and that's what makes the package look so dizzy. He is not the oppterm, but he and the oppterm, at one time or another were pals. But then because he's used the oppterm to destroy the terminal – see, he's used the tiger to destroy the waterbuck so often he also has trouble with tigers now. So he has trouble with waterbucks and tigers now, when you pick him up, see?

But him and tigers have tried like mad to destroy waterbucks and he is right in there pitching on the subject of tigers. He'd hate to see tigers wiped out because they really do a nice job of destroying waterbucks. You let a nice – nice lot of tigers loose and they'll destroy an awful lot of waterbucks. But at the same time he's saying, "Waterbucks should be protected from tigers," because he is a waterbuck. So what a dizzy situation.

Now, that dizziness of that situation is why it makes it difficult for you to pick out the waterbucks from the tigers. But, of course, the oppterm is the pc's strongest ally for the destruction of the terminal. And don't think at any time the pc has any other goal than the destruction of the terminal. The terminal, however, has so overwhelmed him that some of its goals and thinkingness towards survival have overwhelmed his desire to destroy it so he goes on a flicker-flicker.

He comes in for a session, "Well, let's wipe this waterbuck out this session, you know? Rroww! Let's get in there at it. Let's damn waterbucks, and so forth. Let's get in there, and square it around, and so forth!"
He comes in the next session, "Us waterbucks, boy we've gotta get those tigers. It's pretty sad, but we've gotta get them."

The last thing in the world the pc will do is wipe out the oppterm. So you're just in for the – it won't necessarily damage the pc. It'll blow his head off and ruin his eyesight and a few things like this temporarily and upset him and so on, but the main thing you're doing is just wasting auditing. Because he isn't going to do anything to the tiger. He isn't going to do a thing to the tiger!

Tiger is going to stay right there. When you finally get the Goals Problem Mass all torn apart, that tiger is going to be in the same state he was in before you started auditing a waterbuck, which is quite remarkable. In spite of all the questions you have about tigers in your command sheets, just realize that those questions are going exactly no place except to straighten out waterbucks. That's the only reason you brought the tiger in there at all, is to straighten out waterbucks.

Now, if you know that anatomy of the package, it'll make more sense to you about all this. But him and the oppterm is really pals. They're bosom buddies. In spite of how he natters about it.

You can take – take a period in his life – this pc's life – or her life, ten years ago and you'll find her in a tremendous amount of trouble with tigers. Tigers were offensive. Tigers were upsetting. Ten years ago. They were very upsetting. They kept picking on her. Always motivators. Tigers picked on her. Tigers upset her ten years ago.

You can take a period in his life – this pc's life – or her life, ten years ago and you'll find her in a tremendous amount of trouble with tigers. Tigers were offensive. Tigers were upsetting. Ten years ago. They were very upsetting. They kept picking on her. Always motivators. Tigers picked on her. Tigers upset her ten years ago.

Yes, she's very happy to have run this terminal, tigers. Because they were so upsetting. All during her early career tigers, day and night, nag, nag, nag. If it hadn't been for tigers – if it hadn't been for tigers! – she'd amount to something today. "See these long scratches? Look at that. Look at that, see? Now, how could I have won the Miss America Beauty Contest with these long scratches? Hm? Answer me that!"

You're talking to a hundred percent waterbuck. [laughter] That's all. You're not talking to the pc.

Next day the pc has kind of gotten up a little bit, you see. Get an entirely different story about this thing "Damn those waterbucks!" And we don't hear anything about tigers at all, see. Never hear a word about it.

So, they oscillate between being their terminal and damning their terminal. And, of course, while they're being their terminal, they're against anything that is against that terminal. And while being themselves, they are against the terminal. Now, you have to sort this out, that's – it's all, because that's it. You're trying really, on the sheet – the 3D form – apparently to find the opposition terminal. And if you haven't got the reactive mind straight and what this is all about straight, you of course will think you're asking for the opposition terminal to the pc. See, that's a vastly different thing.

The opposition terminal to the pc is the pc's terminal. No, the opposition terminal that you want to get hold of is merely the opposition to the pc's terminal. The pc is hardly there at all. But the pc has a long history of the destruction of waterbucks. And man, can the pc find
problems and incidents on the subject of waterbucks and let me tell you, they just run out of answers on the subject of tigers, just *ththah*.

"Problem with a tiger? Well, problem with a tiger – find a place to sleep. All right, that's good. Yeah." They'd think about it, "That's right. Good. Well, problem with a tiger, well, um – how to rest more." They'd think about it, "Yeah, that's the answer."

That's the way this foolishness would run, see? But you could actually, on the 7 December commands, while running it, listening to the pc's answers, eventually decide, "Hey, wait a minute. I've got this thing all backwards!" You could eventually come a cropper, straight into it. Because you've got pc versus the oppterm and pc versus the term all in there.

And the pc says, "Ohh, uh – problem about a waterbuck, *uhn-uh-duh* – waterbuck. Uh – how to knock one off a cliff. Yeah. You get him to thinking about something else. That's right, and he wouldn't watch where he's going, and go off the cliff. Ah, yes! Yes! *Heh-heh-heh-heh-heh*! That's nice! Splash!

"That's very nice, that's good, all right. All right. Now, I'm talking about a tiger. Well, how to pare his nails. All right, good. And he'd – you'd get him thinking about his appearance, and that'd make him pare his nails. That's right.

"All right. Now, a problem about a waterbuck. Problem about a waterbuck, problem about a waterbuck. Well, uh – how to dry waterbuck meat. Yeah, how to dry waterbuck meat, yeah ... You get some very bright man thinking about it and he'd figure out a way to do it! Yeah, I got that one, all right! Now, problem about a tiger. Well, how to uh – how many stripes he has."

And you listen to this and you'll realize that you're looking over at some... This is a vast, calm vista that has nothing to do with the pc. The oppterm is some vast vista, has nothing to do with the pc. But every once in a while the pc will give you a nice answer like, "Problem about a waterbuck? Well, how to just get him eaten alive by tigers, you see?" Because that's actually what he's been trying to do for trillennia. He's been putting up this waterbuck and saying, "Tigers! Any tigers? Any tigers? Here!" [whistles] "Waterbucks! Look! Waterbucks!" You wonder why deer manage to grow white tails that make themselves very visible across the landscape. Well, they're a 3D package, too.

Well, now this gives you – as another aside, as part of the story – it gives you a very, very interesting view of humanity. All of the people they natter about are their best friends and they're trying to destroy themselves. And that is not a cynical, but quite accurate picture of man.

Why is it that all you have to do is put up a recruiting poster and have just millions of men swarm in for no pay, volunteering to go up against electronic cannon, dive off to other planets, plunge to the bottom of the sea? Why? Why? At no pay, so on. Should tell you, should tell you a lot. It has puzzled greater men than we, because Edward Gibbon says, "Courage must be the cheapest possible commodity in human values, because it's so easily hired in such vast armies, so quickly." Well, that's a paraphrase. It – he actually missed the boat. He didn't even get down – he not only didn't drive onto the dock, he didn't even get down near the pier. There wasn't even water, where he was! Had nothing to do with courage.
It had to do totally with self-destruction. You advertise a war, all the waterbucks take those waterbucks up and put them in uniform and take them right over there and give them a firing machine gun someplace. They'll just stick that waterbuck up and they'll say, "Well, here I am, dying in the service of my country... Well, they're missing me! I may have to move over there." [laughter]

A thetan is basically good. This is a good action which he has undertaken. All the way down the track this was a good action. He's been trying to rid the world of these lice! He actually has been working at it very hard and he should get a medal.

But, there it is. There it is. That's man. Not circa now; it's circa then. And back then and back then and back then and back then. He's always been operating this way. Guy joins up – you can always – you can always spot this.

Well, you can spot things like this about men, that – telling what they're doing and so forth. Person's on post. First few days there on post they look all right. And after a few days they start looking sort of dazed and after a few days start developing eye difficulties and after a few days more they – a little cough in the chest, so forth, huhrrmm! After they've been on the job three or four months they look like something's been parting their hair with a bullet, you know? They've been hired, see, by their opposition terminal while being their terminal. But occasionally they're their terminal, so they're on the side of the opposition terminal, against themselves. You follow this out?

They're on the side of the oppterm. See, what they did was join up and are continuously confronted by their opposition terminal. See, that's the corporation. Let's say they got a job in a corporation; their oppterm, maybe is corporations, big businesses, see. So while they're there, they turn the winds of space on themselves, you see. They've just got it turned on to a high roar and at the same time they, of course, had joined the corporation in order to destroy whatever terminal they are being. So, while they're being the terminal, they are fantastically destructive to the corporation except on the end of the week, at which time they are the corporation being fantastically destructive to terminals – to their own terminals, see.

So much so – so much so that you possibly could go into some large corporation, call in a large number of employees, look at those that look rather flat – whistle up those that look pretty flat – and say, "Would you like a reduction in wages?" "We'll sign a contract by which we guarantee to reduce your wages and in two and a half years you will go broke." And those people would sign it. And they wouldn't sign, "Now we're going to pay you ten thousand pounds a year and so forth." They wouldn't sign that contract. They'd sign the other one.

Everybody thinks wages are striking for – I mean, unions are striking for higher wages and shorter hours. No, unions are striking in an effort to wipe out working men and if you give them a good opportunity they could wipe out working men. You wouldn't have a sane employment union, organizational, structural picture at any time, ever, until you got all the 3Ds out of all the employees and you got it all straight. And then all of a sudden, why, it'd all straighten out and it'd all run all right.

Up to that time it's going to be this weird one of this fellow who has every reason in the world – you keep looking at it this way – you say, "But he's got every reason in the world to do his job and mind his nose – keep his nose clean and mind his own business, and so
forth. He's got every reason in the world to do this and every reason in the world why he shouldn't go in the opposite direction." Yet there he is in the opposite direction.

You say to people, "Now, take this crosswalk with the white lines on it. Now, you always go across the street at this white line." And then they're going to walk down the street half a block and go across where there are no white lines, even though it's out of their road. You stand and watch a white-line area sometime. You'll see people pass by the white line and go down the street, about a quarter of a block or half a block and wait until the traffic is good and heavy and then without looking to the right or left, cross at a slow walk to the other side. They got a waterbuck! They're going to say, "Who wants to hit him?"

And it's always such a shock to the thetan to find out that it hurts them. See, this is an awful shock to them – that they didn't kill a waterbuck, they killed themselves. This is always the surprise. If you catch a failed suicide, he is always in a state of fantastic surprise.

You get a fellow who almost made it, you know and you got him just by the last beam as he was departing from the body and stuffed him back in his head again or something of this sort and you'll have somebody who said, "But why did I commit suicide?", you know, and "Life is so wonderful and so beautiful and so forth," and they go through some kind of resurgence of some kind or another. Well, of course, what they found out is that they didn't kill their terminal, they killed themselves and this was a vast shock to them. They're always getting shocked this way and always getting upset this way.

But anybody who has a terminal has been trying to get rid of this terminal for a very long time. And you can say that his basic dedication and mission on the whole track was to dispose of the thing which you're going to run as his terminal.

And, of course, if you get the terminal, he'll cooperate like mad. And if you run the oppterm – if you run the oppterm, you're not going to get cooperation, you're not not going to get cooperation. They're just not going to, not not. Why, what – what's this? Well, it's all right. He'll ride along. He feels safer on that side.

So there's every reason in the world a thetan would give you the wrong item. But let's go back and look at what was true about it and we find out that the oppterm is usually the high-high on the Tone Scale (higher than the terminal), that when run, the terminal – if the pc is run on the terminal it turns on somatics. The Sec Check responses always agree with the terminal, not the oppterm. The pc shows a reality and a like and a dislike and a disgust and a this or a that or the other thing – he's got some misemotional connotation with regard to his terminal. And when you run the oppterm, you get the winds of space. You get no real somatics; you just get a discomfort. You get a kind of a disappearance of the pc. Of course, it's the – it's the thing which is versus the terminal, so then its mission is to make the terminal disappear. So of course, you do get a kind of a disappearance of the mass and everything else, if you're running on the wrong side.

And if you run the oppterm as the pc's terminal by mistake, they give you just motivator, motivator, motivator. "Look at what those waterbucks did to us. Look at what those waterbucks did to us tigers, man!"
Now, you cannot decide on the basis of what you think is good or bad, because the pc may have entirely different ideas on the subject. What you think is good or bad has nothing to do with it. This pc has a terminal called "a bum." So there are two items here. One is "a bum" and the other one is "a saint." And you say immediately, "Well, naturally, the pc would dislike a bum more than he would dislike a saint, so therefore, by the quality of the item, the pc's terminal is 'bum'."

Oh, man, that just does not work. If you put "a bum" and "a saint" and "you" down on the Tone Scale and "a saint" was the pc's terminal, you would be absolutely fascinated at how saints will solve problems. They solve them by chicanery, treachery, by knifeing people ... They're really characters, man, these saints. Huh! But a bum – he's nice, he's sweet, he never gets in anybody's road, he never bothers anybody. That'd be the kind of a weird – it just – it just doesn't add up, see.

So it isn't the quality of the item and I think, basically, most of your trouble comes, perhaps, from deciding that you can decide which this pc is. Is he a bum or is he a saint? Is he a waterbuck or is he a tiger? Because he's got the attributes of both. That's what makes it all so goddarn, confoundedly confusing.

See, he's in – been in the middle of this fight so long that he's allied himself to the oppterm and he's been against the oppterm and he's always been the terminal, but he's sometimes been for the terminal and sometimes against it. He's just all mixed up, see?

So, the goal that you get for the pc could turn out to be the opposition goal and the pc's terminal could turn out to be the opposition terminal and the pc's modifier turns out to be the modifier for the opposition goal. And it's just all thu-thu-thu. So getting a 3D package doesn't mean that you've got a straight 3D that you can run at all. You now have to set that 3D up and set it together and you have to use certain adjudications by which to do this.

Now, you are not going to hurt a pc by running the factual and true 3D package on the 7 December command series. Why? If you look it over very carefully, you'll find out there's as much oppterm in it as there is term. It'll be a little upsetting to the pc and so on, but it will run. It will run.

And that could fool you, too. That could fool you, too. Because it won't run anywhere near as well as if you have it in the right direction. But it's not going to damage the pc. You're going to get something done. You're going to get something done, one way or the other, because you've got that command package, which is designed to take care of this error.

But, because the command package is designed to take care of the error, you can of course make an error. You could be fooled, because it's running well, into believing you've got it right and sooner or later it's going to be all wrong. And it just isn't going to run right and the pc isn't going to make good gains and so forth. Now, you can run the 7 December 1961 3D commands and actually wind up with all of the needle phenomena that you wind up with, with the proper terminal, while running the oppterm. You can run the oppterm as the pc's terminal and you can have the tone arm go up stick and so on. So there's nothing to adjudicate on the meter. It'll run the same way. But it won't do much for the pc. It won't do as much for the pc, not by a long ways. So it's a good thing to sort it out.
Now, in the first place, a pc who is running wrong-way-to is running under a miscon-
ception and sooner or later they're going to find out that they are telling themselves lies. And it's the way they're lying to themselves that damages them, rather than the commands. They keep saying to themselves, "Well, us tigers – us tigers – and them waterbucks – and us nice tigers – and those waterbucks ..." And this is the other thing that is wrong: You get the wrong level chains.

Let me tell you something about wrong levels. If you were to carelessly jump a level and without getting levels in sequence, if you were just suddenly – skip a level and run some-
thing else, you know, and just make up your mind, suddenly, without assessing it, that the pc's trouble was "drainage." And you say, "How might drainage solve that problem?" It doesn't register on the meter or anything else. You run the pc on this for a little while and the pc starts getting pretty upset. It will turn on the pc's psychosomatics, as opposed to the soma-
tics. If you run the wrong level on the pc, you turn on the psychosomatics of the pc. Now, what is a psychosomatic? That is a chronic pain which amounts to a physical illness with which the pc has been afflicted for a very long time. They turn on and they don't turn off. Now, that's what happens when you run the wrong level.

So let's say we just picked it out of our head and said, "Drainage." And this pc is – has had a peculiarity – they've had a susceptibility to sties and as we run this, they're going to get sties. They're going to get sties. That's all there is to it. So if you run the oppterm, you turn on the psychosomatics of the pc. You tend to turn on the psychosomatics of the pc – you won't necessarily – because you're running wrong levels. You see, you're assessing the oppterm and not assessing the terminal and the terminal goes by a different series of levels.

If you don't believe this, take your pc at any given moment and assess him on the Pre-
hav Scale or some little section of the Prehav Scale. Assess him on the terminal and then as-
sess the oppterm – don't use it – and you'll find out it'll come out an entirely different level. So you can run wrong levels doing this.

Now, running the terminal doesn't turn on a psychosomatic, which is a chronic pain which amounts to an illness or a rough thing with the pc that the pc has always been afflicted with. That isn't what does that. You get another thing here; you get another thing. You get brand-new somatics. And if the pc continually gets brand-new somatics and the somatic pic-
ture is different and the things the pc has never had before are turning on and the chronic so-
matics may be flickering in and out, but aren't necessarily getting very much concentration, then you're running the right levels and you're running the right terminal. But it's – the only thing that would be upsetting to the pc is if you run the oppterm on the 7 December 1961 commands, you of course are running the wrong levels on the pc, because it's – it has entirely different assessment value.

It isn't that it's going to kill the pc but it's not going to make very much fast response. You get a pc; this pc is always, always, always ...

Oh, I'll give you a good one: The pc years ago got rid of their terror stomach. Got it early auditing, did a good job, no terror stomach and they haven't had a terror stomach for years. That's one thing that they're cheerful and happy about. And you're busy – you're busily happily running the terminal, see. You're running the terminal. They haven't been bothered
with this for years, see. And you run the wrong level, see. You just pick out "drainage" at will, see. Nothing with any response; it shouldn't have come up at this time; you just, "They're going to run 'drainage'."

And the pc goes for this because, you see, "drainage" – that explains a great deal to them. That's where you got it off of; the pc's been selling you "drainage," you see. And you run this and their terror stomach comes on. They say, "But I got rid of this years ago!" Mind you, now, you're running the terminal and everything fine. You're just running the wrong level. A terror stomach comes on and till you go back and get the right level and bring it on up to date, the terror stomach tends to stay on and then the terror stomach fades out and washes away. You see that is an experimental action. That's an experimental action.

All right, so therefore, running the oppterm, of course you're getting the chronic somatics on but you're not getting new somatics on.

Now we're running the terminal and we're running it by proper level. The pc remembers having had a neckache, when they were sixteen and haven't had much of a neckache since. And now they've got a neckache which is maybe in that place and maybe in a different place, but it's one awful, horrible neckache. And they don't remember having a neckache exactly like that neckache. And it turns on and it's much stronger and it's much harder than they ever had a neckache on before. And before you have a chance to sympathize with them very much, why, it's all changed. You ask them toward the end of the session, "How's your neckache?"

And they say, "Neckache? What neckache? Oh, oh, what neckache?"

"Well, just that neckache that you had early in..."

"Oh, that one! Well, that wasn't anything. God, you should feel this backache!"

You're getting a changing somatic pattern. So running the oppterm you find the somatics and they stay on, the same, session after session after session or intensify or increase. And running the terminal, you get a shift, shift, shift, shift. Now, you can normally expect the somatics to materialize inside the pcs' bodies and at the back of the pc's body – particularly at the back of the pc's body – in the back of the neck, in the back of the head and inside the head and inside the stomach and all that. You can expect somatics to materialize in the most unlikely places. That's running the terminal.

And running the opposition terminal, you tend to get fixed somatics. It's on – you only get the fixed somatic because you're running the levels out of sequence. That's the only reason I'm stressing running levels out of sequence. It isn't that you're going to find a bunch of bum levels for the pc. You can get – you can get a level that's a little bit corny or a little bit off, or something like that, and your pc isn't going to get into any trouble on it. It's picking out something like, "I know what's the matter with this pc! 'Drainage'!" You know? And you run "drainage." "Yeah, that's what's the matter with the pc." That's absolutely right! That is so true! Only it belonged twenty levels up the line, and you picked it now. See, you've jumped it wildly out of sequence and it'll turn on the pc's chronic somatics, the like of which you never heard of!
And if it's a good level – it really applies to the terminal that you're running, you see – the oppterm or the terminal – really applies, if it's a good level ... This is very logical! Boy, it'll pull that Goals Problem Mass just – oh, man it'll just rip it up, and ... Marvelous! You know? Leave the pc sitting in somatics that then don't move. Until you catch up with them with proper assessments.

So you've unnecessarily put your pc in misery for a couple of more weeks than you should have. That's what happens when you run an out-of-sequence level and that's what happens when you run the oppterm. And that's all that happens when you run the oppterm.

Now, what I've been talking to you about is in the basis and state of flux. A lot of the – this material however was based on very good observation and I give it to you apologetically only for this reason: Is I have not had time or the data to codify you up a perfect card which, when you put the pointing arrow to zero, it says down at the bottom, "waterbuck, terminal; tiger, oppterm." And, I haven't been able to do that. But I have, I think you will see, accumulated an awful lot of indicators which can serve you very, very well.

They are quite true indicators. But you have to know the story of this and you have to know it very well. You have to know what the thetan was doing and how the thetan got into this horrible mess. This thetan may be sitting there, telling you – trying to be proud about it all – but telling you, "Well, I've been a waterbuck for a long time. And us waterbuck, we're really, really quite the thing, you know, us waterbuck are. Except sometimes. Uh – and uh – I seem to keep remembering shooting a waterbuck one time or another down in South Africa. I mean, we kept shooting waterbuck and yeah, we just slaughtered waterbuck all over the place. Yeah, the river was just running with waterbuck. Oh, waterbuck. Boy, there were a lot of dead ones, see? There ... Shameful, isn't it?" [laughter]

You have to realize that he's of a mixed mind. That he must preserve this thing because he's been overwhelmed by – because of his overts, and he must get rid of this thing and his attention is so confoundedly fixed on it that he isn't going to get his attention on much of anything else. Not in life. His thinkingness and educational restrictions, by the way, are all contained in the terminal.

You say, "What – what skills – what skills are you mainly – how – what skills do you really consider yourself good at?" And this is another test, by the way. I just happened to think of this one. You could say, "What skills are you really good at and what can you really do? And how does that compare to waterbuck, the terminal?"

And, "Uh – let me see. A tiger. What skills could you really do with a tiger? Well, I don't like to spring. Don't have too much to do with springing and so on. I don't like red meat, I never eat any red meat, as a matter of fact. Um, and so on. Don't uh – I sure don't like sleeping in wet woods. No, I've never been able to do that. And springing – in high school, the broad jump, I never – just could never pass the broad jump. I just never could pass the broad jump, and so on. Yeah, just don't think I'd have too much to do with tigers. But I can swim. I swim very well. And I'm pretty good at dodging. Dodge extremely well, yes. Remember playing football. Used – that was what I was really good at – dodging! Yeah, I was really good at dodging. And swimming, swimming. Yes, I was captain of the swimming team. Uh – yes, as a matter of fact got the state-wide medal, till I broke my neck, so forth."
It'll be that kind of a story. His skill pattern will also fit with his terminal and will not fit with his oppterm. You say, "Well, what kind of a tiger would you make?"

"Me? Tiger? That's a new thought. Oh, well yes! I'd make a very good tiger! Always have been very, very good as a tiger!" Doesn't mean anything at all.

So the only real danger you're running is the running of a wrong level and the only thing that will do is give you another package that you'll have to run at some time or another on the other level. So it is not killing the pc.

Now, you think it might become clear on auditing. But it very often doesn't. Now, how long does the pc dramatize his terminal during a run? How long can you expect a pc to be dramatizing his terminal or his oppterm or his goal or his oppterm or his oppgoal, or something like that? Well, I can't give you any figures, but actually, it's – it's a couple, three weeks of auditing, anyway. Auditing on levels. They'll come up with – because, what the devil, you've got the whole educational pattern of the pc, the whole experiential pattern of the pc, and it's all composed of these various factors. So they'll keep manifesting themselves.

But the pc will try to withhold his terminal as you're auditing him and that's what makes your rudiments go out. The pc will become very sensible during a run of – all of a sudden, "Oh, wait a minute. That's a skill of a waterbuck. I'd better not do it. See, I'm really not a waterbuck." And the visible withhold of the waterbuck comes up and makes the pc stack up withholds and then the thing won't read. You won't get a read on the thing. All the pc's doing is withholding his terminal. Because that's all the pc has been doing for trillennia, is trying to withhold this terminal from action.

If this pc could go off in a corner someplace and be absolutely sure that never thereafter would a waterbuck ever breathe or jump on Earth, the pc would probably sit there for millennia, perfectly happy in accomplishment of having utterly restrained this waterbuck from ever functioning again and his mission would have been totally complete. He wouldn't be happy sitting in the corner, but his concept of good and his duty and that sort of thing is sufficiently high that that is exactly what he would do. He'd feel very self-satisfied about the whole thing – withholding his terminal.

I would say offhand that the terminal is not necessarily harder to get than the opposition terminal, but the terminal is more chronically withheld. You're liable to find the pc in the present life associating with his oppterm on a friendly, scratch-the-eyes-out basis – actually very closely associating with his oppterm, but not associating with his terminal. You won't find him very often associating with his terminal. Kind of wanting to be his terminal, had goals to be the terminal and so forth. But if any – anyone stood up – he – he'd be more likely, if the waterbuck walked in the room, you know, he'd say, "Well, I guess I'll be going now. Guess I'll be going now. Didn't realize you had such low taste," – to the hostess, you see. Sort of to himself. "I didn't realize you associated with criminals of this particular type – waterbucks."

No association with the terminal. Association with the oppterm. Close association with the oppterm. Intimate. Always swinging into its perimeter. Hate like hell to be there, too, the whole time. Horrible, you know. That's something – something we wouldn't associate with if we possibly could help it, so we associate with it all the time. But actively not really
associating as a general rule with the actual terminal. Actual terminal is something else and it is over there and we don't have too much to do with that kind of person, do we?

If the pc had children, you can just hear the pc say, "Well now, that's fine, but let's not go off in the direction of studying waterbuckery. For myself, of course, I could – if I had to, I could study waterbuckery. I could, and so forth. I've, as a matter of fact, often been active in that particular field. But not – not you children. Not you children, no. That's for us hardened sinners. That's for something else. But, of course, I never would be one, you understand that!" [laughter]

Those are the general attitudes and I hope – I hope in some way that helps you sort some pcs out. Maybe we'll have a little indicator that we'll pin on the side of the E-Meter someday and you feed the terminal in on a slip of paper and it instantly comes up – if it's blue – if it comes out blue, it is correct and if it comes out red, it is incorrect or something of that sort. We don't happen to have that gimmick right now, we have to depend on you and your good sense.

If your pc is running painfully, you are probably right. If your pc is good and in pain, and is miserable, and it's terrible, and the tone arm is going up and hitting, clank and so forth, it's probably all right. On the other hand, if the pc is just getting sort of invisible and getting nowhere and they don't have any somatics, except their chronic somatic of the pain in the end of their ear, or something is now on much harder than it's ever been on before and they've had that pain for a long time, and so on, and they just ... And they're running lots of motivator, motivator and so on. Well, with the data I'm giving you today, you should actually be able to look at your pc during a run or after a run or something like that and be able to tell whether the pc is running the right terminal or the wrong one.

But right now, I tell you, it's in the lap of the gods and the judgment of auditors.

Thank you.
ANATOMY OF PROBLEMS

A lecture given on 14 December 1961

All right. This is the what? 14th? 14th of Dec. Saint Hill Special Briefing Course, 1961.

Well, today we're going to cover the anatomy of problems. About time we had a look at problems and what they are and what they consist of. A problem is count – postulate-counter-postulate. Force versus force. Idea versus idea. Solution versus solution.

You have two people. And they're named Bill and they're named Joe. They're in collision with each other. They're having trouble. Maybe it's over a girl named Mary or a pot of gold. Who knows? But they're in trouble with each other.

How'd they get in trouble with each other? Remember they couldn't be in trouble with each other if they weren't in the same time stream. That'd be the first requisite. They'd have to be in the same time stream.

In other words, Bill would have to be able to talk to Joe and as well as Bill and Joe would be able to talk to Bill as well as Joe. Or, other words, he can talk to himself and he can talk to Bill. In other words, these people have got to be in the same instant of time, so they have to be in the same time continuum. That is the first requisite. That sounds very academic, but that is terribly important.

You'd say, "Well, how could they be in otherwise than the same time continuum?" Well, listen, knucklehead, this isn't the only time stream there is. Where'd you get so monomania?

Now, let me show you something. Do you realize that you, with your problems, are on a separate time stream from the physical universe and that's why you aren't in present time?

So right in the individual, right in the individual, we have two time streams. All right. Look it over. Don't look disgusted. If you're going to get disgusted with yourself, get disgusted with yourself, see. I didn't make you that way. I didn't.

Now, just look it over. Did you ever see a pc out of present time? Did you ever see him out of present time? Well, now, how do you suppose he got out of present time?

He must have started off in some instant of time that had to do with this same time stream, but he went on a spur line. Now, how did he manage to do that?

Well, during the middle of a race, he finds his watch is missing. He's down at the race-track and there are horses and everything is going on and he's got two quid or five bucks on the nose of some dog and here he is. He's all set and he wants to know if – you know, he's going to check up on it to make sure that this is the right race and he reaches in his pocket and his watch is gone. It was bequeathed to him by his grandfather. Family heirloom. Matter of
fact, his stock in trade. Every time he loses bets, he goes down to the pawnshop and hocks it until payday. This is a very important thing, this watch. So he loses it.

Well, while he is at the racetrack in a time stream called a race, he tries to go back to the time he lost the watch and therefore, on the subject of the watch, has a departure in time from this time stream. He starts running on a back time track while time goes forward that everybody agrees on, on this time track, see? So he's going backwards in time and then trying to do something about that time. And he isn't really trying to stop his time stream. All he is trying to do is to find out what happened.

A thetan has the facility of running on another time stream. Now, there is your most realistic example, if you look that over. Simply a branch of this time stream.

So he goes off sideways and starts worrying about it. And he has a problem now. And because he hasn't solved this problem very well, he tends to get stuck in it, but then he really gets stuck by solving it, see? He solves it. He becomes the foe of all pickpockets. And by remaining the foe of all pickpockets, then he won't again lose his watch. But he is already on a time stream which is slightly in disagreement with the time stream that everybody else is in. Because he's on a time stream which begins with the loss of a watch. And that is its beginning and then it, therefore, continues on forever, so to speak, because, of course, he started it. And it goes off and you normally refer to this sort of thing as a game or something. It's a rather downgraded game if you want to get the facts of the case.

He goes off – one shouldn't lose watches. It is proven to him conclusively that watches can be lost. One should always be alert, then, to people who steal watches because there's this time at the racetrack when. And there's a little division there that he has set up and he tends to get hung up. Now, he actually isn't hung up in a moment of this time stream, but a moment that is the exact instant of departure. The rest of the time he, of course, kind of makes time himself.

It becomes an endless affair. This little tiny problem can float forever. It'd be undetectable in the huge mass of material in his reactive bank but nevertheless it's a little thread of time that is trailing along all by itself.

You start running this pc and you – suddenly he goes clonk, you know and he isn't there and you can't get his attention. And you say, "What is this all about?"

And he says, "Oh, I don't know. I'm ... Picture of a racetrack."

Well, what is he doing with a picture of a racetrack? Do you know that you and he are not at a racetrack? Did it ever occur to you that this is something odd?

Here you are. You're sitting in a room auditing and he's got a picture of a racetrack. Well, we already know he isn't there. We already know it's the not-thereness. You see, I'm only pointing out to you a phenomenon with which you are very, very familiar. But I'm giving you some of its genus. That racetrack, to the actuality that it exists in his mind, is. The racetrack is.

It's an object on another time stream. Because there's a racetrack there as a picture, there must be a time stream there if it connects a picture. He's perhaps progressing along very
nicely in this moment of time, but he can at any moment then flick over and start progressing
along another sort of a branch of time. I'll try to make it as real as I can to you.

All right. How about the fellow that didn't enter this universe at all? Have you had any
problems with this person? No, have you? He never got here. He's never been on any part of
your time stream and you've never met him. You never met him, you never heard of him. He
isn't here. He isn't in this universe. He isn't on the time stream. He didn't even take off from
the same spot you took off to enter this universe.

Can you have a problem with that man? He can never meet you. He can never talk to
you. He can never have anything to do with you. You will never meet. The closest you will
ever come to meeting him is my mentioning him. You going to have many worries about this
man? You going to sit up all night worrying about him?

Well, (1) you've never had anything in common with him. And (2) you've never com-
municated with him. You've never been a friend of his. And (3) you've never had any overts
against him or withholds. How can you have a problem? You can't.

So let's look over the anatomy of problems and let's find out that all problems have
their own time stream. It must be a mutual time stream between the two ideas, the two forces,
the two postulates, the two beingnesses. They must have a time stream in common.

They must also have a means of communication. Now, you may have problems with
French taxi drivers when you run into them. I do. But I overwhelm them. I create a means of
communication. They don't want any communication. See, as soon as a French taxicab driver
finds out that you're not going to speak – not French but Parisian – as soon as a French taxi-
cab driver discovers this, he doesn't want you in his taxicab. That's pretty obvious. You say,
"Gare Nord," you know, "Gare Nord."

And he says, "Comment?"

"Gare Nord."

So I create something that threatens to become a problem and I make him solve it. I
show him we have a communication in common, which is a mean thing to do, you know.
There he is sitting there recovering nicely from his bottle of vin rouge for lunch, you know,
and so on. And you put him to work. And he says, "American tourists," you know, "heh!"
[laughter]

And I'm real mean. I point out his taxi meter, and I say, "Taxi mètre? Taxi mètre?
Comment? Eh?" [laughter]

And he finally says, "Yeah, that's a taxi meter."

I say, "Taxi? Taxi?"

"Yeah." And he finally agrees that's a taxi.

Then I say, "Gare Nord ? Gare Nord ? Huh ?"

And he has to agree I've said a railway station and takes me there. How would it hap-
pen otherwise? I had to demonstrate to him there was communication. It's very interesting
Very interesting.
In a line of work which I have followed from time to time when there was low periods of employment, two armies mucking around and milling around and they don't speak the same language and the countries kind of in dispute and I'll tell you, they'll just maneuver forever. They will just maneuver and maneuver and maneuver until one of the generals gets very enthusiastic and fires a shot at the other one and that they can understand. That they can understand, you see?

I mean, they send out a patrol and the patrols clash. You ever follow these communiqués that they were putting out in World War II and so on? You're always reading about the patrols clashing. I've often thought to myself that we could have had a perfectly restful, quiet war if people hadn't insisted on sending out patrols. [laughter] I don't know why all these fellows had to go on patrols. I've talked to them occasionally, but they always seem to want to go on ...

Anyhow, obviously, there couldn't be much of a war because actually one side speaks French and the other side speaks German. Now, you've been told that because one side spoke French and the other side spoke German that there was a war inevitable. That is not true. That would tend, if anything, to prevent a war. But they will communicate in means that each other can understand unmistakably, such as a patrol goes up and takes a Sten gun and starts firing. And that is the type of cause-distance-effect that even a general can understand. Obviously they are in communication.

The next thing that happens, there's a distinctly broadened view of patrol actions, so they send out more patrols and vedettes clash with vedettes – or something happens, depending on what war, what planet – and the next thing you know they're in very, very good communication. They're breast to breast with swords, machine guns, mortars or whatever the period happens to be. They're communicating, cause-distance-effect. They are having an agreement. Look it over. They're having an agreement. The reason people on this planet don't solve war very well is they always think of war as a disagreement. And war is not a disagreement. War is the tightest possible agreement.

A bunch of military men get bored in one country and a bunch of military men get bored in another country and they agree to have a war. And the politicians sit up there and can't figure anything out, so a war occurs. It's almost as stupid as this, but they get into communication. Somehow or another they get into communication about something. And after they have this agreement, then they have problems.

Now, you've got the problems of logistics, casualties, propaganda, lying to the populace, figuring out good enough reasons as motivators in order to commit fantastic overts. See, all of those problems pursue from an agreement of some kind. But look, Germany and France couldn't have any war together at all if they weren't in the same time continuum. And then there couldn't be a war to amount to anything unless at some time or another they hadn't had a basic goal that was common to both of them.

Now, where you see an argument, there must have been an agreement. That is – that is just ne plus ultra fact. Where you see an argument, there must have been an agreement. The agreement could have been a very light one, but then there wouldn't be much of an argument. If the agreement was very light, the argument must be very light.
There must have been a fantastically heavy agreement to cause that much war. Now, I
will give you a little – few cases in point. Some of the goriest wars which have ever been
fought on the soil where we are at this moment had nothing to do with Napoleon and foreign
invasion and all of that. It had to do with domestic issues. Man, they have really mowed 'em
down. Civil wars of various kinds.

I don't think in Rome they ever had very much trouble with casualties on barbarian
floods. But the barbarians eventually could no longer be stemmed. I think the battle was
Messina. I wasn't there, but the Romans lost... I've forgotten the casualty figures. There are so
many wars and so many casualty figures, but I think they lost something on the order of forty
thousand of the pick troops of the Empire in a civil war.

And immediately afterwards they were heavily attacked by barbarians. And they had
no front-line troops. That was the biggest single push the barbarians were ever able to make
on the Empire and actually was thorough enough that it practically destroyed the Roman Em-
pire. They would have been able to repulse this rather easily if they hadn't have been, for so
many decades, so interested in civil war.

There's nothing quite as gruesome as a civil war. If you ever happen to be unlucky
enough to be an officer or a sergeant or a private on the wrong side of a civil war, you've had
it. Man, you've had it. Let me take a case in point.

Even after World War II, a private, sergeant, captain – it was unlucky to be a general.
They were – they were trying those for war crimes, but this was new. Used to just execute
them. Now they tried them. Something new. They're getting closer into agreement, more gen-
tlemanly. But had you been one of these, at the end of World War II, a German, you would
have gone home. Yes, you would have found everything messed up and so forth, but people
left you alone. Nobody troubled you particularly. You were a vanquished enemy. And you
settled down and made the best of it and so forth. And nobody thought very much about it.

But had you been part of the Roman Empire and had you been on the side of Marc An-
tony, who lost gorgeously, you wouldn't have been able to go back to Rome. And the state of
the world at that time, you wouldn't even have been able to go out to the frontier because
there hardly wasn't any. There was Rome and nothing else. You couldn't go home.

What happened to American officers in the Southern cause is a fabulous piece of his-
tory. All their lands were seized and so forth. They were treated like a bunch of criminals.
They lost the war. That was their crime. But actually they were tried and lost their citizenship,
lost everything. People never cease to be mean along this particular channel. People tended to
leave the privates alone, but any noncommissioned or commissioned rank that had been a
member of the Confederate forces caught hell.

What about this? It doesn't seem – seems to be rather odd, doesn't it? I don't know, you
saw Indian chiefs. There'd be a big war and some Custer would stand up and get himself mas-
sacred, and \textit{wow! crash!} And the next thing you know, why the chief is there at the White
House or he's in an agency getting an issue of beef and everybody's shaking him by the hand.

"Yes, Sitting Bull, yes, I remember when..." you know and everything is fine. It's all
right. But don't be the major that was in charge of the first attack at Gettysburg on the South-
ern cause, you see. You see, he was one of us. You get the idea? The usness of it. That's the usness of it all.

There has been a tremendous amount of agreement. There has been the agreement of common nationality, common language, common customs. And when you get a war out of that cauldron of super-agreement and super-ARC, man, it is a killer. It is a killer. There is never anything bloodier than a civil war. Never anything wickeder than an internal revolution. Boy, they just hang men and hang 'em and hang 'em till they run out of hemp and get tired.

The Russian Revolution – they didn't do much to the Germans. They stood around – I think the Germans had quite a war there during 1916 and so on. They used to run the Russian regiments into swamps and then sit around and play band music while the Russians perished in the swamps. I mean, it was a very exciting war. And when the Russians had totally folded up and nobody could keep them back in action again, they went home and they had a war. And that was quite a war.

If they had demonstrated anything like the amount of courage against the Germans that they demonstrated against their own people, they would have had it made and the Czar would still be there.

But they didn't. They went home and, man, they had themselves a war. My God! You read some of the internal battles of 1917, 18, 19, 20, 21, that occurred in Russia under the name, not of communism and revolution, but under the name of "We're all Russians, aren't we?" Really a blood bath. They never put anybody in prison camps. Wow, no.

That is simply a number of mentions of case histories and I think you can find it rather commonly true on the broad third dynamic front. And I'm certain you can find it true on the second dynamic front. Have you ever seen anything more vicious than a woman who has been fantastically in love with a man? And have you ever seen a man more bitter than one who has been deeply in love with a woman? Fantastic. And, boy, I think they would boil each other in vitriolic acid if they got a chance. There isn't any crime they wouldn't commit. Read your newspapers. Well, it works like that all the way along the line.

This is an old subject that I'm talking to you about. You're very familiar with it in Scientology, that an ARC break must follow ARC. That is an old subject.

But let's apply it to problems. And let's find that there couldn't possibly be a wild disagreement without there having been a solid agreement. Let's move that over on just a little bit more.

Let's find out we couldn't even possibly have a problem with somebody who wasn't in our own time continuum and with whom we had no communication. We must have had communication. And the problem is as grand and marvelous and explosive as there has been coexistence and agreement. It actually will establish the magnitude of the problem.

See, what everybody neglects on the German-French wars is the fact that the French are Germans. Everybody neglects this. The name of the country isn't France. I was a Roman too long to even much refer to it as France. It was called that after the Franks who came out of the woods just like the rest of the Germans, only they went a little further. And the ruling classes of France and the ruling classes of Germany ...
You know, some of these wars we used to have around here on both sides of the channel were some of the most interesting wars you ever had anything to do with. Everybody that was on both sides was related to everybody else. There was hardly anything like nationalism. It hadn't been much invented yet. But there was certainly family. And you would find yourself lined up and all of a sudden there was your wife's brother, you see, in the enemy ranks.

Something like that. Well, this was liable to go one of two different ways, you see. It was either liable to be terrific hate involved and you'd go for him at once, depending on how good the domestic relations had been, you see? Or in a lull in the battle, you'd see him over there and you'd say, "Hi ya, Joe. Bessie's okay these days," and go on your way, see? [laughter] That was real mixed up. It was real mixed up.

Everybody was related to everybody else. And there is the fundamental agreement of the European war which has devastated Europe here several times in the last century. It's on the basis of the old agreement. And the old agreement was pretty solid.

Now, looking over all of this data, we find, then, that there might be a road out on the solution of a problem, on the recognition that a 3D is based on a one-time total agreement. One-time total agreement.

Now, as I was suddenly brought up short and given a blast of my own lectures – received a letter from, of course, it would be California – and somebody said, "Hey! What about games? What about the old rules of games?" I was very obliged to that letter because it's time I was reminded. Saved us a day or two. Because you remember about games. You remember about games? The fellow was on both sides of the game? The pan-determinism, selfdeterminism and other-determinism. Remember these? You should. They're all over the place.

All right. Well, that's a game. And a person gets on one side of the game or the other side of the game to the degree that he has reduced his pandeterminism, has accepted other-determinism and considers himself to be operating on self-determinism.

There're always these three factors. It's choosing sides. Choosing sides. I can tell you by experience you can find an awful lot of war if you don't ever bother to choose sides. Honest. I'm not sa- I'm saying it more or less as a joke because I've done it back on the track. Just be a casual observer and decide that – well, get upset about one side or the other and ride in on it. Up to that point, no interest in the matter. It certainly upsets people. Both sides practically turn on you, you see, because you're not part of the agreement that caused the war.

Nations, when they're at war, are always looking for the pan-determined party. They're looking for somebody with whom they can arrange an arbitration. It has to be an outside identity that can resolve a war. Therefore, it has to be an outside source that can resolve a problem. And that's the auditor.

Where 3D is concerned, you always have to have somebody standing outside who has no interest in either side. That's the auditor. 3D, of all things, is one of the roughest to have anything to do with on figuring it out yourself. I have absolutely no business to tell you that as a carte blanche fact because I myself, of course, have had to figure it all out myself, see? But I had to have outside help to the degree of somebody reading the E-Meter because – "Oh, wow, ooo, no!" – I couldn't even pick out the elements, see?
In other words, it was so involved, everything was so involved with everything that it was all self-determined or all other-determined with no pan-determined factors at all. Any time you would have shuffled me a card of – let's say, the forty or fifty items which inter-locked on other 3D items, would have been the first view, you see. Actually a 3D looks to the pc like a minimum of fifty or sixty items before it's ever been assessed, you see? Nothing has ever been knocked off. No edges have ever been knocked off. Nothing has ever been unshuf-fled.

It may look like thousands to the first view, you see. There's just thousands of factors involved. But if he started to even it out, he would find out that there were forty or fifty vital factors that must be part of this 3D package. That would be for sure. Well, at this point, cer-tainly an auditor would have to take over and assess these things. List them carefully and null them out and all of a sudden they start peeling off and you wind up with – well, you can wind up with six. You actually need only five. If you take an opposition goal, you could wind up with more than six. You could get the opposition goal to the opposition goal, you know and we could get the modifier to the – to the opposition goal. We – and you could get all these odds and ends that you didn't need. But you wind up with five of these things.

Well, that takes a lot of sorting. There's a lot of sorting out. It's a lot of pointed in that direction by the auditor. And the auditor does this, of course, by listing and assessing and he comes down with one item.

And the pc, up to that time, could have sworn there were forty, see. One item, you know, eh? When you finally get it down there, he's going sort of this way – you get it down with; you finally get it down there – and you say, "Waterbuck," you know. "That's it. Water- buck."

He says, "That's right." Or he says, "Uh-uh, no. No. Hu-huh. That's the one it abso-lutely could not be." Either answer – you don't care which. Because it'll either be totally self-determined or tend to be totally other-determined. Notice this phenomenon.

Any item that you choose, finally, is liable to get one of three reactions from the pc.

He doesn't know and doesn't care which. Well, I don't know. That could be a wrong item. That could be improper. He just isn't lined up enough on the thing yet to see where it is. He's still grogged. He's had ARC breaks during the assessments. There'd be a lot of reasons perhaps why he would wind up in that state. That's the rarer state.

It's either self-determined or other-determined. It's either selfdetermined or other- determined. In other words, you say, "A waterbuck."

He says, "I'm a waterbuck" or "I'm against waterbucks."

Now, there's another one, see? He says, "I'm a waterbuck. They are waterbucks. I'm a waterbuck. They are waterbucks." He just does a flip-flop. See? You talk to him three seconds after you've assessed the item. He says, "That's right. That's absolutely right. That's right. Ab-solutely. I'm a waterbuck. That's it. No doubt about it whatsoever."

And you say, "Good. We've got all that settled."
You haven't even got time, you see, to turn over your auditor's report or something like that and he says, "Well, I don't know."

And you say, "What do you don't know? What's the matter? You seem doubtful. You seem looking very doubtful."

"Well, I don't know whether waterbuck's it."

Ah. Oh, well, all right, okay. You're not going to argue with the pc. You've got it on the null list and if you know your E-metering, you know what it is. So therefore, you don't pay too much attention to this phenomena. But I call it to your attention so that you can observe it.

You say, "Well, that's all right," and you start to make a comment on the auditor's report.

And he says, "They're waterbucks." Got it figured out now. It's all satisfied.

So you end the session and he goes out in the hall and he says to somebody, "Us waterbucks." And he says to the person who is checking the thing, "Well, I'm not sure what it is. I don't know. I just got it assessed. I'm not sure at all what it is." They finish up and he says, "Aren't they a hell of a thing, a waterbuck? They're pretty awful, aren't they, waterbucks. Yeah, we've been against them for years."

Well, what's this? Well, this phenomena I'm talking about of the "I'm this side; I'm impartial; I am on the other side" is, of course, simply your dissertation on pan-determinism (a low-scale mockery of it), self-determinism and other-determinism. And those are the three factors always involved in a problem.

And you'll see the pc dramatize these when you get him in to – toward the Goals Problem Mass. And he dramatizes these things almost impartially and certainly with no criteria or good sense.

He might hang on to one of the elements three days. He might hang on to the element beautifully for three days. And he's just all set. And there's nothing wrong with this at all and then all of a sudden he doesn't know.

And then for another three days, he hangs on to the element that he's on the other side of it. "That's the right way it goes together, see. The right way it goes together is they're them and I'm me," and so forth.

And then he goes ... He's had a long sleep and he's got some rest, so he woke up early in the morning and he didn't get out of bed immediately, unfortunately for the auditor and he runs off an hour or so of "I don't know."

"I really am something else, you know. I'm actually something else. There – there are the waterbucks and there are the tigers and I'm not either one of them. And uh – uh – that's right, I must have some other 3D element. There must be something else that I am, 'cause I'm obviously not a waterbuck. I'm obviously not a tiger. Sure. Must be something else. 'Cause I'm a... just impartial. I can get the point of view of a waterbuck. But why should I? I can get the point of view of a tiger, but why should I? I'm something else."
And he comes down and he sits down in session and he says, "Well, there's something about my 3D setup I meant to talk to you about," when you get withholds, see – you get the withhold. "There's something there I want to talk to you about," and so on. "Oh, no, no. There – there isn't any. No, it's just that I was thinking about it and I didn't – didn't quite see how, but I – I see now very clearly I'm a waterbuck."

And the end of the session, he knows he's a tiger.

Now, do you see, I gave you yesterday a number of elements involved. All right. And I told you the equivocal data concerning these. I can tell you now that you have only one real interest in this. It's just run the side that you can chip at the best. And if the case isn't progressing – this is all the importance there is to it – if the case isn't progressing, you haven't got a side the pc can confront. See, he can confront one side more easily than he can confront another side and you've chosen the side that he can least confront. And it's too high on the Tone Scale for his reality or something of this sort.

And as a matter of your running it, you are then running up against too powerful a situation. The pc is just sort of overwhelmed and so on. Well, did you ever run 8-C – I know a lot of you have – run 8-C on somebody to whom walls weren't real. Did you ever do that? And did you ever see the ease with which they can go around the room and swat the wall and walk around the room and swat the wall and walk around the room and swat the wall? And there's no change of comm lag, there's no change of pace, there is no change in the case, there's no change in anything.

Well, maybe you haven't done this second step, but I have had such a person and have gone into this rather searchingly and I found out that it was very easy to do because there weren't any walls there. Simple? "Anybody can run that one." No walls. So you're liable to get a pc into this kind of condition in the 3D. You're running him on that side where there are no walls.

Oh, yes, he knows of this terminal, yes. He's had trouble with this terminal. Oh, yes, yes, yes. So you run him as that terminal. And he has no reality of any kind whatsoever. He makes no advance. The winds of space blow his head off, but he'll go ahead and run it. He'll practically stand there and get himself cut to ribbons because it isn't real.

You'll find out that there are levels to be considered here. Now, if we were going to run out the whole package on just one side, this would then be very important, wouldn't it? And it would be absolutely vital that we get the right side right now and that we run just that side and everything's going to go Clear on just that one side. Well, don't let me kid you about this. It could be that running the right side and the right levels and so forth, you don't get a chance to really clear the person because he goes Clear. You don't get a chance to work at it, you know? The needle goes up and sticks and goes up and sticks and blows down more easily and goes up and sticks and blows down more easily and is more easily and more easily and you go up and you try to make the thing stick and you can't make it stick and you can't make it stick and it just seems to blow down. And the first thing, you know, you can't read the meter. Well, I think that'd be a pretty horrible thing to have happen to anybody because you would have cleared somebody by accident. You wouldn't have had to work at it. But you can't always expect that to have happened.
The worse a pc is pushed into this Goals Problem Mass and the harder he is immeshed in it, the less distinct it is to him that either side is real or he's liable to be tremendously fixed in one side and not at all fixed in the other side. And as you run him along the line he just has an awful hard time of it. That's all. They all have hard times of it and somatics at first, but this person just goes along for an awful long time before anything sort of busts up or surrenders.

Now, the main danger is that you can pick the wrong side for that pc on a pc that would clear rapidly and you run him so that it will take a longer time. It's in the interest of time rather than the interest of the destruction of the pc. Why?

Because the Goals Problem Mass is a problem. It is a problem and it's nothing but a problem, it's never been anything but a problem, but before it was a problem it was an agreement. And after an agreement, it became a game.

See, there was a – there was a time continuum and these two elements which make up the terminals and ideas which make up the 3D existed once, in their nucleus form, as a total agreement. First, they were in the same time stream. Second, they were in perfect communication. And third, they had tremendous agreement and goals on what they were doing. And all of these things they had in common.

And having had all these things in common, they now started to depart one from the other and eventually they got into a game. And they got into a very thorough game. And one side was shooting at the other side and they were all messed up and everything was all chewed up in all directions. And, boy, was it just coming to pieces in all directions. But it was a lot of fun and a lot of people got killed and it was sport and so forth.

And eventually this deteriorated as a game and became a problem. And as a problem, of course, it stuck. Well, as a game, it was sticky. And as an agreement, it was marching along the same time continuum.

Everything either party said, for a long, long period of time, was in total agreement with the other party. See, that was the first condition. And then the game? Why, they were in total agreement on what game they were playing, too. There was still agreement in that warfare they were fighting one against the other, you see and that existed for a long time.

And then the game got pretty hectic and it came down scale and got very deadly. And having gotten very deadly, then passed over into a point where neither side were really playing a game and it was now a problem. But having originated with its own time continuum, it now continues right on up into present time as a Goals Problem Mass.

The easiest way to approach it, from the standpoint of most pcs, is to find that side that they can most easily fight. Find that side they can most easily fight. That will give them big case gains in the initial run. And to take the solutions off the top of the problem. Well, now, if you recognize that they were taking solutions off the top of the problem, you should also recognize that we have a long way to go after we've taken all the solutions off the top of the problem. We got quite a ways to go here, haven't we? Why throw the pc in over his head?

So the end of the game or, I mean, the end of the auditing is not the reaching, simply, of the end of the Prehav levels but could be expected to go on further than that.
There'd be other things. There would be distinctly other things you would have to do. Because what are you doing? You're not taking apart a couple of terminals of which the pc is one. You have now got the selfdetermined-other-determinism softened up a bit. Just softened up a bit. And you still have to attain self-determinism for the other side for the pc and you still have to attain totally pan-determinism. All these things can be attained rather easily, but you should look on it as this: that the pc is on neither side. See, that's what the joke is.

All right. Let's take a waterbuck and a tiger. Pc's been waterbuck. Pc's been tigers. And the pc's been waterbucks. And the pc's been tigers. And before waterbucks and tigers were there, as enemies, the pc couldn't have told the difference between a waterbuck and a tiger: "Waterbucks? Tigers? They all have the same goal. We're just – we're just all in perfect agreement, us waterbucks and us tigers and us tigers and us waterbucks and ..."

Somebody had walked up at that stage of the game and said, "You know, tigers are the natural enemy of waterbuck," the waterbucks and tigers all would have looked up and they would have said, "...That man's crazy. That man's insane."

They couldn't even have grasped the idea of being different. Because they weren't very solidly waterbucks and they weren't very solidly tigers. This was the main thing. Their now-I'm-supposed-to's weren't congealed to that extent at that time. How did they congeal to that extent? Well, they started separating out of their package distinct characteristics that became only waterbuck characteristics and distinct characteristics which became only tiger characteristics. And then tigers started really getting characteristics and waterbucks really started getting waterbuck characteristics. And then they solved problems in different ways, eventually, at the final denouement. They play the game the same originally.

Waterbucks originally ate tigers and tigers ate waterbucks. They were indiscriminate. But eventually the tigers developed harder teeth and the waterbucks developed fleeter feet. And they differentiated so they had different methods of solving problems. And then they moved on up further and these different methods of solving problems didn't work very well and the game was deteriorating anyhow so they just – it just all came – became sort of regrettable. They had to do it.

You show a tiger to a waterbuck and the waterbuck knew exactly what he was supposed to do. And you show a waterbuck to a tiger and the tiger knew exactly what he was supposed to do. His now-I'm-supposed-to's were all ingrained in all those eons they were playing that game, you see? He knew exactly what he was supposed to do.

There mustn't be no hair of variation. It must be exactly this dramatization and this one is what we do. Now-I'm-supposed-to. "When we are presented with a waterbuck, if a waterbuck is standing there, we roll back on our haunches and we spring like this. And the spring length should be 9 feet, 3.7 inches. The proper place to bite a waterbuck is exactly back of the skull where the spine connects with the top of the skull. That's exactly. And at the moment of bite, we throw the head exactly that many degrees to starboard."

You ever stop to think of the fantastic now-I'm-supposed-to's connected into animals? Absolutely crazy. Once in a while you see a cat that won't wash its face. But it's very rare. That's very, very rare.
The now-I'm-supposed-to's. How did those now-I'm-supposed-to's get there? Well, they were specialized forms of self-determined survival that had nothing to do with pan-determinism. They had a great deal to do with other-determinism.

A cat knows exactly what they're supposed to do with a mouse. A mouse knows exactly what he's supposed to do with a cat. It's the darnedest now-I'm-supposed-to chain you ever saw. It's utterly invariable. Cruel as it is, it's utterly invariable.

Automobile drivers these days do not know exactly what to do. They are not plowed in to that extent. But you would eventually in a society, particularly a space opera type of society that was maundering along the track building shinier and higher structures and building punier and crazier men. And you'd -- you'd get this thing eventually to a point where, "Well, we know what an automobile driver is. An automobile driver is supposed to slide under the wheel and he's supposed to do this and he's supposed to do that. And he can only drive a car that is 8.7 feet long and he must drive at a certain speed and when he sees another automobile driver who is in a slightly different position, he hits the right front fender in exactly that particular angle, and then..." and it'd be the now-I'm-supposed-to's would just go crazy on the subject, you see.

You're already building up fabulous now-I'm-supposed-to's. Children are not supposed to look at cars, see? They're not supposed to. They're supposed to look up and down before they cross the road to see there are "no cars." See? In the absence of cars, they act. In the presence of cars, they mustn't act. I mean, we're building up quite a hierarchy on the thing. And it's not a very good one. It is pretty wowzy.

The vehicle departments of every country on Earth have now-I'm-supposed-to's. A person comes up. "If he had paid his taxes and he signs on the right line and if he gives us the right number of shillings and if he can tell red from green and if he has a depth perception of so-and-so, we then give him the license and then he goes down and he climbs in the car and then we make sure he can take the car around one block and shift the gears properly and then we turn him loose and he goes down the road and he kills somebody and ..." They know what they're supposed to do. Try and shake that pattern. Try and shake it. Try to keep a beaver from building dams.

See, he's not going to do anything with that. You're building it in the rock. So the society on the third dynamic is going together on these animalistic impulses similarly. All these come out of games. They come out of agreements. The agreement becomes a game. The game becomes a problem. And in that problem, now, you have the characters and dramatizations -- total fix self-determinisms.

Now, the reason you see your pc shift around from one side to the other is because you're auditing your pc. Because you have already done a terrific amount of auditing on the pc just by listing and nulling -- see, listing and nulling of items. That's a tremendous amount of auditing.

So you're looking at a pc whose now-I'm-supposed-to's are shook up like a dice in a box or like Elvis Presley.
These things are just bzzzzz already, see? No, he didn't have any doubt in his mind before you started this or before he was ever audited – if you take a period long before he was ever audited on anything. Auditing in general does these things. And just examine what his conduct was, if you could get a clear picture of it after you shook it up.

Wow, my goodness! You take him back there and "Waterbuck? Be a tiger? No. Nobody would ever even dream of suggesting to a waterbuck that he might be a tiger." He had certain definite responses toward tigers and tigers had certain definite responses toward him. He knew exactly what he was supposed to do. He knew exactly what he dreamed about. He knew exactly what he hoped for. You pushed the top coat button and he went clink, you know? It's just an automatic stimulus-response mechanism. He's just a wound-up doll. He just pang, pang, pang.

You gave him the proper stimulus, you get a response. And the response was a dramatization of the Goals Problem Mass.

All right, you've busted the hell out of this. You've knocked this to pieces. You already listed and assessed. You got this thing getting into view and the pc may dramatize it suddenly and dramatize it very hard and then not dramatize it and dramatize it and not dramatize it and then dramatize the other side and then dramatize it the way they did originally and then dramatize the other side and then not dramatize it. And then know there's something else and their 3D must be wrong.

There's no question in their reactive mind as to whether they were right or wrong, don't you see? There was no faintest question in their reactive mind as to whether they were right or wrong before you started auditing this package. There was no doubt. Must be wonderful to live with no doubt. It must be absolutely phenomenally marvelous to be completely certain, no matter how psychotic the principle, to be completely certain of it. That must be a marvelous sensation.

If you want to know how marvelous it is, go down to the insane asylum someday. Those are the most certain people on Earth. And there's nothing ever changes their minds about anything. They know there's a fire burning in the courtyard. You could take them out, you could show them the courtyard, you could show them there's absolutely not a stick of wood in the courtyard. You could show them there isn't a whiff of smoke in the courtyard. You could show them the courtyard is absolutely clean, perfect. They go back in. They say, "You see? Fire in the courtyard."

Nothing, no proof of any kind ever makes any impression on it. No experience of any kind ever makes any impression on it. Man knows he's supposed to go off a fifty-five-foot high dive board into the concrete. He knows that's the thing to do. So he goes up the fifty-five foot, he goes off into the concrete. It doesn't matter how many times he does it, nothing ever teaches him that he shouldn't do it.

You say to him, "Hey, it's concrete. You remember the last time you did it, you spent eight months in the hospital."

"Yeah," he says, "That's right. That's right. That's right." Walks right straight up the ladder. Goes right straight off the board, fifty-five feet into the concrete.
Now, I'll show you where there are some now-I'm-supposed-to's of this magnitude which aren't in the insane asylum but in the animal kingdom. Migratory birds here and there and butterflies and lemurs all various parts of the world, will suddenly know what they're supposed to do. And they go down to the beach and swim out to sea till they drown. And scientists sit around and they try to figure this out. "Was it that there was once an island out there? Highly probable, you see." Or it was something or other.

But we know for certain one thing about it. That they've got a now-I'm-supposed-to that at a certain season of the year after so many years they're all supposed to go down to the beach and go into the surf on the compass point of north-northwest or something and start swimming and just keep on swimming. Or the butterflies are all supposed to do this or they're supposed to do that. And it doesn't matter how suicidal this thing is. They're all supposed to do it. Well, it's part of some old problem and earlier than that some old game of some kind or another and earlier than that some old agreement.

Well, you've got your pc assessed or a pc is nicely assessed, we've got a 3D package. It's all laid out. It's all beautiful. And now we're going to go through the oddity of trying to find out which side the pc is on.

Now, let me – let me point this up to you. If you choose the right side, it will be that side which the pc can run with benefit. And that's all that's right about it. There's nothing else right about it. It's the side he can most easily run with benefit. It's the side which he can run best to run out somatics. It's the side that he can run best in order to buck the Goals Problem Mass and start shooting it as full of holes as Swiss cheese. That's the side.

It's not that the pc is that side because the pc is equally the other side. And the pc is also neither side. At any given instant, the truth of the matter is that the pc is neither one and is capable of being both – and is both. And both sides are equally other-determined to him. But one is higher than the other on the Tone Scale and therefore probably easier to view as an ally and much harder to buck in auditing.

But the pc has used both sides down through the ages until he has eventually gotten to a point where he has so many overts on himself while he was a waterbuck, you see, that these overbalanced and he became only a tiger.

Now, your first attack on a 3D package, then, is simply the "only." You're trying to establish as much as you can the only onlyness of it. What is the only onlyness of it? That's all. I mean where is the preclear the most only. The only only. See, is he mostly waterbuck at this moment? Does he think of himself mostly as waterbuck at this moment?

But we don't even care what he thinks. Which is the easiest side to run? Well, it would normally be the side which is the least high-toned. The lower-toned side having already been caved in a bit, of course, is more susceptible to attack. So if you run the pc as it, you get – because of the trick of the commands, you get more attack against the weakest part of a Goals Problem Mass. So, therefore it runs and it runs more mass and it runs more flows, and it's easier for the pc to handle and only half kills him.

The other side may almost totally slay him, you see or no reality at all. "Tigers? I never had anything to do with tigers. Problem with a tiger. Oh, combing his hair, I guess. I
suppose that would be. You see, I've had very little experience with tigers. Only during half the duration of the Goals Problem Mass have I been a tiger. I've had very little experience with tigers."

Tiger is too high-toned on the scale. He can't attack the tiger. He doesn't think of himself as capable of attacking a tiger. So he just sort of not-is the whole thing

"Well, there are tigers. You expect me to attack this? Huh, well, I can sit here attacking this tiger and it's so comfortable, you know." Because tigers don't exist. Naturally, it's comfortable.

Well, the pc will actually move himself into this position and get his fool head blown off because you can't help – with that high power a command, you can't help but turn on something. And all of a sudden, why, the pc isn't getting any somatics. The pc doesn't feel mentally very upset, but the pc's starting to look sort of wild-eyed and their skin starts turning black and their eyes look like they're being pushed through the back of their head or something like this and it's not a comfortable position to be in, because you're not running the easiest levels for them to run and you're not running the side which is the easiest side to confront and you're not running any part of the situation which is an attackable quarter.

It's something like, you're sitting there, you got a perfectly good army and there's one part of the castle which is ten times as high as the rest of the castle and has been very well cared for and the mortar is in marvelous condition and it's totally impossible to scale it. And there's another part of the castle that the walls are all fallen down into the moat and it's a bunch of stuff that any schoolboy could wiggle through, you see? And your only crime as the auditor is saying, "All right. You see that beautiful high tower over there? Climb it and take the castle," you see?

And the pc – he tries. He tries. It's just awful high. No castle is that big. Whereas you might just as easily say, "See that breach over there in the wall and see that moat? It's perfectly easy to walk across that. You attack it over there."

And the pc goes over there and he has a hell of a time. He gets his hands all cut to pieces on the briars and he gets all muddy in the moat and he just gets all messed up. My God, you'd think there was – it was a – World War VII was going on, to hear the pc sometimes. But there's something happening. There's obviously something happening He eventually crawls through the breach and walks into the castle. Looks at the back side of this thing and oddly enough the huge towers that are up there so imposing and so forth, have a back side that is held up with rotten rope. The thing starts going creak, you know. Creak. And it's the kind of condition that once you're inside it, don't sneeze, boys. Don't sneeze because the E-Meter will stop reading. It'll start floating.

You get the – you get the difference of view here? That's about the – that's about the best breakdown I could give you on the conditions of the problem. Of course, I give these to you in relatively comprehensible attack-defense-retreat lines. But you can easily send a pc up against a job which looks sufficiently big to them and sufficiently impossible to them that all it looks – although it looks not dangerous, it's just too big. And they'll go ahead and work on it and they get no place and you don't make much of a gain and so on.
The odd part of it is, even so, if you kept attacking that particular tremendous amount of spires and everything else, something would happen. You can't do nothing about it. I mean, something will happen. It just won't happen as fast, that's all. It's going to be uncomfortable and it's going to be unreal. And you're going to be provoked because the pc is liable to ARC break more easily. He knows he's being sent up against too many piles of manuscript paper. You know, he, "Yeeeeeex," looks pretty terrific to him. But he'll sit there and go along with it.

"Well, if you say so. If you say, well, that's the way it is, well, guess so. If that's the way it is, why, all right, I'll attack it. Of course, I know it isn't there."

He has an odd frame of mind. He doesn't get this factor known as reality out of it. So that is the liability. That is the basic liability of choosing the wrong side on one of these things.

All right. Well, what do you do about one of these things? Could you just blow one of these things up? No, I don't think so. I think in the early stages of the run, if you were to ask the pc what he thought of just blowing all of this up or wiping it all out at one fell swoop, he would go into an awful confusion. He just hasn't got it differentiated enough. He just isn't used to the idea at all for him to do very much about it. He just – well, I don't know. He's not even hardly used to the terms. He's not even hardly used to the new state of "What? I'm a waterbuck," you know. "Me a waterbuck, waterbuck."

He's still in the process of laughing at himself every time he sits down to dinner and won't drink any water, you know? And right about this time, you say, "All right." Sweeping to him, "All right. Well, I'll tell you what let's do. Let's just – let's just find the genus of this whole thing and then let's wipe it all away, huh?"

Well, look, let me call to your attention that he couldn't attack one side of the problem because it was too big for him to find it real. What do you think his reaction is going to be to just wiping out the whole thing? Well, that's just about seven times as unreal.

And actually early in a run on 3D, the idea of this game ever ceasing or the idea of this game ever having an end is preposterous. And also, it's also preposterous that the game ever had a beginning. Game never had any beginning. Ha-ha. Been going on forever.

"I suppose at one time or another I have played this game," as an attitude varies with the fact this game has been going on forever and ever and ever and ever.

Now, in view of the fact that there are confusions back on down the line that tend to bang the pc up on the anatomy of problems, you know, you find the prior confusion to the problem, you tend to move up into the problem. Well, you keep auditing this thing, you keep hitting prior confusions of one kind or another and it tends to bang the pc up toward present time. So the track to him for a while looks shorter and shorter and shorter and shorter and he thinks maybe he was only a waterbuck for one lifetime, you know.

Well, maybe last life he was a waterbuck. Yeah. Only once. And then again this starts to broaden out and he cycles back on the thing. And the next thing you know, he's telling you, "You know, I think I was a waterbuck before they invented this universe." See, you get a variation of the two extremes.
Well, there's no doubt his having been a waterbuck for a very, very, very long time. There's no doubt about that at all. But there's also no doubt about the fact that he might find this too beefy to attack.

My diffidence in approaching this as a full and complete layout and so forth, does not stem at all from the fact that it can't be beaten. This is easy to beat.

It stems entirely from the basis of the easiest way to beat it. You see me looking around and shifting it around here and there and so forth. Because I want you to find an easy win.

Now, I know these facts – that it'd be utterly impossible to get under the Goals Problem Mass and just go bang. I should think that over a period of over a month or two you could do this: You could take pieces of it that the pc can find – conflicts of it – and date them on the E-Meter and get the whole track plotted on the subject for a month of sessions. And by that time the Goals Problem Mass would look like a Swiss cheese that somebody had taken a shotgun to. That's just by the process of pinning it on the time track and getting it aligned and getting the data and getting the ball unraveled and that sort of thing.

During that period of time, you would never have had to have discovered which the pc's side was on. You would not have done anything. You'd have said something or other.

"Now, we've been talking about this a little while. Do you have any pictures of a – of a tiger and a waterbuck? Do you have any pictures of this and so forth?"

"Yes, well, I've got one here."

"All right. Let's date it."

I mean that type of dating. Let's find out when that occurred on the time track. Let's pin it down. A lot of other things will come off of it and we eventually – remembering to work with just the one picture, not trying to date the rest of the stuff that came up – get the one picture on the time track. And we just build that time track back.

I tell you that that is a totally feasible method of clearing somebody. That's totally feasible.

Teaching you how to date? Sometimes when I have tried, I think it's impossible. But that's just me being snide. You could learn how to date rather easily. Most of you know how to date on an E-Meter. But I'll tell you, years ago in teaching people how to date on an E-Meter laid in enough overt's and withholds on my part, you see, that I get a weariness when I think of going into it. I think of some student coming here who doesn't know anything about dating on an E-Meter and I think of having to put him through all of the ropes of dating on an E-Meter with his own bank in the road and it makes me tired, that's all.

I'm trying – I'm joking now, but I'm actually trying a bit not to add this additional skill because this is quite a skill. You get all mixed up with A.D.'s and B.C.'s and years ago and they run into implants and you run into this. And then the implants have got in them 176 thousand years, you see, 176 thousand years. "It was 176 thousand years ago. Well, this doesn't – this isn't working out." The poor auditor almost goes mad. And eventually the thing, if it's ever solved, turns out to be an incident which has the figures 176 thousand years ago in it.
And the incident is 8 billion years ago. And he eventually gets this kind of stuff separated out and so forth.

But remember that, that is a very feasible, proven tool. That is a very proven tool. You can do fantastic things with getting incidents back on the time track and aligned with the pc.

There's another one. You can find every confusion. You can find every confusion that might precede any stuck picture the pc has on the problem of the waterbuck versus the tiger. Prior confusion. Then find out what the person was at that time and what they did. And you, of course, would run that problem by prior confusion. We're now talking, not about – . You're not talking about infinite auditing, you see? I'm talking about – in terms of what we were thinking in terms of a few years ago – we're talking in terribly rapid auditing. And this again would be quite feasible. It would be quite feasible in dispensing with the Goals Problem Mass.

Now, what I am working with right at the present time is simply this. I want the pc to run the easiest side of it for the pc to attack.

In other words, I want the pc to run that terminal which is the easiest for the pc to attack himself. And you'll find out this will turn on no winds of space. It turns on masses. It gets rid of the somatics. It causes the tone arm to go up and stick easily, that falls down, the needle gets looser and looser and it straightens out and so forth.

All right. Now, that takes a bit of a time to run. That takes a little while to get all of that squared away.

I don't at all worry about somebody running on the wrong side of a 3D. I'll just level with you. Except I have peculiarities. I like people to look pretty and running on the wrong side of the 3D makes you look like a mud pie. [laughter]

I remember one night, Suzie assessed me on the wrong terminal we just – just for fun, you know. And she can tell you I looked like I had a parted skull when she finished off and so on. Quite interesting.

The oddity on such a thing is that there should be an easy road in and out. That is the oddity. And you are given that oddity that there is an easy road through it by the mechanics of assessment, the accuracies of the E-Meter, the oddity of having invented a Prehav Scale and the oddity of the command package of the 28th, 29th, 30th November 61 and 7th December. These are oddities. Those command packages are quite fantastic.

Do you know those things have been separated out from every type of command? You talk about work, man; you really make me work. You know those have been separated out from every type of command that have ever been used for eleven years? God! Don't think that wasn't a – that wasn't a sweat getting those things straight. That command pack was fantastic.

The command package now only becomes nonfunctional when you've got the wrong level. It'll become very nonfunctional if you've got the wrong level.

The pc gets this wonderful problem, you know. He's sitting there, he's very happy. He gets this wonderful problem. "Yes, well, how to take the throat out of a waterbuck the most painfully. Aaaaah, yes, as I think most painfully."
And the auditor says, "How might smell be a solution to that problem?"

Pc has been made wrong, of course. See, the level either was flat – the level was flattened or misassessed or something like that, see – but mostly probably flat.

Another thing is what's wrong with that particular package, as I've already told you, that the word problem or difficulty or trouble or confusion or whatever you're using there – "Tell me a (blank)" – can itself move the tone arm. And you could omit the even-numbered commands. "How might (Prehav level)?" You wouldn't get anywhere doing this, by the way. I mean, the thing would go nowhere. Well, you're looking at about a thousand-hour run.

But you'd get a – you could say, "Tell me a trouble that you might have had with a tiger. Tell me a trouble you might have had with a tiger. Tell me a trouble a tiger might have had with you. Tell me a trouble a tiger might have had with another tiger," you see. And just by that – you know, just by doing that, doing that, doing that, doing that you're going to get some motion on the tone arm. That's for sure. It's going to be a rather endless proceeding, but you're going to get some motion on the tone arm.

Remember the old process "Tell me a problem. Tell me a problem. Tell me a problem?" or "Tell me a problem similar to that problem," or "a problem of comparable magnitude" or some such process as that, will handle present time problems quite nicely. Don't try to handle a Goals Problem Mass with it, however, without the booster of the Prehav Scale immediately behind it because the pc is obsessively solving these problems with that level of the Prehav Scale.

And if you haven't run out the level it works. But the level, of course, could go flat or you could get a new level too soon. In other words, the very errors which you're trained not to make, if they were made, would produce a zzzzz on the part of the pc, so it has to be done rather – rather neatly.

Well, all of these things simply add up to a knock through the wall, that's all. I mean, we're doing fine with this sort of thing.

Now, characteristically – as I've done all year – all I'm trying to do is shorten the thing down and make it more positive. Shorten it down. Make it more positive. Shorten it down. Make it more positive. Work on this rather consistently. And at the same time, try to make it simpler for the auditor.

I can tell you a gimmick, now, which would be an interesting gimmick. If you made a list of the number of goals which the term and oppterm had in common, see – if you just listed that. Or on what points would the terminal and the oppterm be in complete agreement? See, that would be another approach. Or what game – and this would be a latter, more complicated thing and is probably your best entrance because it's more complicated and later, you see. After you're done with solutions to the problem and so forth, if you suddenly said, "Well, now, what game would ..." – it'd be some process which would amplify this, see but – "What game would a waterbuck be likely to play with a tiger and a tiger with a waterbuck?" And you just keep the guy listing games and game situations, of one kind or another and eventually you'd run the center of that track out.
In other words, these are all approaches to shorten up the run on the Goals Problem Mass. But they all presuppose that the thing has already been straightened out and that Prehav runs have more or less got the thing fairly well into perspective for the pc and the pc has gotten over his worse somatics on the situation and the hardest part of the road has already been traveled. Those things presuppose, then you have these other approaches of this particular type.

And do you see why? Because you're not trying to establish the self-determinism of a waterbuck. You are not trying to establish the other-determinism of a tiger. You are not trying to establish the self-determinism of a tiger. And you are not trying to establish the other-determinism of waterbucks. These you are not trying to do.

You're trying to establish the pan-determinism of a thetan who has gotten so biased that he can't tell a good action from a bad action because the now-I'm-supposed-to's all fit in this exact pattern and he has some game running here which has amounted eventually to an insurmountable problem which has given him his total package of now-I'm-supposed-to's so that he can't breathe. And hardly anybody has pointed out to him that there haven't been any waterbucks and tigers having a game for some time in these particular climes or that it isn't much of a game or it's a very serious game. And you point out to him, "Well, yes, that's a very interesting game, but I understand you haven't played it for eight lifetimes."

"Well, no, but on the other hand, I might. You never can quite tell when the pterodactyl is going to come back." [laughs] He's very outmoded. But his pandeterminism has been submerged and having been submerged, he, of course, is being obsessively self-determined which pins him thoroughly on a dynamic. And he's no longer loose on the dynamics. He's clank on the dynamics.

His idea of the dynamics are the exact now-I'm-supposed-to's given to him for the identity package which is either the term or the oppterm or whatever it else is. What – whichever one he's stuck in.

Now, in view of the fact that he can be the terminal ... If he could ever be a pure terminal, we have no objections to a pure tiger. But he isn't. He's a tiger with the mores, sometimes, of a waterbuck. And sometimes isn't either one. And he's a tiger with a special goal that isn't necessarily the goals of tigers. And he has an opposition goal which triggers him – which upsets him terribly – such as "you mustn't eat long grass." And all the more – all the poor gardener has to do, all the poor gardener has to do, is leave the grass for three days too many, you see and the grass threatens to get a little bit long and we've got somebody who is dying in the house from psychosomatic rages of one kind or another but who doesn't even know he's mad at the gardener and doesn't even know it has anything to do with the grass.

And I could say this state of confusion is well worthy of being straightened out. I think that in itself is a big game.
But these things, when properly found, make up, first, a problem ... You see, of course, a solution when you first look at the pc. Everything he's doing is solutions. You don't see any of the problem. He's solution, solution, solution. And the next thing you see is problem. Problem, problem, problem. And when you get the problem peeled off, what are you going to see? You're going to see game, game, game, game.

It'd be very dangerous for you to continue to go into an agreement with the pc over how bad tigers are. Well, he's going to turn on you about threequarters of the way down the run and you're going to have an awful ARC break and you're not going to be able to get him in-session and you're going to find out – you're going to say, "Well, what's the matter?" and you're going to get all your rudiments in. You never think to ask him about terminals.

By the way, I've already discovered just one little flub on that. Not much. But you're not realizing that what makes the pc's tone arm go up is a break of mores of the terminal, a break with the mores of the terminal. It's not a break with the mores of us or the society. Mores get busted up on the terminal.

The person does something that the terminal wouldn't do. And having done so, you get a rise of tone arm. And then you look for it according to the code and mores of our present modern times and of course, you can't discover why the tone arm went up between sessions.

Person went to bed and went to sleep. No reason for the tone arm to go up. Terminal, "cat burglar." Get the idea? Why, you get a raised tone arm every time between sessions.

And you say, "Make sure you go to bed now and go to sleep quietly," and he comes back and the tone arm is up. "Well, what did you do between sessions?"

"I went to bed and went to sleep."

You say, "Well, then, he didn't do anything between sessions."

No, he did nothing but refuse to dramatize his terminal. Or he did something that was contrary to the terminal, which is to say he went to bed and went to sleep. And what is a cat burglar supposed to do? Ha-ha. That's something else. No self-respecting cat burglar was ever found home in bed at night calmly sleeping.

We find a girl, terminal unknown, tone arm flies up, Flang!, between sessions. And you say, "What did you do?"

Well, all right. It's very hard to get that tone arm down because you don't know the terminal. But let's say we know the girl's terminal. We say the tone arm went up between sessions and comes back in the next session and we say, "What did you do?"

She says, "Nothing. I had a talk with Bill last night and uh ..."

"Well, what – what did you have a talk with Bill about?"

"Well, nothing. We got everything all settled. I was going to be faithful to him, and he was going to be nice with me and so on. And it all went on all right."

You – you knucklehead, say well, that's the way they're supposed to act, so therefore there's no reason for the tone arm to go up. But the terminal is nautch girl. Faithful to Bill, of course, would be a total break with the mores and now-I'm-supposed-to's of a nautch girl.
They just busted it to flinders. So the tone arm is up. What you might call a terminal objection.

All right. Well, you see these things in passing and you can audit them, but I'm trying to show you exactly where we are and what we're going toward. And in view of the fact that I'm riding on a little bit of slack time, in that I'm still trying to find out here and there exactly what's a more comfortable side to run on some of these terminals, and so on – got most of them going all right – we've got the little slack time of knowing how to clean up the game aspect of it. By the time you get there, I'll have it.

Thank you.
3D PACKAGES

A lecture given on 19 December 1961

Hi today.

_Audience:_ Hi.

Is there anybody alive? [laughter]

_Audience:_ Yes.

Okay. What's the date?

_Audience:_ December 19.

Nineteenth Dec. Christmas is on its way. Saint Hill Special Briefing Course '61.

Now, there are many vagaries and upsets which you are going through in pursuing your course through the knothole. The course known as from normal up through mere being in hell ... I think Dantes wrote a book sometime or another – a comic book I think it was [laughter] – and he wrote this thing, and apparently they came up through seven levels, and processing wasn't so good in those days. [laughter] And the levels that we're going through – from normal up to merely being in agony – have to do with, well, first hearing about Scientology. That's, you might say, a step. And that's quite an adventure to some people. After they read the RC's accounts of Scientology in Australia or the psychiatrists' ravings over TV on the subject, and so forth. That is a tough one. And that is the period of "Does it exist or doesn't it exist? Is it true, is it not true? Is it a fraud, isn't it a fraud? What is all this enthea I hear? Is there any facts through it?"

Now, factually, for some people, this period – because it matches up with their oppterm and their terminal so nicely, you see – I mean, you got messy collision with these things – this period isn't over until really they hit the Goals Problem Mass with a thud. They're still wobbling, you know. They're still wobbling. Some raving maniac comes along, you know, with his hair standing on end, you know, still with the electrodes from the insane asylum, you know, trailing out behind him, wearing some weskit. In other words, an authority. And he says, "Hubbard is wrong! Ha-ha-ha-ha." And they say, "Well, maybe he is. Maybe he is."

You know, this horrible thought strikes the person, you know? And "This is all a fraud!" you see, and "Maybe it is," you know. And then you read in the newspapers how we have just overthrown the North Pole or some other ridiculous statements, you see?

And then the next co-audit session or something, you get a little somatic, you know.

Somebody says, "Something you wouldn't mind forgetting," you know, or something like that. Something goes *tst*, you know. It's the somatic one's had for some time, you know.
And all of a sudden one remembers some small period of one's life. You know, yesterday, something like that. [laughter] And this is such a startling reality and is a reality of such magnitude that our next and immediate step, of course, is to say, "It's true! It's true! It's true!" You see? Until one hits the next "maybe" in the case, you see?

And all of this is all part of going Clear. Let's just accept it as a fact. As you see people around Central Organizations, PE Courses and your private practice and so forth, just accept it as the fact that they're going to wobble on and off and on and off. There's a great wide plain. They don't know there's any road across it at all.

Of course, it's all marked out. It's got verge, and it's got center lines, and there are lights and traffic signs on it. But they walk along, and they walk straight over the road, and they wonder if there's anything there, you know. And they get off on the plain on the other side, and they don't know if anything is there, and so on.

Well, that's basically because they're searching for themselves. They're not searching for Scientology. Look, they wouldn't stay around that long if they were really doubtful. That's what's interesting, you know. The doubt is mostly verbal.

It's in only a minor percentage expressed physically. Somebody usually succumbs when his family have decided long ago – their option, you see, is a boy or something like that – and they decided long, long, long time ago, you see, that he should go the road, their road. You know, the rougher, the better; and the crazier, the more satisfactory.

In other words, they run a "make fail" on him of great magnitude, you know? And they've always been doing this, and he collides with that one time too often and actually knocks off and doesn't get processed again or something like that.

You can see people disrail this way, but it takes a considerable amount of force and duress to derail them. And all the ravings of the RC and their companions the communists, and other people of this character deter them not at all, really. Some of the biggest upsurges some Central Organizations have ever had is immediately after one of these blasts, you know. And the favorite red rag comes out and says, "The E-Meter is a pile of junk." The subhead of the title should be "Boy! Do we have withholds!" [laughs, laughter]

And this comes out with a crash, and sometimes it has an adverse effect. Sometimes it has no effect. *Time* magazine – I wrote them one time, just to give them an estimate of how well they were read and believed, that as far as I could tell on reviewing Central Organization figures of preclears and students and mail, that not one blast in *Time* magazine had ever affected the Central Organizations of Scientology, plus or minus, by as much as one letter. I thought I'd give them a win. [laughter]

They never answered the letter, you know. They usually do, but they never answered that one. And once here in London somebody came on ITV.

For some years, we have pursued this program. Every time we hear it's going to be shown someplace in the world, we clobber the station and tell them we're going to have thousands of people in their area turn off their sets, and they always buy this and never show it – if we hear of it coming on.
And some psychoanalyst went nattering around one way or the other on the thing – and it was momentarily destructive; for one week nobody walked into the London front door – and then it all came back again. I think you had something to do with that. I mean – and it was all supposed to be in the best of all possible guises, you see. I mean, that was good publicity and it recoiled. Relatively speaking, it was good publicity. But nobody walked in the front door for a week.

But a recent blast at the – in Australia, the recent blasts are so important that students all over the campus – their university paper having published a blast on Scientology – are phoning the Central Organization apologizing for their newspaper. And the person who wrote the article, or one of the people who helped write the article, has been in and signed a full confession voluntarily, and so forth. So that was getting no place.

But their PE has been full to the rafters ever since the stuff appeared. So it doesn't have too much to do with it. You start worrying when there isn't any comment anywhere. That's when you should start worrying, see. Think of the number of philosophies and ideas and thoughts. Think of the number of wild Indians that have come out of India and sat cross-legged in the middle of Times Square in the last eleven years, and we don't know any of them.

You know, we never heard of any of them. Nobody's cussing them out. Nobody's mad at them. They're not getting anyplace, either. One of the penalties of popularity is dodging bullets. And one of the penalties of advancing truth into this aberrated society is dodging avalanches. They'll throw brickbats, pots, pans, and everything else at you because everybody who has a pitch and a curve sees at once his vested interests threatened.

What would happen, for instance, in all hospitals if the public suddenly, en masse, demanded effective medical treatment in every case. Think what would happen. Oh, man! They'd have to sack every medico in the joint. Because they can't deliver.

And so, of course, when we come along with a philosophy of saying everybody should be helped, ooohoo, we're advancing a very hostile philosophy. Very hostile. Because their philosophy is "If we can have an out, we're all right," you see. And one of the reasons we're advancing is we left ourselves no out.

So remember, it's this kind of a society in which the person who first hears of Scientology and goes through his first stages of processing lives in. It's this kind of a society. He's surrounded by people with a vested interest in keeping him crazy, in making a fool out of him, and so forth. He's surrounded by these people.

He also has been many times defrauded. He has parted with money – "Hypnotize yourself and become popular overnight: grow green hair," you know? Or anything like this. So he doesn't know.

Well, don't expect him to know very fast because after the environmental upset goes out, then his own immediate invalidation – which is his Goals Problem Mass – starts going in and out, in and out, and it monitors, to a large degree, his attitude. And his attitude is very definitely monitored by this. I'm going to tell you some more about this. It's quite interesting to you technologically how it does monitor.
But anyway, there might be a long period of this, wishy-washy, "Maybe it's here, maybe it's there, maybe it isn't, maybe it is true, maybe it isn't true. I hope it isn't true, I hope it is true." This might go on for a quite a long period of time before somebody seriously sat down and began the fateful seventy-five hours of Security Checking, Problems Intensives, and things of that character which will lead up to an assessment.

Now, during that period, he wishes to God he had never heard of Scientology. That's one of his frequent reactions. He says, "Well, I just won't be able to tell the auditor in the morning."

He's forgotten this withhold. He's forgotten it utterly. It had never preyed on his mind. All of a sudden the thing has leaped into view, and there he sits with it. Half an hour after the last Sec Checking question, he has suddenly remembered it. It's going to be something on the order of maybe fifteen to twenty hours before his next session.

During those fifteen or twenty hours, of course, he goes through numerous cycles of, "Well, I'll just ... I'll just sit down and I'll just own up, just like that." And then he says, "Oh, but I don't know. I don't know." [laughter]

And there's the question, of course, of what will the auditor do with this. Yes, and other people will hear about it, and so forth. Well, of course, I could answer this from my viewpoint.

I have ceased to worry about anybody talking about my withholds. You know why? Lots of people invent so many withholds for me that I have... [laughter] It's very remarkable, you know. I'm the best-supplied person with withholds you ever heard of. If they only knew what my actual withholds were, their hair would stand on end, probably. [laughter] But it's almost pointless my trying to tell anybody my withholds.

And we used to notice this in the old days, way back, six, seven years ago. Somebody'd come in and he'd sit down with the D of P -- "I see in the Auditor's Code it says that the pc's secrets and so forth... Are you sure you're not going to ... Because I don't want anybody to learn about my flat feet." [laughter] Time after time, you know.

And just in the course of old-time Class I-type processing, day after day, being chewed at one way or the other by this idea or that idea or this mass or that mass, something of the sort, whatever it was. And after a week, two weeks, something like that, the same pc comes in, she sits down, and she says, "Well, my flat feet are certainly hurting these days, you know!" She can be heard out in the hall and upstairs and everyplace else, and she couldn't care less. It's a very remarkable change that they used to experience.

That was my first noticing of this phenomena. Whenever we did have them super-secret, if we were doing a good job of processing them at all, why, they would wind up in a few weeks, they didn't -- couldn't care less.

Now, of course, that period is passed during this seventy-five hour preparatory period. Now, I'm saying seventy-five hours just to give you a unit of time. I don't mean seventy-five hours. Two hundred. Five hundred. Fifty. It depends to such a tremendous degree upon the expertness of the auditor and it depends to an enormous degree upon the depth of curve of the pc.
And remember, you are sec checking up against a Goals Problem package. You've got that package. And if that package has a holder of secrets versus a person who punishes people with secrets, everything that you say to the pc is to some slight degree being interpreted as coming from the punisher of secrets while the pc sits there and flips easily into the valence of the holder of secrets, you see.

So you're going upstairs against this package, anyway. And that could make a long haul. That could make a long haul out of this.

The expertness of the auditor is another factor. An auditor who says, "All right. Now, what have you – what have you – what you have done, here, is the question here, I guess. Print's rather small; can't see very well. Let me get some light on the E-Meter. I don't know if these – this instrument really works. Uh – uh – uh ... Let's see now. What – what's the question here? Have you ever – well, have you ever picked any cherries? Yes, have you ever picked any cherries? Well, have you ever picked ... It says right – right here. I'm not asking you – it says here, so uh... Have you ever picked any cherries? It says," and so forth.

And the pc says, "Well, I knew somebody one time that picked some cherries, and so on."

And the auditor says, "Well, that's good. Thank God that question is clear. Now, let's go on to the next one."

That's going to take a long time. Because part of the long time it's going to take is the number of times the person has had withholds missed on him, has blown, and then has had to get ahold of himself by the collar and bring himself back in and decide that or some other auditor can continue to sec check him. You get the idea?

And he has to face up to it. And do you know that there could be a period of ten years intervening in that seventy-five hours? And I've already seen several years on some cases intervening. You know, they just disappear and go over the hills. And next thing you know they turn up again and say – sit down rather – with a desperate look in their eye. And that time they don't stay either. They disappear again.

And this kind of fluctuation all gets into that seventy-five hours, so it's not a little thing.

All right. They get up to the Goals Problem Mass. Now, how long is it going to take to get a Goals Problem Mass? At the moment that they get all of the elements, they're in better shape than they have ever been in. They're in better shape they've ever been in at the time they get all the elements.

When they got their first level and it's half run, or their second level, and it's all run, they're in worse shape than they have ever been in. It goes from the sublime to the ridiculous. That's such a roly coaster, up-and-down dive on the pc that it's quite remarkable.

And if he's unlucky enough to have these, his oppterm and his term, of fair equality, that they are not too great a difference in them so that you can't differentiate too well between these two things and you have to run it experimentally to see if you turn on somatics, and that sort of thing, or if you do something of this character or you test it out by processing... You
shouldn't have to do this, but frankly in some cases there's no other way. And you test it out by processing, and you run him on a level just to find out what level he's going to come up with and what's going to turn on, of course, he feels horrible if it's the wrong side. He just feels terrible. It doesn't kill him. So what?

But he sure feels bad. And that'll make him feel even worse than running the right side. And he goes on up the line and I would say his first fifteen levels are the hardest. First fifteen levels are the hardest, and then they begin to bite. He doesn't mind, however, when they are biting. It's when he is fighting the shadows that he doesn't like it.

And where he goes from there and how long it takes him to come up at the other end again has a lot to do ... Is he run on these levels? Is he run on these levels with the rudiments in or the rudiments out? That's important because that tells you how long.

How many times is he going to have to retrace these levels? Because you don't run them just once. You get up to a certain number of levels like a dozen or something like this, and sometimes if a case is not progressing too well, six, something like that.

And then you'd assess the levels again. You don't do a new Prehav Assessment. You go over the run levels and find out if any of them still tick. And if that one still ticks, you re-run and flatten that process, and you'll find that button has come up again. So you can continue this rerun process as you run the levels forward by Prehav Scale, you also rerun levels. And you'll every once in a while find that your pc is feeling kind of goofy because the level – that two levels ago – has come alive by virtue of having run the one you had just run.

It wasn't that it wasn't flat when you ran it. You did. You ran it to a flat point, but now you've opened it wide up. And there it is.

It won't assess, particularly, if you go down the Prehav Scale, because it's too weak, but it's still run. And now you have a pc running on one level while another level is alive. And that is what makes a pc feel spinny. Nothing else in 3D makes a pc feel spinny but running on one level while another level which has been run is alive. That's what makes him feel spinny.

He – "No." He wonders if you got the right button. "Is – is – is it the right... Well, I don't know. Isn't there a button on the Prehav Scale called apprehension?" You know, something like this. "Uh... terror maybe. Maybe it's terror. Maybe – maybe the auditor's got the wrong button." Well, it's not "apprehension" or "terror." It's "withdraw" and "communicate" are both alive, and the two between them make, of course, a sort of insanity ridge. And one has come alive after it's been run, and so you've got buttons in that shape. So that particular thing we can take care of. The rest we don't care to take care of except straight on forward.

Pc starts to feel spinny. In a 3D run, you simply reassess. You don't assess for a new level. You reassess the existing levels and find out which one – any one of them, then, that needle reacts at all, you rerun – in sequence. That's the rule.

You don't assess them out for the one that reacts the most. You take them in sequence every time. You go back over and you find out the third level you ran is now getting a stick. So you rerun that level to a stuck. And you find out that the fifth level you ran gets a little, tiny theta bop. Sporadic theta bop. Now it bops, now it doesn't bop, now it bops, now it doesn't bop – something like that, you see. You rerun that level, and then you come back up and
follow them all the way through. Every needle reaction, you flatten the level, and then reassess on the Prehav Scale and continue your run. And all of a sudden it goes much more smoothly.

You eventually get up to the point, regardless of how many levels have been run or how often they have been rerun, or something of this sort, you get up to this point of the thing goes up to stick, but the pc wiggles his nose, and it goes down to Clear read. And then eventually you can't make it stick anymore. Then it just won't go up and stick. It'll just go down to Clear. And from there on it goes out to a float.

Now, there are various ways to accelerate this, and I'm working on some of those accelerative methods, and you are dropping out Security Checking, of course, during a 3D run which is in violation of the basic design of packages, see. Your pc should be getting security checked. But the only Security Checks that will do the pc any good of any kind, whatsoever, of course, are on the terminal and the oppterms.

I was clever enough the other day to dream up a process, of all things, which security checked the terminal and oppterms and the pc, and I'll release that to you. That's an interesting round of roodles. That's basic — it's a — you remember the old mutual motion process which I gave you much earlier?

Well, it's "What's the mutual motion of the terminal" and "What have you done the terminal wouldn't like," and mutual motion of the oppterms. Oppterms, terminals, see? "What is the mutual motion of the oppterms. Well, what about that motion? What have you done that they wouldn't like," you know?

What you're doing is kicking together their moral code. And then, "What's the mutual motion of the terminal and the term?" And "What have you done that they wouldn't like?" And then "What is the mutual motion of you and others?" And "What wouldn't the terminal like about that?" And "What wouldn't the oppterms like about that?"

And that is your formula. That's the extent of the formula. Of course, it goes round and round, and it's all balanced into flows, and it runs off the exact moral codes of the term, the oppterms, and you. Don't you see? So it gives you in essence a Security Check.

This is under test right now, and I don't know quite whether to run it in every other level that is run or every two levels that is run or in a special period, or something like that. I'll have some more data on that and release it very shortly.

But anyway, that gives you a Security Checking boost which should run the run faster. And anyhow, you would have to run it before the person was released off of the thing because it would take all the remaining bits and pieces of the 3D — original 3D package and blow it up on a Goals Problem Mass. It's quite fascinating.

There are a number of these little boosters, by the way. One of them — perhaps you haven't quite understood this. That your Problem Solving Survey — which is what you might as well call this thing, I've had to write it on so many reports that I eventually had to get a name for it to tell the auditor to do it — a Problems Solved Survey is simply "How would you solve problems? How would terminals solve problems? How would oppterms solve problems?" And did you realize that if you kept going on this, and getting a list for you and a list
for the term, and a list for the oppterm, and a list for you, and a list for the term, and a list for
the oppterm, and a list for you, you realize that if you just went around as though it were a
process, you would be running a tremendous differentiation on these three items, and the pc is
never really run on this. And I think you will bear me out in this.

A pc can't have any kind of ... Well, he finds ten or fifteen ways to solve problems that
"you" would solve problems, ten or fifteen ways that the oppterm would solve problems, ten
or fifteen ways that the terminal would solve problems. And you come up at the other end
having had one of these run on you with a better idea of the differentness of these three
things.

And I think you've already experienced that. Well, you keep that going for a little
while, they just tend to shred apart. Because what essentially does an E-Meter register? An E-
Meter registers disagreement. And what are these but disagreements? It shows the basic dis-
agreement between "you" and the terminal, and "you" and the oppterm, and the oppterm with
the term. And it shows these disagreements. It shows wherein they disagree. And that the dis-
agreements are very large, you develop a mass. So if you take anything as massive as the
Goals Problem Mass, you will, of course, wind up with a disagreement as the basis of it, see?

Now, you also ask what goal do they have in common. Here's another one of these
stunts. "What goal do – does 'you' and the terminal have in common? What goal do you and
the oppterm have in common?" What – and you've only run it so far. "What goal does the
terminal and the oppterm have in common," see? Or "What goal or goals do they have in
common?"

When you run this for a little while, you're liable to throw the package. The package –
all of a sudden the pc's attention goes over for the next couple of levels you run almost totally
on the oppterm. Or it comes back very harshly on the terminal. But it dislocates the status
quo. It shakes up the mass, in other words. It gets some more differentiation going and some
recognition of what the mass is all about.

These are two stunts by which that can be done. The Problem Solving Survey and the
goals in common. Now, you also have actions in common, and so forth. And you have this
other one, which is much more important than those as a process which gives you these vari-
ous overts, really overts and withholds from the mores, the exact mores of it.

This is a great gift to you as an auditor because if you were to sit down, you'd take the
pc's terminal – you just never happened to have been acquainted with a snail – some reason or
other, snails have gone one way and you've gone another. And the pc has an oppterm of a
snail. And you going to dream up all out of your wits all of the overts a snail would think he
was capable of in order to put together a Security Check. You're not going to do it, that's all.
Because those things which you would think a snail would consider overts are very often
quite the reverse. Because you're dealing in a sphere which is very difficult to deal in, which
is to say, the exact ideas of the other fellow's terminal.

Now, we can form our ideas of the other fellow's terminal, but they wouldn't be close
enough for a Security Check because the things wrong with terminals is – is they're so differ-
ent. That's what's wrong with them. They are out of agreement with everything under the sun,
moon and stars and have been for trillennia. They have been ages, countless ages, these things
have been wildly out of agreement. How else do you suppose they'd ever hang up in a thing called a Goals Problem Mass? They must have been a – at a disagreement that whole length of time, so how much understanding of these particular items do you think there has been?

Well, there hasn't been any understanding of them. And now we say to the auditor, "Now, just go ahead and understand a snail and dream up an entirety of the mores of a snail in view of the fact that it's your pc's, not your terminal."

Now, the pc could take a stab at it but would inevitably and invariably miss all of the real overts and all of the real withholds because he would not be able to confront any real part of, except on a gradient, the mores of a snail. Because if it's his terminal or his oppterm, well, I'll tell you, it's there and stuck because he has always violated his mores.

That's why you say somebody who has a terminal as "a wife" is very often a lousy wife. Somebody who's got a terminal of "bus driver" is usually a lousy bus driver, if they are ever luckless enough in life to come along as their terminal. You know, the wheels of time go around – roulette, roulette, roulette, roulette – and one fine day the ball drops in the slot which accidentally happens to be the pc's terminal. And he's right there, and he is it. Oh, there'd be nobody more stupid about it than he is.

He could mess it up faster than anybody you ever saw. Although he would apparently feel fine about it, he'd apparently know all the answers, and it would all feel natural. If his terminal was a ship captain, let me guarantee you he'd spend nothing but tangling himself up in hawsers and getting drowned. He would be able to tell you all about ship captaining, and he'd talk a good ship captain, and he'd look like a ship captain, and he'd act like a ship captain, but he'd just keep getting drowned.

Now, in view of the fact that the thetan steers himself in toward the oppterm every time, and the terminal whenever he can make it, we see what kind of a life he has been leading these last many trillennia. It's been a mess. Because there he was always trying to be the one thing he was in total disagreement with. If he had a total disagreement with it, he was going to try to be that, that was all about there was to it.

All right. Now, as you start walking along this track, running up the line, your pc will be, of course, convinced – your early runs of the 3D package – of course, your pc will be convinced, usually, that it is the wrong terminal. If he doesn't have much of a grasp on the situation, he'll tell you it was the right one at first, and then after a few somatics have turned on, he'll decide that the other one would be much more comfortable. Unless he's got an excellent grip of exactly what he is bucking into, he will try to change your mind as an auditor. That's in a large number of cases. Large enough to be very interesting. It's not 100 percent, but it's some big number.

Now, what's this all about? Well, it's just that the person is disoriented in this area, and he is the worst judge. Now, he might be a better judge of the mores of the terminal or oppterm than you are. But let me assure you, he is the worst judge of which is which and what it is all about and which he is. He is the worst judge.

During periods when you're reading off oppgoals and things like that to him, a great certainty of the beingness of the thing will come to him. During a period of listing and as-
assessment, a great certainty will come to him. And maybe for a run or two a great certainty
will be his lot.

And then, of course, he inevitably starts passing through all the maybes. And I don't
think there's a person going to Clear alive who won't spend some time in the middle of the
night, at sometime or another, wondering if that's the right package or if that is his terminal or
if it is all correct, anyway.

Now, some will do it more than others, but you usually get into a lineup on this. And
you as an auditor should be vividly aware of this interesting fact.

The worst judge in the auditing room is the pc. It is not a case of the pc knows. It's the
case of the pc is something on the order of a roll going through the player piano, and that is
the way it is running off. It all depends on whether the air is blowing through the roll or not,
whether you get any music. Hasn't anything to do with anybody playing the piano. And you
would be very stupid and very unkind and even very, very cruel if after you had determined
by all seven types of reaction that this was the pc's terminal, if you then wobbled off the line
and decided it wasn't.

Perfectly all right to run the other side, you see, and find out how the pc reacts on the
other side, if you're not sure and you can't make up your mind. But it isn't all right for you to
wobble because the pc is unhappy about it. That is the last reason you should wobble. Be-
cause he's the worse judge. Although he has been a snail for at least a hundred trillion years,
although this is his most favorite game, and so forth, until you get him well run on the Prehav
levels, you know, he really knows nothing about it. You could go to the Encyclopaedia Bri-
tannica and look up snails and learn more about snails than he ever could tell you any day,
any day.

But then all of a sudden he passes through the not-know barriers, one way or the other,
and he decides to confront this thing, and then of course he becomes a great authority on
snails, and the Encyclopaedia Britannica hasn't anything in it about snails, that's all. It's just
got nothing in it, hardly a thing. And it's true; he will really know about snails.

And it's early in the run, early in the run, this knowledge may turn on flickeringly and
turn off again, and on and off, on, off, on, off. And then eventually it starts coming on. It
comes on very strong and stays on, and then he knows all about it. And at the time when he
starts to know all about it, he more or less stops dramatizing it. He will eventually recover this
fact: that the one series of skills he could not execute were those connected with his oppterm
and his term. That is one zone of skills for the term and one zone of skills for the oppterm that
he is just about as expert as Charlie Chaplin trying to walk a tightrope. He is from nowhere.
This he knows nothing about. He can't do them.

And he himself will not realize this. For a long time he won't realize this. He'll say,"Well, my terminal is a tightrope walker. And, I remember when I was a boy I used to fool
around with tightropes, and go to circuses; always appreciated tightrope walking. I know a
great deal about tightrope walking."

He'll tell you this. He'll think this. And his oppterm is a ringmaster. Well, he can al-
ways shout loudly, and he knows a lot about being a ringmaster, too. And he's got it all set.
And he's sort of convinced in his own mind, you see, at this stage, you know, that he knows something about this and can do those things. A period will arrive in his processing – as you go running levels on the term and oppterm; running levels on his terminal, of course, and the oppterm coming off incidentally – when he will suddenly realize that he has never walked any tightropes for a long time. For the last million years or so maybe he's never really walked a tightrope.

Yet he thought about walking tightropes. He seems to know a lot about it. Yes, he saw tightrope acts. Yes, all these things are true, but the point is the one thing he would never do is walk a straight chalkline on a sidewalk, walk on the edge of anything, walk at any height close to falling off, you know, or walk any line that was off the ground or have anything to do with people who would do it. And that would be one huge zone of existence with which he has no communication. He only has the apparency of familiarity. Here's this tremendous zone he really knows nothing about.

And that comes on about the same time as he finds out something about it. And after this has been run for a while, of course you have your authority.

At the time he really starts talking about this, unimpressively but happily, with great authority and with considerable knowledge, will be after he has recognized that he is at odds with all of these skills and that they are locked out as far as he is concerned. Life has never really permitted him to do these things.

He's tried to do them. He's fallen off his – more tightropes and more high tents than you could easily count, but for the last – for a long time he hasn't done it at all, really.

Now, when the zone opens up, he recognizes that it was a zone of stupidity, not a zone of knowledge. Now, of course, what's interesting is, the same time this opens up to him, he stops dramatizing it and the information becomes available to him.

And that's an interesting phenomena. The information becomes available to him. After all, he did have the information. After all, he has studied it. After all, he has been it. And you have this tremendous fund of information on this particular subject. Now, he could be it well, and you as the auditor could make a mistake at this point.

You could say, "Well, we've certainly gone on and on and on, here, just to get this fellow up to where he can dramatize because he keeps talking about tightrope walking." No, the guy's now interested in tightrope walking. Never really was before. You've got a tremendous zone of data which has been opened to the pc that was never opened to him before, and of course he's liable to err all – a lot of this data and so on. It sounds like he now has really sunk solidly into the valence, to the auditor, see.

My God, this fellow comes walking in, he walks down the hall on a crack on the edge of the rug, don't you see, and he says, well, it's just to show himself that he could. He feels pretty good about it, you know. And he walks in, and you'll notice him balancing before the session. He balances his chair on its two back legs, you know, and so on. And he does interesting things.

And he'll give you all kinds of data about Japanese tightrope walking. How, that's not quite the thing. You know, that's not quite right because they use these balance poles, and...
they're leaded in the ends, and that's just cheat, you see. See? Because who could fall off a
tightrope with a long balance pole with lead in both ends of it, you see. He'd be very authori-
tative on the subject.

You make your mistake. When the information opens up to the pc, it is not informa-
tion he is longer going to dramatize. The more he knows about it, the less he dramatizes it, the
more he can do it. And you will see all that unfold before your eyes.

But he will actually enter... And it looks like he's introducing some of these things into
his life. And you say, "Well, he's really sunk now."

No, only thing he's doing, he's making up for the absence of them. He can accept these
things along with the other things which he already has had. And it's sort of a beautiful feeling
of freedom to him to be able to string up a tightrope in the backyard.

"Hey, what do you know? Ha-Ha-Ha. I can string up a tightrope. Pretty good, you
know."

You'd say, "Boy, this guy's gone around the bend. There he is stringing up tightropes.
We found this terminal, 'tightrope walk.' We run it for fifteen levels, and here he is stringing
up tightropes, and be breaking his neck and enrolling in a circus next."
No, he won't. He will
neither break his neck nor will he enroll in a circus, but he's liable to put up a tightrope just to
show that he can confront it, you know? Because it's such a pleased, wonderful feeling, you
know.

Or let's say his terminal was a goldfish, and you're liable to find him down at the
aquarium. Going down to the aquarium and saying, "Gee, you know. Gosh, you know. Look,
I can confront the little bastards." [laughs, laughter]

You know, anything like that. But what he does is express relief, and the return of in-
formation is actually return of a zone of activity, return of an enormous zone of activity. And
he has been barred out of it for trillennia, and he has never been happy in it.

And it's a great feeling of relief to be able to get into communication with it. Well, the
case is three-quarters cracked when that occurs. You want to know how fast somebody is go-
ing Clear, well, there is that exact point on any line.

Now as you move up further – it's mostly needle phenomena – but you'll find out that
the pc's intelligence, his ability to inspect and grasp ... I don't care what it reads on IQ sheets.
I just couldn't care less because an IQ sheet is actually too limited to tell you, really, what the
increase of IQ is. His ability to perceive, absorb, and apply information is enormously in-
creased.

You'll see this constant and continuous increase from there on out. That's your next
noticable phenomena. He'll take up studies of some kind or another. He'll start studying
something, and he'll come up with conclusions that nobody's ever concluded before. Things of
this sort. He'll have a better grasp of the immediate situation. And he starts to get busy, he
starts to get busier.

And you'll have trouble keeping the rudiments in all through this period that I'm talk-
ing to you about because he confronts the zone with beautiful freedom, you see, and runs into
something he shouldn't – thinks he shouldn't be confronting, and he doesn't know whether he should or shouldn't. He's falling off of the wagon. He's getting back on the wagon again. He's trying to adjust himself in life and trust himself in the environment in which he lives all through this period.

So the rudiments are, if anything, harder to keep in late in a run. But you won't notice that they're harder to keep in sometimes because they can be knocked in so easily. You get so that you can put the rudiments in more easily and you don't realize how wildly they are going out.

So don't develop any contempt for rudiments toward the end of a run. They have to be put in much more frequently, much more often and much harder. They go out so easily. The person's colliding with life, it looks strange, and it looks different to him, and he is an impact. Not so much here, but if you were clearing somebody in Pretoria, you might find yourself in – well, he's in collision with the society. And society doesn't much like what's happening to him. You know, there'd be a member or two around invalidating him or something of this sort.

It's always a good idea to get possibly – you see, the personnel around the pc doesn't even have to be invalidating the pc for the auditor to take action on it. You recognize that? That it is a fruitful source of upset to the pc. So fruitful and can cause an auditor so much wasted auditing time, that an auditor is actually foolish not to make some sort of an effort to get the pc temporarily and momentarily out of an un-restimulative environment while certainly running – assessing and running the Goals Problem Mass. Certainly it's a wise thing to do. And if there are possibly restimulative personnel around, even though these restimulative personnel aren't actually chopping up or doing anything much to the pc, and the pc's case is not going well or something like that, one of the measures you can take is just advise him very frankly to remove himself momentarily from such contact, you see, until he finishes his auditing.

Otherwise, you'll find that toward the end of cleared run you get stalled and you won't be able to tell exactly how you're being stalled. But you're being stalled because his collision with the society, constant comments on people telling him he looks different, that he acts different. He tells them about things they never heard of before. He says, "Well, I remember the last time I was out here, I was with the Mormon army, and we were coming out here," and his lack of caution on the thing has permitted him to say this at a dinner party, you see.

And then he's more perceptive, so at once he realizes that the hostess and three or four other people at the table have realized that he'd gone around the bend.

He doesn't invalidate himself so much, but he becomes a little upset about it. And then he begins to wonder if he could live in this society if he were really sane. And then he invalidates going Clear, and so on. And that, by the way is a good point.

Now, the next thing that you want to take up along this line is the willingness to be Clear. Now, although this might have been cleared up with the pc back during the Sec Check period, the willingness of the pc to go Clear when the first Goals Problem Mass hits the pc is
probably very great because, "Good God, this much mass certainly has been doing me no good," and he gets explanations in all direction, but then he gets a secondary reaction.

He's not quite sure, and that's about all that's expressed. He's just not quite sure. And you'll get invalidations of going Clear off of him. He'll say, "Oh, I'm not quite sure."

Now, there's a bigger one follows this that is a real crasher. And it's liable to happen. And it's probably happened to some cases here, and you should look at – for this rather constantly in running the goals problem thing. Keep alert to it as a factor.

He's not sure that he wants to get rid of this game. Now, I refer you to lectures clear back in June, Saint Hill Special Briefing Course, on the subject of "It's the Only Game." And he goes through a period of its being the only game. And, of course, that is what is wrong with him, the idiot. He can't have even that as a game, so he is not in a games condition. He's technically in a games condition, yes. But his actual condition in life is a no-games condition. And he's so fixated on this game of the snail, you see, that he can't conceive of any other game. He has to start sticking his head out of his shell.

And he has arrived at a point where he is not at all sure that there are any other games, but he is perfectly sure that there is a game called being a snail.

And his new reality on this game called being a snail causes him at once to try to put on the brakes and saying, "If I lose this game, I will lose everything because where would you be if you couldn't be a snail," you know. "What if you forgot to be a snail after this? Just what would you do for a shell?" [laughter]

Lots of puzzling things are stirring in the reactive bank at this time.

And you get these expressed as invalidations of going Clear. Naturally, he never sees this other more interesting point. The other more interesting point, of course, is that if he weren't so confounded fixated on being a snail, he could even be a snail. That's what's interesting. He could even be a snail. He's never achieved that yet. So his unwillingness to give up a game he hasn't got is, of course, the purest of idiocy. But it's a reactive combination which a pc goes through.

You'll find almost any pc who is making good progress will hit this thing. And it's so much so, that if a pc doesn't hit this at some time or another, I would start wondering if he was running the right terminal or oppterm or missing the commands, or if I was running it all with the rudiments out, or something. I would start asking questions. It would be one of my indicators as to gain. The all of a sudden feeling of "Oh, I don't know. Just think of that. No shell, you know. You know I'd be awfully unsafe not to have a shell. I don't know if I should want to go Clear or not."

And this varies on the other side of it, "Well, if I run this any further, I might become so free in it that I might actually become a snail, and wouldn't that be horrible?"

That would be the most ghastly thing he could think of during this particular period, you see? What if he did become a snail, you know? And if he takes these withholds off from becoming a snail, of course, somewhere up the track it is a wide open pit hole, you see. He's
liable to just go crawling along and fall right in to it unless he keeps these barriers up, unless his whole life is filled with signs saying "Hole in road," why, he won't be able to live.

But, of course, have you ever tried in one of these one-way-street cities to get anywhere? You know, you drive up the one-way street and down the one-way street and back down the one-way street, and you find yourself on the first one-way street again. And you say, "Well, I didn't intend to be here, I wanted to be at the City Hall." So you'll ask a cop, and you say, "How do you get from here to the City Hall?"

And the cop thinks it over for a long time and thinks over all the one-way signs that are pointing between here and there, and then he eventually looks at you, and he says, "Well, you can't get from here to there."

So here's your pc living this kind of a life, you see. It's nothing but one-way-street signs and on both ends of the block you have signs pointing to the middle of the block one-way streets, see?

And if he didn't have all these, he might become a snail. So it's very important to stay in the middle of the rat race. That condition and consideration hits him rather constantly. It may hit him hard. It may hit him harder than you think.

Now, a piece of technical data is, an invalidation of a terminal or other 3D part reacts similarly to the 3D part. An invalidation may act similarly. The 3D part rock slams, the invalidation of it will rock slam, no matter how tiny the slam is.

So whatever the invalidation is, it's easy to locate because all you have to do is get some part of it reading or just remember how it read, and then ask him for people who have said things about it until you get that little rock slam. And then follow that right on down, and you'll find invalidation of the goal, invalidation of the terminal, invalidation of the oppterminal, invalidation of the modifier – find something there – or invalidation of going Clear. And all of these things will read the same as the package.

Why does it read the same as the package? Because it's activated the package. That's why. So it reads back as the package.

There are only a few things that ever read the same. The six parts of the 3D package all read the same. If you consider that the opposition terminal has its own goal in addition to the opposition goal or six parts.

They will all read the same. They will read equally plus the Prehav level. And the hot Prehav levels always read the same as the package. So all those are equal reads.

And an invalidation reads along with that package. Interesting thing for you to know if you're looking for some guy who all of a sudden has decided he doesn't want to go Clear. All you'd have to do is, "Who said that? Who didn't want that? Who has talked to you about this? What have you hit? When did you think of that?"

And all of a sudden you'll turn on the same needle reaction as the whole package gives, you see, or any item in the package gives. Follow that needle action down, and you'll have the invalidation of it right on the button. Nice thing to know.
All right. Now, with all of these ramifications and rolly coasters and bad spots, and so forth, it is odd that the pc continues to be interested at all. This is remarkable but is part of the package.

His attention is so bound up in the package that he will only get disinterested if his attention is yanked too violently off of the package during session or he is put into braces about this all.

"All right. You're a snail. Well, you can act a lot differently in life. Just look at all this life that is going on around you, and so forth, and we don't care whether you're a snail or not."

Somebody knowing about this and using it in an argument with him, something like that, yanks his attention, rather violently, off of the subject, and so forth. It's attention off that keeps the fellow from going Clear, not attention on. Attention on continues him on toward Clear.

All ARC breaks that you've ever had with a pc is attention off the Goals Problem Mass.

Now, patching up is another phase that is with us temporarily, but there are people around who have gone Clear on 3D. And there are people around who have had their goals and terminals found and who have been partially run on Routine 3. Did I say 3D a moment ago? I meant 3. Excuse me.

And it is necessary that this all be put together on a Routine 3, and I will tell you briefly how to do this.

In the first place, it is probably hard to do to get them to go ahead and get it done. That is probably hard because they feel good, they feel better, and they have had the first blush bloom of interest taken off of it all. They may, if they've gone Clear, have had the whole cotton-picking Goals Problem Mass keyed out, and it's sitting over there half a light year away. And they may not contact it for another century. But there it is, and they think this is just fine, thank you. They're just not interested in anything else happening.

Of course, such a person is a liability. He's a Keyed-Out Clear.

Well, now, how do you put such a person back together again? He's been cleared on Routine 3, and we're going to clear him on 3D. What is going to happen in the process of doing this?

His first goal, you take a piece of paper ... This is the way you do it. I'll just give it to you exactly as I would do it. You take a piece of paper, and you write down his first goal found, and you write down the first terminal found. And you write down the second goal found, and you write down the second terminal found. And you write down any other terminal or goal that was found in the process of cleaning up this case. And you write them all down on the same sheet of paper. You get the rudiments in with a crash. And then you find the modifier to the first goal that is a likely specimen. And if the following, right after this, doesn't happen by reason of having found the modifier, then you take another goal that has been found in the clearing, and you find the modifier of it. And you find the modifiers and repeat modifiers until you've got a nice, sticky, collapsed bank.
And then you check out everything that has been run on the pc until you've got five or six pieces. And then you assemble your 3D package, and that's really all there is to it. Because, of course, the first time they found a goal on him, they probably found his goal. Who knows? The first terminal, if he went Clear, was undoubtedly his terminal. Otherwise, he wouldn't have gone Clear on it.

But the next goal found was very probably his oppgoal or something of the sort. The next terminal was possibly the oppterm, and we don't know what was found from that point on, don't you see? It got keyed out enough so that he could actually run the oppterm off at a far distance and key it out, too.

What you want to assume is, in straightening out a Routine 3 Clear, is that all parts have already been found except the modifiers. So your main task and your main difficulty is getting the needle to slow down and read any and do anything. That's your main difficulty, is getting a needle read. And you do that by finding modifiers.

And they will cheerily give you this modifier or they may not so cheerily give you this modifier. And if you haven't got any slowdown on the needle for that modifier, well, let's take the next goal or some other goal that was found on him because usually several goals were found on him and several terminals. Let's find a modifier to that goal and a modifier to the next goal and a modifier to the next goal until we just slow that thing down to mud.

Then they say, "But that beautiful needle. It was so floating clear and I felt so good. Damn you." You know?

And you say, "That's fine. Thank you very much. It will all come out all right in the end."

Say something platitudinous and hold him in the chair, and you've got a needle that will read again. That's your main problem is getting the needle to read. Now, you've got the thing reading, now take all the parts you've got and assemble the 3D package out of those parts. And you do that, of course, by just checking them across until you get five things that equal read, and so on. And then you find out which he was. And you do a problems solving survey as to how they would solve problems, and this one, you and the oppterm, and you eventually select out your – what would probably be your terminal, and you look for your other indicators. And then you just clank into it and run it.

Now, if you're lucky enough to have all of their records available, you also run that terminal on the first level it was ever run on, but with the commands of 7 December 61. You rerun all the levels ever found on it, too. In fact, your work has all been done for you actually, if you know how to do it right.

Now, you do the same thing in a patch-up of a Routine 3.

This fellow has been running forever on his first goal and first terminal. Well, assume it's probably the oppterm. See, otherwise – otherwise, he wouldn't have run forever, don't you see? So just assume it was. And you'll probably be right, see? It's already been tested by run. Oh, it hadn't done him any harm.
You'll find when you get the Goals Problem Mass, it cleans up faster because it's full of Swiss cheese holes already, you see.

All right. Now, he's also conditioned into running it. Nothing can faze him now. Use that, find the other parts of the 3D package from the first part.

But let me tell you now something about the importance of the modifier. Now, the modifier isn't just found for the hell of it. You will eventually use the modifier. As a matter of fact, I've got a package of commands right now where the modifier is used as one of the commands, and so forth. It hasn't been tested out, and so on, but there are a lot of possible uses for the modifier. But this is for sure the use of the modifier.

You can accurately find your pc's terminal if you've got a modifier because it limits the number of terminals. The modifier – the presence of a modifier tends to limit the number of terminals which follow those exact specifications to the pc. Otherwise, you could have a list of a thousand terminals.

If you have the pc's goal and modifier, you have a list of maybe only ten or twenty, if it's the right modifier, and so forth.

Well now, that's assessment use of the modifier. The next use of the modifier is also in assessment, which is this: If you have the pc's modifier, you must realize that you have in your lap a description of the pc in-session every time the rudiments go out. This totally describes the pc in-session.

Now, if it's a raving mad modifier, you know – "and I'll kill everybody – and I will attack and kill everybody in sight" – let's say that was the modifier. Of course, you are the auditor, and every time you have thrown the rudiments out, he has, of course, instantly attacked and killed everybody or tried to, see? Verbally. True it's only verbal because it now is no longer sufficiently hidden to do it in fact, see? Indifferently in view, one of these 3D parts won't really get well dramatized. But that was his behavior in session.

All right. Supposing you had a pc with a modifier – "I'll cry and cry until they let me have my own way." Wouldn't that be marvelous? You'd have a pc that was always in grief. If the rudiments went out, the pc would go into grief.

Pc comes in with a present time problem, you don't take it up or clean it up, the pc cries. You think you're running a grief charge. You're not running a grief charge. You're running a modifier.

And you could take this up forever because the only thing that'll discharge the modifier is the Goals Problem Mass itself, but that means a whole 3D run. And you're going to run that on a present time problem? Oh, no, you're not.

So the pc... There's the basic rule of this. Now, why? The modifier is that part of the 3D package which dictates reaction to failure. This is how he's going to get even. This is how he's going to react if he fails. This is his conduct in case the goal won't stick. If the goal won't stick ... See, if he can't make the goal stick, he makes the modifier stick.

Now, he doesn't so much dramatize his goals. He dramatizes this modifier. The modifier, if you noticed on assessment, was much more deeply buried than the goal and therefore
much more dramatizable. So if your pc's modifier is "and I'll go straight up in the air and ..." It doesn't matter what it is. The pc is going to do something that approximates that modifier. And suppose it's something on the subject of "and if they don't do it I will just get up and leave and show them." And you'll have a pc that will blow session, walk to the door, show you something, and go out. [laughter] Every time.

And you could actually detect the pc's modifier, but it would be a wild thing to try to get it, and it's no type of assessment, but I'm just showing you the longbow. You could certainly make a good guesstimate of a pc's modifier as to his session conduct. This is the way it happens in session. If the rudiments go out, this is what he does. Therefore, his modifier is: ...

See, you could just say those things just one, two, three.

Well, the misemotionalness of the pc on this subject or the upset of the pc is simply not having been able to make any progress on the thing. And he feels that he's been handed a failure, and he conceives himself up against an enemy. You at that moment are the oppterm no matter what his oppterm is. He's got you identified with it. And he will even in his speech – you can sometimes weed out some of the wild statements pcs make, actually make very good sense after you know their oppterm or their terminal or something. It just makes very good sense. You know exactly what they were talking about now.

"And you can put that in a pot and boil it," you see. "You'd be pretty good at pressing my pants, but you certainly wouldn't be any good" – he's saying this to a male auditor, you see – "you certainly wouldn't be any good at auditing me."

You know, if you had records of all this, you could almost guess at the fellow's oppterm, you see. Oppterm possibly wife or something like this. It'll be some conduct – or cook or something, see.

It's very interesting that session conduct is based on the 3D mass. You'll get very good reality on this. And then you'll get good reality on how this 3D has influenced the fellow's life if even in an auditing session he dramatizes parts of it even after they've been found. Well, that is quite remarkable. That is very remarkable. So the modifier is very valuable to know in an assessment because you can always make the meter read if you can get the modifier repeated.

Now, this is very cute. Now, I give you this weapon with some diffidence because somebody, sooner or later, is still going to shortcut the weapon. He's just going to use the weapon, not get the rudiments in and then use the weapon, you know? You can make anybody's needle read if you know the modifier and if it's the right modifier.

The reason ARC breaks don't register on the E-Meter is that an out rudiments cause the modifier to go into action which then, if it has a denyer, a comm lag, a bouncer, a down bouncer, or anything of the sort, is dramatized by the pc, and he leaves the zone of attention, so nothing said to him after that registers on the meter. And that's the exact mechanic of an E-Meter not registering on a pc. And that's the only instance where an E-Meter doesn't register on the pc is when the modifier goes into action. Well, the modifier goes into action because the rudiments go out. So the rudiments go out, so the pc has been handed a failure.
There is a failure in life. What is a denumerator to the beginning rudiments of a session. Failure in life. Failure at the project that he's working on. Isn't that right?

Auditor's supposed to be auditing him, and instead of that, why, they're talking about something else, you see. And he's supposed to be getting an assessment, and they're doing something else. And he comes into the session and he has a PTP, but the PTP has to be run, and you have to handle the PTP, and you can't help but handle the PTP, and you would be shot if you didn't handle the PTP, but it is an ARC break if you do so because he wants to get auditing

All right. So you go ahead and handle it, and all of a sudden you – you handle it. You handle it all right, but for some reason or other, the thing just disappears, and then the lists are kind of null. And nothing assesses out on the lists. What's this? Well, you didn't handle it all the way. You handled it only up to the point where it kicked in the modifier. And the modifier has now kicked in in its full action, and so the meter doesn't register because the modifier is alive, and that's all you can say about it. Very amusing.

Now, let's give it much more succinctly, you see. The modifier is "I'll leave." Pc has an ARC break, you ask him if he has an ARC break, the needle doesn't register. Why doesn't it register? He's left. Remember you're auditing a theten. You're not auditing a body. This would absolutely amaze a psychologist because, of course, the person is still in the chair. Oh, are they?

Now, a modifier can reactivate the bank in such a way as not-know anything which is a method of leaving knowingness. And actually a modifier can influence the reactive mind. And it can actually influence the E-Meter which is really fantastic. But you would expect things like this if you were handling the package, which if cleared up would clear somebody, or which the person has – which does explain their behavior, sicknesses, and everything else. If all of these things are explicable by the package, of course, everything else is explicable by the package such as their electronic pattern reaction.

Now, a pc who goes out of contact with the body whether by more deeply interiorizing into it, leaving the epicenters, departing from it to a point of nullness in the head, just sort of giving up and going blank – we don't care what – you'll get no activation of the whole reactive bank, which is pretty terrific, to show you the value of the modifier.

So his "I'll leave and never find out about it," let's take a modifier like that. Now, that's really nice, isn't it? It's got a bouncer, and it's got a denyer connected with it, and your meter will go null on it.

So the rudiments are out? So the favorite check for rudiments in of course is to check a 3D item. You want to know if the rudiments are in, check a 3D item. Say his terminal to him twice. Say his terminal to him. "Snail, snail." Got a reaction. Fine. Rudiments are in. That's elementary, isn't it?

So if you really were alert in a session, you'd say, "Well, all right. We'll begin the session now and so on and so on. Everything fine," And go through your ARC break routine. You know, I mean, "Talk to me." "Snail, snail. All right." And no reaction.
Oh, well, brother, let's roll up our sleeves. There's no run today. This kind of an attitude, you see. Let's get this thing back in action. Let's get the rudiments in.

But "snail" reacted? One of the parts of – it's any part of the 3D package, you see. The oppterm, anything. All right. Kick, kick. So you hit the next part of the rudiments, brrrrt, hit the next part of the rudiments, brrrrt, next part. Now, run your bracket commands. Here we go. See, you're to it within a minute. Within a minute after you find the terminal is reading, you should be auditing, because the rudiments aren't out. They're in. You hardly even have to watch the meter to see if you got a knock on the thing.

The thing is sufficiently in to run, so run it. Don't waste any time with it.

But "snail" didn't register. Oh. Let's say you were assessing, and this catastrophe occurred. And you did have a part. You had already found the oppterm, so you said to him – this was a snail, you know – and you said, "Snail, snail."

Well, now, let's go to work and find the ARC break and find the havingness situation, and let's find the present time problem, and let's get it all squared around. And let's see if we get a read that way. If we do, we're good. Pat ourselves on the back. We're pretty good. We're pretty good. Because we got the rudiments in, in spite of the modifier which we know very well was kicked in.

And if we don't have the modifier yet, we better look for it. We better get the goal and get the modifier. Old 3A style if this kind of – if this is the kind of assessment that is going on. Let's get the modifier as soon as we possibly can get the modifier before we monkey with anything else, because it's going to take us forever to get other things.

And after we've got the modifier, we're looking for the oppterm. Or we're looking for the terminal, let's say. And we're looking for the terminal, so we say – we've got the oppterm – "Snail, snail." No read.

But we found the modifier which was "and get the hell out of here." So we say, "Snail, snail." No reaction. No read. Let's get the rudiments in as very best as we can. Let's take it up. Let's get the pc willing to talk to us. Let's get all the rudiments in and then let's throw him a real curve.

And let's say to him, "And get the hell out of here. Thank you. And get the hell out of here. Thank you. And get the hell out of here. Thank you. And get the hell out of here. Thank you." Your needle will be reading. Elementary, my dear Watson. You kick out the bouncer.

But remember the bouncer won't kick out if your rudiments are out. If the rudiments are severely out, you've actually got to get the rudiments in before you can kick the bouncer out. But it's just that last little touch that brings the needle back to a hot read.

Now, let's say we're assessing very well, and we've just had a beautiful mark here, and this one was live, and this one was live, and this one was live, and they were all live.

And we go back over the top of the list again. It was only ten items we got there, and that's awful easy and we go over the top of this thing again. And we say, "Snail, waterbuck, izzard." Whatever it is, you know. And wait a minute. There were two of them there alive and they're now null. And then we say, "Lion. Tiger. Waterbuck." They're still all null. Well, we
either have the thing, and we've either knocked it in so we finish the rest of the list. And if they all went null, well, it either isn't on the list or the meter's gone null. But any time you think the meter's gone null, quote a known, tested part of the package.

You already found the oppterm? All right. "Tiger. Tiger. Tiger, tiger." You get a kick? Rudiments are in. No kick? Oh, well, here we go. And if we were reading along nulling list and we just didn't have time to clean up rudiments, we would be tempted, of course, to say to the pc, "And get the hell out of here. And get the hell out of here. And get the hell out of here. And get the hell out of here." Kick, see. "And get the hell out of here." Needle kick. Finish the rest of the list. Crude but effective. Best thing to do is to get the rudiments in and then do it. But this is why people's needles go null. And that is an important piece of technology for you, a auditor. Very important.

I think you will find this bears out very, very well, bears out extremely well over a long period. The trick is, do you have the right modifier. Now, if you've got the oppgoal and you're calling it the pc's goal, and you get a modifier to the oppgoal, and then nothing happens with this trick, it's the oppgoal. There is probably something wrong with it there. Because it doesn't have the effect on the pc. And you could usually prove out a modifier: Is this what the pc does when he has an ARC break in session? That kind of proves out the modifier. Does the pc show any shadow of this? Is there anything like this around?

All right. Well, that is the way you patch 'em up when you've already got 'em, you got parts of it. But your interest on the thing is to keep a person who has started in with Scientology and into auditing going. And the best way to keep him going at this stage of the game and today is, of course, to tell him the truth. Tell him where he'll wind up and where he's got to go.

And you'll find people will believe the truth if it's the truth. Not to kid him along or cajole him along. Just make a good statement of where they're going, and what they'll probably go through and what will probably happen to them, and what probably they will – and how they will wind up. Give them some kind of a notion of this.

They get a reality on that because it is the truth. That's the most reason they get a reality on it. And you'll find that trying to soften the track for a person, trying to soften it all up and say, "Well, it isn't very tough, and there isn't very anything. It's very easy, and all you have to do is push button A and then you get button B, and so forth. All you've got to do is this and this and this. And that's very simple. There's nothing much to it. That's all."

You give him a lose. You better tell them the truth in the first place.

The truth about Scientology today includes this interesting fact. Johannes Q. Glip comes in his wheelchair into the front of the Central Organization, and he says, "Well, I don't know. That last auditing wasn't any good. I still have the pain in my head."

A truthful auditor would say, "What was your last auditing?"

"Well, I was being security checked, and I had a Problems Intensive, and that should have taken care of the whole thing"
Tell him cruelly but very truthfully, "That somatic in your head? That isn't going to clean up until you're Clear. We can make it less. We can make it more comfortable, but it will turn up higher than that before you're Clear. Only one known way to take it away forever, and that's to clear you. There isn't any way else. We can key it out, but we can't guarantee that it will stay out. It could go out and go in. We can make you feel happier. We can make you feel better. We can get you over having an itchy tip to your nose, or something like this. But you're worried about basic and fundamental problems such as weight, worried about problems such as migraine headaches. We can key these things out. We can make you feel much better, but it'll probably turn on again before you're Clear. And the only time it'll ever turn off is after you've gone through the Goals Problem Mass."

They'll say, "What's that?"

"Oh, well, that's what you go through that you would feel many times while going through it that you would be better off dead. And it's probably true."

You needn't be quite so cruel, but you could err on the side, "Well, it's very simple, and there's nothing to it."

Then the person's expectancy isn't up to what he meets.

The Goals Problem Mass gives you many interesting phenomena. The story of the amount of phenomena which turns on during a Goals Problem Mass is a long story. There are many weird phenomena, such as when you're running pictures and engrams, of course, you're supposed to sit there seeing pictures and engrams. And the person running the Goals Problem Mass doesn't see enough pictures to put in your eye on the first dozen levels.

And then he keeps telling you, "Well, I don't get any pictures," and then you find out he's been getting entirely different pictures on his last two levels than he ever got before, but he can't see them very well. And he's giving you the same problem over and over and over on question one. It's always the same problem no matter what he is running. It's always the same problem. And after you've run fifteen levels, he all of a sudden comes up with a different problem. Well, what do you know? You've had a change.

And these black masses all of a sudden turn into pictures, and different parts of the track suddenly start appearing that you've never seen before. Various tricks of mass, cold waves, somatics, pains in back, various other types of things that turn on – all quite standard. And I'd say to this degree that if they're absent, there isn't anything happening.

But actually the phenomena of all of this is quite a story in itself. I could talk for quite a while on just the phenomena connected, and sensations and that sort of thing, with Clearing, and those indicators.

That wasn't what I've been trying to tell you about in this lecture. I've been trying to tell you the person's general reaction and pattern and ways and means of steering it off or anticipating it while they were going through from the first contact with Scientology and through Clear. And I hope I've given you a little data on this which can help you and possibly, in looking at yourself, you get a better reality on what people are going through.
And people going through this line, if you understand what they are going through, will have a great deal more confidence in you because you're telling them the truth rather than patting them on the back, and so forth.

Don't ever try to lighten it up. Play it on the other side if you have to. Don't rave about it and scare them to death. Every once in a while you have a pc sit down in the auditing chair. And he's very worried. He hasn't got all of his Goals Problem Mass yet. And he's auditing somebody on it, and then he comes around and starts to go through it himself, and he gets apprehensive.

Or he has had no familiarity with it, and he gets his whole package, and he thinks everything is fine, and then he is almost eaten up with apprehension about it. He doesn't quite know what the devil he's going to run into next. He expects everything will happen at once. He's usually quite disappointed that it takes many levels before very much happens.

His somatics are slow and painful and crummy, and he gets up in the morning, and he looks in the mirror, and he looks like the same person. Trouble is he can't look in the mirror on Day 1 and Day 10 as a consecutive look, see? If he did that, he would see a difference. But instead of that he looks on Day 3 and Day 4. He looks no different that he can tell. Same hollow-eyed, baggy, his own old self. [laughter] But the expectancy is quite high, and what is viewed is this and it's that.

But you're on a road which the further you advance on it the better reality you get on it. There isn't any question in your mind but what you are going someplace, and that something is happening, and so on.

And then, of course, there's those four levels where all cognitions turned off. Not a single cognition for four consecutive levels. You didn't even think of a thing, after absolutely just thinking your brains out for several levels, marvelous, you know, marvelous. Then four levels just plug, plug, plug, and then nothing happened. And then all of a sudden on the fifth level, why, it's all cognitions again, you see. And it's all different.

Change is the main thing. Does the person change as he goes along? Does he make gradual progress forward? My greatest test for whether or not the person is on the right road: Are they looking better and feeling worse? [laughter, laughs] If they're looking worse and feeling better, I get suspicious. We must be running the wrong side.

No kidding, though. Appearance to me is my best test because I'm pretty good at observation. I can usually look at a person and tell them they're running the right side or the wrong side. And then they expect me to give them fancy reasons why, so I fool them, I tell them.

I tell them some reasons why, but it was because I looked at them. That's why.

I say, "Uh-uh. Uh-uh. Uh-uh. No, no, no, no. No pc of mine ever developed a brilliant green skin." [laughter]

Well, anyhow, that's the way it goes, and that's the anticipatory line, and you yourself add a great deal of subjective reality to this particular item and these various items. But it's a road which is now a pretty well plotted road and which I hope many can travel. It's not a sim-
ple road. It requires much greater technical skill than we have ever before had to deliver and much upgraded from anything we ever had thought necessary.

Well, it just makes it tougher on the auditor. It just makes it necessary to do more teaching. It makes it necessary for all of us to be more careful as to who uses it. What audits it. What audits what. You got the idea? And that we get this thing lined up and get its ethical level fairly high, and stamp like mad on illegal uses that will louse up people – which they can easily do with these processes, and we just have to be more alert to that – and we'll all make it one of these days, I think. You're teaching me that everyday, for which I thank you.

Thank you.
I think that was a very good way to start this thing. Hurry up and get your Class IIs. In fact, some of you could even get your Class Is. [laughter] I won't say that. I shouldn't say that. That's cruel. Actually, I don't feel that way at all.

Now, I've practiced enough for the Washington Congress, so I'll sit down. 20 Dec., AD 11. Shortly be AD 12. Time marches on.

Now, I told you everything there is to know, and there's nothing new that you don't know, and you've got it all taped now and straight, and you're right up there.

Now, the dynamic principle of existence – I'll tell you some data you're not familiar with – the dynamic principle of existence is survive. The cycle of action is create-survive-destroy. Axiom 1 is ...

[laughs]

Now, a lot of things come up in running of 3D and the handling of 3D, and the first and foremost thing that shows up on the handling of 3D is the lack of basic skill. That is the first thing that will startle you. And therefore, I'm going to talk to you today about the handling of groups and the training of auditors in an area, the handling of auditors in Central Organizations, and so forth. In other words, upgrading auditing. And that would be, I suppose, an appropriate title of this lecture – is "Upgrading Auditing."

Now, the first thing we have to realize is that most people have a considerable diffidence about tampering with the human mind. This is the overall majority of Homo sap today, is oppressed by a feeling that he must not inquire into the other fellow's wits. This effectively keeps him imprisoned and in the bird cage.

No better mechanism could possibly be devised to keep a race enslaved than: "One must not tamper with anybody else's thinkingness."

In other words, take no responsibility for anybody's thinkingness but your own and take no responsibility for that, and then you will nicely stay in every implant you have ever been handed. And all of your now-I'm-supposed-to's can be counted on to function and particularly, and may I give you a little slice of galactic council thinking, then and only then can you be absolutely sure that no revolt or menace will ever come out of a planet. If you can make these things stick, then no planet will ever give you any trouble. They will be in constant trouble themselves and they will be in a horrible mess, but no threat will ever come from one.

This is the principle of the boxer. It's thinking of this type: If your opponent is knocked out and sprawled on the floor – you don't want to be guilty of murder, you see, so he should be breathing faintly – but he's perfectly safe, isn't he? He's perfectly safe. I mean, that's
a condition to have an opponent in. Except for this: there's no fight, there'll be no gate, and there'll be nothing if that is all that ever happened. No game is extant.

Galactic council reasoning – and by that term I don't mean some great hierarchy which ruleth this parteth of the universeth; I simply mean the supergovernments which do exist and which come into existence and which fade away and which do carry, on the whole track, the most powerful monitoring effect upon civilizations, because their civilizations are done by slide rule. It's a slide rule civilization. They just figure it all out, and "This is how nobody will ever give you any trouble," is one of their main things.

When thetans have battered themselves up to this particular status, that is to say they have banged their way up the line, they finally made it stick on the basis of space fleets and planets and confederations and crisscrosses and that sort of thing, they are, of course, at the mockery of a no-games condition. They're not in a no-games condition at the top end of the scale, they're in a no-games condition at the bottom end of the scale. And they don't want any game.

So their idea of the perfect game is they sit there and know all about it, and nothing ever happens, and they can be absolutely content that everything is going to be just fine throughout the entirety of the empire. Which is to say, things will be barely breathing, and nobody will ever get out of the hoosegow.

Now, when you've got populations which are in essence concentration camped, you have, of course, an ideal situation from one viewpoint – the viewpoint of somebody who doesn't want any game.

Now, Hitler didn't have any trouble with a large section of his population. He just put them all in concentration camps and that was it. And it's that kind of a game if you want to look at it. It's not the game of government and who will we elect and democracy über alles, or something – it's not all that kind of a government. It's just the kind of a government, "Well, there they are nicely out of the running. Everybody is out of the running; isn't that nice. And things are just barely ticking over, and we're not going to be troubled by those fellows from the 18th Panzer Division that put up such a hell of a fight on Exnoo. We're not going to be troubled with them anymore because we got them implanted very nicely, and they've all been sent down to Earth, and the mores of the society there will take care of everything. And they will never be in circulation again as space jockeys." It's that kind of thinking, you see?

"We got everybody in jail, so now we're all set." I might as well level with you on this kind of an action, because it's something that I happen to be an expert on.

Now, what would you do if you wanted to create that kind of a condition? The first thing that you would do would, of course, be to never let anybody monkey with anybody's mind. You have psychiatrists. Ah, ha-ha, they're the boys! Ha-ha-ha, yeah. All they'll do is implant people further. All they'll do is immobilize, immobilize, immobilize, don't you see?

But if you put this in as a kind of a stable datum along the line, that it was all secret and private and one's thinking should never be invaded and so forth, then you can be absolutely sure nobody will ever as-is anything and throw a monkey wrench in the works.
You won't ever have the captain of the 28th Panzer Division suddenly appearing again saying, "What the hell do you mean doing this to my men," you know? He won't cause any trouble. I mean it's just, you know, quiet now.

And this sort of a graveyard peace is a highly desirable thing, and if you want to know what thinking is on a galactic government basis, that is the pattern thinking. A graveyard quiet.

So little gimmicks of this character are considered rather valuable. And one of those gimmicks is to never let anybody ever interfere with anybody else's rights. Rights. That's the keynote. That is the way you get the thetan to accept it.

You get the guy to get the idea that he has rights and that these rights are the rights of privacy. And then having worked it out so the rights of privacy are paramount to all other rights, you have, of course, created a concentration camp.

So now the auditor is going up against this particular gimmick. And very often when you're training auditors, some have it worse than others.

Now, how does it get worse in some people than others? Well, they're withholding their terminals. They have a terminal and they have an opposition terminal and they're withholding both, because they've been thoroughly punished for ever having been it. So they know that the safe thing to do in order to contribute to the graveyard peace, is to withhold their terminal.

See, first there's the vari- the mechanism that one has rights of privacy and rights of never being interfered with and that one must never invade anybody's rights in privacy. And we've got it all set, then nothing will ever be done on any planet concerning a resolution of the problems of life. Because nobody ever dares look in anybody else's mind to find out why – what makes it tick? Don't you see?

It's no accident that 50,000 years on this particular planet have gone by without anybody even coming close to sniffing at the edge of Scientology. That's not an accident. Of course, it's remarkable to do this, and I'm perfectly willing to share any credit given in this particular line, but I must reduce the credit by this degree, by this degree; is that I happen to be peculiarly skilled along in certain lines of control and so forth, and mechanisms.

In other words, a lot of time has been invested in me, here and there in this universe, and I've had my share of all this, so somebody tells me, you see, something like this, like well, "You mustn't, you know, invade privacy, and it's all for the best, and a graveyard peace is the very best possible thing and if you just keep everybody in a concentration camp for the next billion years, then everybody's going to be happy, you see, and nobody will be troubled at headquarters."

Somebody tells me all these things and I say, "Ha. Now, let's turn to page 2 of the rule book."

So that doesn't make much of an impression on me. My credit in this particular line happens to be reduced by just that degree because I have no respect for these rule books. I
think that – I think a prisoner always has a right to revolt. Always. I'll stake my bottom krop- 

tnick on the thing, see.

I mean, if I myself were running a military prison someplace or another and it had a 
hundred thousand inmates and so forth, and somebody'd snarl around about "those damn pris- 
oners, do you know they're liable to kick up a revolt at any moment?" I would be surprised at 
him for thinking that anything else could happen. A prisoner has a perfect right to revolt.

A slave has a perfect right to strike off his chains, because by essence these are living 
beings. And some people are close enough to the edge of that thinking that they say, "Well, 
that's correct. That's correct. People have a right to be free. That is a right they do have and I 
agree with that right."

I don't agree with the right that the privacy of the deepest-dyed criminal should be pro- 
tected by all the forces of the state from invasion. I don't believe in that. I believe that if a 
fellow means to shove a dirk into his fellow man at any given instant and he wishes to remain 
very private so that he can cut throats at will and unexpectedly, I believe that this fellow's 
privacy is the privacy we should invade.

But all galactic thinking along this particular line runs in the basis of, "Well, the way 
to do this is you put him in the electric machine. And you put the handle down to full blast. 
And you give him a nice mass to worry about, and because this fellow has done things like 
that to other people, why, the motivator-overt sequence takes place at once, and the way you 
handle a criminal is to make a piece of MEST out of him, and then don't invade his privacy."

Well, this thinking is perfectly all right, too. Nobody's being too critical of this, except 
that is the most unsuccessful thinking that has ever been thought in this universe. You never 
are able to guarantee utterly that the archcriminal is going to remain a piece of MEST. Fur- 
thermore, this other hole exists in galactic thinking, is you can never guarantee that a planet 
will not revolt. You can never guarantee that wisdom will not get abroad. This cannot be 
guaranteed.

And the only thing that you can guarantee and find any future success in, and so on, is 
this: Man or thetans are basically good and they get all mixed up, and when you unmix them, 
they revert to being good. That is a piece of thinking which is probably not even well known 
in galactic council lines. Because they don't like to believe in it because it makes everything 
so active.

Everybody gets so active, you know? People start thinking for themselves. They stop 
being utterly dependent upon a proclamation put on the side of the post office to know which 
bread they're supposed to cook on Tuesday. And so therefore, although these truths probably 
are not unknown to them, although I don't know that these truths are known to them – the 
basic intent of man and so forth – I don't know that these things are known at all. I think they 
possibly are quite original as a discovery. But that type of thinking that would make slaves 
only guarantees one thing: a miserable mess. That type of thinking which brands every man a 
criminal and says all intentions are bad has an end product of a mess. These are types of 
thinking which do not make people happy.
Now, you could stand by to be able to confront a great deal of action. You start clearing somebody, one of the things you'll be struck by – as I've told you in earlier lectures – one of the things you'll be struck by is the person goes into motion. Not hectic, agitated, undirected motion. No, but very effective motion, and he doesn't happen to realize that he is moving faster and that's one of the peculiarities of case advances.

It's only now and then that you suddenly will realize that you are moving faster than you were. You're doing things more quickly. You walk a block more quickly. You don't consider it's quite as far from here to the post office and back as you did. These are the types of advances which means greater motion and greater movement.

But in view of the fact that that is regularized movement, in view of the fact that it is controlled movement, it is infinitely preferable to uncontrolled movement because movement in the vicinity where everybody is crazy is movement which is never controlled. It is better to have more motion, in my thinkingness, which is controlled by the individual creating it, than to have random motion controlled by nobody.

Now, you can say that's just a matter of personal preference. I can hear it now. I can hear it now across some council table someplace or another. "Well, now, I don't know, ah, I don't know about that. That's just, that's just your idealism. It's never worked. Never worked. Well, just look at it right now. Take system and system and system and system so on and so on, and here's 809,642 million systems and they're all working very, very well on the subject of slavery, and you come along and you want to introduce a wild idea like this. These people, I mean they're getting along all right, and they're just going to pieces routinely, and well, I mean they're – they have hospitals to care for them if they're sick. So if they're sick a lot, why, that's tough. They've still got hospitals to care for them. We're taking care of all these things. Now here you are, here you are espousing this type of idealism which would upset things. It would upset things."

Of course, I can hear the argument that would ensue. Nobody'd win that argument by the way. Neither side would win because where all power is vested on a now-I'm-supposed-to, you're not about to shake those now-I'm-supposed-to's. Don't try to sell the rulers of the universe on the basis of "all they have to do is change it all," because the first thing they would lose would be their own power. They would lose their total dictatorialness, you see.

Yet their power is artificially upheld. Artificially to such a degree that it isn't power at all, and they don't even dare exert it anymore. This is interesting, you see, but these are viewpoints. You're in the field of viewpoint and speculation when you're on the field of the basic ingredient of man.

But you yourselves can observe this. And you could observe that those people who are not quite spun in and who are not quite enslaved are fairly willing, once you set their heads to it, to invade the privacy of another human being because they're not totally mired into the other philosophy. And the other philosophy is, of course, "Now if we just sit very quietly and never ask any questions, why, nobody's going to wipe us out with a spaceship." You see? It's all prevented action. All that type of thinkingness.

"Well, everything is going along just fine." You see war raging, you know. Millions of men being killed, you know, and everything being blown up, and planet becoming a desert,
where everybody – death – death, and nobody's going to be left, and the planet's going to be a billiard ball, all that sort of thing. But they say, "Now, if I just sit here quietly, everything will be all right." You always can go into a belly laugh over that kind of thinkingness, you know? Because he's the first guy that gets shot because it's rigged that way. See, he's the fellow that would have naturally enough overt to receive all the motivators.

Well, your auditors fall into three generalized classifications. One is the fairly free individual who hasn't taken his terminal too heavily, and so forth. And he hasn't totally subscribed to the idea that his natural lot is that of a slave and a dust mote floating unimportantly through the universe. He hasn't quite subscribed to all this philosophy, you see. And you can count on this fellow charging into a case and doing something.

Then you get your next grade. Your next grade is the person who intellectually can recognize that it would be all right for him to invade the privacy of others, and that the only way he could ever set them free is that this sort of thing did occur, but who has a terminal which is peculiarly worded and composed so as to make him withhold it violently. And if he's withholding this terminal very hard, you'll have a hard time getting this person up to Class II.

He's a person who is intellectually in agreement with the fact that man could be freer, and it'd be better to make men freer, and so on. He can intellectually agree to that, but his own terminal gets in his road. His terminal is peculiarly composed so that he has to withhold it hard. It appears to him to be a dangerous terminal. The reason he's withholding his terminal, by the way, it practically proves this theory that man is basically good. It's the best proof of it as an examination of how a person handles his own terminal.

He'll hold it out of action which is, by the way, what makes it go into action. But he's trying to withhold it, see? He's trying to withhold this terminal.

Sometimes when you're trying to run an assessment list on somebody who has one of these difficult packages that's given him a lot of trouble – a difficult 3D package, you see – and you're running down the line and all of a sudden the thing goes null. He's got it ARC broke up in some peculiar way so he'll withhold the terminal because he's actually afraid of releasing the terminal. That is why he does it.

Now, if you had an idea of what his terminal was – just to give you a broad view of this, not this modifier trick which is a perfectly valid trick – but if you had an idea of what his terminal was, just ask him why he should withhold a woman killer – let's say this is his terminal, see – why he should withhold a woman killer from this session. And he'll all of a sudden wake up to the fact that he's doing it, and your needle would read again.

So you can actually turn a read back on if you happen to know the fellow's own terminal. Because what is he doing. He's withholding a woman killer. You're a woman, and you're auditing him. You give him an ARC break, although hell dramatize his modifier, if that terminal is something like a woman killer, he's actually scared stiff that he'll kill you. There's not the slightest possibility of his ever doing so, but just the hint that he might get mad at you causes him to withhold the terminal so hard that everything goes null.

Withhold of the terminal is the key to a 3D package. That is why the package disappears out of sight. Withhold of the terminal. A violent withhold of the terminal. It is quite
remarkable how thoroughly the terminal can be withheld. That you can get to it at all and that
an E-Meter can find it is fantastic. Don't be taken in by somebody saying, "Oh, well. That's
very easy. All you have to do is so and so." Because it isn't. It isn't at all. Because this is the
one thing the fellow was withholding most.

And you have trouble getting withholds off pc A when pc B, you see, is running quite
easily. You can get his withholds off very easily. But pc A, oh, man, do you have to get down
and sweat. You know, the sweat is dropping off of your brow and splashing on the E-Meter
glass. And you're trying to pull a withhold on this guy, and the fellow squirms, and he goes
through misery about the whole thing, you know, and ooooh, you know, "Whew, I don't know
if I better tell you or not."

And then finally why he braves up to it, and you find out that he used two cubes of
sugar instead of one in his tea this morning, which is a departure, you see, and the landlady
has already told him that he had better use less sugar, and it's a big overt.

You look for another overt. No, there isn't any other overt. It's just that what he does
withhold, he withholds so solidly, you see, he just withholds this, he clutches it to his bosom.
Why?

Well, of course the degree of withhold is the key to the degree of withhold of the ter-
minus from action. They are a direct coordination.

So your second class of auditor is intellectually as himself, independent of the 3D
package, and there is some of that showing always – except in the booby hatch. There's where
a 3D package is in total – you've got a condition of a person whose withholds are so hard and
thorough that he believes that nobody should invade that because he's got to withhold it. So
therefore, he is very chary of ever invading anybody else on the subject of withholds.

And you'll get some fellow who will sit there, and he'll say, "Oh, you thought an un-
kind thought. Oh, somebody else thought an unkind thought. Oh, isn't that nice? Somebody
else, ooooh, that was a close one. Well, we'll buy that one. Somebody else thought an unkind
thought. Well, that's good. Well, I certainly got a lot of withholds off that case in this session.
He thought unkind thoughts about other people thinking unkind thoughts. And we got the
unkind thoughts of his Aunt Bessie and his Uncle Bill, and we got the unkind thoughts of his
instructor about him, and we sure got a lot of ground covered in this session."

You just look down the list – he didn't get off a single withhold. He just wouldn't do it.
Now you've got your galactic thinking keyed in here, you see, whereby we shouldn't invade
anybody else's privacy, you know, it's very hard. Except he really thinks intellectually that he
should, you see? And he'll say to you, "I – I – I but I meant to get in there, you see, but I – I –
I – I – I I meant to ask, you see, and I know ... I know it's right, and I know what you're sup-
posed to do, and so forth. And next session I'll do much better."

And next session he sits there, and he says, "Well, all right. Now, did your Uncle Bill
think any unkind thoughts?", you know.

And he says, "No, that isn't right, no it isn't," and he'll just grit his teeth, and grit his
teeth, and he'll finally say, "What have you done?"
And he notices the E-Meter doesn't blow up, and he notices that the pc does tell him something and he gradually comes through this even though he's got a hell of a terminal package he's withholding, you see? You can educate him past the line. That's the second class.

And your third class of person – this is not classes of auditors. Your third class of person. Man, he is just so mired down in that withholds package, the terminal is so lost below withholds, he's so keyed-in on the basis of must never invade anybody's privacy, and so forth, that he could only be audited. He could only be audited. You just never would crack through the barrier.

Now, this is a pretty wild kind of gent. This would be somebody that you – probably never walk into your co-audits, you see. He does form a large percentage of the human race, however. Just because he never walks into your co-audit does not mean, you see, that he doesn't exist. You'll find him, and you're liable to find him in civil positions. Isn't that strange? I think that's very weird. Of course, he's bought galactic council-type thinking, you see, and it tends to make him part of the boys. It's quite interesting.

You listen to some of the political bigwigs of the world raving around and it always gives to me to laugh.

Anyway, there's three classes, three generalized classes of people. One, the first fellow, you'll teach him, or if it's a girl, you'll teach her very easily. She gets in there, and she gets off withholds, brrrrrrr-boom, thud, bang, crash.

"What have you done? All right. Okay. Good enough. Shot your mother. Very good. All right. That's fine. Now, what have you done? Yeah." So on. "What was that? What was that?"

"Oh, well, I didn't mean to tell you about that."

"Well, you better tell me about that right now. What is it?"

You know, it's just going off bang, bang, bang, bang, you know.

And then your second grade, your second class of "I don't know. I'd better come over. The Instructor has said I better ask, and Ron has said I'd better ask, and the Director of Training had said I'd better ask. They have all said I'd better ask and so, so, so, here goes. Here goes: 'Have you heard anybody else thinking any critical thoughts?'"[laughter]

They just don't dare charge the withhold at all.

But out of those two classes, you can make auditors. In spite of that, you can make auditors. That the person will try at all, shows that they're analytically in agreement with it, but their terminal has some peculiarities that forbid it.

Now, it becomes very interesting to us how the terminal package monitors conduct in session. Conduct in session is monitored first and foremost by the unwillingness to give a withhold. That is a pc unwillingness to give a withhold, just can't quite seem to get one out. And the other factor involved in it is the feeling of doubt that keeps coming across it all. Because, of course, they've got the withhold pressed in so tightly that, of course, it's sort of a
pretended know or a not-know has sort of keyed in, and they're very hesitant, and they're very unpositive, and they're very diffident, and they don't give it up well. This all goes with this 3D package.

You'll see this one. I imagine somebody will have a terminal like a "secret hider" or an "archives burier", you know, a nice terminal, you see, something like that. And you'll kick the terminal into action.

Of course, the modifier modifies their actual visual conduct whenever they get the rudiments out. You throw the rudiments out there, they'll dramatize their modifier in the session.

Now, oddly enough, as an auditor – auditors don't have cases. The modifier doesn't much influence their auditing, doesn't really much influence their auditing. It does to some slight degree, but they can override it.

What influences their auditing more – see, pc'ing is more influenced visually. You can see the modifier go into action in a pc – but what influences the auditor is the amount of withhold on the terminal, you understand? And the degree of withholding – it's fabulous.

Now, if you – you'll start fooling around with this sometime in a session, just on the basis of all of a sudden it all went null on somebody or other, and you do happen to know their terminal, see. Well, let's say during level runs, you all of a sudden notice the terminal is not acting. It's not reacting.

Let's say their terminal is a waterbuck, and you say, "Well, what would you be withholding a waterbuck from around here?"

And they say, "Oh, well, now, that you – come to think about it, for the last fifteen minutes I've been keeping him from going and getting a drink."

You don't have to go let him get a drink. Just the realization of this fact alone will get your needle reacting. That's how important the withhold is. That, by the way, is, you might say, the clinical research test of how I've come to this conclusion concerning withholds and that sort of thing. It's experiments of that particular type and nature; degree that the terminal is withheld and review of cases and their behavior in session and all of that.

Now, we've got another factor involved in the plan of auditing. When I tell you that – well, we give this rough figure of 75 hours of Sec Checking and straightening up and that sort of thing before we do a 3D assessment. This becomes very easily understood by you when you recognize that every withhold he has, every single withhold he has is stacked up 100 percent on top of the withholdingness of the terminal. See? He's withholding this terminal, waterbuck. Every time some water occurs, why, you'd think a waterbuck, he'd become immediately a waterbuck, but he doesn't. He withholds the terminal, waterbuck.

All right. So this starts getting – glued on top of this then is every other withhold he has ever withheld since the first acceptance of the terminal, waterbuck. That's a lot of withholds, isn't it? And because present time has a much greater, greater value than past time, present life withholds then have waterbuck glued down to a point where it's practically unassess-
able when you first grab ahold of the person, see. So he becomes relatively unassessable because he's got this thing withheld.

And then on top of this, of course, he's got all of his withholds. And the withholds are right in with the waterbuck.

So in order to loosen up the 3D package, you have to get the withholds off, hence the emphasis on Security Checking. And you get enough withholds off, and all of a sudden the terminal starts to float to the top. If you could get withholds off on the whole track, you could security check the 3D package into the full view, if you could, if he could remember, if you had enough time, if you could dream up that many Security Checks, if, if, if, if, if, see.

But theoretically, if you got off all of the withholds ever since he became imbued with this terminal waterbuck – well, the last 150 trillion years worth of withholds – if you got all of those off, a waterbuck would blow, you see, with all those ifs, ifs, ifs. But for sure, you have to get off the more important withholds.

For instance, the social standing – his social standing of the life he has just got through living is not as important as his present life by about one-thousandth. See, the withholds of this life and then one-thousandth as important as the life just behind this life, and then about a thousandth as important as that life are some earlier lives, you see, and then about a millionth as important as that is some life he lived a hundred trillion years ago, you see – the withholds in that. Relative importance goes down with great rapidity from present life back is all I'm trying to say. So you have to get off this life's withholds and by doing that you make the package that ... It isn't that these withholds are what is holding down the package. It's just that these withholds have to be gotten off before you can get the package. It does enough to un-burden it so that the package becomes visible.

But everybody's going around withholding their 3D package, and the basic thing, of course, which they withhold in the 3D package is the terminal. You could almost say that the last terminal to come up – this is not true because of the methods of assessment which you're using – but if you had – if you could measure the relative difficulty you had in getting items, you would get items that were closer to the terminal. See, the terminal is the bottom of a package.

Of course, you're so rigged in assessing that it crosscuts, so this rule doesn't hold. But if we were dealing with some other system – if you were dealing uniformly with some other system which unstacked it to the degree that they were withheld, you would find that the last thing to come up would be the person's terminal.

The first thing to come up would be the goal. And the last thing to come up would be the terminal, and other things would be mishmashed one way or the other in between.

This is very, very important to you in the handling and training of auditors. Extremely important to you because it gives us a very rapid estimate of how long a person has to be worked over before they can be assessed.

You will get to this point where you could look at somebody being security checked, and get some kind of a vague estimate of how long it would be before somebody who couldn't assess very well could do an assessment on them. You could make an accurate estimate.
Here's this person sitting there saying, [in a murmuring voice:] "Oh, ohhhhhh. With- holding anything. Withhold. Murder. Murdered anybody. Let's see, have I murdered anybody in this lifetime? I don't know if I've murdered anybody in this lifetime. Yuh, and so on. Let's see now. You say ... What was the question again? Oh, oh, have I ever murdered anybody? Have I ever murdered anybody in this lifetime? Have I murdered anybody? Don't know if I ever murdered anybody in this lifetime, you know."

And you'd say, "Boy, there's somebody that's going to take a while. There's somebody's going to take a while, man. And when we find it, it's going to be one of these plunger-type terminals, like it's going to be a – "a hider", and the modifier's going to be something like, "and never be found out," you know, the terminal more important than the modifier to this degree, you see? But it'll be some kind of an odd terminal like this. It'll be something that wouldn't – would be a secret-type of terminal.

And you see somebody else. He's just taking a medium time, you know, and you say, "Well, have you ever murdered anybody?"

"Mmmmm murdered anybody? Let's see. Mmmmmmmmm- mmmmmm. No. No, I haven't murdered anybody."

What the hell! You mean this guy has to think over whether or not he's murdered somebody in this lifetime? Nuts!

Then the other case – I'll give you another view on the thing – and another case, say, "Well," you say to this person, "have you ever murdered anybody in the present –?"

"No."

He knows, you see. And there's a reversal of this which can fool you, which is the lower scale mockery. You always have lower scale mockeries of practically everything. And this person says, "Yes." Right away he says, "Yes, I've murdered about seven people."

You don't get a single reaction on the meter, the meter doesn't respond in any degree whatsoever, person doesn't care if he's done these things, doesn't make any difference to him. That's your lower scale mockery of this.

Well, this person is not necessarily that much easier to assess. That person is that much harder to assess. Now, you'll dig and dig and dig, and you just never can get him to say "murderer", you know? I mean he'll make lists. He'll make a long list, and you say, "Well, is there anything else on the list?" And you'll get a tick, and you'll say, "Well, what else is on that list?" And he'll say, "Well, there could be a roller skater."

"All right. Is there anything else on this? Is there an ARC break. Is the ARC break what's making this fall?" No reaction, see.

You say, "All right. Well, is there any other on this list?" And the needle will go tick. And you say, "All right. What is the next item?"

And he'll say, "Well, candy maker. Candy maker would do that."

Candy maker is the terminal for the goal, and murder everybody in sight, see.
And after you've done this long, arduous list and gotten clear to the bottom of the thing, practically sheets, you see, he'll come in, usually in the morning after he's had a good night's sleep, and all is well with the world, and he has no upsets, and his rudiments are all just in kind of naturally, don't you know, and he will say to you, "I've just had a terrific idea. Just an absolutely terrific idea. I woke up this morning, and I was thinking it over, and do you know we haven't got some item on that list."

And you'll say, "No, what?"

And he'll say, "A murderer. What do you think of that?"

Do you see the person just doesn't have any recognition of his terminal value of any kind whatsoever. It's just totally withheld.

Now, it isn't naturally true that the more violent kinds of terminals are more withheld or the more secret kinds of terminals are more withheld. You're liable to run into somebody with a terminal "little girl," who is just withholding it like mad. Of course, we don't know what a little girl means to this person. See? That's what it takes. What does a little girl mean to this person? Oh, well, that's another story.

So whatever the terminal package is, it – the way to understand it is by the person's reaction to Security Checking and their ability to security check. Both of these things could be used in a monitoring factor. We could say, "Well, this person can't security check worth beans. This person takes forever to answer questions." Well, we'd just better security check the living daylights out of this person, and get everything as clean as we can possibly get it in all directions before we begin to attempt an assessment.

And as far as training is concerned, we're not going to hope for much from this person before we get an assessment completed, because they're going to goof. As an auditor, you see, we're just not going to hope for much. Oh, we'll let them audit. We're not going to push them. We're not going to spend much time sweating over them.

We'll spend more time sweating over some other auditor making him good enough to assess the one who was dragging up the rear when we finally get up to that. It's that kind of thinking which pays off easier than taking all the dunderheads who can't pull a withhold, who won't give a withhold, stacking them all up together and saying, "Now, you're the only people that's going to audit anybody. And you easy sec checking people over here, well, we're not going to run any 3D package on you. We're not going to find anything or anything. And we're not going to work very hard to train you. We're going to work on this tough group." You know, the way they teach modern schools. They downgrade the whole class to the only idiot they've got.

Now, there is nothing disgraceful about having long comm lags on withholds and having an insufferable terminal in Scientology. There might have been out in life, and on the whole track and that sort of thing, but we consider there's nothing disgraceful about this. But we are permitted to curse about it occasionally. I think we'd be permitted to do that once in a while.

We finally get it totally unburied and we've practically sweat our skin off our brow, you see, trying to get this thing and get this thing security checked and so forth, and we fi-
nally get down to the lower end of the thing and find out that the person's terminal that was causing us all this trouble, you see, was a "never knower."

Now, we're permitted at that time, "Well, I'll be damned," you know. We're permitted one of those. Even tell the person that. The person never appreciates it though. I've said this to a person or two, "Well, now I know why we've been having so much trouble." And you know, they never appreciated it at all. [laughter]

Now, this is an interesting thing that you happen to be dealing with live, living beings with a very live, real and factual science. Our science is not a theoretical, interpretable science. Scientology has about the same delicacy as a pickax right now. I mean yeah, you could be pretty adroit, and you can handle people pretty adroitly and that sort of thing, but it's very direct.

What we know that is important about life can be instantly and immediately applied – instantly and immediately. And applied in certain direct ways, it'll arrive at certain direct places. It's like taking a dry box of matches. You take a match out of the box and you strike it on the striker of the box and the match lights. Well, I'm teaching you to please have the frame of reference of only be surprised when the box of matches doesn't light. And look twice to find out if it was a match you took out of the box and not a nail or something. Because it runs off just about like that now. I mean we've got it running off with just that degree of accuracy.

As you finally wrap your wits around this to a full embracing of it, you'll get to this point where somebody does something in a session. They get mad at you for instance. You don't say, "Gee, I certainly wish I could audit better, and if I just possibly could audit a little better, maybe the person would never get ARC broke, and what is wrong with my auditing, and the person has a perfect right to cuss me out."

We don't go through this player piano piece, see, because there's no facts in it. We have learned to this degree that if a person got mad at us in session that it's one of these things: We missed a withhold. That's the most probable. Other rudiments are out and the modifier has kicked in – has the high probability of it. And we've missed a withhold and the modifier has kicked in. Or we have missed a withhold or the modifier has kicked in by the other rudiments being out, you see?

And then you have another choice. You've missed a withhold and the modifier's kicked in. That's it, you see. You don't spend a long time going quietly off to your room where you can be quiet and breaking out your violin and tuning it up to a low pitch and saying, "Oh, God, what have I done? I have probably ruined him." you know.

In other words, you're looking at what is and finding it out, it is what it is. You see, your certainty is totally based on whether you can do something about it or not. And if you have certainty you can do something about something, you don't worry about it very much.

You know the least hysterical people around a fire – let's say a warehouse is burning down – oddly enough, the least hysterical people there will be the oldest veteran fireman there. Isn't that odd? And the newspaper reporters who are the old newspaper reporters and that sort of thing.
That other people who will be hysterical – you say well a manager of the plant could be hysterical, and quite understandably because his plant is going up in smoke. I don't know that that's understandable. It's all covered by insurance, and he wanted a new plant anyway. He's just not used to fires. That's all. He doesn't know what makes fires tick, and he doesn't know what puts them out, and he doesn't know the inevitability of fires, and he doesn't know this, and he doesn't know that.

And all those not-knows add up to an hysteria. Worry, concern, hysteria. Those are the things which are going about it. And the local dwellers in the immediate area, they've never seen a fire before. They've gotten up every morning and found out the world was there by looking over and seeing that that plant was there, you see? And what's disappearing on them is a stable datum and they go into fantastic hysteria on the subject because they don't know anything about fires either. But if you left it in the hands of the manager who, of course, himself, is accustomed to running that plant and is a very expert man in running of the plant. He's no expert in handling fires. He never handled one before in his life.

So if you turned it over to him and the local dwellers in the area, they wouldn't even save a shed. Man, I mean to tell you the whole plant would go and probably half the surrounding countryside, too. Because they'd be, "Ahhh, oh, and what do we do now," and they'd pick up a fire hose and then throw it down, you see, and then turn on the water and decide that was too much water, and go and turn it off again. They didn't have enough water, and then they'd go start up a truck and move it some other place, and change the fire lines, and then watch a wall come down, and well, that's just because they don't understand fires, you know. So they can't do anything about it.

Now, you sit there and watch a pc burning down, you'll stop him burning down to the degree that you have a good certainty on what makes pcs burn down. You'll see those first smoking embers go up long before anybody else would detect them. What makes me cross occasionally with an auditor is that I can actually detect an ARC break or a blow about an hour and a half before the average auditor can. And I don't know what's wrong with them, you know?

I say, "Arrr-arrrr-arrrr-arrrrr! What is wrong here?" I try to teach them this, you know. I say – I've done this in HGC, you know – "Now look, now listen. The reason why Smith keeps blowing up is because you get something out at the beginning of the session, and then this multiplies, don't you see, and it gets worse, and then he blows. Now, actually, the blow is detectable to you, certainly a half an hour before it happens. Now, please detect the incipient blow and the ARC break long before it happens."

They say "okay," and they go back and this time they catch Smith just as he's leaving the chair. And then I have enough reality to appreciate the fact that they did catch him just before he left the chair.

See, I'll argue for the moon and settle for a round of green cheese, but this is the way the thing is, you see? And I'm actually happy that they get that far. I'm not saying how bad auditors are or how good I am. I'm just giving you the level of expectancy.

All right. But it's rather unreasonable of me with terrific familiarity with pcs over an awful long period of time to expect every time that an auditor will recognize that small wisp
of smoke long before the building starts burning down and simply walk over, and put his foot on it, and go on with the session, see? That's unreasonable of me to expect that an auditor will do this every time. So, I'm unreasonable. You should be able to do that.

Right away you say, "Well, what have we now, here? This person's being cross? This person's being critical? Not able to get this in too good? Day before yesterday I had some kind of a question. Maybe I didn't get it flat. What was the withhold I missed day before yesterday, if I did? Oh, yeah. That's the one."

Bang! He gives you the withhold, and that's the end of that ARC break, the end of the out-rudiments, and your session goes on. It took you all of thirty seconds. You recognized it, you caught it, you pulled it and you're on to the next action, see? So I'm unreasonable. So do it.

Now, in training up auditors, you have no other choice than to follow through a pattern of training which has emerged over a long period of time. People are so diffident. Anybody is rather so diffident about reaching into anybody's mind that you have to start them out on some kind of a gradient. And don't go and abandon every process that has ever worked on Class I, because a lot of those processes have served their purpose in that they conditioned auditors to being able to sit in an auditing session.

They've made pcs more confident of being able to ask questions, and they have even advanced cases to a remarkable degree, more than anybody else has in the past. So don't be afraid to use these old processes.

Let's get somebody auditing before we get them reaching right into the core of the fellow's mind and picking out a handful of brains, raw and bleeding. I think that's a rather unusual thing for you to demand. You start training an auditor, you sit down and you say, "All right. That's an E-Meter. And when the person gets an idea, why, the needle moves. That's all you need to know about that. All right. Now, ask him if he has ever done anything that his mother would be disappointed in him for. That's right. You ask him that right now. And clear the question good, and I'll come back in a half an hour."

You come back in a half an hour. There's the auditor lying there in a secondhand heap in the middle of the chair with the E-Meter busted over his head, don't you see. And the pc has just caught a plane for Canada. Probably the results as dramatic as that actually almost could exist.

And you just haven't realized how far you've come on the line, that's all. You haven't caught the gradient at a small enough gradient. And you'll find that, some of you, teaching in an Academy or teaching a group of people to audit, and so forth, will encounter that exact phenomena.

Sooner or later you're going to take your finger off your number, and you're going to say, "Well, that's an E-Meter, the needle wiggles. Now, you know all about that. You saw that film, we made the other day, and got that. All right, now just find out what this person's withholding, and get them straightened out, and get them straightened out for an assessment, and that's all you need to know."
The auditor will sit there and — "Huh-huh, no, huh-huh. No, I don't think this is for me."

You've just said, "Well, there's the Empire State Building. Now, take a — it's just an easy jump. Just crouch down now, and spring, and land on the top of the building. Now, there you are."

And what have you asked him to do? You've asked him to invade somebody's privacy. And he knows that Galactic Council order number one says, "Thou shalt not invade privacy and the rights of thy fellow being, you slave."

You've just asked him to violate it without any conditioning of any kind whatsoever. He knows better than to violate it. That's kept him a slave for years, so it must be stronger than he is. Years? Kept him a slave for trillennia, so it must be stronger than he is. See how it works? So, you just violated that wildly. Well, there's dozens of things you can do. The smartest thing, if you were going to train somebody up, is to take an E-Meter, a perfectly valid E-Meter, not a dummy one, tell him to be very careful of it, not to drop it, hit people with it. Of course, if you've got any Mark IV's and do that with it you'll regret it because students rather chew up stuff.

I tell you, if you got any old squirrel meters or anything like that, you use them. Oh, no, that's bad. That's bad. That's bad, too. No, no, do it with a regular E-Meter, and then call it to one student's attention, "The reason you can't use your E-Meter is because you have been eating sandwiches – keeping your sandwiches in it for the last two or three ..." [laughter]

Start up a repair service. Anyway – taking old sandwiches out of it.

But you run a Comm Course? Then you're really going to teach somebody to audit. I'm not talking about a public brought in to run a Comm Course co-audit, see. I'm talking about you're really going to make an auditor. Set him down in a chair, give him an E-Meter whenever he is the student in a student-coach situation. He sits there and holds the E-Meter with the thing plugged in, and nobody holding on to the electrodes. See? He just sits there. You don't care whether the thing is plugged in or not, or he puts them on the other fellow's lap. We don't care what he does with that. But he sits there and holds the thing. And you teach him his Comm Course that way.

Get him up to a point of familiarity because even this slight familiarity gained through a Comm Course is valuable. Every time he's sitting there auditing, well, he knows he's supposed to have an E-Meter in his hands, and he will get familiar with the thing. He'll get familiar with its mass, and it won't start bothering him.

All right. Push him through a Comm Course in that particular fashion. Never let a coach have an E-Meter. Fellow's coaching, no. Fellow is being the auditor, he's got the E-Meter.

And your next stage up the line — now, he's going to run this very difficult process of "think something". Give him an E-Meter. It's an exercise process, see. Give him an E-Meter. And make the person he's (quote) auditing (unquote) hold the E-Meter and he'll see that the thing is wiggling. And that will be very strange to him. He will be able to read all sorts of wild significances into the fact that it's wiggling.
He'll ask you all about it. He'll say, "You know, all the time that that was wiggling there, all the time the person was running it, do you know, the needle was moving, but after awhile it went over to the side of the dial and didn't move anymore. I just thought I'd let you know because I like to keep you advised about these things."

So all of such basic processes, "something you wouldn't mind forgetting," all that sort of thing, he isn't doing anything with the E-Meter at all. Just don't give him any- but just scold the living daylight out of him if he ever dares sit down and audit anybody without holding an E-Meter on his lap. He's not doing a thing with it, don't you see? But he'll eventually find out, "What do you know." I mean, as the fellow goes, you know, "To make the thing center, you have to come over here and move it there. How interesting. You have to move it there in order to make the thing read center. I wonder what that means. It's gone up to 6 now. I'll have to ask the Instructor. Does that mean he's Clear at that point?"

"Oh, here we've got a fellow. He must be almost Clear. He's reading 1." [laughs] Let him go through all that. Let him be totally baffled. Who cares? As long as they're doing their practice, their practice oddities, just little, little runs. Anything except a CCH type process. Anything except that. That alone is exempt. They don't do the TRs of Upper Indoc, of course, with an E-Meter, and they don't do the CCH Processes, they wouldn't do Op Pro by Dup with an E-Meter. But anything else they sure do it with an E-Meter.

All right. They get up the line on this, give them some talks on the E-Meter. They name the parts of the E-Meter. Show them exactly how it's set up and how it's turned off and how it's turned on. Anything, training materials you have on the subject, and demand that they study E-Meter Essentials and take an examination on it with a grade of 70 percent. You're just going to ask for a grade of 70 percent. And before they are permitted to run an HCO Information Letter type Security Check on anybody, they have to have gotten a grade of 70 percent on E-Meter Essentials, have had some lectures on it, and so forth.

See how downgraded that is. Really downgraded. And you don't let them, at that stage, run anything but the most innocuous type of Security Check, such as, "Have you ever put on shoes?" HCO Information Letters have some on it that are quite beefy, but there are also several innocuous ones that came out which are good student training checks. There's even some with kind of a motivator side of the thing, "Have you ever resented an Instructor speaking to you?" you know? It's this kind of thing – nothing. And they can detect those things, and make them security check that, but only after they have attained this grade.

It's actually, you call it Class I grade if you want to, but they've attained this grade. They aren't a Class I at all. So it's just – just a – they're just a student grade. They're permitted to security check. They passed E-Meter Essentials by 70 percent and they've had some training on it and already they've been holding it in their lap for a week or two, see?

And they've had some demonstrations, and they know what it's all about, and then you let them struggle, and these are very innocuous, extremely, extremely, extremely innocuous Security Checks. It doesn't have any meat in them at all. And it'd be a wise thing for an Instructor to go down over the type of Security Check they're using and take out anything that'd ever had a real punch to it to any student. Just thread it out. Just scratch it out. Alter those checks all you want to, but make them innocuous.
Well, "Have you ever returned late for lunch here at the Academy?" You know? That would be just about the upper limit of severity that you would permit on one of these checks, you see?

"Have you ever disliked the color of a dress?" You get what I mean? I mean, these are almost average, everyday situations. And you'll find out they'll get a read. They'll get reads on these things, and they'll be able to "clear" them (quote) (unquote).

But what is the final gain here? I mean, the fact that you've got somebody who can handle the thing, he finds out it operates, he finds out he can security check.

All right. That would be your next stage. That would be your total stage there of training on the thing, he's using them. And he continues to use them for any other auditing, but he also actually runs these innocuous-type Security Checks.

Now, we make this fellow actually pass the examinations of a Class II auditor: Hundred percent grade on _E-Meter Essentials_, demonstrations, tapes, anything else, any materials on the E-Meter, has to pass them a hundred percent, and then we let him use the Joburg, an HCO Policy Letter form type check. And we won't let them touch one of those forms until. Otherwise, you're going to have mangled masses of auditor lying all over the floor and people acting as pcs blowing for the North Pole as a routine action.

Why? Because it's just going to cause the most fantastic amount of randomness in an Academy. Missed withholds by the ton. Well, you can pick up this missed withhold, which is a training withhold, "Have you ever been late for lunch while you've been at the Academy?" See? So somebody missed that withhold. Oh, well, so somebody missed the withhold. He realizes he's being checked by a student and it's all kind of funny anyhow and fuzzy, and it isn't very important, and you're not going to give him randomness.

But you ask, "Have you ever raped anyone?"

The meter falls off the pin. Got a person who spent seven years in prison on three different occasions for rape, and feels worse about it every minute, and then the student says, "Well, isn't that the lunch bell?"

Well, the guy goes out, puts on his hat, catches the plane for Canada. He might as an afterthought come back and shoot the student who did it. But this would simply be the mechanisms, the mechanisms which you would restimulate by not following such a policy.

So these are the stages of training. Now, the mere reason of having passed a Class II classification in an Academy or in a field auditor's training unit or in a special course out in the field someplace, that doesn't make anybody a Class II Auditor. It just permits them to use HCO Policy form Security Checks. And they shouldn't be permitted near one until they can pass those qualifications as stiff as a Class II Auditor. Don't you think that's wise?

_Audience_: Yes.

All right. Now, Academy training and training of people will begin early to give you a good insight into what kind of an auditor this fellow's going to be and which way this fellow's going to go, and what this fellow's going to do, and what this fellow's not going to do. You
should be able to catch all that up rather, rather quickly. You should take a pretty good estimate of the situation.

But the length of time in training can often be slowed up. But remember that it isn't going to do you too much good to suddenly say, "This student is not learning well and so we'd better send him over to the HGC, or we better send him over to an auditor; I'd better audit him, find his 3D package, and then he will learn better."

You haven't speeded anything up. Instead of getting trained then, he is just going to get audited forever. You're not going to find his 3D package. What's wrong with him?

Well, he needs all of his preparatory work. You could send him over to an auditor or send him into an HGC or something like this to get his 75 hours preparatory done. Oh, yeah, well, that would be quite wise. Nothing wrong with that. But you would not be able to go this other route and say, "Well, we just – all you have to do is find the fellow's 3D package, and that's it. That'll change everything around, and instantly he'll feel better, and he'd be Clear," and so on.

Going on the basis of training Clears would be quite interesting, only you would very rapidly run out of auditors to clear auditors. I don't care if we were five years up the track, with a Scientology population of Earth of fifty million people. No, you'd be running out of auditors all the time. That is a course which runs out of auditors.

In other words, if nobody can be trained until they have been cleared, that you will find will never work. You see, because you always got that many more people being cleared. It's almost fatal, you know, to clear people. You disseminate Scientology. So it defeats itself at once. How would you like to be the only auditor in Egypt with training up against this one basis, that we musn't train anybody until they're Clear. Well, that would be great, wouldn't it? That would leave you auditing everybody in Egypt. Well, maybe this would be all right, but I don't think it's a very optimum solution. Certainly never train any auditors because you'd never get around to clearing anybody either. You'd have maybe fifteen people on the auditing lineup and about three years later, you would have fifteen Clears. But you still wouldn't have any auditors, would you?

So, now you would go out on the basis, don't you see, of clearing up some more people and it would take you another three – . You know, you get the wild nonsense that would go on on such a program. You'd just better make up your mind to it that there is no other solution than to train uncleared, unprocessed people. That's all. This other one is an ideal piece of nonsense. It arithmetically breaks down at once. Actuarially it becomes utterly unfeasible. There isn't any way it could be done. So, you'd just have to go ahead and train uncleared auditors, that's all.

Therefore the subject of training uncleared people becomes quite a technology in itself, because it's nowhere near the same technology as training people who have been cleared. That's an entirely different training technology. You give them something to memorize, and they memorize it and you tell them how to apply it and they apply it and they think that's fine, they go on and do it and they do a perfectly good job. So what? Then the pc gets in desperate trouble and they've never been trained or audited by a bad auditor and they can't understand...
why. Then they begin to think people are unreasonable. And that would be the end product of that – would be a total breakdown all the way along the line. That's right.

I was auditing somebody not too long ago, and I – suddenly dawned on me that this person audited rather poorly because they had absolutely no experience of bad auditing, and they didn't think – person perfectly reasonable – but they didn't think any one of these parts of anything were important. Never happened to them. So therefore it couldn't possibly be important.

There's nothing that makes a citizen out of you like being run on a level – I'm not saying that everybody should have this happen, but it certainly would make an awful citizen out of you. Wow, would you really, after that, become absolutely savage on the subject – let somebody assess you on the Prehav Scale and then run it, leave it unflat, assess a new level on the Prehav Scale, run it, leave it unflat, assess a new level on the Prehav Scale, run it and leave it very unflat, and then try to function. That's an absolute sure way of feeling crazy.

I know of no better way to make yourself feel crazy than to have that happen to you. You know, you feel uuhuhh. You're not sure whether the world is still square or not. It gets these must-reach-can't-reach ridges, you see, all in restim. Well, if you – that would be a severe thing and nobody is going to do that particularly just for the fun of – it feels so nice when you stop hitting yourself on the head with a hammer, you know, I mean.

But somebody sits there and their TRs are horrible and their metering is fumbly and that sort of thing – well, it sort of gives you the idea that all of that could be improved. And it gives you a certain perfectionist attitude toward training. And that perfectionist attitude will disappear if everyone was perfect before you started making auditors out of them. You'd no longer have perfect auditing at all; you'd have rather sloppy auditing. In a very short space of time the whole technology would get lost in the slop of it all. It's an interesting viewpoint.

There is a value in having been aberrated, and don't you ever forget it. It has given you a wealth of experience which you can attain in no other way. That that experience is at this time, more or less unavailable to you and has not been used by you, has nothing to do with it. As you go on up with case progress and so forth, you'll find a tremendous amount of experience there. And remember it was, every single bit of it, the experience of a knucklehead. The way you had all of this experience was by being a damn fool. You were a professional. That's about what it amounts to – a knucklehead.

Now, that doesn't mean that all of your experience should be that rough.

But you will find out that eventually you will remember something or other. I think a trillion and a half years ought to be, or two hundred trillion at the outside, I should think would be long enough for a person to get enough experience on the subject of knuckleheadedness. I have faith in you. I don't think you – I don't think you learn slower than that. And I don't think at this particular time you need any further experience in your terminals. I think you've accumulated most of the available experience. It's very doubtful that anything that could happen to your terminal has not happened to you.

Well, looking at it reversely, I think you should get some experience in other lines for a change. Broaden your view, you know. But you'll find out that it's peculiarly a parallel with
auditing, that life, when it does follow to some degree (this doesn't have to be exaggerated) a
pattern from a highly aberrated to a rather sane state – when you're going in that particular
direction. The best way to accumulate experience in that direction is by taking a person when
they're aberrated and teach them something and improve them at the same time. It doesn't
matter how gradually you improve them as long as you keep on improving them and they're
learning as they go.

Man, when they get through with that channel they'll be able to tell you things about it
you never realized. They've been over the jumps. They know it wrong side out now. They
know all there is to know about it. You never look upon misadventure as being much of a
teacher. Well, in the final analysis if you've got to learn by experience at all, it is only misad-
venture that will teach you. The greatest successes in the world can go unremarked if you
have nothing with which to compare them.

Now, you realize that getting somebody sane and walking straight and their psycho-
somatic done and the person back in action and all of this kind of thing happening, you real-
ize, you have a pretty good idea that, one, it takes a bit of doing, and two, it is very well worth
doing You've got that as an action cycle – you have a good view of that sort of thing We
could easily lose that.

If all you had to do was say, "Take this pill," and the person takes the pill and the per-
son cleared instantly and they were now Clear and totally sane and they went on about their
business, do you realize that clearing would have absolutely no value of any kind whatsoever.
Wouldn't have any value.

In the old days most of the people who were real worried and plowed-in and so forth,
used to worry about being – all they had to do was unbuckle their pants buckle and drop one
side and have you shoot them in the gluteus maximus and they'd be Clear. They were always
dreaming of something like this happening I never dreamed about it happening. I' let a few of
them be demonstrated to me. But, I never dreamed about it happening. One, it wouldn't be
clearing, it would be total enslavement. Because, what is this? This is just a new overwhelm,
isn't it?

Nobody ever appreciates his freedom unless he has to work for it. And if he does, he
values it and he then finds out that he is free. And we'll go further than that: If a person does-
't work for his freedom, he never finds out he's free. So, there'd be no such thing as a Clear
who hadn't worked for it. You're going to clear people sometimes, that are going to look at
you and say, "Of course, yes, naturally, uh-huh. Fine."

And you look at them and you wonder why you bothered. They have no realization of
anything having happened or anything really having been improved, or that they're going
anyplace and they have no purpose to which they may put this new breath of skill and it's far
more than they need in anything they're doing on this cotton-picking planet. And the net result
is a sort of a odd feeling of lose for you. It isn't quite that grim. They invite you to dinner.
They introduce you to everybody. They're very enthused about you and so forth and they keep
going on to the PTA and sitting there and taking notes and... So why doesn't this person do
something in life? Well, they haven't found out they can.
It's something like a fellow, you've taken these chains off of him, you know, and it's left – and the chains were a little bit rusty and it's left some rust marks on him one way or the other, and he keeps looking at the rust marks and he still thinks they're chains. He doesn't know they're gone. I imagine he could probably go on like that for a century or two and then someday he'd read something in a book or something like that and it'd say this fellow was Clear and could do so and so, and he all of a sudden says, "Well, I think I could do that," and reaches up and says, "What do you know, I'm not wearing any chains. What happened?"

And then go into a total overwhelm and build a stone image with your features. Set you up as a household deity and pray to you every night – as the fate of people who do sudden things that other people never earn or appreciate. Of course, it gives you a lot of heads to go into but they are usually stone.

All right. Well, I just thought I'd better give you a few words on the training and upgrading of auditors and what you should look forward to in that particular line, because I think you'll be needing the information. And I hope the data is of some help.

Thank you.
PROBABILITIES OF 3D

A lecture given on 21 December 1961

Well all right. Okay. Shortest day of the year. Dec. AD 11. Saint Hill Special Briefing Course. Now somebody wants to know if this lecture's in sequence, they'll have to look up and find out when the winter solstice is and they'll have the date.

At least we have the feeling now that the sun will be coming back day by day and minute by minute into this far northern clime. At least we can look forward now to the days getting longer and a little more sunlight all the way along the line. And I similarly hope that's true of your cases.

Now, today's lecture has to do with, again, suppositional material, which however you will find very valuable. I gave you another lecture of this character.

The probabilities – and I label this very clearly "probabilities." This is based on experience and observations. And whether they are probables or not, you'll find all of this material of considerable use.

Let us take up the Goals Problem Mass head-on and find out what we are doing with. In other words, what is this thing we are doing something to.

It might assist you that the probability of the composition of the Goals Problem Mass is not a single package. I've already told you that earlier. I've said that you've got your most available material, but this has been disclosed to view, and this is very interesting data.

Your first package on this looks like a small circle called the terminal. (Small oval – terminal.) [writes on the board] And now, you have this next circle which we could call the oppterm. And we find that this terminal and all of its peculiarities is a valence with all of its crimes and antecedents and so forth, called the terminal.

All right. This is a whole package in itself. It is a personality. It has idiosyncrasies. It has types of overt. It has moral codes. It has all of these various things. It's a very complex package. It's extremely complex. It is a complete personality all in one fell swoop.

Now, if you were to audit out these various characteristics of that particular personality, and all of the crimes accumulated over the last many trillennia, you would have a very long job ahead of you. And it has constantly been borne in upon me over the years that you audit out the valence. You do not audit out the characteristics of the valence. That is what you are trying to do. You are auditing out a valence, not the characteristics of the valence. That is something for you to remember.

Otherwise, at some fell stage, you can all of a sudden go slightly mad and look at all the characteristics that a waterbuck has and everything that goes into the makeup of waterbuck. And start to audit these out one by one, as an approach route, and you won't make it,
because they are all there because they are a package called "waterbuck." And that is a terminal.

And when you audit out the terminal, all that other material blows with the terminal, you see? This is something on the order of a billion to one, you see? You throw out a billion characteristics and incidents by throwing out one unit, which is to say, a terminal. Now, that is what you are doing essentially.

Now, this opposition terminal is what keeps this terminal suspended in time because it makes a problem. Without this terminal going up against the opposition terminal, you don't have any mechanism that will suspend the first terminal in time. The only way you can suspend this terminal, "waterbuck," in time, you see, is to also have another package of stuff – "tiger," let us say. And we've got this package called "tiger" here and this package, of course, is in itself a complete package. And it also has a billion characteristics and now-I'm-supposed-to's and moral codes and all the rest of it. But being in opposition violently to our terminal, waterbuck, we have then a terrific concentration of attention by which nothing else can get as-ised.

In other words, the waterbuck can't as-is anything else because he's totally concentrated on the tiger, and the tiger can't as-is anything else because he's totally concentrated on the waterbuck. But it's the whole subject, tiger, and the whole subject, waterbuck, that you are trying to audit. You are not trying to audit out the characteristics of a tiger or the characteristics of a waterbuck. But you are trying to audit out these two packages in their conflict, one against the other. And as soon as that conflict is tripped or triggered or imbalanced, it, then, tends to blow and disintegrate. There is nothing can hold it in space.

A problem floats in time. It has its own time track. It floats in time. Everything appears to be "now" about this problem. You get people who have tremendous problems. They have got to get everything now. They can never get anything tomorrow. They can only get it now. They can only be audited now. They can only be cleared now. You see, it has got to be now. You see, because there isn't any time. They know better than to try to clear themselves tomorrow.

Well, what causes this? What causes this manifestation? It is simply the problem characteristic of the oppterm and term concentrated upon each other, floating in time, makes a no-time situation for the pc. So he has no time. He has not got time to walk across the room and pick up a sandwich. He just doesn't have time to do it. The sandwich is over on the other side of the room and there he is, but he can't do it, because in order to progress from where he is to where the sandwich is consumes time.

So therefore, he has to have the sandwich now and he can't get the sandwich because he has to walk across the room first. Now, that's the most ridiculous example that I could give you of it, but we have many of these examples in real life.

And amongst these examples in real life, we come up against the proposition that the fellow cannot possibly ever get a refrigerator next month. He just cannot get a refrigerator next month. And this month work hard to get money for the refrigerator next month. He cannot do that. That is... he is mentally incapable of doing that. What he has to do is get the refrigerator now. He can never get it next month. It's got to be now, now. He can never work
toward getting a refrigerator. The essence of it is, he never gets a refrigerator, or somebody invents hire purchase or time payments.

Now, it's – it's the "nowness" of it all, don't you see? If they can just never have anything in the future, they're all set, because there is no future. All their future is suspended, and it is involved in two terminals, one in conflict with the other. And by that conflict alone, you get a suspension of these two terminals.

So you have the tiger fighting the waterbuck, the waterbuck fighting the tiger. And these two – each one a total personality package – each one a total personality package, is banged against the other one inextricably. So there is no possibility of these things coming apart and you then have something which is floating in time. Nothing gets as-ised. Everything just accumulates. Everything nails down.

Now, when you're taking items off of a 3D assessment list – let us say, like an oppterm or something like that, list – and they null, you actually are pulling these items off their association with the terminal. You are auditing when you are listing and nulling.

When you first looked at it, it was, "tiger, elephant, wild animals, circuses, animal lovers." See, these were all part of the list. And as you go over those things, they actually strip off this package because they're strippable, because they're not the package. But once you get the package down to the package, it ceases to be strippable. And so the thing just keeps on banging on the E-Meter, see? It won't null because that is the package.

Now, if you had to go ahead and take apart every thought and characteristic of a tiger from there on out, let me assure you that if we merely take up the idea of the chemical processes which a tiger must be cognizant of to be a tiger, we have a lot of data. It'd take you many years at a university to begin to learn that they don't know anything about the chemistry by which a tiger would operate. They know nothing about biochemistry – not the way she is really operated. And yet all of that information, as well as everything else – how to hunt, how to track, how to smell, how to do this, how to wash one's face – all these things are all contained in this package.

Now, you don't strip those off. You strip the whole thing off, bang! Because it's only there because it's suspended up against the terminal. All right. So there's the terminal versus the oppterm and the oppterm versus the terminal. And they are suspended because – and this is very important to you and we have tended to overlook this particular thing – they are data of comparable magnitude: You cannot have a problem unless the forces are in equilibrium. You must have these two forces more or less equal. They're certainly very similar in their characteristics.

Now, let's get to the rest of this package. You think that is all there is to this package? No, that is not all there is to this package.

We have here a larger circle and we've got one circle interlocked with the next circle interlocked with a large circle. And this large circle is the oppterm's terminal – the oppterm's oppterm. Interesting, eh?

So we've got this third package and it's a valence. And it's the oppterm's oppterm. And how does that stay in suspense? Well, that stays in suspense because there is a fourth package.
of equal size which is the oppterm's oppterm's oppterm. [laughter] That's right. And that is the "O-O-O," the oppterm's oppterm's oppterm. See? Pretty good, huh? Very interesting And this will get very important to you in just a moment when I show you something about assessment.

And that's all very interesting, but the probabilities are... [draws something, laughter] that there are two more circles out here. This one would be the oppterm's oppterm's oppterm's oppterm and this is the oppterm's oppterm's oppterm's oppterm's oppterm. Interesting.

And then when we get out here we have two more. Now, how far that goes is unimportant because it's the road to OT. That's your road to OT, and that's the composite, the probable composite, of this road to OT. This is, of course, to a large degree conjecture. I call it to your attention. But various things support this theory, and we will go into that right now.

That first package is pinned up one against the other simply because they're held in suspension against the oppterm's oppterm. And the oppterm's oppterm is held in suspension because it is against the oppterm's oppterm's oppterm's oppterm. And the oppterms that I just mentioned is held in suspension against a next pair, and they are held in suspension against a next pair. And each pair, if you will notice by these drawings, are bigger than the last pair. And that's the important thing – they are bigger. And there's where you can make your mistake on a 3D Assessment package. And where, here and there in this very unit, we have made this mistake.

We get the oppterm's oppterm as one of the units, and the actual oppterm, being tinier, is lost. Remember I used to tell you about two trucks head-on against each other in a field and that there was a lot of mishmash around those front bumpers.

Well, amongst the mishmash in the front bumpers, on some cases you will find the oppterm totally submerged. It is gone from view. And sometimes it's the terminal. So that there you've got the oppterm and then the terminal and then the actual terminal. And they're all kind of mishmashed in there. And you'll come along and you'll pick, with your assessment, the oppterm's oppterm off

How can you tell the oppterm's oppterm? It is higher toned. It is so much higher toned, that it's way up at the top of the scale, and the truth of the matter is that your proper terminal and oppterm are very close to equal on the scale. Now that can really help you to pick these things out.

So your problems-solutions survey that you take, I would say at a guess – and more than a guess – I would say that if when you did your problems-solutions survey and you wrote down "how you solve problems" and "how terminals solve problems" and how (quote) "oppterm" (unquote) solves problems, and then you find that "you" would solve problems by stabbing people in the stomach, and the terminal would solve problems by cutting people's throats and the oppterm would solve problems by stabbing people in the neck. Oh, you're pretty sure that you've got that package, you see? That's a nice, smooth, equality package. Gives you good data of comparable magnitude. It also gives you one God-awful problem. Which is which?
But when you've got it with that precision, it doesn't much matter because you're going to be able to audit both sides of them. And your pc just won't get somatics nicely. And your pc just won't run nicely. And your pc hasn't any real idea of the game that is being played if they're being run on the wrong side. They're going to be saying, "Well, what game is this?" You know?

You're running them on tiger, see? And you're running them on tiger, and their terminal is waterbuck, on the combination waterbuck-tiger. And you're running them on tiger. "I just can't see that there's any game involved. Waterbuck? What problem would you have with a waterbuck? Waterbuck? I had a problem with a waterbuck. Got a problem with a waterbuck. Let's see? How would a tiger possibly have a problem with a waterbuck? Well, a problem with a waterbuck. A tiger would have a problem with a waterbuck. Oh, I get it. Yeah. Well, a problem of a tiger with a waterbuck. Waterbuck would jump across the river and the tiger would have a problem of getting across with his feet still dry. Yes. Yeah, I guess that'd be it."

And you say, "Well, what conflict is there between a tiger and a waterbuck?" – if you ask them this.

And they'd say, "Conflict? Well, you could see there's theoretically a conflict between these two things, but uh ..."" Now you go around and you run the waterbuck. And you say, "Well, what problem – ," in the same 7 December commands, you say, "What problem would a tiger have with a waterbuck?"

"Well, how to get around and jump out of the proper places in order to leap quietly upon one." You know, it's a real problem.

Run from the point of view and with the levels of the waterbuck, he all of a sudden recognizes the tremendous amount of games condition that there exists. So run on the terminal, he gets the games condition, but run on the oppterm, he doesn't get the games condition. Why is this?

Well, this is just because when you're running the opposition terminal, part of the opposition terminal's attention is fixated over here on the oppterm's oppterm. So he has a sort of a split attention on it and he can't quite see it. Why?

Well, the oppterm's oppterm is of enormously greater magnitude. It's the pc that you have him go around on 8-C and he feels all the walls and he does all the commands with equal comm lag and he does it all exactly right and he gets absolutely no improvement at all, because it's a "what-wall" situation. Well, the oppterm's oppterm is quite normally a "what-wall" situation, if you happen to get it into your package. Oh, he can see it theoretically. Yes, he can see this and so forth.

Now, I'll show you how we can get the waterbuck and the tiger and an oppterm's oppterm mixed up. We'll be doing an assessment with our sleeves rolled up and just going along fine. And we're doing an assessment and we have a waterbuck, and we have a god, and the goals and everything all fits in. And then when we do our problems – then we get a package and the package, of course, is a waterbuck and god. All right. That's fine.
And here we are chewing along on this package beautifully, and we do our problems survey. We get it all arranged. We do our problems survey and "How would a god solve problems?"

"Well, a god would solve problems by causing things to happen, by instantaneous combustion, by starting forest fires at a glance, by fixing people into statuesque statues, uh ..."

"And how would a waterbuck solve problems?"

"Well, a waterbuck would solve problems by cheating, and by hiding in the reeds, and when somebody comes down to drink, why, all of a sudden reaching out with his teeth and pulling him into the water. And he'd solve problems by appearing very disinterested and not caring."

Well, let's look this over. Are those solutions of problems in comparable magnitude to this other list that you have of gods? Well, by George, they're not. Well, it isn't that you got your 3D wrong. You've just found the oppterm's oppterm. "Where's the oppterm?" That's your question.

Now, if you look this over very carefully, it will be some segment of the oppterm. So what you do is do an opposition to the oppterm and you get an oppterm's oppterm, see?

Let's do some additional assessment using this high Tone Scale item that we have, see. We got this high Tone Scale item. "How would this thing solve problems?"

"Well, all it would do would be to put out its hand and say, 'Peace.' And there would be peace everywhere."

"And how would a waterbuck solve problems?"

"Well, a waterbuck would solve problems by nattering." And he'd say, "Well, grrrrrr..."

So let's find some piece or opposition terminal to the oppterm's oppterm. What would oppose a god? Ah, fascinating. What would oppose a god? All right. We'll make a list of this sort of thing And there's a ways to do that, by the way. This is quite cute. There are various ways that you could do this sort of thing. This would be more likely to find you the terminal. This would probably find you the terminal. I'll give you a trick method just of – apropos of nothing.

You say, "What have you done to yourself? What have you withheld from yourself? What have you done to yourself? What have you withheld from yourself?" And you'd make a whole list of the answers. And then say, "Who would you treat like that?" And you can get a terminal list. "Who would you treat like that?" That's a very nasty little hook to get in on a line. Now, of course, you're liable to turn up with another piece that you don't quite know what to do with. Only it'll be a piece of comparable magnitude. And you sort these pieces of comparable magnitude out and you have found yourself a tiger. You found a tiger.

Now, you see, you could make a new list of some kind or another. And you could probably find the – prematurely find the pc's terminal and then get opposition terminals to that terminal or opposition goals to it and who would do that goal, you see? Or you could find opposition to the oppterm's oppterm and you could do a list of that. And you could crisscross
this thing, and all of a sudden you're going to find another piece which stays in, which gives you a comparable response to waterbuck.

Well then, what about the god? We found the tiger. What about this god? Well, that's all right. Leave him there. Put him on the back shelf. Wait for the next run around when you get out – the first part of this package going, you're going to need that. You're already a leg up on your next package, see? But it is out of the order of comparable magnitude to the terminal. So one of your tests – I can tell you here in conditional data on it – if you've got two pieces now that you're running on your pc, terminal and oppterminal and one of those is saying, "How would it solve problems?"

"Well, it would solve problems by pervading all with peaceful feelings."

"All right. How else would it solve problems?"

"Well, it'd solve problems by putting together several armies and having them descend on the city and crush it."

"All right. And how would the terminal solve problems?"

"Well, by running fast."

"All right. How would the terminal solve problems?"

"Well, by swimming long distances."

"Well, how would the terminal solve problems?"

"Well, by – by – by worrying."

Ah, you look this package over. You say, "Now, wait a minute. These two levels of problems-solutions survey do not compare." Just make up your mind that your pc won't run either.

Oddly enough, the pc will run on it, but all the time you're running the pc on it, you're putting the oppterm, the actual oppterm, further and further on automatic. And it'll all of a sudden start coming down on the pc with a crash. And you'll notice the pc sitting there answering problems. He can't get much reality to it. It doesn't make much sense, this thing "Waterbuck jumping the tiger" – this thing "Waterbuck jumping the tiger," well, and so on.

He's just never interested in the other side. When you get to those questions which are there, they're just not quite real, and he's not quite interested in them, and it just doesn't quite do. And he can tell you intellectually how it would all be, but there's no umph. There's no gut aches in it either.

And when you get this thing sorted out – you've run it for a while, let's say, that's perfectly all right – you possibly will have freed up the oppterm so it's now well in view.

Now do a reassessment on the thing and you'll find the oppterm's oppterm will momentarily drop out. It'll cease to register as soon as you get the oppterm registering. And the oppterm will be something much smaller than a god, you see.

But all the time you're running a "waterbuck" versus a "god," your pc will be sitting there, and you'll notice the pc frequently in sessions just going [demonstrates something] –
and his claws are getting longer, and he's started to grow much longer fingernails. And he will be caressing his fingernails, and then all of a sudden he gets a rather happy look at you, you know, and looks at you as though you might be edible. And you say – well, one of the test questions is – "All right. How does this make a game?"

That's one of the test questions. And if your pc can't tell you, you either flagrantly have a wrong piece in your 3D – I mean just that; I mean it's – so on – or you've got one of the items, really, is the oppterm's oppterm. You've got the extra wheel, and you haven't got an essential item.

So the first motions that you take in making sure that it's all right with your package – your pc's package – is you go across this thing and read out each item and make sure that you get the identical needle pattern. All right. That does not guarantee you do not have the oppterm's oppterm, but it guarantees that your pieces are correct. See, it's still part of the package, but it's a little bit more distant part of the package. It's the next item you've already got.

So let's look across this and find out they all register, and now ask the pc how this would be a game. Have him explain to you how this would be a game. And the pc says, "Oh, yes. Well, oh, yes, a game. What are you talking about? Are you kidding?" And you go ahead and run him and the pc develops somatics and so forth. Well, you're off to the races.

And it'll all look all right, providing your problems-solutions survey doesn't contain this ingredient of noncomparable magnitude. And if that contains a noncomparable magnitude, the highest one of the Tone Scale is the oppterm's oppterm and is not part of the original package.

So you want to do some more assessment. Now, mind you, it doesn't matter a darn if you run the oppterm's oppterm for a while. You could run it fifteen, twenty levels – I can tell you that – without the pc going off the deep end. But the case would becoming less and less satisfactory. The results are less and less satisfactory. And if you remember earlier, he got some awfully good answers that made him kind of... He started talking about his case. He started getting very interested in it, maybe earlier on.

And he says, "You know, I just," random comment, "you know I just feel like roaring all the time. I could just roar with laughter about everything. I just feel like roaring. I mean, I go out and – it'd be nice to go out and have a good roar." You know, or something like this. And he's made some comments of one kind or another. And then he hasn't made any comments – anything about anything – since. And it's just all settled down to a long haul and he isn't cogniting or anything else.

Well, you go back and look, and you'll find that one of your items is way uptone and the other item is way downtone. And they're not comparable and you're probably running an oppterm's oppterm and the thing to do is to compile another list and see if you can get another item that will stay in of comparable sneakiness to a waterbuck. That will be your missing item.
Now, you have to decide again which is which. Once you've done this, you have to re-
arrange the whole package -- which is the pc? But if you've got the two of comparable magni-
tude, frankly it doesn't make all that difference. It isn't all that important.

You can actually run for test. You can run on one side, no somatics, no interest and no
games condition. On the other side, you run it, you got somatics and you got a games condi-
tion. Well, that's the terminal. I mean, that's what you'd call crude testing. That is the crudest
testing there is. The right side gives you somatics. And the pc will know how goofy it is, too.
It's real goofy.

But that is all very important to your assessment of a 3D, because I have now found --
not very many -- but I have found that we have assessed here and there an oppterm's oppterm.
See, very neatly and pulled it in, and so forth.

Now, I was wondering about height of assessment and trying to make good sense out
of height on the Tone Scale of assessment. And I've suddenly found out that the only error
which you can make, apparently, is to have too high a height for one item and not the same
height for the other item. And you've latched on to the oppterm's oppterm, as we will theorize
at this stage, and you've got an extra piece of your 3D. And you don't happen to have the right
terminal or oppterminal. And it doesn't make a package and it doesn't make a game. Mind
you, there's only one item out.

Now, the funny part of it is the oppterm's oppterm will go out very slowly once you
have found the right item. Well, you'll continue to read for quite a while, six 3D pieces, when
you only had five, you see? You'll continue to read this for quite a while. You say, "God,"

Oddly enough, if you keep this up and go to null terminals occasionally and keep your
rudiments in and so forth, eventually -- eventually, after maybe a half an hour or an hour of
knocking at it and going around -- and by the way, pulling the pc's invalidations off. Very im-
portant. His worry about it, his invalidations have all got to be relieved to make a package
read nicely. You'll get into a situation there where god just disappears and this leaves you
with a tiger. And now tiger. Now waterbuck and tiger are operative, and so forth.

But, if you accidentally, somewhere along the line, happen to test god again, you
might find it reacting. Why? Because it's part of the package. It's the oppterm's oppterm and
you've got the next pair.

Well, that's great if you've got the next pair. That's three cheers because if we ever
have to audit the next pair, we certainly have something. All we have to say is, "What would
be a fitting opponent to a god?" you see, or something like this. And we've got a fitting oppo-
nent to a god right now, and so we get these two, and we've got our next package. Now, we
get their goals and their opposition goals, and their modifiers, and the pc's goal that matches
up into all this. In other words, you put together a 3D package and we're off to the races on
there.

This gets to be rather easy because the realest part of the ball-up of existence will oc-
cur in the pc between the terminal and oppterm.
Now, he knows he's nuts. He knows he's nuts. When he's hit this, he's hit things in it that have told him that this isn't quite fitting. This just isn't quite suitable. One would ordinarily not do these things.

Now, one can be terribly submerged in this and have his critical faculties kind of knocked out, you know? So he has to be run for a while until he finds out that running around and stabbing tigers in the back was not the best of all possible bests, you see.

Dawns on him, you know, he says, "I have this horrible, gleeful feeling across the front of my face. I wonder what that is? Waterbuck, tiger. Who knows. Of course, a waterbuck has to go around – what else could a waterbuck do but go around and put poison in all the water holes? Have to, obviously. That's absolute necessity, perfectly normal and natural. Naturally all the other animals that come down there to drink, they get poisoned, too, but you still occasionally get yourself a tiger. And that, after all, is the important thing, isn't it?"

Then all of a sudden he goes kind of over the border. He may, and he's – "Well, you know, I don't think that is quite the right thing to do. Snare, yeah. But not poison in the water holes." And he starts falling off of all of these overts, and this overt picture starts shifting. And his pattern of overts shifts, which is a test of a case running well.

Now, your opponent's opponent has been included in very few of those packages present. But there's a possibility that it is, and you should make a reinspection of this and it will tell you why the pc is not running with any great reality. The pc's running with a poor reality.

The odd part of it is, the techniques and 3D in general are sufficiently powerful that even when you're running the terminal versus the opponent's opponent with that middle part missing, the fellow's making some gains. The pcs will make gains. He doesn't make them very rapidly. He makes them rather slowly, but does make gains up to a certain point. And then he's sort of standing out in the middle of space going nowhere. He doesn't quite see where this goes.

See, the terminal obviously has something versus the opposition terminal. But you will find out the pc, if he's running these – between them, will eventually come to a point of total agreement between the terminal and the opponent's opponent because they, of course, are the harmonic of each other. So you get to a point of total agreement. There, you will – there you will be sitting there – total agreement.

He agrees with everything the opponent's opponent does. And you can't then – because the pc isn't all the way out of the mud yet, you can't quite see, if it's in total agreement, why it shouldn't blow, because he must have come to the basic resolution of the package, mustn't he? No, he's come to the basic half of the package. Only he's got his terminal and the opposition terminal, of course, are blood brothers. You'll find in this case the opponent has as an enemy both the terminal and the opponent's opponent. It's a three-cornered fight there.

Now, this can actually ball you up like mad in trying to assess. You can get a three-cornered 3D. You can get a piece which is – apparently looks like this. And here's a piece here that is violently opposed to what you are calling the opponent and violently opposed to the terminal; is not a friend of either one of them. And you'll say, "What in the name have I got?"
Well, it's very easy. What you've got is the oppterm. Because here's the way it is. What you're looking at here is you're looking at – the oppterm is, of course, fighting the terminal and the oppterm's oppterm, both. So you find an item that is dead against gods and dead against waterbucks. You say, "What's this? It's an opposition terminal to the oppterm we have found, and it's an opposition terminal to the terminal we have found. What is this?" It's the oppterm. That's what it is. And you've got the oppterm's oppterm as part of your 3D package, which you shouldn't have. You make careful note of it, however. You put it on the 3D. You put it on the 3D form because it's going to come in handy. You've got part of your work already done.

But you understand that these problems are so mishmashed, how anybody can make any sense out of all of them is, of course, pure genius, but... [laughs, laughter] But you've actually got a situation here that no pc could ever explain this to you, which is quite interesting.

You would actually have to have run them on this package before they could explain their package to you, which is something that you as an auditor should remember. The one person that doesn't know anything about his package is the pc. But why? He's right in the middle of the whirlwind. Well, that doesn't mean you should cut comm to the pc, sneer at all the pc's opinions, because they can help. They are assistive. You couldn't get any package at all unless you had those.

But at the same time, the pc insists absolutely – "Well, it's a god and that is all there is to it. And that is the opposition terminal to a waterbuck, and I know that's the opposition terminal to a waterbuck because waterbucks have always had trouble with gods. Going out in the middle of the plain and praying and that sort of thing. I can see that in a minute. Yes, sir. It's the opposition terminal."

Your problems-solutions survey says gods handle problems by obliterating planets. And waterbucks handle problems by nattering at daffodils. And, by George, it's not of comparable magnitude. And in spite of the assistance of the pc, you go on assessing. Now, naturally, you want something that is against gods and against waterbucks. So that should help you out immeasurably.

"What would be against a god and what would be against a waterbuck?", if you ever happen to come across this situation in a package. And of course at that exact crossroads you will find the terminal. And it'll be so obvious that the pc'll wonder why he never thought of it and why you never thought of it either. There it is.

Now, as you go up the line on this, you will find that pcs run well on the 3D or run poorly on 3D. If a pc runs poorly on 3D, there's nothing wrong with 3D. There is something wrong with the assessment, and that has been borne out now and borne out and borne out. If you've got the package right, it'll run.

Now, there's something I wanted you to get out of your 'eads. Having pounded it into your 'eads, I want you now to get it out of your 'eads. And that is simply this: You are not going to damage anyone forever by picking the wrong item and running it. And you're not going to damage anybody forever by running, for instance, the oppterm as the pc's terminal.
Nor are you going to damage anyone permanently by running the oppterm's oppterm as the pc's terminal, but that is the one that turns on the terrific winds of space.

If you've not seen that phenomenon go at a whizzeroo, it's because you've never seen it turned on to an oppterm's oppterm. Then it practically flattens the pc's face and skull like a pie plate. But let me tell you something. They recover. They recover.

Almost anything you do with a Goals Problem Mass assists. Almost anything you do with it assists. You can be a complete knucklehead and make the person absolutely believe that he has been ruined forever, and he will tell you so – that's one of the first things you hear about it, when you've picked wrong items and things like that – but it's not basically true. It's not true. You're taking apart a problem, aren't you? So what you're doing is trying to take it away the easy, smooth, quick, flawless way that only knocks the pcs' heads off with somatics, see. That's the way you want to take it apart. That's rapid. That's accurate. Everybody's happy about the thing, and so forth.

But remember, this is a terrifically expert job of action. This is a nice piece of action. This requires good skill on the auditor's part. And you run into all kinds of little bugs as you're trying to do this. And I can tell you the right way to do all of these things and give you the right course through, but that doesn't mean the odd man out won't all of a sudden come up and present you with a total lemon.

You've got "a Ford car" and you know that's absolutely right because it rock slams, it stays in, and nothing drives it out at all. That's what you've got.

You're all set. You've got it made. And you have a "nymph" and that's obviously there, and it proves out conclusively, and the only goal you seem to be able to find is "to whistle Dixie." Whew! What is this, see?

Well, make sense out of it. What you do, the formula you use, is to get oppositions to what you've got. And you keep on getting oppositions to anything you've got in the way of a goal, and keep working it out, and you're liable to be left with two or three extra parts that you can't quite make sense out of. And then you will eventually discover that every terminal has a goal, every terminal has a modifier, and every terminal has an opposition goal, heh-heh, to every other terminal.

So if you have three terminals in your package (terminal, oppterm and oppterm's oppterm), you would then have three goals – the terminal's goal, the oppterm's goal, the oppterm oppterm's goal. You would have three modifiers – the terminal's modifier, the oppterm's modifier, the oppterm oppterm's modifier. And what do you know? The oppterm has two opposition goals. The oppterm has an opposition goal that opposes the oppterm's oppterm and it has an opposition goal that opposes the terminal. That's getting to be a lot of parts, isn't it?

And do you know that you can also find a very strong goal – opposition goal – for the terminal versus the oppterm. You can find a strong opposition goal, and a weak, flabby, wiggly one against the oppterm's oppterm, which might form sometime a method of proving out that it's the oppterm's oppterm, because you've got the pc's terminal, obviously. He's got horns five feet long, and he's got split – he has – keeps having trouble with his fingers because they
all turn into calcium, and his fingers keep splitting and so forth. And he's going... [demonstrates something, laughter]

And he says, "Well, there's no doubt about it whatsoever. I've always thought of myself as a god." [laughs, laughter] I'm sure he has. It's part of the package and of course he's thought of himself as a god every now and then. Because it's part of the package, not because he's god.

So we get this thing all unboiled on the thing and we find out that the pc will have an opposition goal to a god. And it'll be something like, "To not pay very much attention in church." That's the way you handle it, see. So if you want to test out this thing even further, get the terminal's opposition goal to whatever this high-toned thing is you have and you'll find it's some weak, flabby, little thing that he can't do very much about.

You see, the terminal can do a tremendous lot about the oppterm, see? The terminal can lie in wait and trip the oppterm when he comes down, you see? And actually kind of cut away turf on the upside of the banks, so when the oppterm comes down to drink, a whole bank slides away. Ha-ha-ha-ha-ha. That's a necessary action. And you've got other little items such as, when it really gets down to a last-ditch fight, a waterbuck's hooves are sufficiently sharp to cut a tiger's hide to ribbons. And you'll find the opposition goal of the terminal to the opposition terminal – they will be good and strong and meaty, "To torture it until it gives up," or something like this. It'll be good and strong, you know. It will have some teeth to it. But the terminal's opposition goal to the oppterm's oppterm will be something real flabby like – let me see – "to take care of them when they show up but keep out of their way." That is how you handle it. This is the opposition, you see.

In other words, the opposition goal to the oppterm is "cut it to ribbons." And the opposition's goal to the oppterm's oppterm is "Try not to be in its vicinity and be very quiet while it is around." And somehow or another, that will take care of it. Somehow or another, that will take care of it. These are just side tests and considerations.

But I ask you, rather than to look at a bunch of tests, to look at the actual package and its composition and what you are trying to find and what you are trying to do and appreciate what this thing amounts to.

This fellow once upon a time decided on a game. And he went up against something, a thetan. And he picked this thing out as the thing. And he just cut it to ribbons and eventually became it one way or the other. It served his purpose at first, and then he had overts on it and then he became it. And then this thing was involved with another thing. And this other thing, he got overts on it as the thing he was being and it's just like making a snowball. And from there on, there's just more and more and more snow clings to it. And there's more and more conflict. And this thing amounts to a central fixation in the being's existence, and this goes floating on down the track.

But remember that it didn't start with the terminal. It started over here, clear over to the right of this picture, with the great big circles we haven't got enough room to draw them in.
This fellow picked out a "planet builder" as his randomity. He said, "That'd be a nice thing to be. I shall be a planet builder." So he went ahead and he was a planet builder. And he just did fine until he ran up against a fellow who was running temples to segregate and dislocate the orbitation of planets. And he was preaching a creed on the subject and we have the planet builder versus the temple. And if you tried to run either of those engrams, they'd just knock your pc's silly head off, if you could contact them. They just won't resolve, that's all, early on the case. They just don't resolve. They're just beyond his reality. He says, "That's fine." He can even pick up somatics off of them, which is quite interesting.

But there he is out there in space fielding bits of an exploded planet. You know, catching them as they whiz by. And they're all radioactive and he's fitting the things together very nicely until somebody from the temple says something to him, and he picks up the whole ruddy mass and heaves it at the person. Nice engram. You'll find it there totally with its radioactive burn and everything else connected with it. And you're asking a person, who now considers himself to the power of one-half of a grasshopper and you're asking him to pick up the Empire State Building with his little finger. And he's not going to do it. That's – you've reached a couple of circles which are way out here to the right of this picture, you see.

Now, he had that game going, and eventually that game blew up, and he got a subordinate game to that and then eventually that game blew up, and we're now dealing with what we earlier called cycles. You know, there were lives, and then there were cycles. Well, one game, one cycle – you can figure it that way.

The games lasted a long time or they didn't last long. And then you got down to, "Find a more finite size game." And then this game cycled over into another pair of terminals which gave you another game and then this cycled over into another pair which gave you a game, and then you eventually got down to your – what you find in your 3D package of term-oppterm. And you've got your term-oppterm and you're at, of course, the easiest entrance to the point. And you can run these things fairly flat.

But they will run endlessly if you don't have the right terminal and the right opposition terminal. And if you're trying to run the terminal up against the oppterm's oppterm, you're up again into the next cycle.

Of course, it'll run because it's a part of the pc's life. But you haven't got the right opposition to it. Something else is hanging off into the wide blue sky. I mean, you might even make it. Who knows? But all the time you're running it, you are ignoring and not getting asised a piece of the Goals Problem Mass known as the oppterm. And there's that tiger and the longer you ignore the tiger, why, the longer the pc's whiskers will grow, until the pc is just about ready ... He thinks it would be just awfully good fun to ... But he knows something is wrong, and he can't quite figure out what is wrong. He'll start complaining to you about what's wrong. Well, what's wrong is you jumped a point of the cycle. That's about all.

Now, in assessing some pcs, some pcs have bigger eyes than thetans. And at the present moment, they would not be capable of running planet builders, but they're going to sell you a planet builder, man. And you might even get it registering. But be aware of this fact that the pc can actually give you too big a piece of the package, gratuitously.
The pc somehow or another got this thing cut in, and it's beautifully restimulated. So they say, "Well, I know what it is. It's a planet builder. And it's a planet builder, and the terminal is a grasshopper. I know. I know what the game is exactly. I've often gone around thinking about, 'I've got to build planets. I've got to build planets.' I say that to myself all the time. I wanted to in this lifetime – I think."

"And a grasshopper – I've always gone out and felt sorry for the grasshoppers. I've always gone out and felt very sorry for the grasshoppers and – poor grasshoppers and so forth. And the grasshoppers – they're very nice grasshoppers, and so forth. And a grasshopper has troubles. You don't realize how many troubles a grasshopper has."

You see, you're off to the races. Well, probably it's a terminal. It's a terminal. It's an opposition terminal or something.

But you see, those two data are not of comparable magnitude. And the pc can actually sit there and force one of them off on you.

Now, you finally tell the pc this isn't it. And this operates as a hell of an invalidation because it is it. It just happens to be in the wrong sequence, that's all. It's up the line somewhere. You'll collide with it by and by. But it's just prematurely offered, and you'll find a lot of pcs have much bigger eyes than they have present thetans, see?

And they'll say, "Well, terminal? Terminal. Emperor. I know that's the terminal. An opposition terminal? Beggar girl." But you can actually wrap your wits around it, you know. You can say, "Well, an emperor, and he could have a game with a beggar girl, and later he'll have a game with an emperor. The Arabian Nights sort of thing and so forth," until you assess him on the problems survey. And then you'll find how would an emperor solve problems. An emperor could solve problems by ordering the sun to cast too much light on his people. You'd say, "What part of the track is this emperor from?" you know? And "How would a beggar girl solve problems?" By picking up apple cores in the gutter and saving them.

And yet it will look all right to the pc because he's got a short circuit through this Goals Problem Mass. You actually realize we're not talking about anything which is theoretical when we're talking about the Goals Problem Mass. That is very factual. And when we say mass, we mean mass. It's electronic standing waves, actually. They usually appear as black to the pc and these become visible. For a long time they'll be invisible to the pc, and then they will suddenly get more and more visible and all of a sudden he can really see these things – rrrrrrrrrrrr. Worse and worse. And they're what give him somatics, by the way. And they're held in place by temperature.

I better tell you something about the Goals Problem Mass as a piece of mass. It's held in place by temperature's absence. It's by an absence of temperature. It's only hung up at those places where it has been in no motion, of course, and where it has been in the most no motion at those places where it was no temperature.

So it is quite routine – and as a matter of fact would be quite surprising, if somebody were audited on 3D and didn't have – didn't run little fevers and didn't feel awfully cold in the head or cold in the back or cold in the stomach. They've had a pain in the back of their head.
for some time, and all of a sudden it turns ice cold and then you'll never hear about it any-
more.

What is this? This is simply the phenomenon of stop. What is the most stop there is?
Absolute zero, of course. There's no motion at absolute zero. Of course, heat is motion. When
you get no motion, you get extreme cold. And when you take masses down in temperature,
you, of course, get them hung. And this is not a warm universe. This is a cold universe. This
is a very cold universe. But it's very far from absolute zero or it would dissolve. There is al-
ways some heat in this universe, even out in the colder reaches of space.

Don't try to tell an old space jockey that there's any heat out in space because he
knows better. He knows better. But at the same time you call it to his memory, he would tell
you, "Well, it's true that you could take a bucket of air and it wouldn't liquify. It's not that
cold. Instantaneous liquefaction. It liquefies slowly if it didn't disperse if you had the pres-
sure. Well, I don't know about that. Well, there are probably colder places. There are probably
colder places than that. But I don't know, out in the depths of outer ... That's absolute zero."

And he'll come back to a conclusion about "Well, it isn't absolute zero, or it wouldn't
be there at all."

The physics of the matter are quite interesting: Everybody has assumed that there's
such a thing as an absolute zero, which would be a no motion, a no temperature condition.
There's no temperature of any kind. There is no motion of any kind. No particles move.

Well, the second you achieve this, there are just no particles, period. There is nothing,
period. And I don't even know that space isn't a temperature phenomenon because it has
something to do with existing dimension. Space has to do with existing dimension. And if
dimension exists, it must be on the time track. And we know that time is a temperature. If you
ever want to have time pass slowly, go someplace where it's real cold. [laughter] Really.

Now, you will, you'll get a mental phenomenon concerning it. Furthermore, people
there are liable to conceive they have problems. See? Time moves slowly if you have prob-
lems. Time moves slowly in the absence of temperature. So anybody who is cold has prob-
lems. So heating becomes one of the rougher problems. [laughter]

Now, a thetan has become conditioned to the motion called warmth. He thinks this is
necessary for his existence. He thinks he vibrates. He thinks he reacts to warmth. Actually, he
doesn't react to warmth at all. The mass with which he is connected reacts to warmth, whether
it's his reactive bank or his body. That mass reacts to warmth, and moves or shifts. And if you
get him terribly cold, if you get a thetan very, very, very, very cold, or he thinks he's very,
very cold, which is up against some very cold mass, why, then he believes implicitly, you see,
that it's a problem to him because things are going very slowly about all this. So he'll make a
problem out of it. But he gets habituated to warmth, and the more habitual warmness of ob-
jects are around him, the less tolerant he gets of it.

For instance, I know myself, in Europe three, four hundred years ago, you used to
walk around in tinware. You know, in greaves and corselets and helmets and things like that
and always be out in the weather. Well, what protection was there, you know?
If you know anything about the European climate, you'll know that the skies are normally wet. It isn't the pounding of guns that causes it to rain in Flanders excessively during wars. That's a big theory. I guess nobody ever goes to Flanders unless there's a war on and they haven't noticed that between wars it rains just as much. And steel is not very insulative.

Now, I'll give you an idea of habituation. Going across areas of Europe, or being in a European climate and wearing, in a racing helmet, a buckle against my chin – just one buckle against my chin – develop a fantastic somatic because of this cold buckle, just a fabulous somatic. And bothered by it, you know, mind it like the devil, till I all of a sudden realized, well, I've been around in this same area wearing nothing but solid steel. Ha-ha-ha. How much conductivity do you suppose was connected with that? Well, there was plenty and there must have been plenty of somatics. But there weren't.

European climate runs around ... You get so you just can't tolerate – if you get too many engrams in a climate of sixty-one or sixty-two degrees Fahrenheit average. You eventually will feel that sixty-one or sixty-two degrees Fahrenheit and you instantly react to calamity. There must be a calamity involved because that's the wrong temperature.

And you can go into old areas where you haven't been for a few centuries and hit their temperatures. And if they're colder than the temperatures you are now accustomed to, why, you'll be upset by the climate. That is why people get upset by climates. Not that thatens require a certain temperature. It's a different thing, see? It's experiential. It's the amount of heat which they think they ought to be having and of course that's usually more heat than they have had before. So you're running some kind of a gradient of thatens have to get hotter and hotter as they get older and older. Otherwise, they don't keep out of trouble.

I imagine right now if any of you ever go back to Jupiter and shop around with ... The seas on Jupiter are composed of liquid air. And I imagine some time or another you might have come in from outer space, you know, and put your hands up against that liquid air and said, "Boy, it's so good to be warm again." [laughs] And now think of how you would react with a meat body. You wouldn't react that way at all. [laughs]

So anyway, these are considerations. But the problem and the temperature are very closely associated. And they're very closely associated to the Goals Problem Mass. So that if you have a problem – where you have a problem, you have a temperature change. Because you've got a timelessness, it therefore must be a cold one. See, if the problem's going to be timeless, it's a cold problem. And when you run it, you will get the cold coming off of the pc. And I'm not kidding you, it will be cold.

Now, nearly all old implants were done by vacuums – the creation of a cold vacuum. I refer you to work done in 1956 while I was up here at HASI London. The coldness of the vacuum. And to maintain a cold vacuum is rather easy because a thaten doesn't want to have much to do with it. So of course he mocks it up and keeps it mocked up because he doesn't want anything to do with it. But it is the favorite method of implantation. And it operates as something that pulls all the pictures in on it. It is just a sponge, that's all. It's an electronic sponge.

You get a piece of warm electricity near a cold vacuum, and the thaten every time will try to pour it into the cold vacuum to dispense with the vacuum. And, of course, all it does is
hang up. Hence, you get a balled-up mass. It's implantation mechanics, is what you're dealing with, essentially.

I'm not prepared to say anything about how you acquired your valences in the Goals Problem Mass. I'll merely tell you that as they come apart, your implantations of people with beingnesses come off and you get these cold waves. And you can also get hot waves. But the heat waves are less frequent than the cold ones. They are constant, the cold ones. And they will come and they will go.

When I say they're constant, I mean that case by case, case after case, they always get these cold ridges. So much so, that if a case is not getting cold ridges, you can say that the case has something radically wrong with the composition of its 3D. And that forms another test for you. If the case has never seen any mass in connection with the terminal or oppterm that you are running, then you are running a questionable 3D package.

If he never sees any black energy at any time along the line, then the package is questionable. Because these things occur routinely and regularly in the package. Coldness, cold sensations and so forth; black masses of one kind or another; and somatics; pain resulting from these things – all of these things are constant in the package.

Now, the responsibility for finding a proper 3D package is, of course, the auditor's. Now, I have assisted you and pushed you around on this and made adjudications along in this line and tried to muddle the thing all out. And in most of these cases, those are perfectly straight. But in some of these cases, they may not be straight.

The pc in almost every case will overpersuade you if he's afraid of some piece of the 3D. The pc will seek to overpersuade you. The pc wants it changed. The pc does not think that is right.

Now, one of the things is, remember, that a pc will withhold withholds, won't he? Well, the pc will withhold terminals as though it were a mass withhold. So a terminal takes some getting at.

It's the responsibility of the auditor to have a rightness about the 3D package. And the 3D package is achieved on a very precise routine. You get a list, you bleed the meter of all additional items, you list those items and you assess them with rudiments in. And when you keep doing this for piece after piece of the 3D, you will wind up – that's a very mechanical operation – you will wind up with the items you were looking for or some of them or too many. And don't be so horrified to find that you have eighteen 3D items. If you suddenly wound up with eighteen 3D items, it'll be quite a while before the pc can tell you which opposition goals belong to which opposition terminals and all the rest of this. It'd take some sorting out.

Well, naturally, in the course of experience, you won't run into that many items. But you occasionally will find an oddball item that you can't quite figure out what in the name of common sense this item is. Well, there are all the tests which I've given you in the past to find out what item is what item and how they crisscross and so forth.

You are liable to be fooled, by having eight items when you're only supposed to have five, into thinking now that you have too many, you must have them all. And this does not
necessarily follow at all. You may have eight items. You're supposed to only have five, but you've got eight. That does not mean that you have reached the limit of your items or even have the right five. Maybe there were fifteen items available and it'll be the last five that are the correct ones. And you haven't got but one, out of the five you've got is correct.

I mean, you could look on it – that would be a very extreme circumstance, a very extreme condition, but remember all the things there can be. There can be the oppterm's oppterm's oppterm's goal, which the pc woke up in the middle of the night and suddenly knew what it was. It's printed on the wall. He knew what it was. And he comes in and he gives this to you. And you, knucklehead, didn't try to find out where he got it, what it was, if he'd ever wanted to do it; you simply put it down on the assessment list and assessed it and of course it assesses. And it assesses beautifully, except it's the oppterm's oppterm's oppterm's oppterm's oppterm. That's all that's wrong with it. And you try to run it and it just overwhumps the pc like he was being machine-gunned.

If you ask, "How does it solve problems?" the answer is liable to be something like, "Oh, well, it never has any problems, you know. That's the beauty of it. It just never has any problems. No, I couldn't answer that. It just never has any."

Oh? Well, where do we go from here? Do you know that you could actually use that piece in this fashion: You could find out what terminal would oppose it. And then find a terminal. And then get a goal for that terminal. And then find what terminal would oppose the goal. And then find out what terminal would oppose that terminal we just found. And then find out what terminal would oppose that terminal that we just found. And find a goal for it and an opposition goal. And then find out some other terminal connected with it. And all the time we're coming down toward the grasshopper, you see? We're building down from the Empire State Building to the tool shed in the base of the Statue of Liberty. We're downgrading, you see? We're coming down within the reality zone of all of this, but we actually picked it up somewhere up the line.

It doesn't mean that the parts the pc gives you out of sudden inspiration are wrong. It just is probable that they are in very wrong order. Because the one thing that is common to all Goals Problem Masses is confusion. And who is it confusing? Well, we 'ope it isn't confusing you, mate. Because we know it's confusing the pc.

Now, the pc's advice on what has been troubling him for the last hundred trillion years must be listened to, but is of not much use. The pc goes out a waterbuck and comes in a tiger, and goes out a tiger and comes in a god. And goes out a god and comes in a tiger. And goes out a tiger and comes in a lawyer. Lawyer? Lawyer? Where did that come from? "Yes, I feel like a lawyer these days." Well, if you traced it up, you'd find it up somewhere along the package, totally unrunnable, but there it would be.

All right. There's another problem which baffles you occasionally and that is what you in class have been referring to as "a scratchy needle," which means a constantly operating needle. Always got a little rock slam on it of some kind or another. You can't seem to disturb it. You say something to the pc, this thing turns on. You say something else to the pc, you don't know whether he's reacting to you or reacting to the bank and it just keeps going bangety-bangety-bangety-bangety-bang.
Well, now let me give you the first datum on this. I am aware of this phenomenon and have assessed, because of it and through it, very successfully with numerous curses. Oh, I don't tell you that it's easy, because a pc who's got that, goes null every time they turn around, too. You got a nice, scratchy needle, at least the pc is there someplace. And then all of a sudden you start to read a list and there doesn't anything react anywhere. The pc has bounced in some particular fashion. Something weird or gruesome has happened, and the rudiments have gone out. So you get the pc's invalidation off of what you were doing and you put the rudiments back in. And then you start your assessment and you get four more items on the list read and the rudiments are out and there it is. Of course, you're reading all this time through a scratchy needle. And this does not help any auditor's patience.

In the first place, it means that you are doing something a little extraordinary. It means that you are assessing in absence of adequate Security Checking. And those of you who are doing this on your reports, din this into my ears all the time that the pc should have further Security Checks and a Problems Intensive and a Dynamic Check and a Security Check run on this. And what you don't realize is that I agree with you a hundred percent.

But what you also don't realize is that I think you should be able to do it. I'm merely demanding the impossible. I can do it; you should be able to do it. I think that's a good datum of comparable magnitude.

I'm telling you it's mad. The thing is rock slamming and it's rock slamming sporadically. It rock slams and then it doesn't rock slam for a moment and then it rock slams and then it doesn't rock slam for a longer period and then it rock slams constantly for the next three minutes.

Remember all you're trying to do is get a reaction which disturbs what the needle is doing. And the only confusion you will get into is whether it's doing it because of the circuit going on in the pc's head or because you're saying something. Therefore, you have to test everything about ten times. Where you'd ordinarily only test it a couple of times, when you got a scratchy needle, you'd have to test it about ten times.

And you want to know that if you say the item ... You have to become absolutely certain, no matter what it does to your pc. We don't care if it cuts them to ribbons. [pounding the table:] Never let up on the accuracy of an assessment because you think the pc is uncomfortable. Never do that! That's the wickedest, cruelest thing you can do to a pc, because it might disturb him to go further, or it might knock the rudiments out to be less than thorough. You be thorough!

I don't care if you have a hell of a time getting the rudiments in; it upsets the pc every time you get the rudiments in. I don't care. If you are on the best side of it, you get the rudiments in. Well realizing, of course, that if you stop in the middle of a run – you've completed half of a run in the last session, you're going to do the rest of it in this session, you find the rudiments out in the middle and nothing reading – it possibly doesn't occur to you that it's just because the run is interrupted. And you're actually running another process in the middle of a 3D run.

You could actually, with benefit, simply sit down, say, "The session started," and give 'em the next command of the 3D run, you know? You just could do that, you know, no begin-
ning rudiments or anything. Make 'em run that off. Flatten that level. Now monkey around
getting your rudiments in. You might do it better that way. But at the same time, I'm not going
to find any real fault with you for trying to get the rudiments in in the middle of a 3D run.

Now, similarly, this pc is going out through the roof! You've got some item that you
don't know what it is. The pc is already in total disagreement. It couldn't be any part of the
3D. "Mother-in-law! I have never been a mother-in-law! I don't want to have anything to do
with mother-in-laws and so forth. And you just keep up with this story about mother-in-laws,
mother-in-laws, mother-in-laws and I am sick of it!"

You say, "Good," and go right on checking mother-in-law. Because it is much crueller
not to be thorough. That is very cruel. You be absolutely sure. Never, never give it a lick and
a promise. Never give it a lick and a promise. You be sure. Not because somebody came
along and told you authoritatively, "That's it." You be sure! And you won't mess anybody up.

And if you were doing a thoroughgoing assessment that was cross-checked against
everything, against everything, you would wind up with more excess items that you could
normally count. Well, just do them all on a problems survey. Do every terminal you found on
a problems survey. Take the two lowest scaled ones and that's the term and oppterm. Figure
out which one will give the pc somatics and run it. I mean, that's about – that's the crude way
to go about it.

This scratchy needle thing, this becomes very critical. Oh, you're obviously – this per-
son maybe needs another month, another two months of preparation, of careful work and so
forth, before they're really ready to assess. But it can be done.

But now you've got to be ten times as sure. Man, I've sat there and looked at one of
those things, you know and it's gone knockety-knockety-knockety-knockety-knockety-
knock. And I've said, "Grasshopper," you know, "grasshopper, grasshopper." And then I've
just stopped speaking for a moment and it's reacting exactly the same way I was reacting, you
know? It goes on saying, "grasshopper," you know? Only I'm not saying grasshopper, it is.

So finally I'll say, "Floor, floor, floor, floor, floor, floor, floor, floor, floor, floor. What are
you invalidating? Have you invalidated any of this?" No, the pc hasn't. Gets a big fall on the
needle, you know? Clean that up. Get the invalidations off of the terminal, the invalidations
off of the in-session, the invalidations off the auditor, the invalidations off of Scientology, the
invalidations off of me – all of which rock slam. This doesn't quiet the needle down any, but it
gets the terminal reading again once in a while.

And then you sit there: "Grasshopper, grasshopper, grasshopper." And then wait until
the needle is not moving very much. It's only a quarter of an inch wide, you know? And you
say "grasshopper," and all of a sudden you'll suddenly realize that when you say grasshopper,
you get a throw. And maybe the thing is getting an upthrow when you say grasshopper and
that is why you were missing it.

The start of the needle pattern for a 3D item is an upthrow and then a down. You get
absolutely sure that if you saying that it is causing it to change reaction and when you're sure
of that, when you're sure of that, you've got your item. But, boy, it takes you a while.
I wouldn't be cross with you for one minute if you sat there for two hours just trying to make sure of one item. Just letting it go by and waiting for the needle to calm down maybe or speed up. And then try to read a couple of items to it and try to get an instant reaction on it and then try to get the invalidations off and try to get it all calmed down again. And then [snaps his fingers] hit the thing again, [snaps his fingers] hit it again. It's not economical in terms of time. It is just that you should be able to do it. It is a doable activity. So therefore, you should be able to do it. It's impossible, so do it. I mean, it's a perfectly reasonable viewpoint.

You know why you should be able to do it? Because you're liable to have a pc all upset in the middle of a 3D run and all of a sudden find out that you've been running a water-buck versus a god. And you've now got to find the opposition terminal with everything upset. So it's a needed piece of skill.

So you sit there and instead of relegating them – because you've made a mistake – back to seventy-five hours of Sec Checking and smooth-out and get all of the auditing off and oh, my God. Instead of doing that, why, you sit down there and learn to read through that scratchy needle, because he's stuck right in the middle of the terminal. That's what it is. He's stuck right in the middle of the modifier.

Now, if you haven't got all the modifier, the modifier won't turn it off. Your chances of finding all of the modifier are usually quite remote. Equally, I will be frank with you, he could just as easily be stuck in the oppterm's oppterm's oppterm's oppterm. And he isn't about to move off of that until you find the original part of the Goals Problem Mass.

He's probably stuck way deep into it someplace, some weird and impossible situation. There's various combinations of this. But we are talking – when I am talking to you about directions of how to do it, please, please recognize something. We are talking about something which is essentially as simple as a bunch of kids' blocks.

If you took two small blocks and two larger size blocks and then two big blocks and then two great big blocks, and you pair by pair stack these up in a line, you would get about as far as you'd have to go to blow a person to OT, see? That's at a guess. And here's this stack of blocks. All right. You've got to get down to these small blocks, or it's not going to run with any reality of the pc. And the pc's stuck up here in the third pair, so the needle is going tickety-tick, tickety-tick, tickety-tick. "Planet builder, planet builder, planet builder." And you say, "Look at that piece of dirt."

And he says, "Well, that's awfully big."

And you say, "Well, what about this piece of dirt?"

"Well, I don't know. That's pretty big."

And you say, "Well, what's your terminal?"

"Oh, I don't know. I've always thought of myself as somebody who built planets." (If you could get it down to that; only he probably doesn't know anything about it at all.) "Oh, somebody who'd built planets, I guess. You know."
Total apathy. He couldn't – if you gave him a building jack, he couldn't raise up a little piece of sod, you know. And he's trying to buck into a package where somebody picks up a moon in one hand, you know and puts it in orbit casually, you see, and decides he doesn't like that planet, so takes the orbital centrifugal force out of its fellow planets, you see, or slows it down suddenly, you see, so it'll drop into the sun so he can remake it. This is the terminal that is ticking. And you've got a pc that's now ...

"When was the last time you picked something up?"

"Well, I think it was this morning. I was trying to pick up my fork when I was eating breakfast and I had an awful hard time doing it."

Well, you obviously are not going to run this huge, massive, strong, powerful terminal on this pc because it'll practically run forever. It's the wrong end of the 3D mass. You've got to get over here and you'll find out his terminal is a grasshopper. A grasshopper versus a cactus or something, you know. That's the term and oppterm. You see where you're going? You have a responsibility of getting something the pc can run. But there is this end of it available.

Now, oddly enough, there are tinier pieces of the Goals Problem Mass. And you start grabbing these tinier pieces and, of course, to some degree you are wasting time. And these tinier pieces of the Goals Problem Mass are best handled by Sec Checks and by the other – because they will blow – they are capable of blowing. Sec Checks, Problems Intensives, things like that.

You could find a lesser terminal than the pc's terminal which matches it up. You could find "Agnes." And Agnes might very well be part of the Goals Problem Mass. He's known Agnes for a week. And the opposition terminal to Agnes is "a policeman," and he's known the policeman for three days, you see? And that is the local, current game. It's the fact that Agnes is liable to turn him into the police, only he is this or that. Only, it's all part of the Goals Problem Mass, only he really is a policeman or something.

And it all stretched up here into present time and it's absolutely microscopic. You would handle it ordinarily in a session as a present time problem. And you will recognize as you're running pcs that you very often – very, very, very often will find that you have often handled a piece of the Goals Problem Mass on a pc without recognizing that it was because, of course, it's the most available pieces around – are pieces of the Goals Problem Mass.

No, we want those two solid terminals that will stay in, that we can really audit solidly so that we can graduate the pc on up and take care of him.

It's as simple as kids' blocks, how the thing is put together. There is nothing very complicated about how it's put together. Knowing that, you should be able to exert your wits and go through the complications of E-Metering and so forth, necessary to find those parts because they're not known to the pc and will only become known to you if you, of course, apply an E-Meter and very good auditing

All right. Well, I hope that these theoretical guesstimates and that sort of thing will assist you in some degree. And in my absence after next week and so forth, you'll probably all fall apart, but don't worry about it too much because I will be here next week, too. And you won't be in any desperate states – not very desperate anyway.
But anyway, the one thing that is startling about a 3D is that if put together right, the advance it makes on a case and the reality the case has on it; that is what is startling. When that is absent, you haven't got a 3D. You've got something else. You've got the terminals too far up the line. You've got something wrong. Put it together right so it's of comparable magnitude, so that the pc can run it, so there's reality on it, find it just exactly the way you've been taught. If you find extra pieces, you can even find out where they belong, too.

Okay?

Audience: Okay.

All right. Well, I'm very satisfied with the way things are going except you, of course. [laughter, laughs] And I will be looking over the many, many next days' auditings before I leave. But I wish tomorrow you would do something to try to apply this particular lecture to the pc that you are running and just see how it adds up, and you will get some interesting reality on it, or you will suddenly find out why your pc isn't running. Okay?

Thank you.
