But if you will notice – if you've had many sunburns, that a – that cigarette smoke stings. You can hold cigarette smoke up close to your face for quite a little while and you'll get it stinging. Or all of a sudden you get some kind of a lip upset or it'll start burning or something of that sort. Well, it's the same phenomenon. The same phenomena. It's the same stuff.

Anyway, we gratuitously were going to help out the tobacco companies and then found out that they had appointed a Committee for the Defense of tobacco Companies, and this committee is in the research business. And some guy goes around, and he's got a lot of letters after his name and he gets everybody to contribute a lot of money so that he's then permitted to sit at a desk and shuffle papers. And then he takes all the papers that are issued him and he writes new reports, you see; and then they go to some other society, and they take all those papers, and then they write new reports on his papers, you see. And then, they have another society, and they write new reports on these two societies' reports, you see; and then the first guy has still got a job because he can still rewrite the papers of the third society, you see. And they get this circle going and that is what is called research. Never – never be bumbled as to why they don't get anyplace much with research in this society because that is – I'm not even being sarcastic – that is the way they do it. They grab all of the funds for appropriation and then run a can't-have of knowledge on everybody, see, by circulating these papers. You've seen them do it.

The US government has gone insane on this subject. My God, you could walk into the US Government and you could set a spaceship down in the middle of the Pentagon, fully equipped with crews, oxygen supplies, and call all the generals out and say, "All right now, boys. We're going to go up to the moon and bring you back a sample of the stuff – whatever's up there." Take off, go to the moon, bring them back a sample, present them with a sample, give them all the photographs; they've had you on radar all the way and so forth and they would turn around to their research department to find out whether or not it was possible to build such a spaceship! And of course, the research department has only been reading their
own papers, so of course, they say, "No, it is not possible to build a spaceship" and you would have had it.

They're really going to lay one terrific egg on research one of these days because it's getting more and more the old school tie and it's all tied in and it's all this and it's all that; and they are just rewriting papers. And this Committee for the Defense of Tobacco Manufacturers is one of these outfits. See, we've had enough correspondence with them to know what the old school tie is all about, you see and we've just been trying to tell them that probably it is because people don't smoke enough cigarettes. And we can prove that you can actually get rid of the effects of atomic fission using the ingredients of a cigarette. Which of course, what would this do to this anti-tobacco campaign which is now upsetting the income of tobacco companies. But that is a solution, and they're only in the business of problems, so they don't want anything to do with it at all.

I've detoured, but I thought I might tell you something about that because I found it rather amusing when it was happening. I knew definitely what was happening.

That's why we get research done, is because we research. We look. We observe and then we don't spend the rest of our lives getting into arguments with people about what we wrote about it. You see, it's the basis of whether or not it works, not the basis of whether or not we are qualified to judge. Does it work or doesn't it work and that's the whole criterion and that makes us kind of new and strange. All right.

Dianazene is the whole mixture of the ancient Guk plus nicotinic acid and is used only for the purpose of the discharge of radiation and is an experimental drug but does do some remarkable things. So much for that.

Guk, on the other hand, for fifty-seven minutes after a dose of Guk is taken, a pc runs at a much accelerated rate because of the chemical boost, by actual test – by E-Meter, and so on. It does speed auditing for the first fifty-seven minutes after the dose is taken, for that exact period of time. This was very carefully researched.

Female voice: That would be Guk only?

That's the old Guk. That's the first three-item formula which I gave you. If you have nightmares, you should take some Guk. [laughter] That's right. If you're having nightmares during auditing or something, you've simply drifted out on B1 and you want it to drop off [snaps fingers] and take some Guk. It's a chemical assist. That's what it is.

Furthermore, it will run engrams through all by itself, too, which is quite interesting When you start taking this stuff periodically day after day – you take a dose of it every day regularly as a clock, and a somatic will progressively go on through and move – you'll move through an engram. Nutrilite, and some of these other substances, have this same basis, but not in these proportions.

And these proportions are so alarming to a chemist that they just don't know what they're looking at. And yet with great aplomb they will give 100 milligrams of B1 to people, without the calcium and without the ascorbic acid and it sets them up to lose all their bones and teeth, because B1 will find ascorbic acid from the teeth and gums and will find calcium from the bones and teeth if you start feeding somebody with it. It'll find it in the body. And so
you better put it there in the stomach for it to discover real fast. Otherwise it softens up all of the bone structure of the body, which is quite interesting

Shows you the irresponsibility of some of the drug companies like Abbot, Parke, Lilly, Menninger and some of these other drug companies. [laughter] These characters are uniformly having a happy time pushing out into the hands of doctors and psychiatrists, heavy enormous doses of B1 which are given by the needle and given by oral, and so on. They just give enormous doses of this stuff, and it's just knocking people to pieces. They never even bothered to find out if there was any supplementary vitamin had to be given with it.

I think we're the only ones that ever did any research on it, probably because we didn't have any profit motive. Of course, that's a snide remark. I know that Abbott, Lilly and Parke and Davis and all the rest of them – I know they have no profit motive at all. No, they never invest any money in fighting Scientology or drugless healing either. They – never, never, never a penny. They invest it strictly in the American Medical Association and tell them to do it! [laughter]

By the way, there's no Pure Food and Drug Act in England, for which you can be very devoutly thankful. [laughter] But you can buy a bottle of medicine in England and it doesn't have any of its ingredients on it and in America all the ingredients have to be on the thing. But then to make sure, they get the Food and Drug administration which is totally supported and subsidized by the drug people – and if one of the big companies comes in with a new drug – doesn't matter what it does, you know – why, if they're a big company, they get an automatic okay. It's automatic. "Well", they say, "that's Parke-Davis; must be all right."

So they have a sterility pill now in America which was okayed by the Food and Drug Administration, despite the fact that it has about one hundred percent side effects and practically no action on virility. It's almost a hundred percent side effects. It just tears a person to pieces. But because Parke and Menninger or somebody put it out, see, why it was automatically okayed, and they have started actually now, reversing the flow – a good example of flow reverse – and they've actually started okaying only things that are harmful.

They okay the electric shock machines of the psychiatrists even if they are going to short out and kill patients. That's okay. But they won't okay an E-Meter. That's a harmless device so it can't be okayed. They wouldn't okay somebody selling bread pills which are totally harmless, but they would okay somebody selling a sterility pill. I think these sterility pills are the biggest racket anybody ever heard. They are about fifty cents anapiece, and you have to take one a day, and that's fifteen dollars a month, and the net security of them involves with upsetting the entire menstrual cycle, blood upsets; I think it makes people dizzy, huh?

*Female Voice: Sick at their stomach.*

Makes people violently sick at their stomachs and consistently dizzy and – and fixes them so they can't eat, and so forth and so that's the very thing we ought to do.

Every time you get a government bureau set up to guarantee purity, you see, they run a can't-have on impurities on everybody [laughter] until they finally become totally impure. A wonderful example of a games condition. Just gorgeous.
Well, I've talked to you quite a while here, and you're way overdue and probably anxious to get home so that you can get back in time!

I'm very happy with the case results which you have been resulting. Doing a good job of auditing. All except those, of course, who have just come lately and we can't expect anything more than that and we're not going to worry about it particularly. We won't worry about it till Friday!

Saint Hill, by the way, doesn't have any dungeons. There are no dungeons at Saint Hill. There's only the remains of some. And down here there's an – the old wine cellar looks like a dungeon and the electric door on it has nothing to do with the fact that atomic fission has been used in there or anything. And the actual entrance to the dungeons has been sealed. And there was an entrance in there. If you go in and inspect the bricks very carefully you will find out where the dungeons are. They were right back under the terrace back there. It was an old Norman castle sat on this site before 1733 and its dungeons are still there. The boys discovered them the other day and we're not going to use them ... before Friday. [laughter, applause]
GAMES CONDITIONS

A lecture given on 20 July 1961

How are you!

Gee! Green light out there. Look at that! Storm coming. Yeah, green light. I remember being in the middle of a Kansas – what do they call them out in Kansas? Tornadoes. They call them tornadoes. That's it. It sounds utterly incredible. The wind went up to about a hundred and some miles an hour and you couldn't see fifty feet and everything was as bright green as pea soup. I never heard of it happening that way and then twenty-five pound blocks of ice started raining out of the sky. And I said, "This is Kansas." And then I said, "And they took it away from the Indians." [laughter] It's quite startling.

Well, I think this is the 20th of July, AD 11. I asked you for questions yesterday and answered quite a few of your questions and today I probably ought to tell you about something, if I can think of anything to tell you about. There's very little doing.

I have an announcement. In addition to the three other course Clears that were made on the HGA Course in Johannesburg, another Clear has been made by the HGC in Johannesburg in the last twenty-four hours. Little girl recently off the HPA Course by the name of Spinder, using Routines 2 and 3. I'm bringing you up to date on the thing.

You see, now, the oddity why some people get Clear and some people don't get Clear has a lot to do with the ability to confront problems. This was apparently the random factor involved in this sort of thing. In other words, the rudiments factors. They were so oppressive with some cases that they went nowhere. And you just ground and ground and ground and picked off a grain of wheat and chaff and picked off another grain off the pile and it was going slow because the rudiments were out, but the person's responsibility was not up to knowing that they were out and so they didn't register. You get what I mean? I mean the guy is so disturbed by his present time environment he never gets down to the basics of clearing.

Okay. Let me see. There was something to talk to you about. What was it? What was it? It had something to do with the aspects of um – oh, I think it was problems.

There are a number of ways of running problems and I'd better bring this to your attention. When you say Games Condition Process, you mean that it is an interchangeable, negative bracket. In other words, it's interchanged between person A and person B or person B and person C and person C and person B. I don't care how many legs the bracket has got on it, but it is basically a denial of interchange. Whatever it is, it's a denial.

Now, a Games Condition Process – a model process – would be worked out on an E-Meter for the pc. All commands should actually be worked out on an E-Meter. I can give you certain blanket commands that will work on everybody – on some very well and on some mildly well, just because of the variation of the auditing command from pc to pc. Certain things are not meaningful to some pcs and certain things are.
So any auditing command should be cleared on a meter before you run it, any auditing command.

When I tell you to run such-and-so and so-and-so, I will generally give you one that has a high general workability on all pcs. But at the same time, I'm liable to give you one and tell you to "assess the command."

Now, this means that there's probably a much more workable workability to be found for this command in the particular pc you are running.

Now, there are certain vagaries associated with commands which you should know and I, however, am not going to at this time try to sputter off all the rules that govern commands. As far as I know, they've never been written up. I've never written them down in column form – one, two, three, four – and said this is the laws of the origin of command, mostly because I know them but haven't particularly articulated them. I can sort out commands and know whether they work and know whether they don't work. It's quite complex. There are certain things that are workable and certain things that aren't and you see all these things represented in the bulk of the work. That is a whole subject all by itself and you should identify it as such. It is a whole subject of its own.

Now when I say a games condition, I mean an agreement on can't-have amongst various relationships of people or beings. It is an agreement of can't-have and you are likely to find this as the first thing your pc tells you.

"Did you ever deny anybody else a thought?" should be then followed: "Somebody else giving you a thought?" Got the idea? I mean, at once your pc is liable to come up with the fact that it ought to be "have" for self and "can't-have" on others.

Now, that is a true games-condition condition as far as that is concerned, but you're looking for the game. And the game was an agreement, so it is can't-have on the other fellow and the other fellow "can't-have" on you and he "can't-haves" on other people and other people "can't-have" on him. You get the idea? And it – it is just a total agreement about this and only then do you get it nailed in brass.

Now, the disagreements which come up off of this line are immediately and directly on the surface of it and actually could be run. You say, "All right, get the idea of refusing problems to another and get the idea of another giving you problems." You're going to get meter reaction and it will run. There is no doubt about this and there's actually nothing wrong with running it this way, except that it's not very fundamental. You see?

You're looking for the time when everybody was in agreement because it is agreement which nails it in concrete, you see. When you have a widespread can't-have agreement, then you get mass and all kinds of electronic phenomena, see. Everybody agrees this should exist, therefore it is the thing to do!

You want to know what happened to man under the Christian civilization – you had a widespread agreement on can't-have of sex. See? It was very broad and I know that I probably get my share of criticism for chopping up other people's religions and so forth. I'm not chopping up other people's religion. I'm sure you were part of a space-opera party that planted christianity on this planet. [laughter]
This situation of Christianity and a can't-have on the subject of the second dynamic: now that is about the most fundamental can't-have that you can run. That is "can't create", see. Denying other people creations and other people denying you creations and one and all are in total agreement that we deny creations and what does this do? Man, this not-ises a reactive bank into action and limbo faster than you can spit. If people aren't crazy, they'll make it in very short order.

Now, if you see how idiotic this is, let's put it on the subject of pottery. Let's get some kind of a religious wingding going of some kind or another in which it is an offense against some mythical god, who is all-powerful and who will choke down your throat at the least thing and take your thetan out of your head while you sleep and do all the other things this mythical all powerful might do – any kind of a god you want to invent – and then let's have this god have as the finest, highest crime that he can imagine, somebody making some pottery.

All right. Now, therefore, nobody in the society is going to be permitted to make pottery. Now we rig it at the same time that the society is totally dependent on pottery for all of its economic stresses and strains and carry on.

Let's say England – let's set up England you see, so England has only one thing it can do. It has enormous supplies of clay. It has lots of fuel to bake pottery and it ships pottery to all parts of the world and it depends for all of its food and other things on pottery. And now let's get a game going by which, immediately, it is against the law and a criminal offense to create any pottery.

Well now, can't you just see people going around the bend trying to measure up to this thing. You can see it when I put it out there in the clean air, see. They go round the bend. Are they supposed to make pottery or aren't they supposed to make pottery? Don't you see? And they agree that nobody else should make pottery, but they compulsively have to make pottery in order to eat or get paid or have anything to export or use any of their vital, natural resources. And one and all is ready to punish them on the one hand for making pottery, but they're going to be punished like mad for not making pottery.

Now, wouldn't that be an interesting thing. You can see this case in court, case number 362, followed by case number 363. And case 362 has something or other to do with whether or not we have fed the family. And the fellow goes to prison or something of this sort for not having fed or taken care of his family. And he tries to explain to "Your Honor." He says, "But, Your Honor", he said, "I have to uh – uh – you see – the only thing I can do is potter and uh – actually, I was fined last month, you see, for pottering, and uh – so therefore ..."

And the Honor says, "Nothing to do with it, nothing to do with it, nothing to do with it. Ninety years", you see. And case 363 comes up and this fellow is accused – primary crime against the land, of having actually made some pots. They were found in his possession. He was actually – actually did make these pots, and so forth and Your Honor says, "Well, that's ninety years", see and case 364 would have to do ...

Well, of course, this is pure nonsense and idiocy, but what could the society do? It was forbidding its own survival. Eventually, all you'd have to do to anybody in this country is just show them a piece of pottery and they would just start screaming, you see.
Now, let's look at the second dynamic. You've got to have bodies. That's the primary vehicle of locomotion used on this planet is a body. You're not supposed to make them, but if you make them, why, then you're supposed to take care of them, but you're not supposed to make them. And you go to jail for having made them and not taken care of them. You see? Or you go to jail for all sorts of neglect charges and that sort of thing but if you really go flat out and start making bodies like mad in all directions, why, of course, you find yourself in court at once. [laughter] And it's one of these, sort of a cul-de-sac in the Culture, you see. Everybody's dependent when he kicks the bucket, on picking up a new body, but it's sort of against the law to make them.

Now it's against the law also economically. There's a penalty on having children. If you don't believe it, have some and start paying all of the various odds and ends and you can no longer live in a one-room house. You've got to have a three-room house and then you can no longer afford to just sort of sit around in the evening. You've got to work hard in order to pay for the three rooms, which you've just gotten. Only how about the fact you have to work, therefore, you've got to have a nanny or something like that to take care of the child and here we go, you see. We're outward bound.

Now, this is a sort of a penalty mechanism. You see, it's actually a sort of a punishment mechanism and yet, one and all are totally dependent on getting bodies made if bodies are their favorite vehicles. If you're going to have a body and an identity, a beingness, importance, problems or anything else in life, you'd better not show up without a body. People won't pay a bit of attention to you! [laughter]

Now there's more basic law written around the creation, the noncreation, the care of and the noncare of bodies on the subject of the second dynamic than you could easily tabulate up here in the law library in a lot of long English winters. They are innumerable! But running right along with it, worked into the society, is the series of economic penalties of one kind or another.

So it's rather fantastic. Don't you see? You must create bodies. That's obvious, but you must not create bodies. That's also obvious. So when you get a "must" and a "must not", which run right close in together, it isn't enough to run off the contradictory must-must-not situation. You can pull this thing apart because it is in the field of disagreement. These facts do not agree with facts and you can actually start taking them apart with any process you care to take them apart with.

Now a games condition, however, underlies the fact that: how did you get suckered in on this? How did you get so that you could actually accumulate a motivator of this character? And that's the question you'd better ask.

It's like the question I long since should have asked my poor father. He used to complain about money and how it was so expensive, you see, to raise a family. He used to complain about this all the time and of course, the number one question was simply, "Well, why don't you make more money?" Well, obviously he didn't make more money because he knew he was not supposed to. He was already doing something which was just a little bit beyond the pale, you see, in raising a family. Because there is so many penalties connected with having – with doing so, obviously it must not quite be right.
Now, this of course, gave him no resurgent willingness to go on and make the money to raise the family, don't you see? He didn't have any willingness to do it because he was kind of being punished for doing so, and it's very complicated and it's sort of spun in on the thing. Well, you can take all these disagreements apart, and you can cause a considerable resurge in the pc.

But how did you get so you could have a motivator? You must have been party to the can't-have. You must have been party to the can't-have somewhere along the line – an originating part of the can't-have. It would be necessary for you to suffer the consequences. You can't suffer any consequences you didn't have any hand in creating, you know. It's just not possible. So you must have done something that agreed to all this and you must have done it with people, not because they disagreed but because they agreed, too.

So underlying all games conditions, you can very easily suspect that there is a total agreement by one and all that we must all "can't-have." And now what we're doing with the disagreement is disagreeing with the game that we made sure came into being so therefore, you can take the disagreements off the game which we brought into being and you can cause a resurge. Or you can undercut this by getting all of the agreements to have this game, because the game won't persist without the agreements. ARC is always stronger than no ARC.

So that's what a Games Condition Process is all about. It reaches for and seeks to isolate the basic agreements on some kind of a wild game of some character or another and the word "games condition" is a derogatory actually – the words. They mean a very specific, technical fact. There's a technical thing goes along. When you say games condition, you mean a package and the package has to do with this: it means a fixated attention, an inability to escape, coupled with an inability to attack, to the exclusion of other games.

There's nothing wrong with having games. There's a lot wrong with being in a games condition because it is unknown. It is an aberrated activity. It is reactive and one is performing it way outside of his power of choice and without his consent of will. He doesn't want to be there. He doesn't want to be playing this game. He's got to play this game. He has to play this game. He thinks he'd better like this game because he has to play it anyway, you see. And actually, it is an overthrow of the power of choice of an individual. When you say games condition, you mean that somebody's power of choice has been subjugated against his will into a fixated activity from which he must not take his attention. That's a games condition. In other words, it's a sort of a mental trap. It's a sort of a doingness trap. It's a sort of a cotillion in a barred ballroom.

The pc will be the first to tell you that the doors are all shut and locked. There isn't anything you can do but to play this game. There is no dance you can dance but this dance. It's different than jail. In jail you can sit there quietly and meditate upon the sins of your jailers. But not in a games condition. A games condition is a cotillion. You're not even permitted to sit still. You've got to do. You've got to do that. You've got to do something else. These things are all mandatory, and they must be all done in a certain area and always according to some wild ritual of some character or another.
And although the sun may be shining in the village square and the clouds may be caressing the mountaintops round about, that must not be observed. One must never go out there. One must never walk up and down that village square or look at those mountains. That's for sure. There are other people around, but if they are not part of the game, one must have no communication with them. The world in essence becomes massless, spaceless, timeless and peopleless very rapidly. Most marriages that go on the rocks are totally cast in the mold of a games condition. If a marriage is going to go on the rocks, it's just some kind of a games condition.

Here's a typical one. This fellow and this girl. She was a man, and he was a woman. [laughter] Back along the shores of the lower Zambezi when it was a civilization, they happened to be partners to the same execution. Whether they were executed or whether they executed somebody has very little to do with the thing. But they were both involved with this and there was a lot of shame, blame, regret, involvement and can't-have. And they got really snarled up, man. They really got snarled up. If there was anybody's guts they really hated, it was this other person's guts. And that was something we evidently must really do in some future existence, is get even with this person.

So the millennia roll along and one day while calmly picking lotus leaves, [laughter] one looks up and sees passing by in a boat this person. Recognizes him on a sort of a wavelength, God-knows-what principle, you know. Wow, see. Enters into a series of intrigues and eventually gets executed by or executes the person or goes through the whole dramatization again of shame, blame and regret, see.

Now, life is totally narrowed to this point, you see. And time goes on and one is sitting calmly enjoying his martini in a bar in Manhattan and this person sits down at the other end of the bar. Well now, we know by past experience, it does no good to get them executed swiftly. Murder is out. So let's wear them down slowly and the other person, of course, simultaneously gets the same idea and there ensues some kind of a love-hate cycle, resulting in matrimony and we don't know what the devil we're looking at. Of all the misemotionalisms you ever cared to see, you are certainly going to find it in that relationship. Because it's basically based on a total agreement that neither one must have anything: life, liberty, happiness, money, houses, nothing.

Now there have been disagreements with this and one is actually living in the world of disagreement. Of course, the other person must have a house, don't you see. Of course, the other person must have life, of course. And of course, the other person has rights, of course. And every one of these "of courses" are in violent disagreement to the basic games condition, which is a total can't-have on life, liberty and the pursuit of happiness – total denial of any one of those factors. Their tenderest moments are, of course, their moments of wildest disagreement. I mean – not disagreement from the standpoint of fighting, but when they sit down and they say, "Well, we're very fond of each other and everything is going along well", this is the wildest disagreement of it all.

It's pretty goofy to watch one of these things go. Pretty goofy. You can't make head nor tail out of it. All of a sudden one of them gets a chance and it's an oblique chance and they
whip out a bayonet and plunge it – deep, man. But it's usually a legal bayonet of some kind or another.

And out of this, we get all sorts of interesting maxims, none of which are true. Like there is "Hell hath no fury like a woman scorned." We read this off, you know and all we see is the later-day disagreement and we see this later-day disagreement and we say well, "Good heavens, what produced all the fury involved with that situation, because they were getting along so well for four or five years, you see. They were getting along so very well and for this to suddenly blow up like that, well, he must have scorned her and she must have gotten even with it, so this thing of jealousy and so on, these are very, very powerful emotions. Oh, they're very powerful." And we assign it all to jealousy and hate and get a whole bunch of cockeyed rules here that have nothing to do with it. No, this thing is not based on some nebulous thing called "jealousy". This thing is based on a desire for sudden death. You see? It's the agreement and disagreement on the motives involved.

When two people get in this condition with each other, they will fixate on each other and the rest of the world ceases to exist. They stop going places. They stop doing anything. They stop going anywhere. They stop living, actually. They sort of sit and stare at each other. It's a fact. You've seen it, I'm sure. That is the end result of a games condition.

Now, there are your conditions of fixation and there is your "cotillion in the locked ballroom". Well, it's like two fighters being strapped together and made to fight and they can see no part of the horizon except the fight. Don't you see? Now that's basically what you're looking at. Games conditions can exist on any dynamic – any dynamic.

I got in a games condition one time – I'm sure you have, too – I got in a silly cycle. I don't know, a trillion, trillennia, trillennia ago. And every time they had a war, why, I went out. I would either be a pilot in, or commander of, or somebody connected with an interceptor squadron on the outside of the capital. Societies used to last longer than they do now. And it wasn't anything for a society to go a billion years without much change.

But, every time the society would get into trouble, usually with the same adversaries, why, that was the drop of the hat. That was the signal. The whistle had gone and you would go down and snappily report to the Seventeenth Interceptor Squadron, which had in charge of it the protection of the capital, don't you see? And the enemy would come over and you would take off in an interceptor and you would go up to the center of the airport and you would either shoot down the attacking plane or be shot down and always at the center of the same airport – for a billion years.

When I ran into that mass on the track, I said, "What is this?" you see. I could see the airport okay. That was fine. I look around and what is this? What is this nonsense that is going on here? Because it is a total stop exactly above the middle of the airport. Of course, there's your overt-motivator sequence always takes place exactly above the middle of the airport. You know, if an enemy attacking the city can just keep the interceptors on the ground, he's got it, you see, and if the interceptors can just get up, why of course, they've got it. They've got protection accomplished. So one of these two things would get accomplished every time there was a war, but nearly always in the same place. I don't think the perimeter varied as much as a square – as a cubic mile.
And you talk about a games condition! Once I collided with the middle of that airport in the bank. I could practically spot the middle of the airport in the physical universe. The area still exists, somewhat decayed, but it still exists. And you talk about a fixated area, you know. You get your attention on it, you just can't get your attention off of it. Your attention goes clang! What it is, it's a games condition. It's totally aberrated, has nothing to do with reality, has nothing to do with anything. If I'd had any slightest idea during this whole period of protecting the capital, I certainly wouldn't have operated in this other sphere, because that wasn't my normal sphere of operation in that society. That's what's goofy, you see.

I simply would have gone on and done a better job diplomatically or politically, don't you see, or moved into diplomatic or political spheres which I wasn't in. See, I would have done something effective or I would have developed some weapons or developed some defense mechanisms or something like that. They didn't do any of those things. War is declared, you know exactly what you're supposed to do. You go out to the Seventeenth Interceptor Squadron. You take down your cap off the wall and they run out the plane. You get in. Up you go. Clang! You have either protected them or not protected them as the case may be. You know, a billion years is a long time to go on the same treadmill.

Frankly, wars being space opera type wars, they rarely lasted more than about thirty days at the outside. So you never had a chance to do anything else but just clang, you know. You're shot down or you shoot somebody else down. Fabulous. Fabulous.

You get what I mean now? That's just a total cycle. I didn't do anything effective for the society at all, ever. Did nothing effective for the society. Because let me assure you the last effective thing you would do with a society is permit enemy planes to approach to the interceptor field on the outskirts of the capital. Well, for heaven's sakes, an enemy ought to be halted somewhere out around the borders of the empire, if you read it in any of the textbooks, you see. But no, that was the thing to do. You got the idea?

That was the thing to do. No reason could interpose in any way, shape or form against that action. I'm sure that people could have stood around by the hour and tried to talk me into the idea that, "Look, if you're so interested in the idea of the capital being protected, then why don't you get interested in training up better pilots for the interceptor squadrons? And put interceptor squadrons out around the borders of the empire. Why don't you do this?" I would have said, "Nope!" You see? "That doesn't sound sensible to me." And it wouldn't have. It wouldn't have sounded sensible either. It would have sounded stupid.

Any good excuse served to go straight back [snaps his fingers] into that same dramatization, don't you see. Bang! Bang! There it was – over and over and over and over and over and over and over and over and over and over and over – and in the course of a billion years, how many times do you think the capital might have been menaced in a very dangerous society, at the rate that if every lifetime we have had a major war here on this planet? Well, they happen even faster in space opera societies. So it must have been about three times a lifetime, for a billion years. Same motion, same movements, they defied all reason and here's what's crashing about it: It wasn't fun! There was no amusement connected with it. There was nothing connected with it. It was just the machine, "Now I am supposed to." You got it?
If you were to train an armed force with implantation – the way they normally do in space opera societies and the way this society is going right now – you would get nothing but that kind of reaction. Nobody would ever do anything effective. Nobody would ever do anything really sensible. The only thing they would ever do is just play the exact game they were implanted to play or were implanting others to play. You got it? That's what they would do: Bang! Bang!

All right. Let's take the case of a Clear I know of right now, who has another person who is not Clear. And this other person cannot understand that there is any slightest advantage in being effective on the standpoint of a continent, you know – effective. Let's do something. Let's clear the people on this continent or something of that sort. No. This other person has two or three games which must be played, you see and none of them have anything whatsoever to do with getting a show on the road in this planet, you see – I mean on that particular continent.

You see, these are all so reasonable! This other person has got to do these games. One, two, three, you see. He's got to do these games and he's very impatient with this other person who is Clear because this other person who is Clear now says, "Well, there's a much broader game. Can't – can't you see?"

"No, no, no. Well, you wouldn't be able to do anything like that and we've got to play these games", you see. And they don't have anything to do with anything. You get the idea? It's a "fixated into this weird cotillion, got to do these things, got to do these things" and "would you like doing those things?"

"No."

"Well, why do you have to do these things?"

"Well, you have to. You see?"

And you say, "Well", let's see, "what are you trying to accomplish in doing those things?"

"Well, that's beside the point."

You would get some very, very interesting reasoning going perhaps, but it wouldn't have anything to do with anything except there's two or three games here, you see, that are – just have to be played and maybe the game is so silly – as silly as this: One has to go down to a particular restaurant and order a cup of coffee and insult the management once a week. And if one can't do that – if one can't do that, why, just one isn't living, that's all, that's it. The game can be as idiotic as that, don't you see.

You get what I mean when I say a games condition? It's a person who is doing – now here's the clue to it – a compulsive confront. In order to do the compulsive confront, he must compulsively assume a certain beingness. And in order to play this game, he must deny a certain havingness. Part of a games condition is really not having, you see. It's denying a certain having. The United States right now in the last two wars has demonstrated itself to be in a war games condition because it cannot have any of the fruits of its victories. They look on it –
they got all kinds of explanations, you know. All they do is take this poor conquered nation and throw it to the wolves. You know, just throw it in the soup – splash.

It is an irresponsibility of such magnitude that you go to these countries and you find that they're kind of mad at the United States. "Well, they conquered us. Well, why don't they do something about it, you know? We're not supposed to have a government now. Where is the government?" Don't you see. The United States is not doing it. The United States is not actually fighting a war. The United States is just getting a kind of a compulsive games condition internationally.

And this compulsive games condition summates into the fact that if certain conditions occur, war will occur. If certain conditions occur, war will occur. And when war occurs, then one goes through certain evolutions and then one makes very sure one only loses havingness – make sure one doesn't gain any havingness. So we isolate another characteristic here of a games condition is: no matter what the person says, he always winds up with no havingness.

You'll see some "writer" (quote) (unquote) in Hollywood, who is being a (quote) (unquote) "writer". You'll see this character. He will be dead broke. He'll be assaulting the studios all the time. He'll be knocking down the doors. (He doesn't, by the way, ever write any stories.) And he is just caroming around and banging around and he is being a writer. He is doing all the actions of a writer, except writing. And if he did suddenly, miraculously move in sideways on actually selling a play or a scenario to TV or something of the sort, he would be the first one to lose the lot. See, somehow or another he would lose every penny of it or something wild and incredible would happen. He would make sure he didn't have a "have".

So you get a plus beingness or you get a beingness which is an obsessive beingness, a doingness which is an obsessive doingness and you get a "can't-havingness", and that's how you identify a games condition. It's a "can't-havingness." A "can't-havingness" is the other end of the thing.

Now, you'll sometimes get a maintenance man around an organization or a janitor in a building or something like that. And this bird is doing everything but the job of janitoring. He can't have this job. He's got to be this, see. He's got to do this. But he winds up running a can't-have on you on the building. He'll run a can't-have on the heat, he'll run a can't-have on the electricity and so on. And then he will work it out so that he eventually doesn't draw his pay. And then he'll work it out so that he's backed totally off of the thing while still fighting into it.

It's a very interesting thing. He's in a games condition on the subject of buildings. His games condition is the attack and destruction of buildings. So he gets a job as a janitor and he goes through some of the weird motions. The motions are weird, but they look almost like the job of a janitor, don't you see. But you don't get any janitoring out of this and you don't have any building and he doesn't have any building. He's totally individuated from this building and he'll eventually back himself totally off the roster. This is quite interesting to watch.

I'll repeat this because it's quite an important factor in a games condition. You get a beingness: compulsive, not wanted; a doingness: compulsive, not wanted and you get a no-havingness. And that's the easiest way to spot a games condition. Now everybody's got a few games conditions, but very few are playing a games condition to the total limit. Those that are
playing a games condition to the total limit are up here in the spinbin. And you'll see those boys playing a total game. All you have to do is identify what game they're playing. It's pretty interesting. You always can, too. Except nobody ever looked at it like that.

All right. You get generals this way and they just become generals because they're supposed to become generals. And they don't want to be generals. And they hate to be generals. And they hate the doingness of generals. And they mustn't do. And they're always saying they hate war. What's he doing as a general if he hates war? That would be the first thing a Roman would ask him: "You mean you don't like fighting wars? Well, what are you doing as a general?" And of course, that's a very sensible question, isn't it?

All right. Now he'll wind up with no havingness. One way or the other, he'll wind up with no havingness. He's trying to run can't-have on the troops. He's trying to run can't-have on the country and he himself will wind up with a can't-have. One of the ways he winds up with a can't-have, you'll see his old age get accelerated madly. He's running himself out of a body, you see. He's running himself out of all the beingness that has anything to do with it and so on. It's all quite interesting.

When you see one of these games conditions, if you've got your eyes open, you inspect one of these things going on and they just defy all logic, of course, because they're obsessive. And they haven't anything to do with the real universe. And that is true of all aberration. Aberration is aberration simply because it has nothing to do with anything that's going on anyplace. It may have a lot to do with what has gone on. But it's got nothing to do with what is going on. The guy is way out of PT.

I imagine there's somebody up in Manchester right now making buggy whips. I'll just bet you. I'm sure. And he'll give you a thousand reasons for it, you know, and they all sound so logical. But this rationale that reasons out a games condition has holes in it. And if you sit and try to argue with it, you're a fool. That's all. You're just a fool to sit and argue with a games condition once you know what it is. Audit it, don't argue with it. You cannot educate a person out of his aberration and that is the end of it. You can audit him out, but you can't educate him out. You can show him, cleanly and clearly.

Well, little Arthur was upstairs just this afternoon, swinging two swinging doors, madly. And he was grabbing hold of the doors. You know how you grab two swinging doors? If you get a coincidence whereby the two doors come together where the hand is also between the two doors, there's no room. Well, he was having a good time swinging doors – now we know how that door got broken. And I showed him the mechanical characteristics of a pair of swinging doors just a little while ago and showed him when his hand was in there when the two doors shut. I showed him there was no space, you know, if they came together at the same instant. And he looked that over and he inspected that very, very carefully and he sort of says, you know, "Well, what do you know", you know and knocked it off. He hadn't realized there would be no space between those two swinging doors. He was not in a games-condition with regard to swinging doors.

Now, if he was in a real games condition with regard to doors, you would have found him up there ten minutes later doing the same thing, don't you see, even though he'd found out he could get his hands squashed. Got the idea?
So you stand around and you try to tell this fellow that if he keeps riding this motorcycle at ninety-five miles an hour on wet roads – which motorcycles aren't supposed to be run on anyhow – flat out, particularly with no attention to his brakes or anything else and you just keep telling him that when you're on a wet highway you should take it easy, you see, on a motorcycle. You give him safety rules, in other words. Hasn't anything to do with it and nothing to do with him. He's in a games condition on this subject and a games condition is going to wind up with what? Can't-have! No motorcycle, no body.

Now, it's very much better if somebody else also winds up with no vehicle and no body. That's much better. Get the idea? And here sit all these road safety committees. And by the way, I resigned the other day from the Road Safety Committee. I didn't tell them why. I didn't tell them why because they won't adopt a program. That's why. You could lick all these traffic problems in ten minutes. You'd have to screen the drivers and that's the one thing they're unwilling to do.

You'd have to find out what drivers present are in a games condition on the subject of driving. You'd have to screen that out. It'd take 10 percent of the drivers off the road, bang! Just like that. Your accident rate would go down. Somebody could drive on the roads.

They're not about to do anything like that. That's an invasion of privacy. Oh, I don't know. The last time somebody shoved a radiator through my bonnet, I thought it was an invasion of privacy, too. [laughter]

Well, now you understand a little more about this?

Audience: Yes.

All right. Now, let's take up another subject which is quite comparable to this. I'll take up both of these subjects one after the other here, mostly because I'm going to have a week holiday on you. So I won't be talking to you next week. I'll be talking to you promptly when I get back. You haven't digested all of this yet, so why ... [laughs, laughter]

I haven't had a holiday for some years. Anyhow, the – and I'm not taking one now, actually.

The situation with regard to the person who cannot influence his bank with thinkingness is of great interest to a Scientologist. The gradient scale of inability to recover from aberration is the gradient scale of lessening ability to influence one's own thinkingness or mind. In other words, less effect, less effectiveness.

The gradient scale of less effectiveness eventually winds up in no ability to affect – no ability to affect. And now you give this fellow an auditing command and of course, he really doesn't do the auditing command, but anyway, if he did the auditing command, he still wouldn't have any effect on his thinkingness. Got the idea?

Now in view of the fact that this person is the one who breaks auditors' hearts and gives people loses, an understanding of the anatomy of that phenomena – this is not, by the way, a peculiar case. This is all cases I'm talking about. All cases sit at some level of inability to influence the reactive bank. When you clear them, you have simply raised their ability to influence the reactive bank, that is all. You got it? I mean that is all you've done, if you say
this. Now they are effective and can be effective and what they think is effective, don't you see, and so on.

Now therefore, it is of great interest to you how they get into a condition where they cannot affect the bank. How do they get into the condition where they cannot affect the bank? I've been talking about this phenomenon now since 1954 and I've said it many times. I never had a clear-cut way of stating the exact anatomy or its immediate cure. We have the total recovery on this now.

Now, how does he get into this condition so that he cannot influence his bank or his aberration or anything else and so you have difficulty auditing him?

Well, it's the story of withhold. This fellow is backing right on out from life, see, withhold, withhold, withhold, withhold. He's denying this, that and the other thing. He's in games conditions of various characters, but basically with – part of his games condition is withhold. And you can recognize at once that a withhold is a denial of something to somebody else, so all withholds have something to do with a games condition.

All right. So he develops a withhold. Well, now that immediately gives him a "can't reach." If he's withholding, he can't reach. So you get a "no reach out" and a "pullback". All right. Now we multiply this. We get another "no reach out" and a "pullback" and we get a "no reach out" and a "pullback" and a "no reach out" and a "pullback" and a "no reach out" and a "pullback" and a "no reach out" and a "pullback" and we keep doing this. And eventually this fellow practically exits from the dynamics one after the other. And the gradient scale of how he leaves various dynamics has already been discussed as early as 1950, in the autumn. Departure from the dynamics.

Now he can't leave the dynamics, so he inverts in them. You see, he's doing something he can't do and nevertheless, as far as he's concerned, his effort is to leave the various dynamics or livingnesses or universes or whatever.

So his effort to leave, of course is compounded with a withhold and a "not reach." So you get the withhold combined with a "not reach." And, of course, you get an apparent departure while he's still there but you certainly get an ineffectiveness, because you cannot drive cars that you are in maybe, but you are not reaching in any way and from which you are totally withholding yourself. You can't sit in the back seat of a car and drive one. That's not possible. Not unless it's specially built like an old Ford I fixed one time and used to stand everybody's hair on end. Sit in the back seat smoking a stogie with a derby hat down over my eyes and drive around town. It was very upsetting to people. [laughter]

The "mustn't reach" is a "mustn't be reached", of course and you get how punishment downgrades because punishing other people and people punishing him, this just compounds the withhold, don't you see. So the person is less and less reaching, less and less reaching, less and less contacting.

We see this in many ways. Eventually where the contacts will be so sporadic and so ineffective in certain directions that they amount to practically destruction. Everything they touch, you know, like machinery – you've seen somebody with machinery and every time they just look at machinery, it all stops or the gears go clang or something like this.
Well now, that is a games condition with machinery. And one withholds himself from machinery and doesn’t reach the machinery and withholds himself and doesn’t reach the machinery, you see, because his can’t-have on the machinery prevents him from reaching it and then he withholds and he withholds and eventually, he can't communicate sufficiently with machinery to do anything but wreck it. Even though he intended to fix it, he'd wind up wrecking it.

A little kid who was just trying to rehabilitate himself in the next lifetime, you see, and you give him an alarm clock. And he might have been a watchmaker at some time, but that doesn't prevent him from wrecking the alarm clock. His ability to reach the alarm clock is so unaccompanied with any ability to understand the alarm clock, because he can't communicate with it, that it winds up with the destruction of the alarm clock. You got the idea?

Well, below destruction of the alarm clock is no influence of any kind on the alarm clock. He cannot do anything to the alarm clock, not even destroy it and you've got a total withhold from the alarm clock.

All right. Add up all these withholds and all these can't-reaches, "can't-haves" actually, on the – all dynamics and you eventually get a person who's totally withdrawn. He's individuated. And he individuates further and further and less and less effectiveness and of course, eventually he can't affect his own mind. Now that's the exact mechanic of it. I don't care how complicated anybody makes it. That is what it is.

Now of course, when he runs can't-have on people, he is running the – a tendency toward unfamiliarity. He's making people less familiar with something, so people are more withdrawn from it and then, because of the overt-motivator effect, naturally this reacts on him and that explains the exact mechanism of how it comes about that he stops reaching and starts withholding.

A can't-have results in a "stop reach" and then this results in a further withdraw. And when you get this withdraw up there to a total a hundred percent – crash, bang, exclamation point – of course he can't influence anything and you say, "All right. Now, get the idea of disliking cats." He does.

You notice that every time a cat walks in the room he gets a black eye. I mean he sees a cat and his eye goes black, you know and you say, "Well, I'm going to fix this up for this man." And you say, "All right, get the idea of not liking cats. Thank you." And, "Get the idea of not liking cats. Thank you", and so forth and you do this for three hours and nothing happens. Cat walks in the room: he gets a black eye in the other eye. [laughter]

Well, what exactly has happened? His ability to influence his own mind is so low that no matter how many auditing commands you run on the guy, of course it doesn't wind up with any result. It's his ineffectiveness is what you're dealing with and when you're going in straight on a games condition, you'll get this ineffectiveness considerably magnified. And of course, it must be a games condition with cats, if all a cat has to do is walk in the room and he gets a black eye, man, you're way down the scale. I knew such a fellow once. His name was L. Sprague de Camp, one of the great science-fiction writers.
Anyway, this person, when he registers on the E-Meter needle, when the E-Meter needle registers and when you can get tone arm reaction, your command is affecting his mind and then therefore changing his electrical potential, so this tells you if you're in a zone or area where he is being effective. That's what it tells you most intimately and directly.

All right. Now over here on the needle, if it dips, this tells you that you have a chance of affecting it. See, he can affect that area, because it dips. So therefore, you can run it. Now, if you saw that the cat walked in the room and he got a black eye and you just made it up out of your own mind that this was what you should attack on this case and cure up this black eye situation, don't be amazed if he has never noticed it.

He just somehow or another has never noticed the fact that he got a black eye every time a cat walked in the room. Everybody else knows it, but he doesn't. Yeah, he's even been told a lot of times and he'll occasionally say, "Yes, when a cat walks in the room I get a black eye", see. Daaaaaa! He'll say it, but it's not real to him. He really thinks it's the chandelier.

And if you doubt that, take somebody who has a wild allergy to some known object that has been isolated for him by the medicos and ask him, "Is it really Persian rugs? Is it really? Have you ever thought it wasn't Persian rugs?" And you'll get the first reality that you got on the situation.

He'll say, "Well, I – no, I know it isn't Persian rugs."

"Well, what – what do you suppose it is?"

"Well, I don't suppose it's anything, as a matter of fact."

"Well, do you think it's Persian rugs?"

"No, it is not Persian rugs." Then you get an action.

"Well, what is it?" No action. Got the idea?

So you might ask this fellow, "Do you get a black eye when a cat walks in the room because of Persian rugs?"

He'd say, "It's likely". Seems reasonable to him. He'll buy any wild explanation you ever heard of on the subject because he can't think, can't reach or can't rationalize on this particular subject.

Most Dale Carnegie salesmanship is directed toward these individuals. You see? That's if you can just give them a bunch of specious reasons why they should buy and you're sufficiently 1.1 about the situation and so forth and they're in a games condition, of course, they can't do anything but do what you tell them to do or something like that, with regard to an object.

All right. That's being tough on poor, old, late departed Dale Carnegie. Anyway, what you read here is: Can the individual influence his mind? That's what you read and that's what this thing adds up to. And therefore, when you run a command that you have not assessed on an E-Meter, you're doing something very adventurous.

See, you run a command that possibly, quite possibly, he has no influence on. You can be very sure what the command should be, but when you test it out, does it produce any nee-
dle action? Let's say these words to the pc in the command and let's say these commands. And do they produce needle action?

Well, it they don't produce any needle action, you'd better not bother running it, because you've got an area where the pc either doesn't have to be audited or where he is totally ineffective. And if he's working in an area that's totally ineffective, of course, you get no needle reaction.

Hence, you should assess something like a games condition process on such things as problems, confusions, thoughts, facts, motion, almost anything that you could assess. And then you finally got one of these that produces a reaction – not that this is real to the pc, don't you see. That phrase is what we've been using previously and it is not very explanatory.

The mechanism is, can the pc be even faintly effective in this particular sphere or area? Well yes, he can be, because you see a needle reaction. So you assessed it out so that the word he goes clong on is "motion". Ah, voilà! Very good.

But now all we know is that he has an effectiveness where motion is concerned. This we have, that we have. We don't have the gen on the rest of the command. Does the pc have any reality of, whatsoever, on the "wheness" of things? And we test out "wheness". We test out "whatness" and "howness." And we all of a sudden find out that "when", if we ask him "When did you?" or something like that, we're not going to get any reaction on the E-Meter. That's not real to him, he's not effective in the field of time. We say "How could you?" Ha-ha, and we get a reaction, see. "How?" That "howness" is real to him.

All right. So we'd add together and we'd say, "How could you?" and all right, we got that and we've got motion, but we haven't got "deny", "prevent", "not let", you see and a whole bunch of intermediate verbs and we check those out on the E-Meter and we get "not let." Ah-ha-ha. This is nice, now, we've got: "How could you not let another have motion?" Doesn't make much sense to you, but it seems to make good sense to the pc. He falls all over the place on this auditing command, don't you see.

So we put that in its various brackets and we run it and it produces a result. We don't assess it. In the first place, we haven't found the areas where the pc can be effective. In the old law of taking something the person could do and make him do it better is not then present in auditing. You see, the basic thing you're doing in auditing is find out something he can do and then make him improve the ability.

All right. So that is the way you sort out a command. Those are the basic laws. That's why you should check a command out on an E-Meter. That's quite a good thing, to check a command out first on an E-Meter. Because if you get no reaction on this command, you had better start banging the brain cells together and sparking long and blue and getting smart enough to take the same thing you want run on him, just take the same thing, only let's get it into some gradient and some phraseology that does produce reaction on the E-Meter. And you'll find out that the command is answerable, the pc has good reaction on it and so forth.

Now, most pcs will react on one of the three: "problems", "confusions", "motions". They usually react on one of the three. They'll react on one of these three: "thought", "fact", "idea". Those are three that go together, and they're gradients to most people. You've got to
sort out what you're doing so that it's real and what we mean by real is: can the pc be effective in that particular sphere?

Now if you can get the idea of some pc having just backed out of life and then started backing out of his head – you know, "withhold" and "can't reach" and "withhold" and "can't reach" – you'll finally find somebody with a body over there and he's compulsively exterior in some fashion. And this is simply a graphic and a factual example of what occurs. And this is the "detached case" of Mr. Sigmund Freud that he found out he could never help. He could never help this person. The person was detached. This is what he called the case. (The end of the twenty-eighth lecture, if you want to look it up, of Freud's.)

That applies to most homos and so forth. They're detached or it applies to an awful lot of people, not to use any dirty words. They have gotten detached and sometimes somebody will tell you they feel detached in life. Oh yeah, I'm sure they do. In any area where they're in a games condition, they feel detached.

I think the unrealest activity that a soldier – in a games condition about soldiering – the unrealest activity he could possibly engage in would be fighting. Everything would get very unreal to him the second he approached this particular field, don't you see? And he's got to do it, he must do it, he's not going to get anything out of it. He's not going to be effective either. If you let him near a gun, he'll land one on his own command post. It's this kind of thing, you see, but he'll get very unreal. Everything goes very unreal and very foggy and very drifty when he starts moving in toward that area because it's the area where he is the least effective. Life can effect him the most and he can effect life the least and yet he'll always volunteer. See, these are the odd explanations.

So apparently, we feel this man can do soldiering as an effective in the field of soldiering, simply because he does volunteer in the field of soldiering, don't you see. Well, he is not effective in the field of soldiering. But he has to volunteer, that's – that's the way that is.

Now, how do you do as a Scientologist? How do you reverse this condition? Just find it on the E-Meter. What's real to this person means what will react to this person, which also means what will this person be able to affect? And having found it on the E-Meter, then you can, on a gradient scale, bring him up, get his withholds off, get his can't-haves and game conditions out of the road and of course, he will walk up to a total effectiveness. Get how you're doing that now?

You take off the withhold – well, that permits him to reach – and you take off the games condition and of course that permits him to reach. And he just reaches further and further and further and of course the further he can reach and the less he's withholding, the more effective he is and that is all there is to it. It's as simple as that. It's actually idiotically simple. You can get terribly complicated about it, but that is precisely what you were doing. Now, when you violate that doingness, you don't get any results in auditing.

Now, let's take the cure of psychosomatics. If you want to go in for the cure of psychosomatics – nobody says you ought to or should, but this is kind of a nonsensical thing to do, but that's all right. I want to give you this as a graphic example. Psychosomatic illness.
Now, if you can actually enter a certain field and find patients who are so much the ef-
fect of some psychosomatic difficulty that you can alter it but they can't and so you tell them
to get well in some fashion or another and they do. Only they don't find out about it and so
they never thank you and more auditors have run into this one. Now that's a queer one you
know. That's a goofy one, but that's the explanation of it. You found an area where they were
totally ineffective and actually you simply mauled the bank around and straightened them out
and told them that was the way it was and that they had it. Got the idea?

So of course, you effected a cure. And it advisedly could be called a cure because you
certainly did it. You didn't effect an eradication of the difficulty.

All right. Here would be the right way to go about it so you wouldn't run into this sort
of thing. You would assess all the things the person thought were difficult with him until you
got a fall. And you got your major fall of the thing he has the greatest communication with as
a difficulty and then you work on that by getting the withholds off of it and getting the games
condition cured about it and it will right itself just like that. Bang! But you've got to do it by
an E-Meter assessment.

Now doing it that way, you actually could eradicate an enormous amount of illness or
upsets with people, but you would have to assess them.

Now that a pc keeps complaining all the time about some difficulty means nothing,
because the complaint might simply be a piece of machinery firing off or the mechanism that
the pc is complaining about is a mechanism that has to do with another games condition
which has nothing whatsoever to do with the difficulty they're talking about. This is

But of course, you're not going to get rid of that difficulty. The difficulty would be to-
tally unreal to the pc on the meter. But the pc may be saying all the time, "Oh, I'd just give
anything, anything at all if you could cure my migraine headaches. That's what really disturbs
me. Oh yes, it's my migraine headaches."

Why, you – you poor auditor you – you fall for this every once in a while and you say,
"Well, it means so much for Scientology – I cure this guy's migraine headaches." Well, it sure
would. It sure would. There would be no doubt about that, providing you did eradicate the
difficulty and the games condition that was associated with it and everything else connected
with it, so that the person found out about it. Because you're liable to go ahead and cure his
migraine headache and he never finds out about it and goes around and tells everybody what a
bum you are. You get how this is?

Well, the way to avoid that situation – the way to handle this situation, not to avoid it
– is to just take lists of difficulties the person has until you get one that continues to fall good
and hard. Yeah, continues to fall good and hard. All right, audit it. Get the withholds off of it.
Make up some little pat series of questions that has to do with this particular item and then get
the can't-haves off of it, in a bracket of some kind or another.

Well, let's say you actually did find out you could do something for this fellow's arm
and the arm did fall. Well, that's dandy. All right. Now, we actually could do something for
this arm and we would do it on the basis of: "When have you denied somebody an arm?"
"When has somebody denied you an arm?" "When has another denied somebody else an arm?" You get the idea? "What problem or confusion about arms isn't present now?" In addition to that, you would say, "What haven't you ever told anybody about an arm?" You got the idea? You would get the withholds off – just a little Security Check about arms, you see, and you work those two against each other. Get rid of the games condition with the brackets and get the withholds off with a Security Check and you'll just about have it made. And all of a sudden their arm will do a miraculous recovery.

But the condition is – that it has to obtain before you start all this is: does the pc have any effectiveness in the zone called an arm? Or are you being the only one effective? You see, you can hypnotize people and tell them to get well and they do. Only they don't. Their body or bank obeys you, not them.

All right, so much for that. This is the gradient scale of "state of case". You also have a "state of difficulty", the gradient difficulties. The pc has ten thousand difficulties. All right. There may be only one of them would ever find him effective in the zone of, see? In that zone, only one of these things would be. He'd be effective on just one difficulty. He can list ten thousand, but he's only effective on one.

That's an interesting viewpoint. That is actually the barriered line on healing and the barriered line on all therapy of all kinds and is actually the barriered line on "help." Of course you can run any level of the Prehav Scale, any level of the Prehav Scale, in a games condition form.

But I wouldn't advise you to use "no motion" in a games condition form unless you use it with this type of a version: Stillnesses should be used so that they are meaningful of motion. You don't ever run a stillness, you only appear to run a stillness. You say, "What stillness have you denied somebody else?" You get the idea? That's a good command. "What stillness has another denied you?" This was what you assessed on the Primary and Secondary Scale. You got "stillness".

Now, you could also run this on the pc's terminals. After they've been assessed on SOP Goals, you can run a Games Condition Process with assessment and so forth. You can apply all this to Routine 3.

You got their terminal? You got their terminal? All right. Use their terminal, fit it in as a games condition-type process. Work it out one way or the other on the E-Meter. Assess him on the Prehav level. Work it out so that you get a fall and you'll get something on the idea of – let's say it was stillness. "What stillness have you denied an aviator?" and "What stillness has an aviator denied you?" and "What stillness has an aviator denied another?" and "What stillness has another denied an aviator?" You got the idea? And "What stillness has an aviator denied himself?" And if you're going to run a Games Condition Process though, for God's sakes, let's get a direct look at problems. I don't care what command is used or what version is used, let's get him to do a direct confront around here someplace. Every time we do a direct Games Condition Process on problems. Otherwise, you won't get that as-ised.

So after you've got these – five-way bracket all worked out, then you add another hooker on it like, well, "What problem about an aviator could you confront?" or something
like this. Or "... have you confronted?" or "... would you confront?" or – I don't care how you do that one, but throw that one in, too. You see how that would work out?

Now, if you did a terrific assessment on somebody and you got his goal and you got his terminal and you got it all taped and piped and it was going in all directions, you did him on the Prehav Scale, you could run him simply directly or you could run him on a games condition situation with regard to this. There's a number of routes. It's all which is the most effective, which is the most rapid. Okay?

The day you run a command though, that doesn't register on an E-Meter, is the day you start auditing areas where the pc cannot be effective and therefore you plus the pc, versus the pc's bank, simply adds up to you versus the pc's bank. You see how that is? Because he isn't there. He has withdrawn in that particular area to such a degree that his effectiveness never assists you, so therefore he ARC breaks, he gets present time problems, he gets very upset all the time, he's hard to hold into session and so forth, because you are actually auditing a bank. You see, you're auditing a bank without any assistance whatsoever from the pc. So if you want the pc to help, too, then you better assess it first on the E-Meter and get it taped. Okay?

_Audience: Okay._

Well, I hope that'll assist you a little bit. When I come back, I want to see half a dozen of you Clear.

Thank you.
CREATION AND GOALS

A lecture given on 3 August 1961

Well, I will say that in ten days you look less human! [laughter] Good to see ya. What is this, 3rd of August? Nineteen hundred and AD 11.

Thought you might be interested in where I've been. [Murmuring in the crowd, probably LRH shows them a picture.] Isn't that fairly marvelous? Pretty wild, isn't it? Well, that's just about how wild that country is. [laughter] Well, fortunately nobody has ever been able to civilize Spain. Henry the VIII, I think it was or some such Henry a long time ago, used to have standing orders to all British merchant ships. And when they got anywhere north of Cape Finisterre – any foreign ship got north of Cape Finisterre – a British vessel in sighting one – Cape Finisterre, you know. That's down there. That's way down there at the top of Spain.

Well, the standing orders were that any British merchant vessel or war vessel, that any foreign vessel found in those waters, must at once dip his flag in recognition of the sovereignty of the seas of the English; and if he failed to do so, he must be compelled by whatever necessary force.

Well, we don't get down into those waters much anymore and they don't come up here much, but it's certainly an interesting area. You know, that's only 650 miles away. Yeah. Very beautiful, very beautiful.

Found a very beautiful ship down there, too. The Espanoles had been at her, which is a kind of dry rot, which is _manana_². It's a fever which has _manana_ as its primary bugs, you see?

So I've been across all of these wild guarded waters where English vessels are supposed to coerce the firing of salutes and shots. And they – when they got this English vessel down to Spain, they took revenge for this order on a comm lag of about five hundred years or something like that, or three hundred years or something and so they just kept her there and kept working on her and they finally wore out the patience and pocketbook of her past owner. And they kept putting things in her like more mahogany, you see? That was just exactly what she needed was more mahogany; she didn't have any main engines, but what she needed was more mahogany. Most gorgeous interior you ever saw on a ship. Don't open the engine room because nothing there. [laughter]

And the Espanoles and the owner – who was not a sailor of this particular vessel – had gotten to a point where they had made sufficient number of problems to suit them all and they couldn't solve any of them. They just couldn't solve any of them! And so everybody threw up
his hands and they decided they'd better sell the ship in a hurry. And I've been waiting around since February for somebody to decide this about a good ship. And so we have bought her for buttons.

But she's a 106 feet long and 18 foot beam and she sleeps about twenty-two people. And for an additional – see, I sold some yachts over in the States and I've been kind of hiding the money since, you know? And I'm able to cover this one as a result. So I've been letting the money ebb and flow and disappear this way and that way, but I finally got it all collected back together again here.

And for only about thirty-eight hundred pounds of additional odds and ends, why, she all of a sudden becomes a vessel worth at least twenty-five thousand quid on the market. As a matter of fact, I could haul her up here with a tug right now and sell her for fifteen thousand pounds. Just nobody knew how to straighten her out, you know? She's all beautiful mahogany and varnish and everything is marvelous and she just glitters in all directions, but nobody could straighten out such things as how do you get her anchors up and down? [laughter]

Her current consumption throughout the whole ship – she's got air conditioning and hot water and everything – and her current consumption throughout the ship is about 30 kilowatts, or in excess of the consumption of Saint Hill, which is plenty of kilowatts! Look at our light bill sometime.

Anyway, the – with this tremendous, fantastic current consumption, they put in two Sallé diesels built in Spain and two little tiny generators and the diesels make so much noise that when a mechanic started them day before yesterday, he leaped convulsively out of the engine room! [laughter] And the whole ship started shaking from bow to stern, you know. So she has this 30 kw, you see, of potential power consumption and she's got about one watt to supply it and nobody could figure out how to get any power into her, you know? They couldn't figure out how to furnish all this. And she's had Grey diesel engines – very nice Greys, they were sometime in their career. They still run. But they kept wearing out their rings and they kept filling up their crankcases full of oil – fuel oil. You're not supposed to have fuel oil in a crankcase, you know? And they just kept getting all gummed up with sludge and there just wasn't anything they could do about them and they wouldn't run and they wouldn't push the boat and so on. So everybody kind of threw up his hands in horror.

So when they hauled the vessel – I'm late getting back here, by the way, because the vessel wasn't hauled till Monday. More manana. And when they – they hauled it, I sent somebody else down into amongst the brish-brash of the muck of the dry-dock, and got him to brush those propeller hubs off because there's something wrong with his screws, you see. Kept polishing up engines and repairing engines and the engines keep falling out of her. So, obviously, it isn't the engines. So when we got the hubs of the propellers brushed off, we find out that she is fitted with propellers which would make her do sixteen knots, but a Grey – a pair of Greys – at the wildest imagination would only ever drive her at ten. So what the propeller has done is prevented the engines from running, because a Grey doesn't develop its

---

5 Editor's note: Spanisch "Mañana", literally "tomorrow", is a humorous reference to the proverbial delays in something to be get done by Spanish workers. If you ask them when something will be completed, they will always answer "mañana".
horsepower until it runs at 2100 RPM and this has been very amazing to them all, because the engines ran very cool and there couldn't be anything wrong with the engines because they ran so cool. And everybody kept assuring me that the engines ran cool.

Well, a Grey – I finally let them in on the facts of life – has to be at a 185 degrees Fahrenheit or it doesn't achieve combustion! [laughter] And if you don't run it at that temperature, its crankcase fills up full of fuel oil. Some of the little facts of life, you know? Interesting state of beingness.

Anyway, I've had about ten days of wrestling around with my old love, the sea, and finding out how many things people can do, who know nothing about the sea, to make it inoperative. But we're just lucky, man. We're just lucky that it got that inoperative and they made that many mistakes, because they're nothing. I got a pair of Paxman 600 horsepower V-12s located up here – diesels that run on fuel oil of the very low quality – and I got a couple of light plants that are excellent and they will just take care of her lights marvelously and it's just a matter of yanking what's in her engine room out and putting in something new.

And as far as her water is concerned, she's all fixed up to consume water at the rate of about five or six hundred gallons a day. She's got bathrooms, you see, and wash basins every place, you see? You can't turn a corner without having full facilities to take a bath and wash your hands, you know. So there's no water supply! [laughter] Small omission, see. And they didn't know how to figure that out, because of course her bilge is all full of ballast and you can't get any more water tanks into her bilge. So they put a water tank up in the top of the pilot house. A couple of tons is just what you need up in the top of a pilot house. That's – it sloshes, you know, and makes the ship stagger and so forth.

It's a beautiful water tank. It has huge manholes, you know. And they couldn't solve that problem, so ... Actually, what they don't know is that you can get war surplus water evaporators that run on electrical current that have a tray in them. You change the tray a couple of times a day and one of them will make enough water for fifty men a day. So you don't carry a water supply, you carry a water evaporator aboard her. That's very easy to put in.

These problems are all relatively simple. But this owner and the Espanoles ran into them head-on and threw their hands up in horror. Yep, had a lot of fuel consumption, a lot of water consumption, a lot of electrical consumption and no fuel, no water and no electricity. [laughs] And then she could go anywhere that no engines could take her. And boy, her mahogany is beautiful!

Come to find out she's classed: She's a classed vessel with Lloyd's, which is quite amazing. Almost never do you find an ex-Admiralty craft, like a Fairmile B, that's still classified by Lloyd's and she's all in perfect condition, nothing wrong with her.

But due to our ability to confront problems and their inability to confront problems, why, ship falls in our lap. You see, see the advantages of Scientology?

The British vice-consul made a funny remark. He took me out to the airport when I left Santiago and of course this was just Spanish courtesy, possibly. You know, he didn't buy that "being in the locale". But he says, "I have learned more about ships in the last ten days since you have been here than I've learned before in my life!" He says, "I didn't know there was that much to know". I didn't even know I was wearing a hat, you know? I didn't. But I
didn't also know how little they know about them and yet he's the Lloyd's representative for the area.

No, they threw up their hands in horror. I did, too, actually, in the first twenty-four hours. I just said, "How could a group of people make this many problems?" That's impossible, see, unless they're a government. [laughter] How could they? How could they make this many problems? And yet they sure had and I said, "Well, there's nothing at all can be done with this ship. She's beautiful, she sits here, she's got gorgeous lines, her hull is good, no dry rot in her, her decks are good, everything's fine, she's beautiful, but nobody can do a thing with her."

They have just run her out to the far rim of total confusion, you know – no power, no water, no engines, no winches, can't handle, can't anchor, can't move her. And they'd fastened all the mahogany ply in her with iron fastenings instead of copper and of course they'll go to pieces in a hurry. Ah, man. It was just too much! And after about thirty-six hours or something like that, all of a sudden I came out of my stupor and began to confront the problems of the ship and found out they were all just – they were nothing. Weller, here, who is an expert on that sort of thing, all he's got to do is go down there and start pulling nails and hammering brass back in the same spot – nothing to that. We've got companies up here that'll drop a pair of engines into her just as quick as you can send them a telegram, you know? And just right in the next room in there, there's enough electrical fittings to rewire her from one end to the other. There's really no problems to her.

But, of course, it is dismaying that people would put a ship together, you see, that can't run, can't anchor, you see; has enormous electrical consumption and no electricity, has enormous water consumption and no water, has enormous fuel consumption and no fuel. They forgot one area where they could have put tanks. Guess where that was? Between the engines, of course! Right where you would expect to find it. And there's enough for an additional five hundred gallons of fuel between her engine beds. And they've got fifteen tons too much ballast in her which, of course, fills up the remaining space you could put tanks.

You see, if you put the ballast in a ship – your ship's got to have ballast, you know – that's in a book someplace, you know – particularly ships which are planing vessels, which are made to plane when they run, you see? And if you gonna get a vessel that stays up on top of the water and you know, runs like a skipped rock, of course you want to ballast her, don't you? Let's put lots of ballast in her and fix her up so she won't run on top of the water. Let's make her run deep, see? And then because she needs lots of fuel in order to run high, you see, well, you occupy the whole space with the ballast so you can't put any fuel in it. You get the nonsense?

It's marvelous! I watched 1.1 problem creation here. And actually these problems have not just been for lack of knowledge or lack of solution. A lot of these problems are just overt – overt creations. Nobody'd be that dumb! They wouldn't live to the age of five! Isn't it marvelous?

Name of the ship's the Eimor; her name will probably become The Hurrying Angel. For some reason or other that name is blank at the Register of Shipping and Seamen. For some reason or other that name has not been used. And that's John Masefield's famous novel
and you'd think the country of John Masefield's nativity certainly would – you know, I have submitted about three pages of names to the Register of Shipping, without finding more than about five names vacant? I've thought of every name I could possibly think of for a vessel and every one of them, but just this little handful, has been occupied. They've already got – you see, you can't name them twice because you might get charged for somebody else's bills. You know? And weirdly enough The Hurrying Angel was one of the names that's vacant. So there it is.

I've had that all ready to put on nameplate. I've got her barometer and her clock. They're a beautiful set – clock and barometer. They sit on the file cabinet in my office in Washington and years ago – years ago – I was trying to find somebody to cut the nameplate of the ship for that clock and barometer. Didn't have the ship but I had the clock and barometer. See? And I was going to cut a brass plate there for the The Hurrying Angel. And so at last I've got a ship to go with that clock and barometer!

Well, anyway, this is all part of an operation here which is going on. We'll be going down about October into southern waters for a winter of instruction and all that sort of thing. So maybe some of you will have a ride someday on The Hurrying Angel. And you'll say, "I'm very, very happy" when you have had a ride you'll say, " – I'm very, very happy that Ron audits more smoothly than he drives a ship." Because I drive hell out of a ship! [laughter] Okay. Well, you're invited anyway!

Audience: Thank you.

Okay. Well, now let's get back to where we were and where you have now reached. I notice we have some new faces. I welcome you and I notice, additionally, some new faces which have been acquired or have been uncovered, so on.

Now, something very funny is going on. People elsewhere are getting a spattering of Clears. And we're slugging at it here and we're slugging at it very, very hard. You'll notice there's a difference here. All of a sudden they make four or five down in Johannesburg. They've made more, since. They're making Clears all over the place and meanwhile some of you have flattened problems, confusions and emotion of various kinds.

Now, I guess it's just a question of how thoroughly can you make a Clear? And that's the whole question. It's just answered in that. I think that's about the way it is. How thoroughly can you go about this? How many brands of Clear are they? I couldn't answer this question. Because you can get people up to a perfectly good Clear read on a meter and it will stay there, and they'll go along just fine.

But how many zones are there above this state? And how thoroughly do you have to prepare the ground to attain one of those zones? And those are the questions.

Those are not necessarily well-answered questions at this time because Scientology, after all, is – well, I've been making Clears of one kind or another, stable or unstable, for a long time. Those that I made originally, way back when, the bulk of those remained stable. And the secret of those Clears was just that they had been able to – and I couldn't have stated at the time this succinctly – they had been made capable of confronting any type of mental image picture. That made a Clear.
And if you will read Book One and the chapter on it, it wasn't somebody who didn't have any pictures. This is some new interpretation. It was somebody who could control his pictures or who had a bank or whose bank wasn't victimizing him.

All right, taking off on this line, let's go back now – from ships to less mundane things – to the earliest unanswered problem in Dianetics and Scientology, circa 1948. The question: Why does a thetan mock up bad pictures? Now, that is the un – was the unanswered question and that question has remained unanswered all these years. You can see at once that that is a very, very interesting question. After all, he is doing it. Well, why is he mocking up accidents and collisions and burns and cripplings and so forth? Well look, there's all kinds of things to mock up. You could mock up this scarf! You don't have to mock up an automobile accident. But they do mock up an automobile accident. They also occasionally mock up scarves. But you'll almost never find anybody with a fixed pleasure moment.

You start running pleasure moments on a preclear, and they go into grief charges and they break down and life is horrible. Old Validation Processing, as Mary Sue was remarking last night, was the most productive of grief charges that anybody ever tried to run. You talk about agony and sudden death! All you had to do was ask a preclear to "Recall a pleasure moment. Thank you. Recall a pleasure moment. Thank you. Recall a pleasure moment. Thank you", and Niagara Falls would ensue!

And I remember one girl vividly back in Wichita, about 1951, she was being audited, and the auditor asked her to recall a pleasure moment, and she recalled winning a cup at a horse show, which seemed innocuous enough. And the auditor just opened his mouth ready to audit the next auditing command and the pc said, no, that wasn't a pleasure moment. And she really shouldn't have done – think of the other people she defeated to do that and she really didn't deserve the cup anyway and she went on down the toboggan. And the next thing you know it – apparently, the most horrible thing that could ever have happened to her was winning this cup at a horse show! And that's the way it goes when you ask a thetan about pleasure moments.

Now, what is this fixation on death, disaster, collision and whatnot? What is this? And let's get back to this original question: Why does a thetan mock up bad pictures? Why? Why?

Well now, theoretically, many things could be said about this and one of those things could be that he's getting even. He's been made to produce and made to produce and made to produce and made to produce, so now he mocks up a bad production. Got the idea? I mean that could be, basically. Now, we can look at the mechanics of it and we say, "Well obviously, the thing has not been as-ised, he has not looked at it so therefore, not having looked at it, it is still there." But remember, that is a mechanic and remember that this thetan is party to the original agreement that creates those mechanics. Why did he want to agree to these original agreements that then would make it impossible for him to ever as-is anything unpleasant? You see? Let's get terribly fundamental, here. And we find out that it must come down to the fact that – you can't say he wants to, but you can certainly say that he does mock up in preponderance; death, disaster, collision and what-not and you could say, then, that having made some kind of an original agreement he then caps it with some other revolt against the original agreement of some kind. Well, what is this revolt? Well, you could say that this revolt con-
sisted of – he's made to mock up, produce, produce, produce, produce, produce good things. So he eventually invents a mechanic, you see – a mechanical aspect – that when called upon to mock up something good, he promptly mocks up something bad.

Well, the direct thing, the proof of this is that you ask somebody to run a pleasure moment and he mocks up something bad. He doesn't mock up something good. You tell him to mock up something good and he mocks up something bad.

Now, we take some Espanoles and we turn them loose on a ship and we tell them mock up something good, you see? Well, they almost do it. You see, they just come right, right close to doing this, but somehow or another – don't lift the corner of the paint, see? See, there is going to be something bad about this.

You get maintenance men around sometimes in organizations and wow! You know? Just wow! How can they do these things, you know? You're saying, "Well, now straighten up the hall", you see. And you go back out and there's old machinery lying all over it that doesn't even belong to the organization. You say, "Where does this come from?"

"Well, it was here ..."

We've never seen it before in our lives. Well, yes, it's here. You know? You say, "Well, why don't you sweep out the lecture hall? There'll be a lecture tonight." And you go in, and they've dumped all the waste baskets in the place in the lecture hall. Well, that would be a direct revolt, don't you see? You tell them, "Clean up the lecture hall, because we're going to have a public lecture tonight and we want people to think well of Scientology." See, bang. The direct revolt response would be to go and get every waste basket in the place, go get the incinerator and so on, get every scrap piece of paper you could get out of the files and then get all the oddments of furniture in the joint and throw all these things in the lecture hall and then mix them. That would be a direct revolt. Then you would know this fellow was in a revolt and you would stand there with a machine gun with your hand pressed on the trigger and you wouldn't let it up. That would be a direct revolt, wouldn't it?

Well, so let's get an in – the – assuming that this fellow is in revolt – now this is going down scale from this. You see, that's a fairly high manifestation. All right, let's push it down now – this fellow has gotten down to about 1.1 – and you say, "Clean up the lecture halls", you see? So he – his revolt consists of sweeping the aisles only and sweeping the stuff in the aisles kind of back under the chairs and not having the chairs quite straight – they're not quite straight and the things the lecturer needs will not quite be there. Well, you can't censure him for that. Because he can always say, "Well, I have too many things to do." He can always have a lot of excuses, don't you see? And so he gets out of trouble this way, but he still makes his point: that he's damned if he's going to produce a good-looking lecture hall. You see the idea?

All right. Well, the highest harmonic would be "Well, to hell with you, I'm not going to touch the lecture hall." But there's a lower harmonic of this same thing which is you tell him to do it and he forgets. That's simple, isn't it?

I've even heard a court case was being tried. I was actually on the witness stand. I was asked some burningly intricate twisted question, you know, that looked like a Scotch still
gone mad, you know, and – by the prosecuting defense attorney, or whatever he was – and I looked at the man. I said, "Well, I've forgotten." It was some burning question that very much applied to the whole case. I just didn't care to be implicated. So I said, "Well, I've forgotten."

And this defense prosecutor went up, just – he was like a rocketry, you know, and "My God, how can you forget such a thing?!" You know? "How could you possibly forget such a thing?" and he's raving. And the judge said to him in a very cold, bored voice – he says, "The witness says he's forgotten." That was it.

That's amazing, you know? It took me by storm at the time! I didn't even think I'd vaguely get away with this one because it's pure corn. It's straight from Iowa. "I've forgotten." Wasn't even challenged; couldn't be challenged. So you – lecture hall was messed up and you've got a comparable level in occlusion.

And you see, the fellow, well, he can't remember all his past overts or anything like that so how could he be responsible for them? And we let everybody get away with it. Do you realize the degree that we let everybody get away with it? Where's the bird for instance that started the last war? Hm? He's around someplace. He's around someplace. He's probably gibbering in some Russian school about this time learning to say "Verdammt, gottdammt Hitler!" But there he is and they're letting him get away with it. Because what's he saying? He's said "I've forgotten." Simple mechanism.

So you get these various mechanisms that you can see out in life of forgetting and bad pictures and accidents and sudden death being mocked up in the bank and so on, as basically a covert response when you see them and that would then apply to most everybody. There must be a covert response of some character or another to an "I won't." You see? Instead of saying "I won't", they say "I can't" or "This is just the way it is", you see? "Yes, here are all these horrible pictures and I can't do a thing about it."

Now, the oddity is that the mechanism, apparently, is so submerged and is so lost that it itself has become a modus operandi. And that becomes the way of life and the fellow now isn't actually in active revolt at all. He just mocks up bad pictures and forgets. He doesn't know how; he doesn't know why or anything like that.

Well, there have been some civilizations on the track which were corks. Man, they were marvelous! You talk about production-crazy. These boys were really production-crazy – Arslycus.

If you ever want to see tiredness overwhelm the pc, run him into the area of the whole track called Arslycus. And, there, thetans were actively producing matter, you see. And they were hanging off walls, making walls and making tilework and mocking everything up, you see – actively mocking it up and smoothing it out and you couldn't get away. They had various mechanisms where they kept a piece of you in a big boiling pot or something of this sort and if you got away, why, then they put this piece into the boiling water and it caused you a lot of pain so you had to come back. There are all kinds of weird mechanisms here of entrapment involved and everybody had to produce, had to produce, had to produce, had to produce, had to produce, see? And it's no wonder that production got a bad name, because they were producing against their wish to produce.
Therefore, production against power of choice of production is revolted against. Creation against wish to create is revolted against and you get that dramatized by the bank. The fellow doesn't want to mock up the bank so he mocks up the bank. You see how that is? He's creating something against a wish to create. Well, evidentially his will to create has been badly overwhelmed. Both because he has overwhelmed other peoples' and because his has been overwhelmed. Do you see how this would work, both ways?

How about the fellow who ran Arslycus? How about the overt, man? Look at that level of overt. Thetans by the ton, all around, working like mad to build walls and build this and build that and finally, through some mysterious circumstance that nobody has ever been able to trace, Arslycus fell apart and everybody fell and fell and fell. It, by the way, wasn't on a planet. It was, of course, just a construction out in space as itself – nobody had invented planets yet and planets undoubtedly were invented to cure things happening that happened at Arslycus because they had walls and roads and courts and houses and towering buildings and everything. And of course they just ran without foundation – uninfluenced with gravity or anything else. And one fine day it all fell apart.

Well, which one of those workers invented disintegration? See, that's what had to be invented – not disintegration by explosion, disintegration because of gravity or anything of this sort, but just who invented disintegration? Who invented the idea that these things could fall apart? Somebody had to and, of course, it was the workers of Arslycus. This was their only possible response, was to out-create with some new idea – something worse than was happening to them.

Well, when you get the crisscross of production and creation going – and creation, compulsive creation, creation against one's will, and so on – creation itself begins to have a bad name.

But now let's take the reverse side of the picture. I was never as unhappy as when I didn't have any stories to write for anybody. Well, that's an interesting state, isn't it? You say, "Well, it's very tough sitting there grinding out stories and all that sort of thing." But nobody needed any stories – all the markets were full. I was good at that. I'd not only filled my own markets but several other writers' and these boys would be unhappy about it and I've really been condemned for creating like mad in the field of the arts – here, there and every place on the track – because I get interested, you know? And I decide, "Well, let's really mock one up!" You know? "Let's get some volume out here. Let's make it shapely." And the next thing you know, why, everybody around that would consider this, if this was the new standard – this is the trouble you get into – they'd be licked. You see, it's an out-create proposition. So you decide you're trying to out-create them, which you aren't doing at all. All you're trying to do is put something up, see?

So they decide they – you've out-created. So they say, "Well, this creation is bad", and so forth. Well, that actually doesn't affect you, particularly. What does affect you is not having any – any market for your creation or not having any observers for your creation or not having your creation wanted in any way. That's what's upsetting. It isn't creating; it's not having it wanted.
Well anyway, we look over this scene and we disentangle a few more facts here. Here – here's another case history that parallels it. Mr. Weller here is one of the most terrific carpenters you ever wanted to have anything to do with. And he runs maintenance here at Saint Hill. He can't miss walking down this passageway – particular passageway – and there's a spring broken on the swinging doors and it's broken today and it's broken tomorrow and it's still broken. The swinging doors won't swing. The days go by. Mr. Weller walks right back and forth past those swinging doors and he doesn't do a thing about it – till I finally look down my nose and I say, "Mr. Weller, repair the swinging doors." At which moment he repairs them with the excuse that he can't get the proper spring to do it with, so it's liable to break again anytime.

Well this, you say, would tab the boy. Well, it doesn't, at all. Because I asked Mr. Weller to fix me up something that is rather incredible, you know, like a file box out of mahogany with a swinging top or something of this sort – something that's very difficult and involved and can't be done in the realm of finite human carpentry – and he brightens right up and nobody can get him to tend the furnaces or anything else. He's right out there, right now, knocking together a mahogany box, figuring it all out, straightening it all out.

I just saw him a few minutes ago, having come back. Right away, why, he had set up a bookcase for me, upstairs. I get flooded with books. People keep sending me books and I'm always happy to receive books – don't get that idea. Books are just fine. I'm always happy to have books. But it was getting to a situation where all anybody had to do was send me about four more despatches and two more books and nobody would ever have seen me again! [laughter] I just would have disappeared!

So to solve this situation, I wanted some file trays for my papers and some bookcases and so forth and Weller, boy! By the time I came back – he's obviously been racing flat out. He's got one of these bookcases all built, apologizing for not having the other one all built. He's only built it three times as fast as factories – which build furniture untouched by human hands – would build them. It's too slow and he's got these file cases now. He's got only five of them done. There's two more to go and they're all laid out with their varnish drying and he's just proud as punch, see? He hasn't got anything against creating something rather fantastic and rather beautiful. He's got nothing against creating it at all. But he will walk past oddities that nobody will appreciate or he doesn't think they'll appreciate.

I imagine the staff here started making rather crude cracks at him after a while about this particular door, because the staff was walking through it several dozen times a day, you see, and there it was gaping open, ready to black peoples' eyes and so on and they probably snarled at him one way or the other about it.

And I've noticed there are people around who have asked him to put up – oh, I don't know – put serrated edges on the garbage cans or something of this sort, don't you see? And people have asked Jenner out here, the bricklayer, to do various things of this character. But it's not in the field of where they – (1) they don't think it will be appreciated; (2) they don't think it's probably the right thing to do; and (3) they don't think it's aesthetic, which all adds up to (4) they don't want to do it. Which brings us to (5) if they do do it, why, the serrations are going to fall off or into the garbage cans, don't you see? It's a revolt against creation.
All right, now there isn't a person in this room that can't paint, with perhaps an exception or two. Put a canvas in front of you and a brush in your hand and a nice big palette with numerous colors of this and that in your paws and just say, "Have at it, now. Let's – let's get something here. This fellow da Vinci has been getting away with it too long." [laughter] "Let's – let's get cracking here." And you would all turn around to me and you'd say you can't, or "I've forgotten how", or you have a whole bunch of things like this.

Well, that must be borne out of a conviction that a good creation in a certain field will bring one into a state of victimization, or will bring one into some unpleasant consequence. That's the conviction. And that conviction causes one to take a vast retreat and to back up like mad full speed astern and say, "I can't" or "I've forgotten how" or "I don't know how to do that."

You get two excuses out in the broad world. They say, "Well, I haven't got any talent" or "I haven't been educated." These are the two things which you hear consistently.

They used to bore me like mad when I myself was very deeply involved with the arts. I would turn out something that was bingety-bang, splash-bong, and then have somebody come along and tell me that he wasn't doing it because he had never been educated to. Now, there's a – secret of the thing is, if I'd ever listened to anybody's education with regard to this thing, it never would have gotten created, don't you see? Get the idea? Creating by the rules, as far as a painting is concerned, of course, immediately denies its self-expression.

So we look at these various aspects of creation and we begin to understand something more about this thing called a bank, and we begin to answer up this problem that has been around since 1948. And the problem is, with everything else he can do, why does a thetan mock up these things?

Now, I had an answer – I had an answer one time in 48 which was on the idea of harmonics. And I said, "Well, the guy's general tone brings about what he mocks up. And he mocks up something with resonance between himself and tone – you see, his own tone – and what he creates in the bank and that must be about the way he goes about this." 1948.

"The guy is at such-and-such a tone level." Well, that was a bit of a breakthrough. You could change a guy's tone level and he'd mock up something else and it's true. He will, too. But that doesn't give us the full story. And the full story is that an individual mocks up or doesn't mock up in an effort to prevent his will from being overthrown on the subject of creating. He's "protecting his self-determinism" is a very good way to state it; protecting his self-determinism with regard to creation.

If he could determine to create it, he would. But if he's being forced to create it under vast duress, he won't. And he therefore acquires mechanisms to inhibit his creativeness; and these mechanisms to inhibit creativeness are what we run into in processing. That's why old Creative Processing works, but why eventually they finally dreamed up – some preclears did – that the bank got solid if you made them mock up. Now, get that just as a mechanism to prevent creation.

See, "We can't do this", you see, "because the bank gets solid." There's another answer, you know.
Well, it's a very funny thing. I'm looking at one or two or three people here who've been around for a long time and used Creative Processing for a long time before any banks started to get solid. Banks didn't disbehave for a long time. We never heard about this and then we got this new mechanism.

Maybe some old banks did get solid but nobody ever objected. I never saw it happen – not until I started running some tests on the thing and paying attention to it, very generally, and this other series of mechanisms fell out of the hamper. Well, they'd already existed. It wasn't just people in Scientology inventing the thing, but the mechanism had already been established. This was a new method of not creating.

So methods of not-creating or methods of denying creation, methods of denying ability and so forth, are basically what you're involved with when you are processing people. That's the most fundamental fundamental.

Now, this is so boobytrapped as the basic road to Clear that it's something like driving through a – an antitank mined zone in an enemy sector on a bicycle and you go round and round and up the roads and down the roads and of course everywhere you see there are nothing but mines, barriers, pillboxes and chattering machine guns, you see? It's just not ar – it's not a driveable area.

So we have to figure out what the guy is afraid of on this subject of creation and disarm it from that angle. Now, what's he afraid of? Well, he's obviously afraid of being made to do. Creativeness, doingness. You don't say "creating", you say "doing." You see, this gets us a little closer to a driveable road, a little further from those minefields. You don't say "creating", you say "doing". Now that substitute actually is quite workable.

Now the next thing you get him over it – something there, some fundamental, has brought him into a state of mind whereby he believes that there are enormous consequences involved in his doing some of these things; otherwise, he wouldn't be so fantastically afraid to do them. You know, he wouldn't be inventing all kinds of mechanisms that, "If I mock up a good picture, it'll turn into a bad picture" and "If you force me to create something, then this way, that."

The most basic mechanism is why does the fellow mock up an automobile accident? Well, he's got an old mechanism around which goes like this: In order to get things created you have to hit somebody. That's the best way to get anything created. You have to hit a thetan and that makes him create and that's one of the most basic fundamentals you ever heard of. You have to hit him to get him to create ... Way back when.

So, therefore, when a person is beaten or defeated he's liable to start creating. Therefore, you get the birthrate of the (quote) "lower classes" (unquote). Birth rate of the upper classes isn't high because they aren't beaten. If you'd beat a few more women in the upper classes, you'd have a higher birthrate, but I don't advocate this! [laughter] But this is about the way it is, don't you see?

You get this beatingness and creation or punishment and creation or the way you respond to a blow is to create. How do you create? You respond to a blow. That's the best way to do it. If you don't believe it, get somebody to hit you sometime and you find out that you'll...
have a picture of it. Well, you didn't have a picture before. See, you didn't have a picture even of the scenery before. You were just skipping it – and get somebody to hit you and see if you got a picture of it. You'll have one. Well, what are you doing. Well, you're responding with a creation to a blow. So a fellow gets in an automobile accident. Whir, crash, bang! He's hit! So he mocks it up.

Now, this explains to everybody, too, that he's a victim. He's been made to create this thing. These would be the basic mechanisms back of this. He's been made to create it. He has responded, however, and followed the law which is: The best way to keep from being hurt is to create. Since, if one's being beaten so as to make him create, then of course the best way to keep from being beaten is to create and if one creates the picture, then the rest of the automobiles won't hit him.

Now, I suppose where you get the most involved point in an engram is when the fellow has already mocked up the engram in full, he thinks. Oh, he's hit – he's hit by a car on the highway, so he mocks up the engram and this, obviously, will keep him from being hit by any more cars, you see? And having mocked up the engram of being hit in full and now having it in full restim with all the mechanisms involved with it, he is now hit by a tank truck, so he mocks that up, too, you see? So that will keep him from – anything else from happening, don't you see? And then the tank truck catches on fire.

Well, this defeats him. You see, his best answer to a blow was to create and that always got him off the hook way back there in Arslycus and other places, a trained mechanism always got him off the hook. He always fell for it when other people did it to him. He wanted them to create and he hit them and they created and so on.

And so you'll have three phases here. You'll have engram one, engram two, and then a total not-is of engrams which is an utter defeat and the disappearance of engrams one and two and you'll find these things all present in a serious accident. The fellow is hit, so he mocks it all up and he thinks that's the end, but it's not. So he mocks all this up again and the additional, you see? And then something so catastrophic happens that he buries the lot, because he can't mock up. Obviously the mechanism is not working and people with invisible fields have simply gotten into a chronic state of where they believe utterly that it won't do any good to create. This mechanism no longer works, don't you see? Black field is the same thing. They've not-ised the mechanism. The mechanism has gone out.

Now, these are the various mechanisms involved with people mocking up painful pictures. They mock them up and there's nothing they can do about them, except mock them up.

Now it's a defeatist sort of a thing. A person is not really playing much of a game, because the pictures really have ceased to be visible to other people. That again is a protest against being made to create.

So you'd sum all this up to the responses to the summation of all overwhelmed choices. The responses to the summation of all overwhelmed choices. In other words, the person's choice is overwhelmed so he responds in some way, still trying to make his postulates stick, down scale, but still trying to make it stick. Now, the basic assumption of a thetan and the first thing that he wants to have happen, of course, is the communication formula. That's his game. That's his most fundamental game – right there in the Axioms.
If we modify the statement by saying it is the most fundamental game in the interrelationship of thetans – in other words, it's – he can have a game sort of all by himself just creating things. He's above Axiom 10, don't you see? He can have a game above that. But when he gets into an interrelationship and a real games condition, the first entrance point is that Axiom, and from there on all he wants to do is just make his postulates stick and make his power of choice felt – creation of an effect, in other words. He's got to create the effects and create the effects and create the effects.

Now, when he doesn't create the effects, he'll still try to create the effect. He'll still try to create the effect and even though he is unable to do so, he'll still try.

And of course, now we get down to Routine 3. Why is Routine 3 so effective? It is very effective. You're not pushing it as hard as you could in this unit, but it's terribly effective. It's because you're looking over all of the powers of choice he has hoped to effect, most of which have failed, and you're running out his failed powers of choice when you're asking him for goals. You're asking him, in essence, "What postulate and – have you tried to make stick." You say, "What do you want to do in life", you see?

Now, we're getting a little further from these minefields when we say "What goals do you have?" We say, "What postulates – make stick?" This is beyond him. Coo! The last postulate which he made to stick – if you just said it just like that – the last postulate. We could – "Let me see, I think that was somewhere about five minutes after the start of this universe!" It's all that time ago, don't you see? So here we are, all this long, long time ago, that was it and, of course, he's not going to process on that.

But now he has goals and these goals are in essence what postulate he hopes to make stick, re-formed and substituted into what conditions would he like to bring about. So the conditions he would like to bring about dropped back instantly and at once to what postulates he would like to make stick, which drops back to what postulates he could make stick, which drops back to power of choice over his own actions and postulates. Do you see that?

And everything we call a reactive bank is the odds and ends and bric-a-brac and mechanisms of one kind or another which tend to defend his assertion of self. And those mechanisms that are making a ruddy mess out of him – these very mechanisms – are basically intended as prevention of his postulates disintegrating and not sticking so you see, the disintegration of these postulates is what's wrong with him and, of course, his cure is so much more violent.

You know, you wouldn't think a fellow would react this hard. So he looks out there and he says, "Oak tree, oak tree, split apart. You damned oak tree!" It doesn't do it and he goes and he looks around at it to find out what's wrong with it and decides there's something else wrong with it and he goes and gets an axe. And he takes this axe and he aims a terrific blow at the base of the oak tree, you see? And the shaft quivers and the head flies off so he goes and he puts the head back on the axe and he pounds it in with wedges so it couldn't possibly ever fly off again. He gets back there and he spits on his hands and he braces his feet and he hauls off and he takes a terrific blow at the base of the oak tree and shatters the handle of the axe! [laughter]
So he says, "Well, let me see now. Let me see now. Hm-hm! Let me see now." And he goes back and he prowls and he snarls and so forth and invents a saw. And then he finds out the oak tree is on somebody else's property, by this time, you see? And it's not permitted to do anything to the oak tree. And next thing you know he's telling you how wonderful oak trees are and how one should preserve oak trees, and actually, probably, has joined or formed several societies, you see, to defend and preserve oak trees and to punish malefactors who go stand off and make postulates at oak trees and tell them to split apart. Don't you see?

But, functionally, what he's done there is trying to make his postulates stick – the original. See? He's trying to push it through. He's trying to push it through. And it isn't the postulate; it's the effect. He's still trying to have an effect on oak trees.

And the effect of making an oak tree survive is still an effect on an oak tree. He actually hasn't even changed his mind at all. He's simply modified it and the basic of this chain is the basic overt, which is why overts work so well. And the basic is that he has stood off and said, "Oak tree, oak tree, split apart. You damned oak tree!" and that will be the basis on this chain.

You find anybody who is part of the Peskadora Audubon Society for the Accumulation of Colored Paintings of Robins' Feathers and who devotes his entire existence to getting out papers on the subject of this; you, of course, quite rightly assume this bird has had an awful lot of anti-bird action! You assume this must have been the case and that it really has deteriorated like mad, because he's on an apparent "preserve birds" to such a marked degree that it is in itself an overwhelming situation.

Well, let's look just a little bit wilder and further on this thing, and we'll find out that this guy is not as dumb as we have thought he is. He is still trying to make his basic postulate on the subject of robins stick. See, he's still trying to do it.

Well, that's pretty good. He ought to at least get a medal for persistence. You uncover any of those states of mind and you go back to this.

Now let's drop back just a little bit further. Then why does he make this postulate of "Split apart, split apart. You damned oak tree"? Now, why is he doing that? Well, I don't know, somebody else created the oak tree. He's gotten into some kind of a games condition on creating, you see? He was mocking up oak trees and somebody else mocked up this oak tree. And they were making nothing out of his oak trees and he didn't mind this particularly but all of a sudden somebody boobytrapped it. And he somehow or another couldn't make nothing out of the oak tree that somebody put up there – he figures. There's something wild goes on around this.

And you'll find very early on the track thetans specialized in these fantastic mechanisms, you know? They said, "Now, if you'll just go in that hole there, in space, and throw out what you find in that hole..." you know, goofy games of this character. And the guy'd go in and he'd fool the other thetan, you see, and he'd mock up some things in there and start throwing them out, you see? [laughter] This would surprise the other thetan terribly, you know? All kinds of wild, crisscross gags of one character or another.
And the oak tree probably got mocked up basically and fundamentally on something on this sort of a basis; it was a substitute oak tree, don't you see? Somebody substituted the oak tree in the field for another oak tree in another field and the fellow couldn't as-is it because he'd had purposely lost for him the right oak tree that he could as-is, and he's trying to as-is the wrong oak tree, don't you see? And it's probably one of his own oak trees, you see, and it's got a postulate in it that "You must survive", don't you see? Now, he's going against his own postulate and it won't disappear and he still, two hundred trillion years later, is very likely trying to still have an effect on that.

Well, there's evidently something wrong, then, fundamentally with getting the wrong postulates, or something goes wrong in the whole field of postulates. So you say, "Well, what postulate – ." Now this is theoretical, this is not practical. You say, "What postulate could you make stick?" or "What effect could you actually create?"

Now, that would lay us out a process pattern which would be a very nice process, and it's theoretically very good. And it's been run with singular lack of success in all directions.

Well, why? It's going straight through the minefield, don't you see? Boy, there's antitank mines all over the place and pillboxes and trees fallen across the road and explosions and signs are all backwards and you're trying to shove the preclear through too hard. So what's he tell you? He tells you, "It's unreal to me. I can't do it", and so on. Well, as a matter of fact he's dead right. He can't because it's too direct.

Now, here and there you'd find a preclear could run this on a modified basis. I'll tell you a process that a preclear can run that is very close to it: "What decision would it be all right for you to make?" That's a very good process. That'll unconfuse somebody rather decently, because he's in a state about decision.

Now, a thetan must – as – to gets along, he must have some feeling that there are confusions and things which he cannot tolerate. There are motions and confusions that he cannot tolerate. So he must avoid these motions and confusions and he avoids them with various mechanisms of creation. These things do cross one against the other.

So if a person's tolerance of motion and randomity is raised, then his fear of the consequences of his power of choice being overthrown are reduced. You see how this could be?

But nevertheless and most fundamentally obtaining a tolerance of motion, a tolerance of catastrophe and that sort of thing would wash away, on a rather grand scale, fear of failure. You go out and ask a businessman, "What's – what would be the result of you keeping on selling dishpans" – take something rather esoteric – "and what would be the result of you going on selling dishpans and not recording them and not reporting the sales tax to the government?"

And he – he'd tell you, man. They'd fix him up, man. They'd fix him up good. They – they'd really – really fix him up. They'd send him up to the hoose-gow for a couple of years for fraud, and he'd lose his right to be a director or something and have to pay all the money back to the government and have to be – I suppose the worst of the penalties – he'd have to be polite to Inland Revenue or whoever does the collections or something like this. It'd be consequence after consequence that he can face, you see, by merely telling you about them. Yes, he
can tell you about these things and if he omitted doing this, why, he'd be avoiding the rules of
the game and he'd have rather terrific consequences. So the guy sits up all night and he creates
these slips of paper which the government requires.

I don't know why governments require slips of paper, frankly, but they do. It's just a
peculiarity like a lot of other banks. They sure love their slips of paper! You know, there isn't
anybody ever reads them, did you know that? And fifty thousand monkeys equipped with
fifty thousand pairs of spectacles wouldn't be able to peruse all the pieces of paper that get
accumulated for government in one day, you realize that? I have the statistic actuarial proof of
the matter, although it's been rather costly accumulating that many monkeys.

The point I'm making here is that the fellow has got to create this much administration
to stay in business and stay out of jail. That's a what? That's an unwilling creation, isn't it?

So how's he do it? He does it wrong. That's the best way to get around it. Don't do it
quite right. Fog it up a little bit at the edges, don't you see? And then get so crazy as to vote
for the kind of person, you see, that would make it necessary to keep this kind of a govern-
ment system where the government isn't doing any governing, you see; the government is
sorting paper. It's gotten so the armies and navies and governments of the world and so forth,
actually no longer travel on subways, roadways, passageways; they no longer sit in chairs.
The navies float on paper and the armies fire paper, you know, and the government rides
home to work on paper and so forth. Well, everybody is creating paper like mad.

Well boy, if you ever want to see corny arithmetic, you should look at some income
tax reports. That can get pretty wild. Particularly in the United States where everybody does
them himself. This can get pretty wild. Boy, they can add up 2 and 2, and sometimes oddly
enough it isn't even in their own favor, you see? I've seen fellows pay seven hundred, a thou-
sand dollars too much tax just on some kind of arithmetical error. The thing is of the silly na-
ture of adding up 6 and 6, you know, and getting 180! [laughter] They manage it! Unwilling
creation, don't you see?

And eventually, under this duress, they begin to mock up no income tax reports at all –
like Suzie even. You see, because it's just too much. See, it's just all too much, you know, and
the penalties are too much and it's nothing can be this serious, don't you see? So the best thing
to do is just forget the whole thing. Just skip it all. Let it all slide. So those are the responses
to creatingness, don't you see?

But it's going to produce – even that forgetfulness is going to produce an effect on the
government, let me tell you, man! They're going to be a missing slot.

I remember the old writer, Paul Ernst, one time. He was discussing a story with me
and he was just about to write this story, and I don't know if he ever did or not. But it was a
story to be called He Didn't Like Soup. It's one of my favorite unwritten stories. And this guy
from the twentieth century gets in the twenty-fifth century, and it's all mechanized and it's all
laid out and it's all taped and they've got this big endless belt, you see? And they – his friends
that he's now met in the twenty-fifth century take him down and they show him this endless
belt. And it's lunchtime, you know, and they're all standing there and he – they say, "Well,
take your plate of soup off now. Take your plate of soup off the belt and then you turn around
one and one-half paces to the table. And there you eat your soup, you see? And then you push
the belt eighteen degrees to the left and it – it goes down a little chute and it gets washed and so forth."

And then this guy from the twentieth century, he stands there alongside of the table, you know, this – with this big endless belt going by and he doesn't take his plate off. And this one plate of soup then goes traveling along this thing, you see, and it tips over the edge of the endless belt and goes into the machinery and the machinery stops. This blows out the fuses in the main powerhouse. The main powerhouse at once is reprimanded left and right from all directions; calls pour in; the switchboards blow up. [laughter] Here it goes!

And Ernst had it all traced out, the total failure of this entire, precision civilization and they asked the guy afterwards, as they're sitting in the smoking ruins of it all – they ask him af "Why – why – why didn't you take the correct action?" and the fellow says, "But I don't like soup!" [laughter]

I can assure you it will never happen in England! But there it goes! There it goes.

Now, there's your introduction of your various errors and the concatenations as they move on through, everything getting all complicated and so on.

So this fellow not doing his income tax return hopes to leave this plate of soup on the table or hopes that somehow or another that file cabinet will have the missing consecutive number in it and somehow or another in some part of the vast government structure there will be a breakdown, which will then cause the machinery to go off, you see, and the power lines to blow and the telephone switchboards to explode. He's hoping – he's still hoping. Got the idea?

So the creation of a confusion is the last echelon of a postulate and the last echelon of the confusion is the creation of a confusion by omission – not commission anymore; it's omission and therefore we're on a very safe road in processing of pcs if we give them bountiful exercise on the subject of the Creation of confusions. You see where we are?

Now, if you could devise an auditing command which stressed the creation of confusions by omission, why, we would even go a step further down, you see? "If you just sat still, what confusion would occur?" or "If you said nothing, what confusion would occur?" or "What not-knowingness would create a confusion?" or "What not-doingness would create a confusion?" And all of a sudden, why, you'd see a kind of all-is-revealed sort of a – of an atmosphere coming into view. "Oh, is that why I never go out of the house?" You know, that sort of thing.

Now, those are the roughest cases to get anything done with – are those cases which don't move, don't go and so on. This actually goes on down to catatonia. You should recognize in catatonia, the last possible despairing effort of a thetan to make a postulate stick somewhere. It isn't a notdoingness.

There is probably no such thing as a thetan who is not trying to do something. He can be trying to do something by not doing, which is what gets Confused. But there would be no such thing as a thetan, anywhere, who is actually – could be said in an absolute sense to be doing nothing. All thetans are busy, even with omission. They're all busy, even with omission.
So your Goals Assessment is basically targeted at recovering postulates he hoped would stick, which actually is basically knocking-him-on-the-head failures. You're getting his postulate-stick squared around, in other words, and you get a lot of these failures off and so forth. So that you would actually make a dreadful error if you never asked him for failed goals or secret goals or withheld goals. You'd have an awful mess on your hands if you never ask him for these other categories of goals.

If you just asked him for goals:

"Well, when I was a little boy I wanted to be a soldier."

"Well that's good. Do you have any other goals?"

"Well, just that one. Just when I was a little boy, I wanted to be a soldier and that's it."

And you wind up with a list of one. Probably, if your list was that limited, you could make a bet on the thing that the reaction you're getting on the E-Meter is the fact that that goal happens to be a lie. He never did want to be a soldier. The only basic goal he has is the defeat of an auditor. That's one to think about.

Now, very often a pc will become so confused on this blow-create proposition that because an auditor says something to him, then he has to create something. It's quite interesting. He's so confused about it that just being talked to causes him to mock something up. In other words, the blow doesn't have to be a blow. It's just a mere slightest drift of zephyr of air, and he instantly mocks something up, you see? "Well, now it's my signal!" Or, conversely, if he goes down a little bit more, just this mere waft of air causes him to obsessively mock nothing up. So he got out of session; he gets all sorts of ideas and so forth.

I knew this one so well that I used to have a modus operandi, which was just a straight modus operandi. I used to start a session – this is the original short sessioning. Short sessioning has another purpose these days, but this was its original version. I'd start a session on a pc and I'd get him all set and I'd run a little bit through a lock and so forth – and about ten minutes, you know? And I'd say, "Well, how do you feel now?" and bring him up to present time, everything is fine; end the session. Then just sit there for a moment and then he'd hand me a case – now it was safe.

You note it sometime – note it as a mechanism. A pc that you're having an awfully hard time with and so forth, why, just give him a little short session and he'll hand you his case. That's the phenomenon that I'm pointing out, not the fact that he's influenced by short sessioning.

You say, "Well, do you have any present time problems? Or anything like that you could, now – you know? Is there anything you're worried about in life? Do you have any ARC breaks with anybody?" and so on. "Good. Good. All right. Well, now that we've checked this thing over, is it all right with you if I end this session now?"

"Oh, yes, yes. Fine."

"All right. End of session."

Now, he's fool enough to crow, see? And he says, "Well, a couple things I didn't tell you. Ha-ha! As far as present time problems, I'm being shot tomorrow morning by Castro",
[laughter] and so forth and he gives you the lot, see, because it's safe now. You're not demanding that he create anything, so he'll create. Marvelous! I mean, watch it happen sometime.

And after he's given you all the dope, why, wind up on him and say, "All right. Is it all right with you if I begin this session now?" Now you've got all the gen, carry on.

He's on a total reverse. He creates when he's not supposed to and when he's supposed to he doesn't. He's got it all locked up backwards and as far as occlusion is concerned, you could assign occlusion to many things. But basically occlusion is a thetan's last answer. It's the last answer of omission. It's overt act by omissions. It's his last effort. He just hopes something will happen to the oak tree if he forgets it. What might happen? It's leaves might go all haywire, and worms might eat it up and almost anything might happen to the oak tree if he forgets it. But that's his last answer.

Some process such as "What confusion wouldn't occur if you forgot?" Probably would make no sense to you at the present moment, but I'll guarantee you can find pcs around that'd be the most sensible sentence you'd ever uttered in your life. That would be marvelous. Come up with a total roaring automaticity of answers to this thing. All kinds of things wouldn't happen, because he's on a failed forget. It's how far can you go.

Well, now you're attacking the same targets. Naturally, a tolerance of confusions, a tolerance of problems, a tolerance of motions winds up fine. But remember failed postulates is what you're after, and that's closest attack level is goals, which is failed postulates.

Now, trying to get some version of something that runs a failed postulate was very difficult to do, but we eventually achieved this and I was able to get around to goals. You'll notice that failed postulates first showed up at the 1st Saint Hill and then goals all of a sudden showed up down in the South African ACC. They're sequitur in actual fact – getting a pc's goal, see? Very good.

Now, trying to find out exactly what a pc hopes will happen if he does exactly what he's doing would be another version of running Goals Assessment. You'd say, "Well, now, what do you hope will happen if you keep on exactly as you are?" If he can't answer this, you can undercut it. "If you keep on exactly as you are, what won't happen?" Now you're asking him for the failure.

"Oh, well, I won't get run over by cars", and he'll give you all sorts of things. If he keeps on just as he is, lots of things won't happen and this expresses itself as caution. And this is laudatory, you see? This is commendable caution. And all of a sudden, why, this sneaky idea starts rising in the back of his mind that there might be some other side to this coin. It even starts occurring to him that if he keeps on exactly as he's going, something is going to happen someplace! See, you've run the not-is off the front of the – of the shell.

And, "Well, if I keep on going sak-tha-rah-thu." You could also run an intentional series of overts off a pc simply by saying to him, "Well, now what won't be damaged if you forget it?" or "What could be damaged by forgetting it?" and maybe the both questions would produce some rather fantastic reactions. They're both practically the same thing. He's still trying to create an effect; he is still riding out Axiom 10. Well, if he is still riding out Axiom 10,
then for sure, man, whatever he is doing has an intentional effect connected with it somewhere. And if this has gone into forgettingness, then part of the forgettingness is to not-is the intentional effect. But it's almost integrated; it's almost intelligible; it's almost on the top of his mind.

Another way of expressing this: "Who would be sorry if you didn't get better?" Now, that sounds like a different type of question. It's more socially acceptable. But actually you haven't asked him, really, that question, or what he thinks you asked him at all. You're just asking him, "If you went on knuckle-heading along, here, in a total occlusion, who'd get hurt?" That's what you've asked him, not "Who would be sorry?" But that's more socially acceptable, you see? Little kids are always telling you this.

"What damage would forgettingness cause?" Another type of question along this line. And you're running O/W now, crossed with unstuck postulates, crossed with forgettingness, crossed with this and that and on the whole subject of creation of an effect, or creativeness, you're right on down to rock-bottom. Well, that might be a pretty high level of theory, and it might or might not have any degree of workability and actual application to the preclear, because as I say, it's through fields full of mines and this would be a pretty rough passage, in many cases.

But that is the road you are paralleling. And if you haven't got a map of the other road, because the devil himself couldn't draw one and you at least know what more or less is on it and I hope that helps you out.

Okay? All right.

There'll be a lecture tomorrow to make up for some of the lectures I've missed, if that's all right with you?

Audience: Yes.

And right now, I will say, good night.
Okay. We have – this is what? This is the 4th of August.

*Female voice:* Yes.

Haven't got my sextant with me. How can I tell the date? [laughter]

We're going to lengthen this course to eight weeks. [laughter] I'm not going to do anything particularly to – on the cost or anything like that. We are lengthening it to eight weeks just basically because you're being pretty slow, man. I mean that's all. That's being pretty crudely slow.

Now that isn't actually in effect for anybody but people who aren't here yet. That is to say that would only be effect – in effect on people who have not yet enrolled. Your course is still four weeks, and you're still behind. I figured out a way to give you a lose, you see. And I want to invite you to some attention to the checksheets. Make sure that you get those checked out. And I would like to make this statement, particularly to those people who are leaving: It isn't the new technique or the new idea that is wanting. It is sound technical application.

Throughout the world, Scientology has, here and there – where it has – fallen on its face solely because of lack of technical accuracy of application. That is utterly fantastic. Its basic methodology of auditing is just not applied. And in the absence of the basic methodology of auditing, you cannot get a result, and that's it! I make that statement categorically.

A bum auditor never got a good result. He got a sporadic one once in a while, and then tried to get it on the next pc, and then he kept looking for new and startling ideas that would get this idea again on the next pc. But of course, it never did. And he figures out there's something very inconstant about the ideas of Scientology or the actual processes of Scientology. These must be inconstant. No, he should look closer to home. His application of processes is inconstant, so therefore, his results are inconstant.

What it takes to comprise a blunder in the technical department is of such a wild order of magnitude that you normally, when you're supervising processing, don't even bother to ask for it because nobody could be that dumb. And yet, that is the exact blunder that is made. For instance, you seldom ask, "Well, did you report for sessions?", you know. You just don't go into that order of magnitude.
You're wondering whether or not the pc might not have had some tiny little ARC break that held up his processing and all that sort of thing. That is not the order of magnitude that causes technical results not to occur. It's the order of magnitude of "Did you report for the auditing session?" Casual statements very often have a very disarming effect and you're liable to get the sudden truth dumped in your lap, you know.

You say, "Well, did you change the process often enough every hour?" Yeah, you've had a wild, non-... non-result profile, see, over twenty-five or fifty hours of auditing. It's this kind of thing that you're looking at. You may have perfectly nice Auditor Reports, but they haven't anything to do with the sessions that were run. It's quite incredible, quite incredible.

Picking up this Form 6 discloses this, too. You start running a Security Check Form 6 about "What have you done to pcs?", you know. And one of the questions on there is, of course – well, in essence – "Did you fake auditor reports?" you know. And you'd be surprised how many falls there are on that.

The auditor wants to look good, so he writes down a good auditor's report; it didn't have anything to do with the session. It happens. It's happened over the years all too often. So, this, of course, has had the effect of making me work three times as hard as I might have otherwise, because I couldn't figure out what was happening because I myself was not looking for the gross error.

But the error that was gross is gross, man. I mean it's a really marvelously gross error. And such a question as "Well, did you change the process often enough each hour?" is liable to get, "Oh, yes!" [laughter] "You see, this preclear has to have a new process every four or five minutes, you see, because he loses interest." You'll get some of the wildest rationales, you know? And most ARC breaks that occasion auditing are actually an auditor – simply bum TRs. That's all. The auditor doesn't press on, carry through, bad Model Session, that sort of thing. And you'd be surprised what that does.

You yourself, I am sure, have noticed with enormous relief on your own part while being a preclear that an auditor who just ran on down the line with a good Model Session – he might not be very brilliant in the way he's handling the data you give him, but he's giving you a good Model Session. And all of a sudden your confidence gradually rises. You noticed that?

Audience: Yes.

And you noticed what happens to you when you run into several flubbed auditing commands and flubbed bridges, and flubbed this and flubbed that, and how your confidence deteriorates? That is a direct monitoring factor.

This, by the way, is a new field, a brand-new field in the whole field of psychotherapy – the application of the therapy to the person – that has never had any slightest study; not until Scientology. That sounds astonishing, doesn't it? But it never has.

Oh, I'm sure some old witch doctor has educated some kid that he was bringing up to be a super witch doctor or something of this sort. I'm sure he's educated him to the proper way to handle a rattle, you know, and say, "Boo" and scream at the right places. But I'll also call to your attention that those barbaric and uncivilized practices, when they are actually rendered
according to rote and the way they are supposed to be done, they're quite astonishing; they get a pretty good percentage. They at least get their twenty-two and a half percent. [laughter]

Psychiatry doesn't, man. It doesn't get any twenty-two and a half percent. And boy, they handle an electric shock one way one day and another way another day, and then they change it all around and handle it some other way, and they don't know what they're doing. But then you and I, of course, are apt to be bemused and amazed at the psychiatrist because we don't understand what his goals are. And of course, he doesn't have the same goals we do. And you can ask him for his goals and he'll give you some of the most incredible rattletrap bunch of nonsense. Sounds like nonsense to you.

"What is your goal with regard to patients? What are you trying to do with patients?", you see, something like this. And you're liable to get stuff that will curl your hair. I mean, it has nothing to do with your goals. Has nothing to do with helping people. Hasn't a thing to do with helping people. Hasn't anything to do with curing insanity. You can say, "Well how can a fellow be in the field of psychiatry if he has nothing to do with helping people and curing insanity." And you could rattle off yourself the pattern goals which ought to exist in psychiatry. And they don't exist in psychiatry.

And many of those goals are missing in medicine, particularly in the field of surgery. And you ask a surgeon, "What are your goals with regard to a patient?" and you, of course, could tailor-make a whole bunch of goals that a surgeon should have. Well, it's seldom that a surgeon has any of those goals. And so you're very dismayed because you don't understand the man.

And in Freudian analysis, the methodology of application alone prevented Freudian analysis from working. I'm sure that Freudian analysis can work because I can make it work. In 1945 I ruined more cases for the United States Navy. I told you about that, I'm sure. I ruined cases left and right by finding guys out on a park bench and pulling some second-dynamic traumatic experience, you see.

And then they were keeping records on the effect of hormones on ex-prisoners of war and that sort of thing, you know? And of course, I had access to their records. So of course they were running a wonderful test program for me. It must have cost the government hundreds of thousands of dollars. And they would write down in the records how it affected the patient on this day and how it affected him on the next day. And, oh, these were beautiful statistical records, so all you had to do was alter the psychic attitude of the patient toward sex, then go look at the records a few days later, and of course you had the direct test of what you were doing.

The government was very nice. In view of the fact that they intended to do nothing for the fellow but were merely trying to find out. See, they were just trying to find out. And you – I asked old Doc Yankeewitz, "Well, what are you trying to find out for?" And he said, "For? For? For? For?" Sounded like he was playing golf. Stopped him in his tracks. Evidently, his thought processes had never gone beyond that point. He'd been well trained, but his application of methodologies, application of the theories of psychoanalysis are almost 100 percent the reverse mirror to the Auditor's Code.
If you don't believe it, look them over. It's almost 100 percent reverse picture, and then is inconstant. They didn't even employ it the way they might have done, you see. So maybe these theories would have worked, but who would know? Because the theory was applied in such a ruggedly random fashion from one practitioner to the next, from one day to the next, by the same practitioner, and mostly reversed as to what would do anything for the patient.

But methodology, its application – and only then can you get a consistent and constant result. And it starts in with TR 0. And frankly, a person can't even read an E-Meter if he's so agitated about looking at the pc. And, you know, he's got to sit in session, but he's got to look at the E-Meter. And by actual observation, I have found out specifically that the person doesn't get the data on the needle or tone arm. If his TR 0 is bad, then his recording of the E-Meter and what it says is fantastic. Tone arm can be at 5, he says it's at 2, you know. I mean he just can't record, he can't read the E-Meter.

Now, what do you do? You sweat in going out and teaching other people and so forth. Perspiration is doing a Zambezi Falls from your brow, and your sleeves are rolled up, and you're getting ready to call for the rack and whip, you know. You're getting to – you're getting desperate, see. You've told some auditors that when the needle is tight like that and won't drop on a can squeeze with a high sensitivity knob, that the case probably needs Routine 1. See, you keep telling them this, you see. And you get this case in, and at sensitivity 0 on the knob and a near Clear needle, and the tone arm with nice action in it, you find out that this person has been run for three days on Routine 1. So you say, "Well, now study your E-Meter", and you get out E-Meter Essentials, and you put E-Meter Essentials under the nose of this person and you say, "Study that E-Meter Essentials. Now, study your meter. Get so you can read a meter; get so you can read a meter."

And he reads it all through, and he passes the examination about it, and three weeks later does the same trick with another pc. Only this time the pc is totally stuck with sensitivity at 16, and can't even find him with the tone arm. [laughter] And all of a sudden, why, "Well, what are you doing?"

"Well, we're running Routine 3, and that's all we're running, and the pc has such long comm lags, however, that it's impossible really to run Routine 3, because we only get about one goal a session." [laughter] "Well, I think – we think we found his goal. We think we found his goal though already because the whole meter just stops moving whenever he mentions being in session." [laughter] "So we found his goal all right, which is 'to be in session', obviously."

And you say, "Wait a minute now. Read this E-Meter Essentials here. Read it. Read it, would you please?" And you are just banging your head against the wall, because that isn't what's wrong with the pc. That isn't what's wrong with this auditor. He ought to be a pc. But that isn't what's wrong with him. What's wrong with him is he can't confront. It's one of these horrible, wide, wild fundamentals. It upsets him so, the idea of looking at a pc, that of course he can spare no attention for the meter or if he looks at the meter, he can spare no attention for the pc. And these two things, attention on two places, of course, adds up to the definition of a problem, doesn't it?
And so you've got two counter-postulates, what you... here you'd have two counter-objects. And you've got two things with which you are unfamiliar that you are looking at at the same time, and of course, it looks like a problem. And a person's indecision rises. If indecision could be measured in inches of mercury, it'd be the height of the Empire State Building. And... hasn't anything to do with being able to memorize a meter by rote. It has everything to do with being able to connect what the meter is doing with what the pc is doing and regard them as a unit. They actually are two things, until he gets that connection straight – got it.

So, the advice I will give you is simply, basically just this: look for greater technical gains when you have achieved greater skill in application. Don't necessarily look for greater technical gains because you have given them some new ideas. That's the thing to concentrate on. And when you've got that concentrated on, when you've got that smoothed out and squared away, all of a sudden this new factor – ideas and the application of ideas and handling the pc's ideas and all of that – that all ensues afterwards.

But as long as the person is upset and worried and maybe not even realizing he's worried, about the mechanics of how he does this thing, he of course has no judgment. And that's the basic stomp on judgment, is the person has no judgment as long as he himself is sitting in the middle of a problem of "can't apply." Well, he's sitting in this problem of "can't apply", and you expect him to have judgment about this case. Well, he can't do it.

So ideas come after, even though they apparently come before. Handling the ideas, the theories, processes, what process when, that sort of thing, comes after somebody knows E-Meter and TRs and Model Session and the other things – has these things pretty good, can do an assessment on the Prehav Scale accurately and well, and can do a good Security Check. When he can do all these things, now he ought to be worrying about what makes people Clear, because of course, this is the fundamental. These are the building blocks on which this idea of Clear is built. And it's like trying to build the top of a skyscraper without even sky-hooks, to just get an idea about clearing and then without any methodology, try to bring it about. Won't work. I had a lot of experience with this.

Now, I don't necessarily state that the TRs are the most ultimate drill that will ever be invented or even perhaps the best drills that have ever been invented, but they are very widely effective, and they are very applicable, and they are very useful, and people will sooner or later get over the hump with them.

Nor do I say that the last volume to be written on the E-Meter is contained in E-Meter Essentials. There still may be things to be known in that meter although some of the things I have found out about an E-Meter in the course of just the last year had me astonished. I didn't know there could be that much left in that meter. And there was. And this work is pretty well summated now in E-Meter Essentials. Well, that isn't the final text, but it is certainly a useful and usable text and serves our purposes at this time.

I don't say that the wording of Model Session is the best wording that could be devised for all countries, all places, and all preclears. But it's generally applicable, and it works out a good average. And therefore, is a workable structure and therefore a workable methodology.
Now, the basic laws of auditing, unfortunately, have never been stated on one sheet of paper. I have never been this adventurous, but there are certain definite laws that regulate the choice of the command. How do you run commands? Or how do you figure out a command? How do you add up a command? There are some laws relating to that. There are several laws relating to processes, whether they're good processes or bad processes. You have the one – a good example of what I'm talking about in Scientology: Fundamentals of Thought. If you were to run somebody on "can't-have" on self and "have" on somebody else – like this process: "What could you give somebody? Thank you. What wouldn't somebody else give you? Thank you." Well, he'd go right into the ground right away, you see.

So there are several process rules, but these rules are relatively flexible. They are not terribly fixed and most pcs that you try to run a games condition process on are going to tell you sooner or later that it actually should be "can't-have" on the other one, "have" for self. You'll probably run into that yourself on the bank. Well, that's – you're being so hopeful about it, that there it goes.

Well, this violates, unfortunately, another rule. And that is that running "have" for self, under long and arduous testing, has yet to produce any gain. It doesn't upset anybody. It doesn't chew them up particularly, but it doesn't improve them either. And I have looked at an awful prolonged parade of cases on which that particular facet was established, so that you would just be throwing away an auditing command if you said "can't-have" for the other fellow, then "have" for you – you know, his havingness, you. That command would be lost every time. It would be a meaningless command. So you can't run it that way.

It's "can't-have" for self, the other fellow's "can't-have" for you, his "can't-have" for another, another "can't-have" for him, and so on. That is your basic games-condition proposition. Even though it might appear more comfortable to the pc to run it "can't-have" and "have" for himself and so on. That might look much better to him, and it might feel much better. But if it feels much better, there's another little rule that comes up – is the degree of reality of the pc. And it's so weird that pcs can run glibly processes they have no business being able to run. They can run them with great glibidity. And they can just chatter off answers left and right. They get no better. Nothing happens.

Well, they're working behind a protective screen. "Nothing is real and nothing means anything anyway, so it doesn't matter what I do." And these processes don't hit at that particular button, so of course, they just continue to run and the pc can run forever. And he's running without comm lag. He's running without difficulty. Running CCH 2, he'll walk around the room and touch walls and – this was the first time this showed up wildly. Why, he'd just run 8-C forever and just nothing happens. Nothing happens at all.

You've seen cases like this. So you have the reality factor. You have the reality factor which enters into commands and processes. And that is to say a person should have a reality on what he's running and at this point, with commands, in enters the E-Meter.

So the E-Meter moves in because that thing which will cause the needle to change its pattern is real to the pc. I know, it doesn't sound real to you sometimes. You say to this pc, "Well, have you ever had any difficulty with oceans or planets?" or something like that, and all of a sudden he falls sixteen dials. You've run into the clam on the beach, you see, some-
thing of that sort. It's real to him. It isn't very real to you, but it's real to him. So your own unreality sometimes defeats you in admitting that somebody could have such a good reality on being a clam and such a bad reality on being a human being. [laughter]

So your own reality factor doesn't have to get dismayed or pushed around. You've got a simple test called an E-Meter. And so in putting together auditing commands – actually the best way to put together an auditing command is to put it together with needle reaction, and just choose your words of various kinds, and so on.

Well now, this only has one limiting factor: is after the pc has been run for a relatively short space of time on any bracket process, only then do some of the outer brackets become real to him. So he can run it for himself, run it for himself, run it for himself. It fell for himself, you see, but you couldn't get it to fall for the other fellow. So you didn't run that other leg. Well, after he's run it for himself, run it for himself, run it for himself for a while, all of a sudden this other one shows up. And we get the broadening effect of commands. We get the broadening perimeter.

Actually, there hasn't been a lecture on this since November of 1950, Los Angeles. It's a picture of the dynamics, and they're concentric. They're a series of concentric circles. I think it's been sketched around someplace, but there was a full lecture on it back then. A series of concentric circles. The first dynamic is the inner circle, and then the next circle is the second dynamic, and they go on out to eight circles.

Well, the pc's ability to reach is reflected directly in the pc's ability to conceive of somebody else having an idea or an action. And so, as you run a command, his ability to reach betters and the command you started with can become too narrow and now operates as a restriction on the pc's gain. There hasn't been much discussion of this last point at all, but I've just run into it using: pc giving somebody's, or denying somebody, the pc's interest and the – then the other person denying the pc their interest.

After it had been run for quite a while, it started to become restrictive. Why? Well, the pc's ideas now were reaching further, so denying another the pc's interest could be dropped down to just denying another interest, you see. "His" could be dropped out, or "her" could be dropped out, see. Pc identity could be dropped out of the auditing command because it was too restrictive.

The pc now could conceive of other zones and varieties of interest, don't you see. So the auditing command modified to: denying another interest and another denying the pc interest, you see. And more legs could be added to the auditing command, too.

And you'll find this is very common in putting together commands: that you get the first leg of the bracket is the most real, and then the second leg of the bracket becomes real after a while, and then the third leg of the bracket shows up and becomes real. You see how this works. And out it goes. And you get a wider and wider and wider perimeter of application. So that, frankly, there are some processes which are so steep, run on certain pcs, that they cannot conceive of a bracket interchange between themselves and another. They cannot conceive an interchange. Self can conceive of interest; another could conceive of interest, you get the idea. But for self to conceive of interest for another, that's impossible. You get the idea?
So each leg of the bracket stands as an individuated unit without any interchange amongst these brackets. Well, now if you tailored up the auditing command to run as a totally individuated type of auditing command – you see, each leg of the bracket is totally individuated, and there is no interchange with another leg of the bracket – it'd be like shooting.

All right. Let's just use shooting here. "Get the idea of shooting self. That's fine." "Get the idea of another shooting self." Well, this becomes a little hard to do, you see. And this is about all that you could get to fall on the meter. But after you've run as much as you could get to fall, you're going to get the rest of the legs of the auditing command showing up.

Well, in view of the fact that it really doesn't harm anybody to run an unreality – it doesn't really harm anybody to run an unreality if they're approaching a reality from some other quarter – why, you could put all those brackets in right at the beginning. And you could say, well, "Get the idea of shooting yourself. Good. Get the idea of shooting another. Good. Get the idea of another shooting you. Good. Get the idea of another shooting himself. Good." You see? This is kind of a built-up bracket.

Well now, these commands at the beginning would not at all be real to the pc. The pc would say, "Get the idea of shooting self", oh, boy, can he get that, see. It falls off the pin. He thinks about it all the time. That's marvelous, yes. And – "Now get the idea of shooting another." Absolutely no slightest reaction – not a bit. He hasn't got a clue. Shooting another? Nobody ever does that. He's heard of wars. He's been to motion pictures. He's even seen TV – to get to the utmost in violence – and still cannot really conceive of a person shooting another.

And as far as another shooting him is concerned, nobody ever would.

The world is full of kind people and its full of nice people. And wars are fought with chessboards and carved men. Everybody knows this. And there's just no reality. But after you run it for a little while, "Get the idea of shooting another." You've been uttering the auditing command, "Get the idea of shooting another" – if you've been watching your meter, you all of a sudden see when you utter this command, you get a needle reaction. Pow! He can conceive this now.

And you could ask him at the same moment, "Well, is that real to you?"

"Oh, man, yes, Sir. Wow! Oh, that's something I don't want to do. Yeah. It's pretty terrible doing something like that. And then having to call the ambulance, you know. That's pretty bad."

And "Get an idea of another shooting himself."

"Oh, yeah, that's what everybody ought to do."

Well, all of a sudden that particular aspect of the auditing command isn't quite so hot. It's not too hot, but "Get an idea of another shooting you." Oh boy, oh boy, it starts to fall and you'll notice that command gets hotter and hotter and hotter according to your needle reaction. Well, it's getting more and more and more real to the pc.

So if in doubt in putting up auditing commands, choose, if you possibly can, a bracket and command wordings that *all* fall on the meter. See? If you can do that, why, you're really
cooking. Everything's fine. But remember that if you choose a very limited scope of application that the command itself is going to restrict sooner or later the pc's recovery.

Now, supposing all you could get to fall was: pc shooting self; another shooting himself. Well, after you've audited this for twenty or thirty hours, all of the – you see, in the meantime the other actions of it would have become real to the pc, too. And you get all these other things, and they'll start stacking up as automaticities. And he'll start getting some kind of an automatic feeling like he ought to shoot everybody or something like this, you know, or has he shot people? – he'll start to worry about it. Because you haven't let the pc look at it, don't you see.

So therefore, an auditing command – part of the rules of auditing commands is, an auditing command can at any time be broadened and made more general and must never be made more particular. You can broaden an auditing command. Don't ever make it more particular. Don't start out with, "Get the idea of shooting another. Get the idea of another shooting you." All of a sudden, find out it isn't working too well, so add in "Get the idea of shooting yourself. Get another idea of another shooting himself" Boy! Have you goofed.

Now, that is making a more restrictive auditing command. And when you've developed an auditing command and you're going to change it in the course of processing, you must never change it in the direction of making it more specific. You must always change it in the direction of making it more general. Follow that? And you follow why?

If in doubt, take the broadest, most particularized you know, just the most possibly involved and – form of the auditing command with eighteen legs to it, and right – run it from the outset. If you're in doubt about it, just start and run it from the outset.

Then very often your pc, in getting audited, is getting – they all of a sudden start turning on a set of familiar somatics or something of this sort. Well, you can suspect, of course, withholds and you'll probably be right. You can suspect present time problems, and you undoubtedly will be right. But you should also add into your list of suspects, even though it isn't terribly important, the fact that the auditing command is too narrow, and is too specific and has probably reached a point where it ought to be generalized. Now when you generalize an auditing command, you don't change it any more than you have to. In other words, you don't change "woulds" to "coulds" and other particularities of the auditing command. You keep it in exactly the same verb form and so on. You just change its targets.

So it's always legitimate to change the targets or directions of an auditing command, but it's never legitimate to change the wording form of the auditing command. You can add more legs, in other words, or you can add more directions for the auditing command to go or you can add a more general way for it to go. But the basic form which you had – "how", you were using "how" – you better not change it. It better be "how." In other words, don't Change a "where" to a "how" or don't change a "what" to a "who" or something of this sort, you see. Don't monkey with those mechanics. You get what mechanics I'm talking about now, you know. You're running "Think – " Well, don't suddenly start running "Get the idea of – " because that's a wild change.

You can say that you have not changed the auditing command if you have generalized the targets in the command, and if you have not changed the verbalizations of the general
command. Now for instance, "Get the idea of shooting self, get the idea of another shooting himself." All right. That was all we were running at first for some reason best known to us. All right. You can't now say, well, "Think of shooting yourself. Think of shooting another. think of another shooting himself. Think of another shooting you." You're running an entirely different process.

But you can just add more legs or add a greater generality to it such as 'Get the idea of shooting self. Get the idea of another shooting self. Get the idea of shooting another. Get the idea of another shooting you. Get the idea of another shooting another. Get the idea of others shooting another." See, we're just going out further. "And get the idea of others shooting themselves." See? All this is perfectly legitimate. You're just adding, adding, adding, but you're just adding scope and direction, aren't you?

Now, you can drop portions of an auditing command equally easily by saying, "Get the idea of giving another your interest." Supposing you were running this one. It's wrong, but supposing you were running it. "You get the idea of giving another your interest" could be altered very easily – "Get the idea of giving another interest." You've dropped the pronoun which was more of a particularization than all of a sudden it was necessary to have. Maybe it was necessary at first, but now it is not necessary to have this thing so you can drop it.

All right. But "Get the idea of – ", you started out with "giving" – "Get the idea of denying." Oh, no, man, you've just changed the whole process from one end to the other because you've changed the verb. You see?

Now, this process with all these legs goes eventually into this cycle: The pc gets free enough on the whole process and all parts of the process – the pc now gets free enough to be able to consider all of the various legs of the process and the pc isn't running motivator, motivator, motivator all the time, and so forth. And you could just say, "Get the idea of shooting" You get the *redundio ad absurdum*. This would then cover – you've accumulated up to this time, let us say, forty-five legs to this auditing command about .45s. And you – it's got more particularities. You've got the thing involved out there until it's running all over the pasture, you know. And this starts to go pretty null.

Well, if you wanted to polish it off, get all the missing legs that you've missed, and so on, well, just drop the whole lousy lot and go back into a simplicity but use the same auditing commands such as "Get the idea of shooting", period. All of a sudden, why, the pc will add the targets in, and he'll add everything else in. But he's now capable of doing so. Don't you see this?

Usually an aberration is located as a total imprisonment and in a total individuation. Auditing commands, as you run them, resolve the *degree* of imprisonment and individuation. And as this degree lessens, don't suppose because you have knocked out just the individuation on one leg that you have flattened the whole command. Yes, you've ceased to have tone arm action on just one leg of it, but there were many other legs which you've left untouched, don't you see. So you can always "check out" an auditing command, which is another little rule that you should follow.

It isn't enough to say that the auditing command then – I'm letting you in now on some postgraduate college auditing command – a mock-up here. It isn't enough to say that an audit-
ing command is flat because the tone arm has ceased to move while it was being run. That is only a workable statement at HPA level. It's going to hang up some pcs here and there. Not seriously enough to really upset the game, but, give them a headache once in a while.

The tone arm ceases to move when the targets of the process have been flattened. Now the targets of the process mean self-another, let us say, or something of this sort. Now, the tone arm has ceased to move because those targets were exhausted. It does not mean that the process is exhausted. And so therefore, this is the rule: Before leaving an auditing command, regardless of the "twenty-minute rule", which is only a signal, you should check out the auditing command – this would be the very thorough auditor – for all possible variations which might produce new action. And you very often find that they all flatten off in fifteen minutes. But it was a good thing to do, don't you see?

You check back over the process, and you found out the one person that the command never applied to was "Mother." For some reason or other, this auditing command just isolated and made it impossible to use Mother. You can get auditing commands that'll do this, you see. And because it was "his" or some stupid pronoun or something of the sort. And yet it was "Mother", and "Mother" kept cropping up and toward the end of the auditing process, the pc is left there sitting with a static picture of Mother.

Now you check out the command, and you'll say, "Well, now how do you feel about this?" is a nice, general statement, but you should be much more interested. You should say, "Well, do you have any still pictures now?" "Is there anything – what do you think about the command in general? Is there anything to which it did not apply?" "Is there anything that it missed?" So forth. Bong! All of a sudden.

Well, you say, "What was that?"

And the pc says, "Well, it's a – it's a static picture. Could that be a picture of my mother? It's right out in front of me here."

And you say, "Yes, yeah. What about this? Well, what about this?"

He says, "Well, you see, the auditing – I've been dodging this for the last hour or so because the auditing process doesn't touch that particular aspect of it."

And you say, "Doesn't touch what aspect of it?"

"Well, you said 'shooting himself', see. And actually Mother is a herself, and so forth, and she used to talk all the time. That's all she ever said just morning, noon and night. 'I'm just going to shoot myself if your father keeps on the way he is going. He is always here nagging at me.' " Some Dianetic phrase ending it up, you know. And all is now revealed.

Remember that in dealing with reactivity, you're dealing with a Simple Simon type of intelligence. On any point where the pc has been extravagantly reactive, he has been extravagantly stupid. And he can add up more horses in more beds in less time, and on an auditing command, is just walking in the middle of pieces of pie carefully, you see. You see, you didn't say pies. "Have you ever stepped in any pies?" So therefore, when he was in the bakery that time when it caught on fire and walked over pies, he can't find one pie that he stepped on, you see. There's nothing but pies that he stepped on, so he can't answer the auditing command.
You've heard this kind of logic. You yourself have faced up to it occasionally. Well, it isn't that your pc in general is being exorbitantly stupid. It's just because on a reactive point in the bank, you get this Simple Simon, totally identified, idiotic nonsense. And the pc is as unconscious of it as he will be when he said ... Running engrams in the old days, sometimes the pc would give you one word every ten minutes, you know, talking very low and very slow. And the pc's totally convinced he's chattering like a magpie, you know, giving you one word every ten minutes. No way to boot him out of it. He eventually runs through it. Well, he says, "That auditing session certainly went fast." You've just sat there, you know. [laughs] Nothing but weights on the clock hands, you know. Certainly went fast.

Well, a reality factor enters the case as the case is being audited, so therefore, reality has to be kept pace with, with an auditing command if you are really doing a slippy job.

Every once in a while you'll get a pc who is a bit hung up. Other processes will solve it. It'll work out in the long run on the crude basis, so therefore, we don't bring this up. We're just talking now about the very fine points of auditing. It'll sometimes, though, show up sufficiently seriously to cause the pc physical discomfort or something, you know. Can't answer about Mother shooting herself, you see. Just can't do that because... This quite escapes you how this generality of pronoun couldn't be adapted, but it doesn't escape the pc. It's impossible.

All right. The handling of a pc, the use of the methodology, the slippiness with which you can do a Security Check, all these things add up to advancing cases. And when these things are omitted, the cases don't advance. I don't care how clever the solutions are which are arrived at by a D of P or an auditor or anything else. If those solutions are terribly clever in the absence of methodology, nothing will happen to the case – that I guarantee.

Once in a blue moon, a fellow like this will have a win. One of the ways to have a win is to stick the pc in a manic. Pc gets in a wild manic. "I feel wonderful. I feel wonderful", you know. And it wears off in twenty-four hours and he goes into the depressive state. All you've done is shove him over the hump of a little bit of an engram. And it looks like you had a win, you know, to some auditor not using methodology.

This used to happen to me all the time. I never got so disgusted with anything in my life. I finally got very used to this phenomenon of the pc telling me, "Rave, rave, rave. I just feel wonderful. I love the whole world and everything is fine and everything is wonderful", and so forth. And I would just say to myself, "Well, we'll find out in seventy-two hours." We would, too. "Oh, God! Why did I ever get audited " you know is your next immediate sequitur response. [laughs] You just put him on a little toboggan.

Processes which we're using these days don't turn on these manics the way running engrams and that sort of thing used to. Those used to turn on quite regularly.

But anyway, in trying to convince somebody that it's worthwhile knowing his tools, you run into quite a barrier sometimes because the fellow's never sitting there looking at himself audit. And if you run into this too badly, remember the Auditor's Code and the Instructor's Code are two different codes. They're actually mirror faces. They're quite reversed. Never fail to invalidate the wrongnesses of a student, you know, that sort of thing.
Make the student in question or the auditor in question – and borrow a tape recorder and a blank piece of tape – and make him sit there and do all the TRs 0, 1, 2, 3, 4, 5, and then do Model Session from scratch to the end. Just do that, you know, under a coaching basis, but don't give him any flunks. Put it all on the table. It makes a very rapid, short, little piece of tape, you see. It's one TR at a crack. You know, three "Do fish swims" and that sort of thing and go right on through to the end. And then turn the tape on and say, "Now, what in all that would you flunk?"

Well, you do something like this only, of course, at a time when somebody believes he's doing it all letter-perfect and doesn't believe he has to do any of the TRs and believes he's got it all taped. You've got to show him that he has something to learn in it, and that the cruder course is usually the kinder one. Don't go 1.1ing about it and say, "Well, with a little more practice, you'll come along all right." No, I'd just say bluntly, "You stink. Get on the ball, and if you don't believe it, why, we'll let you listen to yourself on a piece of tape." And wow! You know?

It's something on the order of the fellow knows that he sounds exactly like Caruso in the bath. [laughter] Something on that order. And if you were ever to give him a tape recording of all those flat notes ... [laughter] Well, you have to bring it home to them.

Methodology is quite important. It's the most important factor we've had, and the only reason I'm stressing it is because there has been our greatest failures. The greatest failures we have had in dissemination of Scientology is failed methodology. The methodology wasn't there, it wasn't exact, and it wasn't – certainly wasn't being followed. And as a result, processing, and so on.

Now, it's not an accident now, that we're making Clears. It's not an accident we're making Clears because we're pushing methodology, pushing it very hard. You won't make Clears in it's absence, let me tell you.

So them's the – them's the words of advice I give to these dear departed. You will be remembered, however, particularly on the despatch lines. [laughter]

Well, now, very probably you would like to ask a parting question or two, so if you do wish to, spit now or forever hold your speech. [laughter] Any questions?

All right, then. We can assume now, [laughter] that you know your business, you know your business thoroughly and backwards, and any complaints I get, I will not-is because I know they are not true.

Male voice: I'll take a rain check on it.

Female voice: That will save you a lot of work on your own despatches.

Well, I would like to say just a few words to you about this new development because – I gave you a lecture on it last night, but you talk about new ideas – don't downgrade new ideas. They're very important. It's just I'm telling you they don't get anyplace unless they're applied.

Now there is the biggest barrier in organizations, and easily the biggest barrier in disseminations is the not-doingness of people. And next in rank is the misdoingness of people.
But the not-doingness of people ranks above the misdoingness. It isn't so much by their misdeeds ye shall know them, it's by their not-deeds.

And therefore, I'm very, very happy to be able to jump this barrier. I can answer now, bluntly, an old philosophic question of the value and quality of not-doingness. Now, this is a very fundamental, philosophic question that has been with man for Lord knows how long – "to do or not to do." It isn't the Shakespearian "be or not to be" that worries man. It's the "to do or not to do." And it isn't really on a specific instance of "to do or not to do." It's the generality of "to do and not to do" that worries him. Is it better to lead an active life or to lead a quiet one?

Well, for instance, romping around France over here in the last few centuries, I used to alternate rather consistently between two types of existence, one and the other. One was a political soldier's existence, rough, tough, fast and hard, you see, alternated with almost mathematical precision with a philosophic existence – almost a sandwich, one life right after the other life. And in the same pages practically – the Encyclopaedia Britannica talks about this quiet fellow who was well liked, never got around very much, wrote a couple of books and so forth. And you flip a couple of pages, and you find out about this rough, tough character who chewed everything up in sight, see? Same guy.

Well, this was basically an unresolved, philosophic question. Just look at Matisse. Is it better to do or not to do? If you do, of course, you get into trouble. You commit overts, obviously. Spattered brains all over the place. Empires falling and thrones reeling, you know. And if on the other side of the picture you don't do a thing, you get into trouble. And this is what makes it a philosophic question because each is surrounded by a considerable confusion. Those are two islands surrounded totally by confusions. And it amounts to just this.

I had this demonstrated very clearly. I used to be very, very nasty to – (I put this in the first person so you won't feel pushed around on it.) I was a young writer up around New York City. I was just about the meanest young writer that ever lived. If an editor rejected a story, he was in for it, man. I'd meet him at a party – I'd meet him at a party, and as one of my friends said, "My God! The horrible things you do to people!"

"Why, I never treat people badly."

And he says, "Ron, I have seen you take the skin off of a person square inch by square inch, and make him like it." [laughter]

And before the war, it actually was almost traditional in New York City that you'd better not reject one of Ron's stories. And no other writer ever dared criticize my stories or tell editors they were no good. They never dared chop up anything, this was for sure. They were scared. Just plain scared. I don't say that I was putting up a vicious mock-up, particularly, but I could get very nicely sarcastic, particularly at parties when there were lots of people around, you know. I never had any trouble at all.

And after the war, I was very nice to everybody. I was very pleasant. And writers started criticizing me like mad. And editors every once in a while would write me nasty letters. My rates were superior. They were up. My numbers of readers were up. All these things were up. Well, what had happened here?
You solve it. It was an unresolvable problem. To do, in other words; to just go out overtly and claw everybody's eyes out in order to protect and effect a sphere of interest, you see, and a sphere of economic interest; or to be nice, pleasant, well-liked and get along well in a sphere of interest and economic interest. Look it over. Both answers were wrong.

Obviously, it did me no good at all to go around with that many overts. It's a wonder I didn't become an editor. [laughter] Editors, you know, are best defined – are always defined by writers as failed writers. What is an editor? He is a failed writer. I never became one, but there it was.

And on the other side of the picture – let's look at the other side of the coin – to get along well with your fellows, that didn't work. That was an unworkable doingness, and so forth, because obviously the clique that wanted my markets, naturally, would chop me to ribbons because they knew there was no danger involved.

So what did you do? Were you nasty in the field of the arts or were you pleasant in the field of the arts? And there were all sorts of contradictory lessons in this zone – very contradictory lessons.

Such as in Hollywood one time, a fellow criticized some scenes I wrote. And they could make life hell for you, you know. I blew up in his face. He was a producer. He says to me, he said, "Ron", he says, "I – I think you must have had a ghostwriter write these scenes because I don't think you can write that badly."

Well, that is the signal that you are now going to have an office in the basement, don't you see. And that is about the end of that, so – the way Hollywood goes. So I just said Raow! You know, walked back into my office, got a blank copy of a contract, brought it back in the producer's office, tore it in about forty different pieces, all small pieces, threw it up in the air, and it came down like a snowstorm, and I said, "You can go ahead and sue to get me to finish my contract, but it won't do you a bit of good. I'm through."

Well, of course, they just wouldn't have it in any other way that I had to have a better office, and I had to have this and that, and they pushed me on upstairs as fast as possible. And they were very careful not to invalidate any of my scenes. And in view of the fact there wasn't tension in the air, the scenes were pretty good. And everything was running along beautifully. So that was a reward for a total phony doingness. Totally rewarded.

Well, time marches on. One time in the navy I quit one hundred percent. I started telling people, "It's been a long war." That was my pat phrase. And I would tell admirals or anybody else. "It's been a long war." And their immediate, direct response was, "Ah, well, you mustn't quit like that, you know." They had been, the moment before, just raving, you know. And "You mustn't quit", and so on. And of course, I had them backed up against a wall.
They'd look at me and here I had campaign ribbons all over me, and they just, you know, said, "Well, what do I do about this", and it put them in a total know. It was a not-doingness.

And nobody could get me to do a thing. They'd post orders for me on bulletin boards and things like that, and I'd never report and read them. And they'd tell me to go here and do that and do something else. I'd just never bother to do it. They'd come around and beg me to after a while, and so on.

And I'd in an offhanded sort of a way go up and slouch through it one way or the other. Do it all right, but – now that was – they just couldn't do enough for me. So that was a total reward for not-doingness, huh? Doingness gets a total reward. Not-doingness gets a total reward.

Back on the other side of the coin – being rambunctious, being mean and cruel – well, that kept everything going all right. The being nice and so forth and pleasant and quiet, that didn't work at all. But it didn't work at all being mean and cruel because look at the overts you stacked up. You began to hate the whole world, you know. No answers there, see.

I'm just going over this stuff because you yourself can think of times when you have faced this particular problem. I'm sure you can think of times. "Should I do this thing or be this way? Or should I be quiet and nice and orderly, you see, or should I be a chromium-plated bitch?" You know. This is the question. Not the Shakespearian soliloquy, but to do or not to do, that is the question.

Well, the reason you have no answer to it is the basic datum is missing they're both overts. Only the longest, continuous overt is not-doingness. And very far from escaping – well, my dear, dear friend, Paul van Niekerk down in South Africa, wrote me all about the Seychelles Islands. He is proposing not-doingness like mad. He says these islands are paradise. The greatest danger is the lush fruit falling off the trees and hitting you. And he said all you have to do is walk uphill until you find a climate that you like and then just sit down and relax. What's he proposing? He's proposing a total not-do, isn't he? Well, that's great. Nothing wrong with it. We can yearn in that particular direction, and that's fine.

Let's look it over here, in my particular boots. Supposing I did go to the Seychelles Island and walked uphill and found a climate and sat down. Just supposing I did, right at this particular instant. Well, just look at it in terms of overt. Look at it in the term of overt, not term of responsibility or other thing yip-yap, or rights to do this or that because man's got himself all taped through this, so that he guides himself with false beacons the whole way, see. Just look at it for what it is. It's one God-awful overt.

For instance, I'm pulling an overt right this minute on East Grinstead. They gave us a bunch of yak-yak about death lessons and the newspapers up here were not particularly friendly or kindly. They're going to have a lousy parade tomorrow. They're going to have a lousy parade. They have a bank holiday parade. It's quite a feat. They were down here on their hands and knees trying to get us to cooperate. They wanted me to be Parade Marshal and they wanted Mary Sue to be hostess to their guests and lords and ladies and everything, and I just said "No!" And because Waddingham can make a couple of quick quid out of driving the car for them, why, I said, yes, well he could borrow the car – as long as they paid Waddingham very well.
That's an overt because I'll tell you, if I hadn't been on deck last year, they wouldn't have had any damn parade. It wound around all the wrong streets and the wrong corners and tried to get itself wrapped around every available telegraph pole. And even then wound itself up on the side streets five blocks away from where it should have been, and probably would have been there till midnight. I kept it from being a total debacle, but it's an overt because, of course, Saint Hill is actually quite a peg in this community.

But I'm not kidding myself. I don't feel bad about this one way or the other. But basically through the root of this, we're just to some slight degree getting even. Give it another month or so, why, I'll start telling them, "Well, if you people had been a little nicer about your death lessons and so forth, we wouldn't now be trading at Crawley."

And they'll say, "What death lessons?"

"Don't you remember how mean you were to Saint Hill?"

"Well, grudge, grudge, grudge." And we'll bring it all around the circle again.

But of course, all this is totally knowing on my part. There's nothing reactive about it; it's a plot. [laughter] I won't take the blame for the rain. [laughter]

Now, there's your "do" and your "not-do" – your "do" and your "not-do." And the greatest overt that produces the greatest amount of confusion is, of course, omission.

Have you ever noticed the randomity that can be produced by a missing datum in any given problem? You notice that? Right now, I have some randomity with regard to this ship, you see. I don't have all the data and books on the performance of this particular type of hull. And lacking them is making a considerable confusion. And they apparently exist, but nobody is willing to answer up to them, and I have to wander through a lot of things, but it's causing a lot of confusion.

A false datum can cause some confusion, but nothing compared to a missing datum. Look at man with missing technology about the field of the mind. If you want to know what missing data can do, he's been staggering around for the last fifty thousand years, running into blank walls. He's involved himself in autos-da-fé and every other kind of weird, oddball activity. And civilization after civilization has perished one right after the other. And civilization today is almost synonymous with weakness. Various other factors exist, all because he didn't know any – didn't have any instruction books of any kind. He didn't know how the mechanism worked. He didn't know what made it go together or anything else. Well, that randomity is just produced by a missing datum.

Well, how about a missing beingness? Now the ultimate, of course – the near ultimate in not-doingness is a missing beingness. You can be there, you see, and just not do anything, but at least you're there.

How about not being there? You realize that'll produce more confusion? All right. Now, there's one more... That's why this is only a near ultimate. There's a "not being there." The near ultimate is that one, but the ultimate, of course, is "forgetting."

You not only are not there – doing nothing, but you're not there, you see, is the next step down. Doing nothing; next step down, not there to do anything; and the next step down
from that is to forget all about it. And these, one, two, three, produce in that order increasing magnitude of confusion. And this is the production of confusion.

Do you realize there is probably some place in this universe, a power station, right this minute where you are supposed to throw switches in and out. And you're not there, and you've even forgotten that it exists. Isn't that interesting, huh? I imagine there's some activity someplace – some activity someplace – that is just – well, did you ever look out across a bunch of mounds which were once stone walls? You know, just utter ruin.

Rome is a wonderful place to look around. But there are other countries have them, too. Did you ever look out across that? And did you ever have a feeling, a rather pleasant feeling about it? Old ruins. Did you ever have a rather pleasant feeling about it? Did you ever kind of like old ruins? You know? Think, isn't that nice. Look at that cloister, you know.

I ran into one in Spain one day. I came running down a hill on a motorcycle, and here was the most enormous arch in front of me. And boy, was it – had it been a grand arch, and, man, was it a ruin. And oddly enough, it didn't even have an identity anymore. Nobody could even tell you what it was. I remembered it very well. It probably has a great deal to do with my having difficulty sometimes speaking Spanish. But there, there is that action.

Axiom 10, insistence upon. A thetan never, never, never, never, never – this is the rule – ceases to try to have an effect on anything. He never ceases to try. No matter how he looks, no matter what he is doing, he never ceases to try to get Axiom 10 in effect. He just never ceases to try. No matter how many trillennia have gone by, he has not stopped trying. And you are trying to process people who are in the middle of about a hundred thousand continuous overts which they are doing right this minute.

How are they doing them? Well, they may be in life here, but they're not doing anything in some direction. That would be the least of them. You see, doing something is apparently the least overt. It's quite interesting, isn't it.

And look at the success which you have in handling this in processing overt. You know, running overts. But how about withhold. Withhold evidently produces a considerable difference. Ah, withhold apparently is a little more so, isn't it. A withhold seems to be the more therapeutic side of the O/W situation. Produces the greater gains on the pc when you get the withholds off. Well, what is that? You can marry that up to this other thing of not being there.

It's his not-doingness in some version or form or another that is weighing heaviest on his case. His not-doingness is weighing heaviest on his case. And there is no picture of "Should I do or should I not do?" These are not data of comparable magnitude. "Do" and "not-do" are not data of comparable magnitude. "Not-do" is enormously greater, and the fellow sitting down on the Seychelles Island having abandoned all the world, you would say, well, he can't possibly – we've all agreed that he couldn't possibly be committing any overt of any kind whatsoever. Then why does he go to pieces? That's the question.

How has this businessman who has been in there gouging his competitors, ruining his employees, just raising hell in all directions, pulling national security to pieces just – you know, anything he could do – "Well, let's make a deal with the Russians, you know. They've
got some material and so forth, and we can black market it through Switzerland", you know. He seemed to be fairly – fairly bad shape, but he was still functioning. And then one day he listens to a medico, and the medico says, "You ought to retire." Ha, ha, ha. And we see this bird in a few years, or a year, and sometimes in a month or two, and the guy is just a collapsed mound of flesh. He's a gone dog. He's carrion bait. That's all.

Well, how does this retirement produce such a fantastic effect? Why do men die on an average earlier than women in the workaday world? Well, women are still doing more or less what they did before. They didn't retire. But the man did. And he introduces a "not-do." And even though he is advised to do this and he thinks it's the thing to do, and everybody's agreed the thing to do, basically underlying all that, this unknown factor existed: It was one God-awful overt.

Now we gloss over the overt very nicely. In Amarillo, Texas one time, I saw a sign on the wall, and it says, "If you think you're so valuable and needed, go down to the graveyard and look. Those fellows thought so, too." A nice western type of... [laughter] Unfortunately, it happens to be totally incorrect. It's not right. It's not right.

A thetan, down underneath it all and over all of the motivators and excuses and so forth, knows he was important to that zone and action and knows he is important to life. And knows he has a function in life. And when he doesn't perform it, he knows he is performing the greatest overt he can perform. There's only one greater overt – is to forget it. And that is the final effort to have an effect.

You can have an effect on an area by not doing anything in the area if you can have no effect from doing something.

All right. Now, let's take the gradient scale of effect then. All right. It runs like this. You do something and have an effect on things. Axiom 10.

Now let's float on down and see the undergrades of this. You can have an effect on things by not doing. That's still an effect on things.

All right. Now we could have a downgraded, lower effect, a lower order of effect – but still an effect and actually a worse overt in not being there. We not only not do, but we are not there either.

Now, below that gets the lower grade, which is to forget it. And that still has an effect on things. Believe it or not, it still has an effect on things. A very rambunctious effect, too. You can see that in everyday life. You forget to bring home the milk and you produce some randomness, you see. All you've got to do is to forget to do something and you can produce a considerable amount of randomness.

Well, how about forgetting a whole lifetime? Not just a quart of milk. But don't you think that might produce a greater randomness? Well, it does, oddly enough. And it's an overt, and the fellow realizes it's an overt. He recognizes totally the overt character of forgetting. And there is whole track occlusion, and I've been on the track of it here for a long, long while to nail it right on the button to where you could actually resolve this thing called occlusion because it's been a considerable target over a considerable period of time.
And that is occlusion. It is the overt of forgetting. And the law behind it is: that *a thetan never ceases to try to have an effect on targets he has selected. He never ceases to try.* And the only thing which could ever pry him loose from those fixated effects and so forth would be something like Scientology. He is imprisoned to the degree that he is still trying to have a hopeless effect on something. And there is his imprisonment. And that is his most basic imprisonment. He's his own jailer. He's trying still to have an effect.

I dare say there's – there are armies whose bones have been wheat germ for a long time, battlefields totally forgotten, on which you are still trying to have an effect. And your last order of effect, of course, is to forget it – because of course, that doesn't ever permit it to as-is, does it? Ah, that's the overt. It can never as-is if you forget it.

When a fellow goes totally bad and gets even meaner than I was when I was a young writer, he forgets. "That'll show them. That'll get even with them." When you get it on down, all the way down to the bottom, of course, it's just that: occlusion. You make an occlusion on it, and of course it will never as-is, and that makes the finest variety of overt ever heard of, and you're trying to process people who have thousands and thousands of these things.

Now, if O/W can stall a case, and if it's a mere matter of withholds – if the mere matter of withhold can stall a case ... You see what I'm looking for here is speed-up of auditing, not anything else. But if the mere matter of having withholds can stall a case, how fast or how much do you think a case could be stalled by not being there. That's a withhold of self, isn't it.

All right. Now there's a deeper grade. How much do you think the case can be stalled by the withhold from self and there, and from doingness and from the subject, and from any knowledge of the subject, and from any acquaintance, and from any communication with any beingness of the subject? You get the idea? Kowww! And that's why the more occluded a case is, the harder the case is to audit. And there's the mechanics of it.

So you get somebody and you run them on "What wouldn't you mind forgetting?" they're apt to make some very interesting case gains. Because you're really running withholds. But you're running withholds of a specific variety.

But the auditing command which would add up to something like this would be more likely in this zone and area. It would be – this is some generality of pattern of command – it would be "What confusion would forgettingness create?" That's just – not necessarily a deliverable command; it's just the model command out of which you could get many commands. "What confusion could be created by forgettingness? What confusion have you created by forgettingness?" would be your rock-bottom, all-the-way-downhill form.

Those are not the auditing commands. Those are just the theory statements. You ask yourself that question, you're liable to get some astonishing answer. I suddenly realized that I'm still getting even with the Middle East of about the five hundred years on each side of the year zero. I'm still getting even with it. I'll show 'em. [laughter]

Forget all about it. And what would be the consequences of forgetting all about it? Hmm! Nobody would know the succession of kings if I forgot all about it. Nobody would know the various dynasties. Nobody would know the national boundaries. Nobody would know the customs. *Ha-ha-ha-ha.* Nobody would know anything about the weapons. All those fellows
and all those glorious deeds which were supposed to have seen posterity would all disappear. See? I must have done a good job on it because of all unknown archaeological areas in the world, the Middle East is certainly one of them. [laughter] That's the overt.

But we've looked on forgettingness as a sort of a passive thing. And we've looked on not – you know, "The fellow's just unfortunate. He forgets, you know." And we've looked on – we've looked on not-doingness as the natural state of beingness and all of a sudden find these are the most horrendous overts that a person could possibly run, of course, opens up a brand-new, wide horizon for faster processing.

Okay. I wish you all a very good weekend and I wish the three who are becoming dear departeds all the luck in the world and all the success in the world. And I'll be hearing from you.

Let's have a contest. You make more Clears than we do and we'll make more Clears than you do. [laughter] Okay? All right.

Good night now.

*Female voice: Thank you.*
FORGETTINGNESS

A lecture given on 8 August 1961

Thank you. This is August what? Eighth.

Audience: 8.

The 8th. Very interesting, the word eight, the letter eight, the numeral 8. You know, I've been seeing it around since Phoenician times. And they stuck – used to be two money bags. You'd set a money bag on top of a money bag. That's right. That's where we get eight. So I hope you've made a lot of money today. AD 11.

Well, there isn't anything to talk to you about, actually. No new developments except the mind.

Now, I suppose you'd rather ask questions, wouldn't you?

Female voice: No. [laughter]

Well, I've just made a little breakthrough that might be of great interest to you. The reactive mind is basically that area of occlusion which the pc is unable to contact and which contains within itself a total identification of all things with all things. And until released into the realm of knowingness, continues to react upon the person, compelling him into actions, dramatizations and computations which are not optimum to his or anyone else's survival.

Oh, you think I couldn't do it again, huh? [laughter] Well, I'll show you. Peter, roll back the tape. [laughter]

Therefore, we find in this mechanism called the reactive mind, we find that residual of unconfronted, not-as-ised material which the individual is seeking to avoid. All the discreditable things of his existence are, of course, contained in this area, the knucklehead. And he has various mechanisms of survival connected with all this. And eventually the fox, who has run across the river and has been caught, and who has lost his tail on the chopping block to a farmer, will always come back and explain to the other foxes the great virtues of having no tail whatever.

I imagine if you painted somebody with some kind of paint which was utterly unremovable and completely eradical–unradicable, that he would eventually find vast virtues for that coat of paint.

But one doesn't expect the indulgence in this direction that the reactive mind has received, because now we learn that the only reason anybody can do anything is because he is a reactive creature. Circa: Psychology, its definitions, early half, twentieth century.

You can't write, you can't paint (you didn't know this, did you?), you can't accomplish anything in life – none of these things – unless you're totally plowed in and have a very large reactive mind.
Well, in view of the fact that Locke, Hume et/and company were unable to do anything much about it – and by the way, their early articles on it are quite interesting – the articles on the mind. You should read them sometime. The "faculty psychology", circa 1550 A.D. on forward – a great many articles on it and they're all quite interesting.

"Faculty psychology", of course, contains the perceptions, and it's a study of the perceptions, "faculties". It doesn't mean the professors. I thought it did for a long time and then I did a double take on it one day. And they're quite interesting articles. They actually do try to take apart the various fields and zones of perception and thinkingness and attention and feelingness and that sort of thing.

And they are very innumerable, very clever analyses of this, that and the other thing. They're not applicable. They don't go anywhere, mostly because they are directed at knowingness, and they are the psychology, you might say, of knowingness, or awareness, or the analytical sphere of existence. It's quite interesting. They had analyzed and done quite a great deal with the analytical spheres of existence. And they kept getting thrown off their ponies as they would ride them down their pages. They would keep getting thrown by the fact that man didn't act in a rational fashion. And they would get it all stacked up very nicely how man is rational, man always reacts in a rational fashion, men are always acting for the best in this best of all possible Panglosses. And you get a sudden departure from optimum survival. Well, in saner periods, this was harder for men to understand, and they tended to just skip it.

And then all of a sudden – leave it to the German and the Austrian, and the Russian – they went off the springboard and went straight into the middle of reactivity. And they got the ideas of stimulus-response mechanisms. And they – a new philosophy came up in Germany – Leipzig, Germany – Professor Wundt, 1879, Leipzig University.

His papers are also well worth reading someday when you've got a comfortable summer afternoon with nothing else to do. They're sort of ho-hum. [laughter] But there is the cry of desperation. This is the cry of desperation. It is the last ditch "God damn it" of philosophy. That's about all it is.

It says, "Well, we will cease to consider this dirty beast, man, as a rational being, since every time we ride our ponies down our philosophic pages, we get thrown right straight into the quill pot. Because he keeps doing things irrational, and we know very well that he should be rational. So therefore we'll abandon the idea of rationality in man entirely and completely, and we will label him from here on out as an animal. And he is nothing but an animal. And we will say that he operates, not on the spirit, the soul. He has no tender responses. He has none of these things, but he operates totally and completely as a machine, a biological machine. And he is just an animal, and anybody that tries to make him anything else is a traitor to our desperation." And that, in essence, was precisely the point of departure of Professor Wundt.

And all the psychologists of the world at that moment rose and bowed toward Leipzig because this got them off their horrible dilemma. No longer did they have to confront the idea that a rational animal was inexplicably irrational. All they had to say is, "he is always irrational", and they had solved the problem neatly and no longer had to be bothered with it. And that they made no progress, then, to amount to anything hasn't disturbed them at all. They
have had peace of mind in their own subject. They have not had to observe anything. They have not had to explain anything. They have not had to accomplish anything or do anything, actually, except punch buttons.

They said, "Well, you see, it's obvious that if you kick a man hard enough in the stomach, he gets a stomachache. That's all you need to know about it. If you take food away from a man, he will do anything to get food – rob, steal, burn, slay, anything. So therefore, to handle men, you kick them in the stomach and take food away from them." And so they have taught every government on Earth. And governments are now totally convinced that they are governing a stimulus-response mechanism which can be predicted on an unpredictable level.

They think man can be predicted, if you beat him hard enough, you see. It all works out according to the textbooks. See how simple it is? You know, you never have to be troubled thereafter. Nor do you have to inspect the fact that there are just as many unpredictable reactions to these things as there were to the earlier one, that man is sane but is sometimes unpredictable.

Now, that man is insane has just as many unpredictabilities. It is not true that if you kick men in the stomach – well, they don't even all get stomachaches. And in addition to that, if you take the bread away from them a hundred percent, they do not necessarily at all rob, steal, burn, or anything else.

Why, I know fellows that you – all you had to do was walk up to them and say, "Well, all right. Now what we want you to do is just so-and-so and so-and-so, and if you don't do that, we're going to kill off all of your family and starve you to death, and ruin your business", and so forth. And the fellow stands there and says, "ptt." And they go ahead and kill off all of his family and ruin all his business, and they come back and say, "Now are you going to do it?" And he says, "ptt!" [laughter] So you know what the psychologists do with that case history? They hide it. [laughter] And psychology could now be called "that vast morass of hidden case histories which dispute their theories." And you look it over, and I think you'll find out this is about right. It all looks so neat, except if a datum comes up that belies their favorite theory, they put it aside.

A theory. Now, up until Scientology, a theory about man was too precious, much too precious. It was evidently very difficult to get an idea up to this last ten to twelve years. Man really considered it a tough thing. You get an idea, man, you're really doing something. And if you get a theory about how things work, then whether that theory is true or false, whatever else you must do, you must stand there with that theory guarded on both sides by raging lions and machine guns. Nobody must assault that theory because it's precious. Ha-haha-ha. It's precious and must never be – never be threatened. And that was true of the old faculty psychologist. Honest, men went to the stake to protect their theories. And in the field of psychology, they will throw away all evidence to protect the theory. The theory is the thing. Theories are precious.

Now, in old Scientology 8-8008, it talks about abundance and scarcity of all things. Well, we're looking at – up to that time – at a scarcity of theories about the operation of man. And in Scientology we're looking at an abundance of theories. We don't care grass for a theory, see. Just whether or not it works in a heuristic science.
Ah, but this assaults the finest citadels of learning. You mustn't have anything that just works. Now you're in the field of the crass artisans. You're in there with the people who eat garlic and black bread, you see. You're not dealing there with the quill pen in the ivory tower, you know.

Somebody's going to come along, you say, well, your modus operandi is always being threatened by the fact that somebody's holding grandly forth about this or that, and it's not backed up by any workability. And what you overlook is the fact that he doesn't think it has to be backed up by any workability. It's enough that he dreamed up a theory about it, no matter how horrible this theory was, the theory is precious. He isn't interested in its workability. And he does not think that the workability or non-workability would prove or disprove the theory, because he doesn't think the theory is subject to proof or disproof. And that you miss all the time. So these people appear irrational to you. They're not. They're just protecting the scarcity of theories. You think, well, it should be workable. You should be able to do something with it.

Man has a shell pass over his head a foot away, and he goes into a state of shock or paralysis. Well, you say somebody that knows anything about the mind should be able to go up to the fellow and say, "Give me that hand" a few times or something like this, and the fellow comes around.

And he says, "Wooohh!" He says, "That was a rough one."

And you say, "Well, that rough one was a couple of months ago now. Let's – give me that hand."

And the fellow says, "Yeah, what do you know."

Comes out of it, see? You think that ought to be...that ought to be what you ought to be able to do. And actually, that is so reasonable that it is very difficult sometimes to conceive an idiocy such as a fellow who knows all about the mind doesn't have to be able to do anything about that. Or help anybody or apply it or do anything with the mind or better anybody or worsen anybody or anything. See, it's enough that he has a string of Roman candles after his name. See? That's all. None of his knowledge has to be put to test.

The psychiatrist, for instance, or the psychologist today, explains to you very defensively that he has spent years in a schoolroom. That's enough. You say, "Well, what can you do with the mind?" That has nothing to do with it. That has nothing whatsoever to do with it. He spent years at it. And he is now a member of the North Pole Psychological Association for Theories About Penguins. [laughter] Mmm. And he's a fellow of the Let's All Get Together and Swap the Papers we Have Written Society. And that's enough, man. That's enough. And the world at large sits there and says, "Where are the mental practitioners?" That's kind of what they keep wondering. Where are the mental practitioners?

Well, they've been gone so long, the world kind of can't have them. The last effective ones they had were witch doctors. The Zulus have still got good mental practitioners. They go around and get a shot of nearsphenamine for their accidental acquisition of the spirochete. And then they promptly walk around the corner and into the corner of the kraal and see the witch doctor to get the spell taken off, too, so the mental side of it is cared for.
The Zulu is very careful to do that. And it drives the medicos down in South Africa halfway around the bend. Their perfectly good neoarsphenamine is apparently not enough. And it isn't either. That's true. That would be true in any lineup. You take anybody that needs some neoarsphenamine, he probably is in such a traumatic state anyhow that you'd have to do something rather heroic to make his physical rehabilitation occur. So the Zulu's right.

Now, that's the basic history on which we're operating. Unless you understand some of this basic history, some of the other things about existence are a little bit hard to assimilate.

For instance, why isn't the Scientology practitioner at once embraced by governments and Industry everywhere! – clang. Well, they haven't had any. And it's just been an absence for so long that their havingness is shot on it. So they hire a bunch of theorists, you know, that can't do anything. And their havingness is somebody who can't do anything, because there hasn't been anybody who could do anything, don't you see? All you've got to do is shift this frame of mind, of course, and the Scientologist is the only one who can fill the bill. The others can't.

Do you know right now that the United States has literally acquired, in a relatively short space of time, thousands of companies who are now testing people with lie detectors? Just thousands of companies all over the country. They don't know anything about it. They don't know how to do it. They haven't a clue. They're turned out by the big lie detector colleges and so forth. They know nothing about the mind. You can take these boys and put them over the jumps and – I mean the practitioners, you know – and you just leave them sitting there with their eyes as saucers because they never knew one of their machines could do this sort of thing. You know?

And you say, "What about this, what about this little fact, this one little fact here, that nine percent of your people apparently are not registrable on this machine? What about that fact?"

"Well", they say, "that's right. It's nine percent – nine percent of the people just don't register."

You say, "Why?"

"What?"

"Why?"

"What do you mean why? What s tha – you've interrupted the conversation here?"

You say, "No, why don't nine percent of these people register?"

"Well", he says, "It says right here in the textbook of the Keeley Institute" or at the Keeler Institute. I get them mixed up. One solves drunks, and the other solves lie detectors.

And they say, "It says right there, read that line? It says 'nine percent – nine and a half percent of the people they put on the machine ...' That's it, you know.

And you say, "Why?"

And they say, "Look, it says right here in this textbook. It says 'nine and a half percent of the people don't register on a lie detec...' Aren't you satisfied?"
You say, "No, why?"

And they say, "Well, to hell with you. You must be a Scientologist." [laughter]

No, people are being fired by these characters who know nothing about the mind, know nothing about their machinery. They're being fired, they're being hired. It's a rather pathetic thing.

Now, you and I know you can get a large strata of people who never register on a Security Check. They're not up to a responsibility of registering on a Security Check. You don't get a fall with the needle. The fellow's sitting there with his hands dripping red, and you say, "Have you ever touched any red paint or blood or murdered anybody or anything?" And the fellow says, "No, no, no." The fellow says, "No, no. Never did." And the needle doesn't even quiver.

And we know that this is an irresponsible character who can't work – we have to look sideways to find his actual identity – and he cannot work. That's one of the main things. He cannot have solutions. That's another thing. He's every reason under God's green earth why he shouldn't be in an industry,

what he had forgotten. And that is the level of action. And that's the sequence of action that a thetan does on any given subject.

When you enter engineering school, you have to postulate that you know nothing about engineering. When you enter the school of arts, you are asked to postulate that you know nothing about arts. Get the idea? Well, take that in a finite application down here on Earth, and you've just about got it.

Now to some degree we do this in Scientology – to our shame – where you go to school, why you're asked not to – to not-know what you know about the mind, you see. But actually nobody has ever made that request of you. The reverse request has been made, however: "Please look around and find something you don't know about it."

You know, actually find something you don't know, not just say you don't know – just find something you don't know about it. And of course, we've moved you off from "know" back to "not-know." We've moved you from second postulate to first postulate. And in the field of first postulate, we can operate because we can move back rather rapidly to native state. And the peculiarity of what we're trying to do, which is to say to a marked degree return a thetan to native state with the total ability, added, of experience. This is what we're trying to do, you see. And this, of course, parallels in training. You have to find out what you don't know about the mind in order to find out about it. In other words, we're backing up. We're doing a reverse line.

That is to say, in engineering school, or the arts colleges or something like that, they ask you to not know and then learn a lot of nonsense, because there is an awful lot of this stuff is pure nonsense, you see. It has no workability. That's marvelous.

For instance, they've just made a breakthrough on planing hulls with liquid strips. They learned all this from this tremendous upsurge of water skiing that's been going on, you
know. And then they kept looking at fellows on water skis and then kept looking at fellows on water skis, and all of a sudden it dawned on somebody that you ought to put water skis on a boat, that water skis were a better hull and had better hull performances than hulls. And so I'll be a son of a gun if they didn't put water skis on boats.

And I was almost startled out of my life on the Potomac one day. I was going down the Potomac in the Huskie and I saw this boat which was about eight to ten feet off the water, it was this twenty-four foot cruiser. And there was some fantastic, you know, Rube Goldbergian mechanism whereby, you know, you probably pumped wheels and turned levers and ground screws; and you got these enormously hidden girders of some kind or another moved down underneath the boat, you see. And then the boat in some tippy fashion was put forward and eventually got up there. And then you rigged propellers in some fashion to get these propellers to operate down underneath the water skis ten feet below the engine. And you hung it all together with baling wire and shoestrings, you know, and the mechanic's chewing gum, because he gave up long before. And that was about the first real adventure on this.

And then we learn a little later that they had them up safe enough to where they let Prince Philip run one for a little while down here. And they had – and the navy was building some, and they went way up in the air and did about – supposed to do about forty-nine miles an hour. And Prince Philip, I think, got about fifty-five out of one, but leave it to him. And they were – everybody was very upset, because this wasn't supposed to go that fast. But – nervy guy, that fellow.

Anyway, the score is that they had them all on stilts, you see, water skis. And then all of a sudden somebody got real smart and said, "Well, a water skier, now, isn't – just because his eyes are six feet above the water skis, is no reason the bottom of the hull of the boat has to be six feet above the water skis." See, they got real smart, and they said, "We'll put the hull of the boat in the water. And we'll put the water skis right up against the hull."

And as soon as they did that, why, the boat in one of the roughest Nassau races – Mi-ami-Nassau races – ever run ... And that channel out there, that Gulf Stream off Miami, can really get rough. And a boat so equipped came in twelve hours before the nearest competitor. And all they did was tack water skis on the bottom of a hull. They put four water skis on the side of – each side – of the hull. It was very interesting.

Well, I've got a book upstairs – Marilyn sent me – that is the technology of planing hulls. It's a very recent book. It's not an old book at all. And it came out just before anybody made a practical breakthrough with the water ski. It's very recent, and it is old as Methuselah. Its data is all went. It is an antique. And there it sits, brassy new covers and everything else, out of date.

For instance, it tells you rather amazingly that you must never let the forefoot of the boat rise out of the water. If you're going to have a planing hull, you must never let the forefoot of the boat rise out of the water. And these water ski boats do nothing else but rise out of the water, you see. And they explain to you how it's utterly impossible for a boat to be run with its forefoot out of the water. And this is very convincing, too.

Nevertheless, there's a lot of good data in the thing. It proves completely that as soon as you get rid of displacement, you go faster. That theory is very sound. But there is this odd-
ity connected with it. You see how this data gets booby-trapped? Here we can look at the last end of the Nelsonian theory of shipbuilding, see, because he had stuff that planed, too. And it begins right there at this point of where somebody observes somebody on water skis and said, "Why don't we put boats on water skis", and right away, all their technology goes blooey. Well, it must have been an awful lot of invented technology for it all to go blooey. For this much technology to blow up all in one package, there must have been an awful lot of false nonobservation connected with it, right? And that's for sure. That's for sure.

Right at the beginning of the book, it says, "Of course, it's impossible to actually model test planing hulls." That's a wonderful assumption, since I could figure out how to water test a planing hull at fifty-five. But they never get them at fifty-five because you can't get something to go tearing down the length of a swimming pool at fifty-five. Don't you see? You can't get anything to start and stop that fast. And then the water, they would think, was turbulent, you see, if you poured water at fifty-five miles an hour, so they just gave it up.

Well, as a matter of fact, I've seen many a smooth stream of water running at fifty-five miles an hour. If you throw enough water down a pipe, why, you'll get fifty-five miles an hour worth of water. Which is relatively unturbulent providing the pipe is maybe seventy-five feet long. About the middle of the pipe, if that's very smooth and there's enough volume of water, you can certainly get volumes of water going down a pipe which would certainly serve to test this sort of thing.

The theory is real wonderful, but if we look too hard, it'll blow up. And with the theory blowing up, there will go all of our MRINA buttons, and all of our importances will blow up because our importances depend totally on theory. Well, that's the first and foremost thing that we have changed in Scientology. We mustn't neglect that point – is our importance depends totally upon our workability. That is the total dependence of Importance. If we could make what we know work, we're important, and if we can't make it work, we're just another theorist, and the world is full of them.

There's the first time this type of thing has actually appeared. The early days of engineering have a smattering of this in it, but here is a late engineering subject called hydrostatics and hydraulics which still has a great deal of the sacredivity of the theory. If anybody'd ever built a science of hydrostatics, one single discovery couldn't blow up the whole science unless the science itself was a bit of a phony. Right?

Something would have knitted together in this ancient science that went, but nothing did. And now the forefoot of the boat has to ride out of the water in order to make a boat go fast. It has to. I mean there's nothing else to it. There's all sorts of weird things have been going on here.

But if you can make something work, then any body of theorists eventually blow up. The only thing that ever blows theories up is demonstration of a workable counter-theory. The workability of a counter-theory is what blows up a body of false theory. So if you have objection to the false theory which is being stacked up and foisted off on man in all directions, the way to blow it up is simply have a high level of workability.

And you'll find all of the falsity and pomposity of the entire sphere and area will blow up without any further protestation from you. You just go on and do your job, and it will blow
up, believe me. You don't have to pay much attention to it, any more than you've paid attention to a little thin zephyr of air blowing through the room.

You can do your job, you can do your job. And therefore you'd better know how to take a reactive mind apart, *ka-bango-bango*. Because there is the vagary. There is the unpredictable. There was the thing between faculty psychology and modern (quote) (unquote) "psychology" of 1879. There is the bone of contention, and that is all they are arguing about, that Freud called it the unconscious.

We don't care what it's called. They were aware of the fact that there was a zone of unpredictable impulse. We know more about that zone now than any other body of people on Earth. So any breakthrough that we make in that particular zone is, therefore, a very valuable breakthrough. That would come right on the center line. How to cure Arslycus or something, that would be different. That would be *interesting*. But this other is vital. And I found the point where this thing breaks through when I say forgettingness/confusion.

What forgettingness would create a confusion? What forgettingness would cause a problem? There is the breakthrough point, but that isn't as far as it goes. It goes further than that, and I can give you a little additional datum on that today.

Man *wants* it to be forgotten. He not only uses forgettingness as a continuous and continuing overt act, but he *wants* forgettingness to occur.

He wants all of his evil deeds wrapped up in the Stygian darkness of yesteryear. Man is basically good and this is his basic impulse. But if his deeds are considered bad, then there's only one cure for them that he knows, and that's to forget them.

So you ask this blunt question, and it can be put in these very few succinct words: "What should be forgotten?" Just that very few words. "What should be forgotten?" You just ask somebody that. *What should be forgotten?* He'll recover almost at once a screaming impulse to make something forgotten. And there is where his volition and the reactive mind cross. And they cross at exactly that precise crossroads.

Now, I was around in the vicinity of this, the way you'd spot it with a bomb salvo, but we're standing right in the middle of the X with that one, because there is where his volition desires occlusion. And sitting back of all of his confusion is actually a knowable volition. He wishes a forgettingness to occur. And that wish for forgettingness to occur, then creates actively the reactive bank. And that is exact – the exact point between the analytical and the reactive bank. And there's where those two points coincide, with this addition: that we're ahead of the creation of the reactive bank. That is the basic, basic impulse on the creation of the reactive bank and therefore is a very important thing to know.

One, it is reachable. That's why it's important. It isn't a theory, it becomes workable. And it is the impulse which brings about the creation of all of this thing we call the reactive bank without any slightest anything. I mean it's all there, I mean that is, that is the postulate just ahead of all the rest of it. "What should be forgotten?" is the question that uncovers it. Because the statement which starts the reactive bank: "It *must* be forgotten", or "*They* must forget", or "*He* must forget", or "*She* must forget", "The other one must forget", and there is the inception.
And after that, a person can have a reactive bank. Now, when you're trying to clear people, you're trying to clear them of reactive bank. So obviously, this is not a workable statement. The other I've just made right up to this point is a workable statement. This is not a theoretical statement. You theoretically could sweep out the reactive bank with that piece of knowingness all by yourself. You see, theoretically. But of course, that of course will become the most easily forgotten point of Scientology. Isn't that interesting?

So you see why I'm punching it up to you and why I'm drawing you pictures and putting red arrows in the direction of it and exclamation points behind it, and so forth, because it very easily could slide on a broad, general basis. "What should be forgotten?" And of course, the insistence that the actual postulate – "What should be forgotten" is the unraveling question – and the postulate itself is "It must be forgotten." So if the postulate is "It must be forgotten", what do you think amongst the human race would be the most forgotten of all postulates? It would be the postulate: "It must be forgotten", actually. And therefore, would be the least likely to be as-ised and so would start the concatenation of accumulation which we call the reactive bank.

It's an idiot truth, you know. I mean it's idiotically observable. It's – you know, it's one of these things that after you see it sitting out there, it looks like a red barn in the middle of a white plain, you know. You just couldn't miss it, you see. But it's been sitting there all the time, but everybody's not only been missing it, they've been walking straight through it. Interesting, huh?

Well now, this does quite a great deal as you work with this thing. There are all manner[s] of variations, and we get another rule that goes along with it for the handling of hidden standards. This is a cousin to this. And we get a new rule for the handling of hidden standards. If you find a hidden standard in processing a pc, he says well, his ear – his right ear burns, burns more or burns less, and therefore he knows processing is working, you should take your Security Check and move the ear into the Security Check. Now, isn't that an odd place to move this hidden standard? But here's the rule: You move the hidden standard into the Security Check, and then you ask, what is hidden about it or what should be forgotten about it, or about ears, you got it? And there goes the hidden standard, just like that. Zooooooom.

Then two things occur. The pc no longer has his attention bound up on this object and he knows he's getting someplace in processing. And you've at once accomplished a goal of considerable magnitude.

You'll find that is probably the most pleasant auditing you will ever do, is exactly that auditing. You get it out in goals by running in difficulties.

You're running a Goals Assessment, don't you see? And you're running in difficulties. You're doing a Goals Assessment – talking about Routine 3 now, and you'll find yourself using Routine 3 more and more and more in general – and you say, "Well, what would you – what would have to happen for you to know that Scientology works?" See, that nice one.

And after you've stripped all the motion out of the needle, you're going to be sitting there with a list of hidden standards. Well, that's great. I never told you before to do anything about them particularly. I said there were things you could do about them. And now I'm tell-
ing you, you have to do something about them, and that is you move them all over into the Security Check as terminals.

Find a terminal for each one of the hidden standards. The actual operation is this: while doing a Goals Assessment, Routine 3, ordinary run-of-the-mill Goals Assessment, introduce this question and bleed it down. Introduce it often, every now and then, every few sessions, something like that. Get this one beaten to death again, and you will get a bunch of goals which amount to hidden standards. And the question, of course, is: "What would have to happen for you to know that Scientology works?" or "What would you have to have happen to know that you're getting better?" or "If what happened, would you know that you were getting worse?" "What would tell you, that you were getting worse?" You got the variations of this sort of thing?

In other words, you take all of that class of question which would hunt out the hidden standard. And take those and then acquire a terminal for each one. Find a terminal more or less for each one. That's no laborious thing. The terminal's usually sitting right there. He says, "Well, I'd have to stop getting these terrified feelings in the end of my nose." And obviously, it's the end of his nose is the hidden standard. That is the terminal. He's told you. There's no reason to beat your brains about it because it's not all that important, don't you see. So there's your terminal. And your next step is to move the whole thing over into the Security Check. You don't do anything about it. You've done that far. You've done the Goals Assessment part of it. You've wound up with the terminals. At once that he gave you the hidden standard, you asked for the terminal. And you write that down on your Goals Assessment sheet, you see. Now, don't do anything more about it than that at that time. But when you come to the Security Check part of Routine 3, you move that whole bunch of hidden standard terminals into the Security Check. You find out what he's trying to hide about them. You find out what shouldn't be known about them. And you find out, in particular, what should be forgotten about them. And of course, that is the question that would break the back of any hidden standard.

The fellow said the tip of his nose. Very good. The tip of his nose. That's fine. So you say, "Well, what should be hidden about the tip of a nose?"

"Well, what's hidden about it? I can't see it. Obviously."

It is hidden. There isn't anything you could do about the tip of the nose because, you see, you can't see it. You get cross-eyed, you know, if you tried to look at the tip of your nose before you. And that's pretty desperate. So obviously you can't do anything about that. Well, what should be forgotten about it? And now this will all of a sudden emerge into pay dirt.

So no matter how the question is avoided, you could walk around the question and sooner or later go home on it, you see. There'd be some variation of what you know about it. And the formula statement – which I may or may not make with complete precision – is any psychosomatic difficulty or any livingness difficulty which an individual has, is in difficulty because he does not want it known. There's something about that that he does not want known; and something about that class of thing that he does not want known. He wishes to hide it and he wants others to forget it. And that is the story of psychosomatics, and that's all there is to psychosomatics. If you can make it work from there on, you could make it work.
And that's all there is to it. But of course, you see, obviously that it belongs in a Security Check.

And this opens up a great big page. When I was very young, extremely young – it was a long time ago on the early track – I worsened the life and shortened the days of a very clever and a very, very fine old man who was a very fine variety. You wouldn't have called him a wizard, that's kind of a low scale. But he was a wise man. He was a very, very wise man. And he used to despair of my ever learning anything because I wasn't ever supposed to become a wise man. But he had great big books. And it used to be my lot to stagger around with these books when he let – wanted them moved and that sort of thing. He'd put them on easels and so on. You had to put these books on an easel because they were as big as that rug. And you opened them up, you know, and the hinges of the book would groan like the doors in one of those old radio programs. [laughter] And it's very interesting, the emphasis – the emphasis there in that particular library on the subject of rememberingness. Absolutely fantastic. Rememberingness was the only thing ever taught.

And you could pull one of these books out of the shelf and stagger in with it, you know, lurching from side to side and open it up on one of these easels and it would groan, you see. And the papers would – they wouldn't whisper, they'd sort of rasp as you open them, and so on.

Stuff was really locked in brass there, you see, and there was all this knowingness, and it was all knowingness, knowingness, knowingness, knowingness. How you made things sick, and how you made them well, and how you did this and did that, and made animals make bodies and all kinds of weird things like this, you see. And it went on and on and on and on and on. And to the best of my recollection and belief, there wasn't a single scrap in the whole thing concerned with forgettingness.

But you see that as "forget" and "remember" are opposite sides of the coin, that obsessive rememberingness would bring about, sooner or later, occludingness. You got that?

If "know" and "not-know" are the verse and obverse parts of the coin, the faces, you go in the direction of "got to remember, got to remember, got to remember, got to remember", you have already said to yourself, "I might forget." [laughter] And in view of this, you will find that the hidden factor of forgettingness, will start showing up like a small, gray ghost. And then it will get less gray and less gray and darker and darker and bigger and bigger, and eventually you will wonder, where did all that big black mass come from?

Well, earlier than that, you had to set up a postulate "to forget", but it was probably disrelated from the exact thing you were there. And the relationships as they came through, became accidental on your terror of forgetting. You must remember, you must remember, you must remember, don't you see. And every time you say, "I must remember. I've just got to! If I forgot this, it would be terrible. I've got to remember this. I've got to remember this. I've got to remember this", and so forth, concentrating all the time that it must be something building up there, that says, "You're Liable to forget, boy. You're liable to forget." You see?

So a fear of forgetting actually can be built up by a terrific concentration on remembering. Very interesting. You can press on one of those buttons and get the other one.
Now, the poor devil who is sitting there in the South Sea habitat. Not Phil Hudsmith who is down there – who is – he's desperate today. I mean he's down there photographing the last of Tahiti and he can't find out from his office whether the film he has taken is any good.

Imagine being in Tahiti with all the atmospheric conditions that you have to combat with color photography, and you're trying to find out desperately – you're trying to find out whether or not the – any of the film you have – of the hundreds of thousands of feet of film you have taken, if there's just one foot of it that's any good. Or do you have to shoot it all again? And nobody will tell you.

The guy gets pretty desperate, you see. But he's in a different situation, and I don't think he will go into this one. But the standard Robert Louis Stevenson type South Sea bum, you see, was supposed to sit there and try to forget. The reason he went to the South Seas in the beginning was to try to forget. Don't you see?

So he uses drugs – no, at first it isn't drugs. It's liquor – liquor. Probably women first – probably women. And then – at first he moves in location. That's it. And when he gets there it's women and then they pall or something of the sort – or he can't get any – and – don't tell me women won't cure most anything. He goes in for liquor, you see, and then he "must forget", you see, and then this doesn't help him forget. Well, what's he doing running out here? You see. But he's now got to go in for liquor, you see. But right after this, you'll find him normally trying to go in for dope or something like this, and eventually death is his last remedy.

What's this? He's trying to forget, isn't he? Well, what is all this urgency about forgetting? See. If he just relaxed, it would probably all evaporate anyhow. [laughter] But I think the guy's bragging actually. I never ran into many fellows that could be that sinful in one lifetime.

But this very insistence on forgetting, of course, brings this thing up day after day after day. It's getting loomier and loomier and loomier, whatever he's done. You get the idea? He presses on one button over here, and the other button fires off, you see. And then he requires assistance to press on this button. He goes out and buys some weights of some kind or another to sit on the button, and he does various other things, you see, trying to get this button to stay put. And this other button, is the one that's giving him trouble, and he isn't paying any attention to it at all, see. "You're remembering. Well, you get away from here. We don't want anything to do with you. Now, all we've got to do is forget."

So they get on opposite sides of these coins, and this develops an awful confusion. And eventually they develop this mechanism of death and occlusion and so on, and just bury the lot. And what's buried then becomes the stimulus-response mechanisms of the reactive mind. Because, of course, his power of choice and his postulates are being overwhelmed. That they are being overwhelmed by him is no less factual that they are being overwhelmed. Because he's the only one that could overwhelm his own postulates anyhow. You see how this cycle of nonsense goes?

Well now, that opens some new doors for you. Opens some big, broad, new doors. Now, just get inventive for a moment and think of how you might apply this principle to a general Security Check.
Now, I already had some of you doing negative Security Checks, and we found out they were quite successful. Well, let's do a hide Security Check. Let's just assume, perforce, not that the fellow has done any of these things, but let us assume accusatively that he has hidden doing these things. And let's ask question after question, line after line, just on that basis only – we just snidely, meanly, viciously assume that he is hiding each one of these things.

Now, we're not asking him if he's done them, you see. We have already assumed that he has done them. [laughter] We're just asking him how he's going about hiding them. "How are you hiding all these rapes?" You see? We just take the standard Form 3 Security Check, and just use the word "hide", just as an example, you see.

And it says "Have you ever..." I remember the original Security Check, "Have you ever cooked a company's books?" I thought that was awfully poetic. [laughter] "So have you ever cooked a company's books?" Now, well, that's letting the fellow up, you see. That's letting him out. No, let's ask the question something of this order: "How would you go about hiding having cooked the company's books?" Well, that's kind of letting him off, too. You can alibi your way out of that, one way or the other.

Well, let's suppose the needle trembled on that one. Well, then let's lower the boom. Just ask, "When did you first hide cooking the company's books?" Get the idea? That's a very, very accusative type of action. But all of the difficulty you're having with the Security Check would rather evaporate. The difficulty is trying to get the guy to remember because these things are reactive responses, don't you see? So you just cut – undercut the reactive response and you just assume it's there. You say well, he's hiding it someplace. Of course, in a couple of hundred trillion years, he's naturally cooked an awful lot of companies' books. That's true of anybody if you were given a whole track check, which you aren't necessarily doing.

But the next thing you know, you'd find your whole track Security Check became very easy to do. If you did a Form 3 this other way, you'd find whole track. But I was just giving you an illustrative example of the uses of these principles. And the use of this thing, well, whatever's wrong with the guy is what he's hiding, don't you see.

Well now, let's go for broke on this thing. "Who should forget cooking a company's books? Who should forget it? What should be forgotten about a company's books?" Ha-ha. That's an employment Security Check that would be an absolute killer. I gave you a dissertation a little earlier in this lecture about the Keeler organizations. I never could quite regard them before with contempt and I have now managed that. Because there goes their nine and a half percent. There goes their nine and a half percent.

If you attack Security Check questions from the viewpoint of the first postulate – that is to say the commonly accepted first postulate which is the third postulate, "forget" – of course, the fellow just couldn't stay calm about it. The reason he's calm about it, even if he knows it he's – he's forgotten actually what it did.

He's forgotten the consequences that associated with it. He's carefully forgotten these things, so he can tell you, "Oh, yes, I cooked the company's books one time." you don't even get a tremble on the needle. Why? He's forgotten all the emotional response, the charges, the fear, the overt act of it.
He's got all this stuff forgotten. The fact of cooking the company's books, he's conversant with that.

So you very often will have a criminal sit down, tell you, "Yes, I looted, murdered, robbed, burned, did this, did that", and after a while we get the idea we're not security checking. We're listening to somebody brag. You've heard that happen probably. You get no real reaction on the needle for some of the darnedest things. Well, if you want to see the reaction cut into the needle, I'm pretty sure that if you asked about forgettingness, you'll see that needle start acting. And you'll see the charge come off that security question.

So there went the Keeler Company's nine and a half percent and we can now regard them with contempt. Or maybe it's the Keeley Company. I'm not quite sure which it is. One of those names there cures drunks and ...

[laughter]

Now, if you were to do a company Security Check of this type, and you were just asking it just to clear each question as you went down the line, of course you wouldn't have a prayer. You just wouldn't have a prayer because this would plunge into the whole track inevitably. Because you're now undercutting and underprocessing death. You're going right on down below death, because death is the last effort not to remember.

So interrogation for companies should be short Security Checks. They must have nothing to do with anything except the person – what the person would actually be expected to do in his new employment. You know? We don't want people around who are going to cut the staff to pieces and cause people unhappiness or get – try to get other good workers sacked. What they very often will do, is try to get good workers sacked. On an insecure person, that's one of his first impulses. And to protect your own people, you actually ought to check across such a line.

So you'd have to have a very brief Security Check. It couldn't consist of more than fifteen or twenty questions if you ever expected anybody to complete it. And then if you ask on a forgetting – or hiding or forgetting, you know, a general not-know pattern – if you ask these things and strip them down, and strip them of total reaction, you would actually be totally sure of the security quality or lack of it, of the person you were testing regardless of his case state.

You watch. You do a sec- some of you have already done this negative Security Check, and you've seen a little more needle reaction, haven't you?

Well, of course, you're going to hop up the needle reaction again the second you start asking about hiding and forgetting and not-knowing and any one of the odd number of postulates. Any type of action of that character, you see. Hide is about your fifth postulate, by the way. You're doing harmonics of the same thing as you go down the line. I should probably sit down and figure out the rest of them up to about twenty-five or something like that to give all harmonics on the same scale. It would be of use in Security Checking. You see what you could do with that?

All right. As long as you were trying, then, to do this kind of action and as long as you were trying to undercut the reactive mind, it then follows inevitably and invariably that goals would come under the same heading. And you could also do goals with this sort of thing.
Your pc is just having one awful time trying to get a few more goals, and he is comm lagging like mad, and so forth. Well, what's more natural than to ask him, "What goals have you had that you have forgotten?" Well, that sounds like a very mild sort of a question to produce the considerable reaction that it will produce because it'll produce considerable advance reaction to the other, you see. All right. Now, let's ask a more pertinent question. "What goal should be forgotten?" And of course, you'll get goals on all legs of all brackets. "What goal should be forgotten?" If you ask it plural, you're liable to trigger an automaticity, see. You can think of it right now. There ought to be a lot of goals that should be forgotten, man. A lot of them. All dynamics, crisscrossed and so forth.

So of course, you don't, however, commit in either a Security Check or an assessment, the blunder of the Robert Louis Stevenson character in the South Seas. You don't have this thing sitting on the "I must forget", with a total concentration on "forget". Because it's just – you're trying to bring up this fellow's memory and ventilate and aerate the atmosphere and straighten it up, but at the same time, if you specialized on nothing but forgetting, you might run into some sort of a mess. You might get into zones of occlusion, which are absolutely overwhelming. You might get on a forgettingness stuck flow, don't you see? I'm talking now in terms of dozens of hours of auditing, and you did nothing but talk about "forget", you see. No, you're going to have to let him up. You're going to have to talk about "remember", too.

So in a Security Check, you would have to ask the question – maybe after we've disposed of "What company's books should be forgotten?" and so forth, we'll have to ask the question, "Have you ever cooked the company's books?" which is a direct invitation to remember. You see this? And after we've said to him, "What goals should be forgotten?" why, we'll have to take some time-out and ask him what goal he has. Not necessarily what goal should he remember. Let's not get into a one-two dichotomy here, but just ask him, just what goal he has had. Got the idea? Which, of course, is asking him to remember one.

You'll find that this at first – as in the case of all processes which have a deep-seated residence in the reactive bank – is perhaps a little bit hard to apply. Oddly enough, it sounds so simple to apply, but it might be a little hard to apply at first glance and you have to get to living with the lion a little bit, and then all of a sudden it'll get very easy.

If, however, you find yourself stammering over, "Let's see, uh, what the hell was I doing? Uh, let's see, wha-what's the next auditing question? Model Session? Model Session? Scientol – I don – wha – what are we doing here? Uh, well, well uh, here we are in, uh, well, is this New York or Pompeio?"

You know, I mean in auditing it, you're liable to feel yourself hit a little confusion here and there or something like that. Ride it through. It'd be quite normal. That would tend to disappear in a relatively short space of time.

But the confusion – forgetting the confusion, of course, is a one-two sort of thing because a confusion is something that asks itself to be forgotten because it has never really been remembered. You don't – you very seldom see somebody remembering all parts of the confusion. Well, there was a heavy wind earlier today. Do you remember every rattle of the leaf on the tree? No, here were too many rattles of leaves on the tree, don't you see? So even while it's happening, a confusion tends to be forgotten. Or much more accurately, tends to be not
known because you just didn't observe it. You're not knowing it when you're looking at it, don't you see. Which is probably what makes a confusion a confusion. You're just not knowing what you were looking at when you were looking at it, and so this gets difficult.

Okay. Well, enough of this. I trust that this won't upset the tenor of your ways. You are doing Routine 3 right now and heavily specializing in Routine 3. You go right ahead and specialize in Routine 3 and if you're having any difficulty whatsoever in barreling through Routine 3, keep this lecture in mind because it will help you out a great deal.

What I would actually do is get the pc's hidden standards out of the road now, using the formula which I just gave you. In doing a Goals Assessment, to know if he's getting better, to know if he's getting worse, what would have to happen? "If Scientology worked, what would have to happen?" Any type of question of this character which would reveal a hidden standard. Get the hidden standards down, get some terminals for them, and then forget them. As far as the Goals Assessment are concerned, just go right on and run some more Goals Assessment. When it comes around to the Security Check, plow in with those hidden standards and find out what should be forgotten about the tips of noses and what should be forgotten about unkempt hair, and what should be forgotten about these various things. And the next thing you know, those hidden standards will blow up in smoke. Why? Because you have brought knowingness into the thing. Okay? [agreeing murmurs]

Well, I wish you luck. I wish you luck. It isn't that you will need it. It isn't that you will need it, but you will have, I think, a better, wider look at this.

The restoration of memory on the whole track is, of course, the index by which you can measure a case gain most easily. The person who has no recall on the whole track of any kind, who doesn't think he has ever lived before, of course, just announces the fact that he has plowed in very heavily into forgettingness. But the fellow who has nothing but delusory recall on the whole track, of course, is doing a pretended knowingness on the whole track – a pretended knowingness on the whole track. And you'll find out that this is a games condition of magnitude.

Do you know what that's all about? I'd better make some mention of that just while I'm on the subject.

It is giving somebody some knowingness that isn't. Do you understand? It's denying knowingness by giving him instead a false knowingness. So that one appears at the same time to be very cooperative and not playing a game at all, because he's giving you all the hot dope, don't you see.

But right alongside of this thing, we of course get a pretended knowingness. It is – and that pretended knowingness is actually denial of knowingness. He's denying you knowingness. That's all. That's the game. See, you're not supposed to know about his whole track, so he gives you a whole bunch of stuff that hasn't anything to do with the whole track. Well, actually, it's a games condition which is all wrapped up between forgetting and remembering all at the same time, don't you see. It's all compounded in a games condition, and it's in terrible confusion. And my, do you hate to have people talk about their life as Napoleon. Have you ever sort of listened to somebody running on like this and just flinched?
Audience member: Jesus Christ.

Huh?

Audience member: I've listened to about twelve Jesus Christs.

Yeah. Well now, this sort of situation – this sort of a situation is your reaction. Your reaction is not actually to whole track memory, to which you might accidentally assign it. Your reaction is addressed to this: You realize you are listening to a games condition, and that without anybody announcing it, they're considering you a target for a game, such as to give you information that isn't giving you information, to appear to be giving you information when they are not giving you information. And that, of course, rattles you. This you don't like, because you smell a games condition here, and you aren't aware of being an opponent to this person. So you kind of go, "Aw" and "I don't like it", you know.

Now this can build up to a fact of where, if this is played on you long enough and often enough, then your own occlusion is enormously assisted. The game also has a target which is to occlude your whole track with pretended knowingness of their whole track. So it's quite a games condition, man. Don't think that it isn't. And don't think that it isn't a wild target.

But I've seen guys around in Scientology who've gotten to a point where they'll remember something on the whole track and then never open their faces. You know, never say a word about it because somebody else has been going on about that period or something of the sort, you know.

What's happened to you then? You've answered up to the game by permitting yourself to be put on a withhold of your own past. You see? So it must be a games condition if it results in these nonbeneficial aspects. You got the idea?

Now, if your whole track opened up from beginning to end and you remembered everything you had ever been and everything you had ever done and everything that had ever happened to you, would that be good or bad? Would it be good or bad?

Audience: Good. Bad.

Well, I'll leave you that – I'll leave you that to find out, [laughter] because you're right on the verge of discovering it.

Thank you.
QUESTION AND ANSWER PERIOD: GOALS SEARCH

A lecture given on 9 August 1961

Thank you.

I was late because I thought Mary Sue probably had something to say to you. Good excuse, isn't it?

This is – well, for a while she was talking to you, but then I guess I interrupted her too punctually, you see. And now that I'm late, she isn't talking to you. What a – what a ball!

This is the 9th, 9 Aug. 11. Okay. Saint Hill Special Briefing Course. And here we go. You know all there is to know. There isn't anything I can possibly tell you now.

What questions do you have?

Female voice: I have one.

Good. "Was ist?"

Female voice: It's about running Havingness. If the pc's needle is ...

A question about running Havingness. Okay.

Female voice: Yes. The pc's needle is ahm – ahm, fairly loose so that it drops off the bottom of the ...

Pc's needle very loose, dropping off the bottom of the needle – meter. Okay, go on.

Female voice: Yes. At the beginning of the session.

Beginning of session.

Female voice: And it doesn't drop so much at the end of the session – though it's still more than a third-of-a-dial drop.

Mm-hm.

Female voice: Would you say his havingness had gone – gotten worsened?

Oh, yes. It is very loose at the beginning of session, toward the end of session it is not so loose and the question is: does this indicate that the pc's havingness has dropped? Yes.

It also indicates, of course, that the pc has run into some ridges or has gotten tangled up in the bank in some fashion or another. And of course, all ridges are can't-haves. All valences are can't-haves. All wild and confused postulates are can't-haves and anything that is hanging fire with the pc is a can't-have. So any time your pc gets stuck on the track, the first phenomenon you encounter is loss of havingness.
And the phenomenon of havingness is a registry – well, I guess it's the primary registry and a secondary, *apparent* registry is that the pc is stuck in a lot of ridges or he's stuck on the track or he is messed up in the middle of some problems or confusions or something of this sort. And it appears to be, of course, that the track, the ridge, the difficulty he is in would be the cause for the tightening of the needle and basically the cause for the tightening of the needle is the fact that he is losing havingness or this is a series of things of lost havingness.

You see, a pc grips things to his bosom in anxiety to have when his ideas about havingness drop. You see, that is the first manifestation.

Probably if you didn't have the slightest notion concerning the remotest possibility that under some stretch of the imagination you could have nothing. Now if you untangle that, it just amounts to the fact that you would not take any steps to possess anything unless you had some inkling that there might be a none of it. Or it might be difficult for you to get it, you see. Now, this difficulty of getting it does bring about this phenomenon of personal possession, so what you really see happening is that the individual runs through a bunch of bank and track, all of which tells him he can't have. When he thinks of can't-have, he pulls it in on himself and you get a tightening of the needle.

*Female voice:* So any tightening, even if it was so loose that it dropped out the bottom, it's still very loose.

It's still very loose, but slightly less so – it's a drop of havingness. You can tighten the pc's needle. You could tighten it from a total looseness to almost a total stick with sensitivity 16 by phonying up a piece of news for him concerning loss.

This isn't a laboratory test – basically, you look at it humanitarianly and it's a cruel thing to do, but if you suddenly convince him that he had just lost... "Did you hear about the National Provincial Bank suddenly going broke?" you see, or something of this sort, "And all of its depositors – and the government's refusing to make any of the deposits good." You know, something like this. And he had all his money in the National Provincial Bank. Just before and just afterwards, you'd see a sudden *wham.* You'd get a tightening of the needle.

So any news of loss would bring about a tightening of the needle and therefore, it could be stated that a bank is a substitute for the composite losses of the person. Not necessarily the reactive bank, I'm talking about all of his – the standard banks, you see, and any picture that he has and so forth.

For instance, why do you still have a picture of the Battle of Actium, if you do have. Well, you obviously haven't got the Battle of Actium. You've got a picture of the Battle of Actium. So, the losses of things are substituted for by mental masses and these mental masses, electronically, bring about a tightening of the needle. I'm overstressing this point now. It's pretty obvious what happens. But your question is very well put. Does that answer it?

*Female voice:* Yes.

All right. Okay. What other question do we have?

*Another female voice:* I've got one.

Yup?
Female voice: Supposing you have run one goals list and it's all nulled out and you ...
Supposing you've run one goals list and it's all nulled out. Okay.

Female voice: Yes and you've had sensitivity say at 2 and you're not getting very good reads. When you start a new goals list and you start the assessment by elimination, can you raise the sensitivity so as to get better reads?

Oh, and when you start a new goals list ...

Female voice: Yes.

... and you want to get better reads on your second goals list and your sensitivity was 2 and you want to do a different job. No. No, leave that sensitivity right where it is for a third-of-a-dial drop or as near as you can get to a third-of-a-dial drop. You can't have a pc, you know, who doesn't get a third-of-a-dial drop at sensitivity 16. If you're going to do a Goals Assessment by elimination, you do not keep increasing the sensitivity no matter what list you are working on and so on. You just do it all on a third-of-a-dial drop. Otherwise, you're knocking out far, far, far more than you need to knock out in doing a goals elimination. And it's going to take you fifteen times as long in order to do it.

In other words, you don't increase your sensitivity doing a goals elimination or a terminals elimination at any time, whether it's one list or two lists or for a goal or for a list of goals or anything else. Never increase it. Always a third-of-a-dial drop.

Female voice: Like that?

Yeah.

Second female voice: She's ...

Well, all right.

Second female voice: She has a case that you can't hardly – couldn't hardly read the needle on them anyway, you know and it's normally at 1 sensitivity, but on assessment ...

Well, do you get a third-of-a-dial drop?

Female voice: Get two-thirds. Get it off the bottom on 1, normally, but when you start assessing, there's practically no reads.

You're getting no reads. All right. You're not getting any goals.

Female voice: That's true.

That's easy. I'm not trying to dismiss the question. The question is quite well taken – that's a very intelligent question. But you say that you have a pc and you just get practically no read at all, even though he does get a big drop, you get no read on the goals and you want to increase the sensitivity in order to get reads on the goals. Nah. You're trying to make goals do that you haven't got.

Female voice: Yeah. Okay.

You haven't got this person's goals, that's all. Follow the same rationale. Okay?

Female voice: Right. Thanks.
All right. There's something else about goals that I noticed going along. You say a first list and a second list. Actually, you know, I never get a first list and a second list. I work on a list that I add to and it's a sort of a revolving squirrel cage. You know, I just keep putting down – every time I get to the end of the list of goals, I shake them – keep shaking them down for more goals at the end of this list and the list just accumulates. And that doesn't even mean that I've gotten rid of all the goals on that first list, see. I actually got a listing of 163 goals and I started going down this goals list, and 60 of the goals are still alive and just by the fact that I reached the bottom of the list, I start asking for new goals, you see. I don't wait until I got them all gone before I find some more. I try to keep the list cumulative and it's quite interesting. It'd work faster that way. Now, I don't know whether you're doing it that way or not, but I'm just telling you right now. Okay?

Male voice: Ron, a question in theory here. What makes "the" goal, the final goal that you get, persist?

What makes "the" goal persist? The final goal that you get. What makes it persist? I was wondering when somebody would get bright enough to ask that question. What makes that valence persist? See. Why? Well, the final goal persists because it's got an answer and the answer is the terminal. Well, the terminal is the answer to that goal and this betokens an enormous amount of success.

The appearance of a goal, when you finally get it, is actually the long-term problem of the case. And all problems have persistence and what you've done is reach in and pick the central problem of the person out. This goal is a hope that he can do something about this problem. That is what a goal really is. It's a hope that he can do something about the problem and the problem, of course is inherent in the goal and this problem has persisted for the duration of track practically. That's a very long-term proposition ordinarily when you're doing your regular Goals Assessment – unless you've got present time problem comes out to be your Goals Assessment, you see. But it will just be on the chain and you've just picked it up late in some late form. So the persistence of a problem is due to the fact that nobody ever as-ises the confusion of the postulate-counter-postulate and the motion-counter-motion and these things are all pinned in place anyhow so it's – it's a big byaaah. All right. Now, this has a hope about it. This big problem, it has a hope and the person hopes to do something about this problem and therefore, he answers up as the hope. He can't confront the problem, but he can confront this hope about it, you see. The problem, if it – if the problem were totally confronted, wouldn't be there. So he's never been able to confront this problem and don't think you're going to get him to. You go on a via, so you get him to confront the hope.

All right. Now, the hope itself is pinned in place – and there's the goal – by the fact that a valence solves that goal, maybe. You know, it's sort of stated that way in his mind, you know.

The total solution to this goal and the beingness that will achieve this goal is absolutely, concretely and without any variation whatsoever, a nine-foot cat and there is no slightest doubt about this and that's the way it is. Except it, of course, might not.

So it's a total certainty with the invalidations of uncertainties hung on it, so that of course hangs up the terminal. So the terminal is hung up, the hope is hung up because the
problem is hung up and the three are all there in a – in a bunch. Now when you get the hope, the hope rather tends to lose its charge when you get the proper valence that goes with that hope, see. So then you've got – now you're in the realm of terminal.

Now, all the time he's working on this and going up and down the line on this, you're actually cutting away and orienting him on the subject of this valence, this beingness, and eventually it starts dawning on him what this "beingness" is there to do. And what the beingness is supposed to do and what it can't do and the clarification of the beingness of course, it's sort of: you let the pc – now, I'm just talking theoretically – you let the pc look around at this great problem through the eyes of this beingness that solved it. So of course he's right in the middle of this problem, so he's busy confronting this problem all the time and he – if he confronts it enough on the Prehav Scale runs, he eventually winds up at the other end having confronted the problem – the problem disappears, the valence disappears.

The goal might or might not still be there. If the goal were still there, it'd be quite surprising, but it might be. On a proper assessment, it wouldn't be there. The valence wouldn't be there, the goal wouldn't be there and the problem wouldn't be there. See, that would be on a perfect assessment, perfect run. Quite interesting. All – all three of these things would blow up and you wouldn't get this particular persistence.

There's a sneaker on this, and that is the state of beingnesses: What are beingnesses? Now, you already have a thetan that is totally invalidated if he thinks he can't do it but has to have a pat beingness in order to do it. You get that little sneaker on the end? In other words, he's a gone dog. It's like machinery, you see.

Now, when a fellow's been overwhelmed by a machine, man, he has had it. When you see a pc sitting there who is nothing but machine, who thinks as a machine, who answers on a machine, who is a machine, that is about the most invalidation you could get. In other words, he isn't even alive. He isn't even alive enough to be overwhelmed by a beingness. He is only – you get how far this is?

That fellow will come up to a beingness and a machine overwhelmingness, though, is an example of this, you see. The individual has disappeared – and it – actually the machine is an overwhelmed valence and the machine has overwhelmed the valence he was in to such a degree that, well, it's – it's lost, too. And you get this minus-zero thetan who hasn't a clue who, what, when or where, was overwhelmed by a machine. But actually between that machine that overwhelmed and the thetan, there's a beingness that got overwhelmed and you quite ordinarily will be sorting out a valence or terminal and you'll find all of a sudden you will sort a machine. The machine will be showing up there and then the machine goes off and you have a beingness and now you've got a terminal. That's quite – quite amazing. And sometimes by the way you get the machine as the terminal and then you run that and then you'll find out for the same goal, you very probably will have to find a new terminal after that machine's gone. Because there's a sandwich there, you see?

All right. Now, this next point, the point I'm trying to make here, is that in all acceptances of beingnesses, you have betokened failure. The person must have failed as himself to have a beingness to carry on for him. So this is, of course, your basic invalidation and that lies back of that.
Now getting rid of the valence and squaring around the valence and orienting that particular problem, which made the hope called a goal and the valence take place and stick. In orienting those things, you make a MEST Clear.

Now, let me call something to your attention. You've not done anything about uninvalidating the thetan. See? He's sort of looking out from underneath the covers, you know. All you've done is reorient this thetan on the subject of valences and he's got the clue on the subject of valences, but he's still got problems and he really isn't himself yet and when he becomes himself a hundred percent – now of course all beingnesses – he has no necessity for beingnesses. So the basic definition of Theta Clear is: No further necessity for beingnesses. Got that? All right.

Well, that's just – that's a very exact definition. No further necessity for beingnesses equals Theta Clear. But even though he has no necessity for beingnesses, he might not be able to do everything he would like to do and so you have a Theta Clear who can't necessarily tear up ladies' scarves in the thin air and you move from that point to OT. Do you get what this is? You get how that gap would be closed? It would be an able, a very able thetan. Well, all you have to do is have him know he's a thetan and be able to be a thetan and be able to exist without any assist – his beingnesses, and you, of course, have a Theta Clear.

So if a fellow can exist without synthetic beingnesses which are solutions to problems he can't confront, you've got a MEST Clear. See? He's still in a body, you see. That's why you call him a MEST Clear. He's got body beingness yet. But he's gotten rid of these synthetic valences. These synthetic valences aren't bothering him now, so that's out of the way.

But he's still pretty dependent on a body. He doesn't think he could walk down the street. He doesn't think anybody would say hello to him if he walked down the street without a body. He knows pretty well they wouldn't. He can get the horrified idea even if he's Clear just of this. So you can get the horrified idea of walking through the local town and being utterly ignored by one and all. He doesn't like this.

He keeps lugging a hundred and some pounds of meat around with him. [laughter] And he keeps putting up this meat and saying, "Say hello to it", you know and this is his level of conviction. But all he needs then – the only thing he's depending on actually is MEST beingnesses. No longer any synthetic mental beingnesses. He had no dependence on those things at all. Well, that's a MEST Clear.

But remember he's still dependent on MEST and he's still dependent on a MEST beingness. Well, when you don't any longer have a dependence on a MEST beingness and identity you have a Theta Clear. That's a real honest-to-goodness Theta Clear. And every once in a while somebody writes and says, "Well, we've cleared this fellow up. He was cleared some time ago, and now we've cleared him to MEST Clear", you know. There's always a burning question that you can ask on the thing. "Well, is he still lugging around a hundred and some pounds of meat?", you know. Does he have to? And if he doesn't have to, why of course, he's Theta Clear.

And then if somebody wrote you and told you that he'd made an OT, however – he'd personally made OT, you know – why, the only test question you'd have to ask him is, "Well, how did you hold the pen?" If he writes you, "With my hand, of course", you say "Why?"
you know. And of course, you don't send him the halo. It's a halo you have to issue for OT, you see. [laughter] We've had some in stock. They're – they're surplus. We've had some surplus halos in stock for some little time. They were originally made for Christianity and then nobody could qualify. [laughter]

Okay. What other questions do we have?

Female voice: What is actually wrong with a case that takes such a tremendous time in doing the Goals Assessment on them? What are they doing? Are they playing a game with the auditor? Are they in a games condition ...

Nah!

Female voice: ... on auditing or are they just ...

Yeah, well, yeah. There's something in that. They're not playing a game with the auditor. They're in a games condition with the auditor.

Female voice: Uh-huh.

But maybe there's more to your question.

Female voice: No, I just wondered ...

What is going on with the pc ...

Female voice: Yeah. That it takes such a tremendous ...

... who takes such tremendous long time in getting assessed and up to a Goals Assessment? What is this pc doing?

Female voice: Right.

Well, of course, if we could say specifically exactly what this pc was doing, he of course would be assessed much faster. So we probably at this moment don't have all of the answers for exactly what it takes so long and we're work – we work instead on the auditor trying to get him to make a perfect approach to this situation. That is our best answer to it at this time and the most enduring answer.

But what is wrong with this pc? Now, you're asking me mostly for conjecture. I say it's conjecture, he could be doing an enormous list of things and amongst them, of course, you could include as a common denominator to all of them, he's in some kind of a games condition with regard to life. But he isn't kidding the auditor and I don't think people are playing coy and being mean and so forth. They aren't, really. They're doing all right.

They just can't bring themselves to give up much. The guy is actually being asked to give up his dreams. They're the most valuable commodity there is. There's been a poem written about them – when the last of a man's dreams is dead, why, the man is dead, you know. And if you badly do a Goals Assessment, he sort of gets the sensation like he's being killed, dream by dream. And that is why I say we got rid of some of that when we took this third-of-a-dial drop, you know, as a Goals Assessment. You're not trying to rub the pc out as he sits in the chair after all. Let's just find out if this goal is consistent and continual.
Now, giving up something valuable to the auditor is what being assessed for a goal entails. And the common denominator of a games condition is "Thou must not have. Maybe me neither, but thou certainly." [laughter] And you run into an obsessive games condition of this character. You could go over the hills and far away, and probably do something about this. You probably could approach it like this:

"Who used to ask you what you wanted to do in life?" And of course, the needle will fall off the pin on anybody who was having a hard time giving up a goal. Because it's certain that he has been plagued by his parents and associated personnel and maybe even by the military and other people. Some oblique, wild program of "You have to make up your mind what you are going to do in life" or "You are such a disappointment to us" or something like that.

I've noticed that girls very often – I've had a lot of girls – I've seen a lot of them from time to time who actually are just totally knocked in the head because they were – their parents expected so much of them. And they somehow or another didn't measure up to it and there was this terrific nostalgia about all this and this terrific, "Well, I tried", you know and now they feel totally degraded and very upset and they were supposed to paint twice as good as Leonardo da Vinci, you know, and sit in the model chair and look three times as good as Mona Lisa.

And simultaneously with this, they were supposed to marry a millionaire and there have been a few little mild goals laid out for them more or less of this character, don't you see. You know and they just weren't ... I'll tell you a good example of this. The day of the Saxon is still with us, but the Saxon has – in America and England – has a peculiarity and the peculiarity is – is "Don't let him be." That's sort of a motto, you know.

And other races find this as very peculiar. You get down to Spain and you run into waiters. And it's all right to be a waiter. Nobody looks down on you if you're a waiter, you know. And you get out to China – Spain kind of draws the line from that point on down because a waiter is still able to dress and so forth. They start drawing the line on the laborer and they don't kind of want people to be a laborer, you know and it's just a little bit beneath it all. But out in China, my God, a man can be a laborer, a rickshaw coolie and next month be a warlord and it's just totally rolly coaster, you see. And everybody respects any beingness they run into, which is quite amazing!

You know. The fellow's a coolie, so it's all right. There's nobody chivying at him saying, "Now, when are you going to be the construction boss?", do you see? No, it's perfectly all right he's a coolie and he's supposed to carry a basket and every time he passes the tallyman, the tallyman pops another bamboo stick into the other box and this is the way life goes. And he carries this basket and they fill it up and he carries it back and he empties it and that's all right. And nobody finds any fault with it.

His wife isn't standing around saying, "Well now, Wong – ." [laughter] And you don't have this vast notion of "getting promoted" or "getting on in life." In other words, they leave these beingnesses at rest.

Now, this could be at two positions on the Tone Scale. It could be a harmonic, you see, of a – of a decent attitude, and it could be a total apathy about beingness, you know.
Well, the fellow was there and there's nothing you can do about it. That doesn't happen to be present in China. The other condition is more alive. It's quite amazing to watch this.

You – you're around a brick foundry or something like that and some bird all of a sudden lays down his brick paddle and comes over and offers you a cigarette and asks you for a match and sits down. And he's covered with dust and grime and he – all he's supposed to do is stand there with a paddle and pat the bricks as they go by or something, you see. And he is of no importance of any kind whatsoever in this area. He'll have a long, drawn out, very familiar conversation with you about the political issues of the day and about this and that – totally relaxed. He has no apology for his own beingness. He's doing a very good job of patting bricks.

And you run into some of this in the West Indies. I had a fellow one time whose name was Horatio Nelson and he let go of a barrel – he was rolling a barrel of rum, he was part of a longshore crew – and he just knocked off. He saw me standing there and he came over and had a conversation with me and he bought me a drink and I bought him a drink and then he went back to rolling his barrel of rum and there was no apology for it. It's quite amazing. No apology for beingness. It's very weird being in a society of that after being in a society where everybody is apologizing for their beingness, you know.

And you get in America right now young boys or – fellows in their late teens, twenties, something like that – why, they're always explaining to you how they're about to be promoted, you know. And in the services, it's enough to drive you mad. I mean every reserve that you ran into was explaining how he was really supposed to be commissioned an admiral, he left this job in Chicago which was paying him 865 dollars a week, and he'd given up all this to come into the service and he didn't amount to very much here now, but in spite of all this – you've heard that. What's the guy doing? He says, "Forgive me for being. The beingness isn't here. I mean I'm not – really not in any beingness, and I know it isn't adequate. And I feel like I should apologize for it all." You get the idea?

So you get this – I'm a little astray here on this other question – but you get this condition in American, English-type societies, at the present moment more dominantly. So that must mean that in this particular society, at this particular time, there's a tremendous amount of chivying at someone to make one amount to something else.

You see, there must be a lot of pressure on the subject which in itself serves as both an invalidation of the person as he is and a demand that he be something else, and that he have some (quote) "ambition" and that he have some goals. And you get somebody who has been clawed at on the subject of "You've got to have goals, you've got to have goals, you've got to have goals", and he finally just sits back sullenly and sets his heels and then eventually gets overwhelmed, so he starts giving you a bunch of goals that have nothing to do with his goals, but are – which are bought goals, you know. They're just foisted off on him.

Now, sorry to go astray on you about ethnology, but it happens to be a hobby of mine. And you get a condition here whereby the individual feels that if he voices any of his own goals or own opinions, he's going to get slapped down. Now, the various responses he could give, you see, was as he worsened in this condition, he could get to a point where he wouldn't
give you any at all, you see. He'd give you no goals at all. You ask him for a goal, and he
doesn't tell you anything. He doesn't even think of anything. You understand? He's just numb.

Now, this can go down – and as I was talking yesterday on the business of pretended
knowingness – well, there's a pretended goalingness. [laughter] And he'll sit there and pretend
to have goals just to satisfy you, you see. It's kind of a delusory state, you know and he does-

In other words, you could apparently be dragging goals off of a person who in all hon-
esty thought he was giving you his goals. And all he was doing was handing them out of a
little goals package over here that was laid in by Mama a few trillennia ago, you see. And he
just keeps giving you these things and keeps giving you these things and they aren't his goals.
You got the idea?

Well, there are various conditions could exist here. Let's review these conditions again
just for succinctness.

There could be the condition where the individual is just knocked in the head on the
subject of goals. He feels he'd just better not give you any because it's just going to be invali-
dated anyway. Now, when you actually do then start to erase this fellow's goals, he feels this
is true. You start erasing the goal that he just gave you, and he says, "You see, see, the audi-
tor's making nothing of my goals." So this confirms it, so then he's much slower in giving you
his next goal. All right. Let's – there's that case.

Now, there's the case that will just dream up goals to please you. It's just a delusory
sort of a – of a package. And then there is the case – different than that – of the person who is
giving you somebody else's goals in whose valence they are in which somehow or another fits
on their own valence chain and naturally they would tend to marry or associate with people
who were on their own valence chains. And they'll sit there and give you somebody else's
goals by the package.

So knowing these various conditions about goals, you could speed up a Goals As-

Now, we're getting awfully – we're getting awfully adroit here to do this sort of thing. I
wouldn't really frown at you if you weren't able to untangle somebody's difficulties in this
particular direction, but you could hit at it and you could knife around on it. And you could
take these three classes which I just gave you and you could ask questions such as this:

You could say, "Well, if you did give me a goal, would I just invalidate you?" And if
you got a very deep fall on this sort of thing, of course you've got an ARC break going on the
subject of goals and you should do something to clear that up. You're not trying to erase the
goals. You're just trying to find out which one will hang fire. It's quite a little bit different,
you see. So you could handle that.
Now, there would be the – another condition here. And this condition would be a simple condition of individuals trying to please you. And you could ask – this guy's very glib, you know. He says, "Well, what I want to be is a carpenter, I want to be a bricklayer, I want to be this, I want to be that and I once wanted to be a singer. And I want to do this. And I want to do that." And so on and so on and so on. And he just goes on and he gives you goals and it all seems to be automatic and he runs on and on and on and on and on. Well, after a while you suddenly wake up to the fact that he gives you these things and there's no charge on them. What is happening here? Well, if there's no charge hardly on the list at all, we can assume then probably that the individual's just dreaming them up. Just – so on. So you can ask him a question something on this order and search this thing out real well. And some condition of this character, I think I'd ask the person, "What would happen if I asked you for a goal and you didn't give me one?"

You know, this would disturb the needle quite considerably if that were the condition the person was in, you see? "Well, I don't know", and so on, and he'd get into the idea of having to please you and so forth, and you could straighten this out with the pc, you see. Two-way comm sort of a thing.

And then the next thing that you could do about this sort of thing is somebody else's goals. Well, it's right here in this lifetime and you have already seen me -. Well, the class at large hasn't seen this particular one. Well, we just had a couple of students here that – it was rather remarkable. We didn't get anyplace on this girl at all, until I asked for her husband's goals. And, boy, they just came out brrrrrr and she even misread it at first, you know. She read it "goals for her husband", I think it was being run at and we got that shifted back to where it should have been which was "her husband's goals." That was what we wanted to know. And boy, she just ran like a canary bird on her husband's goals. I mean, marvelous. Didn't have any goals of her own, apparently. Had her husband's goals. Had some goals for her husband, but was giving her husband's goals as the response, don't you see.

Well, I'd be awfully tempted if I ran into that particular one myself to get awfully clever about the whole thing and say, "All right. This is a girl who runs on a man's goals. Obviously in her husband's valence. In her husband's valence that solidly, the terminal chain must be a man that looks remarkably like the husband."

And I'd be likely to get a falling Terminal Assessment right at that moment. You know, just shortcut the whole thing and then check it back for the goal. Well, I'm not teaching you how to do this particularly. I'm just saying how I would – might go about shortening up some of these things. Very circuitous. I would find out that this person ran off brrrrrrt on goals for husband and didn't run off brrrt on goals for self. Didn't have any.

Then we must assume that the husband has stolen the wife's valence or the wife is, you see, in some kind of a state of "in the husband's valence" or there's something going on here which is not routine nor ordinary. That is not very usual. Everybody gets in a little bit in somebody else's valences. They get mixed up in valences.

You get a southern girl in class here and Suzie starts to drawl. I mean it's – this kind of thing. That hasn't anything to do with it. I'm talking about this person actually doesn't have
any goals of their own but just runs on another person's goals. As though they were their own goals.

Now, I'd sort that out. I'd immediately suspect that that other person was on the terminal chain of the pc. And I would start finding out what this other person was in an effort to blow the person.

And I would do a Terminals Assessment "on that husband" or "on that wife" or something like this, see, or "on that father or mother". I'd just do a Terminals Assessment. I don't care how long it took me to do a Terminals Assessment. I would just go on and on and on and on and all of a sudden you would find that terminal would blow free. And then we would go back on a Goals Assessment again, we'd probably find out it would match up with one of those terminals. We very likely could get a terminal hanging fire though before we got the goal, don't you see – just an entrance on such a thing.

You have to find out what the pc's doing. That's the golden rule of auditing. What's the pc's mind doing? Now, those are a lot of particularities and a lot of mechanical approaches and so forth. And I'll give you a much better answer now. Of course, the person is not-knowing their goals like crazy. The person is not-knowing their goals, you see. You ask for a goals list and you get a bunch of not-knows. You say goal, pc thinks not-know.

Anybody who sat there and every time I asked them, "Do you have another goal?" and they said, "Well, now let me see, I don't know." I would certainly take it that they were running a not-know on goals if they did this consistently and continually and so forth. Then I would suspect that the person ought to have a lot of goals that shouldn't be known and the – there're all kinds of variations once you understand this principle. You could just have a picnic with it.

And on a Goals Assessment, if you understand the exact principle, how they're not-knowing the goals, you know. You ask them for various kinds of goals that would blow these things out. You're already doing it – secret goals, withheld goals and all that sort of thing. But there are lots of ways of doing this. You shouldn't shorten your scope of action. There are tremendous numbers of ways of doing this.

You could say, "Now, have you ever thought you would like to do anything which wouldn't be generally accepted socially?", you know? Not "Do you have a withheld goal?", but "Now, have you ever thought of doing anything after that you did it you would have to carefully cover up your tracks?" That's another way of asking for a withheld goal. "Now, is – do you – have you ever had any goal that other people sure as the dickens better not find out about?" "Have you ever had a goal to make people stupid?" "Have you ever had a goal to not know?", you know? "Have you ever had a goal to make other people not know?" "What varieties and versions of not-knowingness or forgettingness would you have me put down here on this goals list as your goals?" This can get pretty crude, you see?

"Now, let's see, what goals do you have with regard to stupidity?" Interesting question. "What goals do you have with regard to escaping knowledge of?" "Are there any subjects – are there any subjects which exist as academic or scholastic subjects which you would rather not have any understanding or knowledge of, of any kind whatsoever?" And you all of a sudden may hit the jackpot, don't you see?
The person says, "Well, hardly any. There's just algebra, geometry, physics, chemistry, reading, writing, arithmetic, geography, uh –." Then you might ask somebody, "Did you ever know anybody who had the motto of 'know thyself'?", "Who was that?", "Who didn't think you'd succeed very well in life?" Oh! "Who didn't? Who was that now? All right, now. What goal did that person have for you? Now, what goals did you have before that person started talking about it?" And all of a sudden you'll get a very fast – much faster moving goals list.

"When you were a child did you – in this lifetime, did you attend a specialized school of any kind which was fitting you or readying you for having fits in some profession?"

"Oh, well, yes, I went to military school from the time I was eight until the time I was nineteen."

"Well, how have you never mentioned this before?"

"Well, as a matter of fact, I've just been trying to forget the whole thing."

"Well, what is the goal of this particular school?"

"Well, I was supposed to become an officer."

"Ah – an officer of what?"

"Well, I just never got along very well – that has nothing to do with it. I never had any goals in that particular sphere, so we'll just skip that."

"Well, yeah, all right. We'll just skip it. Now, getting back to this military school, what were they fitting you for, to do particularly? What subjects were you seeking to avoid in this particular institution of learning?"

And the person says, "Artillery. I just always flunk artillery. If I could – I had a goal in that school all right. And that was to get out of those artillery classes! Ha-ha-ha. Yeah. I did have a goal. Yep. That's right. I had a goal. Yeah. Yeah. I had a goal to get out of all the artillery classes. That's right."

You say, "Well, that's fine."

The needle fell off the pin along about this time, you see. Well, it might be just a cognition surge so explore it further and further and you say, "Well, artillery. Have you been resisting becoming an Artillery Officer or something of the sort like that?"

"Oh, well, if you look at it that way. Yes, I suppose, could say so. Yes. Yes."

"Well, did you ever have a goal to become one?"

"No. Never. Never. Never! I've never had a goal to become an Artillery Officer! [pounding the table while speaking] No time have I ever had a goal to be – . I wouldn't even think of it! That's it! There's no reason to ask me anymore because I just tell you, that's it. That is a closed book!" Now, you can go on with your Goals Assessment if you like, but uh ...

[laughter]

What have you just hit there? You have run into a road barricade of magnitude on the subject of this person giving you any goals of any kind because somebody was trying to give them a goal and now they're reacting totally on the subject of having been given a goal that
they didn't want. They are now resisting giving anybody any goals that they do want and you could get a crisscross going here on the subject of goals.

But you have to loosen up your mind in doing a Goals Assessment on the potentialities of a person being beaten down on the subject of goals or the person beating other people down on the subject of goals, you see? And once you've loosened up your own mind on how many ways could a pc be boobytrapped into giving a slow, numerous, covert, inarticulate or any other type of a Goals Assessment. Once you've loosened yourself up on this thing, you can outguess him.

Oh, he sits there, and he says, "Oh, yes, I have goals. Yes, I had a goal to be a pitcher. And I had a goal to be uh – once upon a time I wanted to be a cricket umpire for some particular reason or other and yes, I wanted a goal to drive trains. I had a goal to be a politician. Wanted to be a painter, bricklayer, cat. I remember I wanted to be a cat one time, and yeah, lots of goals. Oh, yes, I can give you lots of goals." And, boy, they will too, you know.

You invalidate the pc, of course, by being too direct in questioning, but the temptation – "Well, now are any of these goals factual? Did you ever really want to be any of these things?"

"Now, if you hadn't – if you hadn't come up against it so heavily on this and that and being all these various things – well, just confidentially, what – what would you have been before they wanted you to be something else? What would you have been?", you see?

Ah, well, that's a different story and all of a sudden this mad tirade of pleasing the auditor slows down to nothing, you see. And the goals that don't fall, well, the pc just isn't giving you goals in some fashion. You're just not getting the pc's goals. That's all. Or every time you say "goal", the pc goes into a ridge. He can't have it. You can't have it. He can't have it and so forth. Because the needle phenomenon which Madge mentioned earlier would demonstrate the can't-have of course at once. Needle tightens up and that's it. You say goal and the person can't let you have goals, they themselves can't have goals. There's various approaches here. I mean I could just go on by the hour giving you various approaches to shake all this stuff loose, so forth.

There's another oblique approach, is the horrors of ambition. I imagine that would be very, very useful today with modern youth, because apparently one of the things you mustn't have is ambition. They've gone to a negation. You find this very broadly but factual. A person doesn't want to amount to anything. A no-beingness situation. So you might have a dissertation, "Well, what trouble would an ambitious person get into? If you made anything in life and you made a lot of things in life, who'd take it away from you?"

Just go the various – round and round on all the conditions of games conditions and processes of this character. Who stopped this fellow's goals? Who blunted them? Whose goals did this fellow stop? And how did he blunt them? And can we walk into the middle of this and with a que- a few quick flips of the wrist disentangle the whole ruddy knot and just to get the thing rolling?

There's where lack of the use of the principles I've just been talking with, or a lack of a broad, imaginative approach to the subject is what slows these things down. For instance, an
auditor who does a very fast Goals Assessment and an auditor who does a very slow one, there's a difference between these two auditors. It is not the difference of the pc. And one, the auditor who is getting a slow Goals Assessment will get slow on some people, fast on some people. In other words, he'll get the Goals Assessment at the exact rate that the pc he has at the moment is willing to have a Goals Assessment run, don't you see. He'll always get it at that rate.

And then you have the other auditor who beats the game, you see? Then he changes this rate by some adroit line of questioning. He smells something is wrong here and he goes in with a circuitous roundup and he decides he'd better fix this up. He asks the pc a dozen questions and he says, "Well, what would you like to have been in life?" and "Do you have any ambitions or goals of any kind?" And the person says, "Well." [sighs] Well, right there, you know. He'd say, "Well, what have we got to clean up here before we get a Goals Assessment?" You know, you hardly even ask any questions at all. You just see it written on the wall that this one is now going to run to some vast number of apathies. It's not going to be done by hours, it's going to be done by apathies. And we say to this – another person, we say – well to such a person, why, then we might say, "Well now, who didn't measure up to your expectations in life?"

"Oh, well, my son, my daughter, my wife, my mother, my father, my grandfather, my teachers, the postman, uh..." And he could almost do a Goals Assessment on this basis alone.

"Well, what should your mother have been?"

"Oh, well, that's different, now." I mean it gets real live, you know. "Well, she should have a this and a that and the other thing, and so on and so on and so on and so on."

"What's your father been?"

"Well, he should have been a this or that or the other thing and so on bom, bom, bom, bom."

"And what should your son have been?"

"Well, I kept telling him just time after time, I mean day after day after day for just – well I just wore myself out. I told him the only thing he could possibly amount to in life would be a plumber and he just never seems to have realized it and so forth. And he just goes on with this silly artist business all the time out in Chelsea and so on. But he would have made a good plumber and I just kept telling him and telling him and telling him", and he's got real interest, see.

You watch it. You just – it's all in the way you handle the cookie, how fast it crumbles.

You get this individual saying, "Well, I was a this and I was a that and I was the other thing and I had a goal to do this and that and the other thing and so on and so on and so on. You want any more?"

"Yes, I..."

"All right. And I..." [laughter]
I call that "pretended goalingness."

Yeah, there's a lot of – lot of different attitudes, but as long as you ... If you're trying to get a pc to do something or give you something or get something over the bumps, you've got to handle what's sitting in front of you. No system under the sun will handle it wholly for you. You yourself have got to do some observation.

The first and foremost rule in any processing is if you can just parallel – find out and parallel what the mind is doing – it goes \textit{phloof} and you take it apart in any of its difficulties.

Like psychosomatic illness. You could probably set up shop. We've had several things you could set up a shop with. You could probably put a great big shingle hanging out flying in the wind on security checking psychosomatic ill parts of the body. Just that. And you get adroit at this and you get practiced at this one way or the other. And you just hang your shingle out and say, "Spines adjusted, skulls..." [laughter] "skulls reformed, your beauty restored in twelve easy treatments." You could make it cook, too, if you worked at it straight way. You'd just do nothing but security checking.

"What skull do you think should be hidden?" you know?
"What zorch are you trying to hide?"
"What have you done to livers?"
"What have you done to a liver that nobody should know about?" "Oh, that."

Because in any – in any cluster of wrongness, you have a great deal of not-knowingness and therefore ignorant societies which uniformly specialize in wrongnesses up – in ignorance – wind up specializing in wrongnesses. I probably very often stand people's hair on end talking about religion and I'm – I can't really say with sincerity I'm sorry for it. But I will say this. I will say this. That any zone which is a zone of pretence – it's pretending to do one thing and it's actually dedicated to doing something entirely different and so forth – I'm afraid I'm liable to laugh at. Not necessarily attack it, but I've certainly reserved the right to laugh. Hope I never lose it.

All right. Well, one more question before we close this up. One more question. Yes?

\textit{Male voice: Is a Book One Clear a MEST Clear, Ron?}

Yes, very definitely.

\textit{Male voice: Thank you. And also, are the South African Clears MEST Clears?}

Yes.

\textit{Male voice: Thank you.}

There's only one person around in Los Angeles we're talking about as a Theta Clear at the present time whose status is in question with regard to this. It's quite goofy, you know. A theta beingness is actually very, very dominant and quite visible by the time you've made a MEST Clear, so people are apt to get quite confused about all this. And they also think a meter should sit there and never say anything after a person is Clear at all but it should sit there totally idly.
There's a point of clarification on this. If the person you've got on the meter is Clear, this condition will occur: That if the person isn't doing anything actively and knowingly – isn't doing anything, you're not going to have any needle reaction. It's going to sit there just square at Clear read and all is going to be well if the person isn't doing anything. Got the idea?

But they know they're doing something or not doing something. Now, you ask this person to do something, you're going to get needle disturbance and you're apt to get tone arm disturbance, too, because they can change the mass of the body and they do it rather easily.

Evidently, on one report on a South African case, you got an inch-wide theta bop or thereabouts every time the preclear moved in and out – or the Clear moved in and out of her body. Every time she moved out of her body or back into her body again, you got a big, wide, inch-wide theta bop.

Well, naturally – naturally, because the electrical phenomena of the body was being considerably disturbed and you got the reading of the thetan moving out and the thetan moving in.

Well, that is quite different than a not-knowingness condition whereby a theta bop, you know, where does that come from? You know? A person says, 'Well, I'm not quite sure where I am. I'm back of my body or I'm in my body, one or the other", and you're getting a theta bop. Well, that is not the reaction I'm talking about.

The reaction I'm talking about is you ask the person, "Well, are you in your body?"

And they say, "Yes. You want me to move out?"

And you get an inch-wide theta bop, see? And then it stops. And you say, "Okay. Well, move back in again." You get an inch-wide theta bop and then that stops. Got the idea?

In other words, it's – the difference of course, the key difference – is predictable behavior of the meter. Now, trying to clear up something on one of these people – because, of course, they're living in the MEST universe, you see? And a Clear walks out into an oddity here. He's perfectly cheerful. He's perfectly able to do things and he's able to get a show on the road and that sort of thing.

We've been so carefully sold on the idea of Buddhist serenity as a token of altitude and high state. A high state is a still state. And boy, that has been very far from the case in every single one of these Clears, you see?

They just depart wildly from this particular lineup because they go into motion and they – they go around doing things and tearing things, and they get impatient with things. And they go up and down the Tone Scale very volatilley and they're quite alive and everybody gets the idea: Clear, Buddha. Well, you see, he's supposed to be sitting there and legs crossed, naked, loin cloth, regarding his navel, you see. That's what he's supposed to be doing. If he's really Clear, he's sitting up there doing that, you know. A bright shade of yellow.

And instead of that, you find this person tearing around, straightening up this and straightening up that and doing this and getting very impatient running into a barrier, you see,
and saying *whoooooa*, barriers shouldn't be and *rhaa-rhaa-rhaa-raaah* and so on and then getting that done and fixed up, you see.

It doesn't present the same picture. It presents a picture of action. It presents a picture of effectiveness. Well, similarly, the E-Meter presents this same thing, but now the E-Meter is a problem when used anywhere in the vicinity of a Clear because as long as the Clear's sitting there doing nothing, you're going to get a perfectly idle, swinging arm, just you know, textbook and the person will be sitting on their sex' Clear read and everything will be just dandy. See this?

Now, they do something and you don't have that condition because they can very definitely disturb the masses of the body with the greatest of ease, don't you see and it goes flying off. But, of course, they know what they're doing and you know what they're doing, too. There's no mystery on your part as to what they're doing. They're not sitting there influencing the needle with a thought, you know. They're moving around. They're kicking the body in the back of the head, you know. And thinking big thoughts and mocking up a ridge and throwing it away and doing things like this and this all influences the meter, of course.

So when one of these people has a present time problem – and they can have present time problems – and you decide to audit this person on a present time problem, you are now going to have a picnic. Because one, you can't get the registry of the problem unless you're quicker than greased lightning.

You say, "Do you have a present time problem?" And as the needle coasts across the dial, you see. You have to notice this momentary little flick, you see, as it went by and you say "Well now, what problem is that?" And actually, you're trying to audit below the level of knowingness into the reactive area, you see, and they're responding simultaneously on the analytical level.

They say, "Yes, I have a present time problem. Yes, I know about the present time problem."

And you say, "Well, we'll try to isolate it a little better."

And they'll say, "Well, that's good. I'd like to inspect it and I'd like to confront it a little better."

And trying to isolate though what they're doing on the needle and get the needle to coordinate with the questions you're asking and the responses and what they're doing, of course is all haywire because the needle is – the E-Meter is totally rigged to respond on the reactive mind and doesn't register on the reactive mind. It just registers on electronic ridges and things of this character now which comprise, actually, what the body is built out of.

All right. What's the next thing then that we've got to have? Well, we've got to have a Clear meter, you see. We've got to have a meter that'll register this sort of thing and we've already had some despairing wails on this subject of people trying to audit Clears. Sounds funny, auditing a Clear, you see, but he's still got Theta Clear and still got OT to go, you know.
And we're trying to get a clue what they're doing, you know and trying to read a registry and it just doesn't read anymore. The sensitivity is all gone. The needle is floating clear across, back and forth across the dial and you ask for a withhold. "Do you have a withhold?"

Do you think offhand, if the person were Clear – the girl were Clear sitting here at 2.0 and you said, "Do you have a withhold?" that the person would move the tone arm maybe a tiny, little bit, but then move the needle a little bit. Now, that's what you're accustomed to and that isn't what a Clear does at all. The technical facts I'm giving you now are of observed material. You say, "Do you have a withhold?"

The Clear says, "Yes. Five."

You say, "What is it?"

And they say, "Well, I had an unkind thought about you last night, and it was so-and-so", and there it goes – Bang! Which is quite goofy, man. It clears up instantly on the whole read. It goes right back to where it was.

It wasn't there to begin with, don't you see. And it's only there as long as they didn't tell you. And then the second they tell you, it drops right straight back to the Clear read. Quite interesting. They're very easy to security check. But the meter can still be used on security checking a Clear. But it of course blows up for any practical purpose on auditing, and therefore we have got this other project of research well underway. As a matter of fact, more or less got it licked. I think it's quite amusing myself.

Of course, you get these ideas about what a Clear should be and they're actually based on what you have been told a Clear should be. And that basing is back at five, four, three B.C. Gautama Siddhartha rewritten. And naturally, the way you would pin down a whole race would be to take them out of motion so that they made the ideal, a person who was in no motion of any kind whatsoever. That was the ideal. And now if somebody was going to feel good and be able and so on, you naturally would have to take him out of the category that absolutely mauled a complete race, see?

Psychologist today is cooperating in this. Don't think that this is a stray datum that only a person in the field of theosophy or something would know. It isn't. Psychology dramatizes this a hundred percent today. They even wrote in civil defense – their additions for civil defense. The only condition under which they're going to incarcerate somebody during a civil defense disaster is if the person is in motion. If they find a person going around trying to organize things, they are supposed to put him at once in an institution. I read this carefully. I got their definitions for it. I couldn't believe it.

In other words, if anybody's going to do anything about the disaster that just occurred at all, why he's by definition – not by any stretch of the imagination, you know, I mean not me making too much out of a definition.

"Well, yeah, yeah. Well, who's supposed to do something then?" you say.

"Well, the civil defense workers, you see and the government workers are supposed to do something."

And you say, "Well, what if they were all in the wrong building?"
"Oh, well, that's a chance you'd have to take."

Well, man, you can take that chance, but after this ruddy country's blown off the face of the Earth by atomic bombs, I can tell you the first thing that will be apparent, is that it has no government. Now, what are you going to do? Well, you depend on the civil defense workers. Ah ... [laughter]

Of course, I'm not now talking about a field I don't know anything about. I'm talking about a field I know a great deal about. And the only people – the only time some order comes out of chaos is with – some guys get together and decide to put it right. And they'll be the guys on the ground, not the guys with the badges, you see? They've had nothing to do with that. And this is any time anything works or works out and so forth. It's because the people are there who are trying to do something. And you get all of these areas where just the guys with the badges can operate and only the guy with the badge can operate and under no circumstances can anybody else operate and you have the present Arab situation.

You know, these Arabs who were driven out of Palestine and you know they're there yet. You know? They're just a mob. And they just won't do anything and they won't lift their finger and they're just in complete apathy and there's never been any recovery of that particular group of people. And they've evidently followed out some kind of a basis that if any one of them got up and said, "All right, the rest of you guys, now let's go out here and carve up a few acres, and let's raise some khatinkas", or whatever they raise, "and cabbages."

They apparently said, "Well, that man is being too active, you know. He's trying to do something." So doingness has been divorced from being Clear. I want to make that very, very, very clear there. It's a booby trap, see. That's the basic and primary booby trap of Buddhism. That's the basic – that if you're in good shape, you'll be sitting still. Mmm-mmm. If you're in good shape, you can sit still.

I used to upset people no end by going out and sitting under a tree. And they'd say, "Where's the book?", you know, "What are you going to do?"

And I'd say, "Nothing."

It'd drive them nuts, you know. Just sit there and do nothing for an hour or two. They'd go bezeeeh. How could you possibly do that? Well, a person wouldn't be able to do that.

At the same time, I'd get the same objections from a person, "You know, I think you're working too hard. You know. Don't you think you ought to take a rest? You know, you really ought to take a rest. I think you're working much too hard." Although you couldn't confront somebody being totally motionless, they at the same time couldn't confront.

But that's the basic tenet and one that we must be very careful of in Scientology that we don't give this thing much credence because apparently every Clear we have made to date has all of a sudden gotten busy and that is without exception. They've gotten busy. And they don't believe in being MEST.

They're very alive. And they get in people's hair. People get upset about them, you know? And they sometimes have opinions that are not true but they have them just because
they believe them. And they argue and they're not necessarily totally a hundred percent right every five minutes, you know? They make mistakes, you know? But boy they sure make them on a grand scale. One has to give them 100 for trying. But they're in motion and they do get things done. And a Homo sap alongside of a Clear looks like a snail crawling along the road, you know. That's the way he looks to a Clear, too, apparently. From their viewpoint, you know?

They say, "Why don't you people get moving?" You know. "What's the matter with you people?"

And "Moving? Well, we're just hurrying as fast as we can.", you see?

They don't believe it. Speed ratio has changed on them. Idea of what fast motion is has changed on them. Idea of what work is changed on them. Idea of what is worth doing has changed. You see, all these things have shifted and I'd make this very thorough, solid recommendation. That we take a look at the people who have been cleared and then we watch what they're doing to find out what a Clear does. That's – that's snidely put. I mean it's a very sound thing. Because it's out of the area of theory, you see. It's long been out of that area. But it's out of this area of theory. It's a fact. All right.

Now, there is something to be observed about it. And there are people who are Clear and if you put them on a meter as an auditor, you would see at once there was something drastically wrong with this person. They weren't reading on a meter. The arm was coasting around and you were trying to run processes on them and you weren't getting anyplace processing them and you couldn't get any meter reactions and they blew things by inspection and all kinds of things like this and that's the way they behave as a pc, which is about – be the most reliable test of a Clear.

Now watch what those people are doing. Watch how they react and take that as your index, rather than Book One. Just take that as your index. This is what a Clear does. Well, this is what a Clear is doing. What is a Clear doing? And of course, there are an awful lot of people totally sold on Buddhism that will suddenly decide having observed that, that this is not a desirable state. Because the person now doesn't go and sit on the temple steps, you know? There's this fellow down in the marts and businesses of life, you see. And saying, "Come on, get this show on the road, get that done. Let's do this." And "Let's go here. And I think it ought to look very nice and I've got some long term goals for this country – ", and so on. "And I think we ought to be getting at it in this particular line."

And then instead of sitting back at it like the usual fellow with the ideas is concerned, the person gets in and works three times as hard, you see, as anybody else involved in the project.

A Clear in Johannesburg wore out the whole staff. Everybody was utterly panting and their tongues out. This person was teaching about nine hours a day and auditing a pc or two and answering all of the organization's backlog of letters in her spare time.

And things work out right for these people, you see. Because they've got more velocity on the thing and their postulates stick harder and they have a very clear idea of where they're going. They have no held down fives telling them they ought to be doing something else.
But there is our best zone of information and at the present instant, we really aren't using it. I try to publish little scraps and stuff that come along, but I ought to get it more thoroughly done. Of course, I also have the idea I shouldn't invade their privacy or invalidate their states.

Okay? Well, that's enough. That's enough for now. That's enough. You've had it.

Okay. Good night.

Thank you.
QUESTION AND ANSWER PERIOD: GOALS ASSESSMENT, BEHAVIOR OF PC

A lecture given on 10 August 1961

Thank you.

Okay. This is the 10th of August 1961.

"If a pc dopes consistently throughout the Goals Assessment, not getting a lot together but running a list by repeater technique, does one keep on bringing him up to present time?" I should say not. "Or does one go on repeating goals because one is addressing the reactive rather than the analytical mind?" Very interesting. Probably requires an orientation on the – what you're doing. I probably ought to sit somebody down and take a piece of his goals list and show you how you run it. I mean that would be about the most satisfactory answer to this. Runs like this.

Pcs audit, whether they're asleep or awake, and you'd expect no response from a pc of any kind whatsoever while you were doing a Goals Assessment on the pc after you've gotten the goals. He doesn't have to say anything. Nothing in the Auditor's Code that says he has to say anything. There is no pc's code. You can tear that out of Book One. I didn't write it in the first place. Written by John W. "Astounding" Campbell [laughter], Jr. who, the older he gets the more astonishing he is. And so on.

There is no pc code. The pc doesn't have to behave. There is no behavior factor involved. And you ask this pc for some goals. Well, he's supposed to come up with some goals, and if he doesn't come up with some goals, you hit him or kick him or do something with him and make him come up with some goals. You understand?

Pc has no responsibility for the conduct of a session. That's it. And don't expect that a pc does have any responsibility for the conduct of a session because he doesn't. You're the auditor. You're supposed to know what you're doing. You're supposed to know what he's doing. So you get the session going and you get him to run some goals. And as soon as you get the goals on a list, you null them. Well, he doesn't have to say a thing. He just doesn't have to say a thing. I read them over about three times and they look like they're dying out and so forth. I read them about two more times and they're dead. Another goal, I read it about three times; it looks like it's getting tougher, I just skip it. Put it in as still there. Got the idea? Don't try to do anything else with that goal. It looks like it's going to stay, so I just let it stay. And I won't read a goal more than about five, six times anyhow. If it doesn't null in that long a period or that short a period and so forth, leave it. You're in no rush.
There is no anxiety about getting these goals erased. Actually, it's quite invalidative to the pc for you to be in an anxiety about it.

And I think basically, probably what you're trying to do in running goals, is you're probably trying to get rid of the goal rather than just inspect the goal. You expect the pc possibly to answer up or think about the goal or pay some attention to the goal while you are reading it. Any one of these things could be part of this same situation, you see. Or you're running the Goals assessment with the rudiments out, which is highly probable, or you don't pick up the ARC breaks during the session.

You know, there's something called interim rudiments. You know, pcs an get present time problems and things of that character while a session is in progress. And... you see an ARC break come up with a pc – well, let's not fool around, because I can tell you, absolutely guarantee, that a small flub on an auditor's part will blow up to become an ARC break within a half, to one and one-half hours. You may not see it at the time it happens. You may not see it explode but it will come up later. Oh, you didn't know that, huh. Ha-ha. I can see an ARC break in a session coming, oh, my God, ages before the pc blows up. I've listened to them over speaker systems and things like that, you know. And I look at my watch and I say, "Well, one-half hour to an explosion."

Well, the explosions actually aren't necessary. You get an ARC break and you don't handle it, or the pc gives you an origin or you don't handle it, or something goes wrong with your TRs and then it's not handled by some rudiments process, you see, and you can count on an explosion of some kind or another occurring sometime later, but it's the most interesting thing. I mean it will be half an hour to an hour and a half, and there it goes.

Well, see, there goes a TR or there goes a rudiment of some kind or another. And then we say, "Well, it didn't affect him and nothing happened to him", see. So we don't pay much attention to it, and then a half an hour to an hour and a half later, all of a sudden we get an explosion on some entirely disrelated and apparently quite different thing. Worth knowing, isn't it?

Now, the safe way to audit is to patch up the pc's ARC breaks whether they exist or not. Got that? Let's just make a rule. Patch them up whether they exist or not. And you all of a sudden won't have a pc going this far out. When you think that the pc looks restive because you have flubbed an acknowledgement or something like that, well, just go ahead and insist that you have, you see, and take the thing up. Get it? That's you, then, taking responsibility. Otherwise, the pc is forced into taking responsibility for the session. And of course, the moment he takes responsibility for the session, he goes out of session.

So that if you insist on your rudiments being in, you can make a frightful bore out of yourself and still be quite right, you know. The direction to err on the TRs is to insist that they are out, and the direction to err on the rudiments is to insist that they've got to be patched up. That's the direction to err. If you're going to make mistakes, make mistakes in that direction. You can become pitifully boring as an auditor, apparently. Somebody else listening to the session would say, "Oh, my God!" You know? "How horrible." You know, it's like this.

The pc says, "Well, uh, I did have a goal. Uh, yeah, I had a goal like that once. Uh, a goal to sell curtain rods."
And you say, "Okay." And he looks at you a little bit oddly. And you say, "Well now, do you know I acknowledged that?"

And he says, "Well, I uh, uh ..."

And you say, "Well, all right. Now what was that about curtain rods again?"

And he says, "Well, I think I had a goal once. I'm not quite sure, to have curtain rods – to sell curtain rods I think it was, and so forth."

And you say, "Well, all right. Sell curtain rods, all right. Sell curtain rods. That's good. All right. Good."

And he says, "What was that all about", you know? But he won't cause an upset.

Now, this will cause an upset. He says, "Well, I had a goal once to sell curtain rods."

And you say, "Good." And he looks at you kind of odd. And you say, "All right. What's another goal?", taking a goals list. Actually, you don't know and sometimes he doesn't know whether he's had an upset or not. But he might have thought that you didn't adequately acknowledge this goal "to have curtain rods", you see.

All right. Well, this is going to build up, and this is going to build up. There's a possibility that this will build up through the minutes, through the tens of minutes, and another little one hits, you see. And another little one hits. All of a sudden, on some disrelated subject, he suddenly has a present time problem about his car parking or something, you see. This has flown in, and before you have a chance to handle it, he insists that you didn't.

Well, the whole argument is based on this oddity about the mind: the things that go wrong are not things that are known. The known things don't go wrong. It's the unknowns. And if you're looking for the source of an ARC break, you must look for an unknown area. If you're looking for a breakdown of a session, you must look for something that both you and the pc have overlooked. You got that? If you want to waste time take up those things you already know about.

All right. I'll show you a very fast way here to patch up an ARC break of some kind or another. The pc says, "Well, I had a goal to sell curtain rods."

And you say, "Mm-hm."

And the pc says, "Did you get that?"

You say, "Mm-mm."

And the pc says, "Well, sell curtain rods, you know, sell curtain rods."

"All right."

Now, on the face of it – now, on the face of this situation – it appears that your lack of acknowledgement at that point upset the pc. This is the way it appears. And remember, this is a universe of appearances. And if all the appearances weren't somewhat fallacious, the universe wouldn't be here. See, there's little curves on these lines. So you assume at once that it wasn't that acknowledgement – yourself privately. You can pay token to the fact that well, you didn't acknowledge and weren't terribly enthused about this horrendous goal that was
going to wreck the whole universe about selling curtain rods. But you plunge at once on the basis of "Was there an earlier goal I didn't acknowledge? Was there an earlier one I didn't acknowledge?"

And he says, "Mmmmmmm ..." He'll always find one.

You get what I'm talking about? You give a cheery "aye-aye" to what he just said, and you think that's okay, and you do acknowledge, and you do handle that situation. And then you go back and handle the underpinning which might have caused this later upset.

You assume that any time a pc is upset, there's been an earlier upset he hasn't demonstrated. You got that? It's an unreasonable assumption perhaps, but you will always find that he will find it. It is an amazing mechanism. The pc has an ARC break about the fact that the window dropped. By all means, listen to the ARC break about the window dropping, but find the ARC break that happened earlier. And you'll always find the earlier one, and for some reason or other, it'll always blow out the window dropping. And that makes for awfully fast auditing. Terribly fast auditing.

An auditor who is continuously involved in patching up ARC breaks and patching up present time problems has just not been alert earlier in the session. You see that? Just hasn't been alert. That's all. The auditor is the doped-off one. He hasn't been alert.

The auditor who's continuously involved, and having to rerun rudiments and patch up those ARC breaks and patch up those present time problems that occur during the session, and that sort of thing, there were lots of them that went by that he didn't notice, and they finally culminated into an upset which interrupted the session.

You see what the mechanism really is here. It's those little first unknown upsets, the not-recognized, the not-seen upsets, which then build up into the visual ones. The hidden upset is what you're really looking for. So if you go and spend three-quarters of an hour now on running the ARC break about the window dropping or the lack of an acknowledgement or something like that, you're being utterly foolish because it hasn't anything to do with it. That was merely the one where it got so bad that the pc went out of session.

Well, where did he start out of session? Pcs never go at right angles out of session. It would have to be really horrendous to get a pc to go right angles out of session. They drift off at about an angle of about twenty degrees to the session line. You got the idea? They're a little bit out, and then a little time goes on, and they're a little bit out, and then there's a little bit more out, and then a little bit more out, a little bit more out, and a little bit more out, and all of a sudden it becomes noticeable. But they've been drifting out at a twenty degree divergence from the course of the session here for maybe a half an hour to an hour and a half, before they really went out. You got it?

Now, if this happens early in the session – you just start the session, the pc goes out at right angles, apparently – oh, well, it was your session yesterday, and you didn't pick it up. Got the idea?

This actually puts you in a rather comfortable frame of mind. It puts you as cause over the actual situation because you're not now in a bad condition of thinking that you consistently do things that are bad as an auditor that causes the pc to get this upset. And you can get
yourself pretty upset as an auditor, as a matter of fact, if you think that these things are actually what is upsetting the pc, you see. Because you are going along the line of attributing the cause of your upset as an auditor to the wrong target, see. You're saying, "Well, my auditing incompetence is demonstrated by the fact that I didn't prevent the window from dropping suddenly." You know? "I didn't protect this pc one way or the other." Well, the actuality is – is that the pc suddenly was that nervy and went out that suddenly, and so forth. Your incompetence as an auditor is actually demonstrated by not picking up the little ones. Those little departures from the course of session way back, you see.

It's quite interesting to take a pc – and you should actually run a pc this way once, severely, to get the point very well subjectively. But pc has an ARC break. Pc dopes off. Pc goes any which direction but being interested in own case and in the session. You know, pc does anything. Instantly assume there was something happened an hour and a half to a half an hour ago, or in the former session. You see? The second you see this "out of sessionness", you just make the assumption, true or not, that something went wrong yesterday or earlier in the session today. You got it? And you just go ahead and look for it. And take them all up, you see, one right after the other. Go down the line exhaustively. Find out which rudiment and which where and... "When I was auditing you yesterday, did you have a present time problem?" See, running rudiments for yesterday. "Did you have a present time problem while I was auditing you yesterday?"

"Well, no. No, not really."

"Did you have an ARC break with me yesterday?"

"Oh, no, no, no, no, no. Oh, no. I had no ARC break with you."

The needle drops. You say, "Well, what was the ARC break that you had with me yesterday?"

"Well, I thought actually that you began the session rather abruptly."

Well, boy, that is a session and a half ago, don't you see. Now, if you just, as an exercise and to give yourself a good reality on this thing, if you start picking up "out of sessionness", which includes dope-off, see – dope-off is just another variety of going out of session. Flying out of the chair, throwing down the cans, or walking out of the room, or doping off – these are all methods of retreat, aren't they? See, they're methods of "get out of here." So, if this situation existed as it went along the line, certainly something must have steered it there. Now, the pc did want auditing, and actually it takes a considerable volume of reasons why he shouldn't have it. It takes a lot to push him out. Got the idea?

Just as an exercise, go back and track it arduously, painfully, painstakingly. Lose all the auditing time you want to lose doing it. Cause another upset with the pc as far as you're concerned, 'cause you're doing it. But if it's causing an auditing upset with the pc, I'll clue you: It's there. There is an earlier one. There are several earlier ones. If the pc is now upset that you are looking for them, it is simply the fact that he is being restimulated by your looking for them. And his restimulation is what you're getting the argument over. Got it?

So if you want to be a real smooth auditor and have your pc always in session and always winning and always gaining, stop concentrating on trying to be so alert and so much on
the qui vive and so interested in the pc's case. Stop worrying about that. Worry about your mechanics. Make those things real good, and assume that every time your pc departs from session either subjectively by doping off, boiling off, going unconscious, retreating in that direction, or attacking you as the auditor, or actually blowing the session or starting to blow session, just assume immediately that you are looking at a chain of things that have no foundation in the incident which seemed to bring them out. You got that? Now, just assume that and then go look for the chain. And maybe it makes it very explicable to you here if I say don't fixate on the effect end of the line.

You see, the pc's going out of session, retreating subjectively or objectively, either way – if you treat that as cause of the upset, of course, you're going to lose because you are looking at the effect of something. Well, what is it the effect of? It is actually the effect of a concatenation. And the least you'll get off the thing is a lot of unkind thoughts on the part of the pc, you see. Your pc's been doing something. You know, pc's had some disagreements here, and there are some backflashes as you slide back down the line and look for this.

Give you a very – example. Pc throws down the cans. This is pretty extreme, see. Pc throws down the cans and says, "Well, there's just no sense in telling you one more time because you just aren't listening to me."

Well now, there's no reason why you should at this point assume that this is factual. The pc said it, yes. The pc has become aware of it, yes. But your assumption at this moment should be that there's a chain. And that is the golden datum: that you are looking at a chain. And if you try to treat it as anything but a chain, you are not at cause.

A crude sort of an approach which is factual and not usable but very crude would be, "What was the first time you tried to – you thought you had better get out of this session?" That isn't a usable statement, but it is a summation of what you're trying to do. And you say, "What's the first time you tried to get out of this session?" In the first place, it's too accusative, in the first place. It's too this, it's too that, but that's what you're really trying to do.

Pc throws down the cans. You say, "What was the first time you tried to get out of this session?" "Have you tried to get out of any earlier session?" "Have you thought you should not be in any earlier session with me?" That's what you're actually trying to do, you see. And boy, that needle will start wiggling. You'll just be amazed. You say, "Well now, you were sitting here. Everything was running along fine, and look-a-here, all these ARC breaks were occurring, and I didn't even notice it." And then that'll learn you that when the pc suddenly goes, you know, at you, something like that, pick it up, you know, pick it up right now. And you say, "Well, was something wrong with that acknowledgement? Was something wrong with that situation there, just now?"

And the pc says, "Oh, no." (You notice your needle drop.)

Right away, same rule applies. You noticed it, so there must be a hidden one. And you say, "Well, is there any earlier time you disagreed with one of my acknowledgements?"

"Oh, yes. No, no. No, no, no, no, no, except, uh ..." Got the idea?
So if you always treat it as a chain on any rudiment or TR breakdown... For instance, I'd be – if – about the fifth time that a pc, or the third time a pc came into session with me and had a present time problem, I would ask this pc some sort of questioning like this.

You know, you say, "Do you have a present time problem?" And this is about the fifth time that this pc has had a fall on this rudiment. Every time the pc comes into session here lately apparently he has a PT problem. Well, now the PT problem is this: that the pc is having PT problems.

Now, there's several things that can be adjudicated. Theoretically and casewise, you could adjudicate a lot of things from this. And you could actually trace the type of problem. You could actually scout down his chain, you could scout down his terminal, you could scout down his goal, just by "What kind of present time problem do you have?" don't you see? I mean there's a lot of technical nonsense and foofaraw that you could go into like this. You could make this very significant.

We're not talking about that type of significance now. We're just talking about the fact that this is the fifth time I've noticed this pc have a PT problem. So I assume immediately that this pc has consistently been audited with PT problems in restimulation. Pretty good, huh? I just assume. Well, all right. This is the fifth time he's had one with me. How often has he had one with auditors? "Have you ever been audited", then I will say, "when you had a PT problem?" Doesn't make any sense to him, so I say, "Well, have you ever been audited and you didn't think you ought to be having an auditing session?"

Boom! "Well, when was that? Good. When was that? Good. When was that? Good. When was that one? All right. Good. When was that one? Good. When was that one? Oh, oh, yes. That one. Yeah, that one. That one." There are only eight thousand times.

So the pc has gotten up to a point of actually being audited when he shouldn't be audited. And he gets present time problems... There's a curious mechanism I ought to talk to you about.

Do you know that you can make somebody think they have done something by punishing them? You know that mechanism? Well, you can make reverses on all mechanisms work. If there are any mental mechanisms, you can pull the effect of a pc's action on the pc and make him wonder if he hadn't caused. You got the idea?

Because it's truth, you know, that he is at such cause over these things that those causes usually exist. But supposing we took somebody and we shook him suddenly, surprised him half out of his wits, you see – a schoolboy – and said, "Well, we're giving you a note to your parents for not having been in school yesterday." And then would say, "No, no, don't answer back. No arguments on your part now. No." And don't give him any chance to as-is it, you see. And within a half an hour, he'll wonder where he was yesterday. You got the idea? The other one is so grooved – the cause-effect of the person is so grooved – that when you do something to him, he thinks the cause existed. In other words, you can just give him the effect and the cause is apparent.

So you can override this asking for yesterday's PT problem to a point of where he's absolutely convinced, you see, that he must have been causing things in yesterday's session that
he doesn't remember now, and it'll cause a mystery. You get the idea? So you have to kind of play it in between. You don't want this other phenomenon occurring too thoroughly. So be reasonable about it and don't overwhelm him. Don't do this in an overwhelming fashion. Do it in rather quiet fashion. Don't jump him too hard about this sort of thing.

For instance, "Oh, haw!" he says. Something like this.

And you say, "Well, didn't you think I got that acknowledgement?"

And he said, "No, I don't think you did."

And/or "Don't you think I got that origin?"

"No, I don't think you did."

And you say, "Well, now, what did you say again?" And he tells you, and you say, "Well, good."

And now if you leveled a long, bony finger at him and you said, "You realize that you have not originated once and had it arrive with me?" The wrong thing to do, you see. The pc actually would kind of have a sneaking notion that this was true. So you have to approach it with the other angle, and you say, "Now, as unlikely as it may seem, have you originated anything else that I mightn't have gotten?"

"Yes. Yes. Oh, no, no, no, no. Uh, yes. Yea-... No."

He'll be just racing over these things one right after the other, and he'll finally pick one out. Now, you say, "Well, is there an earlier one than that?"

"Well."

And all of a sudden we will usually run into one that is nicely, deeply buried. And it's not now a mystery. You see, you can kind of insist too hard that one existed and get him to actually believe that one might have existed but then not be able to find it, you see. And he'd be left in the mystery that there probably was one there, but he couldn't find it, you know. So you mustn't be too forthright. You mustn't be too harsh. I don't mean forthright. Go ahead. Be forthright. But don't be harsh about existing, you see.

"Now, there certainly was one, you know. Yes, there was one. There was one yesterday. I know there must have been one because today, you see, you are ARC breaky. And there – so there must have been one yesterday, and Ron says so", you see. [laughter] And that kind of an attitude, and the guy says, "Was there one yesterday? Well, there probably wasn't one yesterday. I don't know whether there was one yesterday or not. Huhuhuhuhu! If he says so, it must be true", and so forth, "and therefore, there must have been one yesterday."

So it takes a rather clever attitude on the auditor's part. It takes a mild attitude. You have to play this thing in the middle of the path, you see. "Could there have been one yesterday?" You know, it's that type of approach which you want. "Could there have been an earlier one? Is there any possibility that this might have been the case, huh?"

"No. Oh, except, uh ...", you see, and one will turn up. Get how you do this?

All right. Down go the cans. You say, "What's the matter?"
Pc says, "I shouldn't be here."

You handle that. "Why shouldn't you be here?" Handle it very briefly. And "Have you had an earlier feeling that you shouldn't have been here in this session?"

"That I shouldn't have been here. That's an odd thing. I always feel like that, you know."

And the pc starts tracing it back and he gets interested in this, and so forth, and may hit the first time he was ever audited. And just before the session, he said, "Well, maybe I shouldn't let somebody fool with my mind", or something like that. And always since that time his auditing has all been balling up on this one little early point. His distrust in auditors. This sort of thing will tend to come up one way or the other, and then – you have actually then handled the situation, and so your auditing will now be much faster.

So the answer to this question – I didn't mean to go on like this at this length, but the answer to this question is, if a pc is doping off, you might be expecting too much of the pc, or you might be expecting the pc to answer or you might be expecting something or other to happen. But factually, the pc has had some impulse to leave session. So you better find it out, and you better trace it back. And look for a chain. Don't look for an incident. So you get way, way back and you find out the first time Goals Assessment came up, that he was very leery of telling anybody any of his goals.

And you get back to what I was talking to you yesterday. There are lots of reasons why people don't want to give you goals because people just step on goals and, you know, all kinds of things, and people insist you have goals. So unless you clear up that sort of thing, you're bound and determined to have somebody boil off, out of session, long goals lists, you know. These various other manifestations all occur from the same thing: A pc – a person has some feeling like he shouldn't be there. And of course, that's "out of sessionness." "Shouldn't be there" – "out of sessionness." "Interested in own case, willing to talk to the auditor." That's your technical observation of the person being in session. So the person is in-session. He is interested in own case and willing to talk to the auditor. The person is not in-session, then there's a feeling he shouldn't be there.

There isn't a feeling that he shouldn't be interested in own case and shouldn't talk to the auditor. You know, these are not two sides of a coin. On one side of the coin is "interested in own case and willing to talk to the auditor." On the other side of the coin is this entirely different thing, which is "shouldn't be there." You get boil-off, dope-off, everything else. Something has happened to convince him he's in the wrong place. Only it might have been in earlier auditing sessions. It might have been with other auditors. It might go way on back, don't you see. It's a good thing to run them down. I don't care how much time you spend straightening out somebody or orienting somebody on the subject of auditing because it's all gain.

So you've asked me a question here – it's unsigned – but you've asked me a question here, which had an answer which you probably didn't suspect which is that all boil-off and all dope-off is blood brother to "walk out the door, throw down the cans, ARC break with the auditor." It's all blood brother, and it's "shouldn't be here", which is the reverse side of the coin of "interested in own case, willing to talk to the auditor." Come to think about it, we've
never defined "out of sessionness." And that is the definition of out of session. We define in-session, but define out of session and it might make your auditing much easier. The definition, of course, is "unwilling to be there." Simple as that.

Okay. Any other questions here today? ... Yes.

Male voice: Could you give us some hints about dealing with stuck and sticky needles in rudiments and elsewhere?

Dealing with stuck and sticky needles, rudiments and elsewhere.

Sticky needle means games condition. Person is in a state of denial, and so forth.

Needle stuck – person's stuck on the track. Always in a condition of "should be there-shouldn't be there", if we want to carry on the same thing we were talking about before. Only stuck on the track is a "should be there-shouldn't be there", all in the same breath. Why is he keeping it mocked up if he shouldn't be there? But nevertheless he shouldn't be there and he's keeping it mocked up because he should be there.

You could drive somebody stark, staring mad, you know, if there were a real, honest-to-goodness, observable emergency going on, such as a building being bombed, and telling him he ought to be inside rescuing the people, at the same time convince him that he had better be outside to take care of them when they're brought out. Well, you could go worse than this, and you should tell him the safest place is inside as long as he stays outside. [laughter] And a person would go kind of mad.

So a sticky needle is a sort of a "shouldn't be there-must be there" sort of a situation. And sticky needles are difficult to cure only to the degree that they betoken a certain amount of "out-of-sessionness." Just to that degree that the person is out of present time. It's not a very serious out of sessionness. It's just that the person is out of present time. He's listening to the arrows whistling on the walls of Acre, you see, and he should be listening to the auditor giving the next auditing command. And he gets distracted from what the auditor is doing and saying and to this degree – which goes on continuously in cases. There isn't anything you can do about that, except audit them. That's why you're auditing them. So you get a situation where the fellow's needle is badly stuck. He for sure would recover more slowly than if he were fully in-session. Don't you get the idea? So the more time you spend effectively in getting this individual in-session, the faster a sticky needle will loosen. Interesting? Actually, your effort to get him in-session gets him out of whatever he – where he's in on the track, you see. And it works very neatly.

I here s no worry about a sticky needle. So needles stick. So they loosen. It's when a needle is sticky and continues to be sticky and never loosensthat you start worrying. You never get a change of setting, and so forth, because it means there isn't much case gain going on here. A not-know type of Goals Assessment, you see – I mean a forgotten goals, goals that shouldn't be known ... And if you ask somebody, "Do you have any goals that shouldn't be generally known?" Cow-cow-cow-cow. You get a brand-new response on the thing. A type of goal of "Where would you like to be?" following this thing out. "Have you ever had any goals of being places? Have you ever had any goals of not being places?" And you can loosen up somebody's needle wham! wham! wham! wham! wham! wham! wham! See? Just run, "to be there-not to be
there" off as part and parcel of the Goals Assessment, and you'll get into some very interesting responses on a sticky needle.

Of course, if he's in a place he shouldn't be in then he doesn't have any havingness, is that right? And if he has no havingness, why then, of course, he's got a sticky needle and he's got lots of ridges, and so on.

If a person's needle was sticky on me – if I had a person whose needle was consistently sticky on me in an auditing session and I didn't seem to be able to do too much about it – I'm afraid I'd start plowing it to them on the subject of withholds, long duration present time problems, find those hidden standards and put them in the Security Check, and in doing a Goals Assessment, I would find "goals that had better not be known." You see, it's a whole class of goals that couldn't be accomplished if they were known. Do you realize that?

In the banking world – what do you think about the banking world? Supposing everybody knew the various goals of various financiers with regard to the swap and exchange of currencies, contracts, negotiable securities between here and Switzerland? Game would blow up in no time.

I'll tell you a symptom of that, by the way, that you might find quite amusing. Did you know that twenty-four hours before there is a change in the bank rate that you cannot get a call through to Switzerland? And that the telephone company always knows when there's going to be a change in the bank rate and the Exchequer is going to make an announcement, because twenty-four hours before they can't have a line to Switzerland. It's all jammed. It's jammed totally, straight across. And they say, "Well, there's going to be a change in the bank rate." [laughter] "Somebody's pals have been let in on it", you know. "Here we go." Interesting, huh?

So here's a whole bunch of hidden goals, you see, that would be knowingly hidden goals, you know, which these very fellows would tell you, "Well, it's the most practical thing in the world", you know. "What do you mean? That isn't reprehensible in any way. We wouldn't make any money if these weren't hidden. The goal is to sell so many securities before the thing falls, and if we let it out that we were going to sell the securities before we sold the securities, cow! Well, of course, this would wreck the whole lot, and our goal would be ruined, so therefore we must be very secretive about this whole object and our objectives and so forth."

Well, you, I imagine, find very many government-hired slaves – I mean scientists. The slave brains they call them these days. I imagine those boys are very difficult to audit. It's not whether or not they've got withholds of secret materials. It's what goals are they withholding that the government has. You see, what goals of the government are they part and parcel of that must not be known. And you take such a case and it'll go bang, bang, bang, bang. You ask them "What goals shouldn't be known?" Oh, man, they are legion. Well, naturally, a pc not in that dramatic atmosphere is going to have a similar difficulty. Goals that shouldn't be known. And then goals not to be there and goals to be there. Yeah, what kind of goals are those? Let's shake them down. And you will find, I think, that needle start loosening up like mad, very rapidly.
They've had a goal to be in school. They've had a goal not to be in school. They'll usually be flip-flops, you see. They've had a goal to go to southern France, and they've had a goal to stay in England. And they've had a goal to live in a big house, and they've had a goal to continue to live in the house they're in. And they've had a goal not to live in a big house, and they've had a goal not to live in the house they're in. And you watch these things. And they'll just be on both sides of the card. It's a deck of playing cards with kings and queens and aces, and so forth, printed on both sides. You can't turn these cards over without finding the same card on the other side, you see.

You say, "Have you had a goal to do anything?" Well, yes, they've had a goal to do that, and they've also had the goal not to do that. And it is just repetitive. You say, "Have you ever had a goal to own a boat?" "Yes, I've had a goal to own a boat." And they have also had a goal not to own a boat. And they will almost invariably add gratuitously, the negative goal. It occurs to them immediately afterwards, you see. So your plus and minus goals and, of course, your plus and minus locations – goals with regard to locations – are particularly pregnant with susceptibility. And you could move that sticky needle.

Routine 3, as you might have suspected, is your beefiest process. It is the strongest of all these processes. And the only thing that gets in the road of Routine 3 is a person isn't enough in-session to be assessed. That's the only thing that gets in the road of that. That's what we've been trying to solve, one way or the other.

But that is a sort of a self-defeating mechanism because this other thing is true. This other thing is gruesomely true: that the pc is in a valence which is denying help and everything else to the pc, and to whom the pc is denying help. And the computation is if the pc gets well, the valence will be helped. And, of course, the pc is going to stay as sick as he can get to make the valence sick. You got the idea?

So anything that is not directed immediately to the goal and the valence connected with this situation, is to a marked degree lost time. The isolation of that terminal isolates the biggest games condition the pc has. And up to that time, you are to a marked degree only auditing a terminal alien to the pc's better being. You see that? Until that terminal is isolated, nothing much is going to happen.

Now, I know how to scare such terminals into view more rapidly. I know how to do faster Goals Assessments, but your first law on that would be progress, and progress is measured by the change of meter. And if you're not getting any change of meter as you do an assessment, you must assume there is something real weird going on here which inhibits this thing from changing and that there's something very wrong with being assessed for goals. Goals must be not-known. You must assume that there's a great deal of mystery of location and whereabouts and other things of this character on this case. And you'll just go to the root of these things because as I say it is self-defeating because these things only are useful to the degree that they advance a Goals Assessment for the location of the eventual terminal of the pc. You follow that?

So you do anything in your power to get a goals assessment running well and smoothly. And there's a couple of mechanisms – I've already given you one of them, which is not-known goals; goals that are not known, goals that they've forgotten. "What goals have you
forgotten? What goals have you forgotten?" "What goals shouldn’t be known?" Any not-know – postulates one and three in order of line. First not – Native State, Not-Know, Know, Forget, Remember – postulates one and three. You work those things over one way or the other on the subject of goals backwards and forwards; on the subject of terminals, backwards and forwards.

And let me give you the other one here which is, I just said, terminals. Not-known terminals. When you're doing – finally get up to a person's Terminal Assessment, and so on, you can run "unknown people", "not-known people." "Who would you care not to know?" Interesting question, isn't it?

You could probably use variations of that to do a different type of clearing. Which is to say, you theoretically could blow all the valences the case was mixed up with by running nothing but generalities on beingnesses and terminals, don't you see? But that's only theoretical. And it's never been done. And the other is successful, so we'll let the other one ride until it gets up into an area of good practice where we know where it is. "Who would you rather not know?" "What sort of being shouldn't be known by anyone?" "Is there any being on the track that you regret you knew?" This type of interrogation would, of course, shake up the valence in which the pc was locked up. So remember there's that type of approach, completely aside from this assessment type of approach. Two different ways to go about the same breed of cat.

What you're trying to do is get the person's valence out into view because the person is at war with this valence, and this valence is the solution to a problem that the pc has never been able to confront. Right?

So anyway, any which, any way you work it out, you'll win as long as you can get the pc to sit still. The best way to keep a pc sitting still is to pick up all of his ARC breaks and so forth, and don't keep courting disaster on the thing. Anytime, by the way, you have a tumultuous pc, don't keep blaming it on the pc because it's ARC breaks, rudiments out earlier than the time they're occurring.

If you wanted to really set a pc up for auditing ... Let's say you were in San Diego and the pc came walking in, and they'd been audited by this one or that one down through the years, and so on, and they came in and the case didn't appear to be in very bad shape, and everything was going along fine. And you actually wanted to do the best possible thing for this pc. It would be to cover rudiments of all sessions the pc has ever had, including the time period before they decided to have their first session. Just – in other words, just set it up and go about it arduously on down the line.

Now, what gets in the road is the pc isn't going to sit still for all this. They're going to consider it a waste of time. It is a slow freight. There's all sorts of arguments of it. And your own impatience and anxiety to get the show on the road doesn't get you to set the case up so that it can be audited, and so mistakes can be made. And you very often – in the largest majority of cases you get away with it. So you can keep on doing it. But if you were just arduously to take the case and set it up on every rudiment for every session and every auditor and every session they have given – "Have you ever given a session while you had a present time problem?" You know? You get the idea? "When was that?" you know.
And just take all the rudiments and set them all up on the subject of auditing from the first instance, and spend fifty hours at it, clearing would be a hundred hours earlier. You see what I mean? You could speed it up by apparently taking a lot of time.

And anybody who had—who was making no gain or no progress, who had had auditing before, I would suspect there was something wrong with the auditing, and try to trace all this back and find out if there wasn't a hangfire or a failed help or find something else. You know, just look over this auditing. Let's set up this case. Let's look over the whole zone and area, and don't keep auditing at one little target when you've got all of life for a target as far as this pc is concerned.

Of course, we know the fast way to get about it. The fast way to do it is set the pc up so the pc will stay in-session so that you can do a good assessment on the pc for goals, get the goals—find the one goal that hangs up or, lucky you would be, no goal hangs up; they just go Clear. You see, that's possible, too, you know. If they just went Clear on goals, you've had it. You never get a chance to do a Terminal Assessment. [laughter]

But get the goal and then get terminals for that particular goal, and then give it some runs and flatten that, and do another assessment. Let's check over that goal and find out if it's flat. Maybe get another terminal for the same goal, or get a new goal. And they just keep on running, and they will go Clear. That's it. That is the way to clear them. There is no other known operation at this time, which auditors can and will do to clear people. That one will. But setting a person up for that and straightening them out and making them handle a great many things, getting all kinds of things out of the road in order to set a person up for the assessment, of course, is of interest, too. But the pc isn't much interested in it, and that's what gets in your road.

The pc is sort of hauled away from his central goal of getting a Goals Assessment done. You've all had that happen to you already. You'd much rather be assessed for goals. Much rather find your goal, not necessarily be assessed for goals. Would much rather find your goal and find your terminal and that's it. And any preliminary step to that finds you very impatient. "Oh, no. You haven't got a fall on a present time problem again? Oh, good heavens. That means you're going to burn up here a half an hour or so handling this present... oh, for heaven's sakes", you know. The guy's got a present time problem right now in having to handle a present time problem, don't you see.

Good way to handle it, however, if the pc will sit still, is let's just trace all the times they were audited while they had present time problems. A present present time problem will probably blow up. Did they ever have this particular type of present time problem before is the best entrance point for that kind of a search. Well, that's an interesting question.

The fellow says, "Well, I have a terrible present time problem. I've just received a letter from my solicitor, and I have to come up with eight billion pounds or drachma or something by two o'clock yesterday, you know." An interesting way to handle it—it has probably never been mentioned to you before, but an interesting way to handle it is say:

"Well, have you ever had this type of problem before?"
"Oh, well, now that you mention it. Come to think about it, I never have any other type of problem." [laughter]

"Oh, is that so?" And it goes insensitive as far as the session is concerned. Cognition of this as a continuous state of being. All of a sudden, "Well, let's get down to this, see. Why? Why do I always have this kind of a present time ... Why me?", you know. "How come?" You see. And the immediate existence of that specific present time problem has now broadened out, and you've actually cut the props from underneath the present time problem. And even though it took you a half an hour or forty-five minutes or an hour to bring about that cognition, you are not then going to have to handle present time problems afterwards to amount to anything. When they come up, you just refer to the same modus operandi. They know that worked earlier. They rip it all up again, and there goes the present time problem, see? You can get around it that way.

ARC break. "Do you have an ARC break with me?"

"Oh, yes."

"All right. Is this the same type of ARC break? You had this same type of ARC break before?" Brrrrroot, see. Rip them up. Otherwise, you're just going to keep getting ARC breaks, see. ARC breaks, add to the chain. ARC breaks, add to the chain. ARC breaks, add to the chain. You get the idea? So you're going to handle a late engram. You're going to be running late engrams all the time, huh? Hey! You can't erase them. So your pc, of course, is making no progress in assessment.

There is no substitute for setting a pc up to be audited. No substitute for it. There is no fast road for it either beyond some of the tips I could give you about the fact that ARC breaks go in chains. PT problems go in chains. The difficulties with auditing rooms go in chains. And you can handle them as a chain. And then you are saving time. And you are doing a better job of it. Any rudiment can be handled as a chain. And if you handle it expertly as a chain, particularly if you find basic-basic on that chain, the whole chain will tear up.

See, ARC breaks are basically resting on overts. And if ARC breaks are resting on overts, then an unkind thought regarding Book One Scientology may very well be something that sat at the basis of the chain. The person hadn't even read it, see, had never even seen it. We had a case that was always getting ARC breaky in sessions, and so forth, and they actually traced back on the basic-basic of the thing of having made an unkind remark to his father about – . Well, they picked it up. They read a chapter too carelessly. They gave each other a five-minute auditing session, and then they agreed it didn't work. [laughter] And you know that postulate hung fire with that same person for about seven years? It wasn't picked up until about 58. And all of a sudden the case just started to make very good gains in processing, and so forth. But up to that time, I was having a hell of a time with it because they ARC broke all the time in sessions. See they had an overt against the thing that was now supposed to help them. Interesting.

We had a case that was always getting ARC breaky in sessions, and so forth, and they actually traced back on the basic-basic of the thing of having made an unkind remark to his father about – . Well, they picked it up. They read a chapter too carelessly. They gave each other a five-minute auditing session, and then they agreed it didn't work. [laughter] And you know that postulate hung fire with that same person for about seven years? It wasn't picked up until about 58. And all of a sudden the case just started to make very good gains in processing, and so forth. But up to that time, I was having a hell of a time with it because they ARC broke all the time in sessions. See they had an overt against the thing that was now supposed to help them. Interesting.

So handle your rudiments in chains and you'll get along a lot faster. Handle all of these things. And if the case is hanging up, why, suspect that there's a great deal of not-know about it. It's just as – if it would take you a long time to clear up a rudiment, suspect that there is a
not-know about this rudiment. The basic not-know about a rudiment is that it happened be-
fore. And the ARC break that exists is not the ARC break you are trying to handle but an ear-
lier ARC break. You see, that's a not-know. So there's a not-know hanging back there on the
chain. The chain won't therefore pull up and the later incident won't erase. So the pc remains
slightly out of session even though you have handled the (quote) (unquote) "the ARC break."

And then with the generality of a case not making progress under a Goals Assessment
or not giving their goals properly, again, assume that a not-knowingness exists someplace in
that zone. You don't know what the pc's responses to goals is. You don't know what the pc's
response is and you keep asking him for goals, well, what's his response based on? Does he
say to himself privately, "Oh, for Christ's sakes", each time before he gives you a goal? Does
he? See. You wouldn't be making progress, but you wouldn't know what it was. And the thing
would not be running and it would be hidden.

So you say, "Well, do you have another goal? Or did you have another childhood
goal?"

And he says to himself privately, "Oh, for Christ's sakes." And he says aloud to you,
"Well, to be a railroad engineer", you see.

Well, how far do you think this number of overts can continue without suddenly blow-
ing up one into a storm or at least stalling the case just to a dead stop. So any time you're not
making progress with a case for any reason at all – this is just auditing in general – assume
the case is out of session. Definition of out of session is "don't want to be there." Why not?
Must have overts if they're trying to leave. All these various other laws apply, don't you see.
So trace them down.

And when you're handling rudiments and you keep finding rudiments out, find the
chain. And if the pc is getting upset in a session or restive or something of that sort, assume
that something happened much earlier, and find it and blow it. And all of a sudden your audit-
ing will become a very, very smooth activity. Won't have many bumps to it. Be a delight.
You're in for a surprise before I end this off. You're in for a surprise.

If a pc has a number of ARC breaks scattered up and down the auditing chain – of ses-
sions, you see – and ARC breaks unhandled exist broadly on this chain, then you're going to
find out that a pc, in the session you are running, is getting an ARC break about every third
auditing command. You're just going to be staggered at the number of actual ARC breaks that
you can find on this pc in the session you are running, you see? That's something you want to
notice on a pc that's getting lots of ARC breaks. So pick 'em all up. Pick 'em all up, all the
way back. Take up the whole history of auditing on this pc if it's getting that rampant.

But you're going to be utterly amazed. You're going to find out the more ARC breaks
there have been on the auditing track, the more ARC breaks occur on the auditing track. It's
sort of like the more you eat, the more you got, you know. And it's unreasonable but factual.

The more PT problems you find on a pc, the more PT problems have existed on this
pc, and if this pc is also an auditor, you're also going to run into the auditing chain of auditing
while having a PT problem. You know, got an appointment at three o'clock and the pc is now
getting at a quarter of three, and... That last fifteen minutes is audited with a PT problem.
Well, it's not very destructive and it doesn't do very much, but these things will come off as you run the thing. Okay?

Well, I'll probably give you a lecture tomorrow.

*Female voice:* Good.

Okay?

*Audience:* Thank you.

As far as your Goals Assessment is concerned, I hope you're having a little better luck. Did goals assessing speed up on you using some of this material or didn't it? Hm? Or is it going the same speed as before?

*Female voice:* Well, as a pc it certainly speeded up.

Hm?

*Female's voice:* As a pc it certainly speeded up for me.

Hm. Have you noticed any difference as an auditor using "not-know" on goals? Have you?

*Female voice:* Mm-hm.

All right. But not too much difference. Now, you notice this then – notice this then – how fast it speeds up if you really handle these out-rudiments in chains. Then you just find out how rapidly this thing goes.

And the only other hint I would give you is, don't be so anxious to erase them. Just establish whether or not they're going to stay or going to go. And if they're going to go, throw them away, you know. Just run them down if they're going to go. You can tell. And if they're going to stay, why, find out in about three questions. You say, "That's still alive." Ask three times. It's gone. Don't expect the pc to say a thing back. Don't expect the pc to contribute one blasted thing to the actual rundown and erasure of goals. The pc can sit there like a stump on the log, and the E-Meter will still react. The pc doesn't have to say aye, yes or no or spit. Nothing, and it'll still react. It's very amazing. The pc doesn't even have to have his (quote) attention (unquote) on the goal you just read to have it react if it's still alive. Did you know that? Quite amazing, isn't it?

And don't be so anxious to rub them out, you know. Leave them there for a while. Let him have them for a little while, you know. [laughter] You'll find they disappear faster because you're not spending so much time on one goal. It's actually a faster way to get rid of goals. Okay?

All right. Thank you.

*Audience:* Thank you.

[Applause]

Thank you.
Thank you. Thank you. Of course, that was Mary Sue's applause. [laughter] Ah-ha. Whose applause was it?

Audience: Mary Sue's. Yours ...

All right. That's it. All right. 11 Aug. 11. [laughter]

The subject of today's lecture – well, one could say this in a sad voice, one could say this in a happy voice, almost any kind of a voice – is auditing. [laughter]

I think a lot of auditors are doing something besides audit. I think they're trying to press through in addition to auditing. I think they are trying to introduce some additional factor that will make auditing work. I think they are – are pressing hard. They're putting something else in sessions.

The exact tools with which you're working, if you will just sit back half asleep and administer them, will clear people. You actually don't even have to be very alert.

Now, I myself am responsible to some degree by saying the auditor is making the auditing work and that sort of thing. But probably this advice has occasionally gotten a different reception than was intended. Yes, the auditor ought to be on the ball, he ought to be alert, he ought to be there, but the auditor shouldn't have to be doing something else beside auditing. A certain impatience for result or a certain apathy about result causing a sort of a grind atmosphere, you know. These two things alike would speed up or slow down, apparently, auditing. That is to say if you were pressing in there all the time, you see, and you say, "Well, that process isn't working. I think I'll change it." You know, "It isn't – hasn't – I've – I've run it for ten minutes", you know, "and it hasn't worked, so I'll change it", merely is expressing your desire to help, you see. It's an anxiety, you know. It's an anxiety. Or, contrarywise, "Well, this probably won't work, but I'm supposed to run it", you know, that sort of thing. "And so I'll just sit here and grind away on it", you know. "Well, what girl haven't you ever known? Yeah." [laughter]

Well, the pressure or the withdrawal of the auditor from the session, the impatience of the auditor, the feeling that the auditor has that it ought to all be different or ought to all be faster, alike get in the road of a smooth rendition of Model Session and a smooth application of processes.

I've been a long time at this business. I gave a session last night (oh, to Mary Sue, she had a bit of a headache) and it was, by standards, of course, would have been – seemed to you – a rather sloppy session. I'm sure you would have thought of this, "sloppy session." It started
without rudiments and it ended without rudiments, but it was an assist. And it started with "Is it all right if I give you an assist?"

"Yes", she says.

So I explore around and find out what I'm trying to assist. And then I move around and try to find out why she feels bad and then I take the basic technology of Scientology and put a process together that answers this. And then this ran scram-bang into an engram. And I knew confounded well that the process I was running might run into an engram, but it darned well wouldn't move through an engram, don't you see. So I thought we'd better clean up this engram with practically the same auditing command, but let's put "not know" in it, you know. Let's find out what she's not-knowing in this engram and get the thing blown out of the way so we can smooth out the track and get her into PT. Otherwise, I had a vision of her being parked down the track some place at the end of session, don't you see. Blew her through that, returned to the original process, smoothed – see, flattened the interim process, returned to the original process, moved her up to present time. Headache was gone; everything was fine. Checked through some – just the important things: "Do you have an ARC break? Was there anything I did wrong in the session?" You know, that sort of thing. "Are you upset about anything? That's it. End of session." See, "Is it all right with you if I end the session? Now, is there anything you care to say?" You know. Boom! "End of session".

Oh, I don't know, it took twenty minutes, something on this order. In that twenty minutes, took a chronic headache (which had apparently been cutting in and out for a long time) and a heavy engram (which had apparently been there for quite a while) and got rid of both of them. At the same time got rid of a present time difficulty. Twenty minutes, auditing.

All right. But there was no – no doubt in my mind about what I was doing or what my intentions were or what I was doing. Which is to say, I was there to give the pc an assist, wrap it up as fast as possible, effectively; not with superpressure or doubt or withdrawal. I was just there to help the pc, so I went right ahead factually and helped the pc and that was it.

And as I was doing this, I had a bit of a cognition about some other auditors' auditing. I – I suddenly sort of exteriorized from what I was doing and took a look at it and made a comparison and was suddenly struck by the fact that my auditing was very matter of fact, basically because there is no doubt in my mind but what I could help the pc. There's no doubt in my mind about the effectiveness of the process I'm going to run and there's no doubt in mind about the fact that the process is working and there it is. The thing that summed it up is matter-of-factness. You know, there's just an inevitability, matter-of-fact relaxedness about the thing that I haven't seen in other people's auditing and I just thought I'd better make up my mind on it, because we've still got this – well, it's a factor that measures five to one. I get auditing results with considerable speed and I suddenly realized I don't get in the road of my own results. You see, you get what I mean?

Well, it's just a matter-of-fact application. I – I know that this person has a – has a headache and a difficulty, is having a present time problem and it all lumps together in some peculiar fashion, so I just go to find out what this is; and then I know the mechanics of the mind and what the mechanics of the mind add up to in terms of a psychosomatic illness. So we just start getting rid of this whole thing and sure enough, run right into the engram. So we
hit a secondary, so we're going to run into the engram and that blew a little grief charge. Secondary. Must be an engram there. Got the idea? Old Book One. So – boom! Well, let's plow out the engram. Well, what was the biggest difficulty we've had with engrams – well, people not-know – don't want engrams known. There's something they're trying to hide about the thing or something, or it wouldn't be that – held in that close. Well, run the thing out, get rid of that thing, bring her back up. Let's make sure the original process is flat. That's it, man. Just checking with the pc all the time. How is it? You know? And where are we going and so forth. But it was all very matter-of-fact. I think you'll agree with that, that was ...

*Female voice: Good session, got rid of my headache.*

Well, it was a good – good session, see, that was just nothing to it.

But I thought I'd better remark on this. Not holding myself up as a vast paragon of virtue, but I do get auditing results and I don't have any difficulty with auditing.

You could say well, it's my subject. No, not necessarily my subject. I've known witch doctors and – and I've known birds that were pretty clever in my day. Pretty clever at getting some kind of result, very clever at handling people and so forth. My hat's off to them. I know – I'm no only one at this particular business, but I just suddenly realized, well, there's – there's no doubt about what I'm doing in me, you see. It's all matter-of-fact because it's just matter-of-fact. This is – this is sort of inevitable, and it's all going to come out all right. I – just auditing by the rules of the game. I wasn't departing in any particular direction on the thing.

And also some more data turned up that the reason an auditor wasn't flattening processes was because the auditor was anxious to get the job done. So he didn't flatten a process because it wasn't getting the job done, don't you see. But then the process never had a chance to get the job done. You got the idea? Terrific impatience has entered into the thing. Therefore, sort of an anxiety is communicated. Therefore, the pc gets pulled out of session all the time, so therefore there's ARC breaks, so there's all kinds of upsets, you know.

And I've often wondered how I could get away with the things I get away with in auditing, because I have to caution you all the time not to do some of the things I do in auditing. I don't evaluate for a pc. But I sure tell him what I think, you know. If they're struggling around and floundering around and – and they're avoiding auditing commands or something like this, why I'll just level with them, you know; I say something like, "Come on, come on, come on, come on, come on, come on, come on, come on. You want to get rid of this or don't you?" You know.

And the pc says, "Oh, yes, I want to get rid of it."

"Well, let's get down to business. Come on now."

It's sort of an odd approach, but it's – it is quite real in that I don't artificialize the way I feel about the pc particularly. When I – when I'm giving a session that I consider a successful session or it's a very happy circumstance of one kind or another, I'm perfectly happy to give a session and so forth. As long as I keep it real. As long as I'm not on a big artificiality, and auditing sounds kind of artificial to me here and there when I hear it, you know. It sounds like the auditor's being very artificial about it. He's not really being very matter-of-fact about what he's doing. He – he's sort of being stilted madly, so his intention, of course, is not too
well defined. But even so, if he just sat there and did Model Session right according to the
rote without pressing it, you know, without being impatient about it and without pulling off
and just being exhausted about it – it he just was sort of matter-of-fact and did Model Session
and did the process he was supposed to do and the assessments he was supposed to do, I'll tell
you, the pcs would come out the other end feeling wonderful.

And I've looked in vain for any other bug factor in auditing now and I don't find any
bug factors in auditing. I just don't find any additional bugs that we might have overlooked
and so forth. I've been looking for this for a long time. I've been looking for maybe, oh, I don't
know, two or three years and I haven't found anything we've missed.

Since I put the Model Session together – I put the Model Session together last year,
actually, and put it together because I was perfectly convinced that it was time for an auditor
to memorize a session form, because we had a session form, you see. It had been on there and
it had been working for a long time. Well, let's standardize it and there'd be a lot of use in
standardizing it.

Basically, in my matter-of-fact session, I did not particularly depart from a Model Ses-
session form. I was running an assist, not a Model Session, but I was running the assist in Model
Session form. There was nothing strange there. You would have found all the words – all the
words and music would have been very familiar to you, but I think you would have found the
atmosphere different. That's what I think you would have found. The matter-of-factness of
which this thing was rolling off was ... I had to stand back and look at it myself. I said, "There
– there is a difference."

I actually was taught this many years ago by Ken and Steve and I found these guys
were listening to me audit to find out what I was doing that other people weren't doing and
they kept isolating factors and kept speeding up auditing; and the first of these was acknowl-
edgment. It had never been announced, you see. It had never been announced that you ever
acknowledged anybody and they discovered this as a fantastic discovery, that when a pc said
something, I answered them and that was a big, new thing. That was a fabulous discovery to
them.

So the only reason I bring this up and make this level of comparison is because they –
they were making such fabulous discoveries, and I suddenly awoke to the fact there was a lot
about auditing that hadn't been communicated and it's all been communicated so far as I'm
concerned now.

Now, an auditor who will sit there and turn in a good Model Session and run some-
thing that's real on a process, handle the exact pc that is in front of him, handle the exact run-
down, makes sure he flattens what he's running and so forth, within the realms of reality – oh,
man, he can't miss. I don't think he could miss. I think he'd just have to work day and night,
belong to the union, in order to miss. I can't understand how he'd miss. It's something to think
about.

But there is a difference which I have detected which might be of interest to you and
you might care to take that as a frame of mind.
Sit down, draw a long breath, relax, make up your mind you're trying to help the pc and then just go ahead and do so. Just go ahead and do so with no further nonsense about it, you see. Just run off your Model Session patter, but that's all just to assist you to help the pc, you see. And just go ahead and matter-of-factly help the pc and take care of what the pc's doing.

The pc's writhing around. You say, "What's – what's got into you, Mac?"

And the pc says – you say this because you want to know, you see, not because it's all written down someplace. And, "Oh, well, I've got this horrible pain in my umbekillus."

And, "When did that turn on?"

"Well ..."

"Did it turn on in the process we were running before this one? Oh, it did. Well, why didn't you tell me? All right. Here we go. I'm going to give you one more – two more commands of the process that we are now running and then we're going right back to the earlier one. Next time, sing out, man."

You know, just be effective at all times compared to what the case is. Don't be so hidebound that you won't do something.

You know, it's something on the order of walking a tightrope anyhow. The guy who walks tightropes best, of course, walks them and yawns at the middle of the tightrope and he's very familiar with tightropes and stands on his hands for a few minutes and finishes off and goes to the other end of the tightrope and he doesn't think anything about it.

Somebody else comes up and takes a look at the tightrope, and he says, "Uuuuuuuuuuuuhhh!" He'd fall 117 feet, point 5. He's worried about falling off the tightrope all the time. He's not worried about walking the tightrope. You got the idea?

And this is expressed I think, with this term matter-of-factness. It's just a matter-of-fact proposition. If you can turn in a sort of a matter-of-fact – nothing heroic about this sort of an auditing session, I think your pc would do an upsurge.

It isn't that you're doing badly or the cases are holding up or anything like that, but that addition by itself might speed it up for you. I'm only interested and have been interested all summer only in one thing: is just a faster result in the same unit of time with greater ease of auditing. That's all I've been interested in all this summer. I've had it taped since February. I've tried to clarify mistakes and bring people back on them again and I have taken the liberty of trying to set cases up a little bit better for assessment for you and so on; and find out if there's any great advantage to that, and so on. Feeling my way through here about what you can do with it. That's what I've been concentrated on.

Same time, we've made some interesting discoveries and rediscoveries. The practical application of "forget" and "not-know" are utterly fabulous. Turn back the clock to 1950. Any engram, any secondary you ran would have run on just "not-know". Any one of them would
have run from beginning to end on "not-know" and "forget" and, man, they would have run like startled deer.

You get this guy into this horrendous, cataclysmic, space opera God-'elp-us, you know and he's writhing around and so on and burning down cities and executing maidens and revolting against the captain; and all kinds of things going on in this particular engram. Well, we used to just agonize through it, and grind, grind, grind – grind, grind, grind, grind, and then grind, grind, grind. And then all of a sudden his perceptics, you know, would turn off and they would turn on, and we'd sweat to get these things on and we'd run him through it again, and so forth.

Well, I'm telling you it's very weird, but you could set a person down and you could run "not know" on an engram or "forget" on an engram in a command form which includes as many dynamics as necessary to resolve it. A command form must include dynamics. In other words, "not known", you could specialize it in, "Well, what would you rather not-know about this?", you see. Now, there's the first dynamic. "What would you rather your family would rather not know about this?" Or, "any children would rather not know about this?" you see. Or "What should be not known about this to children?" "What should children not know about this?" "What should be..." any kind of a way you want to use this thing, you see. "What should remain unknown about this incident to the public at large?", you see. "What should the government not know about it?", "What should your superiors not have known about your activities on planet Xerxes?" Bzzzzzzz! See, it's just all – occlusion just starts flying off in all directions.

Our enemy in 1950 was occlusion. We can say that the occlusion is selfmotivated in order to withhold; and that the hang-ups in any engram are from a desire to get these things unknown or on the third postulate, forgotten, or make somebody forget or use "forget" as an overt act. It'll be some combination of occlusion and you can play it directly. Play it instantly and directly.

You can ask somebody, "Now, if you forgot about that, who would really be messed up? Now, if you knew nothing about that whatsoever, would this – would this mean something else would happen someplace else?" You'd always get the answer, "Oh, yes." Forgetting is a sort of an overt act, you see.

And the forget and the withhold come together, and you've got the sum and substance of the reactive bank and the reactive bank is composed of engrams and secondaries, so if you use various versions of what we know now about not-knowing and what we know about forgetting, why of course, these component parts of the reactive bank known as engrams, secondaries, machines, anything else you want to say, will just start flying apart in all directions. Shades of 1950.

Wouldn't have mattered whether the fellow had sonic, visio or anything else. Man, he would have had sonic and visio on. The redbreeds' and the rebels' rifles alike would be knocking his eardrums in, don't you see, as he ran through the incident. Up to that time, it's all black and invisible, you know. "Well, I don't see anything here. You say there's some kind of an incident here, but I dza-za – don't see any incidents – dzaa-zza – eh incident. Yeah, I just had that one little flick. That one little flick there. You know, that picture of the corner of the
Tower. Just, ha-ha, that one picture of the corner of the Tower, and so forth. Yeah, and kind of the idea – kind of the idea that maybe I was beheaded at the Tower. Yeah, maybe, maybe; could have been, see. But of course now you're trying to force this incident off on me."

All of that's just occlusion – this unreality, this feeling of pretense, the feeling of... The pretension of knowing about it also blows on a not-know. This is, of course, the pretension of knowing about an incident – dub-in, in other words, simply blows up because that's another method of disguise. Boy, can you run incidents if you try that one. You ought to try that just for the hell of it to give yourself a good win somewhere along the line if you ever ran engrams. Just try it.

Just sit somebody down and say, "All right now. Go to the incident necessary to resolve your case", you know and they wind up *plank* in a prenatal or conception, sperm sequence or a beheading or planetary space opera or something of this sort. And now just run it on the basis that he is overtly not-knowing and forgetting various parts of it and just use any version of that command, or those commands, necessary to plow through it. And you'll find this thing going *boom, boom, thud, thud, boom, boom.*

All of this, of course, has as a prerequisite that the rudiments are in and that the individual is – is to some degree in-session, and therefore under the auditor's control so they will do what the auditor says. With those reservations, why, you really find the engrams flying.

Kind of fun running engrams and I don't know how much we've speeded up the run of an engram with this because I haven't made an actual measure, but I would say something on the order of about one-thousandth of the time. I mean it's a jump of that breadth. Take you about one-thousandth of the time to run an engram now.

Running engrams, by the way, should not be discounted in the benefit to the case because you're liable to do this. You're liable to clear somebody and you've got them more or less stabilized. This will be in the stabilization period which usually follows for three or four months. But they'll be Clear all right and the needle will be drifting around. Everything's fine and you'll have worked on them to stabilize them, and then they will defy you by all of a sudden being in an engram. See, here's an engram staring them in the face and so on, giving them symptoms of some kind or another.

Well, because they're Clear and able to take these things in their stride, it's not going to take very long to run this thing anyhow. It's going to take a very brief span of time to run it because they're Clear, don't you see – even if you ran through with old Dianetic techniques of 1950 and it'll blow up. But you want to clear up that particular thing. This guy has got – still got a piece of bank. All right. Clear up the bank. Bang!

We had a Clear down in South Africa had an appendectomy. They were going to rush her to the hospital. She was Clear. But the doctor said, "Oh, terrible. You have all the symptoms", so forth. She went around and saw the auditor. The auditor had a hell of a time because he couldn't read the E-Meter on it and gradually was able to read the E-Meter on it, cleaned up the incident, *zuuup-booop-zzzt, bong, thud, crash.* That was the end of the appendectomy.

But – so this tool is not – not to be despised at this time. It isn't just nostalgic value. You'll have something like this. During a stabilization period, while a person is coming out of
it and unsnarling track and that sort of thing after... they're as-ising – still as-ising things and so on, they'll still run into things, you see. Now, you've got to give them a hand as they come along and then all of a sudden it'll all blow Clear.

If you can run an incident with even greater speed than a Clear can run them, it's practically at a glance. You know, just – it's almost at a glance. A Clear running an engram runs them almost at a glance, you see.

"Well, it's so-and-so and so-and-so and so-and-so and so-and-so and so-and-so; and it's so-and-so and so-and-so-and-so and then I so-and-so; and then they said so-and-so. And oh, there's the overt. Oh, well, that's it." Bang, it's gone. [laughs]

Well, that's – that's fast enough. Now, supposing you said, "Well, what are you trying to not-know about that?" or "What not-knowingness about that would do somebody in?" or any kind of a phraseology you'd care to apply using the not-know as an overt, using it as just a straight occlusion, so forth, why, the missing piece of it that is holding it there would blow – [snaps fingers] just like that. It wouldn't be da-da-da-da-da-da,da-da-da-da-da-da,da-da-da-da-da-da. It'd just be da-da – [snaps fingers] da! See, a difference of speed is – would even be apparent there. So this is a trick you'd better latch onto. Latch onto.

You're going to use this trick and I hope you are using this trick with some success right now in handling your Goals Assessments and Terminals Assessments, and handling what you run into in terms of getting the pc set up so they will give you some goals. Now, there's probably the most valuable application. Pc goes on to 2,975 goals and so forth and you haven't got a goal out of the pc yet. Well, what is this? What is this? You know something's wrong with the pc's giving of goals. It's – something wrong there? Are these the pc's goals or is the pc trying to please you or something of the sort? There is something disconnected here and before it went out that long, you had certainly better introduce into a Goals Assessment another type of questioning.

When you start up a Goals Assessment, it just could be that you should set up a pc to having a Goals Assessment and you should keep the pc set up for Goals Assessments with some kind of an additive question of more or less this character: "What sort of a person would get in the road of somebody having goals?" "Has anybody ever got in the road of your goals?" See? And "What are you not-knowing about goals in general?" And "What goals don't you want known?"

Of course, now when we say, "What goals shouldn't be known?" we're over into assessment, because that's a legitimate assessment question. But "Who's gotten in the road of your goals?" "What sort of a person would get in the road of your goals?" "If I were sitting here trying to make nothing out of your goals, what would my name be?" This kind of an approach, you see. "If I were here trying to pound you and hammer you and order you to get something done in life, who would I be?" It's, in other words, clearing the auditor to get the auditor disassociated from the personnel who has stamped on the person's goals. You get the idea?

So it's another – another string to the bow on the clarification of the identity of the auditor. It's a more modern version of "Who would I have to be to audit you?" You know? "Who would I have to be to make – to raise hell with your goals?" "Who would I have to be
to actually make hash out of you on the subject of goals?" "To what person could you best tell your most secret ambitions?" This type of questioning, you see. "Who would you leave totally in the dark with regard to your –" [laughter] "with regard to your goals?" "Who would you leave in the dark with regard to your goals?" "Who had you better not tell them to, man?"

And you'll get some kind of an interrogation line like this going and all of a sudden the pc will sort of loosen up and disassociate you from the barricades of progress toward their own ambitions. Got the idea? Because let me tell you, one of the most prevalent neuroses afloat ...

If goals can stand in the road of Clear – obviously they do because if you straighten out a person on goals, they get Clear – been demonstrated time and time again. Well, then you'd look around the society and you wouldn't find very many Clears. Then you must assume... You see, you look around the society, pre-Scientology society, and you find out there weren't many Clears present – none – [laughter] so, that you must then assume that it must be a fairly prevalent neurosis, psychosis or "batosis" to knock in the head other people's goals and ambitions. You must assume that there must have been some people around who were anxious to do this, see, by assumption.

And therefore, if you were having trouble with a pc in getting his goals, you then – by no great mathematical computation – should assume that he as been up against such a person and so therefore, a bit deranged and unwilling to communicate on the subject of goals. Do you follow out the reasoning there? Very elementary reasoning.

So I think that should be taken care of thoroughly at the beginning before you start a Goals Assessment on a pc. Just beat this to death. This one I know you can beat to death because it'll have the pc's interest, see. And just – just take a flail to it, and a morning star and a broad sword and a mace and then beat it for a while, you see, with a sjambok, and in other words, just knock this around something fierce and hammer and pound it; and all of a sudden you're liable to get your pc with a big cognition on the idea, just using these basic mechanics I've been talking about.

"Oh, oh, yes, well, as a matter of fact, you do look a little bit like my father. He's an ugly son of a ..." [laughter] And then he'd have a big cognition. Big cognition. "You are not my father", you know. "You know, my father use – used to sit there, day in, day out and he'd say, 'When are you going to amount to something?'" [laughter] "And I remember I was working at the bakery and I was making sixty-five quid a month and I was doing all right and I was buying new clothes. And my father would sit there and he'd put the paper down in the evening and he would look at me and he would sigh deeply. And then he'd pick up the paper again." [laughs, laughter] "Yeah, I remember in the army, the officers always used to keep telling me that if I just had a little ambition I could make something out of myself and so forth. I remember, just like my grandfather used to do", you know.

And then, of course, there's – be all mechanisms with regard to goals. There'd be coercing a person to have a goal and trapping him because he did. There would be the mechanism of making sure that any goal a person came up with was promptly stamped on and wiped out of existence. There would be the mechanism of demanding that a person had other goals than the person has. The person comes up and says, "I would certainly like to take a
nice photograph of that landscape out there." And then the mechanism "Well, it would look much nicer if it were painted. Instead of photography, actually your interest ought to be in the subject of oil painting. Oil painting, yes. You should go in for oil painting. Not – not photography. No, not – well, much better, much better, oil painting."

Now, what the person, who was standing there who had been talking about the landscape and photographing it, does not latch onto at that moment, is the other person's simply dramatizing a squash of goals. It has nothing to do with anything but a squash and if the person examining it had said, "Oh, I would certainly love to make an oil painting of this particular landscape", the other person would, of course, said immediately, "You don't want to take up oil painting. You should take up photography." See? But this is being helpful. This is normally branded as being helpful. Constructive criticism. Man even has various labels for it one way or the other.

But then parentally, children almost never are recognized as individuals by the parents. They are recognized, if at all, as an extension of the ambitions of the parent. And they're just all over the place, parents are busily trying to do a life continuum on their ambitions, you know and they take this poor, little, skinny runt, you know – this little runt of a kid – and Papa, who was a fairly broad bruiser in his day, you see. He wanted to be a star of the football team or something like this and nothing will do but what this poor little runt, you see, he's gotta get out there on the football field and get half killed, you see. The old man just never seems to notice that there's some stone difference between the two, you see. Never seems to take this out, you know.

The kid has the mathematical genius of being able to add up always two and two and get three, six, nine – any number, just think of a number. Oh, yes, he's got to be a mathematician because the old man wanted to be a mathematician, you see. Life continuums of various kinds and it's odd how many people are walking around right now who actually fell for it, went ahead and executed it and are being moderately unsuccessful, successful, and so forth, in some walk of life.

Well, I tell you the armed services in any war can be utterly counted on to just dramatize this just flat out with shown teeth. Fellow walks up, he says, "What have you been doing?"

He says, "I'm a garage mechanic."

He says – and the navy will say to him inevitably and invariably, "Deck force." You know? Or, "What you really want to be is a signalman. How about cook's school?"

And he walks up and he says, "Well", he says, "I've been a merchant sailor and a deck sailor for the last fifteen years and here are all of my tickets and that sort of thing."

"Very good. The very, very man we want. You're a yeoman." Instant and immediate response. I mean it's almost berserk. And then they give tests that can be thrown any way you want to throw a test, called aptitude tests.

And I had a lot of fun one time. I took a bunch of these tests. It was very nice of the government to give me these tests. I spent all one day in some little town in Pennsylvania, where my records happened to be at the moment, taking aptitude tests to find out how I
should be rehabilitated as a disabled veteran. It was utterly fascinating. They finally woke up at the other end that I ought to be playing an organ. [laughter] I never found out whether it was the hand-crank variety or the pipe variety. [laughter] As a matter of fact, it – was – what was baffling to them is anytime they gave me a test I showed aptitude, you see. So they just took the one I didn't really want, and that was – that settled it. But I malign them. Because they were very pleasant after the war and training up veterans and that sort of thing.

But anyway, even these tests are about the cloudiest things for vocation you ever want to have anything to do with. You look them over sometime. You notice we don't use them. We have them. We've got tons of them. I've investigated most of them.

Only one test out of the commercial tests I was terribly interested in. I was fascinated with this particular test because it was an anonymous test that employees could make out with regard to the management and their own bosses and so forth and you gave this test out to a roomful of employees and then they marked down all their nasty, unkind thoughts, you see; about the management, and then they turned it in; and management then knew what their employees thought of them.

I thought it was an awfully interesting test in that it was rather pointless. Management that is unimaginative enough to know what employees are thinking about it anyhow, shouldn't be managing. Obvious what this score is. Well, anyway, that test was very good. As a matter of fact, I figured out a way for – for them to booby-trap it and I've been very carefully not telling any psychologist how to booby-trap this test.

Well, you make it out, you see and you have a form number, tiny printed Figures – form number, you see. You just number the chairs of the room [laughter] and you have this form number of the test which goes undetected as different, but it's the number of each chair, you see and the fellow turns it in, and then you know who to fire. [laughter] You fire the fellow who says the kind things, naturally, from the psychologist's point of view. That's why I haven't released it.

They are now running all kinds of lie detector tests on employees. We actually have really started one in the US. We are being copied like mad in the US – just copied like mad. It's marvelous. Start worrying when nobody copies you. Don't worry about all the things they're grabbing that are ours, see. Start worrying when they don't do it and we're sure leading the van because apparently every detective agency, every employment agency and every psychologist has suddenly set himself up with battery E-Meters. They are lousy E-Meters and they mean nothing. But he's set himself up with them and they're giving lie detector tests to everybody. And it's getting to be quite a – quite a scandal, so that even in Australia they are publishing articles about how to ruin your home. Just bring in one of these things, you see.

So these are the earmarks of success. There's no greater – the greatest praise with which the public at large is capable, of course, is damning you thoroughly and if you want even greater praise, have them lie about you. But that's about as high as they come up the line, because they – they move off of this point, you see – they move off of this point – onto copying, imitating, and the duplication gets a little closer and a little closer and a little closer; and all of a sudden, why, there it is. It's nothing off – nothing to be worried about when you see that sort of thing. Of course, your hair kind of stands on end when you first see this. But any-
way, everybody is now doing this and they are only hiring – as I mentioned, they are only hiring those people, you see, who get no reaction on the machine of any kind whatsoever; [laughs loudly] and if this trend, of course, is followed, every able person in the country will be out of work. [laughter] Interesting, isn't it?

Ah, well, they'll discover the error of their ways sooner or later and come around to the old stand and ...

They covertly get on our bulletin lines, which is quite interesting. We have all sorts of Joe Doakeses and Bill Smykes – Sykeses and things like that in our mailing lists and so on in order to get bulletins and memberships, and so on. And these turn out to be the most interesting people when you run them down. They turn out to be the head of MIT or something like this, you know and the ... We've suddenly started selling books in the United States to the most unlikely areas. The Army Infantry School has just now officially put in orders for many Scientology and Dianetic books. One invoice was sent to me – maybe there was just one at the moment, but there'll be more. Loyola University, by the way, uses *Dianetics: Modern Science of Mental Health* as a textbook – the Catholic University that teaches priests. Interesting, huh? Well, the American Psychiatric Association, the American Psychological Association spent rivers of money to get Loyola to study psychiatry and psychology. And after they succeeded in doing this and Loyola set up an actual department to do this, then the first book they ordered was *Dianetics: Modern Science of Mental Health*, which I thought was pretty good. They're doing a land-office business in book sales these days to unlikely areas. There's quite a few of them have come in lately.

*Female voice: American Tel. & Tel.*

*Mmm?*

*Female voice: American Tel. & Tel. have bought all of our books.*

Yeah. Yeah. They got them all.

So don't – don't worry about it. Dissemination goes out on a covert line when you're being successful broadly. It goes out on a covert, unlabeled, copyist line and then keep moving up and eventually they establish it. Because, of course, they'll – monkeying with this sort of thing, they'll get into so much trouble that they'll need help sooner or later. [laughter]

It's like two guys were found someplace or another who were auditing each other and they hadn't a clue. They had just heard it on a rumor line – this is back in 1950 – and they heard it on a rumor line, so they were auditing each other. And what they were doing – and somebody from 42 Aberdeen Road got ahold of them and spent all one night with them straightening them up, teaching them how to audit and went away and left them and never had another report on it.

But they were in plenty of trouble. They'd parked themselves all over the track and just messed themselves up gloriously. But they could be straightened out.

All right. Back on this other thing, the slam-bang attack that one's goals are up against, are not confined, of course, to an antagonistic personality. One himself has overts on the subject of other people's goals and you can straighten that out too, you see. One has run all kinds
of ambitions with regard to other people's ambitions. For instance, right now there's a tremendous ambition on the subject of Russia to covertly take over small nations, one after the other, or dominate their political scene, you see. Well, saying Russia shouldn't do this is actually invalidating Russia's goal to do this, don't you see. It's simple.

I've also watched with some amazement the United States getting itself whipped up to go into an atomic war. I think the deterrent factor has now been accepted by the public as the very best way to bruise off a war. The public attitude should now serve as a deterrent. Evidently, they've collectively sort of gotten the idea somehow or another that – that if the public is unwilling to go to war, therefore, they are not a deterrent. So all you have to say is you're willing to go to war and this is very deterrent, because Mr. Khrushchev counts totally on the decadent democracy – each war it's the decadent democracy, you know – the decadent democracy is not willing to engage in war, so therefore, of course, he can do what he pleases and apparently – this is all I read out of this. I don't read any war dangers to amount to anything or I'd be helping out the Washington organization to evacuate and so on, which I am not. Nothing's going to happen. It's just a deterrent. You're going to watch Khrushchev back down on this. He's going to back down fast and if that wins, you're going to have a nation of warmongers. They're going to say, "Look, we won." Of course, I will admit that it's mostly Texans that they've been interviewing. [laughter]

Anyway, on the subject of goals, the – there's an interplay of goals. And an individual who has countless, just countless overts on other people's goals – well, let's say a music critic. Let's take him as a profession. He comes and sits down in the auditing chair as – in the pc's chair and – and he's in an auditing session and his profession is a music critic and you start to do a Goals Assessment. Well, use your head, auditor. How many ambitions in the field of music do you suppose this boy has wrecked? Hm? So you could start in as well as finding out who has stopped the pc's goal lines – let's not go totally motivator about it – let's also find out a few of the goals that the pc has stopped, you know.

"What goals should be unknown?" Some broad question of this character.

"Other people's goals", he will say.

"Yes, yes. Well, which one should just be forgotten completely, you know, and just not known?"

Oh man, on some people, you'd get a roaring automaticity as a result of that question or that type of question. "Whose goals should never be valid?" "Whose goals should never take place or form up or become reality?" "What goals should be unknown", of course, tends to plow it out of the pc. His unknowingness-occlusion button is then set to work and he starts showing stuff to the light of day.

So there's numbers of things you can do. I'm just trying to show you, there's numbers of things you can do by being very matter-of-fact and very flat about the whole thing in looking at this pc. This pc is having trouble giving you goals. All right. Then you had better get down to a basic trouble with regard to goals. You just better ask for it right now.

All right. Now, let's take a Terminals Assessment. You see there's something wrong with a pc's goals. They give them to you slowly, or – or very, very slowly or poky or don't
seem to have many. They give you unlimited numbers – any one of these various things. Or they give you goals that they haven't themselves anything to do with. You could handle this by handling the factor of who has suppressed goals and whose goals that they have suppressed. You got the idea?

All right. Now, let's take terminals. That's slightly different and we get back to a lecture – a lecture back here in Camden of 1954, wasn't it, Suzie? Yeah, it was about 53. It was way late in the autumn of 53: Granting of Beingness. Most of you've heard this lecture. Well, you know how scarce it is, granting of beingness. The willingness to grant a beingness to somebody, that's pretty scarce. Oh, that tenet and that observation and so forth is still valid. Well, apply that tenet to – to assessment for terminals.

Let's look it over. If this person's very unwilling to grant beingness, ah-hah, then this person would be rather unwilling to remember beingness, you see. They squashed beingnesses, so that beingnesses must be on a scarcity. There's a misemotion here with regard to the subj – whole subject of beingness and therefore you're going to get terminals being out. Terminal lists then are hard to acquire or they're too numerous and so forth. You don't have as much trouble with terminals, however, as you do with goals. But, nevertheless, remember that you could remedy difficulties with getting a – getting a terminals list. You could remedy them rather rapidly.

You could ask the individual – ask the pc, "What type of beingness should remain unknown forever?" That's a good, broad statement. "What class – what general class of beingness should just be forgotten, not known, never heard of again, and so forth. What – what would be that?" Well, they start plowing up terminals for you, the like of which you haven't heard before. Don't you see? All of a sudden here're a lot of terminals.

Of course, you don't ask that in conjunction with the assessment itself. You just ask that in general, you know. Just two-way comm sort of a basis, you know. Let's get this out of the road. Let's see if we can start any roaring automaticities going here and of course, if an automaticity starts going, why, we continue to run what started it as a process until we get it slowed down; and all of a sudden, you'll have a pc who's assessing on terminals entirely differently. They'll assess entirely differently. Because "not granting of beingness" is an effort to suppress beingness, isn't it? And if this is fairly prevalent and your pc's having difficulty giving you terminals, then he must be having this trouble with beingness and he must be suppressing beingnesses, so when he tries to think of a terminal, his automatic suppressors on the subject of beingness will squash the terminal out of existence and he won't be able to give you a list. That's as simple as that. So you can take care of that.

Any – any type of question that says what beingnesses should be forgotten, unknown, skipped, never looked at – particularly what kind of beingness should just be ignored – various types of questions this way add us up to some of the most innocuous sounding questions you ever heard of, which add up mildly to the same thing, which is, "What sort of person shouldn't you associate with?"

That sounds like a perfectly reasonable, almost Freudian, sort of – you know, mild, psychotherapeutic, you know, sort of question. "Have your parents ever protested against certain types of association?" Or something like that. Well, you're asking them what beingness
should be unknown, not known, forgotten, gotten rid of, gotten away with, you know. "What type of personality is particularly detestable?" Now you're much further afield, but you'd still produce some kind of a result. You're getting away from the core of the matter, but it's still a – still a question that could be asked and you'd say, "Well now, if you were in the business of manufacturing people, what types would you keep off your list?" "Who would you never under any circumstances, list as 'to be manufactured'?"

Any – any such type of oddball questioning, of course, is just "not-know beingness" and you can take the formula "not-know beingness" and extrapolate from it day and night for a long time and still get material off the pc; and you can set a pc up for a fast Terminal Assessment. Of course, you could do the oddity of setting them up for Clear. You – the whole thing blows if you treat it in this particular line.

You know, don't you, that it isn't necessary to run the terminal to make Clears. You – you know that, don't you? I mean that you can assess a person through to Clear and it will happen. For some reason or other, you just never seem to find the goal and maybe you find the goal and you find a goal that sticks. And you say this is marvelous and then you assess the terminal and then you can't find any terminal and so forth; and go back and check the goal, and you can't find that goal anymore. And you say, "Well, where the devil have I wound up here?" You know? And now you go back all over it again and you've got to do another Goals Assessment. You see what I mean? And then you find a goal that hangs up for a whole session and then you start in looking for a terminal for the goal and it all goes into mush and it's nowhere. And you go back and check the goal, and it's gone now and you could keep doing this and run a person through to Clear. I mean it can happen. A remarkable number of cases will do this and this should change your attitude toward "you must find a goal that sticks."

Because this will occur that you will, every now and then, find a pc that's – not even rare, in fact quite ordinary – you'll find a pc who doesn't have any goals stick at all. They just goals assess to Clear. Pretty soon, why all of a sudden, the needle is splop, you know. Needle's coasting. You're not getting any registry and so forth. What do you do now? Well, you goals assess to stable Clear. That's what you do now. Got the idea?

And then another type, as I just said, you goals assess the case and find the goal. Hurrah! Hurrah! Hurrah! And we're all set now and all we've got to do now is find the terminal. You set the person up for terminals for that goal and you never find a terminal and you go back and you check the goal, and it's gone. Got the idea? Get off of your anxiety that you must, must, must find the pc's goal, see. What you're trying to do is clear the person by assessment. It's a different action.

Now, if their goals go too numerous and the needle is not getting loose and the tone arm is not getting better and so forth, now this is the case we were talking about where you have to do some work on the case to get this malfunction out of the road. The person hasn't given you any goals. The person's having great difficulty giving you goals. You get the idea? Well, that's a person who has such a heavy bug on goals that's sitting right there, that you just can't really get an assessment going.

If a person is assessing easily and you're doing a good job of assessment and your rudiments all stay in and so forth, you can assess a person straight through to Clear – just on
goals alone; never even get to a terminal. And you can assess a person through to a goal and
the goal hangs and you never get through with a terminal to run. You just never find a termi-
nal that fits the goal. You find a lot of terminals, but then you go back and check the goal and
you – you can't get anywhere with that line. That's it. You've run that one completely out.
Now, you've got to go back and find more goals.

And this is, on a gradient scale, the next step up from that is you find the goal and then
you find the terminal and then you assess the terminal on the Prehav Scale and that's it.
You've had it. You can't find any level for the terminal on the Prehav Scale. Well, then you go
back and check the terminal and you find out it no longer registers. Now, you go back and
check the goal. You find the goal registers a little bit so you'll find another terminal for that
goal, you see.

All right. Now, you've got that terminal and you get a terminal and you've got the ter-
minal all pegged and it's right there and you open your mouth to get it onto the Prehav Scale
and you don't make it; and then you run it back and you check for that goal and the goal is
now gone. Then you have nothing to do but to return to another Goals Assessment. You got
the idea?

You see, if you're trying to find something, if that is the basic goal of all of your as-
sessments, if you're – you've

have failed, if you've failed to find the pc's goal, you see, you're just going in the wrong direc-
tion entirely. That isn't – that isn't correct, you see.

What you're trying to do is clear a person. Well, clearing a person consists of getting
the stuck goals and stuck terminals off the case. You got the idea? So you're really taking the
goals and terminals off the case and if you have to take them off with – by finding a terminal
and then assessing the terminal on the Prehav Scale and then running the terminal on the Pre-
hav Scale, on and on and on, don't you see – that's the way you've got to go about it – and
then run it for a – lots of hours and so forth, to loosen it up; well, all right, that's how you had
to go about it. Don't worry about that.

But you see, that's why the fast, short assessment to find the goal and terminal so that
you can run it and run the person through to Clear is not a valid approach. It's not a valid
piece of thinkingness. That is that you've got to find the goal and then find the terminal and
then find it on the Prehav Scale and run it and that is the only way to make a Clear, you see.
That's not a valid approach. That would be the rougher Clear level, you see. You're going to
make it that way, but that's going to take longer. The approach is, you're trying to knock out
the stuck goals and the stuck terminals that have got this pc fixed in various game conditions
which prevent him from escaping into existence again. That's what you're trying to do, so if
you'll just change your level of orientation there and what you're trying to do, all of a sudden,
why you can draw a long breath, and you'll find your assessments are much smoother, much
happier, don't you see.

And if this pc doesn't seem to be getting any meter changes by reason of assessment –
you know, you're assessing the pc but you're getting no meter changes – then you can assume
that you have leaped off with a case that isn't going to give you any goals or there's something
wrong with goals at large or goals in general and you certainly better straighten this case up.
So just to be on the safe side, straighten all cases up on the subject of goals before you start to do a Goals Assessment – and every so often, during Goals Assessments – or reorient the person on the subject of goals. "What class of person is particularly hard on goals?" You know? "Give me a list of people that you wouldn't want to have have goals." "Give me a list of people whose goals are not very acceptable", and he comes back with gangsters, politicians, psychiatrists, you know and he comes down and he's thought each one of these over and he's decided their goals are not acceptable.

Well, you could take this list and run a different approach on the thing and that is you could ask him – one, two, three, ask him just this: "What goals of a psychiatrist have you combated?" You know, this is just a light run sort of a thing. This is not anything you would do as a profession for the next five hundred hours.

But this guy will come up with the fact, "Well, they just shouldn't hurt people and they shouldn't do this and they shouldn't do that and they shouldn't do something or other and they shouldn't accept people's money without giving them any benefit in return", and so on.

Well, you say, "Well, form these up into goals. I mean what are the goals?"

"Well, they don't have any goals."

"Well, they must have some kind of goal. All right. Well, what goals do you think they would have?" Do you see?

"Oh, well, they have this kind of a goal and that kind of a goal, and they have the goal to hurt people and they have the goal to do this and they have the goal to do that."

"All right. Now, have you been in combat with that type of goal?"

"Oh, yes. Yes, I have been."

"All right. Now, what are you – can you run back now and find exact times when you have actively combated those goals?"

"Oh, well, yeah... well, that's pretty hard to do", you know.

And then he spots one and he spots another and he spots another and he spots another and he spots another and he spots another; and you say, "Well, that's it." You're not getting much needle action now, so you say, "Well, that's it. We're not going to go any further along that line."

"All right. Now, let's take up this gangster. All right. What gangster goals – ." Well, this time he knows what you're talking about, so he's grooved in. "What gangster goals have you objected to?"

"Well, I haven't really objected to any gangster goals. As a matter of fact, I was a gangster in my last lifetime." [laughter] Something like that blows off. That sort of is out of the road now.

And now we take a politician. "What political goals?"

"Well, the goal of hiring young men at slave wages to go out and shoot other young men because they're wearing a different uniform. I – I think that's a bad goal."
"Well, now exactly what is that goal?"

And the guy will think for a long time. Then he'll decide, "Nationalism. Yes, nationalism is a bad goal. Yeah, they have the goal of nationalism. Yeah, their goal ..."

"Well, now have you ever actively combated such a goal?"

"Oh, yes, yes, yes. Oh, yes, yes. Used to make speeches and that sort of thing. Nationalism. Combed these goals."

"What other goals in that area were you combating?"

"Well, there's so-and-so and so-and-so and so-and-so and so-and-so."

"All right. Okay. Okay. Well, now how about your immediate family? Any of them very hard on goals or any of them have goals?"

"Oh, well, my brother. My God, my brother. He always wanted to play the pianer."

"Was there something wrong with that?"

"Oh, yeah, he was just obsessed. All the time he wanted to play the pianer. Of course, he -- he's with Sammy Kaye now at -- and so forth, but gee, he always wanted to play the pianer all the time."

You'll notice this guy's kind of sighing. He's looking at a failed overt on goals. See, he didn't want his brother to play a pianer, but his brother went and played the pianer. And now his brother's being very successful, and he has Hollywood beauties standing ten deep around the -- the baby grand, you know. Big failed overt.

You can start sorting these things out and it isn't the aggregate of small things. What you are really looking for is some crashers. See, we're looking for the unknown people here. We're looking for the squelchers and so forth. We're looking for the incidents where one's goals really started to blow up in smoke, you know and just went blooey! Or when one really got to somebody else and blew all of his goals up -- blooey, see.

For instance, I know several people at the present moment that you undoubtedly couldn't goals assess. You just couldn't goals assess because every single ambition Dianetics and Scientology ever announcedly had, these people were violently against and they're just violently against them. So you're assessing them with the understood goal of freeing them. How are they going to make it? How are they going to make it? Well, the only way you could make them make it is they'd have to pick up all their overts and attitudes against Dianetics and Scientology and then they possibly could make it. But they've stood in the line of any goal that we had for man or anything else.

Now, handling a pc has a lot to do with it. Because you handle the pc you are auditing and when you get glib enough and smooth enough with your tools and you feel very sure of these tools, you can sound very matter-of-fact in the use of these tools. But let's put it another way. When you have had some wins, you will start getting very matter-of-fact. You see that? And you'll all of a sudden find that your tools are much easier to use. See, so it works both ways. And what you need are some wins, basically. And what you need is -- to get those wins
is a very relaxed attitude and – and just an application of exactly what you're doing in order to get that forward.

Now, I've shaken out of the hamper – for my money – anything that was wrong with goals assessing I think I've got taped now and it's all right with me if anybody anyplace in the world wants to run Goals Assessments. This is okay with me. They're not going to do anybody any damage.

But for heaven's sake, keep on assessing. I mean let's keep going here and let's not get some wild idea... This is what they were doing. Somebody would get some wild idea that this fellow's goal really is --. You know. They just make it up out of the blue, and foist this goal off on him and say, "That's it, isn't it?" Yeah, well, don't bother to look at the E-Meter, [laughter] and then get a terminal, you see, that fits the goal very nicely. That's all set. They're – very easy to do that; all they're reading is ARC break, you see. [laughter] And then they go tearing off on the Prehav Scale and they run this thing madly and they say well, we're going to make a Clear. Well, that's not so. Had to be much more skilled in assessment than that, believe me.

But keep assessing. Just go on assessing. If you just went on assessing and checking through, you'd sooner or later reach the stop point where it became obvious to one and all that you either weren't going to clear this case by just running out all goals and all terminals by assessments, you see, but that you had come to a total stuck. Yeah, a goal had stuck and there wasn't a single thing you could do to free that goal. That was it. That was there. And then, you pick up all the cause-effect – both ends of the goal, you know, the line of the goal; the person that wants to do it and the person it's to be done to or something like that. You pick up both ends of the goal and list those things and just keep listing them and listing them and listing them and going on and on and on until one sticks and if one doesn't stick, just keep on going and eventually you can get nothing to react in the way of terminals and so forth, go back and examine the goal and you'll find the goal has probably blown up at this point. You've run out all the beingnesses that had to do with that particular goal. Now, you've got to do a Goals Assessment all over the top, okay...

But the game is assessing. Assessing is clearing. If you want a Clear, do good assessment. This is what is emerging as people have gone ahead and done a lot of auditing and as a lot of results have emerged here and there. They have all emerged on assessment. The runs of the terminal, flattening that and then reassessing and all Clears have emerged on that pattern; and Clears have not emerged in any other pattern. The only other technique of clearing I know of is familiarizing the pc with the bank so expertly, that he no longer has any slightest qualms of facing even the most unknown portions of his bank and he will eventually blow Clear and it's done by gradient scales; and I've never been able to teach anybody to do it. This other one is a surefire. And auditors far away from supervision are making it with it and so forth. So you just have to say, well, that's the way to clear people.

Now, as far as preparatory steps are concerned, preparatory steps as contained in Routine 1 and Routine 2 and Routine 1A, that sort of thing – these preparatory steps are very valid and very valuable preparatory steps. But I wouldn't use them any longer than was necessary to put the pc in a shape to be assessed. How long do you use Routines 1, 2 or 1A? You
use them long enough to put the pc in shape where he can be assessed well and then you go to town on assessment. And there is a faster method of handling this and a better definition of how you go about it and I think your own experience so far tends to bear that out and you get a little bit more experience along this line of assessment and you are really going to see this thing borne out like mad.

So get to be demons on the subject of assessment. In the last two lectures, I've stressed nothing else but assessment. This requires, of course, pretty smooth, matter-of-fact auditing, no invalidation of the pc, just carrying on, putting them all down, doing a workmanlike job, knowing where you're going and knowing what you're doing. The pc communicates to him, he goes ahead and he gets in there and he saws on down the line, and his anxieties start coming off and he starts straightening up, and he gets more and more in-session. The more in-session he is, why of course, the faster he clears.

As running it is concerned, you don't need much experience or practice in running the thing because we've had lots of auditing on this. We need experience right now in assessing. How to set a case up for assessing. How to assess a case and what to expect from an assessment and then at the end of all of this, how to check and reassess; and all of those things are very skilled activities.

You can invalidate a pc out of existence, you know. I mean, you can – you can take a Goals Assessment, Terminal Assessment, you can just invalidate the pc down to a nothing. But you have to be pretty crude. You have to be actually kind of overtly snide about the whole thing or there has to be something in the attitude which is all wrong. Or you have to be doing it in some fashion which is totally, totally, totally contrary to in-sessionness or the Auditor's Code or something like that. The error has to be very gross to do a poor assessment.

And if your pc isn't progressing, I am charitable enough to assume it's because the pc has such a wide bug on just the subject of goals that you cannot penetrate that particular barrier without letting some sunshine in on the subject first, and on terminals, well, he has such a large bug on beingness that you cannot get anyplace with the beingness. So as a result, why you've got to do something desperate about beingnesses.

Well, right along with this emerges this brand-new tool which is the – an old tool in theory, but was never really applied successfully in practice because the whole ramifications of it – . You see, the O/W was missing on the early "not-know." We didn't have O/W when we were first using "not-know" and "forget." So therefore, it didn't have the horsepower to climb the hill and the O/W gives it the horsepower. "Who should be forgotten?" "If you forgot something, who or what would have been gotten even with?" "What forgettingness would get even with them?" Interesting question. "Who or what would be confused by your forgetting?" is enough question that on trying to answer at once, all the somatics a pc's got, could and have blown – in just trying to answer it once. Every somatic the pc had blew up. Of course, it was a half hour attempt to answer, but no answer was ever really given.

So you see, as soon as this is combined with O/W and as soon as it's combined with goals and as soon as it's combined with terminals – you make that various type of combination there – why, you should be able to straighten out any pc rapidly that is having a lot of difficulty trying to give you some goals, you see or is very afraid you will invalidate his goals.
or thinks the erasure of the goal or the testing of the goal is an invalidation of the goal, don't you see. You have to be very careful of that. Well, if a pc is getting all ARC broke on this subject, he must have a whole lot of bugs on the subject of goals. So let's take these up with him, you see. As a sort of a – of a necessary rudiment to Goals Assessment, hmmm?

And I want you to try that out in giving your sessions now and just try and find out how this pc of yours is oriented on the subject of goals. Are goals something one must never have? Are goals something one must make up? Are goals something one must stamp all over? What? What? What's the orientation?

You can get that orientation as I gave you earlier in the lecture by using "not-know", "forget", "people" – "What kind of person ...?" you know, that kind of thing – and smoke it out. You're liable to blow some secondaries. You're liable to get some action. You're liable to throw some engrams into view.

Of course, you understand that every execution is simply an invalidation of the goal of living. That's why the state does it. The most effective invalidation of life known, is to kill somebody and that's very successful. That's also the most equal thing there is: dead men. [laughter]

Now, I wasn't chipping away at the philosophy of equality in a democracy, because Thomas Jefferson was absolutely right: all men are born with equal rights under law. I notice though, he didn't at the same time say all men are equal and I notice that the democracies today have gotten this as – on the third string of their violin as the most monotonous chant that you ever heard: "All men are equal." Well, the inequalities of men start showing up in all directions. When you clear one, and one remains unclear, you've got an inequality like mad. It's – its an observable fact. It's contrary to life.

So we must assume then – I have just a little while ago figured out the most equal man I could think of, and of course, that's a dead man. All dead men are equal to all dead men, so now we know which way they're going. Snide remarks.

All right. Well, have a good auditing session tonight. And have a good weekend and I'll see you next week.

Thank you.
QUESTION AND ANSWER PERIOD: ANATOMY AND ASSESSMENT OF GOALS

A lecture given on 15 August 1961

Thank you!

Okay, this is the 16th, isn't it! 15th. boy, it's a lucky thing you people keep me on the time track. I haven't been reading any newspapers lately. Don't read Russian very well.

Male voice: Ron, could you put Pretended Knowingness on the Prehav Scale?

Would I put it on there? Yeah. It's probably – probably should be there. Yeah, it's a fairly vital button. The scale of knowingness goes from Not-Know and Pretended Know. Pretended Know could be said to be a harmonic or delusory state of Know. Be an even numbered postulate. I don't know, it must be down there somewhere around six, seven, eight – probably eight. It's probably something in between Remember. Probably six is something on the order of surmise or guess, or something like this. It's pretty late. And as a person comes off of a false knowingness, then they go into an insecurity about knowingness. This bird has studied, let us say, elementary physics, and he's got it all taped. And then he takes nuclear physics. And now he doesn't know whether he knows or not. He can't quite know nuclear physics, you see, and he doesn't dare revert to this. And this accounts for, by the way, the scientific fad and style today.

There's a fad. Science is a sort of a fad. And the fad is more or less this. It's interesting. There's a tone today that is associated with truth. The tone that is associated with truth by the politicians and the lay public. They call them the lay public, you see, because they just lay around, do nothing. [laughter] And this is a conventionalism. And that is, you must express enormous reservation and doubt. Every sentence must have a doubtful in it. And if you read the thing, it's a doubtful. And this, of course, is nothing but the sheerest of pomposity. They don't doubt.

I mean if you saw – if you are doing scientific observation of experiments and that sort of thing, you don't have to state your conclusion, but neither do you have to doubt your observation. And you dunk a four-foot piece of wood, which is marked in gradient scales of millimeters, into a solution or something of the sort with a lead weight on its end, and after the solution no longer is agitated, and it's no longer bobbing, you look at it, and it says 360, see. 360. And you'd make a record and said 360. You don't say, "according to observation, which
may of course be at fault, I might not have been there, so forth”, you see, and it's very, very amusing because more and more and more the hallmark of truth is doubt.

And if you get a real doubtful man, then the public falls for him as a real truthful man. And all this is, is two postulates going together. Know and Not-Know. And they have moved into an insane ridge. The guy doesn't know what he knows. He doesn't know what he not-knows. So his total expression is doubt. And occasionally, when societies go real buggy, and when they know nothing about the mind or anything else, and when they're just about three-quarters of the way around the bend, you get this emerging.

You have some great writer all of a sudden says, "Well, I say that man's greatest ability is the divine doubt." And they deify this thing called doubt. What do you mean doubt? Doubt at once says, "I am unable to find out, and I don't know, but actually I don't know that I don't know, and I guess that I might know, too, and somebody might know". You see, all of these things are combined in the same word. And somebody might know. And somebody might not-know. And I might know and I might not-know. But I am not going to make a what? Postulate. I am not going to make a postulate. So then therefore, we get the current scientific fad as being the fad of irresponsibility. And we look across the vast vista of confusion which science is calling itself right now – the dog's breakfast it's made out of civilization – and what do we find? What do we find? And we find out that their irresponsibility is very definitely being reflected.

There were just two or three guys left at the end of World War II who would uphold and try to continue responsibility for scientific creations. And the government got to them. Actually, there were sixty-four of them, and the government – US Government – shot them all down in flames. Oppenheimer, Condon, you can go off and list the whole list of them. They were found to be insecure. Well, those birds might occasionally have been talking with the divine doubt because it was the literary fad of the day. But nevertheless, those guys were pretty sure that you had to continue responsibility for your creations, and they were upset that they hadn't.

Nowadays, you get somebody, some working stiff scientist and so on, and the government says, "Put a fire engine in the beauty salon", and he does. You know. I mean, it doesn't matter to him, you know. You know. Make a weapon, make a weapon which will spread diphtheria only amongst children one and one-half years of age, you see. Some mad, some mad-screaming general, you know. He's utterly "Thuh, thuh, thuh", and he tells this fellow, and the fellow says, "Well, that's what I must do", you see. And when they get into a devout doubt, why, they are of course, then ruled by insanity.

Devout doubts can always be ruled by insanity. You get the doubt being ruled by the insane, because doubting and insane are practically synonymous. Doubting expresses the inability to find out. The fellow says, "I doubt it." Somebody says, "It's going to rain today", and the other fellow says, "I doubt it."

He doesn't say, "It is not going to rain." He doesn't say, "It is going to rain", you see. He's put himself on the hedge between Know and Not-Know, and this is pretty late on the postulate line. Because of the existence of this thing, which I am studying right now – pretended knowingness – I'm not quite sure where it goes on this Know-Not-Know Scale. But it's
probably late, probably late on the scale. Probably after the guy has doubted himself round the bend or something like this, why, then he'll pretend knowledge of some totally fallacious line – as you find most sciences doing today.

For instance, the science of marine propulsion. They think they got it taped. They think that a proper thing is this, and it's that, and it's the other thing. And you're supposed to do this and that, and engines should be so and-so.

They take atomic engines, and they take an 1860 steam engine, and they put an atomic boiler in it. And then they tell everybody they know what they're doing. No, they don't know what they're doing. They don't know anything about propulsion. You see, they've neglected the whole sphere and field.

They'll go over into pretended knowingness. Next thing you know you're going to get pronunciamentos, and you already have had them from leading scientists concerning the deity. And I – let me point out – I haven't been introducing you to any gods, large ones, small ones, green ones or pink ones. I haven't even been introducing you to the doubt of the situation. I don't think there's any doubt in your mind concerning my attitude toward this idea of deity. I think you're fairly sure that I think it's for the birds. But nevertheless, you're going to get a pomposity going here, and you'll get – a scientific religion will be the next one around the corner. This will be a real one. This will be a **wowzy** one. Space opera societies usually go in this direction one or the other. Religion is where you find that sort of a thing. But finding it in a test tube is really marvelous.

And there'll be some vast, pretended knowingness arise out of this. It's quite interesting. It's quite interesting, this whole field. I do want to say something here about this particular knowingness scale. Of course, it goes, as you know. Native state. Not-Know. See, native state – potential knowingness. And then it goes number one, Not-Know; number two, Know; number three, of course, is Forget; number four is Remember. Now we know exactly where we are up to there.

Now, we go down, and it'd be the – the factuals would be the even numbers. You know, I mean the grasping of the fact and so forth. That would be the even numbers. And the dismissal or not-ising of the facts would, of course, be odd numbers as you went on down and completed the rest of the scale. But it gets so mishmashy after a while that you're not quite sure whether they're doing which or what, and it's probably – doubt is down there somewhere or another, and it would have to be probably two numbers of the scale. You see, because it's neither Know nor Not-Know, or Forget or Remember or anything else. It's a hang-up between the two. It's the stuff that's gone into a ball.

But then, from doubt, we get a total avoidance. A total avoidance of factualness and get into pretended knowingness. See, the guy not only will pretend the knowingness but he'll also pretend the facts that back up the knowingness.

One of the things which you have to safeguard yourself against all the time in research. There's no pretended knowingness in there. Somebody's overtly making a pretence of having known something, and he has written down as having observed it, like there – oh we saw eighteen monsters in Loch Ness or something of this sort, you see. And then, therefore,
we base a whole science on this, and we develop a whole science called "Sea Monsters: Their
Habitats and Behaviors."

But this is quite important to an auditor. And actually, by the way, it is important to a
pc. As he unravels his bank, he runs back up this scale, and somewhere along the line, if on
some subjects – as of course, inevitably any reactive mind is – he runs up through doubt. And
when he hits this doubt, then of course he doubts everything, and one of the rough things to
do is he would go across that barrier. If he were going across it so hard that it pervaded his
entire existence, of course, he also would be brought into a point of doubting Scientology, of
doubting auditing, of doubting everything that's going on, and would stop sessions.

And, of course, he's in the fellow who is walking across the middle of the chasm, and
he's right there in the middle of the chasm, you see. He isn't on an even numbered postulate or
an odd numbered one, and he has been left exactly nowhere. And he goes off into a sort of a
fog about the whole thing. And you can expect a pc who has had a rough time or is being au-
dited on a rather low scale terminal, either way, to come up through these bands. And you
really don't want to pay too much attention to a pc when he says well, he doesn't think Scienc-
tology works, you know. Two weeks ago it healed a broken leg for him or something like
this, but it doesn't work, you see, and he doesn't know whether it's true, and so forth. Don't
pay too much attention to that sort of thing. Recognize it for what it is.

Now, probably he had a pretended knowingness on some subject. And then when he
moved off this pretended knowingness, he moved up scale. He is inevitably going to go past
doubt. He doubts something else.

A medical doctor is pretending to know something about healing. We don't doubt that
a medical doctor knows something about the mechanics of the body. We don't doubt that he
knows something about the mechanics of the endocrines and functional systems of the body.
They fought that up the hard way. Like plumbers know about pipes, they know about bodies.
And pretty good in this particular line. A lot of them are very clever. They get somebody on
the operating table gasping under the ether, and they can tie bowlines on the bight and double
carrick bends in their intestines and fallopian tubes, and things like this. And they're neat. And
some of their obstetrical activities, the better ones – the more impatient ones don't have this
skill – but some of the better ones in their obstetrical activities are actually very clever with
their hands, very clever with their knowledge about all of this. There are very few of these
fellows.

Now you lower the boom on this fellow, and his pretended field of knowingness is
healing. He pretends to know what will make the body well. Of course he's always missing on
this. He's always missing because he says structure, of course, monitors function, so he can't
help but miss because he's got it exactly backwards. He says he fixes up somebody's broken
leg, you'll make him happy, you see. Or he fixes up somebody's broken leg, he'll walk. If he
just sets the leg right, you see, and it's all neat, then the guy will walk again. Well, it happens,
and it happens, and he keeps seeing this happen, and then one day the fellow doesn't walk.
Well, then he gets curious and he'll repeat the operation, you see. And they rebreak the leg
and they go in there, and they look at all the nerve fibers, and so on. And then they put it all
together again, and neat it all up, and when it comes out of the cast again they say, "Walk,
you ...bum." [laughter] And the guy doesn't walk. And they say look, perfectly all right. The muscles are all right. The leg is all right. The nerve sensors are all right. The guides are all right. Everything is apparently all right, but the guy won't walk.

He never admits to himself that he really doesn't know what the score is until he's had quite a few of these. And then all of a sudden he either goes in two directions. He says there's something called religion. Qs-and-As with another sphere of pretended knowingness – how many angels can stand on the head of a pin, that sort of a thing, you know. Or he says there must be something to the mind. And by the mind he means the brain. And there must be something to the mind. And the mind must have something to do with all this, by which he means the brain. And then without any proof at all that the mind has anything to do about it, he invents a whole science. They've invented two or three of them since about 1894. And they haven't done anything with that either. That's another sphere of pretended knowingness.

So you start getting compartmented, built-up sciences which consist of pretended knowingness out here, see. Nobody's making a breakthrough. Now you invalidate these things by demonstration. You bring him back through. There's only one thing you can do is bring him all the way through the band of doubt, because he's going to drive you half out of your mind, as an auditor, as you bring him up the line, because it's all going to shed off as doubt.

And the hallmark of the case is doubt. He isn't going to know whether he's in the auditing chair. He doubts whether you were doing it. He doubts, doubts, doubts, doubts, doubts, you see. He doubts whether it's working. He doubts the result he got yesterday existed yesterday, although he thought yesterday it did exist, but today he doubts that yesterday existed. You get the idea.

So he comes up through all of these bands of doubt, doubt, doubt, doubt, doubt, and he'll eventually come up topside to some kind of a certainty of his own observed certainty. But he has a longer way to go.

And you could say the more pretended knowingness which an individual has, the more doubt he'll encounter on his road out of it. You see, because he's got an awful lot of not-ised facts in there. See, he's got a lot of not-ised observations, you see, and he had to sort of shut his eyes to get into that kind of a pretended knowingness, you know. He's led some kind of a life, like his mother beat him every day, and wouldn't let him have anything to eat, and ran down the old man to him, and made sure the old man was a drunkard, and he's got a fixed datum: "Mothers are angels." See? And his existing observation in this particular lifetime is – just totally violates this basic postulate – "Mothers are angels", you know.

And it's the most pathetic thing, and I've seen this happen with both children and adults, you know: "Well, my mother was just an angel. She was just a darling. She was nice to everybody." And you get into this, and you say what is this other character that is rushing around in this fellow's case, you see.

And then they'll go the reverse. And they'll have the idea that all women are no good. Stable datum, you see: All women are no good, particularly mothers. Mothers are no good. So all right, you look around all over this case one side of it, up side of it, down side of it, examine it, turn it over. You cannot find a single incident where his mother did anything to him,
you know, but try to treat him decently and bring him up. He's gotten this datum in a long, backtrack lifetime, sometime or another, you see, and he's just clung onto it as a datum.

So, this guy is in a real fog because his experiential track leading up to this lifetime now does not permit him to predict anything in this lifetime. Nothing in this lifetime is predictable, so he's in a chronic state of nowhere. Now he will eventually go over this boundary because he doesn't like to be nowhere, and get himself a pretended somewhere. A thetan does this with the greatest of ease – pretends he is somewhere. This is very comical.

You know, the whole source of a dream is an effort to orient. There is nothing else to a dream. Take my word for it. Someday you'll get a good subjective reality on this thing. A dream does not forecast. A dream doesn't do anything else except tries to orient.

The fellow is asleep in a skull and some squishy stuff and the body is insensitive and insensible, and he hasn't got his communication lines out, so he can't feel the bed, and he can't perceive anything. He wakes up neglecting to get the body awakened, you see, and he is suddenly terrified at being no place. There's just a little flick there, you see. And he's just a little bit terrified of being nowhere, so he immediately creates himself a lot of somewhere. And he will create himself one of the wildest somewheres you ever saw in your life sometimes. He gets Washington, DC all mixed up with London, you know. And then this is somehow or another in the South Seas, and so on. But it's a frantic effort to orient. Just to locate himself so that he can feel secure. That's what a dream is, and a dream, of course, is pretended knowingness because he is in none of these places. If you try to run out somebody's dream, you'll go through a band of doubt.

He doubts he dreamt it. That is one of the first things you run into as you start to erase a dream. He'll doubt this. He'll doubt that. Well, he's not sure – he's not sure of what time of the night it was. He's not sure of this. He's not sure of that. You get the idea? Well, what he's really hitting at, he was not sure where he was.

If you have somebody who has chronic nightmares, you can actually cure their chronic nightmares by getting them to orient themselves consistently, something like TR 10, something like this. Any orienting havingness process will cure nightmares. Interesting. After you've run it for a little while, and run it a bit flat, and got the guy a little bit more oriented, he won't have nightmares anymore.

The other way of handling nightmares is to give somebody B1. Guy's having a lot of nightmares, give him B1. Evidently, B1 molecules have compasses in them. [laughter]

But now, when we're talking about things like this, of course, I'm just talking to you about practical observation, the practical observation, that's all. A guy who's having trouble with nightmares, I found out what it was, or I was having nightmares and got an orientation slant on it, and looked around and examined it someplace else and tried to find out if this was the fact of the case of the nightmare. Yeah, this is the fact of the case of the nightmare. All right. That compares with the observation, so to that degree it is knowingness. Simple.

We have a very simple rationale. It's much too simple for modern science. We don't have all the frills of modern science. All of the conventionals. And these conventionals are so darned unwieldy that it's a wonder they ever get anyplace. You know, you're supposed to
make a record of everything you do in modern science. Well, that's the most wonderful way of slowing somebody down I ever heard of. Just think of what I would have done, or the research I would not have gotten done, if I had made a complete and detailed record of every observation and every action that I had observed that led to any type of a conclusion, since when you're handling something on the order and zone and width and dimension and height of life, you, of course, do nothing but observe.

Now, if you observed only for the record, and then if you filed the records and then took only the conclusions which the records gave you, you of course would have made a job which would have lasted over five or six hundred lifetimes. So, of course, the job couldn't have been done. And yet we do have quite a lot of records of one kind or another, but we don't have a large impractical record. Someday somebody's going to curse me for not having done this.

That I'm sure of. They'll curse me for it. But then that's a kind of pretended knowingness too, you know. You know things because you have 8,692 million Library cases full of paper. That's not true. You don't, you know. That's the Ford Foundation's motto. "We know as much as we have filing cases full of paper." And it never occurs to them "we can do as much as we have filing cases full of paper". That doesn't follow, does it?

So you had to have, in order to accomplish the job at all, a method of shorthanding recording, and of summarizing observation, to get out of this slough of pretended knowingness. Otherwise, we would have wound up pretending we knew a lot of things we didn't know just because they were written down on paper. Quite interesting, but the insane asylum records on cases give you inevitably and invariably the full engram the person is stuck in, word for word, line for line. Examine them sometime. It's fantastic.

How could these fellows actually have been sitting around recording this long without having come to this interesting conclusion that they were recording something. There must have been something there for them to record. You know? They never looked for anything there. They never looked for anything to be recorded, you see, in the patient. They just observed the patient and made a record of what the patient was doing. And then never found out that it was consistent or continual or repetitive, and never assumed that it must be coming from somewhere, and never tried to ask any patient where it was coming from or how they got that idea or anything else. And yet the records of insane asylums are full of the engrams in which their patients are stuck. You can actually pick up a lot of insane asylum records, go into the patient it refers to and get them to run the exact engram that is on the records, and the person will run on through it and be in another dramatization quicker than scat.

And then of course, you've changed the case all over the place so this becomes quite startling and everybody goes into awe and propitiation. I've done this a few times. That is why psychiatrists only have one thing against me, personally, is I'm trying to show other people how to handle the mind. And this is a betrayal. They have no slightest doubt in their own mind but what I know all about the mind. They think I'm a pretty able boy. But they sure hate this idea of developing competition. And it's just results of doing things like this, you know, of looking for pretended knowingness.
So there can be knowingness which is not observed knowingness, and that hangs around in that band someplace. You see, that's also got to be oriented on the track. You keep observing this woman drinking Haig & Haig, and she drinks it in the morning when she gets up, and she drinks it for lunch, and she drinks it for supper, and she never draws a sober breath, and you never file the fact that she is a drunkard. This is omitted from the knowingness. Get the idea? We never say, well, this woman is a drunkard. We're liable to say, well, she has trouble with her husband. That has nothing to do with it. It has nothing to do with the observation. We may or may not have observed that she had trouble with her husband.

So you get then also a lot of devious observations of knowingness. Motorcycle breaks down. We take a look at the motorcycle. We say, well, the owner doesn't live right. It's not what we're observing. Don't you see? So it's a misobservation. That the owner lived right or didn't live right or that the owner is messed up mentally or not messed up mentally has nothing to do with the immediate observation that the motorcycle is broken down. You see? And as a matter of fact, the owner might be in very good condition but just bought it from somebody else, and our observation would be for the birds. The worst this would say is that the owner is a careless purchaser. Or it might say that motorcycles are scarce, and it might say a lot of other things but it's a nonobserved datum that is recorded. In other words, one looks at the evidence and then records something he didn't observe. And you'll see this in auditing.

A person will run an engram and then tell you something as pc that he hasn't seen in the engram. Very often it adds up to you as, it isn't a cognition, but it's a type of cognition. It's a very low order of cognition. He runs this engram through, and somebody's being beaten up, and he all of a sudden announces all lumberjacks wear boots, you see, but there aren't any lumberjacks in the engram. And you wonder what the hell all this came from. Where did we find this one?

Well, now you're introducing via knowingness, you know, or guessing by evidence. There's something else. There's so many stratas of this I – all I'm trying to do is show you there are so darn many stratas of this that I'm a little bit chary of putting them all down on the Prehav Scale because it's its own scale. But some of them are going to appear on the Prehav Scale. Probably Doubt should be on the Prehav Scale and Pretended Knowingness probably should be on the Prehav Scale. Ah... Guess should be on the Prehav Scale. There are quite a few of these should be, but I don't have the whole Knowingness Scale yet. I only got a few steps of it. I'll have it all taped one of these days.

Okay. Enough of that. Anybody got any more questions that won't lead to so much randomness on knowingness.

Female voice: Yes, I have. I think I've missed some data here. When running Goals Assessment by a repeater technique, I think one should put an acknowledgment after each repetition. Am I correct?

Mmm-hm. Always, whether the pc said anything or not.

Female voice: Mistake then. I didn't.

Ahh, well, that would slow you down.

Female voice: Mm-hmm.
You say "To fly to the moon." Pc doesn't say a word. You say, "Thank you."

Female voice: Mmm.

"To fly to the moon. Thank you. To fly to the moon. Thank you. All right. That's all of that. Okay. Now, here's the next one. To run steam engines. Thank you. To run steam engines. Thank you. To run steam engines. Thank you. This one is disappearing, so we say, "To run steam engines. Thank you. To run steam engines. Thank you. To run steam engines. Thank you." Okay. We cross it out, and we say, "All right, here's the next one." And so on. The pc hasn't said anything this whole time. Pc can sit there in the finest, most gorgeous state of irresponsibility you ever heard of and still have a Goals Assessment work like mad. He doesn't even have to have his mind on the goals you're reading, actually. It's a communication straight between the auditor and the reactive bank. Bang! Bang!

So, thank you for bringing up the point, Madge. There's always an acknowledgment every time you read a goal or a terminal.

Female voice: Okay. Another question on that ...

That isn't true of the Prehav Scale. Assessment on the Prehav Scale, you don't. You say "TR 10." [laughter] Is that it, Madge?

Female voice: No. The other question was, when it was nulled out, is it all right to say to the pc, "Well, that's out"?

I don't care what you say.

Female voice: Okay. Thanks.

It all depends on how good the communication is. The pc is liable to start getting very restive. I'm liable to ask him something, "Is it all right that that one went?" And he says, "Well, no, really, because that was my favorite goal.", and you say, "Well, what was your favorite goal?" And he said, "Well, it wasn't exactly that." And we got another goal out of him. [laughter] Any other questions?

Male voice: Did I understand, Ron, that you said that we don't acknowledge on assessing on the Prehav?

You understand right when I said you don't acknowledge on assessing on the Prehav Scale. You just fire, and you just go right on down the line, Rackety-rackety-rackety-rackety-rackety-rack. The proper assessment on a Prehav Scale I'll review for you. You simply – you – let's say you're assessing generally, you simply read the levels, and you start at number sixty-four, and you carry right on straight up the scale; and you make a dot or some such mark at every reaction you get, reading each level just once. Now having arrived at somewhere toward the top of the scale, you turn around then and you start down the scale, and because you start down the scale, you don't go down the whole scale, you only go down those that have – you have put a dot after.

And when these react on one reading again, you put a second dot. And now you'll find out that you normally wind up with two or three with two dots. So now you read the two or three with the two dots up, and then you read them down, and you'll be left with one with
three dots. And it's a very rapid action, but there's no acknowledgment done. There's nothing said at all.

If you're assessing with a terminal, you announce the terminal each time, and if you're very clever, you'll flip-flop it. In other words, it will be the terminal doing something to you, you see. You doing something to the terminal, for the next line. For the next level, the terminal's doing something to you, and the next line, why, it's you doing something to the terminal. You get the idea? It's just to keep the flow from sticking on the assessment. One way – one way, and one way the next level. It doesn't matter which.

Because you've always got one run out of it. And you're trying to solve the problem of too much outflow. And the problem you're trying to solve, is you don't want the pc to sit there on the whole Prehav Scale from beginning to top, outflowing toward the terminal. Nor do you want the pc to be sitting there with the terminal outflowing toward the pc. So you just keep the flow going by doing a flip-flop up the line. Pc to the terminal. Terminal to the pc. Again, no acknowledgment. Nothing. Just read it one time each. Bang! Bang! Bang! Bang! Very simple operation. It's almost so simple that you could overlook it very easily. But, no acknowledgment is necessary. Okay?

Male voice: Thank you.

Right. Any other questions? Yes.

Male voice: I have one that's not concerning the kind of rundown – it's this: That you laid a lot of stress on Presession 1 at one time, and then all of a sudden there it was gone, and we're not using Presession 1 now. Can you clarify this, or the difference how the pcs go into session now?

All right. We had a ... we had a lot of emphasis on Presession – Presession 1?

Male voice: Yes.

Oh. Way back. And then we didn't do Presession 1, and now your question exactly is?

Male voice: Well, we – at one time you said that it – or said words to the effect, I think, that it wasn't possible to get a pc into session until they had a free needle on help and control and communication.

Hmmm. Well, that is degree of "in-session." You understand? There are degrees of going into session. And that would be a pc fully in-session. I'm not trying to worm out of this. I'm trying to show you something here. You've got another problem involved here. And it's a good thing to call this to attention. You get raw meat straight off the street, and you don't clear up any part of Presession 1, or you don't attack the opening guns with anything like Presession 1, and he's usually in a fog because he's stuck on all of these buttons.

It doesn't take too long to orient this sort of thing. Now, this is all under the heading of HGC stuff of taking a raw pc who has never had any auditing before and getting that pc into session. Now, as the pc comes into session, you'll find out it will be because he has a freer attitude toward these various things. Actually, two-way comm on them, discussion with them, that sort of thing, tends to get the pc much closer to being in-session. But something else has happened since, something else has happened.
We have cracked a fast way to get a pc into session. And the fastest way in the world to get a pc into session known to man or beast is Routine 3. The person who is not interested and who becomes unwilling to talk, well, Routine 3 – I mean it takes it. The fellow will talk about his goals. The fellow is interested in his goals. He then is interested in his own case, which is definition of "in-sessionness".

He'll jump over all of these earlier concerns. Don't you see? He just goes right over the top of these things and he's off to the races. Now, you've got another part of Routine 3, which is the – you're actually hitting at why we're using this type of approach now. Routine 3 also includes a Security Check. And this makes the fellow – this solves all the reasons he is not talking to the auditor. So Routine 3 contains those two elements, which keep a pc most from being in-session – which is, of course, interest in own case and willingness to talk to the auditor. Security Check handles willingness to talk to the auditor, and of course the Goals Assessment handles interest in own case.

And it's overwhelming if you're doing at all a smooth, technical job, that in fact it is nearly impossible to get a pc out of session.

Male voice: Yes.

And that is why you see so little emphasis these days on Presession 1. Does that answer the question?

Male voice: Yes, it does. Thank you.

You bet. Technology has handled the problem even more aptly. Okay?

Male voice: Yep.

Right. Okay? Any more questions? Yes.

Female voice: Can one ask the preclear a questions – the two questions of in-sessionness? Whether he's willing to talk to the auditor or whether he's interested in his own case?

Ummmm.

Female voice: on the meter...

I wouldn't say offhand that it was a very good approach because it's liable to sound accusative to a Scientologist. [laughter] I'd say – I'd say – it's a good thing you bring this up. I'd say no. One shouldn't do this. We shouldn't want to ask the pc if he's interested in his own case and is willing to talk to the auditor. You can, of course, always ask somebody, "Are you willing to talk to me?" and clear it on the needle. It's perfectly valid. But "Are you interested in your own case?" No, I'd omit that. [laughter] So one of them is quite valid, and the other is quite invalid.

Female voice: I was just wondering about the needle read ...

Mmm.

Female voice: ..."not interested", what the needle would read. Would probably be a drop: "not interested."
Q & A PERIOD, ANATOMY AND ASSESSMENT OF GOALS

No. Now listen, honey, you're assessing the Prehav Scale at the level of Interest, and that's all you'd get a reaction on. If the fellow was sitting on Interest as a hot button, you'd get a response. And if he wasn't sitting on Interest, you wouldn't get any response. And after you ask the question, you would know exactly nothing. [laughter] That's why. You got it?

Female voice: Right.

Now, don't you feel bad about asking a question. Perfectly all right. Okay. Any other question?

Male voice: Yes.

Yes.

Male voice: In Terminals Assessment, would you keep on repeating these terminals that sends the pc into whole track and gets them a bit mucked up? Do you stop to do anything about it or do you press through on the assessment?

All right, if you're doing a Terminals Assessment and you keep repeating the terminal and the pc goes through into whole track and gets a bit mucked up, why, do you do anything about it or continue with the assessment? And the answer to that is a very difficult one to make because it's a matter of an adjudicative sort of thing which is not actually based on anything but giving you a guide.

Because a pc being assessed is a pc being assessed. And it is that pc that's being assessed. And you take pc one and you start taking up anything he's going into on the whole track one way or the other, and he has gone up to the seventy-five-foot high-dive tower and in he goes, and this is a wonderful opportunity to just never get anywhere, don't you see? He's just got brakes on from there on out. So, if you do it, if you start taking it up with this particular pc, why, you're in trouble from there on out.

Another pc, he accidentally gets into something of the sort on one terminal. Repeater Technique is nothing to be running this one terminal on, particularly, and he's going down track and up track, and it's not something that is happening chronically, something like that. You decide, well, I better do something about this, so you take it up with two-way comm or something like this, and you pull a little bit of the charge off the thing. The best thing to do that with would be Not-Know or Forget or something like that.

The guy started charging backtrack, you say, "Dentist. Dentist. Dentist. Dentist." And then he's going bzzz, and he's backtrack. Bzzz bzzz, and he's backtrack. Bzzz bzzz. And then you say, "Dentist. Dentist." And it's getting hotter and hotter and hotter. Well, in the first place, let's ask this question: What are you doing repeating a terminal too many times, that is getting hotter and hotter? See? There would be mistake one. This is how you can keep out of that kind of trouble and not have to confront this problem.

Why worry about it? In the first place, if you just read a terminal without any bric-a-brac, just read a level – just read a terminal three times to a person, and it is still reacting on the needle, it's not going to erase, that's for sure, without some ardure. So, the best program is to leave it alone. Don't score it out. Skip it. In other words, you take terminals off in layers. You don't take them off by the terminal. You take them off in classes of terminal. You got the
idea? You finish up reading a whole list of terminals, and you're left there with fifty percent of the terminals still alive. I'd say that was pretty good. Seventy-five percent of the terminals still alive. You only got rid of twenty-five percent of the terminals on the whole list. I'd say that was pretty good. But remember you would have done it very rapidly.

Now you go back over it again. You go back over the remaining seventy-five percent, and you'll find out that only ten of them disappear on this read. And then you go back over it again, this whole list which is now getting to be a minor list indeed. It's only got thirty on it, or something like this. And you go over this list, and all of a sudden they all scrub. You watch this phenomenon. You practically just read them once, and they're gone, except one. And boy, that's good and solid. You apparently have got something there.

So we ask him for some more terminals, and the second we've got more terminals, we go back over them, and we pick up this one that was red-hot, and we all of a sudden find out it's flatter than a flounder. We read it once, it's gone.

And I would say the only way that a person would get too messed up on the whole track – the only way that this could occur or would occur, is where the auditor is trying to scrub terminals that aren't going to scrub very easily. And that you shouldn't be so arduously trying to scrub terminals, and I'd say that if you had this rule – it's just a rule of the thumb, you know – you read the thing three times and it's still alive, leave it. That's a light look, but after you've read it three times, on the third time it didn't react – you know, one, two, three, third time it didn't react – go ahead and scrub it. Read it four or five more times, and it'll scrub. But after you've read it four or five more times and it's still get – it still seems to be very alive, don't get hectic about erasing it. Just leave it. You made a mistake.

But you should be able to adjudicate on the first three reads of a goal or a terminal, whether or not that thing is going to go or remain. And if you get very good at it, you will be able to make that adjudication in the first three reads, and if it's there, it's there. Don't feel defeated because it's still there. That's fine. So it's still there. But if you are trying to erase a terminal or a goal, which after three reads looked like it was going to stay there, and you now read it twelve more times, and it's still going to stay there, but it seems to be less. So you press on and read it eight or nine or ten more times, and now it disappears, you're liable to find the fellow has been pressed onto the whole track. You get how this would happen?

He'll only go on the whole track with terminals or goals which are extremely alive and are usually interdependent on other terminals, classes and goals, you see. So if you want to keep your pc off the whole track – not that that is vital either – but if you want to keep him off the whole track in a Goals or Terminals Assessment, why, you'll follow this three read rule.

You know, it looks like it's going to stay after three reads. Well, let it stay. Looks like it's going to go after three reads, well, take four or five more and see if it's going to disappear. And if you follow that, you'll get very minimal whole track proposition.

Now a pc that is having trouble going up and down the whole track is probably being assessed out of PT with the rudiments out. A person will more greatly tend to go onto the whole track if the rudiments are out than if the rudiments are in. So I'd say if the pc was plunging around, I wouldn't take up these things that put him on the whole track. I would leave them alone, very severely, and I would move off at once, off my assessment. I would
end the session with end rudiments. I would start another session with beginning rudiments with a break between. And now I would proceed along the line of read them lightly. If they look like they're still going to be there, leave them. That is the way I would handle that situation.

It is very true that a person can be plowed all over the track, all over the track with goals, reads, and repeater, and that sort of thing, but ordinarily it is done with the rudiments out, and they'll go all over the track, or one is trying to erase things that are trying to stay. And one is in a kind of a games condition with the pc.

He's saying, "Well, here's a goal."

And you say, "No. You haven't got that goal", you see. And that kind of a games condition develops, of course he's going to go all over the whole track.

I would say that rudiments – the cure for that is get the rudiments in, and read them more lightly, and be quicker. Be very quick on adjudication as to whether they're going to stay in or go. After all, you're trying to find the fellow's goal rather than get rid of the fellow's goals. You're trying to find a goal that is all up and down the thing.

Now at the same time, this must go along with a Goals Assessment, since a Goals Assessment itself is not just a pre-therapy action, but is an action which is right part and parcel of auditing. It is auditing.

So the individual gets into some kind of a goal area that needs considerable discussion, needs considerable elucidation or something of this sort. And he's into some kind of a snarled up package of goals one way or the other, and he can't make head nor tail out of it. I would just patiently have him list all the goals he could think of out of there and use a lot of Not-Know in trying to get the patches of goals out of there. I'd settle right down in the middle of the list to get some more goals out of this thing if he's so snarled up. You get the idea?

He says – oh, I'll give you an example. He says, "Well", he says, "I want to burn down the town", he said. This has obviously been a goal of longstanding – burning down a town. "And I want to burn down this town. I want to burn down this to..." But that's just really not the goal. It's quite an ordinary situation in Goals Assessment. "Well", he says, "it's really not the goal. It's really not burning down a town."

Well, now if you want to take it the long, arduous, involved, and upsetting way, if you want to take it the long way and the wrong way, go into "towns he has burned down". [laughter] See, this is the wrong way to.

Now, the right way to take it up is to find out how many other goals are buried in that immediate vicinity. And you'd run a Not-Know on the situation, you see.

"Well, could there be any goals you have forgotten like that?"

And he'd think it over and all of a sudden, why, two or three more goals pop up, and suddenly this thing will clarify for him. And he'll say, "Well, it's not to burn down a town. It's to singe people. Come to think about it, when I was a little boy, yeah, that's right. Oohhh-ohhh-ohhh, wait a minute, man." You know. "I was always throwing firecrackers under peo-
people's feet and sticking burning matches, and so forth, around them and yeah, it's 'to singe people'. That was the goal."

Yeah, now he's happy about the whole thing, and you go on with your assessment. But you assist the pc to clarify his goals, not assist the pc to clarify his track. Best way to do it is Not-Know, Forget, other things of that character because obviously if he's mixed up, it's because he's forgotten something. Ergo. Does that answer your question, John?

**Male voice:** Yes, that does.

Okay. All right. Any other questions? Yes.

**Female voice:** Yes. I'd like to know what it is that happens to a goal that just seems to seep away. I can see what happens to a goal when it comes at the end of a chain you say, "Oh, well, that's it. That's fine. I get the whole picture now." But sometimes they just die on you.

Yeah. All right. Well, you want to know what happens to a goal that just dies. Well, actually, you move the fellow. It's the degree that you move him out – the velocity with which you move him out of the zone he had this goal.

First place, we have to take an anatomy of goals. A goal is a not-hereness. See, it's a not-hereness. It's a non-existence state. This fellow's on this desert island, and he looks around, and he says, "I would really like to build this place up." Well, that's a mild one, you see.

Well, he's already expressed dissatisfaction with havingness. He's expressed the dissatisfaction of the desert island. He can't have a desert island, you see. This is probably why he was forced into this goal. He can have the desert island and decide to build it up, too. Well, that goal is not very upsetting on the track, believe me. There's nothing to that. That probably won't even come up.

But there's another one, see. That he's standing in the middle of this desert island he says, "The hell with this place", he says, "There's no water. There's no blondes. There's practically no modern conveniences of any character." And he says, "That's it." And he says, "I'm just going to have to build this place up." He says, "I've got to. I've got to build this place up because there's just nothing here, and there's nothing doing, and you couldn't live on it, and so on, so I got to." So he sweats himself half to death and he goes in a heroic cataclysms of one character or another, and he's got this big goal to build up this desert island, and here he goes, you see. And so help me Pete, you find a desert island sitting on the track.

Well, what takes him off of this desert island? Is the fact that he had a goal not to have a desert island, didn't he? He said, "I've got to build up this desert island." Now he's immediately got the obverse goal understood in it not to have a desert island. So of course, he's stuck with a desert island. You see, he couldn't have the desert island by postulate. But he could have the other situation.

All right. You run into something like that, and you run into consistent goal of that type, and you get a whole chain of goals of this particular type, and you get this whole long line of can't-haves of great violence. Well, man, that will be one of these goals that – that's it!
Well, supposing he was just standing there and every time he got on a desert island he got into wars, you see, and that sort of thing, and he kept being shot down on desert islands and that sort of thing. And he says, "Oh, ho-hum." He said, "I will have to fix up the place a bit, you know." And he doesn't make much of a postulate not being able to have it. But this has been a consistent practice of his, you see. He's going to fix up this desert island. And the importance of it is not very great. You repeat it, it just seeps away. It's the relative importance of the goal and the relative importance of the goal is the relative can't-havingness of the goal.

In other words, all mass transfers from the existing environment to the goal, so the goal becomes mass, and the environment becomes no mass. Importance is mass. In thinkingness, when you say importance, you mean mass. Well, if there isn't much mass attached to this goal, and there isn't much can't-have on the mass he did have, why then, it'll just fritter away. There won't be very much charge on it. It'll just disappear.

But if the reverse is true, if the reverse is true, well, you get this: He could have the desert island. He thinks desert islands are fine, so he's going to fix it up. And you strike that, and you don't even get charge on it. There's not even enough charge on it to put it down.

Why isn't there enough charge on it? Because the individual could have what he was changing. Now, the reverse and the most charged goal is inevitably the degree of can't-have that he ran on his surroundings while formulating the goal.

He sees this marvelous army, and it's arrayed in battle array. And it is about to attack the army which he is heading, you see. And he sees this marvelous army, and he says, "That must cease and desist. We must triumph over the Franks. We must smash'em. We must turn their country into a shambles and ruin. We must really wreck this outfit", he says, and then lays on Macduff and really wrecks the outfit, don't you see? Ka-wham, wham, wham. Don't be surprised in his next life if he becomes a Frank. Why? What happened?

Well, he couldn't have, he couldn't have the Franks. He couldn't have their army. He couldn't have any part of them, and yet this is a very violent, capable-of-motion, important unit. And so he's saying can't-have on a very important have, don't you see. And he runs can't-have with violence and therefore he can't have the property of the Franks or anything about the Franks and so forth, and his goal is then expressed to you, as to be Emperor of the French. You see, this is what he expresses it as – to be Emperor of the French. This is his goal. He decides this is the case.

Of course, that's a Johnny-come-lately goal. There's some earlier goal actually which amounts to this. To smash that whole, con-blam, cotton-picking army. The whole ruddy works, you see. And this is a failure. And then he walks up to a new failure. And he finally gets up on top of this thing, and he says, "Well, the only way I could have the French and so on because I can't have the French and uh..." There we go. You see. And he's all into confusion about it.

All right. You knock out the goal, and he – even for an instant, you see – perceives the havingness as a result of... you know, he's now not making the postulate of the can't-have. So all of a sudden he can have, so all of a sudden it blows. It's a very, very rapid mechanism. You hardly see the thing happen, it's so quick. And you're restoring havingness up and down the track like mad. And you get – you get this fellow – his goals are all can't-haves. His goals
are all escapes that you register, but it isn't true that every goal he's ever had is an escape goal. See, all of his goals aren't based on can't-have. To some slight degree, the fact that he changes an environment, of course, deprives him of the old environment, but if this is not very important, you get no registry.

You get the conduct, by the way, of the West End kid. Just measure this up. Here's the West End kid in New York, you know. He's down around the docks, and he's — boy, he hates the tenement, he hates the drunken father, he hates the this, he hates the that, you see. And he hates the public school. And he doesn't want to do this, and he doesn't want that, and so on. And he has this tremendous goal to become a rich and powerful beer baron or something. That's the thing to be, you know, and here's this goal to be a beer baron, and the more beer baron he gets, why, the more he stinks of onions and flats.

And you get this boy after he's moved up in life. You say, well, anybody moving through various stratas of culture certainly will pick up some of the culture. How come the West End kid, notoriously by reputation, never picks up culture when he moves upstairs? 'Cause he's got himself pinned in the tremendous can't-have of a culture which has overwhelmed him already. And he can't get rid of that culture.

And it doesn't matter how many yachts and butlers and anything else he gets as he goes on up the line, he winds up at the top stinking of onions. You got the idea? He's still got the environment because he couldn't have the environment.

All right. You audit him. And you run across the goal — he's got to be a beer baron. And all of a sudden something happens because simultaneous with it went "can't have the West End", you see. And that is the obverse, so it tends to blow. And he'll understand this.

Now a pc being audited on goals who isn't permitted to inspect this, every now and then, or who doesn't see any part of this or doesn't inspect any part of this, is going to make a slow freight.

Got something going on here that we can't quite put our finger on. So it must be that the goals are pretended goals or it must be the goals are just made up to satisfy you or he isn't telling you all of his goals, or there's something wrong with the Goals Assessment. There's something wrong there. There's something wrong with the type of goal he's giving you.

And of course, his can't-have on environments is so great, the goals themselves stand independent of and disassociated from the can't-haves. You got the idea?

The second he gets in the middle of a desert island, why, he wouldn't say "I've got to build this place up". He wouldn't say, "I've got to get out of here." "If I live through this, I'll have to own some Brown Derbys in Hollywood." You know. Now he's getting a little bit dis-associated, see. He's on a desert island, and his goal on this desert island is not even to live through it, you see, but not to have it happen again, see. So his answer to that is to own a Brown Derby in Hollywood. And this is totally disrelated. How come? You run across this goal, it just doesn't make much sense. What does it go back to?

And your pc will also be rather bemused sometimes about this thing. And he says, "Well, to own a chain of Brown Derbys in Hollywood." He's on desert island, you know. This isn't Hollywood, see. When he says, "Brown Derbys in Hollywood", he expects to get a pic-
ture of Hollywood, you know, and funny looking, very gilded, polished-up drive-ins – which is all they are, actually. And – he expects that, you know, and he doesn't get that, he gets this desert island. And it leaves him in a "What the hell is this?" you know.

And your pc starts bugging on this sort of thing. Recognize you're looking on a disre-late. It's a disassociation. In other words, the can't-have is not associated with the goal. "To become a great restauranteur." And he's in the middle of an island in the South Pacific. Well, you can connect that, you see.

But how about this? "To sell fountain pens." And he gets a picture of a desert island. This doesn't make a bit of sense, see. It doesn't make any sense to him either. Because he doesn't remember this, and he can't even quite figure out how it was. And there's some devious methodology by which he has been on a desert island, and he couldn't write to anybody or he could have written to somebody, don't you see, if he had just had a bottle and some ink, you see, and he figures out this is his only method of getting out of this and can't-have the desert island, you see. And this is totally stopped because he can't figure out any way to make any ink, and he gets the idea, if I only had a fountain pen. The best way to have fountain pens, of course, in abundance, would be to sell fountain pens. And he goes kind of buggy, you see. And he says, "Well, I think I'd love to sell fountain pens." And he says, "Sell fountain pens", he gets a picture of a desert island. See, the can't-have of fountain pens is a desert island. And that doesn't make any sense to anybody.

So he gets pretty confused. Well, what is there, there? There's a not-know there, isn't there? There's not only a can't-have, but there's a big forgot, and a big Not-Know, and a big Disconnect, and something of that character. And you're totally within your rights to work over something like that. Just because a guy was cruising around on the track, I wouldn't try to help him out much. So he's cruising around on the track. It won't kill him. These conducted or nonconducted tours. Sell him a season ticket to his own bank. [laughter] Don't do anything drastic about that, but the bird's saying, "Sell fountain pens? Yeah, well, I had a goal to sell fountain pens, all right. Yeah. I – I – I did. Yeah."

Well, if you're just sitting there grind, grind, grind and you don't understand the mechanism of what he's going through, you never ask him burning questions such as "what desert island are you sitting on", you know. In other words, "what are you looking at?"

He appears to be quite mystified by his own goals. He's got a disassociate or he goes over into Pretended Knowingness, you know. He knows what his goals are, but they had nothing to do with anything. And you say, "What are you looking at?"

The guy says, "Well, I want to own the Brown Derby in Hollywood and start a whole chain of Brown Derbys."

You say, "What are you looking at?"

He says, "I'm looking at a desert island."

You say, "You remember when you had that goal?"

"No."

"Well, what's unknown about it?"
"Ha-ha-ha. Oh, well, I remember that. Yeah, was ha-ha-ha. Yeah. Yeah. I was on this desert island, see. And I all of a sudden realized there was no food in the joint. And about the best way you could have food, you know. And when I finally got out of this thing, I figured out well, that's it. Yeah. Hey! What do you know. Hey! That was some island."

Well, he's actually removed himself from the desert island, you see, forevermore. You can kick that just like that if you know these mechanisms. You can make the associate happen. And your long, arduous, apparently disassociated goals list that had stemmed from that particular source will, of course, all of a sudden connect and start blowing like mad, because you're making the guy connect. Now you can get down and make somebody connect any way you want to now that you've got Not-Know and Forget and so on.

What would be unknown about making that postulate? What would be unknown about having that goal? What would be unknown about such a goal? Where would one not want to be when one made that goal? That, of course, would be an unusable but a very involved question, but a very factual one. Where would one not want to be when he made that goal? Or what would one not want to know about while he was making that goal? And that, of course, is a very workable one. What would one not want to know about while he was making that goal? And of course, the guy's bank is liable to do a 3D shift. And it's not all disrelated.

You know, there are people walking around all the time whose pictures don't associate with their existence? Of course, they're very baffled by this. Electronics engineer, wouldn't you know it, he's -- was up in my office one day. I said, "What are you looking at?"

And the fellow says ... Well, I says, "Come on. What are you looking at? What are you looking at? Do you look at something all the time?"

"Well, yes."

"Well, what!"

"Well, it's a window."

"What window is it?"

"Well, it's just a window."

He had been sitting looking at this window for seven trillions of years. Place got atom bombed while he was standing there at the observation post. I ran him a little while on the responsibility for the window, and for the incident. I've told you about this before, and he actually went outside in his engrams, you see, and got in a car and got the full kinetic of a space car, you see, pulling up a hill and going over the top of the hill with the hoomph! you know. He got the full kinetic of it, you know. He's been just over the top of the hill ever since, sitting right there, but... [laughter] I didn't take it any further than that. But he's a man who was over the hill anyhow.

But now, that fellow, of course, must have been every now and then pretty mystified. What was he doing with a picture of this picture, you know? "What's this window? It must have some religious significance. Maybe it's the window of light. Yes. Maybe it's the window of the soul." [laughter] Somebody says, "The window of the soul." you know. If he'd become
a poet, he could have become allegorically lyrical, Miltonishly *blah* on the whole subject of the window. "Window, window, endure, endure. Prehav, Prehav, Prehav."

And you find him worshiping window or something of this sort. You'll find him never able to go by an arched window. So go bing! bing!

Well, now look. In order to have that stuck picture, he had to make a can't-have on the window. It was a can't-have there. And he had to have a goal there. And he had to say something else, you see. He said an *I've got to be*: *I've got to be elsewhere* or *I've got to be a...*, or *I've got to do forth*. And maybe there were a lot of them all occurring at that.

Now, instead of taking it apart with responsibility these days, I'd ask him about "What about the window had he forgotten", or "might he forget" or "was forgettable about the window." And having asked him that a couple of times, I'd ask him "What else would one – what would one really want to be doing while one was looking at a window like that?" And probably the basic goals of this lifetime would have just come off *brrrrrrrr*, you see.

He must have made a whole lot of very, very tough postulates, and the whole environment overwhelmed him at the same time. And a whole lot of not-there sort of postulates, you know, of be elsewhere. And no as-is of this, and no acceptance of this in order to stick himself that thoroughly. It must have been a very complex situation, but expressed in terms of goals, he was postulating elsewherewheres while being thereness. While thereness was occurring, he was postulating elsewherewheres, you see. While he was in one being, probably he says, "Never again shall I be an officer of the Upper 3D Galactic Space Ranger Empire. This is it, man." And he expresses that by saying, "I think I'll be a janitor in my next life." See, his be-ingness is invalidated.

Possibly, you could romance as to what was behind this exact picture, but the very great possibility, which he didn't admit to, was the possibility he was actually, probably, responsible for safeguarding this particular zone, civilization, or area. You see. He was probably the boy who had said, "Well, now, I'm the boy who's supposed to safeguard all this and I'm taking care of it." And probably it was being done with a huge number of electronic mechanisms of some kind or another, you see, or something like that. And his postulates made then are carrying forward now. And he's in electronics, and he's trying to build a what? He doesn't know. So very often he feels very pointless, you know. He builds something and it goes into a little box and it makes a whistling sound, you see. And that's great, but that isn't it.

And everybody says, "But that is it. That unlocks the door, you see. I mean when you press this button, the whistle resonates, and it locks and unlocks the door, and it does it." "And *well-ell*, I don't know, I'm not satisfied with it", you know. And he gets a reputation as being a perfectionist. Actually, he's no perfectionist at all. He's a not-thereness case because that isn't what he had to invent to prevent the destruction of the city. See, he had to invent a gadget to prevent the destruction of the city, but he never formulated it. So he's still trying to formulate the gadget for the destruction of the city.

In other words, he's got a game going here, and the game is simply the formulation of gadgets which prevent the destruction of cities. And we run a can't-have on destruction of cities on other people by the formulation of gadgets. And you'll find out this'll slop over into
his life. It regulates his whole life. It's just like he's in an Iron Maiden of "I-am-supposed-to's", you see.

He goes down the street and he finds that the people emptying the wastepaper – litter baskets, you see, they bang the cans back and very often dent them, you know. Or they bung up the sidewalk or something like this, and he feels very something or other about that, you know. He's quite emotional about it. He writes letters to the *times* and does all kinds of things. He's very upset about this. The preservation of these litter baskets and so on, you see. It's all just a tiny little gradient of the destruction of the city, don't you see.

And he's very preservative in this particular line. And he sees somebody tearing a building down to build a skyscraper, and he says, "Oh, no. No, no, no, no, no, no. That shouldn't be. Hm-mm. Hm-mm."

Shouldn't be. Somebody is moving a brick in this city, you see. That's the basic thing, is somebody is changing something slightly about this city that looks like it might possibly be a destruction. And he can't even analyze that it's a betterment of it, see. And he gets this instantaneous emotional response that he himself can't analyze. And it'll all be pinned up on that series of goals which are right there, looking at this window.

You see how the mechanism of Goals Processing works? If you understand the exact mechanism of why it works, you can make this thing fly. And nobody's going to tell you, you shouldn't make it fly, either.

There's ways of making Goals Processes fly like mad. You – pc says... "Well, have you got a – what goals have you had?"

"Well, I've had a goal to keep my job and wash my teeth every morning and – um – make a fair salary, and I've had a goal of being not too observed in life. And I've had a goal of, well, I've had a goal of just doing my job. And that's it. That's it. That's right. That's it."

"Well, do you have any more goals?"

"No, no. I told you, I told you. That's it."

Well, now from this point on, don't you see, you always get to this point with a pc whether or not he's given you a hundred and thirty or three. That point occurs when he's telling you that's it and there are no more. When you've just about at that point begun to knock on this door, see, of the E-Meter and you're saying, [knocks on the table] "Hey! Hey! Open up and show us the stuck picture, huh?" *Uhh-uhh.* Be painful. The thing is an overwhelming situation.

Now if you led in on a gradient scale like this, and he gave you "to have a job" and so forth, and you say, "Good. All right." And you write it down.

And you got this list, and now you go back over the first one of these things, "to have a job." And you say, "Well, all right. That's fine. All right. I'm going to read this goal to you. To have a job. To have a job. Well, what picture do you have?"

"Well", he says, "it's this big granary. And there's these huge machines, and so on. Well, I've never seen that picture before much except it's there all the time." [laughter]
"Well, that's fine. Let's see what this is all about." See.

But we can go on and say "To have a job, to have a job", and it disappears, and we say, "You got the picture now?"

"No."

We didn't learn anything more about it. We didn't have to. All right. And "To brush my teeth every morning", and you say, "To brush my teeth every morning. To brush my teeth every morning." This thing is increasing. "All right. Let's go to the next one." And so forth. And we read that one off and we get that one erased. And we get back to this "brush my teeth every morning." We say, "To brush my teeth every morning." And it's increasing.

"What picture you got there?"

"Oh, it's a seascape."

This is pretty wild, isn't it? Brush his teeth – seascape. Well, at least there's water in both of them. [laughter] And you say, "Well, tell me some more about that picture."

"Well, there isn't anything more to tell you about the picture. It's just a seascape", and so forth.

And you say, "Well, is there anything you've forgotten about that picture? Anything you'd rather not-know about that picture? Anything you don't know about that picture?"

"Anything I don't know? There is everything I don't know about the picture. I don't know what sea it is. I don't know where it is. I don't know where it's located. I don't know anything connected with it, so forth. Don't know this. Don't know that. Don't know the other thing, and so on."

And you say, "Well now, what do you know about it?"

"Oh, well, I can tell you a little more about it now", and so forth.

And all of a sudden he says, "You know, that's funny, I'd forgotten all about that, but in World War II, I was a scuba diver. And we used to have to go in, you know, locate these mines and stuff under the water all the time. I was only on that duty a few months. Funny, I'd forgotten all about it, you know. And it's the taste of this god damned oil. This god damned oil, you know. I can taste it now.", you know. [laughter]

And you say, "Well, what do you think a fellow chewing on oil like that would think he ought to be doing?"

Well, he says, "He ought to be brushing his teeth every morning!" [laughter]

That's the end of that goal. See how you could knock them out? You could just knock them out by the count if they didn't go very easily or something of this sort.

And then you eventually will get onto a goal line on the bulk of cases which is "every time they're in a tight spot they say 'I should be a schoolteacher'" Doesn't matter what's happening to them. They're running a P-99 Interceptor, and they just shot down their hundred and
fifteenth enemy plane, and at that moment the instrument panel disintegrates in front of them, and they say, "I should be a schoolteacher." You see.

Or they're a clerk, and they're selling bolt goods in a store, you know. And they keep selling these bolts goods and so forth, and people keep saying take down another one. Take down another one. And the whole store is at last nothing but bolts of cloth, all unstrung, and the lady says, "No, I just don't see what I want." And they say at that moment, inevitably, "I should be a schoolteacher." You see? And it's just the goal which, for some peculiar reason, it is so asinine, it doesn't connect with anything, and they never do become a schoolteacher except this lifetime. And now by accident they became a schoolteacher. And being a schoolteacher, of course, puts all of these things into restim.

And they're having a hell of a time in life, because, you see, they're shooting down their hundred and fifty-fifth aircraft with a P-99 Fighter and so forth. They're teaching the little kids, you know: say your A's, say your B's, say your C's – and these guns are going off, [laughter] here's the pilot, you know. And then they finally say, "Well, I guess I must be a nervous type." You see what's happening. God help somebody who has actually realized his chief goal on the whole track. [laughs]

You see what – you see the words and music that would go on as he started to run it out. So that is what goals are all about. But you could actually sit there and take apart any goal that was sticking. You could take it apart similarly if you ... You should investigate the mechanism, you should get a subjective and objective reality on some of these mechanisms and see exactly how they look to you. And you could play it by ear. You won't be sitting there slavishly, you know, saying "Well, Ron said read it three times, and I don't know why I'm reading it three times."

Of course, you're in a game situation, too, because you're sitting there reading it three times and you're liable to say to yourself, "Well, I wish I was a, a..." [laughs, laughter] There goes your old games condition. You get into a games condition on the subject of a goals condition. And you see how easily that could happen?

So what you should do is observe. I'll tell you a fundamental auditor error. Do you want to hear the fundamental auditor error? A fundamental auditor error is to fail to discover what the pc is doing with the auditing command and what the pc is looking at. All summed up under what the pc is doing – subheads, observing, thinking, feeling, any other subhead you want – but all summed up under: What is the pc doing? What's the pc looking at? What's the pc involved with now? Does the pc all of a sudden run into a problem here? The pc's aspect changes, any way, better or worse and you don't find out about it – oh, what the hell! What are you doing? Flying on instruments in the fog and rain in northern England? What is this all about? Why should you do that? There's no point in it.

The pc's sitting there. Now the pc is supposed to be in communication with you, but how about you being in communication with the pc? See, that's the other side of the coin. And let me tell you, you'll fold up someday if you don't keep the other side of the coin bright.

Pc in communication with you. That's supposed to be in the rules, but how about you staying in communication with the pc? And that is all under the heading of "Just what's the pc doing?" You know? What's going on? What's cooking, good looking, you know. That sort of
Q & A PERIOD, ANATOMY AND ASSESSMENT OF GOALS

a thing, you know. What's happening here? And you should make it a point, even though it makes your auditing terribly arduous and is very clumsy at first and seems to extend it out ad nauseam and puts hours in on – on a result length from your viewpoint, you know.

It wouldn't matter. This wouldn't matter. Just every time the pc does something different or every time the tone arm goes to a new high or a new low, you know. Not each time it flicks, between, you know – while it's rising. But it finally gets up to 4. It's been going from 3 and a quarter on up, and it gets up to 4. And it seems to be hanging there at 4. Say, "What's happening?" You know? "What's happening?" You know? It means something. Pc twitches. Pc does something else. Pc coughs, sneezes, seems to get his eyes watering.

Change has occurred. Investigate the points of change. No change is occurring. Investigate the points of no change. Find out what the pc is doing. And the pc very seldom resents this. It's a primary failure in auditing. Has been the primary failure since 1950. It's a failure to discover what the pc is doing. What's going on? Now when I tell you that every time you've got a goal that was sticky on the pc, the pc had a picture, how many of you have asked and found this out as a personal observation. And how many of you have found out that it's always a disrelated picture. If it's really stuck, it's quite disrelated.

Brush your teeth; he's got a seascape. Got the idea? Every time you say brush your teeth, he's got a seascape. What's this? Your curiosity should be aroused about that point; you should find out why. It's an interesting thing.

Now, wrong thing to do is go chasing all over the bank and chasing seascapes all over the bank, and trying to run engrams all over the bank, and that sort of thing while doing a Goals Assessment, and just restimulating everything in sight, and so forth. That's not what I'm asking you to do. I'm just asking you to find out what's there and get the pc to look at what's there. Because the more you make a pc look, the more the pc's going to as-is, and the more the pc's going to understand. And that's for sure. That's a cardinal law.

And the auditor who won't make a pc look, the auditor who is not himself curious about what's going on with the pc, presents to the pc an attitude of disinterest. And if you feel your auditor is disinterested, just attribute it to one thing: He's probably just going over the methods by rule of thumb, and he's not asking you what you're doing.

Now on the auditor's side of it, you would present the same aspect, if you never asked. And the way to present an interested face is just be snoopy. The way to convince a pc that you're terribly interested is not protest and demonstrate you're doing your job right and all of this sort of thing. That is not the way to go about it.

The way to go about it is simply to be snoopy. "What are you doing? What are you looking at? What's been happening?" You get the idea? And you get some kind of a brief answer, and it doesn't seem to be leading anyplace. And it doesn't mean very much. Well, you say, "All right, all right, all right." And you're liable to find out that this is the reason ARC breaks are being caused with the pc, is you're just not being snoopy enough.

Now, that's a hard thing to teach to people who have been educated into "the invasion of privacy is bad." But in this particular case, the invasion of privacy is absolutely necessary. You've got to find out what's going on. The pc's eyes go shut on you. The pc's been sitting
there brightly alert, and all of a sudden goes blooong, and so forth. Well, the second it happens, don't jump him. Don't be so quivery. Look at him for a command or two. Now say, "Now, what's going on?" The pc's surprised enough at first, you see, without you surprising him too. [laughter]

But, let him have it for a couple of more commands, and then say, "What went on?" But maybe a couple of more commands, his eyes opened up, and he was bright. And he's all cheerful. And again you say, "What happened?" You know? I don't care how you say it. You don't have to say "What happened?" or something like this, see. You say, "Hey! What happened?"

"Oh, wow!"

You know? He's liable to give you some kind of a stuff like this, and he's never had anything much to say to you before, you see. And he's saying, "You see, all these dark octopuses came swimming up out of this particular area. What do you think that has to do with getting my watch fixed?"

That's fantastic, you know. What's it got to do with it, you know? And you found a heck of a big not-know on the thing. Well, help him out. Say, "Well, what have you forgotten about octopuses?"

"Huh, they're timely." I'm sure it's something like that. "That isn't right. No. No. That isn't right. I don't know. What have I forgotten about octopuses? Forgotten about – never knew any octopuses. I never met any personally. What's it got to do with getting my watch fixed?"

You say, "What have you forgotten about watches?"

"I don't know. I haven't forgotten anything about watches, except I'm always forgetting the t – I always forget my watch every morning. I always forget my watch every morning. Oh, I know. I know. My first wife, ah, yeah, I got it. She ought to say, 'If I had as many arms as an octopus and carried a watch on each one of them, I still wouldn't know ...' " [laughs, laughter]

So what he's got. He's all – you're all ready, you see, for a whole track exposé, you see, and you get something totally different. That's it.

Now, I want you to get snoopy and you'll see this goals mechanism. The not-is of where he is and the elsewhereness of where he is, then inhibits the where he is, so of course this sticks the whole bank and gives him a whole bank and gives him his reactive mind.

The primary source of the reactive mind is not hidden creativeness. It's hidden elsewhereness. The guy wants to be elsewhere all the time. Well, if he wants to be elsewhere all the time and he creates where he is, he never as-ises it, and he winds up with a whole kit and caboodle, doesn't he? Which, I suppose, at some time on the track, he considered a nice trick in order to accumulate havingness, but he has since found that it was more of a curse than a trick. You see what that is?

So the creation of the reactive mind depends on elsewhereness. Elsewhereness is best expressed by a goal. All goals, of course, run back to an area which is not-ised, or which he
didn't want to have anything to do with. I want you to look at this mechanism while you're assessing, and also in using your Security Checks, run Not-Know on the incident that turns up. This is the Goals Assessment I've been talking about in this lecture, so I don't want you to get disoriented here. The question has to do with rape. You say, "What's not-known about rape? What have you forgotten about rape? Is there any rapes that you've forgotten about?" Some such question. "What shouldn't be known on the subject of rape?" Anything like this. Bang! You start to get reactions all over the place, and he's in the middle of a heck of a great big incident of some kind or another. Well, don't expect some automaticity's going to erase the incident. Ask him what he could not-know about that incident. What's unknown about that incident? What's he forgotten about that incident. You got the idea?

Flatten the incident. Get the needle action off of the incident. And then get the needle action off of the question again. In other words, when you're taking a security question and running Security Checks by Know and Not-Know, Forget, Remember, you know. When you're running them that way, take the needle action off the question, for sure, as your basic goal, as it always has been. But when incidents turn up, take the needle action off the incidents with Not-Know. It's a fast way and it'll run engrams very heavily. In other words, you're doing two things. You ask him Not-Know about rape, and he's all of a sudden stuck, for God's sakes, in the middle of something wild about rape.

Ask him what he can not-know about the incident, and ask him until that needle goes cool.

Okay? Right.

[end of lecture]
UNKNOWN – CYCLIC ASPECT OF GOALS

A lecture given on 16 August 1961

Thank you.

This is the 16th of August, AD 11, and the subject of today's lecture is "unknown". By the way, there's a letter up in Suzie's basket, and there's an unstamped letter up in there, both very important, so let's make sure we get them tonight in the mail. It's very important. One has to do with boats, and the other with photography. [laughs]

People get the idea that I don't do my job. Actually, they believe probably now that I'm never going to write this book about SOP Goals clearing. And you'll notice that I wanted the Prehav Scale complete before that, and I was not satisfied with our Prehav Scale. I didn't think it had completed its evolution. And sure enough, we have various levels on the Prehav Scale. Your Prehav Scale, actually, should have No Motion taken off of it and Problem put in its place. And all of the emotions which have ever been listed, any emotion which has ever been listed at any time, in any scale, any place, goes in the Prehav Scale, ending with Hide. Hide is an emotion. It's the bottom of the Prehav Scale. It isn't really the bottom of the Prehav Scale. Unconscious is below that – but try and run it.

So into your Prehav Scale, pour the whole Knowingness Scale which ends in Hide. Bottom of the Knowingness Scale is Hide. Bottom of the Emotional Scale is Hide. And these two things come down in a parallel and suddenly turn into a V at the bottom. Interesting, isn't it?

But there's where the Emotional Scale and the Knowledge Scale cross – at Hide. Knowledge becomes an emotion when one hides. If you don't believe it, watch somebody who knows something that somebody is after him to find out. He's actually not registering any other emotion than Hide, and it's a bad emotion. I mean it's uncomfortable. And that is why your Security Checks work so well.

All right. There's one more item here, and that is the organizations are about to get a Security Check, which is a Security Check, and I will go into this very rapidly.

It is Security Check Form 7A and Form 7B. HCO WW Security Form 7A and HCO WW Security Form 7B. And these are the pair which will be making their debut very shortly. And you should be aware of the fact that those two Security Checks now, all by themselves, are run without clearing. They have two different purposes. One is for employment with an organization, and that is 7A, and one is for the person who has been on staff for some time.

Yeah, that's right. That's – 7A is for the person who has been around for a long time. And 7B is for the one who is newly seeking employment with the organization.
Now, I'd better clear this up with you because you say, "Well, Ron never said anything about that", when you get home. And you'll have an argument of some kind or another, so I'd better clear it up right away. Those things are used just like the original Security Check was used.

We don't now have a valid security form which is used for its original intent and purpose or is used the same way. They've all moved over into processing. And you can clear any of them. So 7A and 7B – luck or unluck, the word seven; indivisible prime number – is an uncompromising check. It's easy to remember because seven is a sort of a nonmathematical, nonfactorable number – noncompromising.

It takes only about ten minutes to do one. It is very short. They have only about twenty questions. Those questions are all blood questions. They would be the kind of a thing that if the fellow did that kind of a thing, you wouldn't want him in the Central Organization. You got the idea? So you read it for instant read. And you just start at the top and you go to the bottom. And if the needle falls, he's failed it. The only other precaution you would take would be the compartmentation of the question. And if the needle is falling on it, obviously, not on some of its component parts, that's it. The Security Check is flunked. That's the original approach.

But now that you know about instant read and latent read on a Security Check, this makes all the difference. Now, it's only instant reads that flunk. This is not one of the questions, but "Do you make a habit of getting your fellow staff members fired by spreading tales about them?" or something like that? You see?

All right. Instant read. Bang! Happens right now. That's it. You don't clear it. You find out if the needle is falling on the question, but you don't clear the question. You don't want to know anything from the person you're administering that check to. You don't want to know a thing. It's just totally between you and the E-Meter. If it falls, that's it. He's had it.

It's a matter of "get audited!" It's a matter of this, a matter of that. But he has flunked a Security Check, and it's an insecure personnel. Now, remember, this check can only be that savage because it only has vital things which would get the organization or its staff members in trouble if this person were consistently doing them. You understand?

And so therefore, it hasn't any fog questions to it. So when doing this thing, don't go adding any variations to the questions. That's the other rule that goes with it. Don't go varying this thing around as though you were clearing the question, see? If it falls on that fact, that is it. And don't now ask parallel, rephrased questions of some kind or another in order to get a better read or something like that. Now, you can compartment the question. Now, you know what I mean by compartmenting the question. You read it phrase by phrase and find out that it's falling on beautiful women, you see. And it has nothing to do with the rest of the question. It just falls on beautiful women. See?

It falls on staff members, but it doesn't fall on "Do you make a habit of getting other staff members in trouble?" See. It doesn't fall on any parts of it except staff members. Staff members, falls. Well, it's not part of your security question, so you go on. He didn't flunk it. It didn't fall on the question. It fell on staff members only. You do that by reading the various phrases of the thing and finding out what part it falls on. Because it is true that if you read a
full question and get an instant reaction, bang! like that, immediately after you read the thing, that one of two conditions can obtain. And condition one is that the person is simply falling on the question. Meaning he has beaucoup withholds, himself, in person. Instant read, you see. Latent read. That's for somebody else, a closely associated question or something else. But you got – just your instant read falls on that, that's it. On number 7 that just flunks the person getting the Security Check. All right.

Now, the second way that this thing could fall, as you already know, is "Do you make – a habit – out of getting your fellow staff members – in trouble?" See, you watch that needle each time. Is it falling on one of those phrases independently? Well, if it's falling on a phrase independently, the next time you read the question as a whole, it'll fall on the question or not, as the case may be. Don't you see? You can clear that thing up, in other words. But it won't fall on the question of a whole, once you've compartmented it. So if it falls just on some part of the question and doesn't fall on the question as a whole, on the reread, of course that's not a flunk. Do you see how that is?

"Has the cat ever PD Hed you?" You see. That sort of thing. And you'll notice that after you've taken a question to pieces and asked its various parts, the person associates well enough on the question that it's only if the question itself is true as a whole that you'll get an instant read after reading it. You look a little fogged on it. How do you feel about that?

Audience: Okay.

Seem all right?

Audience: Hm-mm.

All right. Are there any questions about 7 – 7A, 7B? Yes?

Male voice: Just to clear it, Ron. You take the – once you've compartmented the question and you find it is coming – falling on the compartment, when you read the question again, it will then null if there is no fall on the question itself.

That's right.

Male voice: Thank you.

Okay. This 7A, 7B will be useful for organizations. And it would be – if you went security checking for an organization or something like this, you would use forms 7A, 7B. You wouldn't use any other form. You wouldn't use old Form 3 or something like that.

In other words, you could do a person in fifteen minutes. You can do one of these things almost as fast as you can read, because the instantaneous character of the reactive mind is not fully appreciated by you yet; not fully appreciated. It's quick – hah! It's quick. It's wrong, but it sure is quick.

Well, there's a basic definition of the purposes of the reactive mind in Book One. I've never had any reason to change that. It's a mind that acts without the person having to inspect, and so all of its content is uninspected. So the person has to, himself, have conceived that he himself is inadequate, before he develops a reactive mind.

Female voice: "I have a question. You said fall ..."
Hm?

*Female voice:* "You said if the question fell ..."

Reacted.

*Female voice:* "Reacted?"

Reacted.

*Female voice:* "Okay."

You're running into the colloquialism of you say a needle fall, you mean a motion. It's a carelessly used phrase, and it's just – it's just been too long that we only thought they fell. You see? I'm sorry. You shouldn't use fall. Don't do as I say, do as you're supposed to do. I say "fell" carelessly. Reacted. But let me tell you something. As far as this goes, you will only get falls. Fall is also correct.

When you've got a fellow who is guilty on the line, you won't find any theta bops or anything else on the thing. It goes *pow*! I don't care if he's security-checkable or not security-checkable or anything else. You ask it with good intention, and it hits right in the middle of the reactive bank. It'll restimulate. And it'll get a fall.

Now, there's a liability on all Security Checking. Person has to be up to having some responsibility of some character or another. Otherwise you don't get the thing falling as it clears from the reactive to the analytical mind. See, the reactive mind doesn't fall because it isn't alive. Your reactive mind is not alive. The reactive mind has to be energized. An automobile with no fuel in the gas tank goes nowhere. And the reactive mind without some energization, can't do anything.

Now, the fellow could be totally a reactive mind at which time he'd behave like an analytical mind, and you find them in institutions. You don't find them outside, believe it or not. I mean a person who isn't only capable of dramatizing one engram, of course, long since has either kicked the bucket or walked over the edge of the cliff or has been scooped up by the little boys in their white coats with their butterfly nets.

There has to be an energizing factor. Now, energy only exists where a person has a bit of responsibility. The thetan is putting out energy. Only a thetan can put out energy. Energy doesn't come from food. The thetan has to think the food has energized him, so he energizes it, see? Dead tissue is very amazing. Because you can feed it into motors and engines, you see, and because it then does something. Why people think that when they eat they get energy. That's quite interesting.

The body *is* a carbon-oxygen engine that runs at a temperature of 98.6, just like a Grey diesel runs at 185 F. You see? I mean it's the same deal. But the difference is that a diesel runs when the engineer has left the engine on, but a body doesn't. So it is not a total engine. See, this is actually a different kind of engine.

It requires somebody around at the crank, who is pretending the engine is running. And the fellow is around at the crank, and if he grinds the crank fast enough and doesn't notice that he's grinding the crank fast enough, then he thinks the engine is running. And he's very happy about it. But it's not really quite an engine. It follows all the rules of an engine,
you know. It requires fuel and it runs on heat, and it furnishes motive power, and everything is just fine, but it won't run after the engineer's left the engine room. It just goes goomp, fub.

You should see some of these big – great big steam generator plants that they – the wogs been building – the old days. Boy, they were Rube Goldbergian things to end them all, you know. Great big steam generators, triple-expansion Curtis steam turbines, you know. And, boy, they were running at a high scream. I don't know what they made, seventeen thousand rpm or something like this. And reduction gears went down, and it turned great big generators, and huge cables ran out to switchboard. Boy, they were marvelous. And more gimmicks and gadgets and levers you could pull.

And my strongest memory of one of these things is being gotten very cross at one time because I dared whistle in the place, you know. And obviously, obviously, the engines were supposed to make all the noise. No small boy was supposed to.

Anyway, you can walk out of the building, walk around the block, practically take off a weekend, and one of these automatic stoke – preferably an oil boiler sort of thing – just goes on running. You come back, it's running at the same rate of speed. Remarkable. You walk out of the place. You walk back in, take a look at it. Yeah, it's still running. Same rate of speed. You exteriorize from a body, go past Arcturus, and come back and pick it up, you'll find its temperature has dropped.

And it's very embarrassing, too. I remember down in Europe one time, I left the body at an inn, and went over and went through a couple of capers and did something of the sort, and came back to pick up this body, and by God, they'd buried it. [laughter] They just did it. And took all of its accouterments to pay for the funeral of course. Terrible. Ah, well, wogs. Anyway ...

Now, a perfectly good doll body won't do this. You won't get a doll body doing this. Doll bodies either run on power packs and switchboards – at which they are very close to robot bodies. You know, they're self-energized in some fashion or another, or they're hooked up in communications or something of the sort.

Or a true doll body – and a true doll body comes as close to this definition of "the engine that won't run without the engineer present" as you can possibly get. And a true doll body has absolutely no machinery in it of any kind whatsoever. It doesn't have a single cogwheel in it. It is simply a sheath. And you pick it up and make it walk around. And then you put it down and there it is. And of course, it's usually made by some of the better metal companies, and the thing doesn't rust or anything like that. And you can get it wet and get it dry, and get it ice-cold; it's usually quite impervious to temperature. And you can get it at 200 degrees centigrade, and it doesn't go to pieces. And you can get it up to 2 or 300 degrees – I mean, minus 200 degrees centigrade below the pressures when gasses turn into fluids. You can get it below that, and it still is all right. You get it above that a couple of hundred degrees, and it doesn't heat up or jam or anything. And that's a good doll body. That's a – that's a real doll.

Now, those that get energized and so on, have the little cogwheels and the "thingamabbits" and the thing where somehow or another you make its head turn, and it hits the button over here that makes it go nya, nya, nya, nya, and so on. That's getting in close to robot,
but it's a thetan motivated set of motors. And the thetan furnishes the energy which pours the current through. You get the idea? The thetan — he puts a little energy in, and then the motor puts a lot of energy in. That's helping you out real good, you see.

And now those things, because of their electrical connections and because electricity and so on, tends to have funny things happen to it. And it does have — electricity does have remarkable things happen to it as the result of temperature. And because it does have resistances and capacitors and things like this in it, it's narrowed the band, you see? It narrowed the band of tolerance, the temperature tolerance plus and minus is getting quite narrow.

And usually they'll build these things so that none of the cogwheels have to be greased or something like that, but nevertheless, expansion and contractions of metal may cause them to freeze and so on. And you start getting into trouble with this type of doll body. Move just a little bit further, and you've got a robot. And that is a body with no thetan in it. And you'll run into these types of bodies on the track.

A pc's sitting in them as valences and that sort of thing. You should have some kind of a grip on the variation of the things. There is the pure doll body which, of course, is no machinery, no connections, no nothing. I mean they just — when you get rid of a doll body, when you take a doll body off, you stand it in the corner, and of course it just goes into a bunch of metal. You know, it's just like taking off a dress. You just drop the dress and it goes crunch, and it's not even stiff. Then there's of course the one that has the machinery that helps you out and narrows the tolerances, and then, of course, there's the robot.

And then, of course, there's the biological body, and that is something that helps you out enormously. And it is a cousin to this middle type of body that's got the machinery in it and the "gimmagahooogits" and the "gilhoolies" and the junk. And its tolerance, because it's biological, is so narrow as to be frightening. It is fantastic! I mean, in its lack of tolerance of temperatures and lack of tolerance of velocities, lack of tolerance of impacts and so forth.

And you try to walk one of these bodies around at 20 degrees Fahrenheit plus, and it'd very shortly be in trouble. Unless it's assisted considerably, you see. And you try to walk it around very much at a 130 degrees Fahrenheit, and once more it is in trouble unless it is assisted enormously. And its band, you might say, is probably somewhere in the vicinity of about 100 degrees Fahrenheit, is about the only band you've got. Of course, that makes it totally unusable in space travel. Just totally useless. Man will never get off into space, into planets or anything else until he wakes up on this subject.

Now, the way they wake up might also be of interest to you, but they start artificializing bodies. They don't actually, suddenly realize that there are thetans and all this kind of thing. They start artificializing pieces of biological bodies. They've done it — doing it now. They put in a mechanical voice into somebody who has no voice. And they put in mechanical hearing and mechanical this and that. And pretty soon, some guy will make the Salk vaccine discovery of the century, which is television screen installed back of the eyelids to let the blind see. Oh, this would be marvelous. I can just see the scientists now. The marvels of modern science, and so forth.

Why don't they do it now? They need a small television camera and a knife and some aseptic surgery. But gradually, why, they displace various parts of the body. Then they go on
a very hectic got-to-survive! Got to survive! And they won't let anybody die. And they're right there right now. We're living right in the early beginnings of this thing. They must not die. Huuuuuuuuu!

And some bird – half his head's gone, his right leg's been torn off in the accident, and he's going to look like hamburger for the rest of his life, and so the medicos roll up their sleeves, you know, and they put in a silver skull, and they put in an artificial leg. And then they hook the thing up and connect it all up with the crisscrosses so he twitches the nerve someplace or another, and something else doesn't happen, you see. And they got it all taped, you see.

And, well, this is the artificialization process. And this will go on for some time, a century or two, and they'll gradually put more and more "gilhoolies" and "gimmagahoolits", and so forth, which are substitutes for the biological parts of the body. And what they're really doing is building this second class of body. Not a real doll body, but they're building this second class of body.

And eventually they'll get this guy totally rebuilt, you see, and he'll be hardly any biological parts, and then they'll realize that they - the printed circuit that they have put in it, you know, that is probably what's making it run. And it's very mysterious, but it's probably this. And there'll be some vast theories on it. One of these false sciences will come up on the thing, you know, about the very small energy wavelengths that "whirly-girg" around the "capacitugs." And you get this all mucked up one way or the other, but this guy is still operative, you see.

And he's moved out of the biological sphere, and they'll find his temperature tolerance is now wider. Ah, now somebody will brighten up and say, "Well now, if a person were fixed up like that, and this sort of a deterioration has gone on – we haven't let this fellow die through twenty-eight accidents, and so forth, and he's got no biological left, and he's all metal, and so help me Pete, this fellow really will do well in space." And so they fire him off to some planet. And they get up on the moon, and it's 200 degrees centigrade one way or the other way. And its – freezes up some of his parts, and they keep trying it again, you see, and they keep messing it up and trying it again and then they get very interested about the thing. And one day they build one of these things, and they omit the printed circuit – accidents, you know – and it functions. This guy still functions.

They didn't put the circuit inside the chest, you know? [laughter] And they still don't know anything about thetans, you see? And it functions without the printed circuit.

So they start fooling around and they start cutting down on the juice of one or something like this, you know, putting smaller and smaller batteries in it or something, to make the guy function. And then they find out there's no batteries much – and no printed circuit and no batteries much. And about this time they invent a new religion. [laughter]

It's really God doing all this, you see. Some god or another. And science moves straight over – right in that zone somewhere during those medical discoveries, science moves straight over into a wingding, religious, space opera type of existence. Nobody knows what cooks, what's happening or anything, but they've got it over in the banner – the borderline here.
And science is religion. And now you have to believe Newton's laws, and you have to believe this and that, you see. And you're liable to be charged for heresy in the midst of one of the finest chromium-plated courtrooms, you know, with everything going whir, clunk, you know, and teledisc typewriters that take down all of the thing, you know. This – the judge's speaking causes the machines to go, you know. And the sentence is carried out mechanically. The moment that they say guilty – the jury says guilty, why, big fingers pick up the fellow out of the – out of the box, you see, and put him on an endless vacuum hoisted express and land him up in a preservation body-in-pawn-type jail, you see. I mean it's all very modern, you know. Boy, have they got the scientific principles, but the charge will be heresy.

You see, they've gone the whole circle now. Science having escaped religion has arrived right back in the lap of it again, because they don't understand what's happening here; without the printed circuits, this guy operates – there's – must be something wrong here someplace. So anyhow ...

If they last long enough, if the society lasts long enough, they will eventually back out into real doll bodies with a sort of a quasi-religious sort of an atmosphere, you see.

Well, all the time they're going up the track of this – and sometimes it takes thousands of years to do this whole evolution – they get back up the track on this thing, and they've only been doing it to a few in the society. And what's this been doing to a handful of thetans? See? Not very many thetans. You know, a matter of hundreds, or something like this. Well, what's happening to these fellows?

Well, they're getting conditioned back into, getting familiar with once more, running a pure doll body. And they're developing this facility, and they don't do it by processing. They do it by familiarization. And they gradually get up into a point where they kind of know what they're doing. You see?

They're not very aware. Their ethical level is something that you would sniff at, you see. But here they are. And they can actually – just a handful of guys – and they can run real, honest doll bodies. Not only that. They can step out of one doll body which has been in a crash and pick up a new doll body on the assembly line. And they can operate it. And say, "Yeah, my name is John Jones, No. 780-Tk-Z-Thrip", and all of a sudden they are a caste. They are a hierarchy.

And this hierarchy of a few hundred will go along, and they'll actually run the whole cotton-picking shooting match, because what can anybody do to them? Nothing. Their doll bodies are made out of impervium, and they take a higher tolerance of impact than can be delivered by the normal bullet.

You've created a doll-body hierarchy. And this doll-body hierarchy then moves further and further, and then these fellows commit overts as dolls, and commit overts and commit overts. They still don't know really what they are or what they're doing. And they're all mixed up with God, too, remember. They think they're God's anointed or something And next thing you know they lose two or three of them, you see. And then they lose two or three more, and then in desperation the last five or six or seven or something like this, will gang up and say, "Well, they're not going to do away with us! We're not going to get lost", you see? And then they stand in, running some kind of a galactic empire of some kind or another, but they get
lost just like anybody else because their overts keep piling up on them, you see. And then they disappear into the track, and that'll be the end of one of these doll-body hierarchies.

Usually about that time, things have gone so bad, and the biologicals are all in a state of super-communist – excuse me, slavery – no, excuse me, communism. And everything is all supersocialized so that what's mine is yours, is the state's, and nothing is mine, and nothing is yours. And after a while nothing is the state's either, you see. Try to run a tractor that isn't owned by an individual, a company or a state. It won't run very long. And the thing comes about then – the final denouement of all of this is, of course, that this folds up by reason of law or lack of management, it's too involved, goes sploopy – bang! And you wind up with a disintegrated galactic society.

And then splinters of this society will start making it on their own. And they'll go on an independent evolutionary track.

And Earth isn't a splinter of such a group, by the way. Earth was a kind of a territory that was sitting out here, minding its own business. It was actually part of the Biological Survey Park Reserves. This had no more importance on the full track than that. That's right. And its current importance is that it might form a bridge into the basic galaxy on the rim of which it sits.

But anyway, then these splinters, they'll pick it up, and through the thousands of years and so on, they will gradually start this process once more of medical substitution, mental implantation, fixing up the mechanical voice box, and then somebody finally gets fission going, and then they decide they're going to fire one off into space. And then they find the biologicals can't stand it. And they keep nagging at this idea of getting man into space, sometimes for decades, sometimes for centuries. Then eventually they get a total semi-doll. You know, a doll robot. That sort of a combo, and they'll find out that that is a form which can go into space. And of course all these boys all get familiar again with space opera, high blast velocity weapons, everything else, the whole thing works out. You got a space opera society, you got a hierarchy. Your hierarchy, of course, dwindles down by overts. You got a few left, so you got an empire. And then your empire, the overts get to these last boys; they dissolve, bang! The thing splinters up. And that's the way it's been going. Might be interesting to you in investigating somebody's track.

That isn't the only type of evolution there is. But when Darwin was talking about evolution – the evolution which I have just said, is a far truer picture of actual evolution than, "Well, it was the vast sea, and it was an ammonia sea, and there was a little spontaneous combustion somewhere in it", [laughter] "and this spontaneous combustion was a cell. Now, isn't that cute, kiddies?"

And then with other fairy tales, we finally get this thing all built up. The actual facts behind this, you see, are so outrageously different that it makes it very, very funny, you know.

Here are a bunch of guys sweating like mad around drawing boards saying, "What is an optimum zebra", you know. "I don't like that. I don't like that design. He's not well camouflaged particularly. What particular type of continent is he fitting on?"

"Well, he's fitting on an X9 continent. Perfectly well designed for an X9 continent."
"Yes, I know. But an X9 continent doesn't have any red flora."

"Reds are – oh, well, that's true", see, "make them orange. Okay. That's nice looking zebra, so forth. And what's his habitats? And what's his various morale and what he's supposed to eat, and how's he supposed to congregate, and what's supposed to prey on him, and what's he supposed to keep down?" And get it all figured out. Great big computers going, you know. Make IBM down here look like a child's typewriting machine, you know.

And these things are going **whirr, whirr, clank.** And they finally get a bunch of thetans, and they say, "How would you like to be a zebra?" Ha-ha. [laughter] "Here are the advantages of being a zebra. Here's the list of now-I'm-supposed-to's." And we eventually see some thetans around, and they're getting all educated in various directions or another in being zebras. And they finally get so supereducated on the subject of zebras, they can do nothing but zebra.

And you got it all made. They got all the now-I'm-supposed-to's. They know exactly how to fire this one off, and so forth, and so they pack them up and ship them off to X9-type planet. You got zebras. [laughter]

And then somebody slips sooner or later. Somebody skids. Somebody's drawn this thing, and so forth, and he's drawn this body, you know, and got it all set. "What do you think about that, Joe?"

"Well, I don't like that very much."

"Well, what – what's the matter with it?"

"Well, it looks like us." [laughter]

"Yeah, well, I know, it's a biological; it isn't us. Biological."

"Oh, well, got to have a few wogs."

"There's this problem about what's to keep down lions. You realize that you got lions, and there's nothing keeping down lions at all."

"Well, all right. We'll put a few of them on. Make a few of them."

"All right. Okay."

Sent out this volunteer call, "Who would like to be this animal, man?"

Everybody says, "You know, that looks awfully like the gods and kings that are walking around here, you know?" Gods, kings and technicians and other priests.

And so they say, "Well, we have a few blue wogs, you know. We'll put a few wogs down on this X9-type planet, and that'll keep down the lions. And we'll give them a big fixation about lions. You know, they must kill lions. It's all right."

Only trouble is, this particular line is too inviting. So the boys, as they get knocked off in other actions and so forth, see these wogs walking down on an X9-type planet, and they pick them up. But you got an educated technician running the thing. And so he keeps your evolution going.
Homo sapiens. And every once in a while, why, one of these societies will get very excited about the idea, "Do you realize that that planet there has killed off not only all the lions, but now they're starting on the passenger pigeons, and they're starting on this and they're starting on that, and they're knocking off all the buffalo, and so forth. And do you realize that there's a virus there, called Homo sapiens? Do you realize that?"

"Oh, I guess you're right, Joe."

"I tell you, let's get a couple of fellows and let's gen them in real good on the subject of atomic fission."

"I see what you're hitting at." [laughter]

And there it goes. All kinds of weirdies like this go on. Space opera is actually incredible, but space opera is only one phase of civilization. And it's only one phase of the civilization processes. And of course, these types of bodies are only one small fragment of classes of bodies.

There have been bodies, of course, which are just simply spheres. Spheres which can levitate. There's bodies which are triangles, there's bodies in any geometric form. All of it based on the basis the fellow's being nice enough to put up a mock-up to show his location. And on that idea alone, you get the whole idea of bodies.

But of course, some fellow that's sitting around on the edge of a cloud and hasn't got a single thing to do and isn't even – well, just bored stiff, you know. Somebody comes along to him and says, "How would you like to run a grasshopper?"

"What's a grasshopper?"

He's had it. There's his C. There's his C, after it follows his D, and then comes his E, and then comes his I. Of course, they usually make a contract with a fellow like that. And they say well, after he'd been a grasshopper a few thousand years, well, we'll come down and set you free. Then they forget.

And you get a revolutionary spirit entering into all this. All the grasshoppers are mad because they've been forgotten.

All kinds of wild, oddball aspects to civilization, the making of life. All of it goes down to the basic activities of thetans. They forget things, they remember things, they re-familiarize themselves with things, they plot out vast and intricate civilizations and patterns, and so forth. The desire for complexity exceeds their desire for simplicity. And they get into trouble and then don't know where the hell they are, and don't know what they're doing. All kinds of odd circumstances. And out of this tremendous mishmash, why, you get such a thing as this universe and its functions and its distresses, and all that sort of thing.

But you should know, really, that there are various types of bodies of this kind or another.

And if you can find a pc, now, who has a vast allergy to some type of civilization, you've got it made. Got it absolutely made. Because he's got a large section of his track squashed into a not-is, and now you've got the ways and means of releasing a not-is. You've
got the not-know types of processes. And you can release tremendous not-is, off of this particular section of track. All right.

You find somebody – if you were assessing somebody in a calm sort of way, minding your own business sitting there – particularly minding your own business; not inquiring into his because that would be an invasion of privacy – you get your thetan that's sitting across from you, going along all right. And then he says, "Well, I'd always wanted to be a sailor." Yeah, that's a goal. A goal. Sailor. Sailor. Sailor. Now, I'm not telling you to do this, but if you were to say, "Well, what would that –." Because this would be a direct invalidation of his goal. But let's follow it there. Your questioning would be a little more circuitous.

But, "Where would somebody not want to be before he wanted to be a sailor?" – any type of things. And of course, he's got this – the Sahara Desert or something, you see, and he's – some opposite of some kind.

And he says, "Well, uuuaah, I haven't much to do with this."

"What's the matter with that?"

"Uhhh. Ahhhh. I don't know. It's these planets with no vegetation on them, you know, and that sort of thing."

And you say, "Well, what would make a planet with no vegetation on it?"

"Well", he says, "obviously an atomic physicist. But, ha-ha, an atomic physicist. I guess. I just sort of answered it. Yeah, that's right. A planet with no vegetation on it – an atomic physicist. Or – yeah, that's right. Atomic physicist. Well, you don't want to have much to do with that. Ha-ha. Well, let's get on to something else."

And you say, "Well, what about this atomic physicist?"

"Well", he says, "well, let's get on to something else. It's just not a subject that I have any interest in whatsoever."

Now, you run into an impasse like that with a pc, and of course, what have you got? You've got yourself a great big massive scrunch of not-is. And this goal, by the way, is liable to register highly agitatedly. To be atomic – an atomic physicist, of course, is lying behind that, but he can't reach it, you see. The goal is not to be an atomic physicist. And that's a nice, big, whopping, negative goal. Now, you start tearing this goal up, "Well, what could you not-know, you see, about this beingness? What could you not-know about blasted planets?" or something like this, and you just see track just suddenly fill in in all directions, you see.

And all of a sudden, the pc starts getting over his habitual habit patterns. I'm talking about the habit pattern – the pc – you know, he's – he hates to have headaches but somehow or another, even – no matter how much you audit him, he always manages to get a slight headache, you know. And he isn't leading too good a married life, and he – you audit him and it patches up his married life much better, but he's really not quite there.

It's all these not-quites, you see. And you'll find all those not-quites in that bundled piece of track. And it's scrunched right in there, see. If you want to change somebody's attitudes that he desperately wants to change, find out what he – under no circumstances, the goal
he doesn't want to have anything to do with, and then "not-know" that goal to kingdom come. And you all of a sudden will find yourself about the wildest, widest section of track. The fellow says, "Under no circumstances – an Indian society, ho-ho-haha-ha-ho-ho. Not an Indian society – I don't want anything to do with that."

And you say, "Well, an Indian society, you know. Indians and Indians, and they run around and shoot game and canoes, and that sort of thing."

"Yeah, he's – that – that's the kinds of things." He says, "Well, I don't want to do anything to that. Never had any interest in it in my whole life. Not only have I never had any interest in it, I don't want to have any interest and that's the point."

And you say, "Well, what part of it wouldn't you want to have any interest in at all?"

And he says, "Well, no part of it at all. And you're trying to lead me in, you're trying to trap me", and he'll – is liable to completely kind of lose his head at this point, you know, saying, "Whoa, whoa, whoa, wait a minute. Wait a minute. I'm an auditor, too. Now, you're not getting me into that, man." [laughter] "That's it."

Now, if you're lucky enough, and I do mean lucky enough, to have singled one of these areas of won't-go-into's as a class of civilization, behavior, activity, anything like that, if you're lucky enough to have stumbled into one of these things with a case or if you've wormed yourself into one of these things by your Goals Assessment, finding out also what he has never had a goal to be – he's liable to tell you with some violence what he's never had a goal to be, which is quite the reverse – you start handling that with Not-Know. Forget. Just crisscross that thing up and down, back and forth, and you will find that all of the pc's fixed behavior patterns, his detestations, his compulsions, his obsessions, the real deep ones, the ones that you're just spinning over the top of, all lie in that exact zone and area.

You may not get all of them, in one of them, you understand. There might be two or three more open up afterwards, but that first one will be a big payoff because it, of course, opens up other zones. And now that he's licked one zone, if you got him to do it well, with your Not-Know and Forget, and so forth, now he's got courage enough to tackle some of the others.

It's a very interesting case entrance, I assure you. It's something that – you're real lucky, if you get your hands on a – on one of these in a pc, very early in the auditing. Why, you'll save yourself an awful lot of auditing. Just tear it to ribbons, you know. And you're restoring knowledge, knowingness, whatnots, and recognitions, and so on.

Look. This is absolutely factual, as close to an absolute as you can get: That which is most aberrative is least known. See, that is true. That which is the most aberrative is least known. And if the pc knows something about what is giving him a lot of trouble, it isn't giving him any trouble at all. Now, how do you like that?

So much for the pc that comes in with eighteen pages of his aberrations – not his goals; that's all right. But he comes in with eighteen pages of his aberrations, telling you that all of his difficulties stem from his early life and his sexual relationships with his sister.
File it, man. File it with the greatest of care along with his case, file it. Thank him very much, because – you don't need to tell him what you're thanking him for, which is telling you completely and positively that he is now giving you a place where you don't have to look, even slightly. You can just avoid the whole subject from here on out. Obviously, if he knew this much about it and he's still looped, that isn't it. You see, that's the test. The test has been fulfilled. If he knew about it, there's something wrong. Got the idea?

If you actually were to twist a Goals Assessment around, just into the basis of finding vast zones where this guy doesn't want to go, doesn't want to have anything to do with or otherwise, and explored those zones, you would be doing such fantastic stunts with a case that you would look like a miracle worker. And it would be with speed. You wouldn't – you wouldn't be doing any grind on the thing.

It's rather amusing to watch the speed with which they will try to escape one of these particular areas and the artfulness with which they'll try to escape, all the time going slam-bang into the middle of the area. You can practically – practically the soles of their feet are smoking. They're being yanked back into the area so fast because it's the one place they postulated themselves out of, of course if it's the one place that is never as-ised.

So of course, it's the one place with the maximum call-back. And it's, of course, the one place that they will never confront. So it's the one place they know nothing about. All these things add up, you play this. You could actually do some fabulous things.

Fellow says, "Well, I had a goal to be a plumber, and I had a goal to be a fireman, and I had a goal to marry a rich widow. Yeah. I thought that would be a good idea. And I had a goal to do this and a goal to do that."

All right. Let him go on with his goals. Go right ahead and do your Goals Assessment. Nobody's telling you not to do Goals Assessment as per Routine 3. But he's got lots of goals, he's got lots of goals, he's got lots of goals, he's got lots of goals.

Next coordination: The more goals a pc comes up with, the more the pc has tried to escape. From what? And if you just add that little question mark into your auditing, your questioning, your handling of the particular case – yeah, what – from what?

"Now, what would a goal to be a plumber – what would that get you out of?"

"Well, that's an interesting idea. Well, it would get me out of having to pay plumbers to fix pipes."

No pay dirt there. "Well, now this goal to be a fireman. What would that get you out of?"

"Oh, that would – oa-oaaa. Ohhh. Oh, that's something else. Oh, yeah. Of course, you think it'd be to get me out of fires." Pc's face getting red, you see. "Well, yeah, as a matter of fact, that's right, too. Huh-huh, huh-huh. I'd completely forgotten about it. When I was two years old, the house burned down."

All right. So he's contacted an incident. You going to leave him hung up in this incident forever? Something like that? You've already, by offbeat questioning, got him into this incident. You've already asked him, what would be a fireman – what would that solve or what
would that get him out of? And he's handed up to you the confusion. Well, you can run it right out with "What could you not-know about that?", you know. And "What have you forgotten about that?", and crisscross it up. And you find out that if you're very good, it'll only take five or six questions to blow the whole thing. So it'd be actually stupid of you not to do so.

If you're doing a straight Goals Assessment and he goes into these things, skip them, see. But if you're actually the one who's putting him into these things, if you're shoving him into these things, and so forth, take them up. That was why I didn't particularly want to talk about that yesterday.

But you'll find out that there's very fruitful areas of auditing. This is the biggest "open sesame" to a whole track on a case that you ever want – you ever wanted to handle. So get so you can handle it.

There's another coordination. It's not necessarily the person who has lots of goals who's in bad shape, but the person who has had lots of goals has been trying to get out of a lot of things. That's for sure.

All right. Now, there's another one, is: That person whose memory is the closest to PT, with the rest of it shut off, is the worse-off person. You see, a person is as bad off as his memory is only close to PT. Got that as a coordination? It's a rule. That's a good rule of thumb with a case. Good case analysis. Person is as bad off as his memory is – only exists close to PT.

The reverse of that, of course, is the person is as bad off as he is occluded. This actually doesn't have too much coordination with ability, which is one of the odd things. A man can be overcoming by the grit of his teeth, a lot of this occlusion and that sort of thing, just by, you know, just sort of gritting his teeth and carrying on. But you can expect this fellow to fall on his face sooner or later. He's not going to be happy about it. He apparently has a considerable amount of ability, but with that ability you'll find a considerable amount of strain.

Now, if you suddenly start opening up the track on him and showing him the vast vistas that are closed out to his view and so on, for a little while his strain will decrease, and his doingness will decrease – this is only during auditing, you see. He'll start to say, "Oh, well, now I can sit back and relax. Now, I know what has been making me – it's just been my aberrations." See, he'll run into the same thing they ran into in psychology and psychoanalysis. "It's my aberrations which have been making me do – now I know. So I don't have to strive anymore", do you see? "It isn't necessary that I strive."

He will sort of start thinking this way and then thinking this over, and he'll look that over. Of course, that's specious. Utterly specious. He strives for an entirely different person – reason. He strives for interest. He strives to have something to do. He strives to have something to be interested in. He strives to have a game, for God's sake. That's the obviousness of it.

And you open up a few more spadefuls of track and the garden – it looks more or less like garden soil when you first pick it up off the case, by the way, you know – all balled up, and dark black and all tangled up with the roots of yesterday's roses. And you start straighten-
ing this out, and all of a sudden he starts saying, "Well", – in a very relaxed frame of mind – then he can go on and accomplish eight times as much.

Now, he becomes a dangerous man. A truly dangerous man right about this point because he – obviously, everybody will agree that he's very dangerous because he's in action. They will never assess the fact that he is getting things done, he's helping people, that things are going along fine, and so forth. The fact he's in motion will cause some of the people in his vicinity almost to fall flat on their backs. They will be upset. You can count on this. They will be upset.

Now, he therefore has to be in good enough shape so that he can go on doing and not minding all of this upset. So he has to be gotten over the approval button. Otherwise, he will slump as a case. The approval button is the makebreak point of that. And all of a sudden, why, he does, his control of the vicinity is so much better, his ability to get on in life is so much improved, his functional characteristics coupled with, of course, this control of the environment or his pervasion, you might say, of the environment, and all this damps out.

People take a few cracks at him, then they quit. Then they say, "Maybe we ought to take this up", you know. "Maybe something else ought to happen here", and you don't get the backflash.

But it all goes back to this idea that – of "know thyself". And this is one of the oldest wheezes in the field of philosophy. Philosophers have been standing around – you could always count on the fact that when a philosopher didn't have anything else to say, and he'd just received his gold piece or something at Delhi or Egypt or Upper Thebes or Lower Chicago or someplace like that, and he didn't have anything else to say, he could always reach out his hands, you know, and he'd say, "Well, son, 'know thyself'"

And of course, this poor guy goes out and struggles around. He's not only not got his gold piece, but he keeps trying to look into his bank and look into his life, and there's nobody to help him out. And of course the more furiously he knows, the more on automatic goes "not-know." And if these philosophers had just said to the boy, after they had gotten the gold piece, if they'd just said, "Well, son, 'not-know thyself'", [laughter] why, it would have been a wonderful world.

You see, the aberrated person, the truly aberrated person, is only really worried about one thing. He doesn't know what others are going to do. That is the beginnings. And when it reaches the end, he doesn't know what he is going to do, and that is what worries him. So he gets all kinds of restraints. He uses engrams almost consciously. He uses all kinds of mechanisms to prevent himself from doing things. He does anything he can think of to restrain himself. What is he restraining himself from doing? Well, that question he can't answer. But he can answer this question. That he should. He should.

And why should he? Well, because he doesn't know what he is going to do. He doesn't know what he's liable to do.

You'll see this in its crudest form maybe in battle. Men going to wars in earlier days always used to be tremendously concerned about what their behavior in battle might be. I don't know why they were this concerned. For the benefit of some cockeyed king with eight
mistresses and a crown cocked over his left eye, you were supposed to go out and open your
jerkin and let some farmer from over the hill someplace shove five or six inches of steel in
you. I don't quite see the logic of this, but they used to anyhow. And I've marshalled up lots of
them in line to do just that so – I should criticize!

Anyway, this bird – this bird, you see, his questions as he starts forming up, you know,
and he hears – it was a good idea to join the militia, you see. The girls all loved you and you
got this nice uniform. Used to have nice uniforms – don't anymore but – the girls loved you,
and you could strut around and make brassy sounds in the tavern.

And about that time, you see, you start into the battle. And the guy, "What am I going
to do?", you know. "What will I do?", you know? "What – what will I do? Will I get up there
to the line and instead of nicely unbuttoning my jerkin, will I turn and run?" You see? "And
will I defame myself in front of all of my friends, and will I turn out – am I a hero or am I a
ruddy coward?" You see. And this becomes very oppressive. Becomes very oppressive. "How
am I going to measure up?" Well, we can see that. I just give you that as a gross example. We
can see this big question mark coming up, and so forth. Well represented in Stephen Crane's
Red Badge of Courage.

But – there's another one. How about the guy that goes through life, not only knowing
is – this isn't the question – is he going to run or is he going to stand there. That isn't – that's
too clear-cut. But every day of his life he's not quite sure how he will behave, you see. He's
not quite sure whether he will toe the mark or not toe the mark or do his job or not do his job.
Or is he going to cut and run or is he just going to be sitting there at his desk and suddenly for
some peculiar reason just break down and start screaming? You know. Is he liable to do that?
Well, he is. Huh-huh-huh.

And it begins with the basis of not knowing what others are going to do, you see, and
it winds up that he finds out that he doesn't know what he's going to do. He just can't trust
himself. And in view of the fact that he can't trust himself, why, then of course he's sort of got
to retire from life. He's got to go further and further back. Further and further back. And he
can't go any further back after a while. He finds there's a wall there, you know, so he starts
bringing the bank in on him, you know, harder and harder. And of course, the more bank he
brings in, the more he's likely to do odd things, of course. And he finally winds up at a total
impasse.

Doesn't necessarily go mad, but he certainly becomes inactive. And he'll give you long
speeches of this character: "Well, when I was a young man, I used to have ideas about doing
this and that and getting everything done." And what – you've just announced to him the fact
that you're going to buy a new car or something, you know.

"When I was a young man, I used to do things like this. But when I got alder, I ceased
to be interested in these things." Or you're saying something about Russia shouldn't be build-
ing all these bombs or something of the sort, and he'd say, "Well, I myself, I'm – I'm – when I
was young I used to be interested in this, and as time has gone on – as time has gone on, I
found out that my goals are simply just to get along, you know, from day to day. And I can't
do anything about that sort of thing, and so I of course am not interested really in the scene,
you see, and so on. I don't know why you are, actually, either. I'm setting you a good example
by withholding myself utterly and never getting anything done and being a ruddy bore to everyone, so I don't see why you shouldn't be, too, because you probably can't trust yourself either." [laughs] You know, this kind of a rationale.

Well, you look over existence and you'll find out that it's studded with this type of person. Now, what do you think the actual doingness of that person is going to be? It's going to be very, very low.

Well, of course, now he has the basic goal of nirvana – of somehow or another mixing with a whole bunch of other identities or entities that will restrain him forevermore. And he won't have to restrain himself anymore, and he'll just sort of mix into this huge thetan stew-pot. You know? And there he is in nirvana and everything is fine.

So one of his ideas is that the highest peak of existence would be able to sit forever on some mountaintop getting frostbitten and not noticing it, and regarding one's navel. I don't know what the attraction of the navel is. [laughter] Probably has some vast umbilical connotation, but I'm not aware of that. But he does. He gets into this idea "A navel, that's the thing, you know." [laughter]

And, then of course if he's looking in at his navel, then he knows damn well he's not going to see anything else. So he now knows what he's going to do. He's got a stable datum. He's going to regard his navel, and that's it. That he's got as a stable datum. So of course, he no longer has to restrain himself, you see. So that's a Clear. You get how he gets to that step by step? Finally you get to a Clear. A Clear's totally inactive, totally serene, totally withheld and isn't any trouble to anybody. And that isn't what a Clear is.

And the horrible, glassy trick of the whole thing is, of course, a Clear, more and more able to trust others – partially because he can control them – and more and more able to trust himself, of course, goes into a higher and higher communication line. And then he's more and more positive about what he is doing. He's not always right, by the way, but he's certainly certain. And he's more right than he would have been before. But he goes further and further, he can reach further and further. And of course, he gets more and more done. He gets more and more active. He gets more and more enthused and excited. And he likes existence, and he goes into motion.

And then when he's gone through this band of motion, he can go out to the other side, and he either is in motion or is not in motion at his own choice, you see. And his motions are predictable even to himself, and so he's quite trustworthy as far as others are concerned. He's not going to do something weird as far as they're concerned. Then they gradually realize they can trust this fellow even though he's in motion, but it takes a little getting used to.

I've seen a whole staff go "mmmmrrrrrrrrrrrr" from a Clear, you know. "Ooooh, we don't know whether that's – that's – look at that person. He's doing as much work as five of us!", you know, that kind of a reaction. They're not quite sure that this is the right thing, because of this other idea that they can't trust themselves, so therefore they ought to be sitting further and further back doing less and less, until they get down to a total contemplation of the umbilical fragment. And that's it. You see how the goals diverge.
Now actually, probably only a Clear could sit on a mountaintop with the frostbite nibbling in all directions and actually sit there and mock up enough of an umbilical nub to contemplate. He's probably the only one who could actually do that, but this isn't all he does. You get the idea? How people's thinking narrow down on this sort of thing.

The ambition very often on the part of a pc, when you get a pc running through Goals Assessment, will be to become less and less active. You just read the goals to become less and less active. They announce active goals with regret or they belittle them – you know, not-is them. "Well, when I was – when I was four or five – ", you know, that's standard Anglo-Saxon belittling. You see, four or five, that's supposed to be stupid or something.

"And when I was four or five I had this goal to be a cowboy. Ha-ha-ha-haha. Ha-ha-ha-ha-ha."

[laughter] "Goal to be a cowboy when I was four or five. Nonsense, you know." Try to flatten it. Cowboy, cowboy, cowboy.

I had one – I had one who had an offbeat goal when it was four or five. And I got to plunging into a little bit further and, boy, this was the goal. But at first, it was just, you know, make nothing out of it. But it was a goal of action. And they start by apologizing for these action goals and rather tending to deify the inaction goals. To be – to be calmly in control of myself in the face of any emergency. And they think doing anything about any emergency – the guy's going to be in control of himself while the emergency is knocking everybody else's head off.

But that will be a very laudable goal. Extremely laudable. That'll be a fine thing to do. You just listen to it sometime. Listen to somebody when he's giving you goals, and listen to his difference of regard for these goals as represented by his tone of voice. You'll learn quite a bit. If the fellow's stress is on goals of inaction, you've got immediate case gauge. See. If they're all inaction goals, if he's kidding all of the action goals or doesn't give you any action goals at all and he's tending to deify, you see, all of the inaction goals, why, you've got an idea of what you're bucking into here.

You're bucking into fantastic quantities of not-know. That's the first index you've got. And you also – if the person's total action goals were all excluded and he never gave you an action goal of any kind – not even the kid one, you know – well, don't turn in your thetan, but the sooner you start on this case with Not-Know, and Forget, and so forth... You can expect this case that from one day to the next will give you the same goals over again because he doesn't remember what goals he gave you yesterday, you know. Inaction, that is the thing.

The fellow is getting down to where he is one stable datum as an island in a total confusion. But the stable datum keeps occluding, so it leaves the island of confusion.

Now, there are two ways a person could get out of the porridge. And the first way he could get out of the porridge has been the only way he had. And that is kick up the bucket and put on another body. You see, that's how he got out of the porridge.

So you have enormous amounts of sickness around because sickness is a covert effort to die. And it is nothing else.
Now, death was an ultimate in inaction. And that is why the covert effort to die leads in that direction. So you got inaction. Inaction leads toward death. That is the destination of inaction.

All right. But he could die. So this was the solution. And his efforts to become less active would wind up in death.

Now, there was another part of this. If he could become familiar enough with any activity through the process of living, he would wind up with something resembling a rehabilitation of his action. The process of living could refamiliarize him with the zones of action, and so he himself would again go into action. And that process basically took place on the basis of a cycle which would be the matter of, oh, I don't know – doesn't matter. I can't tell you off-hand. From pc to pc, it probably varies wildly. But a cycle might be anything from fifty thousand years to two or three billion. You get the – you get the order? I'm just trying to give you the order of magnitude.

This fellow isn't trying to become familiar with action over a period of one lifetime. See? He's trying to become familiar with a pattern of action over a period of fifty thousand years, and then he feels he would be out of the soup at the end of that time. It's kind of a little planned action.

And you every once in a while will run into a pc who is telling you that it takes some livingness, too. Did you ever hear a pc say that? That's what he's talking about. He's talking about this cycle of action thing. Of course, he's talking – it doesn't take a little livingness, too, you see. That is not correct. Auditing is a total substitute. But he's got this other program so well aligned whereby a little more familiarization with action, a little more familiarization, and eventually he'll be back in the swing of it again. That's his hope and goal.

And that is over some vast period of time. It'll be, oh, vast. I hardly dare even make a guess at it from pc to pc, but take it anywhere between fifty thousand years and a billion, and he knows he'll make it sooner or later. He'll get back to those airplanes.

Now, when you've found a goal of this character that he's actually trying to execute over one of those long cycles, that is the goal that sticks and that you'll eventually find yourself running. That is the source of stick of a goal, is the person is trying to get back into action to achieve this particular goal, and you'll find it's a very uncertain progress in this particular direction, but a tremendously positive goal.

Well, it itself could, of course, be traced back to the exact activity he has left, which has become too much for him. In other words, he has – he has got a goal to be a flyer because he can't confront being a flyer, see. He cannot confront any part of being a flyer. He can't confront any part of the track when he was a flyer. He can confront none of the scenes in which he was a flyer, but he has the goal to be a flyer. That's one of these circular goals that comes right back to itself.

And he very often, if he has this very consistently, will be plotting it out across some vast section of time, some enormous section of time. And he'll tell you very often, "Well, it takes livingness, you know, and you'll have to do some livingness, too. And clearing, you
know, has to do also with livingness." And he'll give you big arguments along this particular line, you see. Because that's his program. That's a little, private program he has.

And you find yourself plowing into a goal like that, you'll trace it back to the very goal that it is, you see. And then, fall out of that, you'll find out what zone he was escaping from by becoming a flyer. And up until the time you've got the flyer out of the road, you don't get the bottom of the plane. See?

The reason he wanted to be a flyer is he was on this planet that was nothing but mud, you see. And it was mud from there on down is the original planet the Indian priests had lined up. And it's this mud planet, so he says, "Well, the only way you can get off the thing – you can become a flyer. You know? Everyplace you walk it goes squish between your claws. And every time you sit down, you're damp." [laughter]

And he says, "To hell with this racket", and he doesn't want anything to do with it, so he wanted to become a flyer. So after you've cleaned up this whole long-cycle goal, you see, by auditing, you wonder why this thing may be hanging up or sticking up, and you apparently have the goal flat but the person isn't Clear and you can't quite find any other goal – just look under it. "Well, why did you want to become a flyer?" That's the way you check out one of these goals that you've flattened with the Prehay Scale. If it stuck, that would be what you would do. See? You're not making much progress with this goal and yet the goal itself doesn't seem to be worrying him anymore.

Well, how come he went into this goal in the first place? And we'll find ourselves with a brand-new case on our hands. And we'll find ourselves with this vast area of occlusion suddenly laid to view. And you lay into that, Macduff, with Forget and Not-Know, and so on, and suddenly he comes up with a brand-new series of goals, and so on. Quite interesting. It's quite interesting to watch this cyclic behavior.

So that a case, you might say, goes in swoops. And the swoops are out of what they wouldn't confront. And you very often have to run the swoop itself. And having run the swoop, well, find out what they were swooping out of. Now, you'll find out you've got a brand-new strata of case. And you're liable to get into that particular strata with the protest I described earlier in the lecture, you know. "Well, I want nothing to do with that." This is why the case is grinding forever. He wants nothing to do with the basis that lies just under. He begins to feel that he's walking on quicksand. If he gets audited just one more session, perhaps, he might go through the volcanic crust into the ashes of the long dead yesterdays. That would be tragic. He'd get Clear. [laughter]

But do you know that you will also find pcs doing this and going into this sort of an activity. They will tell you very often, "I would rather not be Clear than have to face that. If it means that I have to run through that to be Clear, then I just won't be Clear. That's it." You can run into this.

And at this point, the auditor's horsepower has to be applied. Has to be applied. You're running on practically nothing but auditor determination because, of course, you've got the pc in an area of total no-determination as far as the pc is concerned. He just wants to escape. He hasn't escaped. He's sitting right in it. So you have to apply the horsepower at this point.
Now, anytime on the Prehav run of clearing that you find a person slogging – *slog, slog, slog, slog, slog, slog, slog, slog* – he is probably hovering over in small volplanes, hopefully that you won't notice, but if he lands, he'll go straight through the volcanic crust. Got the idea? He's sort of keeping it arduously in the air.

And I think grind in clearing, in auditing, the fact that the pc just keeps grind, you see, he just keeps grinding, and he keeps grinding, and so forth, and he goes on and on and doesn't seem to be getting anyplace, it means the fact that you are actually now running the escape. You're running nothing but the escape and you're running it for something else. And it's something else has vcome into view. And you haven't seen it yet. And it's been in view for some time.

And the pc had the goal to be a flyer. And he goes on running "be a flyer", and he runs it on the Prehav Scale, and it's getting less and less, and it's sort of grinding out, and isn't really getting anyplace, and the levels flatten off fairly easily and so on, but that's just – you just keep on running it and you keep on running it and you keep on running it. Well, good God, it's about time you did another assessment, isn't it. And find out that there's a whole mud planet sitting there.

The one thing he doesn't want to be is an inhabitant of a mud planet. Well, you've still got the mud planet when you clear off the top goal if you go on a grind with the pc. You got it?

And I think you will find that is more or less the basic anatomy that you're running into on long-term clearing. A fellow – you've gotten the swoop out of what he won't be in, and you're running the swoop. And you just keep running this and running this and running this and running this, and you never notice the mud planet. And of course the pc is actually only too willing to run the swoop. Only too willing, because right there just a hundred feet under the lowest part of the volplane, you see, is this unending sea of mud which squishes up between your claws and ruins you every time you sit down. [laughter]

All goals are an escape. All clearing depends on, not cutting off all escapes, but on re-familiarizing the person with those things from which he's trying to escape, and I think you'll find clearing goes faster if you apply that law. Refamiliarize the person with the areas from which he is seeking to escape.

Of course, for a little while you're liable to find this awful muddy. The pc can go in over his head on this rather easily and get very nervous about it all, and so forth.

But if in the assessment itself, you're lucky enough to find these areas from which they're trying to escape, you're going to wipe out all of the goals that the person has set up in front of you. The person has given you 396 goals, and you've been nulling them very easily, and you get down to goal 80, and this is the third time through, and you're at goal 80 on the third time through, and this suddenly strikes you one way or the other – this unlikely goal – and you say, "Well, what would that get a man out of?" You know? "What would that get a person out of one way or the other?"

And *Ho-ho-ho-ho, that's easy, but of course you're not going to get me into that!*
You get this kind of a reaction of that character, cut it to pieces because you'll find your 386 goals or 83 goals all blowing up in your face. You've got a brand-new case. As soon as you've handled the zone. Got it?

Goals are the mechanism of escape. The looking at the invisibilities and hope of the future and never regarding any part of the liabilities of the present or the horrors of the past.

And of course, you can Q-and-A with this 100 percent. You can only let the pc look at the beauties of the future. Only the beauties of the future. And of course, they don't erase. Why? Because they haven't happened. No. Right back of all of these escapes, of course, were the areas he was trying to escape from.

You'll find somebody saying sometime, "Well, I wanted to be the Lord Mayor of London once on the backtrack. I can remember it very vividly. I wanted to be the Lord Mayor of London."

And you put that down and you try to erase Lord Mayor of London, you know – Lord Mayor of London, Lord Mayor of London. Let it strike you, man, why did he want to be Lord Mayor of London this ferociously? It is there with ferocity, you know. I mean, it just doesn't erase easily. There it is, Lord Mayor of London.

And you say, "Well, what would the position of Lord Mayor of London get you out of?"

Of course, the obvious answer is Wormwood Scrubs. That's the only – you know – something of this sort. You get a lot of hem and haw though before you're liable to get Wormwood Scrubs.

"Well, it'd get you out of, oh, leading a boring life, and it would get you out of this and get you out of that."

"Well, is there anything there it would get you out of that you'd hate to be in?"

"Well, we're not going to take that up. This is a gentleman's agreement",[laughter] "and we've been doing fine in the session so far."

"Well, what would it be?"

"Well, the Lord Mayor of London at that time was the only one who had the right of signing a pardon for somebody in Newgate."

"Newgate? What's with Newgate?"

"Oh, Newgate. Well, now, that's something else again. You really want to know? Well, you really want to know about Newgate? Well, we could start in with the jail fever, of course, but it's actually the straw. It's actually the straw. It molders, you know. And there were no toilet facilities at all, so they just threw in more straw, and uh – uh – and so on. And then there's little rats, and so on." And he'd say, "Well, you don't want to know anything about that. No, let's get on with this. Let's get on with something pleasant like a Goals Assessment."

And you say, "Well, what could you – what might you have forgotten about New-gate?"
"Ohhhhh, zyaaaaaaa! You're not going to catch me. You know, you're not going to get me running that." Ha-ha-ha. If you can strike one of those, you'll change the case just like that.

So prospect some. And out of all the vast gray seas of granite, you might find some little pieces of mica which when picked up turn into solid gold. Okay?

**Audience:** Yes.

Thank you.

**Audience:** Thank you.
Hello.

Okay, this is 17 August, AD 11 and I had a very nice lecture to give you today; and I'm not kidding you. I had it all taped and was going to explain to you all about valences. Instead of that, I'm going to rack up an overt on auditors.

Because I've just caught you out. Man, have I caught you out. All summer long we have had one god-awful problem. Why the hell can't you find a goal on a pc. When it takes me one hour and fifteen minutes to find the goal and the terminal and it takes Mary Sue about two and a half hours, why can't you find a goal on a pc?

And now I know why. And I'm going to twirl my long black mustache and look right down your throat.

There is a phenomenon – that an E-Meter ceases to register in the presence of an out-rudiment. The E-Meter tone arm will cease to register on any process you are running when a rudiment goes out. You can be fooled by thinking a process is flat when actually all that is wrong is that you've got a rudiment out. The tone arm will cease to move; the needle will cease to move; everything will cease to move except the rudiment that is out – that will move.

In other words, if you ask for the rudiment that was out, you'll get a response on the needle. But all other things in the presence of an out-rudiment do not move. Now, can you get that real clear?

All right, you've got Mr. Pc, and Mr. Pc is moving very well on the tone arm and the needle is moving very well and suddenly the tone arm slows down and stops, and it stays stopped for twenty minutes. So you say the process is flat. Flat, my hat! A rudiment went out which caused the process no longer to operate. The only thing which will now operate is the out-rudiment.

Now, if you get the rudiment off that has gone wrong and you get that rudiment in promptly and properly, the process will now pick up the motion of the tone arm and will now, in addition to that, move the needle. You got that now?

Now, don't make a mistake on this because this is the most important part of auditing there can be. There is no more important part of auditing than what I'm telling you right this minute.

A process can appear to be flat just because a rudiment's out. You're running "How often have you failed to leave something?" And all of a sudden, why, it's sitting there at 4 and it
just sits there at 4 and it just doesn't move. And then you say, "Well, that's the end of the process, ha-ha!"

*Mmmmm. Rrrrf.* Aw, you had a rudiment out and the process appeared to go flat and the process was not flat at all. And the only thing which will now move the E-Meter is the out-rudiment.

You can find the rudiment, the rudiment now will operate, but it's the only thing that'll operate the E-Meter. ARC break, present time problem, something wrong in the environment – these various rudiments, you see, will move the E-Meter. You flatten that with a rudiments process then you move back over onto your process. And what do you know, this process that was so flat, is not flat at all, but it wobbles the tone arm and it lets the needle fly around and so forth, and there it is.

So, two things have been happening, and this will become more horrible to you as I go along. I think very often auditors – not just here! I'm not scolding you here. You're better supervised here than elsewhere – but I'm talking about auditors elsewhere in other classes, in other areas, in HGCs and so forth. Here's where your HGC Clears aren't getting made, right here on this exact point I'm telling you.

These people are leaving Prehav level processes unflat on the pc. That's on the running of it. Just because they get the rudiments out, then the Prehav level looks unflat so they assess for a new level. Ah, but the old level isn't flat, so, of course, the pc doesn't go anywhere. So they just grind and then they not flatten the next level, you see, and then not flatten the next level and then not flatten the next level and we just go on grind, grind, grind, grind. Do you see what can happen here? You got that? Have you really got that?

*Audience:* Yes.

You really see this?

*Audience:* Yes.

All right.

The same thing will happen on a Goals Assessment. And I think your preclear's goals lies in the first hundred and fifty goals the pc gave you and I think it is knocked out by an ARC break. And I think the pc's goal has already been given to you, long ago, and now appears to be flat because it's ARC broken out of existence by some technical flub. Them's hard words. But I think I could take any person in this unit and in the matter of a few minutes get the ARC break off by auditing off the auditor who is doing the assessment and find in the first hundred and fifty or two hundred goals on the list that one of those goals is still alive and is still sticking and won't go out.

Interesting. I think I could do it with every person, not only here, but Australia, America; anybody who's had trouble finding a goal. I think that is it. I may be wrong because I've not put this immediately to test. I do know that I could find your goals. But I am pretty sure this is the phenomena that's getting in your road.

And you know what makes me sure? Because there is something – there is something in the South African regimen of Goals Assessment that hasn't been in any other unit or course.
And what is it? I made sure that they had every student there checking the rudiments on every other student's pc, regularly and continuously. Isn't that right? And it aren't been done since. So the answer must be rudiments. There is the one difference, and that's why I think that is the difference. Follow me?

Seem logical?

**Audience:** Yes.

That if everybody, every twenty-four hours or something like that, was getting rudiments checked by another auditor on his pc, and that they were always finding them out, and that this isn't now being done anywhere – a piece of the line-up has been knocked out.

If the Director of Processing of a Central Organization does not, every single day, check the rudiments on every pc in the shop, he's a knucklehead. Well, he's a friend of mine, but he's still a knucklehead. Because, in the first place, the pc very often doesn't go live for the auditor easily on the rudiment where he will go live for another person on the rudiment.

And you can sit there and you can say to the pc, "Do you have an ARC break, present time problem? Is it all right if I audit you?" and so forth. 'Have you got a withhold?" and so on. And they're all apparently null. And then somebody else walks in on the thing and says, "You got a present time problem, a withhold, an ARC break?" Ka-wooww! They're all live.

You should have seen Richard Halpern's face one day when I took one of his pcs and found every rudiment falling off the pin. [laughter] "But!" he said to me plaintively. "But," he said to me, "I just checked those fifteen minutes ago and they were all in." And it's true, he didn't get a fall on them fifteen minutes before. Isn't that interesting?

All right, two auditors should always audit as a team. Auditors shouldn't be out in the brush country of lower south Slobovia, upper north Manito, Wisconsin, auditing by themselves. Anyway, auditors ought to audit in pairs. Wolves should run in packs, auditors should go in pairs. Oh, I didn't mean there was any comparison between the two. [laughter] I didn't say mice!

Anyway, auditing in pairs – should check the rudiments on each other's pcs, every session. Sounds arduous, doesn't it? Sounds like an awful lot of administration, doesn't it? Sounds like an awful lot of people falling over an awful lot of chairs and so forth.

Well, actually you don't have to do it very formally in an auditing session. You can almost lean the guy up against the mantelpiece, prop the meter on the mantelpiece and say, "All right, take ahold of the cans. Now, do you have an ARC break with your auditor? Do you have – been audited with a present time problem? Is it all right if you're audited in that auditing room? Do you have any withholds from the auditor or anybody else including me?" And so forth. Fall. Fall. Fall.

Well, you don't do anything about them. You say, "Joe. Joe. Get on the ball. The rudiments are out on your pc."

"Well, which one?"

"All of them."
"Oh, no!"

You know, that kind of response.

It's a new look. The soothing drone of the auditor's voice has not got the pc into a super control where he mustn't be out of order. Get the idea?

That was in the South African lineup. And Jean, I'm sure, did it.

As a matter of fact, she had two cases that were banging her head in. And she finally, herself in person, went in and they've been running null on present time problems.

"Do you have a present time problem?"

"Oh, no, no, no."

And they did it all the weeks of the course. And she extended the course over a week just to make sure that it was better. And she grabbed hold of the meter on them and she found both of them had such fabulous present time problems that each one of them broke down and wept the second she put her finger on the present time problem.

Ah, they'd been audited. But she was saying, Routine 1 does not work, you see, and something else is going on here. We must be doing something, you know? Yeah, they were running a Routine 1, but it should have been picked up during the Security Checking. But it wasn't picked up in the rudiments on the Security Check, don't you see? And so those people had actually gone six and seven weeks without anybody probing in to find out if there was something wrong with the PT problem. And there was something wrong with the PT problem, and that comprised almost 50 percent of her class. Do I make an impression on you?

Audience: Yes.

All right. Out of kindness to the pc and yourself, for heaven's sakes, start cross-checking rudiments. Ka-now! See? Start cross-checking rudiments. By which I mean, get somebody else to check the rudiments on your pc. You check them perfectly soundly and run your sessions just as before, but always get somebody else to cross-check the rudiments on a pc. You got it? And do it often; do it frequently! If not every session, at least every couple of sessions, for heaven's sakes. See?

Now, I'll tell you what you do with these endless goals lists. I could tell you what you do in a colloquial marine fashion, but I'm not going to tell you that. [laughter]

You get you-self, the auditor, off of the case. That is to say you go on auditing a case, but just get any charge that you may have built up on this case with your Goals Assessment, off. Run yourself on the Prehav Scale. We don't care how, see? In other words, get that – get that flat and then take the original goals list. The original, and find out if any of them are still alive and work it over and find out if there's been an ARC break around any of these goals and so forth. Get slippery about it. I'm tired of giving you a mechanical robot activity, it's time you graduated up into body class II – half human, half robot. [laughs] Okay?

Now, let's just work over that original list and let's find out what is there.

You know, I know at least one person who probably is spooked because Mary Sue, operating I think with another auditor, shook that down in a part of an afternoon. And I think
this pc doesn't trust his goal or terminal, because it was that easy, it was that fast, you see? It was that quick. And everybody else takes so long. Well, of course, it must be something wrong with that particular terminal and goal. No, there's nothing wrong with that terminal and goal, nothing at all. They were running just dandy.

There might be an unflat level someplace on the past run, but that would be about the only thing. Actually, a past run has been a little bit lengthy, so I would suspect there was a rudiment out on the run not on the assessment, and I'd check that over very carefully. But get your rudiments checked. Get your rudiments checked well, get them crisscrossed, get somebody else to check the rudiments on your pc and that's going to speed up all this nonsense about assessment. And don't be so anxious to rub out goals. You're trying to find a goal, you're not trying to erase all the fellow's goals.

Now, it doesn't take very long to find a goal on a pc. Just disabuse yourself from that – it just doesn't. Williams was almost staggered into the -- . Who was the -- the wife -- the wife of Lot that went into a pillar of salt out of frozen shock from watching Sodom and Gomorrah go boom, or something. I've forgotten. It's some fairy tale. And anyway, he turned in -- he went to Australia and he started his course and everything was running all along, and he practically turned into a pillar of salt from shock at the length of time it was taking these goals to be assessed. Because it never happened to him in Aus -- in South Africa. Well, I was riding him awful close. And we were -- and that was the missing factor, and I'm sure it hasn't been done since.

The American ACC managed to go all the way its length with tremendous gains -- tremendous gains. A great deal of instruction took place, everything was fine, all the students happy, and without one single goal being found in six weeks. A record, man! Well, they weren't cross-checking rudiments, that's for sure.

So, put that in as part of your auditing rundown, because it is a missing piece. When we had all these gains and got all this stuff whizzing and going down in South Africa here in this spring, that was part of the rundown -- is everybody was checking everybody else's rudiments. Isn't that right? How often did they do it?

Female voice: We did it every two days.

Every two days they checked the other fellow's pc's rudiments. I'm sure it hasn't been done since.

You get these little tiny pieces of stuff that get left out of the pudding, you know? It's a beautiful pudding -- it's a beautiful pudding except nobody put any yeast in it or anything. See, it just lies there like a pancake.

All right, that was part of the rundown. Rudiments out means Goals Assessment not done.

Now, I've given you some other tricky ways of getting around Goals Assessment. There's a lot of -- this hasn't been in vain by a long ways because you've learned a lot of tricky ways of getting goals and all that sort of thing. You know more about that now and I've had to dig up a lot more about that and that's had to be articulated from one end to the other.
But I am sure, just as sure as I'm sitting here and just as sure as there's a body in this chair – I'm pretty sure of that – that it is simply a matter of you get the rudiments out maybe on one or two goals. Just as slightly as that, you see? You're going on down the line erasing goals and you get the rudiments out on a goal and then out on another goal, and maybe one of those goals was it. You see? And you get the rudiments out. And then maybe on the remainder of the list, why, of course, they all null with a great speed because the pc is chopped up or ARC broke or got a PT problem. You've got in other words, an inoperative E-Meter on the subject of goals. It'd be very operative on the subject of rudiments but it's very inoperative on the subject of goals.

Now, if this isn't correct and if this doesn't bear fruit, I will find out why. Don't worry. But I'm pretty sure that this is it. And what makes me sure is it is the one piece of stuff that was missing from the South African course. That was missing. And it's now missing here at Saint Hill. And it's now missing in Australia, I'm sure. And it certainly was missing over in Washington, I am sure. See? It's the missing item. Somebody else looking over your shoulder and checking the rudiments on the pc repetitively and often, making sure that those things are in. Okay?

You have a whiz at it here. And you go back over that goals list that was first given to you, or that you first got, and you cover that list again after you have gotten any possibility of an ARC break off or a present time problem off or anything else off or any anxiety off or having – finding one's goal as a present time problem off. You got it? Just get all of those things straight, as straight, as straight, as straight, even if you have to run yourself on the Prehab Scale, don't you see, on – off the pc. And I'm sure that you're going to find the goal was in the first couple of hundred. You hear me?

All right, I'm pretty sure this is the case because, you see, I'm not having the trouble you're having in finding goals and terminals. I'm just not having this trouble and it's just something that has got me saying, "What? How? How are they managing this? What has entered into this?"

Well, now here's another oddity: I get goals and terminals without checking the rudiments. [laughter] Hm! You've seen me do it – repetitively. But you can assign that to altitude, because I'm in no uncertain toned voice when I'm getting off goals and terminals. "Is it this, is it that, is it the other thing?" You know, bang, bang, bang-bang-bang-bang, so on. There's a great deal of certainty concerning this. And also it doesn't seem to be very important. I don't make it very important. But I've even said to the fellow, "Well, do you have ARC breaks and that sort of thing?"

And the guy said, "Oh, yes, yes, yeah, yeah."

"Do you have any overts on me?"

"Oh, yes, something like that."

"Well, skip it." [laughter]

So, that is an invalidative part of this analysis. But I think if you look this over very, very carefully, I think you will find that that will deliver into your paws. I think you have slid over the goal and I think, long since, it's in the background. Because you're also doing some-
thing else which is wrong, as wrong, as wrong. You are asking for more goals before you go over the goals list at the beginning of every session, see?

I never want any more goals off the pc. I got enough after he's given me – after I've gotten writer's cramp writing fifty or sixty of the things: I got enough goals. It's almost by postulate one of those is going to be it, you know? I should be careful saying that because you'll think I mean it.

But I just sort of look him over, you know, and, "Hm-hm-hm. One of these is it. One of these is it. Must be."

But then, there is this factor: is, I've actually never known a pc to lie to me. When I ask them for something, they deliver. See, which is all I mean by altitude.

I say, "What were your childhood goals?"

"Burrhm." – "Thank you." – "Burrhm." – "Thank you." – "Burrhm." – "Thank you. All right, that's good. Now, what are your antisocial goals? You know, like burning down the town or something like this."

"Well. Burrhm."

"That's it."

"Burrhp."

"That's it. Oh, that's enough, to hell with the rest of them."

I don't want him to have an artistic goal anyhow. And then I say, "All right. Now, what withheld goals do you have that you just wouldn't ever dare tell anybody about?"

I wind up with a list of thirty, forty, fifty, sixty, seventy, eighty – something of this character. That's it, I don't look over more goals.

Now, the difference is that because everybody was chewed away from this we had more methodology invented than was actually being employed originally on Goals Assessments. And the original Goals Assessment, it was quite odd that the one goal you made fall there actually will continue to fall. That's quite a discovery, but it's true. But you don't even have to do it. There's one goal there going to fall more than the rest of them, and that'll continue to fall unless you get an ARC break in the road. You understand?

Of course, this thing – altitude is one factor, but only one factor of holding a pc in session while you are doing a Goals Assessment. And you can hold him in session like he felt he was cast in concrete, you know? It just doesn't ever occur to him to have a present time problem or an ARC break. That's about the – that's the real secret of auditing.

If you yourself are sufficiently matter of fact, sufficiently relaxed, sufficiently in control of the situation and know your business well enough, there is never any doubt enters your pc's mind from one end of the session to the other but what he should be sitting there getting
audited. But if there's a bunch of doubts around, then you've got to keep your rudiments clean, clean, clean.

So just as they have a large forty-seven foot wastebasket at Times Square; it's "cast your ballot here for a clean New York" – I think that's awfully cute – forty-seven foot wastebasket. That's just what Times Square wants. I can see it now. It was so outrageous that a bunch of businessmen have now chipped in to make a park and a grass plot and so forth there, and so on.

But just with that type of corny, corny, corny advertising we should hang up little signs all over HGCs and classes and so forth: "Keep your rudiments clean for a Clear." Pretty corny, but it's true.

Now, the amount of importance which you are giving an assessment is quite interesting. But a person can be assessed straight through to Clear by Assessment by Elimination, providing the rudiments are all in. If you use the other data which I have now dug up and given you. That is, get all the not-knows out about it and find out why he had the goal and so forth. Another – another side of the coin – an entirely different side of the coin.

Okay? You had enough hell for one day? You mean you haven't?

Female voice: Did you say hell or help?

Just hell. [laughter]

Go back over and check it, and I think you'll find it's true, that your pc's goal long– occurred a long time ago for running. I think so. This would be the only way that you possibly have missed somewhere.

There's the other road and the other road is you can assess a pc straight through to Clear. You get rid of all of his goals, he comes out at the other end; you get rid of all of his terminals and so forth, and he comes out at the other end and that's, that's it. That can happen, too. Apparently, they're practically two different processes.

And now I will give you the lecture I was going to give you today. All right?

Audience: Hm-hm.

Well, this is an important lecture. It summates the findings of a great many of years and particularly a great many of the findings of this summer. And the name of this lecture is "Valences." And I should start it with a definition of a valence.

There are several types of valences. In some other old PAB you'll find them classified into various types. But a valence is a synthetic beingness, at best, or it is a beingness what the pc is not but is pretending to be or thinks he is.

Now, that beingness could have been created for him by a duplication of an existing beingness or a synthetic, which was a proper term, beingness built up by the descriptions of somebody else. That just as Horatio Alger, Jr. built up a synthetic beingness called "Local Boy Makes Good by Hanging on the Coattails of Rich Man" (which was his total motif), a synthetic beingness could be created which everybody would believe in and try to become. Or, Mama can run Papa down so continuously that Junior never, under any circumstances,
ever meets Papa or sees Papa but becomes the synthetic beingness of Papa. All of which is an interesting thing.

One of the basics of this, by the way, is the first lecture of the first congress I ever gave in England. That — there's a tape on this. It's what you think the other fellow is, not what he is, that is the other fellow's — your trouble with the other fellow.

Now, this is a valence. A valence is, then, an artificial beingness of some kind or another. But with that we don't have, factually, "own valence." There is no such thing as one's own valence. This was thrashed out in 1950 and went loose through the middle of the fifties and people refer to it, and I may have even said it a few times — his own valence so forth. But it is not correct — it is just not correct. Because a person's own valence is silliness. That is a silly statement, because a person is himself or in a valence. You see, it's one or the other. He is either himself or in a valence.

Now, a valence is a package. And one of the earliest observations concerning this when I started to come to grips with this thing we now call a profile or a graph, I analyzed it from all sides and came to just one conclusion regarding it. And that is that it was a picture of a valence and that is all that graph is — it's a picture of a valence. And any change that you got on a pc was because you shifted his valence.

Now, you've already read that years ago. It's an old datum but now it merges up into first order of importance. Pardon me, it shoulders its way up through other data to stand on top as a king-of-the-mountain datum. That's a picture of a valence and you're never going to get another picture until you've done something about valences on the person. And this boils down to this didactic statement which can now be made, which makes this a very important lecture: The pc will not gain in any way, shape or form through any effort to alter the characteristics of a valence.

Swallow that one, because it's a very important statement and it's a very factual statement. A pc will not change in any way by reason of processes which seek to alter the characteristics of the valence he is in.

He's in the valence of an ogre. All right, you're going to change the characteristics of the ogre and this is going to make a better pc. No-no. No-no, no-no. The pc will alter only if you change the valence as a whole package.

And why is this? It's because the pc cannot take any responsibility whatsoever for any of the package of characteristics known as a valence. They are somebody else's. And he takes no responsibility for any of these now-I'm-supposed-to's that go and make up this package called a valence.

A streetcar conductor, of course, as a valence, has a number of now-I'm-supposed-to's, right? There he is ding-donging up and down the line, letting on the passengers and taking first crack at the nickels and sixpences. And after that the company gets what's left. And whatever it is that the streetcar conductor is doing, he's got a now-I'm-supposed-to. He's supposed to get up in the morning; he is supposed to go to work; he is supposed to see the passengers on and off; and he is supposed to collect the fares and make change. You see, now-
I'm-supposed-to's, now-I'm-supposed-to's. He's supposed to wear a cap; he's supposed to wear a uniform. You get the idea? I am supposed to, I am supposed to, I am supposed to.

All right. Now, somebody gets into the valence of a streetcar conductor and all of these now-I'm-supposed-to's, are the now-I'm-supposed-to's of a streetcar conductor, they're not anything that can be touched or reached by the person. All the person could reach is the knowingness or identity called a streetcar conductor.

Now, let's get down and find out what use does a thetan make of a valence. This is the only use he makes of a valence. Survival. The road out. The modus operandi of getting on in life surmounted by knowingness. Valence is a solid knowingness; a body is a solid knowingness.

You see a streetcar conductor, you "know" he is a streetcar conductor, so therefore all valences are knowingnesses. They're an effort to get somebody else to "know" that you're there and efforts to get somebody else to "recognize" something. And therefore they are a road out. They are a road out of unwanted areas.

This fellow is slogging around in the mud firing off Mannlichers, Lebels, Lee-Enfields, Springfields, Garand Mark 1's or whatever other asinine thing the infantry is supposed to do. And just as he catches the trench mortar in the midriff, he discovers he does not want to be there. He is in the wrong valence called "a soldier." Wrong valence. That knowingness is now invalidated, it must become a "not-knowingness." So he exteriorizes and he says, "the only way to fight a war is as a general". Obvious, isn't it? So his next lifetime he's going be a general.

I'll give you a big joke on me with regard to this sort of thing. I always said that in the event of another war, I'd be a war correspondent. I'd be sitting there with a blonde on each knee and a bottle of whiskey in front of me and a typewriter – real tough picture, you know? I used to tell my friends this around New York City. And I'd – we'd hear the horns go and then I would lean over and say, "Sit over on the settee a moment, honey." And I would pound out on the typewriter, "Our brave boys, today, went over the top", you see, and put it on the wires to Associated Press. But some of my friends had bad luck in the Ethiopian – ha – war and so on. So, when the war came along I didn't do that. But nevertheless, that's just an example.

You know, the trench mortar catches him in the midriff and he says, "In the next war", he says, "I had better be a war correspondent because the last war correspondent I saw was in that nice thick dugout eight miles to the rear of the front lines." You got the idea? He says, "That's the thing to be", you see? "That's dandy."

So the next war comes along, and he tries to be this thing and he can't be this thing, so he's very unhappy about the whole thing. He can't be this war correspondent but he tries. And how he will go on a long cycle of tryingnesses if this is really one of these plowed-in sort of valence pictures, not as – not just a joke as mine was. And he's trying like mad and he'll go war after war, you know, life after life, and somehow or another he'll eventually familiarize himself enough with the tools of the trade. And sure enough a war comes along. And so help me Pete he gets to sit in this dugout and pound out this deathless line, "Our brave boys, today, went over the top", see, while he's sitting there.
All right, that's fine. That's fine. He goes along like that; is very successful. Time goes on, you see? And they have run out of war criminals by a few lifetimes later, you see? They've run out of war criminals utterly. They've hanged everybody, you see? And they find out they can no longer charge presidents, kings and things, and generals with starting wars, so they assume quite – probably quite rightly – that it's the fault of the press. So immediately after this war, the fifteenth life that he's been a war correspondent, he finds much to his horror that all war correspondents are now being arrested and being shot in a painful manner.

So just at the moment when twelve bullets, straight and true, hit him in the chest, he decides he had better not be a war correspondent anymore. This is something he had better not be. So he decides that the best thing to be in a war is Mata Hari, you see, or something like this. So over years then and ages and so on, he'll go on working uphill and upgrade to solve this confusing problem called war, to become a Mata Hari, you see? He learns how to be a woman, you see? And he keeps picking up female bodies and he becomes enticing one way or the other and he gets himself well endured to certain horizontal activities, and – excuse my French. But he moves on up the line and he finally makes it, you see?

And then lifetime after lifetime, why, he's just happy as a clam, here, being Mata Hari. And every time there's a war, why, he immediately becomes an espionage agent and everything is just dandy, and time goes on and so forth. And then he finds out that the G-2s of all of the armies – this one particular war – have gotten together and found out that this is how all of their information is getting across the lines. So every person who is a camp follower, vandiere, call girl, anything associated with it, ever looks at a general, is promptly picked up and shot. And as she stands there in the courtyard, you see, with twelve bullets going through her chest, she decides at that moment to be nothing after that but a peacemonger. Now, that's the thing to be – a peacemonger. You get the idea? Still trying to solve this silly problem, you see?

Valence, valence, valence, valence. Valences are calculated to do something. They are calculated to solve a problem. And every valence picked up is solution to a problem.

So therefore, you can say, if you'll excuse my rough talk, that these identities as they are passed by on the track are old antiquated solutions to confusions. They're antiquated solutions to confusions.

Now, the goals which go toward beingness are of course the much more definite goal. And the goal which is much more profitable in auditing is the beingness goal because it goes at once toward identity.

Now, a person is not himself, he is a different knowingness the moment that he is a valence. And the auditing truth which emerges is this: You can patch up a valence's broken leg providing the valence is supposed to have nonbroken legs. Got the idea?

And if your auditing of a valence does not violate any of the vital now-I'm-supposed-to's of the valence, it'll work. Therefore, you can do assists on almost anybody, but every once in a while they're bemused and amazed on an assist that should have worked but it didn't work. It worked on everybody else but it didn't work on this particular person. Well, you can chalk it up just to this and this alone – this alone: You have violated a now-I'm-supposed-to of
that valence. And the pc can do nothing about these now-I'm-supposed-to's, they are not under his control.

So your effort to patch up the broken leg was of a valence and the valence, oddly enough, was a crippled war veteran. Well, a crippled war veteran is supposed to have broken legs, so of course you get nowhere. You break your heart, you know? You say what's all this? Well, what all this is, is you're auditing a hidden valence.

Now, any pc is being dominantly, at any given time, one valence, but may be tortured or upset by other valences which are the – only the concern of the valence he is being.

So, any pc's troubles are only the troubles of the valence in which he is. And those are a pc's troubles. And the troubles of the valence are part and parcel of the now-I'm-supposed-to's of the valence.

So, this tells you bluntly and obliquely and straightly and helicopterly that there ain't no remedy of a valence's difficulties. There just is no such thing as being able to take valence A and remedy the difficulties of valence A. You can get rid of valence A but you can't get rid of the difficulties of valence A, because they are outside the power of the pc to touch, because they're now-I'm-supposed-to's which belong to something else, which he doesn't fully control, called a valence.

So we take a girl who is all geared up – she's all geared up; she's carefully grooved in war by war, you see; she's carefully grooved in and she knows the proper solution of this. And if another war comes along, she knows what she should do. She's got this solved, you see – Mata Hari. And she just is horrible to get a withhold off of. But she's awfully good in getting secrets off you. [laughter] She seems to have a total promiscuity as a viewpoint; something that's incomprehensible. And no affair she ever has seems to have any real point to it. That's so mysterious.

And you try to figure this thing out and of course you have not got the key to the closet, so what skeleton is in it must remain, therefore, a mystery.

The key to this closet of course is, in event of another war, she's going to be Mata Hari. And a war is so dangerous that she mustn't let go of any part of this solution. But she would like to feel better. You get the anomaly about it? She'd like to feel better but she can't let go of any of the things that are wrong.

So you get this oddity of "Please audit me, but you better not make me well." That's what it looks like. But actually it's "You better get me over the bumps so I can take care of myself without having to be a Mata Hari in the next war", don't you see?

"These holes that keep appearing and disappearing on my chest while you're auditing me tell me that I had better not be anything but a Mata Hari in the next war." So, you'll sometimes have a somatic turn on in a pc and go off and turn on and go off and turn on and go off and turn on. You never seem to be able to get rid of it. It's part of a valence package that keeps them from becoming something else, and they know better than to become that, see? And so they'll actually keep around the somatic, to the degree that they can, to prevent themselves from becoming an unworkable solution to a future problem.
So this girl's attitude toward men is unresolvable because it's part and parcel of survival. And just as you would be able to get your head torn off or get somebody very upset by you by walking in on a grizzly bear and taking his rations away from him, don't try to take that solution away from a pc so long as it seems absolutely vital that it be a solution.

What you've got to do, quite on the contrary, is to get the pc to face up to the various factors which make that a valence.

I wander afield. The only point I'm trying to make with you is just this one single devastating point, just one, and that is: You cannot make a valence well. You can move a valence. So this tells you that any process run at random on a pc has a very small chance of success.

You take Mr. A and you say, "All right, now we're going to solve your ideas about problems, Mr. A. And we're going to set you up, Mr. A, so that you can reach and withdraw, Mr. A. And we're going to get you over breaking your legs, Mr. A. And we're going to get rid of those funny red marks that appear and disappear on your chest, Mr. A."

Ah, but the trick is you're not auditing Mr. A. You're auditing a luckless person who has it all taped in the next war to be Mata Hari, but he's a man. So this life is a total loss as far as he's concerned. Wrong sex. Wrong, wrong orientation for a proper solution to the goal. And if a war came along, he would be utterly flabbergasted, because he could just see himself drifting back into this war correspondent, who of course is blamed for his war crime. Okay?

Move valences, don't audit them. Now, that just strips down your bag of tricks, as the effective bag of tricks, to a very small bag – the really effective tricks. This preselects them for you, left and right.

Is this process going to change, familiarize, accustom the person to identity; or is it going to handle environments which make identities vital; or is it going to alter, in other words, valences?

If this process is going to alter valences, it will work and work rather rapidly and smoothly and stay worked; and if it is not going to alter valences, it is not going to work and it is not going to stay well and solved. Do you follow me there? That's a big piece of information all in one batch.

Now, what makes a valence stick the way it sticks? What makes a valence stick the way it sticks?

Let us define a psychotic. Let's newly define a psychotic in terms of knowingness. A psychotic does not know what is going on in his environment and does not know what is going on inside himself. It is all unknown and therefore unobservational – unobserved. He doesn't know what's happening inside himself, and he doesn't know what's happening with himself, and he doesn't know what's happening where he is, and he doesn't know what's happening in front of him or behind him at any given time of the day or night. This is the one common denominator of all psychosis: Not-knowingness, what is happening around him in his environment and not knowing what is happening where he is.
Now, let's take neurosis. Neurosis is he's got some idea what's happening where he is on some things and some faint idea what's happening in his environment on some things. But, generally, unknowingness overbalances the knowingness and so you get a neurosis.

Now, let's move it up scale a little bit and let's take you. You know what's happening where you are but you don't know what's happening in somebody else a few feet away – exactly what's happening at all times of the day and night. You don't always know what's going on with everybody. You got the idea? So, that makes a slight unknowingness, doesn't it? So, just look it over now. Just get this as a pictorial picture, just as something to be graphed very easily. There you sit right where you are, and you know what you are, you know where you are, and you've got a good idea what you're doing right where you are.

All right, now let's take it to extreme. Do you know what is happening a hundred miles straight ahead of you? All right, do you know what's happening three feet straight ahead of you? Yeah, in this particular instance you do. Do you know what has happened within a few feet of you all of your life, at all times of your life?

Oh! There's some spots in your life where you didn't know what was going on, a few feet away. You did know what you were doing but you didn't know what was going on there, is that right? All right, those are the stuck spots of your track, because it's a disagreement – total disagreement. You knew, facing an "unknown", see, it's a "know" versus an "unknown" and these two things are out of agreement.

You never be surprised – a whole bunch of cheerful idiots all of whom are stupid and they all know everybody is stupid. You know, they get along beautifully? Look at a communist cell sometime. They're all happy and they all know they're stupid, you know?

But if a fellow gets up to a point where he has the least power of observation of any kind whatsoever, he starts to run into this one. And that is, immediately in his perimeter there are things he doesn't know, which makes an inequality.

Well, now, these unknowingnesses can get so overwhelming that one will adopt a valence to resolve them. He'll pick up a valence which knows about these things. They do it so often that in the United States a great many of the scientists today are content to let the valence know everything that a scientist should do and know.

I got the Polar – my Polar Times this afternoon and it's got a bunch of pictures in it and of course the polar regions are now being absolutely infiltrated and butted into and so on. Everybody is charging into the polar regions and anybody who is a member of the Polar Society gets to know all about what snowdrifts they're jumping into now. And man, let me tell you they're really jumping into a lot of snowdrifts. The boys are having a ball.

And here's a photograph, here's a photograph and here's a bunch of perfectly valid human beings, but they've just invented a motor that will chew up snow. It's a ten-horsepower motor, and a fan blade goes underneath the snowbank and it just keeps chewing up snow. And it's all very nice, and so forth. But you look at the guy who is standing there posing with the picture, you see, of it and he is a scientist one way or the other. He isn't doing anything. He's testing it. And in all the midst of all these parkas and everything, here is the perfect mock-up, you see – up there at about 89 degrees north – here's the perfect mock-up of a scientist.
They've got to have the old school tie; they've got to have their diploma signed just right; they've got to have all of these various things; they've got to be just so; they've got to belong to the right societies in order to be these things. And they get that — that beingness has got to be just exact, you know? It mustn't vary a hair.

And if anybody comes along and thinks a thought in the field of science who doesn't have this exact beingness these boys almost go mad! They just go berserk! Why?

Also, this doesn't add up. The boys who invented most of the civilization in which we are now confusedly involved and who laid the fundamentals of it, were not one of them scientists. Firestone, Ford, you know, Edison. These birds were about as far as you could get from this particular mock-up.

But this other mock-up is a kind of a whole track mock-up. Actually, they've got a scientist all mixed up with a technician. Oh yes, a good scientist always demands of his technician that he have the right old school tie and that sort of thing because he doesn't want him running off with the uranium pot.

But it's a sort of a body running without a head now, because they're calling scientists technicians and that sort of thing, you know? It's all messed up. But it's an exact beingness — it's an exact beingness. And the moment you try to shake that beingness even the least little bit and you — just by a question, you know?

Yeah, I asked one time, I asked a, quote, "scientist", unquote, who was being hired at vast expense on a government project to develop jet propulsion — atomic jet propulsion. And I said, "Well, have you ever made up an orifice — an optimum orifice pressure table for jet orifices?"

Well, this would be the most fundamental thing you would ever dream up if you were doing a jet propulsion job, you see. Because it says how big is the cylinder and how fast must the velocity of particles go out of the cylinder to give you the maximum horsepower — foot pounds of thrust. And this bird was absolutely turned into screaming, squirming jelly. They hadn't done it, you see? They were still using the Chicago Fire Department's hose tables. [laughter] And I had suddenly, inadvertently exposed to view, you see, the fact that they were being about as thorough, you see, as somebody throwing bits of paper in the wind.

And I actually wasn't trying to invalidate the boy. But he just went all to pieces and he became absolutely savage about me — just real bitter, you know? Because, obviously, he's living the life of a mock-up.

You see, you've got the right old school tie; he's got the right letters; he's got the right this; he's got the right that; he is at a right desk; he is wearing the right pipe; he is, you know, he's got it all taped; he reads the right papers and everything else. But, of course, he isn't doing anything. See, all he is, is a package of now-I'm-supposed-to's operating with Chicago Fire Department's hose pressure tables. This is — becomes a very solid valence.

They seldom send the scientists out to fight the wars, by the way, and it could be just another Mata Hari dodge, you see? But the guy evidently really isn't thinking up anything; he really isn't adding anything. He's adding up figures and standing around and posing with a… One of the hard cases in the parka, you see, is the fellow who set this snow eradicator going
and then stepped aside so the scientist could pose there by it, you see – manipulating it. Marvelous!

You can see on all sides of you these outrageously artificial valences which are pretended valences, and you see the level of pretence of the valence. And when you see it to that degree, of course, it immediately becomes spotted for you and you say, "Ha-ha! Yeah, that's very artificial."

Ahhhh, but Suzy Glutz sits down and she is not in this type of artificiality and you say, "She is real." Yeah, George Aloysius Doakes sits down and you say, "He is real." See, no pretence here, this man is a downright matter of fact – well, maybe that's the valence: downright, matter-of-fact. [laughter] He's identified himself hasn't he? Well, if he's identified himself by a bunch of tricks such as clothes, hat – well, you must be looking at a valence. You must be looking at a valence and a package of valences.

Now, the obvious valence that the fellow has a body does not necessarily condemn him at all. It's the valence that he is being and is using the body to be, that is the auditing target. So a human being has a body. All right. So a thetan has a body and it's following the current mode. Well, this doesn't actually make a valence. You know, it's not plowed in; it's not below his level of consciousness. He's just soared down from Arcturus and he picked up a body and he's walking it around and he sits down.

Now, you say to him, "Who are you?"

And he says, "Well, I'm – I'm X54 and just came in from Arcturus."

The only trace of valence there is "X54" – because he knows it. See? But of course a psychiatrist would lock him up.

I've always been going to write another Ole Doc Methuselah story, you know, about this type of crisscross.

Anyway, what I mean by valence, as far as an auditing target is concerned, is more or less the mental-image-picture package which the person has composed to resolve the problems of existence which he doesn't know anything about. He knows practically nothing of this valence. He cannot really identify the valence. He has fixed it up so that it is really unknown and really hidden. Because this thing, apparently, was surviving and it was totally unknown to him. He picked up the package and he's going on with the package, because it's a survival package. This he's fairly sure of.

He notices that this drunken, bum uncle of his, who flops around all over the place and gets sick regularly Saturday night all over the living room floor, is cared for. He doesn't have to work; everybody steps very light in his vicinity; he is just leading a perfectly easy wonderful survival life. And then we wonder why the little boy in the family all of a sudden grows up and is practically his exact image.

Well, one: He doesn't know why this fellow is leading this life, you see? And two: He's got all sorts of confusions himself that this fellow doesn't seem to have. So to escape from his own confusions, he could pick up the valence of this stumblebum uncle, you see?
And it's always easier to pick up a weaker valence than a stronger one. So your more logical target is the weaker valence.

Now, if the pc has a bunch of chronic somatics of one kind or another, these are part of the valence picture; these are not the pc. These are part of the valence picture. So somatics are part of the valence picture. Somatics are not part of the pc.

There's - even the mechanics of this has been worked out some years ago. I worked it out so you've got to have actually two identities counteropposed in order to get a smush and to keep a valence in. You've got to have a couple of identities pinned up. In other words, you've got the pc being himself versus this thing in order to feel pain. A pain phenomenon has to be highly artificialized. In other words, to hurt, why, you've got to have a couple of valences kicking around which are this way and that. I won't go into the torturous methodology of how this was worked out. I think it was Washington, 1957.

But it works like this. This fellow - to have experience, he says to himself - he will have to survive. This is the way he's got it worked out backwards: To have experience, he'll have to survive; to survive, he has to be this package.

You've got somebody who's convinced that he could not survive as himself or experience as himself. He has to be something else in order to experience; he has to be something else in order to survive; he has to be something else in order to live. And he is so sold on this idea of having to be something else in order to live, don't you see, that you haven't a chance until, all of a sudden, he realizes that he could live without it.

And of course his total game or his games condition is the "know–not-know," "have–can't-have," "be–don't-be," "do–don't-do," arrangements of this particular valence. And that's its relationship to some environment. And of course the tragedy of it is, it's usually measured up for an environment which no longer exists.

You get the boys going around - the Teddy boys, you know, or the Edwardian jackets, you know, that sort of thing. They think this is pretty good. They've got themselves all rigged up.

Now, you get the other crew that's going around these days in the slick motorcycle jackets - these leather motorcycle jackets, you see? They're all rigged up to live in space opera. Of course they're just waiting. They're just waiting. Russia and the United States are going to have a ball sooner or later, and they're turning into space societies now, the like of which you never heard of, you know? Socialism. All these things are part of these: Balanced economy, slave dictatorships. And they're getting themselves all fixed up to be rocket jockeys. They're going around acting like they ought to act, you see, if the society were a space opera society. Well, they're getting familiar with it and they're getting in practice and that'll be a very good solution.

It's true too. You'll be able to put them in a spaceship and say, "All right, Arcturus or bust!" you see, and they bust. [laughter]

And you'll see these various stratas with you right now as classes. You'll see whole classes of things.
I don't know what the girls of today are being, particularly. I haven't looked it over very thoroughly lately, but I will say this – I will say this, that the society has got practically every woman a bit out of arrangement, you see? Because here we had a perfectly nice society going along, which was an agrarian society, and its values – male, female, familial – they were all figured out, they were all taped, everybody knew where they stood, you see? Might have been rough, but everybody knew where they stood.

Now all of a sudden you have coeducation and "Girl sniper does for eighteen hundred Germans", you see? And what's she supposed to be doing? Well, she doesn't know. So she picks up all kinds of oddball valences of how women fit into other types and classes of society. And you find some real wild ones, you know? I mean not necessarily a wild girl but you find offbeat valences of various kinds or another.

And a woman tends even more so in a society which is in a state of flux and which hasn't instantly and immediately found a specific use or need for a woman at any given instant, such as an agrarian society where it was all comfortable, you see – everything was taped. Now you're in a society where it isn't all taped and the exact specific need for a woman isn't quite manifest. You know, she's supposed to get married; she's supposed to have children; she's supposed to work.

Now, wait a minute, let's see. She's supposed to work. Yeah, but she's supposed to work at home? No, not really. Where's she supposed to work? Well, she's supposed to work out and contribute her money to the family coffers. Aw, now wait a minute. Now wait a minute. This doesn't make sense. Now let's see, how can we figure this out?

Well, the girl goes half-balmy trying to figure this out and all of a sudden says, "Well, there's a much better solution, you see? I had a much better solution 1,266,000 years ago and a much better solution to the whole thing, you see? And that was to be a ballet dancer." Yeah, well, there's still uses for ballet dancers, that's for sure, you know? Well, there you go, that's the best thing.

Only difficulty is she can't dance at this particular time and she's going to have to go several lifetimes grooving in, grooving in, grooving in. She'll eventually pick up a mock-up, then she'll be able to carry through this ambition. But right now it's on sleep, see? It isn't manifest, it doesn't solve the thing, therefore she's quite unhappy about it. Her now-I'm-supposed-to's get thrown aside so she then picks up a package of now-I'm-supposed-to's, you see, to get her out of situations which oddly enough she isn't in either. [laughter] You get how the confusion merges and how it spins around.

All I'm trying to tell you is just that you've got to find and move valences in order to straighten out cases. You've got to do that. And you can't straighten out a case without moving a valence.

When you have moved a valence you have changed a profile. When you have not moved a valence, I don't know what you've done.

All right, let's look this over. How would you apply this directly? All right, fellow has a toothache. You don't say to him, "What valence would find a toothache profitable?" You could ask him that. But you could say – this is just a quick one, you see, "Who had a tooth-
ache?" That was the oldest one, 1950, June. "Who had a toothache?" Bang, bang, bang. You remember several people who had toothaches and it tends to split the valence.

That is more valid than putting him in communication with the tooth in his head because that isn't his toothache. In the first place, this tooth can't ache without another tooth aching plastered on top of it in some kind of a mental image picture. Ah-ha! It can't ache, that's what's interesting, without another picture valence splattered on top of it. Got it? All right. We're going to say to this fellow. "All right, now uhm..." He just keeps having this problem about cars; he just can't seem to keep a car. Every time he gets a car, why, somebody takes it away from him one way or the other, and so on. All right. You say, "When did you have difficulty with a car? When did cars have difficulty with you?"

Uh-uh. A car isn't really a valence. Could be. There's some engineers – I've got an engineering firm. They're a very good engineering firm, and both the son who is about forty-something, and the old man who is close to seventy, talk to you. And when they start talking they start the motor. And they do. They say, "Rar-rar-rar." That's right. Well, Peter – he's heard them over the phone. Yeah, they say, "Rar-rar-rar." [laughter] And both of them have been to the hospital for repairs lately. [laughter]

So, we might – we might get someplace unexpectedly on this subject of a car because it might, itself, be a kind of a valence, you know? But we say, "When did you have difficulty with a car?" and, "When did cars have difficulty with you?" Well, if it was a valence it would work, but it would be much more profitable to say, "Who would have difficulty with cars?" See, "Who would have difficulty with cars?" "Who would have difficulty with cars?" "Describe a person that would have difficulty with cars", you know? Process it right there at "Be". And all of a sudden, you'd find a fantastic thing.

All right, I'll give you the right and wrong one again, here, that's a little plainer. You say, "When have you hidden? Thank – ..." This guy is – we find him on "hide" and we say, "When have you hidden? When have you hidden? When have you hidden? When have you hidden? When have you hidden?" Yeah, you get some kind of a result and you have a lot of somatics, and so forth. And he comes back the next day and he's got the same somatic, the same package. So we say, "When have you hidden? When have you hidden? When have you hidden?" Yeah, you get some kind of a result and you have a lot of somatics, and so forth. And he comes back the next day and he's got the same somatic, the same package. So we say, "When have you hidden? When have you hidden? When have you hidden?" Same somatics, same package, the next day. You, well, you're processing a valence, see? He isn't there to be processed, practically. You see, he's overwhumped in some kind of a valence and the valence is supposed to hide.

And you'd say, "Who would find it necessary to hide?" "Who would find it necessary to hide?" "From what confusion would who hide?" You know? That's an awful tough one, it's a divided split-double-question. But – it wouldn't ordinarily be used – but that's what you're trying to find out. You know?

"Who would try to hide from what confusion?" "Think of somebody who is always hiding." "Who else would be always hiding?" "Think of a person who hides." Because that valence has got the confusion, he hasn't got it. But you could double it in brass and you would produce probably more bombastic results. You would be processing the condition in which the fellow found himself, and so forth.
You could go at it this way. You could say, "What beingness would be a good solution for an environment where it couldn't be? What beingness would be a good solution for a tough environment?" – better one. We had this a long time ago. We had "Who would survive what?" you know, that sort of thing. Process your who's; process your valences.

All right, now let's get a little bit further and let's go upstairs a little more into the high school aspects of the thing.

Got a guy with a toothache. All right, you're going to cure this toothache. You'd say, "Who would want to cure a toothache?" And you do an assessment on terminals. You'd say, "Who would have a toothache?" "Who would want to cure a toothache?" "Who would have a toothache?" "Who would want to cure a toothache?" "Who would have a toothache?" "Who would want to cure a toothache?"

He's given you the goal. He's got a toothache and he wants it cured. You've got your goal. So your goal is understood so you're jumping right off from there. But make sure he wants to cure this toothache, you know? And you just run two sides of it and do a terminal assessment on the thing.

It might not last to a terminal. The thing – whole thing might blow before you got a terminal, do you see? "Who would have a toothache?" "Who would cure a toothache?" Cause-Effect line of the goal.

You get a whole terminals list on the thing: Don't be a bit surprised if it's blown. But if one of them doesn't blow, you've got it – you've got the valence. You've got it right there, *bongo! bongo!* and it's a real stuck valence.

So open up with your Prehav Scale and you do an assessment on that valence and you run it at that level of the Prehav Scale, not even bothering to mention the toothache again. You see?

You're not now running the Prehav Scale against a tooth. See, you're running the Prehav Scale right directly and immediately against the terminal you've found. So what did you do? You did a Routine 3 operation to do an assist.

Now, if you can see that a Routine 3 operation can operate as an assist and is workable as an assist, your faith and ability in doing Goals Assessments, of course, would increase enormously, wouldn't it?

Now, if you can find a hidden standard on your pc – and this is quite a legitimate operation, having not to do with an assist: Having to do with a present time problem. You find a hidden standard on your pc. "What would have to happen in order to know that Scientology worked? What would have to happen in order to know this processing was working? What would have to happen?" Oh, you'd get a whole list of these things and you'd do an assessment on the thing. These are goals; these are present time problems. You assess them down, you find one that bongs real good and real hard, bangbang on the meter, you see? You take that one, take that one all by itself and there must be a goal of some kind associated with that particular hidden standard. And if it isn't inherently stated in the thing that fell, you're still going to have to get the terminals for it.
All right, let us say, well, he's got a shoulder ache and that's what it is, you know? And when the shoulder ache gets more, why, he knows he's getting worse; and when the shoulder ache gets less, why, he knows he is winning in auditing. And this is the standard he uses in order to measure his auditing – worse or better on the sore shoulder. Good.

All right. Well, you could still go at it on both ends, "Who could have it?" and "Who could cure it?" "Who would have it?" and "Who could cure it?" or "Who would cure it?" or "Who would try to cure it?" or "Who has it?" If you just did an assessment on "Who has it?" you would win. Or if you did an assessment on "Who would handle them?" you'd win. You see? Just get your list of terminals that have to do with sore shoulders if that's what fell.

All right, do your terminals assessment, move it over onto the Prehav Scale and you get the terminal, if the shoulder is still there, and run it on the Prehav Scale – with your rudiments in. You follow this? All right, there would be a method of handling a hidden standard. Right? Using this rule of handle the valence, don't handle the significances.

Now, I will say this as a final word here. For a long, long time I had the question: "Should you handle solids or significances? Should you handle conditions? Should you handle solids?" And I knew even last year that you had to handle solids. You'd better handle solids if you're really going to get anywhere.

But this was not the full picture. No, the picture is this: Do not handle the conditions of the valence, handle the valence. Now that, clear-cut and well-stated, you'll find is far more workable than conditions and solids because some conditions can appear to be solid. "Think" to somebody could be a black blob.

No, let's make it much more workable than this. Don't handle conditions of a valence. Don't audit at those things. Don't say, "Well, how could you cure a sor-shor-uh-a sore shoulder?" Boy, try to say that one as an auditing command. And so forth and so on. "Now reach from the shoulder, withdraw –." Even though assists work and that sort of thing.

This is the limitation, by the way, of a Touch Assist – is explained to you right there. And you know how limited it is. Well, its limitations are the limitations of the valence. You're trying to cure a valence of some kind or another. It's the valence that's got a bad one, not the other. So the condition, the condition, the condition. No, because it's the condition of the valence.

In order to handle this thing, handle the valence. Handle the terminal. Always handle the terminal and you've got it. And this thing will wrap up and I think you'll find this will hold true very, very nicely and very easily.

Now, that moves Prehav – a Prehav 13* sort of an activity right up into the limelight. The tremendous success you had on Failed Help by making a long list of terminals of everybody the person had ever known in this lifetime, and then assessing those down, and then running on the one that seemed to be the livest – Failed Help; is of course, simply expanded into this other area of you assess the terminal on the Prehav Scale and you – not just Failed Help – but you take any level of the Prehav Scale that this terminal falls on.

* Editor's note: Apparently what is meant is "Formula 13". Formula 13 involved making a list of terminals the pc knows in PT. See Red Vol. IV, p.179.
So you get Prehav 13, is an exceedingly profitable type of activity if you went right at it and did it hammer and tongs. You have a person make a list of everybody they have known in this lifetime. And then you go on and add to this list the way you would do a terminals assessment. And you just take everybody they've known. And then you assess that list to get the one that falls the most this time. Now, you don't assess it by elimination, you just assess it by the steepest and biggest reaction. You assess it by reaction of the needle.

And it turns out to be Mama or Grandpa or something of the sort. All right, don't pay much more attention to it. Doesn't matter if you miss. Take that particular terminal that you found by the greatest reaction and you move that particular terminal over into the Prehav Scale and assess that terminal on the Prehav Scale. Find out about Grandpa all up and down the Prehav Scale and you finally find that Grandpa is falling gorgeously on Failed Abandon. And then you run a five-way on Failed Abandon and you've got this thing pretty well set up.

Now, that was the original Prehav 13. Of course, you don't run any twenty-minute rule with Prehav 13. You run the needle quiet, and the tone arm doesn't seem to be moving too much, and you run the needle quiet. But it's just a little – very short period of time that you observe it. Do you see? And then go over and take off another one. Take another terminal and assess this – this lifetime terminals for the now livest terminal and run it on the Prehav Scale. Assess it on the Prehav Scale. Do you follow? And as soon as you've got this set up, run it and promptly get the charge off of that one.

And all you're trying to do is take charge off of these terminals, one after the other, and you'll find your pc will make a tremendous jump.

Now, a pc who has always got the rudiments out should probably be run for a while on Prehav 13, because you're running valences. You're running valences pure and simple. These are the people they're tangled with up and down the track.

Now, you'll find some of those are pretty tangled. And some of those might require a session or two to run, but the pc will emerge at the other end of this thing feeling much better, always – consistently and continually.

Now, when you're trying to clean an auditor off, you use this same procedure. You take all the auditors the fellow ever had, do a Prehav 13 type of assessment, get the auditor that falls the most, move him over onto the Prehav Scale, get the idea? And then you run that level flat and you take the next auditor and – any way you wanted to go about it like this.

You could take any Scientology personnel or any people in Scientology and make a list and run it the same way. You have another type of action, and it'd be very beneficial. You'd get all this... That, by the way, is how you would get off all the auditing a fellow ever had. And also, if you used all Scientology persons, you'd get off all the auditing he'd ever given, too. See? Not that it's terribly important, but you'd get them both off. That's for sure. It's an interesting thing.

A fellow could have been run on a thousand processes and all of them wrong and this rather short – short activity knocks out all the auditing he ever had. Leaves him with the gains and takes away all the losses. Interesting thing to know, isn't it? If you do it by valences.
So, just look at this as a valid activity: That anything you can do by valences is going to get you someplace and things you can't do by valences won't get you anyplace. If you want lasting gains, do it by valences.

All right now, goals – goals. You can run lots of goals on a pc, one way or the other. And I'm sure you can find goals on a pc, left and right. But if you just ran goals, goals, goals, goals, goals, for weeks and weeks and weeks and weeks and weeks without finding any kind of a goal at all, you'd never get a crack at the valences. You only want the goal to get you into valences. See?

Now, you could probably do an entirely different type of Goals Assessment. You could just take a list of the fellow's goals and find – do a valence assessment for each goal. Then check the goal and it's blown up. And that would be auditing by assessment.

Do you see how you'd do that? You'd just take a list; he gives you forty goals; you say, "Fine." You run down the thing; you find one of those things is hot. Well, let's do a terminals assessment on it right now. We don't bother to erase it. Just do a terminals assessment. Well, the thing is going to blow up on a terminals assessment. You'll probably never get to the Prehav Scale with it.

If you just took goal after goal, find out "Who would do that?" and "Who would it be done to?" and so on; and just shook down all the terminals and got him to remembering people this way and that; and got the valences all stirred up on the thing, even a minor goal would produce a considerable case change, don't you see?

So he's got this silly goal, well, "To eat my dinner better." All right. Almost starting from the first goal that he gave you on the list, say, "Who would eat their dinner better?" and "Who would force somebody to eat their dinner better?" You know, something like this. And you get a list of those people, you know, and you'll find out that goal – that goal is cleaned up, man. That cleaned up slicker than any platter he ever cleaned. Got the idea? There would be a different way of attacking this.

Until you've got a clear-cut idea in your own mind of exactly what the put-together is – exactly what the put-together is in the mind – the put-together is a very simple thing. The fellow found himself to be inadequate. That must have meant that he was in some kind of an environment which was horrifying to him. So he adopted a beingness of some kind or another to get him out of it or to be something else, don't you see? This is going on. But he also had a goal to get him out of it.

So he went out of it with a goal and he went out of it with a beingness – sort of a double action was going on here. Now, he doesn't want to go back into that again and he'd just better not ever go into it again. So, of course, you start picking up goals and you start picking up terminals, and you pick up goals and you pick up terminals. Well, you get all of his escape points and he has to look at them sooner or later. He has to see how he got started along this particular line, he has to see where he was going. He starts as-ising bank like mad. Right?

All right, I'll give you one more thing, one more thing here, and that is you can always put a Not-Know bracket after a Know bracket on the Prehav Scale.
You've got a five-way bracket and it has to do with Grandpa – a grandfather leaving. Well, now find out on five different legs what isn't known about Grandfather's leaving, you got the idea? So that you run the five Know, the five Not-Know. And that'll just about treble your speed of run.

Now, the mechanism by which people used to be able to recall on ARC Straightwire – and then they'd recall the same incidents over and over again and then they'd never get any further than this – they – you know – they'd just recall those same cycles of incidents and no new incidents would turn up and you were whipped. Well actually, what was standing in their road was the not-know – the not-know. What did they not know about this particular thing, you see?

So if you were to have added Not-Know on any Recall Process of any kind whatsoever, you'd have plowed out more track. Simple?

"Well, let's see", you'd say, "With whom have you communicated?" or "Recall a time you communicated." And then, "What don't you know about having communicated?" or "What communication don't you know about?" And you'd find out that your ARC Straightwire would not then cycle on the same span of track. It'd be more and more track, and more and more and more and more and more and more and more, as long as you were running Not-Know alongside of the Know. Right?

So we look over this, then, we find out that we could as easily put in Not-Know or some version of Not-Know in every command bracket, five for five – run the Know's, run the Not-Know's. And you'll plow more and more track, more and more track, more and more track and speed the run.

Give you a model of that sort of thing: Well, it's just "What don't you know about Grandfather leaving? What wouldn't you know about a grandfather leaving?" or "What haven't you known?", or any way it works out on your command sheet. Get the idea?

Those commands – package commands are very unsafe. It's very unsafe to run an exact package command with no check for the pc against the E-Meter. You should always clear your commands against the E-Meter and find out if they're all live and all answerable before you settle down for any kind of a run. Okay?

Well, now, you have tomorrow and a whole weekend in order to digest all this and after you've digested it, probably somebody will change your valence and probably it was only the valence remembering, so thank you.

[laughter, applause]
CONTROL OF ATTENTION

A lecture given on 18 August 1961

Now you've given me a guilty conscience!

Given me a guilty conscience now. This is the what, 18th of August? And you are getting an extra lecture today. But that's basically because of this burning fact: You're not doing good. That's the burning fact. When worse auditing is done, there will probably be people shot over it. I hate to say something like that. But when worse auditing is done around the world, it'll be done with brickbats or something of this sort.

Now, I don't wish to be unkind. I don't wish to be unkind, but I wish to be very, very factual. You're not auditing; you're in a games condition. That's why you're not getting goals. You couldn't possibly miss these things the way they've been missed.

And this tells us about 90 percent of the auditors get into a games condition over goals processing and that is the secret behind Routine 3 and that is the data which has emerged. They themselves have been so thoroughly suppressed in their goals and have been so smashed back into environments that they themselves did not want to be in, that in the final analysis, when they start to audit, they do fine right up to the point where they start to run goals and terminals on somebody or something like that and then they go blooey. And you've just got to do a better job of auditing and you've just got to lay that games condition aside on the subject of goals.

Now, I was even thinking you could possibly get run back and forth a little while "What goal would you rather another didn't have" or something like this and run the games condition on goals for a little while till you got over this.

But this is the primary thing. It isn't that you're flubbing technically particularly, but it is just absolute nonsense, man. It is nonsense to have the second goal the pc ever gave you, the proper goal. Now, that's – that's silly! And then go on for five weeks looking for a goal. Now, that's already turned up here. Pc gives you a terminal – gives you a terminal and the terminal is the right terminal and it falls, so the next day the wording is changed on the terminal and it doesn't fall and that's washed out. It's called something else the next day by the auditor. So of course it doesn't fall. The other wording that it was changed to never fell anyhow.

I'll give you an idea of it. "Black cat" fell. So in the next auditing session the auditor takes up the thing and he says "cat" and it doesn't fall. So, he says, "Well of course, I haven't found the terminal." But a check-over reveals that "black cat" was falling on – on one day and "cat" wasn't falling on the next.

But "black cat" is still falling and black cat is the terminal. Now how else do you explain that, than just say, well, the guy can't have a terminal, that's all.
Now look, I know basically there's a certain terror in making Clears. I know, it's kind of spooky, man! Kind of spooky. I – I myself get a jolter once in a while. You know, the records on Clears are coming in here fairly rapidly and here's another Clear, you know and once in a blue moon I find myself, you know, saying "Ah-da oh-oh! Ump!" You get the idea? I mean, just some little reactive flick and I laugh about it, you know, I say, "This is silly as hell."

See, you can get a reactive flip on this – this type of thing, you know, and you're fairly sure now that you're on the right line. And the only way you could stop making Clears right now is just don't run the rudiments, don't find the fellow's goal, and don't let him have his terminal. And if you do that, and audit it badly, of course you won't have a Clear.

I think there's a little bit of jolt connected with this. Now, that's just my private opinion. But don't think for a moment I haven't got confidence in you, because I think if I just point out what you're doing, what I think you're doing; and if that fits, the next time you're looking down the barrel of assessing somebody and so forth, I think you will be able to just checkrein yourself a little bit the way I've done, you know. You say, "Well, uh ..." And all of a sudden you realize, "Wait a minute! I left that whole block of goals out. Ho-ho-ho-ho. Well, now." And get yourself by the scruff of the neck and put yourself back in the lineup and take up that block of goals and let's go over them, let's go over them real carefully.

This is hard lines, isn't it? But look-a-here, if we have operated up to a point where we can learn this, then the time is not wasted let me assure you. The time is not wasted, because I've been looking for what it is and the – the long goals assessment ...

And do you know that I've studied this, just literally, for months. I looked over auditing records and reports and they all seem logical and there just doesn't seem to be a single thing out. But when I gave you a raking over the coals on the subject and you got busy – it confirmed it. That's it. I mean, right away you start finding some goals and terminals. They've been there all the time!

Well now, how do you account for that? How do you account for it? Otherwise than the fact that there must be, not – not carelessness, but there must be this little bit of unwillingness to find the goal and terminal, you see. There's just a little bit of a games condition going on here, you get the idea? Because you're too bright, otherwise, to make these mistakes and you don't make these mistakes in run-of-the-mill auditing. See, that goes along fine. But on goals and terminals, bang!

Now of course, suppressing somebody else's goal is the most natural thing in the world if you've got a bug on being murdered. If you've been murdered recently, what's the goal of the murderer? To kill you, of course. And what is your whole evasive action? It's actually, fundamentally devoted to knocking out the goal of the murderer to kill you. Isn't that right? So if you knock out the goal of the murderer to knock you off, naturally he won't. See? So it's almost livingness to suppress goals.

See, there's whole classes of goals that one would just instinctively suppress, you know. We'd instinctively suppress a goal such as the secretary of state or the president of the United States is all of a sudden going to sell out to Russia, wouldn't we? Well, we'd be horrified! All right, now let's look how far this could go. Are there whole classes of goals that...
could horrify us? Yeah, well, we must have a lot of built-in modus operandi of suppression of unworthy or unwanted goals. Well now, that easily slips over into suppression of goals. Suppression of goals, suppression of terminals.

I don't think you're trying to suppress Clears. You'd be proud as punch if you made a Clear. But I think this instinctive – this instinctive "suppress the goal", you know, is standing right in your path, with concrete blocks on this assessment.

Because now I can tell you that from some data to hand here now, that the terminals and goals did exist in the first part of the list. They existed in the first part of the list. How did you miss them? How could they be missed?

Now, you can go ahead with an assessment. If you were handling every incident that came up and you were cross-questioning and crisscrossing every incident that came up and you were checking the guy backwards and forwards and so forth, all the way through and you were actually clearing this – actually auditing him as you assessed him – you know, running not-know on every incident that came up and running not-know on what he doesn't know about the goal and what area he escaped. The type of clearing which I was describing about three days ago, remember? You could just plow the whole thing up and bring him out the other end Clear, too. See, you could do that, but you aren't doing that. You're just running repeater technique and trying to find a goal.

Well, if you're trying to find a goal, you can find one and it's usually in the first dozen, two dozen, fifty, hundred and fifty goals that the person gave you. And as far as terminals are concerned, it's usually out of a list of thirty – thirty, forty terminals. It's not hundreds of terminals – thirty, forty, fifty, something like that. Can be done and you can find it.

So therefore, we must be letting our reactive minds get a little bit in our road of clearing, wouldn't you say? Must be just something on that order. Otherwise we wouldn't find a goal on Tuesday and on Wednesday change the wording of it, so that it didn't register and then say it doesn't exist. Got the idea? We wouldn't let a goal hang fire for four weeks or something like that, before we suddenly said, "Well, I guess we'll have to let him have it after all." But it'd been there for that many weeks, you see, still registering.

Well, the idea of get more goals, get more goals – this is all fine; this is all praiseworthy and so forth. Yes, add to the goals list and perhaps your directions here are to some degree at fault. I take full responsibility for that, not having obviated them.

But you just don't need all of these goals, you see, in order to do a Goals Assessment. You – you it... Yeah, get your hidden goals and get your withheld goals and unknown goals and suppressed goals, and – and that sort of thing – ask for these in your classification – but when you've got about 150 goals written down there, if you can't find a goal amongst those that would stick, you better turn in your E-Meter. It's just nonsense, not to be able to.

Now, if you cleared up every reason he had each goal and went into it this way – not with a repeater technique but with Not-Know and found out what – you know, got the terminal for the goal and found out what he doesn't know about that type of a valence, you see, and what area that valence would want to escape from, and what goal... You know, just take up
the whole thing, with lots of not-knows and just cover the whole thing. Oh, yeah, you'd make a Clear that way too.

But you're not doing that, you're doing it by repeater technique and repeater technique is simply to eliminate and leave us standing with a goal that will register. You should be able to do it in an afternoon, on any pc that walks up the street.

So let's just rack back our sights here on what we're supposed to be doing on the thing and we are not alone in this kind of a mistake. Because the mistake has been made in Australia and it has now been made in Washington. It's not going to be made anymore.

See, we've been making this mistake a long time. I've finally isolated the factors which are causing us to make this mistake and the factors which cause us to make the mistake is an expectancy of: having to get all of the pc's goals before we find a goal – which of course isn't necessary at all – or have to find all possible terminals before we find a terminal to match the goal, you see. You're being just a little bit too thorough, a little bit too rigorous here, a little bit too stretchy on the whole thing.

Pc gets down to a point where he's comm lagging on you for a minute before he can give you another goal; well, hell, you've got the list; you've got everything on the list you want. Got the idea. He goes home and he does he – he... You say, "I'm going to do a Goals Assessment on you tomorrow" and you say, "Make up a list of goals. Write down all the goals you ever thought of and also the goals that you don't want anybody to know about. Write them all down and bring them in to me." Take the list, say, "Are there any goals you didn't write down on this?"

"Well, no, not really", and needle falls.

"Well, what goal did you not write down on this?"

"Well, I purposely didn't write down the goal to – burning every city I live in, you know." Something like this.

Write it down, you know, strip it down a little bit. You don't get any more action on the needle particularly, for that moment. That's it. Now you have his goals list. Now one of those goals is going to consistently fall, that I guarantee. If it is read out and phrased and so forth, it will continue to fall. Otherwise, your rudiments are out. You've stopped the goal from falling by getting the rudiment out in some fashion or you erased it or you've invalidated it or you've just done a lousy technical job in some fashion.

Auditing, perhaps to you, might seem to be something that had enormous numbers of rules connected with it. And as long as you think of auditing as having enormous numbers of rules, you aren't auditing. These rules just serve as guideposts of one kind or another. But back of those rules, your good heart can carry the day.

You trying to help this fellow out? All right, there are certain things his mind will and won't do and if that is the basket of rules by which you're operating, you're perfectly safe – rather than a basket of ritual. And I call to your attention that every religious organization on the face of Earth must have fall – failed in its original representation to the multitude. Must have failed; must have! Because they developed rituals.
Never let the ritual get to be the thing. Now, we can give you a ritual which repetitively spoken gives you a great ease of proceeding. And you shouldn't depart from it, particularly, but it has no value beyond making a constancy of session, that's all. That's all the value that a Model Session has. It just gives you a constant representation and it gives the pc a little confidence, because he isn't being asked these things in different ways. And it also has the technical advantage of running out former sessions, because you're using the same words. Repetitively, by repeater technique, the sessions never stick then – if you always use the same bridges and that sort of thing – you run out your own sessions. So you're just doing two jobs in one. It's a good piece of auditing, but its value, is no greater than that. It won't do anything. It won't do anything. It's just a standardization.

Now, let's look at what is happening. Here is what a pc will not do and this is what you must learn in auditing. A pc will not go into session with his mind fixated, his attention fixated on something else than what you're trying to do. His attention is fixated on something; now, you are not going to be able to get him in-session. Nor will you get his interest in the process you are running and don't be amazed if your pc is restless and you haven't solved this point of concentrated attention.

Now, a pc sits down and practically can scream at you sometimes and tell you "My attention is definitely concentrated on the fire hydrant which is outside the front door." He'll warn you, if you ask him.

All the rudiments are simply covered on something like this: "Is your attention fixated on something? Is there any reason you wouldn't talk to me?" and you've got all the rudiments. Your rudiments cover nothing else. You could look in vain to find something else. "Is your attention fixated on something? Is there any reason you won't talk to me?" and if that was your rudiments, that would be all right.

Now as a matter of fact, however, the questions are a little broad. They aren't sufficiently particular and so you have the rudiments. How many ways can his attention be fixed so as to stop a session from occurring? Well, it can actually only be fixed a very few ways.

He's got a present time problem of short duration or he's got a present time problem of long duration. Now that would be a fixation on the exterior environment and usually the short – the long duration problem is a fixation on something subjective. Present time problems of short duration are fixed attention on the immediate environment and present time problems of long duration the present – the attention is fixed on something in present time all right, but it's also been fixed on this thing for a long time and it's usually subjective.

So his attention is so fixed – he can articulate this if you ask him hard – his attention is so fixed that, of course, to do anything else than keep his attention fixed there, would be painful to him. So you get into trouble.

Now there's the – the primary sources of fixed attention: present time problem of short duration; present time problem of long duration. Under the heading of present time problem of short duration you get such matters, is, "Well, I haven't given the – the housekeeper a message I had for her and I have to sit here remembering that at the end of the session, you see, I'm supposed to give the housekeeper this particular message." No go. You won't get any auditing done.
You got somebody who's sitting there saying, "Well, yes, yes, yes, when did I eliminate a king? Okay, okay." "Now, I must remember to give the housekeeper the message", you see. "All right, well I eliminated a king..." "Remember the housekeeper, the message." "The king, uh..." "When did I eliminate a housekeeper?" [laughter] You get what's going on?

Well, you're not paralleling what the mind is doing, and of course when you don't parallel what the mind is doing with auditing you of course fail with auditing, naturally. Now, the reason you fail might be interesting to you. We'll take that up in a moment. Let's take up the problem of long duration.

The fellow's attention has been so consistently and so continually fixed upon this particular thing, that at no time can he get his attention really on anything else and he more or less knows about it. It's very close to the surface and it is very real to him and you could say it is the reality station for his attention. Everything else is sort of unreal and this is pretty real and it can be anything. It can be a sore eye, you see. It can be a – a bad side. It can be whether or not he's getting old. You see what I mean? It's whether or not her beauty will be totally destroyed at long last, you get the idea? But it's – it's – be something here. It's something and it's been going on for a long time. By long duration, we mean this lifetime; absolute maximum limit. Got the idea? We – as soon as we exceed this lifetime, we have case. That is the most flagrant of these.

Now, you very often find a present time problem – this gets confusing to pc, because a present time problem of long duration becomes case. He finds out this has been going on for actually ages and he thought it had just been going on for the last few years and factually it's been going on since ancient Troy. You get the idea?

Something on the order of this: Is his son going to disgrace him? See. This is his – you know, he's thinking about this all the time, and he comes into session. It's quite – it's quite up on the surface, usually. If you were to ask him if he was worried about anything and criss-cross it and really press it down – does he go around worrying about something? Does he go around thinking about something all the time? Is there something that bothers him most of the time? And he finally says, "Well, is my son going to disgrace me? Well, yes, as a matter of fact ..."

And we assess this thing out, handling it and we run it as a button, "son" see. And so help me God, it goes back to Egypt and becomes Ra, the sun god, and goes back into ancient – and space opera and goes back to glare fights, see. "Son", s-o-n, s-u-n, all these things are all messed up one way or the other and it becomes a case.

So a present time problem of long duration can become a case, don't you see. But ordinarily we say a present time problem of long duration – we have a case or two of that going on right now, I mean, where the present time problem of long duration became the case. But ordinarily it's just the – a problem. Maximum duration is this lifetime. Something on the order of years. Certainly months. Absolute minimum is months.

Now, I'll give you the reason for this. The reason why you can't audit him with one of those things and it will become very plain to you. You – you won't make this mistake all the time. Supposing you were standing there looking at a tree and you were engrossed in the
beauties of this tree and somebody stuck a pin in your back. Do you know that the pain of the pin thrust would be many times magnified by the violence of attention shift.

The rate of change of attention is a way of defining pain, relative. Relative pain is defined by rate of change of attention.

Now, if a fellow walked up and he says, "It's a nice tree; I think I'll stick this pin in you", you'd turn around and you'd have some defense against it and you'd say, "No, don't do that", or something like that. But you're looking at the tree, don't even know the fellow was behind you and he sticks the pin in you. Sudden – sudden shift of attention from the tree to something painful. And it makes that pin thrust feel like a two-edged sword going in.

Hiroshima, going about its daily wartime activities and all of a sudden there's a loud bang and there is no Hiroshima, you see. Attention shift and that was sufficiently violent that the people who were in the catastrophe had no time for twenty minutes. Time did not exist for twenty minutes. They just hung right there. Well, it wasn't the violence of it; it was the sudden shift – the shift was so remarkably fast, don't you see – and the amount of attention shift. And of course this shifted everybody's attention off all of his PT problems and all of his realities and of course shifted them onto something which was a total unreality and a sort of – net result was we got no time.

So we find that on the track, sudden attention shifts is the common denominator of every hung point on the track. It's when somebody's attention changed; not when his attention was on something. It was when it changed.

You could put a man in paradise and then consistently shift his attention rapidly and he'll become very unhappy with paradise. Do you see? Sudden attention shifts. That's – that's the common denominator.

This is not something new, in Dianetics and Scientology. The first lecture on this is July, American Legion Hall, Elizabeth, New Jersey, 1950. Not something new. Furthermore, it's not even really new with Dianetics and Scientology, because Locke and Hume and some of the others have discussed attention, but they never really discussed attention shift; this is a brand-new factor.

All right. Attention has always been known to be a part of psychology up till 1879 and then actually was more or less dropped out of the lineup. The psychologist does not pay much attention to attention. That's mostly because he's in a total dispersal of some kind or another. It's all unfixed attention, he thinks.

Now, shifts of attention: You are using processes which are sufficiently strong that regardless of what his attention is fixed on, his attention can be yanked off of it and put on the subject of the process. You're using high caliber mental weapons, see. They're very, very high caliber.

So you can make up your mind to run a process and sure enough, that process will yank his attention, but it lays the seed of the first ARC break of the session, because it's painful. He's worried about parking meters and you all of a sudden get him worried about waterfalls. Hm, duh-duh, duh-dum. There's a point of confusion right there in the session.
Now, his attention doesn't totally come off of parking meters. So his attention isn't totally on waterfalls. So he's got parking meters and waterfalls all mixed up now and you've accomplished an identification for him. Which is interesting, isn't it? You've got a new identification. You're not auditing him downhill, but you certainly aren't giving him a good session.

Now, that is true – and mark this well – of a present time problem of short duration and a present time problem of long duration and in neither one of these do you find any exceptions to the rule that your auditing must parallel what the mind is doing. Now, you can go so far with this paralleling what the mind is doing – that you start Q-and-Aing and not really handling what's there. That's the other error. You go too far with the parallel. So that he says, "Well, I've had trouble with ..."

But you say, "You're having trouble with your family? Who in particular in your family are you having trouble with?"

"Well, I'm having trouble with my sister."

"What trouble have you been having with your sister?" Oh, no, he's ...

He says, "Well it's because of my brother and sister are always fighting."

And you say, "Well, have you been – had objections to people fighting?"

And then he says, "Well, no, not really, except the police."

"Well, do you have trouble with watching police fight?"

"No, except when they're fighting with firemen."

"Well, do you have trouble watching firemen fight?"

We'll say that you at least got "watching" and "trouble" in there, but you're just letting his mind go all round and round in a dispersal, you see. He's still got the problem, oddly enough, that he's having trouble with his family.

Only you're riding over the hills and far away, you see, you're actually pulling an attention shift on him. You're not coping with what attention fixation he had. You're now trying to pick up the attention dispersals, see. So you're not worrying about the present time problem, you're going over the hills and far away. That's what we call Q and A.

And I will lay down this rule and it is not a rule so much as an observation. I have never seen a case progress unless the attention factor on the immediate environment – whether of long duration or short duration – was not handled first. I have never seen it fail and I have never seen a case fail to get some version of an ARC break when this was done. So the ARC break always occurs when you don't pay attention to the attention factor.

All right. There it is. If you don't handle the present time problem of short duration, the present time problem of long duration, when doing auditing, you are inevitably going to get an ARC break and there's where ARC breaks move in. What's the ARC break? It's a sudden attention shift. That is all. I don't care whether it was done because of your error or because of what you were running or anything else; it's just a sudden attention shift. That is an ARC break.
When you don't handle attention fixation, you inevitably arrive with attention shift. When you have attention – sudden attention shift, you get an ARC break. This is getting awfully elementary, isn't it? That is an ARC break. It's an attention shift. Unpredicted, unexpected attention shift.

Therefore, you flubbing an auditing command lays in a little, tiny ARC break, even though the pc says it isn't. We don't care what the pc says – must have been! Ah, but there's a much greater ARC break then laid in, when his attention is totally fixed upon trouble in the family and you are auditing Egyptian waterfalls.

Now, the ARC break is going to mount up and his confusion is going to get more and more and he's going to have to protest sooner or later and he protests in a version of an ARC break, but this ARC break turns up by you making a little bit of a flub. You notice that the pc is restive and it makes you restive and so you give some kind of a crossed up auditing command, and he takes exception to it and then you, knucklehead, start to cure up this particular flub. Oh, but that wasn't it. It isn't anything you have done in the session, except to audit him with what you're auditing him with and therefore, it's almost impossible to cure it as an ARC break.

"What have I done to you? What have you done to me?" Well, it doesn't have anything to do with it. Because he hasn't really – isn't really thinking in terms of technical difficulties. And the technical difficulty is what he is objecting to but, he doesn't know it.

So of course – "What has he done to you?" "What has he withheld from you?" – this isn't going to do very much, don't you see. You'd have to run "you" on the Prehav Scale or something like that to get rid of this ARC break, because we have to get – practically get rid of you. Because we haven't remedied what the difficulty is and the difficulty is, is we've given his attention one hell of a yank and it's still halfway on – on the trouble in the family and we've got it halfway on trouble with waterwheels and he doesn't know which way is cooking. Sound familiar to you? His attention is there, and it's there, and it's not there and it's not there, at the same time, don't you see.

Now, you're going to run this as an ARC break because you flubbed auditing commands. Well, it isn't because you flubbed auditing commands, it's because you gave him an attention shift – a sudden attention shift. And he doesn't know what's wrong and you don't find out and there we go. So therefore people with chronic, which is long duration, present time problems, or people with short duration present time problems, get ARC breaks in auditing sessions. And they ARC break in auditing sessions to the degree and with the frequency that, they have attention fixations on problems which are not handled by the auditor. Seem real to you? Can you see this? Can you see this? Is this very plain?

All right. Now, "willing to talk to the auditor" is the other one. Now of course, a pc with a heavy ARC break is not willing to talk to the auditor, but also a pc who does not want the auditor to know something is unwilling to talk to the auditor. But when a pc has a withhold, something new is occurring. The pc is sitting in the middle of the session, with a known where he is and an unknown where the auditor is and so the auditing session is a ridge. He's got a not – he's got a "know", the auditor's got a "not-know" on the same subject.
Now, in view of the fact that the pc's attention is fixated on this withhold, even at a lower level than – than analytical inspection, when we don't get it we're guilty of auditing a pc with an attention fix and it comes back to attention fixation. So if we don't get off the withholds, we've got a pc with his attention fixed on something. Same thing, isn't it? Make more sense?

They had marvelous luck and everybody on the course over in Washington really learned to pull withholds and they made terrific case gains and everything was going along fine on – on – as far as this is concerned. They really learned to do Security Checking and so on; and to that degree I'm very happy with them.

But of course, they'd make case gains. You can always make a case gain with a withhold. Fellow's attention is totally fixed on fireplaces where he burned the baby. You know, "Fireplace, fireplace, fireplace. Now I've got to have my attention fixed on this." But it's a little bit of a complicated attention fix. It's an out-fix with an in-pull. Which of course is guaranteed to anchor it. See. He's got his attention fixed on it, but it mustn't get out and it must be a not-know everywhere else than where he is, you see. And you get what is known as guilt and it forms such a tremendous part of Catholic and Freudian mental therapy.

Guilt, guilt complexes – oh, these are terribly important. Well, what it is, is an attention fix. With the additional complication that it's got to stay fixed to pull it in, so it mustn't get out. See, it's just a little more complicated version of attention fix. So you can't audit anybody with a big withhold. That's simple.

So it breaks down to the fact that you try auditing somebody with a present time problem of short duration or a present time problem of long duration or a withhold and he's going to get ARC breaks and you're going to have trouble in the session and that is all there is to it. And the session is not going to run right and it's going to go over the hills and far away and that's it.

And I don't care whether the pc says it is all right, I don't care if the pc says he likes it, I don't care whether the pc says this is perfectly all right; he knows you're trying hard. The basic mechanic of the whole thing still holds and down underneath all of this "you're trying" and "it's all right", and so forth, are the same forces of ARC break building up. Those same forces are still building up. It doesn't matter what the pc says.

This happens to be a mental mechanic which takes priority over all postulating and everything else on the part of the pc. So it doesn't matter what the pc thinks about your ARC breaks or your auditing. If this condition is there, the pc could think you were a wonderful auditor and make no progress. How fascinating.

Now, if you're very alert and you're very good at observation and you're very slippy, one way or the other, you notice the pc's wandering eye. I do. This accounts to a marked degree for my auditing gains and their consistency, is I see the pc sitting there and I see the pc looking into limbo as I ask this question or other and I want to know what the pc's looking at beneath the level of the eye socket. Pc isn't there. I know it, so I find out where the pc is. It sometimes doesn't take more than a few comments and a few directions and something or other. And his attention just slides very smoothly off of where it's anchored and it comes over
just exactly where I want it to and from that moment on, why, we're in, man. We're running! You see?

And halfway through the session the pc's starting to go, you know, this way and that way and so forth. Let's find out where the devil he's gone to now. Got the idea? He's gone somewhere. It's the goneness of the pc that you ought to be worrying about, because you want the pc here, you don't want him somewhere else that you don't know about. It's perfectly all right to have him elsewhere if you're putting his attention elsewhere. That's perfectly all right. Put his attention all over the place, as long as he's paralleling the auditing with his attention, everything is going along fine and man, will he come out the other end – slick as a new-washed baby.

But if his attention starts wandering over this way on the present time problem he had with Aunt Bertha – oh, you in trouble now! You're in trouble. Because your auditing had nothing to do with anything that could ever reach Aunt Bertha.

Now in running terminals, you will find – sometimes find this condition obtains and this is an interesting condition. You're covering a long, long, long line of track with this particular terminal and the pc was present and the terminal was present, and the pc is seeing more than the terminal is seeing and there is more than that being embraced in the auditing command, so there's a lot of track stacking up that the pc isn't given any liberty to inspect, of any kind whatsoever; and that is why you run versions of Alternate Confront. Let's let him look at the rest of the track and get his attention off of it.

And the reason we use Alternate Confront of a proper command – please, at the proper time. You're trying to do it by E-Meters. Do it by the pc. Pc doesn't seem to be so interested just now in this particular terminal. Well, his attention's gone someplace else, that's all. And what will put his attention right? Auditing will. What auditing? Well, Alternate Confront's the best cure-all you know, when it – when his attention has done this on the long bank track, you see – on the long track, when his attention has gone skittering and scattering and so forth. You're running kings and he's gone galloping along the track and everything is fine and he's happy with you and he's cheerful and he's making gains and all of a sudden then his eagle eye spots a queen; and you go on and ask some more questions about kings, and queen, queen, queen. You say, "What's going on?"

"Well, it's nothing"

"Yeah, but what is? What is? What's – what have you been looking at there?"

"Oh, well, man. Aha, boy! You know there's one advantage to being a king. It's the very fine variety of queens that you can corral. Except sometimes."

And you say, "Well, what about this?" Well, there it is. Of course, I'm not above saying something on the order of "Well all right, what's this got to do with kings?" Not challengingly, but "What is – what does this have to do with kings?"

"Oh, it's a pretty bad overt against a king if you steal his queen. Yeah. Ha-ha, yeah, ha-ha. Yeah, yeah."
He's now back on the subject of kings. Because queens are now an overt against kings. So he'll go on and run the auditing command. But you've spotted it and you've flicked his attention. Got the idea? So you've kept him parallelizing what you want him to do.

Now, a cruder way to do it: "Oh, your attention's on queens, huh? All right. Well, that's fine. Going to give you two more commands on kings and we'll end this process if that's all right with you. Okay. What king have you eliminated? Thank you. What king have you eliminated? Thank you. Very good. Anything you care to say before I end this process? Okay. End of process. If it's all right with you, we're now going to run some Alternate Confront" – whatever version you have of Confront; just as long as it's track version and you say, "All right, look at the bank. Thank you. Look at the bank. Thank you. Look at the bank" – whatever it is. "Look at the bank. Thank you. Look at the bank. Thank you."

And he says, "Hu-hu-hu-hu-hu!"

And you say, "What was that?"

"Oh", he says, "these queens." He says, "Yeah, ha-ha! Boy, that's really some way to get rid of a king, you know. Why, you cave him in, and break his heart and do this and that and so forth. Yeah, yeah, yeah. We used to take them in the Roman arena, Roman parades, victory marches and that sort of thing. Why, we'd get the queen dagging along back of a chariot or something like that, when we hadn't captured the king and so on. I guess it was a sort of a dirty trick."

And you say, "Good. Fine. All right. Look at the bank. Thank you. Look at the bank. Okay. Look at the bank. Thank you. Look at the bank. Thank you. Anything you care to say before I end this process?"

"No."

"All right, fine. End of process. Okay, we're now going to run kings. All right, what king have you eliminated? Thank you. What king have you eliminated? Thank you."

"So-and-so." Bzzt. And you say, "What were you thinking about when the noise happened?"

"Oh", he says, "So-and-so." Bzzt. And you say, "What were you thinking about when the noise happened?" He says, "So-and-so."
All right, you say, "That's good. All right. What were you thinking about when the noise happened? What part of the auditing command were you answering when the noise happened?"

"Oh, so-and-so and so-and-so", you know.

"Okay. All right. How does that noise seem to you now?" No action on the meter; you say, "All right", and without any kind of a – kind of a bridge you return to the process.

You assume that it did something. You don't ask him if it did. Your pc is not your oracle – knowing the mechanic of the thing. Those are rudiments and that's how she is cut. That's the way the cookie crumbles. That's the way the cake carves and the way the balloon goes up.

You are doing the oddity, as an auditor, of finding where the pc's attention is anchored and thereafter guiding the pc's attention and if the pc's attention isn't going where you want the pc's attention to go; you aren't auditing. So that anything gets in your road of guiding the pc's attention, you had better get rid of it.

Now, I'll lay down another statement. Don't call it a rule; it's just a statement. It's an accusative. It's in the accusative tense. Anything that happens in an auditing session is the auditor's fault, even if the building burned down. But that isn't totally what I mean. If anything goes wrong in the auditing session, it is never the pc's fault. It is never the pc's fault. Lack of gain on the part of the pc is not the pc's fault.

The pc will only do in a session what the auditor tells him to do or what the auditor doesn't tell him to do. And if the auditor doesn't tell him to take his cotton-picking attention off of those gams in Georgia, in some gradient that is an acceptable gradient, of course the session will go wrong if the auditor wants the pc's attention on boats in Alaska.

You have to take the pc's attention off of things in order to put the pc's attention on things. Because you haven't yourself put the pc's attention on the things it is stuck on as he comes into the session, you are not quick to take responsibility for taking his attention off of those things. You see? That's what happens.

But if the pc has ARC breaks, if the pc doesn't make a win, if the pc doesn't get a goal – it's the auditor, man. It's nobody else and that's for a D of P or for anybody else. It's just the auditor and that's for you. You want to know what went wrong in the session? Well, not from any part of the pc. Nothing went wrong from the pc's quarter. You did something wrong. That's all.

Just as the pc must be at cause in his lifetime, because you can put him in an auditing chair and erase his whole life, he must have been at cause that whole life or you couldn't have just him there. You can erase the traumas he has had with his mama and his papa and his cousins and sisters and aunts and employer, without having his mama and his papa and his cousins and sisters and aunts and employer present in the auditing room.

And if it was their fault and if they had any bearing on ordering his life about and ruining him, you actually realize that you would have to have them in the auditing room, in order to clear a pc. Do you realize that? He'd have to scrape them up from all the way back the last
couple of hundred trillion years and bring them all together in one lot someplace in order to accomplish any kind of a case gain.

Well, this is not true. You have one person there – the pc. And isn't it miraculous that by shifting his mind this way and that, that he actually can get over this and that. Well, therefore he must be cause on the whole track, right?

But in an auditing session, in an auditing session, there is another cause and that is the auditor and the great oddity is that auditing works. Because it violates this other principle. For the first time, you are having an effect on a pc in violation of the fact that the pc is cause over all effects. Wrap your mind around that one, you really have learned a lot! So this has to be terribly clever on your part. You've got to be very slippy, because you're being cause in a section of track, on the pc's track and that you can do it and get away with it is miraculous. That auditing can happen is utterly fantastic!

Now, the only way it can happen, of course, at all, is if he has some willingness to do what you want him to do. Because he has to do it, all you can do is... Basically, you can't force it into existence; you can suggest it into existence and he can take cause over it. So his cause must still be there. But your direction of his cause must therefore be acceptable to him. Otherwise he is no longer cause over this section of track called an auditing session and if he isn't cause over that section of track called an auditing session, of course he won't make any gain.

Well, how do we keep him cause on that section of track? We simply audit him exclusively with his attention on the auditing session, without his attention splintered up into this, that and everything else around in the environment on present time problems of short or long duration and the ARC breaks that resulted from your leaving his attention on it and also the withholds which he is keeping away from you and not communicating to you.

Though all those things get in the road of this other thing, he must actually willingly follow your auditing directions. And he must have a very clear view of what he is following, otherwise he isn't cause over that section of track. Well, if he isn't cause over that section of track, nothing is going to happen on that section of track and he's going to make no gain. This should be very plain to you.

You assume, probably wrongly, that the pc is delicate or that you can do something to bitch him up and so forth. Yeah, well, the only thing you can do to a pc is not give him a win and the only way you can do that is not by controlling his attention or having his attention there to be controlled. And the only way you can deprive him of a win is violate his attention factors. And the only – only attention factor you can violate is having his attention on something else rather than the auditing command. And if you violate that you don't get any wins.

You don't get any goals, you don't get any terminals, you don't get anything. He sits there for two-and-a-half hours and that's it. Why? Well, because his attention wasn't on the auditing session. Now, you can say auditing works, but auditing in the absence of the pc's attention isn't auditing, so no-auditing doesn't work.

The pc's got to be there to be audited. How do you get the pc there to be audited? Corral his attention. How do you corral his attention? Keep your rudiments in. How do you keep
the rudiments in? Well, you check them very carefully. It's not very hard. You make far too much out of this business of auditing; it's too easy. You know, you're always overreaching with the difficulties of the thing. It's not that hard!

All you had to do was have the person's cooperation. How do you get his cooperation? Well, don't have his attention on something else while you're auditing him, that's all. All right, if his attention is going to be on a present time problem of long or short duration? Nah! You haven't got his attention. Now, he'll tell you all sorts of things. There's all sorts of reasons and rationales. He feels betrayed. He sat down there to get some auditing; what's auditing to him? How is he defining auditing as he sits down in the chair? Well, it's to get over his headache, that's auditing!

And he gives you a goal, he said, "Well, I'd like to get over my headache in this auditing session."

And you don't even give him any hope, man! You just write down that and you write down a couple more goals and then you say, "Do you have a present time problem?" and then don't read the meter, and – and so forth. And then you say, "Well, we're going to go on auditing kings."

Well, the pc just went that-a-way, you see! His attention is over that-away and your commands are over this-a-way and so an auditing situation doesn't exist, so no auditing is going to get done in that two and a half hours and that's all there is to it. And you're just plain lucky if you don't also have an ARC break and a this and a that and the other thing during that session.

Well now, what does it take, actually, to get his attention on this thing. Well, there's several things you can do; you can just sit down and overtly handle the headache.

Just – just start saying, "Well, who had a headache? Thank you. Who had a headache? Thank you. Who had a headache?" or "What type of personnel has headaches? Thank you. What type of personnel has headaches? Thank you. How could a – what – what type of person do you think would have that particular headache? In what kind of an environment? Oh! Well, what don't you know about that picture? Thank you. What don't you know about that picture? Thank you. What don't you know about that picture? Thank you. What don't you know about that picture? Thank you. What have you forgotten about the picture? Thank you. What have you forgotten about the picture? Good. And what don't you not-know about – well, what shouldn't be known about that picture? Thank you very much. What shouldn't be known about that picture?"

And he says, "What picture?"
And you say, "That picture."
And he says, "Oh, well, I can get it back."
And you say, "Well, how is it?"
And he says, "Fine."
And you say, "Do you have a headache?"
"No, I don't have a headache, that was pretty good!"

And you say, "All right", and you go on with the rest of the rudiments.

Well, boy, does he know he's being audited! Why? You found his attention where it was and you moved it over to where you wanted it. *Thud, bang!* You see?

Now, I can tell you that as far as I'm concerned there are no missing weapons. If you can run an engram with Not-Know – if you can run an engram with Not-Know and Forget and so forth, and slippety-bam, without chewing all over on the thing... You find the terminal of some kind or another and you find this and that, and then you find this engram and the engram shows up and you kick the engram in the head. Not by taking up the personnel in the engram, but just taking up the picture of the engram, just taking up just exactly what it is, blowing the thing, moving it around on the track. Well, if you can do this, well, for heaven's sakes, you could handle any auditing fixation of attention that was coming up, don't you see.

He'll say, "I have trouble with my family all the time."

"Well, how long have you had trouble with your family?"

"I've had trouble with my family for years and years and years."

"When's the first time you had trouble with your family? Okay, let's date it. Oh, all right, that's fine. That's fine. Oh, they held you down, poured boiling water over you. Well, that's very interesting. Age of six. Good. Got a picture?"

"Oh, God", he says, "I sure got a picture!"

And you say, "Well, all right. Good. All right. What did you do?"

"Well, I kicked and screamed."

"What did you do?"

"Well, I kicked and screamed." This would be one way of doing it, see.

"All right. What else happened around there?"

"Oh, I don't know exactly."

"Well, good. What don't you know about that picture? Thank you. What don't you know about that picture? What don't you know about the incident? What don't you know about that – that thing? What you don't – what don't you know about it? What happened that you could never figure out? Well, what don't you know about it? What have you forgotten about it? What have the other people forgotten about it? What should they forget about it? Who'd be guilty if you forgot about it?" You know, *boom-boom*, play it on all sides from the middle. All of a sudden, *boom!* It's gone.

You say, "All right, that's dandy. Now, now let's move into high gear here and let's take a look at this trouble with your family. Now, what – what do you think about trouble with your family?"

"Well, I have trouble with my family."

"What trouble do you have with your family?"
"Well, I have all sorts of trouble with my family – or I did have. I did have a lot of trouble with my family. Yeah, I can see how that hooks up. Matter of fact, I would keep telling them all the time, you know, I keep telling them, 'you're always getting me in hot water!' Yeah, well, what do you know about that!"

"Well, now how do you feel about trouble with your family right now?"

"Well, I'm not worried about trouble with the family."

"All right. Well, that's all right. How do you feel about trouble with the family?" Cranked up E-Meter, see. "Oh, you're still having a little more trouble. What family is that?"

"Oh, well, that's my own family! You know, I've always had my own family. You know, uh, my – my – my wife and children, all mixed up with my own. Hey! You know, they're different!"

You say, "Well – well, what trouble are you having with the family?"

"Well, I'm not having any trouble with the family."

You say, "All right. Now do you think we can get down to session here?" Bang! Here we go on the session. You got the idea?

You're in the business of handling people's attention. And that consists of finding out where it's fixed and putting it where you want it. Got it? And gradually they came out of the woods and they find out they can put their attention anywhere they want to put it and there we go and we're on our way. That's about all there is to it.

And you get out of this rudiments and you get assessments, and you get Terminal Assessments and you get all sorts of odds and ends, and running on the Prehav Scale. Oh, these are just methods of fixing and unfixing attention and that's about all there is to it in auditing.

But every time you violate auditing a pc, thinking his attention should be over here on spot X, when his attention is actually on spot A and you have assumed that his attention is on spot X without examining to find out whether or not it's on spot A, you of course get all the evils of a session. First of them is no progress, next of them is ARC breaks, next of them is no trust in the – in the auditor. You get all of these things, one right after the other as you come right on up the line. They all arise from this one cause and from no other causes. Follow me?

Now, knowing this, knowing this, you then can say vividly that anything that happens in an auditing session is the auditor's fault. Anything bad that happens in the session must be the auditor's fault. Why? He didn't find out where the pc's attention was fixed and didn't get it over onto something else.

Now, I'll tell you something else. The earliest method of clearing, 1947, 48, 49, was permissive; highly, highly, highly permissive. It was very delicate. You – it amounts to this repetitive auditing command: "What picture would it be safe for you to look at?" You know why it failed? You know why it wasn't being done and why no clearing was occurring by 1950? Although my Clears were not all that good, they were not bad. But do you know why in 1950 it suddenly blew up? Because I hadn't isolated this attention principle. I hadn't isolated this attention principle so that I could articulate it to an auditor.
And it has taken roughly eleven years to be able to articulate this very thing and I've seen it occurring now and I've just had a little example of – the old style of clearing accidentally got entered into, in a session and then the auditor violated the thing and I suddenly realized that all the old violations only ever summed up in just that one thing. They kept giving him something to look at and the rule was that you couldn't give him anything to look at that was outside of his environment. You could give him something to look at that was in his environment, but you couldn't go any further than that. You know, you could get the picture of the last five seconds or something that's real safe and so forth. The auditing command which accomplished that clearing is "What picture would it be safe for you to look at? Good. Look at it." See, that kind of an approach.

And the violation was – the violation was – and why that type of clearing worked, is everybody insisted on dictating what picture it was. Now, "the engram necessary to resolve the case" was perfectly valid. Of course, that's where his attention's fixed so you run it as a picture. But in tremendous numbers of cases we were running people who were not finding pictures safe to look at, and so couldn't look at the engram necessary to resolve the case and that was it and there blew up clearing in 1950.

But you could today take somebody, have them sit down and say, "What picture would be safe for you to look at? All right. Now look at it." He'd get it. And you'd say, "Good. Now what picture would it be safe for you to look at? Good. Look at it." Just practically nothing else but that, he'd wind up at the other end. Long route!

Now I had a lot of little speedups that I used to use. "What sound would it be safe for you to hear? What sound could I make?" See, this is the violation of "we mustn't give them something out of the immediate environment", you see. "What sound could I make that it would be safe for you to hear? Or what sound could you make that it would be safe for you to hear?"

And the fellow says, "Swwwttt! Yeah, that'd be safe. Swwwttt! Swwwttt! That'd be safe."

And you say, "Good. Make the sound."

"Swwwttt!"

And you'd say, "Now, close your eyes. Now, do you get a picture of the room? Good. Now, can you hear the sound again?"

"Oh, that's what you want me to do. All right. No, I can't."

"Well, let's try it. Let's try some sound or another of some character and let's fish around until you can finally hear the sound again."

That's because one tiptoe down the track, you see, lies the battlefield. But you can actually get them to look at these little pictures and look at facsimiles and what's it safe to look at and what's it safe to feel, what's it safe to hear. Just go on down the line, turn on all the perceptions one after the other. "What picture would it be safe to look at now. Good. Look at it", so an. It goes down the line, down the line, all of a sudden he's looking at an engram, you know. Not sure he likes that. "All right, that's fine. What part of that would be safe to look at?"

"The headsman, he'd be safe to look at. You've got to look at him, as a matter of fact. You can't do anything else! Ha-ha-ha-ha-ha!"

And you'd say, "Good, good, good. What would be safe to look at?"

Just creep through the thing, you know, the slow freight through Arkansas. You lick one engram, he's got the next one licked – already half-licked. Next thing you know you've accustomed him to his bank and familiarized himself with his bank. And the reason clearing occurs is because this other attention problem therefore, unbeknownst, you see, didn't materialize. Why? The permissive approach always found where his attention was stuck.

The guy's worried about the parking meter. You said, "What picture would be safe for you to look at?" Well, the parking meter would be the picture he would get. You see? That is not a very good nor a very fast method of clearing, but it mustn't be lost sight of as a method of clearing. Very gradient, very gentle, very patient with a pc, never giving him a lose, trying to give him wins all the way along the line. And it takes a gentle kind of auditing which is – and a very smooth type of auditing, which is almost impossible to teach, but it works. It works, just as such.

Now, you work auditing today, you say, well – much faster. You say, "Where's your attention fixed, bud?" You're running rudiments really, but you're really saying, "Where's your attention fixed?" and "What don't you want me to talk to you about?" which is "Where your attention is fixed?" All right, we know we got your attention all squared up and it's taken us three sessions to get the attention all corralled.

We got present time problems of long duration. We found a terminal. We found a long terminals list that had to do with the sore shoulders, don't you see and we got that worked out, and we ran that. And all of a sudden his sore shoulder went away on the Terminals Assessment, don't you see and we handled his long-duration present time problem. And we found there were three more long-duration present time problems. We found terminals that were likely to have those long-duration present time problems. We found one of those terminals stuck a bit more than the others, so we ran that on the Prehav Scale, you know. We did a Prehav Assessment. We ran that a bit and we found out this was all straightening out and the fellow knows he's making progress. His confidence is rising. Why? You're coralling his attention.

And they gradually get all of his present time problems of long duration, making sure that we handle the present time problems of short duration in the session. We make sure that he doesn't get ARC breaks and his attention gets stuck here and there. Keep the rudiments in, in other words, all the way along the line. Next thing you know, why, we've got a guy that when we get him rolling on assessments and that sort of thing, it is just bang! You know? It's
just nothing to it. We've coaxed the pc into a total sessioning. If you take that kind of approach you can't lose!

The only sin – the only sin that might be – is that you get into a bit of a games condition with the pc over the subject of goals and terminals. He's not going to have a body and he's not going to have a goal. And you get into this kind of a games condition with him. Well, already you must have lost control of the pc to get into that kind of games condition.

I told you early in this lecture that I thought of tailoring up some processes to handle this games condition. That isn't necessary. The moment that you find out, you actually can find where the person's attention is fixed and handle that attention and get it over to where you want it, your idea of games with this pc goes because you've got the game now, man! And you feel pretty hot about being able to do something like that. And if something goes wrong, don't chalk it up – don't chalk it up that you didn't hold your little pinky just right on the edge of the E-Meter. That isn't the reason the session went awry. Session went awry because you missed, somewhere on attention. You just missed somewhere on the attention factors. The attention factors went awry. Either you really were auditing this fellow with a present time problem, otherwise he wouldn't have gotten an ARC break, or something went astray here that you missed.

And now that you've got a certainty onto what you missed, you're not in a – in a fog as to what will cause this sort of thing. So auditing becomes a much more certain activity to you.

Try this sometime, if you don't believe what I say here; I mean if you have – if you want to get a good – you believe it all right, but if you get a subjective reality on it is what I meant to say. Pc says, "Yow, yow, yow, ARC break."

You say at once, "What was your present time problem?" See? This is not smooth, you know. The smoothest way is to say "Well, yes, I heard that. Yeah, I'm sorry." And then slide over and then look and get the rudiments in, you see. But just – just for the hell of it, sometime or another, in the very near future, pc gets an ARC break, ask him – don't even mention the ARC break – say, "What was the present time problem?" He'll give you an answer, just like that! Just automatically, right on the tip of his tongue.

"Well, I came into this session – I came into this session because I had a pain in my chest. That's – well, I – I needed auditing today. I had a pain in my chest."

That's the first you've heard of it. So you see, you must have missed. Must have missed. Either you weren't looking at the E-Meter, or you didn't have the sensitivity up or something was there or your questions weren't searching enough or you weren't suspicious enough about this thing. And basically it starts with your eagle eye didn't notice there was something different about this pc today, that he seemed to have a sort of a wandering eye, you know. Sat down and you say, "All right. Is it all right with you if I begin this session now?"

And pc says, "Yes."

And you say, "All right. Start of session." And, "Session started for you?"

And the pc says, "No. Not really."
Oh well, hell, that's enough, man! What's it just told you? It's told you an encyclopaediaful. Promptly and immediately, you've been told, the pc has a present time problem because his attention is stuck elsewhere. All right. So you say, "What goals would you like to set for this session?"

And he says, "Well I'd like to get this pain in my chest fixed up and I'd like to get this and I'd like to get that and like something or other and something or other and something or other."

And then if you were to say after these two indicators, "Do you have a present time problem?" – of course you say that, formally – and don't notice any fall, oh, wow! Is your E-Meter busted? What is the question you should ask at that moment? Because you've already been told twice he has a present time problem.

Didn't get into session easily so his attention must be someplace. Gave you a type of present time problem of long duration – pain in his chest. Told you these two things. Now you're going to run something else? You haven't a prayer of running anything else. Not a prayer! You've got to do attentionwrangling. So mount ol' Paint and go out and round up the attention units.

For a long time we said well we didn't handle chronic somatics. Basically we didn't handle chronic somatics because there was no process by which you could rapidly handle a chronic somatic. Well, that was then; this is now. You've got processes that sure handle chronic somatics, man! You just – just get a terminals list on the chronic somatic and you normally would have handled it. Just as idiotically as that. Just get a terminals list. Takes you maybe two hours to get a terminals list utterly complete on the thing because, boy, is this ... The fellow's got something that the medicos, you know – the medicos oil up their secretaries to write bills for hours. You know, it's that serious a disease and so on, you know.

There'd be – between times of making out the bills, why they actually do batteries of clinical tests, you know and move him from hospital to hospital and specialist to specialist, you know. He's got cancer of the lumbosis compounded with felony! [laughter] And you say, "Well, that's just too much for me!" No, that isn't too much for you. Because he couldn't have it. He's a thetan.

In the first place, it takes a valence to get that complicated a mishmash of sensation. Well, if it takes a valence to get that much mishmash of sensation, he's obviously in a valence, so obviously just a Terminals Assessment on chronic lumbosis of the cancer with a felony would be absolutely adequate. You'll find people with that exact sickness back on the track. And you'll find him knocking their heads in, too.

And you take these people in leper colonies. So they've got leprosy. If you were to say, "All right. Give me an – . Who had leprosy? What sort of a person would have leprosy? Oh, this sort of a person. All right. And how would you describe that person?" You write it down. "What other person would have leprosy?", and leprosy, and leprosy. And you'd find probably Gomez sitting amongst them.

You see, ol' Gomez was a very thorough – he was what's known as a – they have antibiotics, but he was an antileprotic. And Gomez, as dictator of Venezuela, decided he was tired
of leprosy in Venezuela, so he hired two riverboats and he told all the lepers in the country that they were going to be moved down the river to a wonderful paradise and going to be given huge grants of land. And he had everything up around and they all walked aboard singing hymns and hallelujah and he got every cockeyed leper – anybody who had even had a white spot on him, you know – he got them all out in the middle of the river, in these two riverboats and then the boys on the bank pushed the plunger on the dynamite. That was the end of leprosy in Venezuela, but I hesitate to say that it was the end of it for Gomez. [laughs] He was real cute.

Now, there's a man with a nice package of psychosomatics. [laughter] He used to take anybody he suspected that was being against his regime and hang them up by their genitals from hooks, which I consider one of the worst activities. He not only did that, but he would hang them up in dungeons below water – at below tide level so that the water would seep in, trickle by trickle by trickle by trickle, you see. Man, that guy's going to have chronic somatics! He was a boy! He was a boy!

Anyway, you was – just start getting things like that – you're running a guy like that, you see – and all of a sudden, why, he doesn't know what it has to do with lepers but "boats". "I'm just a spectator here", he'd say, "I'm on the bank and seems to be a couple of boats blowing up out there. Nothing to do with me. Well, anyway, let's get back to the session." [laughter]

And you say, "Well, he said it had nothing to do with him, so we won't pay too much attention to it, and we'll go on here a little bit further", and so on. You don't even bother to ask him if he's got another picture now. And all of a sudden you notice this wander in his eye, you know. If you then woke up to a point of asking him what he was doing, "Well, it's these boats."

"Well, what about those boats?"

"Well, I just – they – just seem to be stuck. And that's funny because, you see, I was just – just a spectator, here on the river. I can see – I'm a – I'm an Indian, you know. I mean a low-caste person that wouldn't have anything whatsoever to do with blowing up boats. And there are these boats blowing up out there. Isn't that peculiar? And it just seems to worry me, somehow. I don't know why, but it just seems to."

Well, of course, you – about that time you should cut loose with something like Forget and Not-Know and so on and irresponsibility flies off and he says, "Oh, God! Yeah, that's what I did. Well, I think it was a good thing to do." And he goes through all of the ramifications of the thing and all of a sudden the thing blows. And couple of days later the doctors come by to slop oil on him and they say, "What happened to you?", you know. Well, he's had a miracle cure. He's had a miracle cure. [laughs] Well, you get the idea? You get the idea? Well now, we couldn't handle chronic somatics rapidly in the middle fifties, so you had a lot of stuff out about "don't handle them." Well of course every time an auditor handled them, he'd foul up one way or the other, so we'd say don't handle them. All right, well, that's changed. That's changed. You're making Clears. You're making high progress and you have things that can handle them and do handle them. This time you got a good subjective reality on doing so. Because I tell you, you're not going to run somebody with a hidden standard,
which is always a present time problem of long duration. A hidden standard is *always* a present time problem of long duration.

You say, "What would have to happen for you to know that auditing was working?"

He'd say, "Well, the top of my head would have to stop going up and down, up and down. And when it stops I know auditing is working and when it doesn't stop then I know auditing isn't, you see and that's the way it's – auditing is working."

You say, "How long have you had the top of your head going up and down?"

"Well, ever since I was a little boy I can remember the top of my head going up and down."

You say, "Well, that's dandy. Whose top of whose head went up and down?" And you start making a terminals list, you get some pictures, you shake it out, you handle it by terminals, you handle it by pictures and you've got it made.

Now, your case is going to make some progress. Why? Well, although his doesn't appear so, actually every time he sits down in a chair in a conversation, much less session, he knows the conversation's going well because the top of his head isn't going up and down. He knows the conversation's going badly because the top of his head is. He knows he should make the deal because the top of his head is going not going up and down, don't you see. He'll use it as all kinds of barometers. He knows who's going to win the election, because when he hears the name McMillan the top of his head doesn't go up and down. These things are fantastic, you know? And you go researching into them, you find out what the score is on it.

All right, well, I've given you a Friday lecture, but it is very much to the point. You can plow right on and now I'll give you the rest of it, which is simply this: that if you have not now found the goal in the first fifty to a hundred and fifty goals or you've not found the terminal in the first thirty or forty terminals given to you by the pc, then you are auditing somebody who has rudiments out, by which I mean: Present time problem of short duration? Probably not. Present time problem of long duration? Indubitably so! And you will have to handle it before that case makes another single budge forward. He's not in any kind of case to be audited at all. You'd have – have to come down on him with a terrible crash to get anything even vaguely resembling a stable attention on goals, when his whole goal is to keep the top of his head from going up and down, only he hasn't mentioned it to you on the goals list. And you haven't been searching enough to ask for it. You got it?

So when you get rudiments in, get them in with a crash, and when rudiments turn up that you've got a present time problem of long duration staring you in the teeth, well, for heaven's sakes, sail into it, man. You've got the weapons, you've got the tools, you've got the armor plate – well, let's go! Okay?

All right. Now do you feel terribly crushed and abashed because I've been talking to you so accusatively? [audience: No.] It's all right then? You'll still be able to sleep over the weekend? [laughter] All right. Well, that's okay, but don't sleep over your preclears! [laughter]

Thank you very much!
Okay. What's the date?

Audience: 22nd.

It's the 22nd? By George, it is. [laughter] Twenty-second of August 1961. I fooled you that time. There is a date on this watch and it's always accurate. I just never read it. Pretty hard to keep up with Galactic time, Earth time, Greenwich time, Australian time. Just as if there are a lot of times.

Well, I'm surprised, frankly, that you had courage enough to come to the lecture today. I thought you would probably not come.

What I told you the other day – for once in my life, I'm right. As a matter of fact, "Astounding Campbell" ran a whole editorial one time on the fact how damnably right I was and that was what was wrong with me. [laughter]

No, unfortunately, I am right. The reason the Australian course took a long, long time to get people going on Goals Assessments, the reason nobody got their goal in Washington on the Washington course and the difficulty which has been entertained here are all under the heading of "rudiments out, goal vanishes." If the rudiments are out, the goal vanishes.

Now, this is the way it is. And it is worked out with this particular unit at this time. I am very sorry to say that person after person after person, the goal has been there for weeks and weeks and weeks. Smothered by an out-rudiment. So it was just the rudiments were out. That was all. And that happened to the goal. And the goal does occur in the first 150 goals a pc gives you and the terminals should occur in the first couple of hundred terminals. And that is the way it is.

The mystery is solved. And I want to thank the people here at Saint Hill for bearing with me because I have kept my cotton-picking paws off of you. And maybe this has slowed down your case gains, but it's speeded up Scientology. And I will now let you in on something: the fact that I have not been doing Goals Assessments on you because I could do Goals Assessments and it proved absolutely nothing.

And if it depended on me to do a Goals Assessment on everybody on Earth who will be cleared from this time henceforward – . Pretty grim, huh? And me interested in boats, too. [laughter] So look it over. That doesn't make sense, so what I've had to do here is suffer agonizingly and watch this go on and on and on because I couldn't figure out what was happening. You see, I wasn't at all sure – I wasn't at all sure – that we had not encountered another phenomenon. And the other phenomenon was that goals just kept nulling and a person would sooner or later eventually go Clear on just nulling goals. And I was not at all sure that this couldn't occur.
And you've proved it conclusively. It doesn't occur. All right. That's very well worth knowing. And it — I haven't been using you for guinea pigs. I've been teaching you the best I knew. But I at the same time have not gotten myself so involved with cases — beyond steady-ing you up and keeping you on a straight line — that we failed to find out what was going on with Goals Assessment.

So it's a — it's a green light now. The starter's gate is open. There is no reason now why any case, no matter what condition that case is in, cannot be cleared. The barrier is only this barrier: that the goal or the terminal of the case becomes smothered by out-rudiments. And the goal disappears off the E-Meter if the rudiments are too wildly out. And so assessment can go on forever. An assessment forever does not make a Clear. Now, that's very well worth knowing. So that was the only bug, as far as I'm concerned, on the line.

Now, with case after case here in just the last few days we have been coming up with the fact that it was goal number two, goal number forty and so on. And yet we've gone on and assessed just endlessly past this point with no appreciable case gain, you see.

Now we go back, clean the rudiments up very, very carefully and what do we find sitting there? We find the person's goal answering up live. We find the person's terminal answering up live, but smothered — smothered by an out-rudiment. So if it took this long to learn this after we had the technology of Clearing as of spring of 1961, you see and if it took clear into August to learn this bug, I'd say it was very, very profitable to remember that bug.

So this can happen with an E-Meter — although we've known this for a very long time that this could happen with an E-Meter, that a reading could disappear off of an E-Meter because of an out-rudiment. That was not an unknown phenomenon. But it didn't have great importance until we were doing Goals Assessment and I hadn't connected it directly with this difficulty in goals. And it's been quite a little stunt here trying to find out what did connect up and why. But that is the only thing it is. It isn't anything else. It's nothing very spooky. And it's just the fact that Goals Assessments take forever when the rudiments are out. When the rudiments are in, they are rapid.

The goal of the pc will be found in the first 150 or so goals and the terminal will be found in the first couple of hundred terminals. Certainly within that wide order of magnitude you'll find the goal and the terminal of the pc.

Now, when the goal and terminal of the pc is found, now why don't we get instant and immediate clearing? How can clearing hang up now? Rudiments out. That's all. Just the rudiments out. If a case is running and running and running and running and running for a long time on the Prehav Scale and so forth, we could have several bugs. We could be running on a foreshortened Prehav Scale or something of that sort. But that's up to me. That's not up to you. I can give you the best and most now in a Primary Scale. And I've already given it to you verbally. I haven't released it in actual put-together.

There could be something buggy about that or this could have occurred — and this is apparently the next bug: The level looked flat because the rudiments were out. So this phenomenon also applies to the running on Prehav Scale. If it's flat and a level looks flat, then you must turn over hell, heaven and everything else to make sure the rudiments are completely in. And then check the level again for another run. And that's the only way to be safe.
Run it another twenty minutes. Run it twenty minutes to flat, then just tear the rudiments to pieces any way, shape or form you possibly can with sensitivity at 16. In other words, just get them in, in, in. And then run another twenty minutes of the same auditing command. Got it?

_Audience voices: Mmm-hm._

In other words, don't trust a flat-test until you put the rudiments in. Take the first as a conditional flattener. Now, get the rudiments in and run another twenty minutes. So you actually have a forty minute test for the end of a level on a terminal, goals terminal. Follow that? Seem a simple thing to do?

All right. So let's make another little rule of thumb here as we go, just as a cautionary point. When we have gone to 200 goals and we haven't gotten the pc's goal, we get the rudiments in with sensitivity 16, no matter if it takes us _sessions_ to do it. We handle those various chronic, long-duration present time problems. We just handle everything we can and go back to the beginning of the first list we made and go over it again and we'll find the pc's goal every time. Because we're doing it just time after time. This is just working out pocketapocketapocketapocketapocketapocket. It's just open and shut. It's just a – mostly a matter now of going over it. And everybody who has gone through this routine so far – that's over half of this particular unit – we found the goal in the first 150.

So if you get up to goal number 200 and you haven't got the pc's goal – although you were sure the whole time that the rudiments are in; you're absolutely sure that during this assessment the rudiments are in – that fact alone says they're out. That alone says they're out. So you'd better start back at the beginning of the thing. Get those rudiments in with sensitivity 16. Just – be just niggling, nasty about the whole thing. Get them really in. And then go over that goals list again from the beginning and you'll find the goal. Now, that's what's throwing it out. And that's how we can get it in. Okay?

This is quite a win for us. This is quite a win. The first Clear from this unit was Vickie. Now, a lot of people had a hand in this. Took too long to get her goal, so she had to be stabilized out after she arrived back at Joburg. She stabilized out and went Clear, boom!

There was just nothing to it. I mean, it was dead easy. But there was an awful lot of work went in on this case by members of this unit and by Mary Sue and so forth, making sure of the goal and terminal. But we got these a little late. It was a little late in the course when these things finally came so we couldn't complete the run and it took just a few hours to stabilize the case after it got home, so that's your first Clear.

Now, the sooner you get the pc's goal and terminal, the more time can be devoted to this. Now, you've done a lot of work here this summer on the subject of Routine 1A, Problems and Rudiments. I was trying to get problems, ARC breaks and that sort of thing pre-straightened out. Now, oddly enough, that is a successful action. Might not look successful at first glance. It might look like a wild excursion, but it isn't. We have to remember that Vickie was absolutely flattened on Routine 1A before the rest of it took place. Isn't that interesting?

All right. Therefore, you can put another little rule of thumb down here. This is an interesting tip. You've got a pc that's ARC breaky. You can get into this kind of a jam: How do you clear rudiments with a rudiment out? Ah, that's a fascinating question, isn't it? How can
you clear rudiments with a rudiment out? And there's the biggest single problem. That's a rough problem. How do you clear rudiments with a rudiment out?

Well, I'll tell you frankly that you cannot clear an ARC break with a present time problem in existence. And if you make an ARC break with the pc while you are running a present time problem, you have had it. You have just about had it!

The ARC break is sufficiently bad that you can't clear the present time problem. And because the present time problem is in existence – you tell me what happens when you try to audit a case with a present time problem in existence? Isn't it no-change? It's no-change, isn't it. You can audit a case twenty-five hours with a present time problem in existence and get absolutely no graph upgrade of any kind whatsoever. The case shows no improvement of any kind. Why? Present time problem had it pegged.

Well, let's look at this in the little tiny vignette of you trying to clear rudiments on somebody. And you start a present time problem. "Have you got a present time problem?"

"Yes", the needle says. "Yes", the pc says.

"What is it?" you say. And the pc tells you. And then you drop the lampshade and accidentally let off a 12-gauge shotgun and do a few other little minor things that causes an ARC break with the pc. What are you going to do? That is a very interesting point. What are you going to do? Because your ARC break clearing process won't run. Why won't it run? It won't run because there's a present time problem in the case.

The guy gave you the present time problem. You made the ARC break. Now, because he's ARC broken, you can't audit the present time problem very easily. Now, where're you going to go? So there's the biggest, single jam up in auditing and is the basic source of any feeling you have that it's hard to clean up an ARC break. The ARC breaks which you've had trouble cleaning up are those which occurred while you were trying to clear up a present time problem. Think it over. And of course, they didn't clear. There's no process known to man that will clear an ARC break if it has been made on the present time problem. Grim, huh?

So it isn't choosing the wrong level that stalls a case from clearing. It's clearing up rudiments. Ability to clean up those rudiments. And when this one occurs – when you get an ARC break going when a present time problem is in existence – of course you can't clean up the ARC break.

Well, I'll give you a tip as to how to go about this. This is not an unsolved problem. It has been unsolved to you up to this time although you probably haven't really looked at it straightaway as a problem. Only it is the roughest problem of auditing. That's why your case doesn't make any progress from that point thereon. And of course, because the ARC break is there, the present time problem now reads null. It's submerged because you've got an ARC break on top of its read. So you, of course, don't now suspect that you're running a case with a present time problem on it because you think you've solved the ARC break. You got the idea?

Here's the way I would handle this. I would just somehow or another bull my way, plow my way, blunder my way through the present time problem process that I was running. I wouldn't try to clean the ARC break.
Seems to be a violation of auditing, doesn't it? But it isn't. In other words, the pc's got a present time problem, you had a registry. Now, if while trying to clean that present time problem you get an ARC break, you had better give the ARC break minimal attention and continue with the present time problem whether it now registers or not. Otherwise your case will hang fire. You look kind of "What's this?" You want to know how the hell you do that. Well, you just altitude your way through it without invalidating the pc any further or something like that. You'd be surprised what you can do with a hearty "Oh well, I know that was an awful goof and I'm sorry. But let's just bull our way somehow through this present time problem. Let's at least get that out of the way and then we'll handle this other thing. All right?" And go ahead and handle the present time problem that you were handling. Okay?

You see that as a practical course. Otherwise the problem is totally unsolvable because you cannot clean the ARC break with any ARC break – TR-5N or anything else. It won't work when it's sitting on top of the present time problem. That's it.

All right. Now, running an ARC-breaky pc normally is because the pc is being audited over problems you have not detected or you have ignored, in some fashion. Any active, busy person in life has a great many present time problems which he not-ises in order to be audited. I wouldn't be looking at anybody. But they have a lot of present time problems, don't you see. And they not-ise these things. And they say, "Well, I don't have a present time problem because here I am being audited." Wrench! You see? "And I'm not going to do anything about that letter, that telephone call. That's all later." Got the idea? "And here I am being audited. Okay. Go ahead and audit me."

Now, you don't get a registry. The guy's sort of ARC broke himself, you know. He said, "Well, that's it", and you got a present time problem on a not-is.

You as an auditor should suspect – let us take an executive in a Central Organization; let us take anybody who leads an active life in any way – that that person has hanging fire at the moment he's being audited at least one present time problem. And on such a person in beginning session, if you do not find a present time problem, get suspicious. And run one anyhow. Got it?

*Audience voices:*Mmm-hm.

Now, that's the only thing that'll hang cases up in clearing is out-rudiments. And if a present time problem in – is in existence, you, of course, cannot clear the rest of the rudiments. And a present time problem can be not-ised. It can be submerged by the pc himself. Can actually be just smashed into existence.

I've had a pc say, "Well, I just don't pay any attention to these things. I don't see why anybody else has to have ARC breaks or anything, because I just don't pay any attention to these things." The only thing that registered, "Do you have any ARC breaks you are not paying any attention to?" You get a registry.

The pc actually, with attention just totally fixated on this ARC break has not-ised it, and has forcefully put another flow of attention elsewhere, while holding almost with force this ARC break into invisibility. You get a slow gain. See that?
Well, that works on many people with present time problems. If a person is leading an active life and if a person has a lot of Indian clubs in the air in existence, you can just count on the fact the person has come into session with a present time problem. It is utterly inevitable that they have come into session with a present time problem. And that's it.

And on such a person, it is faster to run Routine 1A, any version of, to its bitterest end before a Goals Assessment or goals run is attempted. It is faster. Interesting, huh?

We're not just taking the evidence of one case, although we do have one case in complete evidence of this, but we have other instances of this.

So if you're getting a slow run after you've found a terminal... Now, we know why a terminal disappears. We know why a goal disappears or a terminal disappears. It becomes invalidated in some way, rudiments go out in some fashion, various other things happen in that early assessment area. Rudiments out so you don't find the goal, you don't find the terminal. Assessment goes on forever and it actually does the case no good. Don't think that it does the case any good because it doesn't.

All right. Now, got that? If the thing isn't running smoothly, suspect first that you haven't flattened the level. There's something left on this level. Every time you finish up a level, suspect there's something left on the level, because a series of unflat levels can keep a case from clearing.

So remedy number one of this – these difficulties we've been having in clearing is simply do a double check on the level, as I gave you before. Twenty minute check – it's flat, quarter of a tone arm motion. Twenty minute test – quarter of a tone arm motion or less for twenty minutes. Dandy! Wonderful! Wunderbar! Gorgeous!

Now, let's get the rudiments in. Now, let's run it for another twenty minutes and see if we still have a quarter of a division or do we have four dials? Got the idea?

All right. Now we know it's flat. Now we can count absolutely on the thing being flat before we go on to our next level assessment. Okay?

Now, if a case, in spite of this precaution, continues to hang up in running the goal – on terminal, Routine 3, case continues to hang up – and we're not now paying any attention to Security Checking; we'll take that up in a moment – a case isn't blowing Clear, assume the case is being audited over a present time problem. And just do everything you can possibly do to thresh out this thing. And you have Routine 1A.

And it would not be amiss, if a case apparently is hanging fire, is going, let us say, something on the order of twenty-five hours without any appreciable gain. Even though he's being run on his goal and terminal, twenty-five hours is a perfectly adequate test on this. And the person doesn't seem – twenty-five hours of goals and terminal run I'm talking about – doesn't seem to be making a terrific gain. Something's happening here. Get a profile on him; profile hasn't appreciably done something one way or the other, assume immediately the person is being run on a present time problem. Shift immediately over to Routine 1A. Flatten Routine 1A. Go back and pick up the goal once more that the person had and terminal and continue your run. Okay? Got it? And we won't have this, forever clearing. That will put it to bed in a hurry.
Now, a case that, in the process of doing a case assessment sheet and doing early work with, appears to be ARC breaky, drop your Goals Assessment and go on at once to Routine 1A and get problems goodbye forever. Because a case ARC breaks only when present time problems have their attention split. That is the basis of the ARC breaky case. ARC breaks, present time problems.

Routine 1A is the treatment. And I don't care how many versions you run of Routine 1A. I don't care how many oddities you throw into it as auditing commands; get that person totally, totally, totally accustomed to problems. Confront on problems. "Recall a present time problem." "What problem isn't present?" You know? Anything, anything at all. Only get problems just completely shaken out. I'll give you a little bit more on that. But let me finish off this dissertation just exactly on the subject of Clearing.

Get 1A flat, flat, flat. Now, there'd be two places where you'd flatten 1A. One, it becomes obvious to you that this pc is hard to hold in-session. That's becoming obvious to you that the pc is hard to hold in-session. The pc is ARC breaky. Your auditing is fairly good and the pc continues to ARC break. Assume at once that the pc is being audited over the top of present time problems, which could include merely a present time problem of long duration and hidden standard. You see, that all comes under the heading of present time problem.

All right. That one. And later if the case doesn't seem to be going Clear after being run for twenty-five hours on the terminal and so on – doesn't seem to be – all right, you missed. Let's take up Routine 1A, flatten Routine 1A completely, utterly and completely. Get off all of these stuck attention points on the subject of problems, worries, anxiety and concerns. Come back to the same goal. Don't do a new Goals Assessment. Come back to the same goal, same terminal, get your rudiments all the way in. Reassess it newly on the Prehav Scale and sail along. You'll find out it probably will now assess at the same place that it assessed the first time you ran it. It very probably will. And then go on clearing the case. You got that?

Now, this gives you a little more scope, doesn't it? It gives you a little more hope along this line but I have seen all these points working out. I have a good reality on these various points and it seems very improbable that any auditor doing a businesslike, technical job – you know, knows his TRs pretty good and knows his Model Session pretty good and knows how to run an E-Meter and so on – it seems very improbable to me that with these precautions he would fail to clear any pc that sat down in front of him. Even though they were stark staring mad. Okay? I just would think it improbable that it wouldn't happen because that is all that is happening that stands in the road of Clearing.

Rudiments are out and the chiefest rudiment that can go out is – the one that causes grind is the present time problem. That's the main one that can go out. So that's the one you've got to get off because it can stall everything else. Given an auditor who is giving an auditing session, of course.

Okay? Hm? Is that easily grasped by you? Easily understood? Hm? Feel yourself coming out of a little bit of fog of why are we grind, grind, grind on assessments and why are we grind, grind, grind when we get the fellow's goal and terminal, huh? Does that make any sense to you? All right.
If present time problem is that important, then we had better do something more comprehensive about Routine 1A. And we’d better get Routine 1A into some kind of shape. Hm?

All right. Routine 1A is simply Problems and Security Checks. That's all Routine 1A consists of. Routine 1A does not have any auditing commands. It is simply problems – handle them, you see. So this gives you a completely wide-open field for the handling of problems. How do you handle problems? And that's what it comes under the heading of, which is a whole subcategory of Scientology. And it's become a very important category.

But Routine 1A is a designation by definition, simply handles problems and Security Checks.

All right. So we've got this whole subclassification of, "How do you handle problems? What's the anatomy of a problem?" I've given a lot of lectures on it. Postulate-counter-postulate, each postulate being surrounded by its own confusion. It is problems alone that give you this terrific idea of survival. If you want somebody who works very, very slowly, in an organization for instance, have somebody who has lots of problems. Everything will seem like forever to them, see. Everything seems like forever.

It's your timelessness. A problem gets locked up in time. Because it's a number of factors which are all jammed together and so on. So a sort of a timelessness or a slowness or something like that is caused by problems. So this tells you that problems could be read directly by, one, a sticky meter; an unchanging graph – see, the answer to each one of these things is that the guy's got problems. This is what you'd say, see. Meter's sticky – guy's got problems. Unchanging graph – guy's got problems. See. Relatively simple remark. Slow reaction time. His reaction time is below normal – guy's got problems. Fellow isn't moving around much in life, doesn't like to leave his home – guy's got problems. Got the idea? No motion – guy's got problems. Follow this?

The answer to these various motion characteristics are all problems. Problems stick and float and tend to move forward in time. And the fellow can be so fixated on the thing that he looks like he's moving forward in time, but actually he's stuck in the past. So of course everything seems to be timeless around him. So therefore, his reaction time, his inability to move around and do things, his loss of activity in the society, an unchanging graph, a sticky meter, which – and an unchanging meter, you can add that to the list – all of these things denote problems.

All right. Now, if problems are that important, aside from all earlier definitions of problems, there must be another definition of problems that is even more useful to you. And that definition of problems exists in one single word: unknown. That's the problem.

A problem is an accumulation of not-knowingnesses and a consideration of the person as to the value of the not-knowingnesses.

I told you one time that a thetan was a mystery sandwich, that he was stuck to his bank with mystery. Clear back about 54, 55. Mystery sandwich. Thetan – mystery – bank. And that's how his bank is stuck there. That's how he stuck to anything. That's how he stuck to valences and so forth. Mystery is the glue of life. If you want freedom, you must restore knowledge. If you want slavery, establish ignorance. Now, there isn't – I didn't make a single
comment about Rome or anything of this sort. I'm on my good behavior today. But if you want to – if you want to install a great deal of slavery, you've got to take the knowledge out of the subject and create a bunch of not-knows.

The common denominator then – and it's very interesting to have a common denominator of all problems. Aside from their anatomy of postulate-counter-postulate and confusion-counter-confusion and all of this sort of thing, the common denominator of all problems is an unknown. An unknown. A problem cannot exist in the absence of not-knowingness. When knowingness is established, a problem ceases to exist.

There's an old Dianetic Axiom on this, by the way: is randomity can be caused by a missing datum. Man, that's the most randomity that can be caused. The randomity currently called an automobile engine – a lot of randomity connected with automobile engines these days and the missing datum, of course, is an engine.

An automobile engine is a way to make a state tax motorists. See, it burns tremendous quantities of fuel which is very dear, which is very hard to get. Keeps the state wealthy and keeps the oil companies wealthy and everybody's wealthy, but you haven't got an engine.

What you need in an engine is something you can throw a couple of carrots in and it has a maximum of about three working parts and there it goes. That's an engine, see.

An automobile engine, for the absence of an engine, causes you to put in fuel at high taxation and high sales price to create heat; and then to put in a radiator and a water jacket and a fan to take the heat away. Which I think is an awfully interesting action. Both of them are totally opposed to one another. And the engine must run by heat, so you cool it.

Now, all kinds of things could be said about this, but of course the missing datum is something in the field of engineering on the subject of propulsion or motors or something. See? It's a missing datum. I don't adventure to tell you what the missing datum is about engines, but it causes all this other randomity, see. And every time you get in your car, you say, "Well, can I afford to go home?" You know? [laughs, laughter]

I think the gasoline in the United States is now worth something on the order of ten cents a gallon and the government gets about thirty-five cents a gallon. Oh, but recently, I understand, there's been a gas war. And now they have to pay the service stations to sell it. I think that's about right. They're selling it for fourteen cents and they get – at the stations and the oil companies and so forth, costs them nineteen cents to provide the station with it or something like that. Nonsense.

There's that randomity. Then there's the randomity of replacement of engines and then there's the randomity of automobiles that actually can't be controlled. They haven't got a good positive engine, although the engine's all right. But the engine slows down in speed. It's very hard to slow down one of these engines. Just because you take your foot off the accelerator is no reason you are instantly and at once braking with an engine. You aren't, really. There's a split second or two there when the engine's inertia goes on. Various other things are occurring.

And you get the randomity of traffic. Traffic accidents, that sort of thing. Relatively uncontrollable motors. They're not slung low enough. They're not positive enough. You get –
well, you get the problem called Los Angeles. Totally. Freeways swooping in all directions. Going up into the sky and down into the valley, all completely hidden under a vast miasma of smog, see. Automobile. Automobile mufflers. This causes a bunch of randomness.

So everywhere you look, you get more randomness, more randomness, more randomness, more randomness and so forth and it's the missing datum, engine. What's a proper method of propulsion?

All right. You see that? There are all kinds of problems evolve out of this one missing datum. Now, man's difficulties were busily getting more and more difficult. His various relationships nation to nation, person to person, group to group, this sort of thing, was getting more and more involved and so forth, because of a missing datum.

The missing datum added up to many data – a technology about man. So a lot of people kept coming in with all kinds of false knowingnesses of various characters and another. And this just created more problems, you see. One didn't have a positive datum concerning man. Well, was he bad or good? Or was he an evil beast? Obviously, most of their data is wrong because it isn't working.

All right. So this causes a tremendous – in the civilized world – it causes a tremendous amount of randomness. It's just the missing datum, don't you see.

All right. So – the only reason I'm calling this to your attention in the broad sphere, is so that you can see it easily when applied to a bank.

All right. Here's a pc and you start running problems on this pc and you run – you say, "Describe the problem" and "Describe the problem." He keeps giving you different problems. Different problems. Different problems. Different problems, problems, problems, problems, problems, problems. You ever notice that? You keep running this, he keeps giving you different problems all the time. Even though you went in for problem A, you wind up with problem AAAZ. See, he's got problems, problems, problems. There's a missing datum someplace. There's an unknown.

And just as Los Angeles smog goes up to this idea of no engine – the data on how to make a proper propulsion unit, just as traffic accidents, automobile taxation, government efforts, oil company, you know, all these other problems. Each one of those could be considered as a separate problem, don't you see?

But if you started running them on the pc, "Well, do you have a problem?" And "Describe the problem to me."

And the pc would say, "Los Angeles smog."
"Describe the problem to me."
And the pc would say, "Traffic accidents."
And "Describe the problem to me."
And the pc would say, "Taxation."
Got the idea?
And these things don't seem to add up because you don't even know what the problem is, you see. But that's why he's got a problem, because he doesn't know what it is, see. And it causes you to Q-and-A with him a little bit because he doesn't know what it is. Then all of a sudden, you don't know what it is. Got the idea? Because obviously it's an unsolvable situation.

The common denominator of all problems is, you could cut through to a center problem of the pc with great speed by running unknownness on the subject of problems. Interesting idea, isn't it? Unknownness on the subject of problems.

All right. Let's give you a sample process. Now, let me define for you, first, two-way comm.

Two-way comm is an inquiry of the pc as to what is going on and an invitation to him to look at it and that is all. It's an inquiry as to what's going on and an invitation for him to look at it. An invitation. No direction for him to look at it. So it is limited to, "How are you doing?" "What's worrying you?" and, "Well, what's that all about?" And you've just about summed up the totality of two-way communication.

And when we say two-way comm, you'd better just limit it to just exactly that and nothing else: "How are you doing?" "Well, tell me about it" – which is just about the same thing as "Take a look at it" – and, "What is that all about?" That's two-way comm.

Now, I've done a no-bridge statement here. But you have been handling processes as two-way comm. Ah, ah, ah, ah, ah, ah. Two-way comm does not consist of any process whatsoever. You understand? There's no process involved in two-way comm except the process called two-way comm: "How are you doing?" "Tell me about it." "What is it?" Got it? That's it. And there's nothing more to two-way comm than that.

Now, our next observation in this particular line is that if you start a process, you flatten it. And that had to do with engrams – 1950. And it had to do with all of the 50s. And it has to do here with the early 60s. And this is a datum about auditing which has never changed. There has never been any change, variation and so forth. There are a tremendous lot of constants in auditing. And this is one of them.

Three basic constants of auditing could be – say: Run a session, flatten all the things you run into – don't keep Q-and-Aing and running into more things that you don't flatten; flatten what you contact and end sessions. These have always been with us, you see.

So that if you start any type of inquisition on the subject of the present time problem, you flatten it by the E-Meter. If you're going to run unknowns on a present time problem, flatten it by the E-Meter. What do I mean by flatten it? Well, you don't have to run a twenty minute test on it. But you sure have to get the needle action out of it. You have to get the needle action out of the process you are running.

All that is – all that is cautionary. I'm just doing a review here of something, because I'm about to give you a datum. And that is to say, in Model Session it is totally allowable to run out the present time problem by discovering the unknowns connected with it. And you'll run more present time problems faster than you ever heard of. It's with speed.
Use any version of the odd-numbered postulates. "What shouldn't be known?" "What is not known?" "What have you forgotten about it?" "What should be forgotten about it?" "Who would be upset if you did forget about it?" Anything you want to do. That is one process. You're running unknowns on the present time problem. And that is not two-way comm. You're running a process. You're running a process with a varied command and that's all you're doing.

So get that well established because you can wind a pc up in a fine state, man. Because you get him way down the track and you all of a sudden shift gears on him into saying, "I'm going to run some other process on this now", thinking you have not been running a process and you're going to be in trouble at once.

So running the odd-numbered postulates, which is the Not-Know, Forget, on down to Doubt and Pretended Know – the whole rack of the not-know scale – you can keep putting these to a pc in any kind of a version or wording you want to. And you don't have to go repetitive, repetitive, repetitive. "What have you forgotten? Thank you. What have you forgotten about that? Thank you. What have you forgotten about that? Thank you." Now, that is not being very smart and it's not being very speedy. Because there's something forgotten about the problem. There's something not-known about the problem. There's something doubted about the problem. That's something pretended.

And all you've got to do is get all these various versions of not-knowingness off the thing and the problem goes svoosh! I'm giving you this because you can stop worrying about a present time problem occupying threequarters of your session, if you do this well. Now, the only reason you object to a present time problem is because it takes such a damn long time to flatten one of the things. And there's such a marvelous opportunity, in this long time, for ARC breaks – as I've just pointed out to you are very dangerous while you're running them. See?

So we've got another process here which has just sprung up and – which is very old actually, but applied to this particular problem of problems is right on the common denominator of problems. The guy's got a problem because he doesn't know. Well, let's find out what he doesn't know. And the problem goes foosh! Got the idea?

A problem almost has one each – at least, a minimum of one each – of each part of the not-knowingness scale. Usually the problem should be not-known by somebody. The pc doesn't know something about it. In other words, an unknown. There's an unknown concerning it. By forgetting it he would get even with somebody. You see? Some part of it. Somebody else doesn't know about it, you know. All of these various versions of not-know occur around a problem. And there may be just only one of each. See? So it's a varied idea of problem. Well, let's plow out the stupidity of the thing and we've got it made, you see. See how that would work?

Now, if you became able to do this, well understanding that two-way comm just has its three parts of, "How you doing" "Tell me about it", and "What is it?" and that's all, then you won't get into the idea that you're running unknowns with two-way comm. That's phlooey, see. You're actually running a process.
Now, you said in the rudiments, you said, "All right. Do you have a present time problem?" and you got a little knock. No matter how tiny, but you got a knock on the meter. And you say, "What was that?"

And the pc says, "Well, that was, uh – I don't know how long the session is going to last."

And you say, "Well, we agreed to end it at four o'clock."

And he says, "Well, all right."

And you say, "Good. Well, do you have a problem?"

No knock. You've got it.

You say, "Do you have a present time problem?" Knock. And you say, "What was that?"

And the pc says, "Oh, I don't know. I'm pretty worried about the mail. I don't know whether I'll get the mail tomorrow", or something like that.

And you say, "Well, all right. What's in it?" You know?

And he says, something or other and something or other. And that's what that's all about and so on.

And you say, "Okay. How is it?" You know, "How you doing?" that sort of thing.

"Well, all right. I think I can handle that."

You say, "All right. Do you have a present time problem?" No knock. Now, you've handled it by two-way comm.

All right. But the second time you said it, "Well, do you have a present time problem?" – the second time you said, "Do you have a present time problem?" – you get another knock.

Well, the way you'd handle it with Not-K now is, without announcing the fact, you would start in on a Not-Know run on this particular problem. And it is a process and you should understand it as a process. The way you bridge out of that can be very careless, but it nevertheless has to be a bridge out. "I'm going to ask you a couple of more questions about this now and then end this." End this. See? It's not a process. But it is. And you'll find out the problem will have evaporated rather rapidly.

Now, what would you ask him? Well, he's worried about the mail. Now, that's a present time problem he's got. But this is going to turn one way or the other, one way or the other.

And you say, "Well, can you phrase that problem a little bit better?"

"Well, yes." And now it's twisted one way or the other.

And you say, "Well, is there something unknown there?"

"Oh, hell, yes. I don't know whether the mail's going to come or not. I just told you."
"Well, all right. Are you afraid somebody else is going to forget?"

"Oh, yes. As a matter of fact, that's the whole thing. They might've forgotten to send it to me, you know. And then that would be a hell of a mess."

And you'd say, "Well, all right. Now, should this be unknown to somebody or other?"

"Well, not really anybody, but it really should be unknown to my wife because she doesn't know I'm getting it."

And you say, "Well, all right. That's fine." you say, "Well, is there anything else there that is unknown? Is there anything else there that should be forgotten? Is there anything else there that if you forgot it somebody else would be real upset? Oh, I get it. All right. That's fine. All right. Now, do you have a present time problem?" No knock. Got it?

Now, if you learn to do that expertly and smoothly and try to kind of stay on the subject of vaguely what his present time problem is, not try to run his whole case and terminal, too. You got the idea? You're talking about mail. And he was worried about mail. So this seemed to be the common denominator of his present time problem, was an unknown about mail. Or it might have been an unknown about somebody going to mail him something or something of this sort, you see. But you got that sorted out. Now, you stay on that as a line of questioning. It's not-knowingness about mail.

Otherwise, you're going to get Los Angeles smog, taxes and we're going to wind up running the whole case and find him eight trillion years ago and so forth. And we won't have handled the present time problem. We'll be handling the whole case with unknowns, which we could do, too, see. But flatten what you contact. Not only flatten the process you're running, but flatten what you contact. Don't let that thing get out from under you.

You're trying to flatten that thing which you contacted. You are not trying to flatten the case. And that is the auditor's biggest difficulty on the subject of Q and A. And Q and A could be redefined as an auditor's effort to solve the whole case, having contacted one incident. See? They let that incident go. And then they get a hold of another incident and they get hold of another and another and another and another and another and another and another and another. Ohhh! Where are we? What is this all about? So the fellow said present time problem and he said mail. All right. Mail.

We got him to redefine it. We were careful about it. Let's make him really define this present time problem. And then let's get that present time problem fixed. That present time problem. It has to do with mail. Otherwise, he's going to go down to the deepest unknown of his bank. There's nothing wrong with that in processing. But there's everything wrong with that in rudiments. See? See, he's going to wind right up and find the unknown which is motors and he will suddenly say, "Motors!"

And you'll say, "What?"

"Well", he says, "this adds it up. Los Angeles smog, taxation, oil companies, the murder of Rudolf Diesel – it all adds up. Everything all adds up and so forth. And I got it and that's the basic unknown. They don't have a motor."
Well, that's great. There's nothing wrong with that at all, but that is not what we are trying to do in rudiments, see. So he will go around this whole excursion and get down to the central unknown of his track if we continued to question him in this particular line. And that's perfectly all right for a session but not all right for rudiments. So identify the object of the PTP. Remember you get changes on terminals. You don't get changes on conditions. So get the object of the PTP. PTP object – a car. PTP object – mail. PTP object – wife. PTP object – husband. Got the idea? PTP object.

Now, of course, there's another object going to creep in on you. And that's the beginning of the smog over to the tax company, you see? You're not interested in that other one. That wasn't worrying him a minute ago. Why should it worry him now? Well, we've restimulated him into a worry, so we can process him out of a restimulation. In other words, we're going to come off of that. Got the idea?

"So what don't you know about mail?" "What should be forgotten about this mail?" Preferably "this mail", you see. "What should be forgotten about this mail?" "Well, should this mail be unknown to anyone?", you know. Suspect him of that. "Well, if you forgot about it entirely, would that be an overt against somebody?"

"Yes, it sure would. It'd be an overt against me. I wouldn't pick up my paycheck", you see.

You got what you're trying to do? You're trying to take this whole thing, but you're trying to take it against one object which is the object of the present time problem. And if you get very good at this, you'll find out present time problems cease to worry you. You'll start to regard them with some contempt.

So the guy has a present time problem; you know that twelve, fifteen questions at the absolute outside later, he won't have this present time problem. He'll be fine, his attention will be in the session. Okay?

See this? So there's a trick there.

Now, obviously, that was one of the things we needed desperately in auditing, was ways and means of handling a present time problem, rapidly, effectively and scoot along right on down the line and get it all handled and get that rudiment out of the way and get the session going. Okay?

Now, you'll find out that if you can ably handle PT problems, that your ARC breaks will get very few. To minimize ARC breaks, handle present time problems.

All right. Now, there's one more little factor involved in all of this. And that's Routine 1A as a whole subject. Routine 1A consists, of course, of everything you could think of, in relationship to problems. Any time you think up a Problems Process, it could be part and parcel to Routine 1A. You could say, "Who has problems? Thank you. Who has problems? Thank you. Who has problems? Thank you." That's fine. That's Routine 1A.

"What problem could you confront? Thank you." – Routine 1A. "What problem isn't present?" – Routine 1A. You understand? "What unknowiness exists about problems?" – Routine 1A. Good or bad. See, it's all Routine 1A. You could run any of these versions for
Routine 1A and you'd come up at the other end with a total ability to confront problems without being upset about the unknowns of them.

You'll find man's main difficulty is confronting the unknown. And it's the one thing he does not like to do. Well, basically, it's hard to do. It's hard to do.

Germs. You say, "What germ could you confront?" And of course, the answer is, "No. I can't confront any germ." As far as your confrontingness is concerned, germs were an invention of a fellow by the name of Pasteur and existed only in his notebook. You've never seen one. You've seen a microscope, but how do you know you aren't just looking at Brownian movement? I never talked to any germs. Oh, I've been down skid row in Chelsea and I have talked to some germs, but – I'm sorry. I apologize.

But it's not there. You ask some – it's an absence of confrontingness, don't you see? There's nothing there to confront. You don't carry microscopes around and examine all of your friends, you know. I can see a social gathering now where everybody was insisting on microscoping everybody's hand before he shook hands, you know. Very interesting.

But anyway, it's a no-confront. Confronting the absent. Joe, Bill, Pete, somebody, wife, husband, something, is absent for forty years. And you say, "Well, what part of your wife could you confront?"

The answer, of course, is, "No part of my wife, she isn't here." It's a no-confront, isn't it?

All right. But it also happens to be an unknown. An absence adds up to an unknown and we're back to processing loss, which we knew as a very powerful, potent button about 57 and 58. Loss, the direct processing of loss when you start processing unknowns. Because what is so damned maddening about a loss is you don't know what has happened to it. [laughs] See? And it just becomes instantly a not-know.

So therefore, a person who has lots of problems is liable to start experiencing sensations of loss. You get all kinds of crossplays going here of one kind or another, you see. He's starting to assign causes of loss. Person has the problem of having murdered his father that he'd never seen. You find this in an institution. He's going around the bend on the subject of having murdered his father. You find them all the time. But he didn't, see. But the idea that his father is gone and that he doesn't know who his father was or he – some kind of a lineup of this character occurs. So a lot of not-knowingness about a father causes the fellow to go to the bottom of the Prehav Scale and pretend some knowingness. And to add to this, pretended cause.

And pretended knowingness and pretended cause are almost blood brothers. You'll find these two things going together consistently and continually. When somebody gets real plowed in on pretended knowingness, you'll find a pretended cause moves in behind it. And it makes somebody who is busy inventing things feel very peculiar indeed. I mean, somebody who's actually inventing something, it makes him feel very peculiar. Because if he gets down to the Inventor's Society, why, he'll find a bunch of fellows, perhaps, who pretend to know all about his invention and who invented it two years before he did. These things go hand in glove. Boom! Boom!
And we ran into this so often that I invented a rebuttal in Scientology which is quite effective, which is "Well, what did you invent?" And, of course, it leaves them there with their jaws flapping.

You say, "So-and-so and so-and-so and I did so-and-so and so-and-so."

And then the other person says, "Oh, yes, yes, I invented that. Yeah, oh, yeah, we did that and so forth. And we know all about that."

And you say, "Well, what do you know about?" That's the end of the conversation, man. The person who is in that state can't duplicate and they can't feed back what you've said, you see. That's the trick.

So they tell you something entirely disrelated, that is way over the hills and far away.

Up to that moment, you're caught in this trap. You say, "Well, I haven't done so much", you see. You – nothing has been made out of you for whatever you have done, you know. Nothing's been made out of you. But then you find out, hasn't been nothing made out of you; that you're just looking at a whole pool of nothing. It's an interesting rebuttal.

But pretended knowingness and pretended cause are blood brothers, not cousins, but brothers. And you find the two things coming up consistently and continually. You'll find somebody whose pretended – whose pretended knowingness is saturating his whole track from one end to the other.

And you get – you get to a point where he can't look at a monument without having ordered its erection. You got this? You see, his pretended knowingness goes along with having caused it. Now, when you start running into this, you're at the bottom of the not-know scale because it's a substitute know. You got the idea? It's a substitute know. It isn't a know.

Now, exactly how you handle that particular end of the game is very interesting because it isn't really a direct contact. It's very hard to make a direct contact at that end of the game, unless you go at it obliquely through the subject matter of problems.

The person has had so many problems that he has begun to substitute false solutions. And those false solutions are the pretended knowingness that you see on the case.

So, you actually don't process the pretended knowingness. What you do is process the guy for problems. Any Problems Process will cause such a pc to really get up on the step and fly. I don't care which one of the Problems Processes it is, but any one of them will just – will take off on this particular process. Because you enter it at the level of reality of what a problem is.

And then you'll find out, because you're handling the confrontingness or the existence of problems, all of a sudden his false solutions and pretended cause and that sort of thing fade out on the case. So problems are a very good approach on it.

1A, then, has very extended usages and can handle cases which are baffling you to this degree: You can say that if the case is baffling you, an excellent approach is to flatten 1A. Now, when I say flatten 1A, I mean to get the guy used to confronting unknowns.
When he was finally used to confronting unknowns, whether in the version of problems or otherwise, you would then have somebody who wasn't obsessively escaping from them. You would have somebody who was no longer experiencing superanxiety. You'd have somebody who wasn't experiencing "got to go", or "got to stay", "can't move", you know, "can't leave", "can't stay" or anything else. You've solved this. But it is the confrontingness of the unknown.

Jealousy is basically an inability to confront the unknown. Very possibly the absence of jealousy amongst the Polynesians is the fact that when infidelity – as it's called by the Anglo-Saxon – is accomplished in the hut, it is normally done in full view. See, there's nothing unknown about it. So jealousy becomes unknown in these particular zones and areas.

But where an unknown is racked up, you get jealousy and the sickness and so forth that somebody experiences over jealousy itself is not on the buttons of betrayal, is not on the buttons of this, on that, on the other thing.

And infinite numbers of explanations – we're just back to more smog. More smog and taxes and oil companies, you see. And all of these things are not quite related, but somehow or other the incidence of cancer in Los Angeles, you see, would come into all of this and so on. And just bzzz. Wild explanations which just dot the landscape all connect together to an unknown. And the unknown is "Is she being faithful?" or, "Is he being faithful?" or, "Is he being unfaithful or not?", or, you know... or, "Do they know something about the activities of my wife that I do not know?" You got – you got all these things? Unknowns. Unknowns, you know. "Is there something I don't know, that they know?"

And you get all these balanced knows and unknows. And a person who gets literally sick about love, for instance, you know and he's all mixed up about all of this kind of thing – don't enter it on the basis of male and female. Has nothing to do with it. You could probably solve it on the basis of old scarcity and abundance of women or men or something like this. But basically, it just comes down to inability to confront an unknown.

Now, that's a fundamental. Only this particular unknown has to do with the sexes. You see how you'd work this out? So when a case is presenting a baffling aspect to you, make up your mind that you had better improve the case's ability to confront the unknown. And we're right back in Routine 1A. A method of approaching the unknown is, of course, through problems.

You just get him to start citing problems. "What problem could you confront?" "What problem would you rather not confront?" And so on and on and on and on and on. Doesn't matter what you're running. You're still running something that is on the border fringe of unknown. See? Not-known. So therefore, you would – you would get that thing mopped up, wouldn't you?

All right. Why does a case suddenly dive into the middle of the bank and can't come out and won't come out and you can't plow the case out and you take dynamite, blasting powder, anything else you can possibly think of... What on earth would you say offhand would be the reason for this? Why does a case dive at his engrams? Why has a case got himself so glued into his bank? Why? Why? Well, it's just, why? I mean, the question itself, "Why?" answers it. The guy is unable to not ask why.
There's an unknown occurs in the incident. He gets some tiniest, slightest glimmer of the unknown and he dives right straight at the engram and there he goes. And you find another engram and he dives at this one. And you find another engram and he dives at that one. You find another engram and he dives at that one. And the next thing you know, you've got the most horrible mishmash you ever saw called a bank. Why?

The answer is he can't stand the question "Why?" That's all. He cannot confront an unknown.

In other words, he becomes very hectic at the idea that an unknown exists. It mustn't exist anywhere in the world. Well, the hell it mustn't! What'cha going to do? Run it totally on know? We can't. It's a stuck flow.

Here's an oddity though. His all-knowingnesses are invented knowingnesses. Even though you're in a body and your body is real, it isn't necessarily true. It is simply a know. But that know is invented. Somebody invented the idea of a body. You follow this?

Now, with the inability to confront an unknown, eventually you get into a state of inability to confront the known. You know, it's both sides of the same coin. And eventually you get somebody who can't confront. And then you'll have trouble with the person. So that to this person, any little tiny incident of the day or night becomes a problem that he dwells on.

He's outside. All of a sudden, he doesn't know whether he might have dropped his ballpoint outside the door or left it in the car. He doesn't have the ballpoint now. Did he leave it in the restaurant? Ah, is it here? Ah, did he have a ballpoint in the first place? Has he ever owned a ballpoint? And this just magnifies and magnifies. You get him in-session. You yourself say, "All right. Do you have a present time problem?"

"Well, I don't know where I put my ballpoint", he says very matter of factly, you see. You get a little fall on it.

You say, "Well, what about this ballpoint?"

And he says, "Well, I missed it."

And you say, "Well, do you have a present time problem now?" You don't get any fall. And you say, "Well, it couldn't be too much of a problem because it only concerns a ballpoint." And what you have totally overlooked is the fact that to him that much unknowingness is enough to send him through the roof.

And he sits there all through the session without telling you and thinks, "Ballpoint? No, I didn't put it there in the car; I put it ..." [laughter] See, it isn't that the ballpoint is valuable at all. It's just the fact that there is an unknown. Where is this damn ballpoint? Got the idea? He's almost berserk on the whole idea.

You're not processing a person with a present time problem. You're processing someone with a craze, practically. And yet you as the auditor might say to yourself, "Well, that isn't much of a problem, so I won't pay much of attention to it." Well, the bug factor is, how much of a problem is a problem to a pc? And that is all regulated by his ability to confront the unknown.
And if he can't confront anything that is unknown, you will find him totally glued all the way up and down the track, totally mishmashed into every engram he has ever contacted—personally, privately, by himself. He's—every time he ran into one, he goes zoomp! Stuck, see. Got the idea?

All right. That's what you're trying to process. And of course, you're trying to get his attention off of something on to what you want to run or what should be run and his attention's stuck on his damn ballpoint.

And if you queried him, you'd find out that the last ballpoint that he had anything to do with was totally empty. And he didn't even have a refill for it and it wasn't the kind of ballpoint that could be refilled.

All right. That's what's stopping people from going to Clear. That's about all it is, too.

All right. Now, you could get something going like this. Now we're getting wicked. Now we're getting wicked. We could get something that would be as horrifying as this as a process. And this is a horrifying process:

"What unknown about an auditing session could you confront?" "What unknown about an auditing session would you rather not confront?" I don't care how many legs you put on it. You can run it just that far. And you get anybody who's having any very great difficulty auditing or just doesn't really think they ought to be auditing and they'll blow their skulls on it practically. It'll solve this difficulty. It'll solve the difficulty, wham-bam! And it is a specific process that you could run on an old-timer that doesn't really like to audit much anymore or somebody that's having a lot of difficulty learning how to audit or something like this. This would resolve on that exact process—is: "What unknown about an auditing session—?" Because, of course, the pc is sitting there being totally unknown.

And the fact that the pc has some unknowns is enough to drive the guy halfway around the bend. And he gets stuck up in every pc.

I know an old-time auditor that—I think he audits once in a while, but you can't get him to audit very much and he does a fly-about. Every time you hear of him someplace, he's someplace else. See, the intelligence never has time to get to you. I'm not talking about anybody that you know particularly. It's an old-timer from South Africa.

Anyway, he picks up every pc's somatic. No matter what somatic the pc's got when he's auditing the pc, he'll pick it up. And he'll have it for two or three days—the usual settle-out period for restimulation. Why? Because it's a mystery. And just the fact that—"What is it?" Bang! And that's it; he's got it. You got the idea?

He just snaps terminals with these unknowns, instantly. Well, it'd half kill him to run this process on him. But he'd run it and he'd come up at the either end feeling fine and smelling like a daisy. This is just a specific application of a particular type of thing in its simplest form. That is a workable process. And it does handle, then, a specific thing.

All right, we've got somebody and he used to write and doesn't like to write anymore and we want to rehabilitate his writing. Use the same factor. "What unknown about writing could you confront?"
"Whether the story's going to be bought, of course!" you see. And he – automatic. The unknowns. The unknowns have driven him out of it. Nothing else.

Eighteen lives ago the fellow could sure speak Arabic. Hasn't been able to speak much of it since. It go – turns on and off. Appears in Casablanca or something like that, asks a street beggar something, speaks Arabic. Startles the hell out of him, see. And then the next moment can't speak Arabic.

What's happening there? What's happening to somebody who can't learn German. Now, there are some unknowingnesses – German. Mm. One of these compound polysyllabic words or an irregular verb.

H.H. Munro remarks on a fellow being stomped to death by an elephant in a zoo that he was trying to teach German irregular verbs to. The fellow could make animals talk. You know the story.

Well, what is this? What's unknown about, not the German language so much, but "a German" would undoubtedly produce a considerable reaction there for the rehabilitation of a language, don't you see.

All right. Now, I'll give you another one. It is true that this is the case – this is – this is a truth here, as far as processing is concerned – that it is valences. Valences are packaged mass knowingnesses. And the treatment of a condition is an attempt to alter a valence without addressing the valence. And at no time can this occur.

You cannot, well – you cannot treat Mr. Joe Blow, if Mr. Joe Blow isn't present. You're trying to cure Joe Blow's arthritis, but Joe Blow isn't on this side of the planet. Maybe not even on this planet. You got the idea?

So you put some arthritis in a test tube or something, see. And I'll fool around with the calcium and so forth and you finally conclude there isn't much you can do about it and so on. And then this fellow is trying madly to do something about arthritis and he does something about arthritis, something about arthritis, arthritis and he finally has got arthritis. But he got arthritis. He was trying to cure Joe Blow's arthritis. Only you don't know that Joe Blow ever existed.

So, "What about arthritis could you forget?" and that sort of a thing would probably be a bit of a blind alley. You might get someplace with it.

Some process addressed directly at arthritis, just as such: Well, the probability is that unless you handle some mass, like an engram or something like that, that would cause jammed bones or something, you actually are not going to get anyplace with this arthritis. You got it? Because you are not addressing a character named Joe Blow who is basic on the chain of arthritis.

In other words, address the valence. Do not address the condition. It took me about fifteen years to find this out. So it's well worth filing behind your left ear. It's a good auditing rule. So, long lists of goals are not going to make anybody progress particularly, but long lists of valences could.
And I am now working on how to get rid of hidden standards – which is to say present time problems of long duration which people are using for standards as to whether auditing works or doesn't work – and the first process I have turned up with that has anything to do with this is one of the unknown processes and it runs like this. This would be a series of commands that you would run. And you understand that this is an experimental process, but I have every reason to believe that it would be quite a workable process. It's on the basis that – a treat-the-valence idea. In other words, get valences on the case. Don't get conditions.

You want to treat his arthritis, so you say, "Who or what might have arthritis?" "What isn't known about that person?" "What might you have done to him?" "What might you have withheld from him?" Four commands in a row. There is a method of using an unknown salted down with some other things and combined with this valence idea.

"Who or what?" It goes idiotic as this. "Who or what would have a case like yours?" Ohhh. "What isn't known about – ." Whether he said "who", why, it'd be "him" or "her" or whatever it was, proper pronoun or "it." "What might you have done to him?" "What might you have withheld from him?" And you run a Security Check and an unknown and a valence identification, all in the same bucket. I don't say that that particular one will produce any particular marvelous results because the thing is too dug in on something like that. And you'll get it best on your Goals Terminal Assessment.

But we're talking about the handling of hidden standards. So this fellow has bad eyes. And we are very interested in this. And it's a good, beautiful, hidden standard. Now, we know how to get it on the Security Check. We say, "What shouldn't be seen?", you know. "What have you done that shouldn't be seen?" And that sort of thing. And just start checking them off and flatten it out on the meter, you see. We can do that. We've already done it – and practically had somebody's eyeballs rolling around on the floor, you know.

But let's look at this now from this other process line. Not necessarily neglecting the Security Check approach either. We do that, too.

But this person's got bad eyes, good hidden standard. Is his eyes getting better? Well, auditing's working. Eyes getting worse? Well – what the hell – it's a present time problem. He isn't being audited. He's sitting in a present time problem so you got to handle it, see?

All right. So you'd run something like this. "Who or what would have bad eyes?" I don't care what version of this you use. "What is unknown about that?" "...the person?" "...it?" "What might you with – have done to them?" "What might you have withheld from them?" And you would just go on stripping off valences, valences, valences, valences, valences, valences, valences, valences and all of a sudden zzzzzzzz! Something is going to happen with regard to his eyes. See?

I'm attacking this problem of hidden standard and attacking this problem of problems because these things are the primary holdups in clearing, you see. As you can see, because I've been telling you this in this lecture.

Anyway, there is an experimental process which undoubtedly would bear a lot of fruit. Now, you could probably get rid of all sorts of things. You could probably invent a whole route to Clear with just knowing about this particular facet, you see.
You've got hit-or-miss, hunt-and-punch sort of thing that could handle an awful lot of hidden standards. Well, this fellow is worried about a habit he's got. And he just keeps worrying about this habit he's got. Well, "Who or what would have that habit?" "What isn't known about it?" – or "him?" "What might you've done to such a person?" "What might you have withheld from such a person?" And certainly we're going to get whole track God-knows-what, you see. But it's just going to be valences, valences, valences, valences, valences, valences.

Now, there's one more rule that goes along with this, is for some reason or other – well, it actually substantiates the theory that a thetan is a mystery sandwich. If you run lots of unknow and not-know, I mean lots of it, you've got to remedy havingness. So stand by to remedy havingness if you're running lots of not-know – not-know, first postulate stuff. Because frankly the whole bank is becoming unglued.

Havingness will remedy much more rapidly and so on. But you've got to keep it jacked up or the pc is liable to get pretty nervous because you're taking bank off of him in broadsword slabs. And he's got to be able to reorient himself in the physical universe.

So therefore, it'd be an awfully good thing to find the Havingness and Confront Processes early in processing in any event. At any convenient time early in processing. You find it too early and it's going to shift. But at any convenient time early in processing, find the pc's Havingness and Confront Processes, particularly since you are going to run some unknowns. Sooner or later, you will be running some unknown of some character or another on this pc and the second that you do this, you know that the havingness is going to drop and that you're going to have to stop the process every half an hour or so and remedy the fellow's havingness just to keep him flying. Okay?

So, it's a rule that goes along with it. That rule has been going along with Not-Knowingness for a very long time, by the way. Takes – terribly smooth auditing job to get around this and it takes a optimum environment for auditing and all that sort of thing never to have to remedy havingness on Not-Know. It'd just be superoptimum and nobody ever gets audited in a superoptimum atmosphere.

Okay? Well, now if you can wrap your ears – . Don't bother you wrap your brain around this stuff. [laughter] I want it to be available. But if you can put some of these in practice, why, I think you will get some of these cases really off the launching pad and really rolling. Okay?

Thank you very much.
AUDITING BASICS

A lecture given on 23 August 1961

How you doing? How you doing?

_Audience_: Okay. Fine.

You all dead today – I mean, all alive today? [laughter]

Well, I'm glad you made it. I didn't think you'd ever get to August the 23rd. [laughter]

Back there in the Roman Empire I was damn sure you wouldn't get here! [laughter] And I remember one space-opera society when I didn't think it was very probable that you'd make it. I remember standing there at the edge of the spaceport as the battle planes took off, and I said, "Well, they won't make it." I knew, you see, I knew the high command hadn't given you any ammunition.

Well anyhow – anyhow, you're in the midst of clearing. And your first takeoff on this subject has already occurred. And I've been talking about it for years – talking about it for a long time, everybody coming along and saying, "Where's the Clears? Where's the Clears? Where's the Clears?" Very embarrassing, you see. Central Organization pcs flying over banisters you know, and hung up by their heels you know, and being sup – people pouring cornstarch into them so they looked like they were standing up stiff, you know. [laughter]

And "Where are the Clears? Where are the Clears? Where are the Clears? Where are the Clears?" I never got so tired of a sentence in my life! Now, I'll tell you my withhold. "Well instead of sitting – standing there, asking me silly questions, why the hell don't you find out?" You know, I mean, kind of forthright. But that's kind of the way it was.

Because it's very mysterious over a long period of time as to what were the elements missing. What were the missing elements? What brought about this condition where people didn't get cleared? And now I realize that we might have had – well, we have had dozens and dozens of clearing processes. That's why I've been studying, you see, for some years, auditing. Been studying auditing.

There's been a parallel study: The theory and practice of Scientology has included, of course, theory, experimental results and that sort of thing, but this other study – a big broad one – is auditing, just as such. And I just sort of relaxed a few years ago and just started watching, looking it over and seeing what this was all about, and looking at it from all sides and "What were people doing with people?"

You see, it isn't good enough that I can take somebody and audit them and get some horrendous result and so forth, and everything is fine, because you run out of me rather rapidly. In the first place, it interrupts my photography. [laughter] And, you know, frankly, you
can only put in so many hours a day; figure out the number of human beings on Earth, and it gets to be some very disproportionate figure, doesn't it?

Group auditing, well, matter of fact, that comes close to blowing a lot of cases apart with group auditing, you know, but it still didn't make any total grade and there still weren't any Clears on a group auditing basis so it had to fall back on individual auditing.

Well, what happens in individual auditing that makes it fail to result in clearing? And our biggest single breakthrough on this – of course, aside from all the technology we have on how to audit – the biggest single breakthrough on this is simply that the goal disappears and the terminal disappears if the rudiments are out. And that is – becomes one of these crusher things, like when you pull the trigger on a guillotine, why, the blade falls, you know? And it's one of these facts that stand up there and – twice as big as the Empire State Building with three Washington Monuments on top of it, you know. I mean, it's a Fact! with an exclamation point and a capital "F." You can't do it.

Now, if that is the case, why do pcs get audited with the rudiments out? Let's take a look at that. Let's be very dispassionate about all this.

Why these four little simple rudiments? How come? And we find something very interesting when we look there. We find something very, very interesting. They aren't considered to be important. See, the level of importance of getting those rudiments in is slight.

Now the auditors -- . Our first Clear here, and one of her first clear observations is the fact that auditors thought of Security Checks as something you got through with luckily because nothing dropped. Duuhh! See.

So Security Check isn't looked at as something that will advance a case. It is looked at as something that has to be gotten through with and the faster we get through a Security Check, of course, the more time we can put on auditing. And I think rudiments fall into the same category -- the same identical category.

Rudiments are a necessary evil, and if we can just get through the rudiments without anything dropping, why, wham! whiz! everything is fine now, because of course if we spent any time on the rudiments, why, it'd just be time lost from auditing. Interesting! But I think that is the basic consideration. Do you agree that it's just kind of a -- it'd be too bad if you had to take up a lot of PT problems and ARC breaks and things of this character, because you wouldn't get any auditing done in the session.

See, it's an unlucky thing. It's just an auditor sits down in the beginning of the session and he puts the cans in the pc's hands and sometimes he has lucky days. Sometimes the pc has no PTPs, ARC breaks, withholds or anything of the sort, and he can get on to auditing. And sometimes he has unlucky days and the pc has present time problems and so forth, and he has to take these things up. Isn't that kind of the way it's looked at?

Well, I think that's about the first consideration we have to shift. Now, it looks like the rudiment is out mostly on the evaluation of importance of the rudiment. Now, I gave you a series of rules that if the rudiment didn't fall with the meter set at a third-of-a-dial drop, why, then you could neglect it.
Well, that was in sort of desperation because everything was going awry, and so forth. And I'm going to exercise my privilege of having created it to as-is it. And let's go to the other extreme, Aristotelian. He had a pendulum, you know. And the world was all described as swinging on a pendulum and it went between the two extremes before it settled at the mean. So we might as well go over to the far side of the pendulum and run the whole thing at sensitivity 16. Just for kicks, try it. Because the rules I just gave you yesterday basically take care of these rudiments being wildly out.

The materials I gave you on the 22nd, which just simply consisted of what you did if you consistently had too many present time problems – you did 1A. If present time problems is the trouble and if you were getting lots of ARC breaks, same remedy. Let's get 1A flat on this case. Got the idea? So, that gave you a good way to approach the whole situation and didn't leave you messed up with doing nothing but rudiments.

Now, I think that this is one of the difficulties with rudiments, that the rudiments processes don't work well. I think that is one of the basics – difficulties with rudiments – is the processes which are given in Model Session are tailor-made as a highly generalized shot at an awful lot of cases and I think they miss cases often enough so that auditors become impatient with these particular processes. And there are pcs who cannot run responsibility, so running responsibility on a present time problem is a waste of time. And it just takes you forever to clean up the present time problem running responsibility on it, so you say, "Oh my God, he's got a present time problem. I'll be sitting here running this responsibility, and the pc can't run responsibility." So there's a hell of a present time problem arises around the present time problem, you see? And that makes a rough show.

So, it must be – a certain dissatisfaction must exist around the processes, which are given in Model Session and which we've had for some time – must be a dissatisfaction with those. Otherwise you wouldn't feel such a strain on the subject of handling rudiments.

Now, there are several constants in auditing sessions and these constants are this – are these. And you've got an awful lot of rules and you could be terribly rule-happy. You know, you could just be ritual-happy until you can't see where you're going. But there are few out of all of these rules (and there could be said to be hundreds of them) – out of all of these there are very few of them which have any real bearing on the subject of auditing. And I can give you those very, very rapidly; run them straight off. I already gave them to you, I think, yesterday. I can give you possibly a slightly varied version of it, but just because I play it off the cuff.

And that is, you've got to start a session and get the pc in-session, and you've got to get all your rudiments in, and you've got to flatten all the processes you start, and you've got to end the session. And that's just about the lot. And the errors you can make with this are most flagrantly failing to get the rudiments in, running too many processes without flattening them, and failing to end session smoothly. And those are the failures that go along with this. And if you don't manage that little small basketful of tricks, of course you're going to have an awful time of it.
Now, you can get particularized and say, "Well you've got to have your TRs well." That's for sure! That's for sure! But that almost goes without saying, that a fellow who is an auditor would have his TRs in some kind of shape, don't you see.

Now, to this we can add this interesting observation (just to show you how particularized we can get): For a pc to be in communication with the auditor, it is necessary for the auditor to be in communication with the pc. There is some added factor here and that is added into in-sessionness. You see, the pc has to feel he is in communication or able to talk to the auditor.

Well, let's broaden this. Able to talk to the auditor, able to be in communication with the auditor. Let's spread it a little bit further, and an auditor who would give invalidative comments or who would fail to articulate an auditing command, so that he couldn't be understood and so forth, is knocking the pc out of session. Get the idea? Because the pc's understanding of what the auditor is saying drops. Therefore, the pc's understanding of what the auditor is doing drops. So therefore, the ARC drops, and the auditor finds a pc going out of session. On what? On himself not being in session. You see? So the auditor's got to be there, giving an auditing session, before you can expect the pc to be in-session. And that sums it up. Part of in-sessionness for the pc is for the auditor to be giving a session.

So we can add, in a masterfully way here, one third line to the pc being in-session. One, he's got to – the pc has to be interested in his own case, and he has to be willing to talk to the auditor – we can still say it the same way – but the auditor has to be giving a session. And that is in-session.

Now, what is – what consists of an auditor giving a session? Actually it's an auditor sitting down to run the session. The auditor sits down and runs a session. Now, he can run an awfully haphazard-sounding session and there'd be no doubt in the pc's mind whatsoever about who was running the session, and you'd get an awful lot of auditing done, wouldn't you? There'd be an awful lot of auditing occur on that. There might be a lot of rules violated one way or the other; but the rules I've just given you can't be violated. The second you violate those, you've got no auditing session whatsoever.

So it isn't how you hold your pinky, it's how you hold your pc in-session. And of course the best way to hold a pc in-session is by giving one. That sounds like one of these horrible, horrible simplicities. There's a whole tribe of Indians that I've commented often and their wisdom – their wisdom, read off their – actually, out of the books of the missionaries who were so interested in them, way up the Hudson someplace or the Saint Lawrence or somewhere. You know, "The way to cross the river is to cross the river." "The way to eat duck is to eat duck", you see. And their wisdom just ran on like this and it actually filled up numerous pictographs on numerous wigwams and has come down to us in the numerous pages of numerous long-since-murdered missionaries. Bunch of it up here in the Hudson Bay Company archives. "The way to cross a river is to cross the river." "The way to eat a duck is to eat a duck", or "The way to shoot somebody is to shoot somebody." This was a very Q-and-A sort of wisdom. But in this particular case it sure fits. The way to run a session is run the session – rather a thing.
Now, to tell somebody how to run a session has its limitations. And the limitations are these: How much disagreement is there on the part of the auditor with the forms and actions he is using to run the session? And that should be a subject taken up in a HPA [pronounces the "H" as "haiche" instead of "aiche"] Course, and that should be one of the subjects, and we will institute it in HPA Courses. After the fellow – you know, it's HCA [pronounces the "H" normally], but it's HPA [pronounces the "H" as before]. [laughter] Never heard it called anything else in the early days in England. Always has stuck with me as being – it's rather nostalgic to me, as a matter of fact. We had quite a few in the old days – we had quite a few cockneys and so forth around the organization. It was marvelous to hear them, you know. You could remember some of them.

Anyway, it would be simply this. We'll probably write up some sort of a drill or some sort of a test. I've got a couple of them to get together, and this would be the second one. The other one is a straight Security Check that out-rates this 7A, 7B. I haven't written them finally yet. I've got the notes on them is all. And that is simply this: is after the fellow is all set up, and knows – has been jumped through the TRs and has been given rudiments and Model Session and that sort of thing, and he's supposed to sit in there and pitch and deliver this, you see. Now we're going to take an E-Meter and we're going to find out what disagreements he has with these elements. Good idea, isn't it?

He must have some disagreements with them, he won't do them, or he must have some basic ARC breaks with some part of the modus operandi. And of course, I've enumerated a couple of practical aspects of this. Some days you can get some auditing in and some days you run rudiments – the lucky and unlucky aspects of it. But the dissatisfaction must stem from the fact that rudiments processes do not easily handle the situation which you find in the rudiments. So that would make it kind of tough to handle rudiments. So there must be some kind of a disagreement with handling rudiments. But there might be some more fundamental disagreement than this, such as, "Well, he shouldn't have to be audited." That would be an awfully sweeping disagreement with the whole thing, you see. This expresses itself in numerous ways, such as, "A pc shouldn't act that way."

In Upper Indoc drills – we have had the remark made in an Upper Indoc – I was running one ACC when the remark was made "Pcs never act this way." Little did she know! [laughter] She, by the way, ran slam-bang into a pc, abruptly and immediately afterwards, who did act that way. And was she surprised! She thought that we were running Upper Indoc much too rough, don't you see. So she was in basic disagreement with this much roughness in an Upper Indoc, because "pcs didn't act that way."

Now, that's a very fundamental disagreement and yet it works this way: that you, using the elements of auditing, could take anybody, and I do mean anybody, and by running them with the rudiments out produce a confused, ARC breaky pc. You could make anybody into an ARC breaky pc, that I'm very sure of, just by running with rudiments out. Now, if you don't run an ARC breaky pc, you're liable to run down into a propitiative pc. So don't look for just violence. How about propitiation? You run with rudiments out, you get propitiation.

Now, I'm about to send a cable after the lecture here to – it'll be a very historically noteworthy cable – I'm about to send it to a certain area and say, "So-and-so is expected at
Saint Hill for training." This will be a vast shock to one and all, because everybody insists that this so-and-so is a very fine auditor, and he's not. He's not. Because I've had the unfortunate experience of meeting some of his pcs, and they've just been beaten with out-rudiments into a heavy propitiation with regard to this particular chap. And they all look caved in. He's not making any Clears and he's having a heck of a time with auditing, but everybody says he's a marvelous auditor. You got the idea? We're getting a lot of advertisement going on here. So I'm going to send a cable and say send him in here. And we'll get him over this trick and he'll be a good auditor.

But there would be some wild impatience with rudiments or the mechanics of auditing. And I know already that this particular auditor never flattens a process – never. I mean it's almost a modus operandi; never flattens a process – never! And this leaves everybody stuck on the track, you see. So that's a bum show, and just for the good of the game, why, I'll send a cable. Now, I'm not bringing that up for any other reason but to show you here's somebody who never has an ARC breaky pc because dead men can't protest.

This guy, you see, the fellow says, "I have a present time problem". And the auditor just comes down on him with a horrible crush and a crash and so forth and bowls it through. And the pc says, "Well, I don't really like being bowled through." And the auditor knocks that out of the road, you see. And then he says, "I have a..." – pc says, "Well, I do have a little bit of a withhold." And the auditor says, "Well, that's not important to the session." And if he runs any rudiments at all that's about the net result of it, you see. And the and product is not an ARC breaky pc, but a highly propitiative pc, you see. So you see, you could go in the other direction, too. And of course the guy has to come up through all that auditing – that's easy to do, too, but – in order to go anyplace. You see how it could work?

So the rudiments could be out and you could produce several different phenomena, which I won't bother to list, by having the rudiments out during session. So a disagreement with the rudiments or a difficulty in handling rudiments or an actual technical lack in the field of rudiments then could produce a considerable bit of randomness. It could prevent clearing; it could upset things; it could prevent case advances and make Scientology fail in all directions. See how that could be?

So we'll shape this up. Now we've already had a breakthrough and the key rudiment is the present time problem. That is the key rudiment. This is a sneaky one, because it very often doesn't fall on first inspection. You say, "Do you have a problem?" Fellow has a very immediate present time problem, you get your instant fall. But you ask him if he has a present time problem, and classification and dispersal and "It must be something else", and that sort of thing enters into it, you see, and it isn't even reactively in view. He has no reality on his migraine headaches being a present time problem to him. You audit him a little bit, and so forth, and you suddenly are facing a long duration present time problem that wasn't really there before.

And on a little inspection of present time problems as you go along, you suddenly start finding out why this case hasn't been snapping and popping. It's because he's just getting a reality on the fact that he does have a problem. And this other factor enters in and this is an interesting factor. This is probably a sneak limiting factor on all cases. The pc goes into action
by reason of auditing, and being now in motion on this planet, accumulates problems, and is 
now being audited with present time problems. Do you get the idea?

Audience: Mm-hm.

All right, sitting there quietly in the corner like a mushroom, he didn't accumulate any 
present time problems. You audit him, he gets up a little bit, he goes into motion in the soci-
ety and you have a universe absolutely triggered up to furnish more problems than you can 
easily count. He gets a whole bunch of problems, and then his continued auditing, then, is 
auditing against these new present time problems and so he doesn't continue to make a case 
gain and you get into a grind.

In other words, all the auditing benefit he got was enough auditing benefit to pull him 
up into action. And I've noticed it now for about thirteen, fourteen years, that one of the pri-
mary characteristics of a case gain is the person going into action.

See, I've tried this business of just sitting in an ivory tower and processing people end-
llessly. Didn't work well, because I kept losing everybody. See, they didn't think there was any 
game, and there was nothing doing, and it was just Ron, he was supposed to do these things 
and he did them. And then they went out and they got into action, and they'd go over the hills 
and far away.

And I'd very often run into a case that I couldn't complete. Fellow was now too inter-
ested in life and he was getting going in all directions and so forth. Well, it's just as well that I 
didn't continue to pressure auditing as far as that particular person was concerned, because I 
would have been auditing uphill against all these brand-new accumulated present time prob-
lems, don't you see.

But where you continue to audit somebody who has gone into motion in life, you are 
probably auditing up against new present time problems. So the cycle that you could expect 
on present time problems is, as the case went along, he would get more, not less. You could 
expect as auditing continued, if it were being successful, to run into not just more and more 
withholds – which you know he comes up to the responsibility of knowing he's withholding – 
but this other thing: he accumulates and has in a session, more and more present time prob-
lems to handle.

So you're liable to get some cyclic aspect. You're liable to get a cyclic aspect of a pc 
who is relatively ARC breaky, and it would look like this: You audit him up the line and then 
he goes into action and he gets a lot of new problems, see. And then we have some ARC 
breaks of some kind or another and his auditing ceases. And then these settle out, don't you 
see. And he gets – and then we audit him again and at the time we pick him up for auditing, 
why, he doesn't have many problems because he's not doing much, you see. And then he 
moves up into a bunch of present time problems and then he ARC breaks, and then we get all 
ARC busted in the sessions, and then he knocks off auditing, don't you see. Only he's not 
crawling up three inches and falling back one, he's crawling up two inches and falling back 
two inches, and crawling up two inches and falling back two inches, just endlessly, you see. 
This would be the way it would be. So that is probably the sneak limiting factor on cases. 
That's a sneaker.
It is your very auditing gain which brings the pc new present time problems, because going into motion of course in this universe, he accumulates more present time problems if he is in motion. He was all right as a vegetable; he didn't have any. It's true, too! He didn't have one!

We've run into somebody who was on a pension or who was getting a disability payment. And if we'd cured the disability payment he would have had problems, you see. So we cured the disability payment and then all of a sudden we had an ARC breaky pc and we'd lose him as a pc. You see, it looked like because we'd gotten rid of his pension, you know, he was upset with us, or that he wouldn't give up his bad heart, or something, because this'd mean he'd give up his pension, or something. So auditing sort of stalled there someplace.

Well, actually he had everything taped. Here's what really happened. He had everything taped. Life was absolutely by the square, diagonal, and perfect circle. You see, at the first of every month he drew a check and he went home and read the comic books, or whatever he did, you see. And this was all that ever happened. All that ever happened. He just went through this cycle. And now all of a sudden, why, we move him up the line, he goes into a little more action, and as he goes by the comic bookstand, he makes – a triangle is put into his life, you see, he walks by some girl's house and sees her. That's guaranteed to give him problems! [laughter]

And then because we've been running a quiet preclear who didn't have any problems, we then, of course, don't expect to have a pc who does have any problems. So we are a little bit taken by surprise. So therefore, we are lulled into not looking for them. So a little datum for you, as you go by. Probably you – not a surgically important datum, but one that's well worth noting is, as auditing progresses there are two tests of progress, independent of all other tests, which an auditor can note. Does the pc have an increasing number of withholds? Does he have new withholds on the Security Check? That's a very good test.

If you give your pc a Security Check and you went through it all very, very nicely, even though it took quite a time, and there were – oh, seventy-five percent of the questions had no fall on them. And then you gave him another Security Check and seventy-five percent of the questions had no fall on them. And you gave him another Security Check and he had no withholds of any kind, watch it, because this boy is not getting better. Betterment is represented by increased responsibility, which brings about new withholds. And what you should finally work up to on a Form 3, really, is every question live, particularly the way you're running them now. You see, they go on the whole track.

You mean to tell me – do you mean to tell me – are you actually willing to sit there and tell me that in the last two hundred trillion years you have never committed any single one – or is there one of the crimes, see, that you haven't committed that is listed on the Security Check, you see? Well, I doubt it. I doubt it. I'll go into doubt for you about that. [laughter]

And the other one is, an increasing number of present time problems which have to be handled at the beginning of session. Those are the two: Increasing liveness of response to a Security Check and increasing liveness of response to the question, "Do you have a present time problem?"
Now, there is another factor which mitigates the horrors of that exact situation. And that is as the pc increases his ability, he blows these things faster. So although you have more by maybe triple, you have less time being occupied because it only takes a quarter as long to clear them, you see. So if he's making progress at all, they clear faster. So that would be another little cross-check. He has more present time problems, he has more withholds, and they clear up faster.

And if that isn't happening to your pc as you audit him, then you're probably auditing a pc with the rudiments really wildly out. There is something wildly wrong in this auditing session, and the most wildly wrong thing there can be is just wildly out-rudiments. Simple. Rudiments aren't in. Pc isn't making progress – rudiments aren't in.

You're dealing with processes today which can only be stopped by the rudiments. And the only thing that could happen is that the rudiments aren't in, that's all, or the pc didn't report for the session, or the auditor isn't giving one.

Now, on the general subject of auditing, an auditor who expects the pc to be doing something besides being a pc, of course, is inevitably in trouble. If you expect something else of the pc besides pc-ing, you of course, are in trouble. It's like auditing somebody who is supposed to be doing the cooking at the same time, you see. And you have to – this is an odd beingness to grant and it sounds very difficult. It sounds very – it doesn't sound difficult, it sounds Simple Simon to say that this is a beingness that has to be granted.

But an auditor, in running a session, has as one of its essential parts, granting pc beingness to the pc. You know, the auditor is not willing to have a pc so much as the auditor is willing for a pc to be sitting there, you see. Willing to make no demand on the person sitting opposite him beyond that of being a pc. And if you check it over you find out some auditing difficulties you've had in the past very possibly may trace to an expectancy of the pc being something else beside a pc.

Now, all a pc is supposed to do – there isn't any such thing as laying down a code for a pc because he's just a pc, but actually what does a pc do? Well, a pc does the session which the auditor is auditing. You see, he does the session. He does what the auditor says, and he answers what the auditor says, and so forth. This is what the auditor expects of him. We're not laying restrictions on the pc. But this is what you as an auditor expect of the pc; that he follow your auditing commands, that he do the things which you said, that he furnish the information which is required of him. That's what you're demanding of him.

Now, if you grant this beingness of being a pc to the pc, and that is all you expect him to do, why, you will find out that your auditing enormously simplifies. Because you, then, don't expect him to volunteer information, or be a walking encyclopedia of something or other, or tell you if something is going wrong, or something. This is nothing. This is no part of his bargain. It's not up to him to tell you this thing is going wrong. You see, that's up to you. It's up to you to find it out. You've got a meter and you've got your pair of eyes and your observation and the pc, types of answers. You've got innumerable ways to find out. But it isn't up to him and there is no rule anyplace that says he has to tell you what to do. Nor is there any rule of telling you what is happening, unless you ask for it.
In other words, it's just grant the beingness of being a pc to the pc, and he's sitting there being a pc, and that's it. You don't expect anything else of this pc but to answer your questions and to furnish information, that is, answer the questions and follow the auditing commands and stay there in-session and do what you say. That's all you expect of the pc. Now, if that's all the beingness which you're granting, and that's all you expect of the pc, you see at once that it is necessary for you to find out what's going on, because there's no responsibility on the pc's part to tell you what's going on. Got the idea?

I notice you're looking at me a little puzzled, but I think that's because you're not puzzled, it's you're just digesting a fact. I wonder if you've ever expected a pc to be something else beside a pc. At any time have you looked to a pc to be anything else but a pc, while being a pc from the beginning to the end of the session? Because if you have, I will guarantee that at that point your session broke down. In some mysterious way it would break down.

Now, Scientologists are very prone – understandably, and nothing wrong with this at all; me too – prone to run a big ought-to-be. Well, run an ought-to-be on anything under the sun, moon or stars. Run it on the revolutions of planets, the evolutions, so-called, of governments, or anything else. Run any kind of an ought-to-be you want to, except in an auditing session. See, just delete that ought-to-be out of the auditing session and you'll be much happier.

I know, because – I know this personally, you see, because you run a horrendous big ought-to-be on me. I'm the most ought-to-be'd character. [laughter] It's marvelous! It's absolutely marvelous! And I'll tell you, if I was no saint, you're going to make me into one! [laughs, laughter]

Anyway, an ought-to-be actually doesn't belong in any part of the auditing session. It's like the Upper Indoc student who was saying, "Well, pcs don't act like that, so therefore, I shouldn't be doing this wrestling around the floor", don't you see. Well, a certain feeling like that could get into a session, you know. There are your horrified aspects. Sometime some pc comes up with a string of withholds that would lift the hair of a priest, you know, with all they listen to. And "Coo!" you know, you say.

Well, you're actually running an ought-to-be. You say, "This person ought to be a well-disciplined, well-behaved person, and should have been well disciplined and well behaved for the last two hundred trillion years." Well, if that's the case, how the hell did they get in the pc's chair? [laughter] And this ought-to-be is joined up with a "probably-is". It's not only an ought-to-be, but there's also a probably-is. You have a supposition about this pc and then you operate on that supposition. And this supposition, of course, is liable to find you way out in left field, or it's liable to find you sailing without sails in the middle of the Antarctic. You're not quite sure what happened to you or how you got there.

Give you an example: Perhaps, two weeks of auditing were wasted on a course once, on a dear lady who was the most disarming-looking probably-is you ever saw. She was a real probably-is, you know. Because she looked like a dear, sweet, unassuming lady, just the very kind that you would cast for "Aunt Mary" in some super-saccharin play of 1900, you know? Just marvelous! The most marvelous casting you ever saw in your life, you know. And every-
body for two weeks audited her that way. And it just never occurred to ask her for any blood
and guts. Most marvelous thing you ever saw.

And when the curtains finally fell on this particular case, an auditor had just simply
become sharp enough to go past the probably-is, you see. And instead of buying this mock-up
complete as a package, noticed that all of the efforts to get this person to improve in any way,
shape or form were all failing, so there must be something else there, and began to really
sweat over this case. I think Mary Sue was behind this push.

Get some of the withholds off and, of course, this dear, sweet, perfect casting for Aunt
Mary had made a specialty for the last fifty years of stealing everyone's husband that could
possibly be stolen, and engaging in nothing per se but flat-out adultery in all directions. And
there are probably something on the order of four hundred different incidents of this particular
character on this case. [laughter] It's marvelous! When they finally got that Security Check
going, man, it went like a prairie fire! This read like something "Bouncing Betty the Gun
Moll", you know?

And I remember another one in an HGC one time, and they had looked in vain – this
was when we were doing dynamic assessments – and they'd looked in vain for any kind of a
terminal on this lady. And she was dear and she was sweet and she was everything, but she
was a rough, tough space commander. And that was her valence. And for some reason or
other when people get into the position of the loneliness of space, they tend to keep the va-
lences. Because of the coldness of space, and that sort of thing. But how about the loneliness
of space, and then the isolation of command added in on top of this, you see. And that really
makes a honey!

But everything about this case belied this valence. There couldn't possibly have been
any such valence of any character whatsoever. So nobody looked for it. And I'm sure she
must have said it. I'm sure that meters must have said it. But nobody could believe it. Don't
you see? This was a rough, tough, blood-and-guts, bucko master, you know. Why, she proba-
bly made Captain Bligh look like a patsy! [laughter] But the only role any auditor could see
her in would be making cookies for the kiddies in the neighborhood, you know? So they just
bought the mock-up and never asked for anything else.

Well, I'll tell you, if the mock-up is factual, and the case isn't advancing, don't blame
Scientology, just blame the estimate of the situation. This (quote) "factual" presentation must
have some fantastic unknowns concerning it which must be in wild disagreement.

Now, for instance, I'll give you an idea here in technology, how wild a wild disagree-
ment can fail to resolve things. Jealousy immediately and at once must have to do with the
terminals of men and women. Because men and women are jealous, obviously, so if we run
men and women we solve jealousy. That's for sure. Only it won't. So it must be something
else.

Cases resolve on the isness of the case. No matter how hidden it is, it's still the isness
of the case, not the might-be's, ought-to-be's or probably-is's. See, it's the isness of the case.
And the isness of the case must be totally unknown to one and all, if it fails to resolve at once.
It must be just totally unknown. It is not what the pc is telling you, if the pc is making no pro-
gress.
If the pc is sitting there saying complain, complain, complain, complain about this, that or the other thing – his lumbosis is just killing him and you handle his lumbosis, and his lumbosis is just killing him and you handle his lumbosis, and his lumbosis is just killing him and you handle his lumbosis. Well, now you've bought one of these probably-is's, you see? You said it's probably his lumbosis. But obviously, if you haven't cured his lumbosis don't blame your auditing skill, just blame this one fact alone: You haven't gotten down to the isness of the situation, that's for sure.

Let's begin a very tight series of questions that isolate what this is. Is it lumbosis or what? This person says to you all the time, "My feet are cold, my feet are cold", so you audit him for cold feet. "My feet are cold", so you audit him for cold feet. He comes up with this problem: cold feet, cold feet, cold feet, and you keep auditing cold feet. And I can tell you by actual test that you could do that for seven years. I know such a case. You could do it for seven years without ever making a happy pc or getting much of a gain. And we must assume after a while that it isn't even cold feet. We have to assume after a while, it just isn't cold feet. Because we're not auditing the isness, see. We must be auditing something else. We must be auditing some kind of an alter-is of some kind. If auditing cold feet then doesn't resolve the pc's cold feet, that he's complaining about, then the pc doesn't have cold feet.

What does the pc have, for pity sakes? So your line of questioning should go in on the line not, what makes cold feet, cold feet, cold feet, cold feet. Your line of questioning should go in on the basis, "Just exactly what are you complaining about? What is the isness of it?"

And you generally find out, well, it wasn't cold feet anyhow. The person just said cold feet, and really it isn't cold feet. It's because they burn all the time, and it isn't his feet, it's his ears. But he's afraid it'll go into his feet and so forth, but that isn't what's really wrong. It's because of the disconnections of the spine that they're liable to cause cold feet. Because you can't get circulation in the feet, you see, if you have difficulties with the spine, and that sort of thing. And you get right down to it, and you find out it's – they're afraid they have a disease. And that's the isness of the situation. How fascinating! Yet they were complaining about cold feet. You get how far afield this thing finally went?

So your test is simply this: If something isn't resolving, you haven't got the isness of it. It's just, if a case isn't going Clear, the first isness of it that you would test is the session. You wouldn't be worried so much about the valence before you had the session straight. Got the idea? You got to have the session. That's the first isness, and the next isness are the rudiments, and the next isness after that would be what you're addressing in the case. And those would be the isnesses in more or less order of importance.

Now, if you've got in the isness of the session, and you've got in the isness of the rudiments, and the person continues to complain, and you continue to try to help them with a certain (quote) "isness", it's just a "probably." It is never it if isn't responding rapidly. It is some other isness. Because you're looking at an alter-isness of some kind. So if the valence is wrong, well, it's wrong, that's all. Find the right one.

The most problem you're going to have with a case is going to be in the realm of the long-duration present time problem. And that is going to be the most suspect as far as its isness is concerned. Is that the problem? And the best test is, if it doesn't surrender rather rap-
idly as a problem, then you haven't gotten the pc to state the problem. That isn't what the problem is. In other words, it isn't necessarily true that you are handling it all badly. It just might be true that you are actually handling something which isn't there. And that something else is there to be handled, and you just don't happen to be handling that. But this isn't a good enough reason to change processes.

We now have a test that tells us whether or not a process is working. Anything aside from two-way comm which is totally limited to just asking — this is the three things I gave you yesterday — it's just you say to the fellow, "How are you doing?" and "Tell me", and "What is it?" and that's the end, you see. There isn't any more to that. You can ask those many times, repetitively, in numerous ways and so forth, but that's the end. You're not running anything. Anything else is a process.

So don't try to say you're two-way-comming somebody's problems out while you're asking them to describe the problem, because you're running a process called "Describe that problem to me, please. Thank you." Got it?

You say, "Describe the problem." You would say — you can ask a pc, "Well what is the problem there that you're worried about?" And the pc says it's so-and-so and so-and-so. And you say, "All right, I will take that up", or something of the sort. You're right on the border between two-way comm — and you're still safely inside two-way comm — and running a process. And that's where the border crosses — right at that point. Because if you once more say, "Tell me the problem", you're in a process and you're committed to flattening what you've started. And the moment you leave two-way communication you are committed to flattening what you begin whether you began it in a process form, Model Session, or not. If what you began produces tone arm motion, you're going to have to run the tone arm motion out of it, whether it is a rudiment or anything else. You got it?

And therefore, you should not be very adventurous about what you begin. You better get a good grip on what you're going to start before you start it. Because the careless woofity-bap launching madly into — . Well, the guy says, "Well, I'm stuck in — I'm stuck in, uh — I'm in — stuck in this, see, 'Mother'. It's all about Mother. And I'm stuck in this about Mother."

And you say, "Well, is there something unknown about that?"

"Eh, yes, as a matter of fact, yeah, I never knew my mother." And needle moves.

And you say, "Good. Is it all right if we go on?" Boy, have you goofed! Oh, God! That is a goof, you know! Something on the order of the biggest British dreadnought firing on Windsor Castle, you know. That is a goof, man! That's shame, blame, regret.

I used to know this, that you could run three commands of a process without getting into serious trouble. But that was yesterday's processes! Today's processes commit you, right now, with the first command because they are hot. They are hot. You're auditing with sabers and it's hot. You start something — finish it. Don't go shifting it off. And if you find yourself in the unlucky position of three days later still running, "Which side of a girl is up? Thank you", [laughter] just look back at that moment when you unluckily started it. That's your only choice. Your only choice is to complete what you begin. Otherwise you leave a pc with unfinished cycles and these begin to hang up and make auditing itself a problem.
Now, when there's too many unfinished cycles on a case you've got the remedy of Prehav 13. You can take auditors and that sort of thing, some such generalized term, do a Terminal Assessment of some kind, run them on the Prehav Scale. That's got a liability, too.

Supposing you only had four levels live on the Prehav Scale and you decided – you know, and you were assessing auditors. You only had four levels live, and then you run "Fail to abandon." "The auditor failed to abandon the case?" "What auditor didn't abandon your case?" "What auditor did?" you know, 'What auditor did you fail to abandon?' you know, and back and forth and we got it all set. And we run that kind of flat and there's no more needle action because you run those out on needle action, and then you assess again and you have seven levels live. Where do you go now? What do you do now?

Well, this is the one exception which I will give you. You get off of that train even though it's going 125 miles an hour, you hear me? You just get right off of that train. You go down to the bottom step and throw yourself into the brambles because that's the time to get off! Because obviously you are running a terminal which is in wild disagreement with the pc's case and you are assessing up the whole Prehav Scale. And if you continue to do that on your next assessment – having run "faith in auditors", – on your next assessment you've got twelve live – twelve live. And if you ran it again now (this is just a funny peculiarity, you see), and you ran serene, "What auditor was serene?" and "What were you serene about auditors?" and so forth, you're going to have twenty live – twenty live levels.

Well, don't get the whole Prehav Primary and all the Secondaries live before you find out that it didn't pay. You get it? Because the difficulty with running rudiments, and running random processes of any kind whatsoever, the difficulty of it sums up only and totally to this: If they are in opposition to the pc's goal and terminal setup, the case will not progress at all.

Now, that's very interesting, isn't it? So that any process that you adventured upon in the rudiments, any process that you adventured upon to straighten out the pc so he could be audited, any process that you adventured on, if it happened to be counter to the goal and the terminal of the pc, of course was something that is better deserted fast. You got the idea? So it does have that reserve on it.

In the first place you're trying to set up somebody to be run on Routine 3. There is no other clearing process, you might as well make up your mind to it, that is broadly working. I can think of several processes that would undoubtedly clear people and all that sort of thing, but these are not on the assembly line, and remember these processes in the hands of other auditors have not cleared people. So you are left with Routine 3.

So the job in running anything and getting the pc into session is just getting the pc up to the point of where he can be assessed and run on Routine 3. See, that's all you're trying to do. So all other actions are preparatory to this action, because that's what's going to clear people. And as long as that one is followed out and as long as you eventually get up to Routine 3, and as long as you get Routine 3 well done, you're going to clear people. And anything else is dross. It could be thousands of hours of dross, and it could all be entertaining, but it would not resolve the case or produce a Clear.

It could cure psychosomatics and it'd make bank managers into bank clerks and you could do almost anything. Make janitors into presidents. You could do all kinds of things with
These things, you understand, and have – rather spottily and sporadically, because sitting there all the time is the goal and valence. And it's the valence situation.

So, get a good reality on this Routine 3, and get a good reality on where it goes and what happens and what stops it from running. And of course, what stops it from running is basically the pc, before he's audited, is not in-session. So you've got to get him into session, you've got to have a session, you've got to have a pc, you've got to have your rudiments in and the thing well straightened out, and then you've got to do a Goals Assessment, and then you've got to do a Terminals Assessment, and then you've got to get over there to the Prehav Scale, and you've got to run it. And doing anything else, skip it!

Anything which you do – I can tell you bluntly now – anything which you do which is not contributory to completing Routine 3 is a waste of time.

Now, there is only one process type and class which does not violate the goal and terminal and Routine 3. There's only one that does not violate it, and that is Routine 1A which is very, very contributory to it.

Now, there is another one which probably won't, and which runs on very low-scale cases, and that is Routine 1. And there's another one which won't get you into too much trouble, and that is Routine 2. And that gives you your total bag of tricks. And there's the total bag of tricks. And beyond that there is none.

So you got Routine 1 – runs very low, and probably doesn't mess up somebody too badly as far as their goals and terminals are concerned, and certainly progresses them, and is very slow, and it's the only thing that you could run on an unconscious person, and a lot of other stuff. This pc won't talk to you and the pc can't be put in-session at all. Well, you got Routine 1. And it's long and it's arduous and it's hard for auditors to do, but it is successful and it shouldn't be thrown out of the bag of tricks. It's too good. It probably won't interfere with the goal and terminal.

Routine 2 – well, you can normally get away with that. You can do various broad general runs on the case and you're normally running against the terminal. Think this is quite amusing. And you're sort of running the terminal blind. You don't know what the terminal is, and yet you're running the case anyway. And that's very functional. There's nothing wrong with doing that. But it certainly is no substitute for finding the goal and running – and the terminal and running them, see. That's no substitute; there's no comparison. It improves your eventual run, but not to the degree that you might think it might. You don't lose. You don't lose on it. That's about all you can say about that.

Then you've got Routine 1A. And Routine 1A is the one thing that will not interfere with the Goal and the Terminal Assessment, but will improve it enormously. Routine 1A. This also improves the living daylights out of your rudiments situation. And if your rudiments keep going out, why, you had – really haven't got much of a choice, except Routine 1A, that's all.

Routine 1A processes could be entered in upon the first time that the pc is found to have a present time problem that didn't clear with the three types – questions of Two-way Comm. You know, all right, Routine 1A, that's it. Well, you'd never get in any trouble if you
did that. It's a rather arduous look at the situation. Then you bring up Routine 1A to a flat point and twenty-five hours later continue on to the point of asking, "Well, do you have an ARC break? How do you feel about my auditing you?" See. Twenty-five hours later we get to that rudiment level. You get the different look at this situation. Never did run a session on the fellow. You're still there on the brink.

Well, that would certainly be a safe way to go about it. And I can tell you if you did this you'd almost never have an ARC broke pc. It would be a thing that would become very foreign to you. Somebody doesn't have any ARC breaks, auditor. Well, obviously if this auditor never had an ARC break with the pc, the pc never ARC broke on the auditor, you'd have to assume about the auditor that the auditor took care of every problem that came up. See, so therefore the pc was very solidly and always in-session. You see how this fits together as a pattern?

Well fortunately, it does fit together, which is quite remarkable in itself. That's interesting, isn't it? That there is a road out. That's what's interesting, that there are some blazes on the trees. And of course, these blazes now – there's getting to be a pretty well-trodden path past them, and it leads straight out into the clear and has been doing so, consistently.

And picking up all of the elements of the, oh, God, hundreds of thousands of elements, and millions of them perhaps that I've reviewed in the past thirteen years that just about sums it up. And as far as processing is concerned, those are the safe things to do and those are the various things which are reliable, and those are the things which get you there, and those are the things that produce results.

So this leaves you with what? This leaves you with the fact that on anybody, anyplace, at any time, you could run and flatten any Problems Process – great security. Never had any difficulty holding them in-session or anything else. Flatten the Problems Process, just flatten it, and run it out. Unless you do something really wild, like run two commands of it and skip it or something like that, you know. But you run – just run it and start your session, "Do you have a present time problem? What was that?" Fellow says, "Well ..." You say, "All right, good. We're going to run a little process now." And you just pick up one of the processes from Routine 1A.

All right, your dissatisfaction with trying to clear rudiments would evaporate if you laid down this particular rule: that there were no rudiments processes. That's fantastic, isn't it? If you just said, well, there were no rudiments processes, when you got the fellow up to a rudiment and so forth, then you audited the case toward Clear, and that wouldn't be no waste of time at all, would it?

Well, how to do that? How to do that? Well, that would be the way to do it. You'd start the session. You'd say, "You have a present time problem?" You'd find the guy has got a present time problem. Well, you've had it. Now let's just go on with Routine 1A. Eventually it flattens – twenty-five, fifty hours later it flattens – and that's out. That's gone now, you're not going to have too much trouble with problems. Now you say, "Is it all right if I audit you?" It sounds kind of odd to introduce it at that particular stage of the game, but that's actually where you've arrived to. Guy looks up for the first time, you know, and he says, "All right to
be audited – ? Well, what do you know? I thought it'd be a problem, you auditing me and it isn't", and that's that. So that clears that rudiment. Got the idea?

All the time you're doing this however, you could be clearing Security Checks. Takes care of a lot of ARC breaks and withholds. So a Security Check could be done at any time and Routine 1A could be done at any time, and how to keep out of trouble, well do 1A and Security Checks. See? And pretty soon you can't even squeeze anything out of the E-Meter on the subject of problems – in all of its various ramifications and unknowns and everything else that goes with it – you can't squeeze a yip out of the E-Meter. The guy is consistently sitting at the Clear read and the needle isn't clear, it isn't swinging – don't expect that it will, either – but it'll be fairly loose. There it is. You say, "Well, it's time we took up me as an auditor." Might be adventurous up to that time, mightn't it?

Sort of non sequitur. The fellow's sitting there in this little cage of problems, you know, with all the demons of existence poking despatches and sabers and small atom bombs in through the bars and this disrelated item suddenly emerges: "Is it all right if I audit you?"

And this just looks like another despatch, or another saber, or another small atom bomb which is shoved in the cage, don't you see?

So if rudiments are that important, if you're having trouble handling rudiments – which is obvious – all right, just take a broad, long look at the rudiments. And say, "Well, the rudiments aren't three seconds long at the beginning of session, the rudiments are fifty hours long at the beginning of session" and you'd certainly have it. And your dissatisfaction with a bad rudiments process, such as Responsibility and so forth, would vanish of course, because you're going to run the best processes that can possibly be run on problems in general. And you've had it. There it is. You're not going to have any trouble with that rudiment afterwards, I'll guarantee. You're not going to have any trouble at all with that rudiment. This fellow's up to a point where he can confront unknowns and wrap problems around his heads and give people problems and take problems, and he's no longer sitting in this cage, don't you see. He's no longer in a totally interiorized state, even though this has been run against his valence.

Well, you see, the valence – the trick behind this is – the valence was adopted to solve a problem and therefore any valences the person is sitting in tend to resolve when you lessen his concern about problems and you lessen the tension of the valence. You don't even have to know the valence to do this. See? All you have to do is lessen these things.

It's very funny. I wrote over to Washington from London, I think, in 1956, and told them to lock it up in the safe that the road out certainly contained "problems", and that was the most reliable road out on the subject of it. And that's just a valuable piece of technology. Probably still in the safe in Washington. But anyhow, I just didn't want to lose sight of that one because this obviously measured up to the various things that a person had and which way they were going.

All right, it is very true that it is very difficult – very, very difficult – to handle problems at the beginning of a session and then go on to something else. This is true. Unless you
can say to the pc – if you can't say to the pc, "Well, tell me about it", "What is it?" and "How you doing with it now?" You know, that sort of thing. And you ask him, "Do you have a present time problem?" and look at the meter, and there's no response on the meter whatsoever – unless that condition could occur, then if this can stop the whole parade and if this can submerge the goal and if this can submerge the terminal and if this can make assessments impossible and if you can waste weeks on doing a Goals Assessment, and all this thing, why then, we have to come to the inevitable conclusion: If it was that important, well, we'd better roll up all of our very best guns and just take care of it right there. You know, just the whole thing.

And therefore if the pc begins to have a large spate of problems, or a pc apparently has problems, or there's bunches of problems around, or if a pc after being audited for a while all of a sudden starts to run into lots of present time problems, you know, he goes out and gets busier. Well, you go back and flatten 1A. How long does it take to flatten 1A? Oh, it's not – it's been taking about seventy-five hours, fifty hours, thirty-five hours, time periods of that character. Yeah, but look, all that time is saved off the assessment. And if you're going to waste a hundred hours on assessment, you certainly better spend fifty hours on 1A. That's all that amounts to. And then you know where you're going and you have a certainty on it and you're not fumbling with the dissatisfaction of running an inadequate process on present time problems. Look good?

Audience: Yes. Yeah.

All right. That would be a way to approach this situation.

Now, we get up to the auditor, as the second rudiment. And of course, if the fellow can have problems and he isn't going to have a lot of trouble with problems, certainly ninety percent of what would be charged up on this particular auditor would have vanished by that time. Certainly, even though the auditor's been auditing him, it'd just be vanishing all the time. But there might be a little bit left, so you would take up the subject after 1A; you could take it up, and hit your next rudiment. Do you see? And you've already been hitting withholds, and so forth, consistently and continually. And in that you should be running the Havingness and Confront Process of the pc, you have been reme defyng the fourth rudiment all the time. Oh, I haven't necessarily got the sequence straight; I'm talking about end rudiments. But you've been handling this so that's out, so you haven't got to worry about that. So it looks like these things could be handled rather easily just on their own ground, but given an importance.

If these things are that important to a case, then they are all of them worth handling. If you find a fellow who is flat on problems, he isn't going to have much trouble with the auditor. And also an auditor who's been sitting there pulling withholds off of him, he's certainly going to be willing to talk to the auditor, so that's solving that, too.

So you could go at it in these various ways, and you would wind up at the other end with your rudiments in. And I would say only after you've beaten them totally to death – since we've been having trouble with this. I haven't been, but you have. And let's look at it on the reality of the situation and not curse and scream in our beards and break the china, and so forth and say, "You aren't doing your jobs." Let's get practical about the thing, and let's just take up rudiments as a preliminary to clearing and say that rudiments are not a preliminary to
the session but a preliminary to clearing and just upgrade them. Until such time as all rudiments are in and will stay in, and so forth, why bother to assess.

Now, as far as somebody staying interested in his own case is concerned, you can be absolutely certain he will be on Problems, because that's what's got him mainly interiorized. So that'll answer up, as well as assessment. This is a way of approach, isn't it?

_Audience: Yes._

All right.

These things, the whole subject of auditing, is a subject of practicality. It is not a subject of theory. It is what works. The philosophers of the ages had been trying to drive shiny coaches down nonexistent boulevards. And the screams of the dying multitude were dinning in their ears, because their philosophies didn't work. But they were pretty. There's no doubt about it – no doubt about it. We should take our hats off to Nietzsche. It's certainly pretty – until you go over to Germany and France and start looking at all the graveyards and things like that. You'd say, "Well, that isn't quite so pretty, you know. Looks messy!" And you start looking at the pillboxes that still are extant around Nantes, Nancy, and so forth, and you say, "Well, I don't know, they're not good architecture. There's something missing. There are no subtle curves. But it was awful pretty." Thus spake Zarathustra. [laughter] But he didn't give a damn whether it worked or not, you see. Never entered his mind for a split second. Workability, _pooh!_

The gorgeous example of the nonexistence of the eighth planet. For years! For years and years and years and years, the eighth planet did not exist. It had been observed in a telescope. It'd been plotted. People in astronomy knew its name, rank, serial number, mass, density, course and spin. But Hegel had said that there were only seven because seven was a perfect number. Beautiful coach! Lovely! Had big springs, so forth. Only the road it was traveling on was built on nowhere. And the end of the road went off to ignorance. There was no workability with regard to this.

Whenever you look at auditing, whenever you look at Scientology, you should just look at that one fact. Does it work? We have actually been condemned because we're interested in whether or not something works. And current extant philosophy knows this has no bearing on the situation whatsoever. It is a crude attitude. It is absolutely crude. I've had a person object to Dianetics simply because they said, "Well there was more to life than survival." Well, nobody said there wasn't! I certainly said it was a common denominator of existence. Yes, but they couldn't take Dianetics because there was more to life than survival. They liked to think that. They liked to think of this other, and also it was obvious that man was not good. And so of course that washed up the whole subject.

And you say, "Well how did you come to these conclusions?"

The fellow says, "Well, I just thought it over." He didn't bother to look at anything, you know. He didn't bother to go outside, open the door and take a look at the world. No, it was perfectly adequate, utterly adequate to sit there, you see, and have a couple of errant thoughts, be distracted by the ticking of the clock, and say, "Well, no. Well, I'd like to think of higher things."
Well, man has been very interested in thinking about higher things until he began to suffer from anoxemia. He's up there in the rarefied air. But it certainly has nothing to do with – well actually, it doesn't even have anything to do with man. I think it would be a sad day – I think it's been a sad day every time they've tried to connect ancient philosophies with man. They have nothing to do with man, they have nothing to do with life. They're just pretty.

The Greek, of course, in his terrific worship of the integrity or the thinkingness of man, himself went into a terrific figure-figure. And his various schools and so forth that he formed were all more figure-figure and more figure-figure-figure. And Greece lost her empire, lost this, lost that, everything was caving in in all directions and coming down. The Greek race was becoming less and less effective. Things were going to pieces. The Turks finally came in, took over the whole lot, burned practically everything, destroyed the Greek language, knocked everything all out, and Greeks still figure-figure – 1961, he still will figure-figure. It's quite interesting! Nevertheless he did have an idea that man was a subject of study. And to that we owe him some hat-tipping.

But I'm afraid I don't owe very much hat-tipping to a lot of these philosophers, because they would say that it was a total betrayal of a philosophy to alter anything in it that had been laid down. And I'll tell you, of course, that you're perfectly ... All you've got to do – all you've got to do – is make a Clear by some other route, which is workable and practical and other people can do, and that follows up to all the tests of Clears of course, and we'd abandon every trail we've got, you see, if that was much easier and faster. But it hasn't happened. Hasn't happened.

Thirteen years, everybody's had a large, wide opportunity – the last ten, eleven, certainly, they've had a wonderful opportunity to figure out brand-new routes, ways and so forth. And I've had them mailed to me and telegraphed to me and cabled to me in far parts of the world. And I've seen them on boards and fixed up, and they've been applied this way and that, but they didn't clear people. All right, right now we're clearing people so my whole attention is upon the workability of this one fact because I am a man of ambition. I am a man of very, very vast ambitions. And the vastest of my ambitions right now have this particular zone and area: is every time somebody walks in the front door of the Central Organization or up an auditor's front steps, that, at the end of the auditing he will turn around and walk out Clear.

That is a considerable ambition. And we are right there on the threshold of achieving that ambition. As a matter of fact we're more than on the threshold of it, we're actually taking the practical steps to effect that very thing. When we whistle up somebody from a Central Organization and say, "Come on in here", we're not kidding. And when I send a cable to somebody in some far place and say, "So-and-so is expected at Saint Hill", we're not kidding. See, it's not nonsense that we're talking, because that's what we want to have happen. I think that'd be a very interesting thing to have happen. And when you see these Clears, and they start into their immediate areas and they start polishing everything up and everything goes into action and everything's very busy and so forth – the horrors of the ancient philosopher. I imagine the man could have nightmares over this! He knows what a Clear is supposed to do, he's supposed to sit on a mountaintop and regard his navel. [laughter]
But anyway, we're interested, therefore and thereby and only, in the practical steps necessary to it. And my conclusion as of right this minute, is that if you are having trouble keeping rudiments in, in order to do Goals Assessments, and if you were totally capable of actually using up two or three months in trying to find somebody's goal, well it'd be simpler to get the rudiments in first. And it would be simpler and timesaving if each rudiment required something on the order of fifty hours and was simply taken separately, one after the other, and fifty hours were devoted to each one. It would still be a time economy. Because naturally at the other end of it you'd wind up with his goal, bang! Right now, you see. You'd wind up with his terminal, bang! Right now. You'd do his assessment, bang! And you wouldn't lose a single minute of his run. And probably if you took two hundred hours to get in the rudiments, you'd probably clear a fellow in five. You got the idea? I mean it's that ridiculous. And as I look at it, that is the practical way of approaching the thing.

So watch those rudiments and turn up that sensitivity and if your pc has got one consistently out, go back and flatten 1A. Okay?

*Audience: Mm-hm.*

Thank you.
All right, what's the date?

Audience: 24th.

Twenty-fourth of August, AD 11. And you better ask some questions... Come on, ask some questions. Nobody knows anything, huh? You haven't got a single question in your mind? Here you've had a whole rash of new data and there hasn't been a single question crossed your mind concerning any part of this. Yes, Kay?

Female voice: When you're running the Prehav level on the terminal, does the Confront and Have alone stabilize your person for Clear?

Mmm. When you run the Prehav on the terminal does the Confront and Prehav alone...

Female voice: No, the Confront and Havingness. Is that what stabilizes your Clear?

Yeah, but you've said the Confront and Havingness on the terminal stabilizes the Clear?

Female voice: No, when you're running the terminal.

Another female voice: When you're running the terminal on the Prehav Scale is it the Confront and Havingness Processes that stabilize the person?

Absolutely not. They have practically nothing to do with it. They just make it easier to run sessions. They just have nothing to do with it. The stabilization of a Clear consists one hundred percent of checking out goals, finding more goals, doing terminals lists (long terminals lists) for those goals, assessing the goal found – the terminal found on the Prehav Scale and trying to find the command for that and getting a command for that and running that level of the Prehav Scale. And when you've got that terminal flat, why, go back and check the goal. And if you can't find anything left of that goal, make sure that your rudiments are in one hundred percent. And then check it over again and go back to the original goals lists. Find out if one of those goals are now alive, try to get some more goals. When you finally got a new Goals Assessment clearing all over again, you find a new terminal.

In other words, you just do that same operation of Routine 3 over and over and over. You assess for goal, assess for terminal and run on the Prehav. Assess for terminal, assess for goal. That's all. Once you've got a goal, well, let's get every terminal that applies to that goal flat, as long as the goal itself registers.

I mean you don't go back and find a new goal every time you flatten a terminal. You go back and check the goal. The goal is still alive, you find a new terminal for it, and run it on the Prehav, see? It's just a continuous cyclic process. And anything else you're doing, such as running rudiments, such as running problems of any kind, and anything to do with Security...
Checks, anything like that is simply aimed straight at keeping the preclear in-session. And if the pc gets out of session, if the rudiments go out, if your Security Checks are not kept up-to-date, and so forth on the case, the goal will disappear, the terminals disappear, and the person won't go Clear. Then you get endless runs to Clear. Endless runs to Clear. And they all add up to rudiments out, rudiments out, rudiments out. And in case you haven't noticed, there are broader processes now for the rudiments.

One of the broader processes is at the level of withhold – the pc registers on withholds – you've got the whole of Security Checking. That vast panorama of action all fits at that level of the rudiments. And you keep the rudiments in, in other words. You keep them in. You keep them in, you keep them in. The goal disappears, you find out if the rudiments are in. All right, now see if the goal still disappeared. All right, if the goal hasn't disappeared – you flattened one terminal for this goal. Make sure those rudiments are in, in, in. Make sure that terminal is, is, is flat, and then make sure the rudiments are in, in, in, in. And then check the goal again.

And with the goal: All right, is that goal still alive? Find another terminal for it. If that goal is now gone and your rudiments are in, in, in, why, you've got to go back to your original goals list and add whatever goals now occur to it and do a new Goals Assessment. And then do a new Terminals Assessment. And then do a new Prehav level for it. And then get your command and do the Prehav level run. And there you go, you see?

It's just – the process of clearing somebody actually only consists of this and nothing more. It consists of getting a list of goals, and assessing that list to find one goal which is constant and continuous with the pc, which of course means that goal has to be run. So you take that goal, and you do a Terminal Assessment for the goal – the cause and effect end of the line – and then you'll find a terminal which stays in, in, in, in and doesn't go in and out and fluctuate around, but it's just in. And that is the terminal. And then you assess that on the Prehav Scale, and then you form up a command for that, and then you run it. And you run it until it produces no more tone arm action, all the while keeping the rudiments in, in, in, in. And you're all set.

Now that thing is finally flat. It doesn't respond anymore, you can't even get a fall when you mention it. It is all run off of the Prehav Scale and when that is finally accomplished then you'd better make a special activity of making sure the rudiments are in. But now, let's check that goal, find out if that original goal is still alive. If it is still alive and it still gets a fall then you had better do another Terminals Assessment, find another terminal for that goal, move the terminal found over onto the Prehav Scale. Assess on the Prehav Scale. Form up a command and run, run, run. Assess on the Prehav Scale, and run, run, run, and assess on the Prehav Scale and run, run, run. And then no more action for that terminal; now go back and make sure your rudiments are in, of course. Go back and find out whether or not the goal is still alive.

All right, you can't get a peep out of this goal now. Now make sure the rudiments are in. Now try and find out if you can get a peep out of that goal. No, you still can't. Okay. Now you've got to go through a whole cycle I've just said, once more. And you start in right there at the beginning and you find out whether or not the individual has a new goal that won't hang
up. And he does have, he will have, and that moves over into the terminal list and you get
your new terminal and then you move over into Prehav Scale, and it's just the same cycle over
and over and over – it's just exactly those steps.

Now, anything else, running Prehav – running a Havingness Process on the pc, running
a Confront Process on the pc, doing a Security Check, running problems, doing rudiments,
other things to keep the case running, anything that you do to keep the case running
and cleaned up and so forth, is totally and completely auxiliary to clearing. Clearing only
consists of Routine 3 and nothing else. And nothing else will make a Clear known to man at this
time except that exact process I just gave you. And that is really taped.

And the only thing that booby-traps that particular operation is, one, a bad command
of technology on the part of the auditor. That's the only thing that booby-traps it. If the auditor
knows his business, if he knows his TRs, if he can follow a Model Session, if he's willing to
run a session, if he's willing to flatten the processes that he runs into, if he can read an E-
Meter, keep these things going, so forth, the rest of this is just nothing.

Well, where the auditor has gaps and goofs, and where he's very, very poor on this, or
very, very poor on something else or where he isn't quite sure whether you read the sensitivity
knob or the trim button, you're not going to get Clears.

So all of these other things, such as learning how to do a Model Session, learning the
TRs, learning the E-Meter, knowing that when you contact processes you flatten them, and
on, on, on, on, on, on, everything that you learn about auditing – even going back to Axioms,
the behaviour of the pc, what are engrams, anything in Book One, anything in Scientology 8-
8008 – all these things are simply contributory things. And there aren't very many an auditor
today really has to know. He has to know his TRs, bang! He has to know his E-Meter, boom!
He really has to be able to make it talk Arabic, Greek, anything, you see, or Marcabian. Only
I notice that the Sullivan type individual tries to make it talk Marcabian, but it's actually just
talking Sullivan.

When you get into this kind of action, knowing these various things, and so forth –
those things known – now clearing works. And I can tell you right now that clearing works on
every individual, every person, man, woman, child. And if you could talk to the flowers it'd
work on that, too.

It hasn't anything to do anymore with case level. Has nothing to do with case level.
Not a thing! But it has everything to do with an auditor being able to run a session. And the
degree that an auditor can run a session, the excellence with which he can run a session, to-
tally monitors how fast and how many he will clear.

That's an extravagant statement but what proves it is this: I've been able to make
Clears on offbeat processes. There's a process way back ... You see, in vignette, doing the
Dynamic Assessment, doing the old Dynamic Assessment, and finding the terminal and run-
nig Help on it, and so forth, it got Clear – and as clear as Help would make anybody Clear –
those people who did have Help as a hot button on the Prehav Scale, see. That's how many it
cleared. That was right there. But that still depended very exclusively on the ability of the
auditor to audit.
But let's go back to the oldest clearing process there is, which is way back when, and that process is so esoteric, it can't be handled! Requires such as – insight, such sensitiveness and takes so damn long, and is so questionable and a whole bunch of things like this. It's like, well, building a watch in the dark blindfolded with a couple of elephant's feet for hands. [laughter]

It wasn't even very reliable, you know. But it's taken something on the order of all these years, here, of about – whee, it's getting something on the order of about thirteen years now, something like that, to develop technology which was handleable, which was predictable, which didn't require all these super-unknowns and this super-insight and all of that sort of thing, and to develop the auditing technology which we have today.

Now, the only thing that slows down clearing is the command of the auditor of that exact technology. And when I say that exact technology, I mean simply the ability to do the TRs, the ability to do a Model Session, the ability to handle an E-Meter and the incidental knowledge of doing a good Security Check, of running an assessment and that's it. You see, it just stacks up into that very small package – your importances.

And you possibly still have some idea of this vast panorama of unending sea of data going out in all directions that you have to know. Get rid of it. It's a very finite little area. And frankly, when you look over *E-Meter Essentials*, there are only two data missing in *E-Meter Essentials*. There are two data missing in it. One data is instant read – the difference between instant read and latent read, and which one you use (of course, you use instant read), and what it looks like and so forth. That's missing in there. And there's one more datum that is missing out of the E-Meter manual. What is it? It'd be fatal for me to say there was one missing and then not tell you what it was. It's something very incidental. Twenty minute rule? I don't think that's in.

*Female voice: No, it isn't.*

But otherwise it's a complete book. And we'll print up an errata sheet and paste that into the copies and so forth, and that'll be that. It'll be up-to-date.

All right, your TRs – they're all up-to-date. You've got them right here. Model Session, you've got it right here. As far as rudiments are concerned, you've got an awful lot of rudiments processes, but because rudiments have mounted up to such importance, we're kind of throwing them away, using beefier processes, giving the rudiments more attention, giving it more umph. And, once more, you've got those right on these lectures: 1A and Unknown. And actually you've had this data consistently and continually now since about the 10th of August – the tape series going right straight on through bout this "unknown," use of, in Security Checks, and all that kind of thing.

But that's just beefing up the rudiments, beefing up the rudiments, beefing them up, beefing them up, making them stronger and stronger and tougher and tougher. And then finally we'll get down to this kind of a desperation, I can guarantee you, that after you've got the most powerful process of Scientology to bear on the pc on any given rudiment, and when that rudiment is totally vanquished, then you assess, or something like this.
Actually, this amount of rigor is not necessary at all. It's precautionary. From – I am operating with you now in an unreality. That would be a withhold on my part to tell you otherwise, but I am in an unreality. I don't see how you can miss, you see. And therefore, I'm just making sure you don't. Only I am now something on the order – it looks to me as though from an engineering standpoint that we're taking this bridge, you see, and it's built totally out of concrete by this time, and it's got girders which had nothing but sixteen-inch thick steel, you see. And it's totally weatherproof girders, and these things are hung together, you see, with huge clamps. They're not even drilled to weaken them, you know. And this is going across this little tiny brook. [laughter] Isn't very wide, wouldn't hurt anybody to fall in it, but this huge, massive structure, you see, is going over there. And then the bed of this bridge, you know, is all fixed up with huge Roman-road-type construction, you know. Nine feet of ballast, you know, and then match stone and then match stone on top of that, and then we of course have put final, modern, hammered concrete in it, see.

And that's the kind of a bridge we've got, and I kind of feel like you're asking me to put up some staying rods to make sure the steel won't fall down, you see. And to repave this thing in some character with a thicker pavement, and so on. That's kind of the way it looks to me. I'm not running you down in any way, but this is the record that is being run up at the HGC from this unit and other classes and so forth. Apparently this is what it demands, don't you see.

Now, I'm trying to find these additional holes in the fence, where it looks to me like there aren't any, you know? I'm trying to find out where this bridge breaks down. It makes me feel as though you drove across a wide plain blindfolded, you'd run into this bridge; you just couldn't help it, you see. And then the bridge has got guide rods on the side of it that even though you hit at a slant you'd still go across it, you see. That's the kind of the way it looks.

All right, from this point on, we're superbuilding. Because I'll tell you this: Any one of you could run an assessment in two-and-a-half hours on a pc and find his goal and find his terminal and find his level on the Prehav Scale, see, right to the start.

And we're running a real goofy one right now. We're going to make a Clear for you. We're going to make Tinny-Tin Clear, little Quentin. And Suzie's busy auditing him for a few minutes each day. And this little kid, he's got his full goals list, amounts to about thirty. One of them is "to run a candy store" [laughter] and he's got the lot. And it's assessing right straight on out. And he's down – I think he's got about six, seven of these.

Female voice: Eleven left in.

He's got eleven left in on this list. It's moving on down. He'll do a Terminals Assessment. When we get a Terminals Assessment, going to assess it on the Prehav Scale, and going to run it, you see. His needle's loose. It's getting looser. You know. Well, of course, there's good altitude at work here and the rudiments are in, but that's what's happening.

That isn't being done as a show-up or something like that; it's just his turn to be processed. So instead of running him on CCHs or something like this or trying to straighten up something – nah! let's go for broke; let's clear him! Not take too many hours at it, either.
All right. Now, that's possible. That can be done. But, let me call this to your attention, it is – this is the controverting fact. It is not being done. Now, you can't argue with that, can you? Now, I could get down and scream and howl and beat the floor, and Hitlerize the room. But let me tell you something, that isn't going to do any good. That isn't going to do any good at all. That's in the line of reason, or something like this mounts up.

If you looked at it very broadly you could say, "Well, just nobody can audit." I mean, that's the first thing you'd say. "Nobody can run a session in the whole world, except just this little handful of maybe five," you know. Something like that. But that's an unacceptable datum that isn't true, see.

So it must be, it must be that there were some great big broad bugs on this, and the biggest bug – and I finally located what it was, a very simple bug – it's just the fact that the goal and the terminal easily disappear in the face of an out-rudiment. And I know what I have to convince you of, is what is an in-rudiment, see. You don't recognize a rudiment when it's out. And you think that this machine here is going to fall off the pins, and that there's going to be a neon light, which isn't in the machine, appear along this whole red band of the dial on an E-Meter. And it's going to appear on there, and it's going to blind you when a rudiment is out. Well, let me point something to you, there is no neon light back of that to do that, see. And you expect maybe a bell to ring in this thing or something, you know. But there's no bell in it, see. I've got to show you what is an in-rudiment. I know what my job is, you see.

Now, in addition to that, we've got to analyze why a pc doesn't stay in-session and why he isn't in-session. And what happens that he doesn't remain in-session long enough to be audited. All of this becomes a very important study. See, but it has to become one of these studies of adding the additional five coats of concrete to this already superpaved road, see. But it's got to be done, because there's obviously something awry here.

I know you can audit. I have no doubt about this whatsoever, and so forth. But I think what you don't do is recognize an out-rudiment. And then I think maybe you don't handle the out-rudiment. And then I look over our tools, and I find out the tools are rather inadequate, perhaps, for the handling of an out-rudiment.

All right, well, let's go for broke! Let's give you some tools that work, invariable, and that you have great confidence in. That seems to be a good solution, right? All right, so let's be able to set up a case at any given moment. And we at this moment do not care how long it takes you to clear somebody as long as you're progressing, see. We don't care how long it takes you to clear somebody, so long as you are clearing them. But we do care if you are auditing somebody and just wasting time. If the case is not advancing under your auditing, aw, that's just nowhere.

You see it could easily, profitably take fifteen hundred hours to clear somebody and you would clear somebody in fifteen hundred hours. Well, people would still work at it. They would actually still work at it and they would still go in that direction, if they were progressing all the time and all that fifteen hundred hours was useful auditing, don't you see, the case was making gains during that period of time. All right, that would be within man's finite limits of observation.
Well, it isn't anything like that. It is something on the order of about a hundred. See, we're dealing with about a hundred hours. If all the auditing is effective, you have a Clear in about a hundred hours.

All right, therefore, you can afford one hundred percent margin of error. You can have a hundred hours of wasted auditing and a hundred hours of effective auditing, and you're still going to wind up at the other end with a Clear. Well, now that's very well within your ability to deliver, don't you see. Only a couple of hundred hours.

All right, what we're chipping at now is trying to reduce off of the hundred wasted hours. That's what we're trying to do. Because the cases which you are auditing are making progress. But I can tell you now what is wasted. And perhaps you'd like to know that. What is wasted time?

Goals Assessments that go on and on and on are wasted time. You can just peg it down. Let's set an arbitrary figure, something on the order of six hours. If your goals, terminal, Prehav Assessment is requiring longer than six hours, then from the seventh hour on, including the seventh hour, is wasted. There's waste here. It's just being wasted. There's something wrong; your auditing was something wrong. It is not right. And the something wrong is, a rudiment is wildly out. So time from that moment thereon, that is just wasted time. It's just a waste of time.

I've got enough cases now and I've racked up enough cases and done enough observation and let enough people flounder long enough, studied enough graphs of the flounders, that we have proven conclusively that it is a waste of time to go more than six hours with a Goals Assessment. Interesting, isn't it? Beyond that point it's not therapeutic. Doesn't damage a case but it doesn't help anybody. It isn't advancing the case and the case is not going toward Clear from that point on. Interesting, isn't it? It's just not going toward Clear from that point on. That is a stall.

So, number one of your waste is excessive time consumed in finding the goal. Time is wasted.

All right. Next item of wasted time is running a Prehav level on the found terminal with the rudiments out. That is wasted time. Running it and it's taking too long to flatten, it isn't smoothing out, it isn't changing. You're getting a tone arm action, and so forth, but the pc is not coming up out of it.

All right, you can apparently grind one of those things forever. And I've got records on that, too. Because you're running the pc with a rudiment out. Actually, the terminal has disappeared, and you are not running anything that is real to the pc. It's just like the goal disappeared and you couldn't find it. Well, during the Prehav run, if the rudiments are out, the terminal disappears, and you're running nothing.

So you can go on and say, well, "How far over the hill would a little girl go?" and so forth, or whatever the auditing command is, "To leave home," or something. And "little girl" – "little girl" is the terminal, but the rudiments are out and this terminal is not real to the pc.

Just as it disappeared on the assessment, so, by out-rudiments, it can disappear during the run. Therefore, the Prehav run isn't biting on the pc because the rudiments are out.
There could be the biggest span of wasted time. Because that could go on forever, and the auditor is just hopefully going on auditing "little girl," "little girl," "little girl," "little girl." Great day! "Little girl" submerged back there in about the third hour of run. Auditor never sits there and says "little girl" to the pc and notices that there is no fall on the meter. What you're doing is running a Routine 2. You're running some kind of a Routine 2 with a wasted phrase in the auditing command now called "little girl." See how that would be?

Well, it's obvious – this is just extrapolation, but it's very logical – that if a terminal can disappear from the E-Meter read during an assessment because the rudiments are out, certainly rudiments out can make it disappear during a Prehav level run. That's obvious. If it can disappear one place, it certainly can disappear another place. And that's a good enough explanation to me, backed up by a bunch of evidence – not as solid as the first, but acceptable.

This will account for an enormous period of run on a terminal. Terminal long since ceased to be real to the pc. Not because it disappeared or was flattened, but because the rudiments are out. And you're not really running this terminal. So therefore you're not running the case to Clear. And the answer to it is, keep the rudiments in.

That – so those are the two biggest areas of wasted time in clearing. And they are both summed up to running with the rudiments out. So, when we keep saying rudiments out, rudiments out, rudiments out, well, we haven't described the reverse side of the coin. The reverse side of the coin is, of course, rudiments in.

What is an in-rudiment? Well, I saw an auditor not too long ago, had too much action on the needle at sensitivity 16, so turned it down to 8. And then asked several combinations of a phrase on withholds and thought this was all right. And was willing to leave withholds.

But the definition of in-session is this: interested in own case and willing to talk to the auditor. And of course "can't" was the missing – "can't talk to the auditor." This produced a very wild drop. But do you have a withhold from the auditor? No, pc didn't have a withhold from the auditor. Pc couldn't talk to the auditor. Why couldn't the pc talk to the auditor? The auditor wouldn't listen. This was a conviction and this added up to a "can't-talk-to-the-auditor," so obviously the pc was out of session.

So that's an out-rudiment, but a rather oddball out-rudiment, isn't it? Pc feels he can't talk to the auditor. Why? The auditor never receives a communication. So therefore it's a withhold. That's kind of a strange one, isn't it? See? "I can't say anything to this auditor because it doesn't matter. It isn't that I can't speak. It's that the auditor can't hear." So if you have an "I-can't-speak," that would be a different kind of withhold, too. Well, "Do you have a withhold?" Well, that therefore, is not an adequate guarantee that the rudiment is in. Because that rudiment guarantees talking to the auditor. Doesn't even guarantee willing to talk to the auditor, but it has to do with the ability to talk to the auditor.

Well, I better go at this in a very orderly fashion. Let me tell you what an in-rudiment is. That's another – that's branched off of your question. You got that answered.

*Female Voice: Mm-hm.*

Would you like to know what an in-rudiment is? All right.
In the first place you are processing a valence. Even though the valence is hidden and unknown, you are processing a valence. The valence does not well respond to conditions. So all rudiments are monitored exactly in this bracket: that any rudiment process, no matter how beefy and how strong is relatively ineffective. Just put it down in your book! By definition!

You are processing a valence. See, this pc is in a valence. And therefore, the answers he is giving are valence answers. You cannot change the conditions of that valence short of Routine 3. That's the only thing that'll find and discharge this valence. So that all rudiments are monitored with this particular limitation: that to change the conditions of a valence is next to impossible. And yet your rudiments processes are addressed to changing the conditions of the valence in which the pc is sitting. "Fascinating," isn't it?

That puts you a hurdle that Epsom Downs steeplechasers up here would balk at. See, most of the horses would pile up right there. Unless we went just a little bit further. But you must recognize that as a fact, that no matter what process you run on a pc short of actually separating off valences – spotting them with goals and running them as valences – short of that, you are not going to get very sweeping results. We have been at it for years and we might just as well recognize the truth for what the truth is. If you run anything on a pc other than the location of his goals, the separation of the valence which is the solution of the goals, and knocking that out on the Prehav Scale, then you have this condition resulting, and this is going to be the condition which follows through, but the results are very limited. So anything that has to do with keeping rudiments in is monitored by this fact.

Now, let me give you an example. I'm just going to show you how rough it is to keep a rudiment in. I'm not going to paint any golden picture and say, "Well, if you weren't so stupid you'd be able to keep the rudiments in very easily. And it's just because you're stupid that you can't keep them in, and you're really doing a very bad job of auditing." You see, a fellow – one could go off on this wild tear, if he didn't know this other point. It is next to impossible to keep them in. Because, by definition, conditional processes on a valence are trying to change the characteristics of the valence and those characteristics are not owned by the pc, and therefore are an other-being's characteristics. And you are changing an other-being's characteristics which are none of the postulates of the pc.

Do you see then why that is? And do you see then why no matter how many fancy processes were dreamed up over the years, if these processes did not immediately separate off the valences and orient and restore the person to himself, they, of course, had a limited workability.

Now, that series of conditions applies to all rudiments processes. So you handle rudiments processes with your eyes wide open that they are not easy to keep in. Because by definition they are going to be very limited.

So, how do you get around this? How can we get around this? Now, we've got Epsom Downs and tons of horses piled up all ready for the meat packer, see. Because I tell you frankly that it's an impossibility. Now, it's an impossibility only to this degree: Remember as part of this definition – this is very tricky technical stuff I'm giving you here; you get it very straight. If you haven't got it, go over it again, because it's – otherwise you're going to break your heart on it someday.
To change the characteristics of a valence without removing the valence from the pc is almost impossible. You got that? But you get the modification that is in that? "Change the characteristics without removing the valence."

Now, right in that, the booby trap, you see, there is a road out, right there. A rudiments process which does not tend to shift valences is nonfunctional. So the functional rudiments processes would be those processes which shifted or lightened valences. And rudiments will go in very easily if you pay attention to that particular rule. And that is probably the most important rule of keeping rudiments in: that the rudiments process that works must tend to shift valences, and the rudiments process that doesn't work is one which seeks to shift the conditions of a valence.

And the pc as he sits before you being audited, pre-Clear – and this word takes on enormous significance right at that point – is of course a valence. He's in a valence and he cannot shift the conditions of this valence or change the conditions of this valence, and it's been driving him to despair for eons! He cannot change himself. He doesn't know quite how he is going to act. He's an unpredictable being to himself. That's because once, long, long ago, he lost faith in himself as himself and so adopted other beingnesses and reposed his entire hopes of survival in these other beingnesses. And now these other beingnesses are unchangeable in their conditions.

All right, I'll give you an example: "What part of that problem could you be responsible for?" Well, let's look it over! Has a very limited workability, doesn't it? Why? Because it seeks to change the condition of a valence. It seeks to get a valence to be responsible for the problem, but remember the valence had the problem and if the valence had been responsible in that zone or field he wouldn't have had the problem.

Now, that it works at all is absolutely a fantastic tribute to Hubbard and you! [laughter] You see what I mean?

Now, let me give you an even more gruesome example. Goal of the pc, unknown and hidden to the auditor at this stage, see – he's trying to get rudiments in. But he doesn't know this goal, see. He doesn't know the terminal. He doesn't know anything. But let's say it was this: "To make problems." Let's just say it was that. All right, you've got Mr. Pc, Mr. Preclear, sitting there, and of course you're talking to a valence, and this valence will be something that carries out this goal. Now you're going to get problems straight?

Why, the person's going to have a problem every few minutes. They're going to have problems. They're going to start with the beginning of the session, and you're going to clear up the problems and you're going to go ten minutes deep in getting something you want done, and you're going to have another problem, you're going to have another problem, you're going to have another problem, you're going to have another problem, you're going to have another problem, you're going to have another problem, you're going to have oh-nun-nnn. And pretty soon we just say "Whoa, it's impossible! You can't clear anybody! Because look, you can't get past the present time problem. So we'll just ignore the present time problem of this particular pc and we will just carry on anyhow." And eight thousand goals later you suddenly decide you can't find the pc's goal. Why? Because the rudiment is obsessively out. Because that's the goal of the pc. But that isn't known to you at the time you're trying to get that rudiment in. You see the example? Hm?
All right, a person who creates problems all the time and the terminal is going to be "agitator." See, he's going to run "agitator." All right, you're talking to an agitator. Well, look, if the British government and the electricians union, and so forth, can't function in the basis of the agitator, why, how in the name of common sense do you think, in the auditing chair, you're going to function with an agitator? Well, you're just going to have to what? You're going to have to soften up this goal and soften up this valence before you handle it.

So therefore, this process would have a prayer. "What problem could you confront? What problem would you rather not confront?" Ah, ha! Why? Why does that have a prayer? It hasn't got much of a prayer, but it's got a prayer. It's a workable thing because of course all valences are accepted by the pc originally as a solution to some overwhelming problem – by definition. That is how he got the valence. He himself failed, so therefore he had too many problems. He had so many problems that he failed. So he adopted a solution called a valence.

Well now, the possibility is that two thousand hours later, 1A would run him to Clear if you took every single possible slightest cockeyed version of problems, you see. You just almost set them up on electronic computer to get enough versions of problems, you know, enough... and you just flattened everything, just flattened everything about the problem.

Of course, because you're flattening them in the teeth of a machine that is making problems, see, all the time, you'd be going slowly! See, but you nevertheless would have a slight uphill grade all the way. You'd be making it as you went. Why? Because the valence is being separated.

So, therefore, every rudiments process which separates valence as its primary action will handle the rudiment. And every rudiments process which seeks to handle a condition will be of minor importance. Win a little bit, go flat, lose from there on. You can't keep the rudiments in. You see how that is?

All right. Let me give you an example of this. This fellow who has a thing "to make problems" – that was his goal. An agitator is going to be his terminal but you don't know anything about this yet, because you couldn't get this goal and terminal, you see, because the rudiment of "problem" is out. Kind of an auditing problem that you stare in the face, you see. All right, now you're going to run something on "What problem could you confront? What problem would you rather not confront?" You're going to win. But, if you ran this kind of a thing – if you ran this sort of a thing – and you said, "What part of that problem could you be responsible for?" of course, you're just asking the fellow to pick up his whole case and say, well, "responsible for the formation of it." But, of course, he isn't the person who is forming it. He is a valence and the valence is forming it. And, of course, he has no responsibility for the valence, it just goes on operating, so of course he can't do it. Follow this? So it would tend to knock something down momentarily and then this thing wouldn't be very successful and it would pop up again.

All right, but let's take a much worse problems process. Let's think of a much worse problems process. Let's say – I'm set up so that I only think of good processes. I have to get in practice thinking of bad ones. Let's see. Well, let's take, "Now, what condition" – this problem is about his wife – "What condition of a wife would you be able to tolerate?" "What condition of a wife would you be unable to tolerate?"
Well now, of course, this is asking a valence called "an agitator" to run plus and minus toleration on a wife in order to handle a problem. And, of course, we are not going to get anywhere with it. Because, of course, he'll make another problem that has nothing to do with his wife the second that you come off of the other problem, you see? Even if you did manage to somehow or other ARC break the thing down to a point where it no longer fell – which is not an accepted method of handling a rudiment, but which has been used [laughter] – that is addressed straight to the condition and is trying to alter the characteristics of a valence directly and so, of course, won't operate as a process. Okay?

All right. Now let's move on down the line. And let's take up the auditing room. Now, let's say the pc has a goal "to help mankind" and the terminal is a cow. [laughter] You get the package of characteristics which would go along with this. And now we are auditing him with a meat chart on the wall. This takes a wild example of it, you see. "Is it all right to audit in this room?" you see. Hell, no! It isn't all right!

But you have – the goal and the terminal of the pc is totally obscured, you cannot find it until you get the rudiment in. You cannot, of course, get the rudiment in because the goal and terminal of the pc are totally opposed to it. If you could find this out directly and immediately that he was opposed to that chart that was up on the wall, you see, you naturally could get it in, but then you would have had to have cleared the case before you could audit him in the room. You see?

All right. So the type of process that wouldn't work on that sort of thing or would have very, very minor workability would unfortunately be TR 10. Very minor. It'd run for a long time and it'd run with somatics, see? And the person would kind of get familiar with it and find out there wasn't anything really going to bite. And the thing would cease to fall, but the rudiment wouldn't be well in. See, because you just kept – every time he – "Notice that chart." "Yes" – of course, he couldn't confront any part of that meat chart. You get the idea? "Notice the fireplace. Notice the table" – table-eat-food, you know? "Yes, yes." And just be more and more somatics.

Well, the fact that any familiarization with any piece of mest produces a gain in a case, come hell or high water, because it itself – the common denominators of all valences is mass, energy, space and time. So the familiarizing with mass, energy, space and time on a very, very long look might possibly do it.

Therefore, TR 10 has had some workability. It has had some workability, as you know and I know. But that is the degree of workability and that is the length of time it would take to do anything for the case, because it's altering – trying to alter the condition of a valence and of course you're not going to alter the condition of the valence until you clear the guy.

So, I'll give you a good valence process, and it would have to be a valence process in order to handle the auditing room. And you'd have to say something on the order of "who." Valences – "who." The magic button back of all this is merely the "who/what." The list, the "who/what." You're doing some kind of a Terminals Assessment long before you should be doing a Terminals Assessment, don't you see.

You say, "Who couldn't be audited in this room? Who could be audited in this room?" You get the idea? Or you say, "What could be done in this room? Thank you. What couldn't
be done in this room? Thank you." Some such approach as that, of course, is an effort to separate the terminal. And what you're doing is just keying the thing out, momentarily, so later on you can get a hold of it and key it in.

Now, some such approach – I'm not giving you those as pat, perfect auditing commands but I'm just giving you the key of it. You'd have to handle it on a valence proposition. "Who would you have to be to be audited?" "Who would I have to be to give you a session?" See, that was an old one. And that was a nice working process. "Who would you have to be to be audited?" "Who shouldn't you be to be audited?" All of this starts listing terminals and to list people, you see, and beingnesses and objects and – pcs can be objects, you know, valences can be objects.

By the way, in your assessments (just as a side comment) if you omit objects you're going to miss some pcs, do you realize that? You keep saying, "Who, who, who, who," you turn yourself into an owl! And you better say once in a while, "What, what, what, what," see. Goal: "to go fast." "Who would go fast?" "Who, who, who, who," just on and on and on, doesn't seem to be any sense to it, you know. It's, "What would go fast?" Pc's in the valence of a vehicle, see, and actually might slip the valence of the vehicle during the session and give you a "who." See, so it's "What, what, what," and "Who, who, who," and "What, what, what," and "Who, who, who," and that sort of thing, and you'll get more terminals that way on an assessment. All right, well, enough of that.

Let's get back to this other thing. Anything that you dream up, then, to shift valences on the subject of the room, or desensitize momentarily valences on the subject of the room, or let him have some more valences that could be audited in the room, or anything like this, that would have a better degree of workability and should work faster.

All right. Now, let's take up another one here. "Is it all right if I audit you?" Well, "I" is a valence, remember – in the valence column, you know. As far as the pc's viewpoint is concerned, it's some kind of a pat beingness. Well, the same thing applies about the auditing room, you know. It'd be, "Who would I have to be to audit you?" and get him to make a list of terminals. 'Tell me who could audit you? Good. Who else could audit you? Thank you. Who else could audit you? Thank you. who else could audit you? Thank you. Oh, thank you very much. who else could audit you? Thank you very much." And you'll find yourself a screwdriver, an oil can. You're liable to find almost anything, you see. But nevertheless, you make some kind of a thing if you say, "What would I have to be to audit you?" see, "Who would I have to be to audit you?" You'll find a lot of people would be perfectly willing to be audited by a tape recorder, but not by a being. You get this?

So once more the "who/what," and we've got a valence approach here and you will find that ... I'm not telling you this will work in three minutes, you know, because you're working uphill, all the time you're running valences, you're working up against the key valence of the case. And you haven't got it yet. All you're doing is shaking up valences or remediying his havingness on valences or doing something about valences and you'll move out the other end with some kind of a result.

But don't expect that this won't occasionally be spectacular. It'll be very spectacular. Sometimes quite painful, sometimes quite upsetting, because you're really kind of doing a
Terminals Assessment on the guy, you see. And you just have to run it across the bumps and have to wear ship while you're running the thing. Keep your other rudiments in, don't make flubs. Run a very, very good technical approach to this thing. Have an auditing environment that the person would have some confidence in. In other words, it's "Who/what would I have to be to audit you?" and that pretty well should take care of the stuff he is immediately and directly stuck in. He's liable to settle down. "Who am I?" is the earliest successful auditing command that solves that rudiment. You'll find that in the Model Session, by the way, present Model Session processes.

All right, let's take the next one. Withholds. Well now, actually, it's withholds that caused him to hold the valence, so withholds work. As you get withholds off you do shift valences. And you do have the answer to that in the Security Check. But you can whipsaw back and forth on questions as you ask in the rudiments, "Do you have – are you withholding anything?" "Is there anything you should tell me?" "Is there anything that couldn't be said to me?" "Are you trying to communicate anything to me?" "Do you feel you can't talk to me?"

Now, I'm talking about whipsawing all possible varieties with this, because we are trying to restore the ability of the pc to communicate with the auditor. Now, that is a brand-new statement in Scientology. It's a brand-new phrasing. We're trying to get the pc able to talk to the auditor, not willing and we're shifting a word there. Although willing and able are very close together and one depends on the other, we want ability to talk to the auditor. It's just a matter of more bluntly "Can you talk to me?"

Once more, you don't seem to be able to clear it up – you don't seem to be able to clear it up – you've got your "who" and you've got your "what." "Who could talk to me?" "What could talk to me?" You've got your whole routine of Security Checks which are right where they belong and as important as they are, you see. And you've got the lot of those and they're all devoted to getting this rudiment in, see. So in a session, as you pass it by, you nevertheless should get it squared away. You find out if there's anything he's withholding and all that sort of thing, just as you have been, but in addition to that, you can also find out if he feels able to talk to you and if there's been any part of any session that you've given the pc that he has felt or she has felt unable to talk to you and why. And you'll reestablish these old cut comm points. And if this doesn't seem to be producing too much results and you still can't get that thing clear, you'd better find out "Who would be able to talk to me?" "What would be able to communicate to me?" You'll be surprised sometimes: "What would be able to communicate with you?" "Well, a bullet." And you'll get a lot of the misemotional feeling of the pc off with that type of an approach. Have you got the various ways to handle that?

But remember you have a whole battery of processes devoted to this withhold, called a Security Check. You've got a big broad thing called a Security Check, and that is terribly important. So if the rudiments seem to be consistently out on this pc at the level of withhold, then, of course, you should be devoting the bulk of your time to Security Checking the pc with the various HCO WW forms. And until you've got him pretty doggoned well security checked one way or the other, even though it took fifty hours to get all these Security Checks straightened out. Voilà! You nevertheless have won all the way and the pc's feeling better and better, and so forth. It's a winning process and a winning approach. You see how this would be?
All right. Now let's take havingness. There is no substitute for havingness except finding the Havingness Process of the pc. And we've got thirty-six Havingness Processes, and it's a very good thing to find the Havingness Process of the pc. And instead of randomly remedi- ing havingness, find the one that does remedy havingness. Because it's quite a trick to remedy havingness on the pc.

Now, a common denominator of all valences is matter, energy, space and time, so that any approach to matter, energy, space and time has some slight – as I was telling you about TR 10 – has some slight power of shifting a valence. And in view of the fact that it does – we have demonstrated it for a long time – you go on and use havingness just the way you've always used havingness, but I would prefer that you had the Havingness Process of the pc early in processing, okay? Now, that seem rather sensible as an approach? All right.

Now, the willingness of the pc to be assessed is great. The pc will be interested in his own case under assessment. But the pc gets terribly interested in his own case on these other things I have given you, too. They get very interested in their own case. It becomes very curious to them, some of the phenomena which occur. And if you think a person you're trying to security check successfully is disinterested, you're wrong. They're never disinterested. They're in a sort of a games condition, because it's a withhold sort of a basis, but nevertheless they're terribly interested in it, and they can become very upset if you fail. The only way they can get upset with you on a Security Check is if you fail to knock a question totally out. If you pass a question and they know they still have a withhold on that line, their respect for you as an auditor goes down, down, down! And that is the fastest way in the world to lose altitude with a pc, is pass a question in a Security Check where there is something still on it that you have- n't got.

But now remember, a Security Check is done in Model Session. So a Security Check will most aptly function with the rudiments in. But the power of a Security Check is so great, and in view of the fact that it is one of the rudiments, that the particularities of keeping the rudiments in to do a Security Check are nowhere near as great as they are in an assessment and a goals terminal run on the Prehav Scale. You see it's just you haven't got the same value for rudiments in doing Security Checks as you have apparently in assessment and running. There's a lesser value. But still keep them in.

The way you can bust up a pc on a Security Check is just as I said. This is one that has not been well learned in HGCs. Somebody says, "Well, I'll just report this pc is terribly unwilling, and he ARC breaks very easily when I run a Security Check on him." That auditor has said in effect just this – they've said one, two, three, four: They've said, "When I first started in the list of questions I found that it was hot and I went by it and I didn't buy – strip it down and it didn't go null and the pc has been in a mess ever since." It might as well have been written in that terminology because that's what the auditor has said.

Now, it's a surprising thing, you wouldn't think how many people will sit down and take a Security Check right off the street, which just is a Security Check, not even a shake-down type of check. You just go down the list. And if they are left with the impression that they have passed the Security Check and you have found nothing, whereas they know very
well a couple of the questions were hot, the odd part of it is that they're disgusted with you and consider that your whole operation is a fake.

So you must always at least tell the pc that the question is hot, broadly, whether you clear it or not. Always tell him it's hot. And that is the one restriction I'd put on you. Not necessarily, it isn't mandatory then in doing Security Checking for employment to clear every level. But it is mandatory to say "That one is hot." "Question is" – well, you say to the fellow (you're on question thirteen) – you say to him "still falling, still reacting," and so on. "We'll go on to the next question but that thirteen is still reacting. All right. Anything you care to tell me before I go on to the next question? No? All right, okay. Here's question fourteen." This guy says, "Wo-oh-oh-oh-oh. He knows!" See?

And your altitude can suffer faster doing a Security Check than any other single operation in Scientology. You can lose altitude as though you had dropped in a bomb case. Just by failing to do that. And you yourself might have spotted it, you see. You might know very well the pc is withholding; you still might have a reaction, but the meter is facing you and you haven't informed the pc. And all of a sudden you find yourself in a bad ARC break situation of some kind or another. You can't quite find out how you got there.

Well, you got there very simply. You went by a question without informing the pc that it was hot and that you knew there was something on it.

So if you can't in one session strip down a particular question and get all of it, at the end of that – now, I'm talking about a therapeutic Security Check – at least say, "Well, we'll have to work on that one tomorrow because it is still hot." Don't leave him with any kind of a remote idea of any kind whatsoever that he has cleaned it if he hasn't. Otherwise, he's liable to go home and say, "Ah, well, I can get away with that." And next day he comes in and, by golly, you can't get anything off of him at all. He's ARC broken and he doesn't think you're so good and, you know, it's all messed up.

But although it's a games condition, apparently the individual is totally convinced that he loses if you lose. Now, isn't that odd? That holds good. That holds good with the men in the street and the cop in the park and it holds good to anybody. If you the auditor lose in failing to get one, why, they know they lose. The mind seems to know what the mind is doing. They know that it wasn't so good that they didn't give that up.

So that's the proviso I would give you on a withhold while handling them in the rudiments. If you want to have no altitude for the remainder of the session, go by your rudiments point of withhold and leave one warm, hot or undetected, or not searched out. If you really want to lose altitude for the remainder of the session, why, just flub on that.

So be very careful that you ask this question in a whipsaw fashion, and it just must go left, right, center. Any possibility of ability to talk to the auditor? Anything they're withholding? Anything they haven't communicated? Anything they've failed to communicate? Anything they've wanted to communicate and didn't communicate? Anything they felt they couldn't communicate? Any effort they have made to communicate which was not received by the auditor? You get the idea? Any type of questioning of that character. Now, when you get that all of the fall out of that, your altitude goes up. And there is a primary altitude factor, you see.
All right. Now, in handling rudiments there is another thing: "Who should I be to audit you?" (let's go back to that one for a moment and take another look at this thing) comes into the basis of "Who would you have to be to be audited?" – this sort of approach. And you still consistently, here and there – I say this advisedly – have a pc who is doing something else. This is the old one. Now, it's not quite a part of the rudiments – not quite – but is apparently something that is slowing up things. And it comes in there "Is it all right if I audit you?"

Now, we had an earlier rudiment at some time or another that had to do, "Who would you have to be to be audited?" or "Who are you?" or "What are you doing?" I think that was the original one, wasn't it? "What are you doing?" That was 1955. And to some degree that has dropped out of the lineup. And don't be too surprised if on the next release of rudiments you find that back in the lineup again, because we have just caught a case out. And we catch too many auditors out on running a pc who is doing something else. Not being a pc; they're doing something else during the session. And because it's personal I'll operate on that as a withhold. There's a couple of these are screamingly funny. And it's too bad I can't give them to you, but I won't be able to. They're doing something else. They're not being audited, see.

So "What are you doing?" – some version of it – belongs in a rudiment setup. And possibly its missingness is accounting for some of the difficulties. "Is it all right if I audit you?" Somewhere in that vicinity, you would have to have this other question of "Are you willing to be audited?" or "What are you doing?" or something of this sort. But what you want to find out – what you want to find out: is the pc willing to be a pc and willing to follow the auditing commands? That is what you are trying to find out. Or is the pc all set to do that and something else? That's what's the most amusing part of this. Is the pc going to do something else while he's following the auditing command, don't you see. And you want to know all about this.

And somewhere in a session if you notice any peculiarity about a pc, an in-rudiment makes it necessary that you enquire occasionally about that rudiment and we get middle rudiments, or running rudiments. And we get the same rudiments. If they look like they're going out, well then you're wasting session time. So you had better just break down, just right there at that point, and just interject a rudiment. Handle that rudiment as you're running.

So that would be an in-rudiment and that would be keeping the rudiments in. And something like this, you notice that this pc is sitting there obsessively crossing and uncrossing his feet, crossing and uncrossing his feet, crossing and uncrossing his feet. Well, you'd run this rudiment about "What are you doing?" or "Are you willing to be audited?" you know, or that sort of thing. The pc's crossing and uncrossing his feet and you ask him what's he doing. Well, he's going to be in a track race tomorrow and he's getting some exercise while he's being audited. You'll find some wild ones, man!

And of course, this is all in the package. This would all go back to the package. He's got a present time problem: he's spending his time here being audited when he ought to be out on the track. Only he didn't bother to tell you this in the beginning of session, and so on, and you better handle this right away, you see. And there's all kinds of oddities then. He obviously is not only not willing to be audited but he has a present time problem, and this is going to
amount very shortly to an ARC break and here we go. We're going to have all the rudiments out here before we can say "scat." Why? Because we didn't observe something peculiar.

Now, a pc does not mind particularly being nagged. They don't mind it. It is all interest. It's all havingness. "What are you doing?" "How'd you do that?" and so on. This is one of the oldest wheezes that I use and one of my heavier failures in getting auditors to do it, is "What are you doing?" occasionally. "What is that all about?" "How are you answering the auditing question?" "What else are you doing?" "Now, tell me now, exactly what happens?" You notice that this is getting pretty grindy. This is getting awfully grindy. You say, "Well now what are you doing with the auditing command?" something like that?

Well, he'll say, "Answering it, of course! What the hell are you talking about?"

"Good." You say, "Do you have a present time problem?"

"Yes, I sure do!"

"What is the present time problem?"

"Well, I – I haven't been able to understand the auditing command since the beginning of session. What am I supposed to be do ...?"

You'll find this session was going, you know, kind of grind, grind, grind, grind, apparently wasn't going anyplace, pc wasn't ARC breaky, he's just in a constancy, you see. You're getting some tone arm motion, because you practically can't stop an auditing process these days from working somewhat. And about that time you've all settled down for the long grind of some kind or another, you just apparently are not getting anyplace. Well, you shouldn't upset the session, you shouldn't suddenly depart from what you are doing wildly and never come back to it and leave pc in a big not-know about it, but you say, now, "How are you doing the auditing command?"

And the pc says "Well, I'm uh, hmmmm – well how the hell am I doing the auditing command?"

"Well, is there one of the legs of this bracket ...?"

"What did you want to know?"

"Is there one of the legs of this bracket you're finding a little bit rough to do?"

"Well, yes, you can't do the third leg of the bracket at all."

"Well, have you done the third leg of the bracket since the beginning of the session?"

"No."

"What do you do?"

"Well, I just say, 'Yes.' "

"All right, can you recall the first time you did that? All right, that's fine. Next time you did that. Next. Ah, good, good, recall several times you did that. All right. Now, how do we phrase this third leg of the bracket so that it is answerable?"
And you rephrase the third leg of the bracket so that it is answerable and just carry right on, not stopping anything, starting anything. You haven't stopped anything, you see. And you just give the auditing commands you were on and get the thing answered and keep on going. You had to be pretty smooth to keep from upsetting a pc who is deeply interiorized into some fantastic problem.

Usually there's something going wrong, however, when a pc is not experiencing gains and it'll be a rudiment out. And the basic rudiment, we haven't paid enough attention to is "Are you being audited," see. Person isn't being audited; the person is sitting there figuring out the command.

All too often you'll get an old-time Scientologist sitting there auditing.

Happens every once in a while. He'll be putting a curve on the auditing command so it works. Because he can't answer the auditing command. So you better straighten that out, see, straightaway. Is it a feasible command?

Another thing you often run into and maybe don't handle is self-audit. And you say very coolly to somebody, "What self-auditing process have you been running that isn't flat?" Well, this is not the same thing as asking him "Have you been self-auditing?" He'd say "No," or something. You might or might not get much of a reaction. But "What self-auditing process have you been doing that isn't flat?" That's an awfully good way to start a session on an old-time Scientologist. "Which of these self-auditing processes now, haven't you flattened? Yeah, well, let's take a list of the things here. Now, that's good. You got several of them here. All right, and so on. Good enough. Well, when did you have a lose on self-auditing?", you know, that kind of thing.

"Oh, so-and-so and so-and-so."

"Well now, all right."

See, this is just chatter. You're just asking for information and make a list of it one way or the other. You could ask him, "Well, have you ever been without an auditor when you needed one?"

"Oh, yes."

"Well, when was that?"

"So-and-so and so-and-so, so-and-so and so-and-so and so-and-so and so-and-so and so-and-so."

"Oh, yeah, all those times. All right. Well, that's good." And, "Who would you have to be to audit you?" [laughter] And, of course, you're right into the middle and could kick right straight out the self-audit crisscross valence.

These are the various problems you run into that'll slow down clearing. These are all handleable things. What is an in-rudiment? It's somebody interested in his own case and willing to talk to the auditor. That's by definition. But, of course, it is also somebody who is doing the process. And this, of course, is also somebody who is being audited, and that's up to the auditor. So all of these things count, all of these things list up, all of these things are important to an auditing session.
Now, if it's very difficult to keep the rudiments in, you shouldn't particularly become self-critical about it. But there's the old R-factor – the old, old R-factor, way back in the Fourth London – is you want to ask yourself if you're being real with this pc. Because the first thing a pc smells – "Is it all right if I audit you?" This comes under rudiments, you see. One of the first things he smells is a missing R. The reality of the situation is not present. The auditor is not leveling with him. There is something else here. There's an ingredient in this auditing session that he knows nothing about. And it may be quite innocent, but nevertheless it had better be leveled with the pc.

An auditor who sits down, who hasn't had any lunch, who's had to rush back for the session and so forth and who doesn't say to the pc, "Well, I had to rush back to session so I didn't have any lunch. It's all right with me that I don't have any lunch," and so forth, "but nevertheless I haven't had any Lunch and so on. So bear with me" – and the pc's fine. That's all right. He's not really at a position where he wants to be guilty of the overt or anything like that. You make it so that he doesn't feel he is guilty of the overt, but you rive him a reality.

You'll find a pc will ARC break, go out of session, have a present time problem. What is the present time problem? The present time problem he's groping for is the auditor doesn't seem real. This is up to the auditor. It isn't something the pc is doing, it is something the auditor is doing.

(page missing)

the next time it comes up, that the pc suddenly looks up and he says, "What's wrong with you?" or "What's going on?" or "Did that shock you?" or "Are you nervous?" or "Are you upset?" or something like this. Any type of question of this character that concerns the identity of the auditor. This is what? This is a symptom of being out of session, isn't it?

All right. And your action right at that time should be, "Well, is there anything?" Think it over, you know. "Is there anything?" Take a moment out. "I don't know. Am I disturbed by all this? Have I got something on my mind?" And if you have, for God sakes, tell him! If you've been disturbed, for God sakes tell him. "Yeah." You say "Boy, about eight withholds ago I started to get absolutely dizzy. I must have one like it."

And the pc says "Oh, is that so?" you know, and he gives you the next withhold, just like a soldier. Perfectly all right.

And pc says "What's wrong?" and eight withholds ago you've started to feel very dizzy. You say "No, nothing is wrong. No, nothing's wrong," just go on and next auditing command, next auditing command, so-and-so. "We'll just carry on here." Watch all those rudiments go out, man. One by one, they will just go by the boards, because there isn't a person auditing the pc. Got it?

So these are what makes rudiments in – what makes rudiments in. And they are actually very simple to keep in, they're very easy to keep in. But you'd better not, with the type of auditing you're doing today, except on a Security Check when you can be a little bit careless, except with a present time problem – when you're doing sessions, boy, you'd better be thorough. You'd better be thorough as thorough as thorough as thorough as thorough. I don't care if you occupy three quarters of the session to get the rudiments in. End rudiments of course

SHSBC TAPES 001-100 972 04.02.15
are nowhere near as important as beginning rudiments. But they have an importance, too, because you're doing them for the next session. This pc is going to come back and be audited well and it all better be smooth, well, you better get the session out of the road.

End rudiments are normally devoted to getting the session out of the road. Beginning rudiments are normally devoted to getting the atmosphere and environment out of the road so that you can audit the pc, and middle rudiments are rudiments used one after another, inquiries about various rudiments during a session, of course, are used to keep the session progressing and keep the rudiments in. Okay?

Well, I want you to get your hand in about this, because you've got to get smart with this. You've got to get awful good with it. Okay? All right.

Thank you.
BASICS OF AUDITING

A lecture given on 29 August 1961

Thank you. [laughter]

This is the 29th of August 1961, and I'm often gagging about using notes in lectures. But this particular lecture I have some notes for, believe it or not. That's because this is a very, very tricky subject. And I'm going to talk to you about something that is going to make you more auditing gains in less time as an auditor and make us more Clears than any other single subject we have opened up on in recent times.

Now, this is quite an important lecture. This lecture should be a basic on HPA and an absolute necessity at the level of HCS/BScn. And if a DScn is missing these points, we ought to revoke his thetan. [laughter] But this is quite important, this material; not to give it an over-stress of some kind or another, because I don't think it could be overstressed.

Now, you see, earlier this summer I was confronted with the fact that with all the materials in hand as to how to clear people, very few Clears were being made. Interesting, huh? But every time we have borne down on the subject of auditing and accuracy of auditing, all of a sudden we have people finding their goals and terminals on, you see, finding goals and terminals on pcs and we have more Clears being made.

This is very direct. We have had this experience here. We are all, I'm sure, agreed that it was a matter of the rudiments were out. And just as soon as I said, "Well, we've got some kind of a games condition going here, and the rudiments are out, and you'll find it in the first 150", it's proven true. I think maybe we got, maybe, something on the order of one or two goals out of fifteen cases that are still not found since that was released just a few days ago, right?

Female voice: Yes, two cases ...

Just two cases.

Female voice: ... who are hanging.

See? Interesting. And in every case, the goal was within the first 150 and yet they had assessed for weeks and weeks and weeks after that first 150. See, they'd added it up to a thousand and all gone up and on and on and more and more goals, and longer and longer assessment. And I said, "Well, go back to the first 150." I think that's where you found them, isn't it? Interesting, isn't it?

So that all the time after the first 150, certainly, goals were taken, then the rudiments were out during auditing. Obviously the rudiments were out.
The goal was buried. And as soon as the rules were put right, the goal came back in, perked up and *pangity-pangity-pang*, and everything was going along gorgeously. As my friend Paul said the other day, we were all off at a smart trot.

Now, there's a point, then. Here's a point of some interest: that by improving auditing technology and the skill of individual auditors, we then come closer to very broad clearing. It is *not* case difficulties that are restraining the pc *now* from getting Clear. All the evidence is in, and that's what it adds up to. All right.

Therefore, the stress must be on auditor technology – the handling of technical aspects of Scientology. Now, the better that is, the more Clears you're going to make. We've got the weapons with which to make Clears. There aren't any bugs in it. I haven't written up your last Prehav Scale, but you mostly have it right now. There's no missing items of any importance that would restrain this from happening. So therefore we come back on auditor technology.

Now, I don't want you to accept anything I am saying as accusative casewise, or anything like that. I'm simply going to give you data here and this data is very well worth having. This data was arrived at the hard way. It'd be a withhold from you to tell you otherwise than that it was arrived at at a hard way – on a hard line. I've been getting some auditing. Sessions have been going out. We sat down and analyzed, and we have analyzed now, all the points where sessions were going out and so forth. I got a good reality on that, and Suzie got a good reality on it, and we were straightening out these points. Because, frankly, we weren't doing it particularly to find out more about auditing; but it's just stuff that came up and we analyzed accordingly. And apparently what it boils down to is not auditing attitude or anything as nebulous as this. It boils down to very concrete data, which you'll be happy to find out.

Now, as an auditor, perhaps, you say, "Well, there's so many rules of auditing, and which one of these rules of auditing should I be following, and how much memorizing of rules and all of this sort of thing should I do?" Well, basically, first and foremost, if you are worried about the rules of auditing, there is something wrong with your auditing approach. We can count on that, then, as a stable datum; that if somebody is worried about the rules about auditing and the zigs and the zags and so forth about auditing, and terribly concerned with these things and so forth, then there's something basically wrong. Because auditing, fundamentally, is simply this – it goes back to *The Original Thesis*: The auditor plus the pc is greater than the pc's bank. And the auditor is there to direct the attention of the pc and get the pc in there and get these objects confronted and straightened out, and the unknowns off and the bank straightened out and the track straightened out, and so forth. And he winds up at the other and with a Clear. That is what it amounts to with the technical knowledge of what you do with a pc.

It all boils down to that. You are there to get auditing done. The less auditing you do which is effective auditing, the more upset your pc is going to be.
Now, let's take the first object lesson here. The auditor sits down in the auditing chair; the pc sits down in the pc's chair. What is the contract? What is the understood contract as of that instant? That understood contract is a very simple contract. The pc sat down to be audited. What does the pc understand by being audited? He basically understands it as getting on toward Clear. What he means "toward Clear," we're not sure a lot of the time, but even that – he senses it is there, he senses he's got a direction to go, he senses that he can arrive at a certain destination, and he's there to get that done.

Now, he's not there to have ARC breaks run, present time problems handled; he's not there to straighten out the auditing room; he's not there to have any of these things done at all that we call rudiments. He is there to get audited toward Clear.

Well, the first observation we can make, that rudiments go out to the degree that auditing doesn't get done. That's a direct ratio. Rudiments go out to the degree that auditing does not get done.

Now, this poses you a problem. If you are using no session to put rudiments in, if you use up no time at all to put rudiments in, of course, you're apparently around the bend as far as handling the pc, because the rudiments are out. You see, here's a puzzle that we face at once. If you're not spending any time putting the rudiments in, of course the rudiments are going to go out. But the more time you spend putting the rudiments in, the more rudiments you've got to put in. Have you got that?

So, somewhere here there's an optimum amount of rudiments putting-in and it's not very much. It's on the order of five minutes. You know, five minutes and the rudiments are in; the pc will bear with that, but not much more. And when it goes to a half an hour, his present time problem is actually, basically, the fundamental problem of getting auditing.

Now, he'll say the present time problem is something else, is something else, is something else, is something else; but his basic problem: is he going to get any auditing? And after he's had half to three-quarters of the session thrown away on a bunch of things that he didn't care about, why, of course now, he has a new present time problem called "getting auditing." In the next session, he comes in with this new present time problem: "Am I ever going to get audited?" because he doesn't consider any of these other things auditing.

Now, that's quite fascinating. He doesn't consider them auditing. So therefore, he doesn't consider them auditing. So therefore, of course he's out of session. From a pc's viewpoint, auditing is a direct press forward, getting himself straightened out so he can get a good Goals Assessment, and finding his terminal – if he knows anything about it at all, this is what he demands – and getting auditing straight along on the road to Clear, and knowing he's getting someplace and all of that sort of thing. This is what he really settles for. This is by experience.

They will even hang on for months, as we know now, getting assessed for goals. Even though the goals are all invalidated and everything else, they're still interested and they'll still go to session, don't you see? Even though the thing is being run completely crosswise, you see, they'll still go to session and still be assessed. You got that?

Well, they won't be run endlessly on general processes that don't approach them any closer to Clear. They'll only go for maybe seventy-five, a hundred hours, and they'll leave the
HGC, and they take a lot of persuading to get back, and they won't want to be audited by you anymore, you know, in private practice, and so forth. What are all these things from? – from the basic present time problem of not getting auditing. So actually your main chance is simply to audit the pc.

If it comes to a question of whether to audit the pc or go through some arduous flipperoo on straightening out some kind of a super-relationship, or something – audit the pc first. See?

Now, you've got to find out what the pc's attention is on and what he considers auditing; and he very often considers it a chronic present time problem of some kind or another – or a long-duration problem. And he judges everything as to whether or not he's making process [progress] by whether or not this problem is getting stronger, getting weaker. The hidden standard sort of thing; he's got all that sort of thing. Well, he'll be interested in that. Why? – is his attention is on it. So that's auditing.

So auditing could be defined, to the pc, as anything which is handling the things his attention is fixed on. That's what he considers auditing. If his attention is superfixed on it and it's being handled, he considers that auditing. And of course his attention is superfixed on goals, so you can get away with assessing practically forever. He will stay in there being assessed longer than he will stay in there being run on oddball, bit-and-piece general processes that don't lead toward Clear. Isn't that fascinating? That's an observation that I think you'll find is quite valid.

Now, if it came to a choice as to whether or not we went about it endlessly, endlessly, endlessly running rudiments to get them in, or auditing the pc, you would always choose what the pc considered auditing. You would always choose what the pc considered auditing, and let the rudiments go to hell. And the next thing you know, they'll disappear in importance.

Remember, what you validate becomes important. You start handling too many present time problems and ARC breaks too arduously and too long and believe me, you get more ARC breaks. Why do you get more ARC breaks? You get them simply because auditing itself is a present time problem, because he isn't getting auditing. In his viewpoint, he is not getting auditing, he is not sure he will get auditing; therefore, his contract is violated so he is in disagreement with what is happening in the session. Do you follow that?

Now, a pc will sit there and endlessly run 1A. Why? Well, his attention is stuck on it. His attention is stuck on all these problem points, you see? He considers it auditing as long as you are auditing in the direction of his problems – of course. So he will settle for 1A. It's amazing how long he will run how many versions of 1A. See? This is amazing, too. If you were to flatten 1A, then – as we already have talked about – and gotten problems and Security Checks totally out of the road, you would find your pc would stay in-session and think he was going someplace, and of course he is going someplace. And if you were to flatten 1A, giving the rudiments a lick and a promise before you did a Goals Assessment, you'd find out your rudiments were in when you were doing the Goals Assessment. Because, you see, the pc now can confront problems. You've already brought him up to the point of being able to confront the rudiments before you started fooling with the rudiments. You got the idea?
Although you run rudiments every session, although you try to find out what they are, although you try to knock them out, although you do run some Havingness on the room – and you keep the rudiments in, nobody is saying just forget rudiments – but don't consider rudiments anything like a session. Don't ever make the mistake that the pc will think he is getting a session when rudiments are being run.

You'll find pc after pc, when you ask him, "Do you have a present time problem?" will groan. Because he knows now that his session is going to be endlessly chewed up with the John and Mary of life, and he doesn't consider he's getting anyplace. Why doesn't he consider he's getting anyplace? Because he knows he's getting no place with his wife, and so forth. Well, you say, "Well, that's a problem." But he doesn't consider this the general problem of his case by any means.

You have found a problem. He is worried about having to write Blitz and Company. And you say, "Well, we'll have ..." and you just start to make the motion toward handling this problem of having his attention on Blitz and Company and the letter he's got to write to them, and you get "Oh, no! My God!" [sighs] You've heard him, huh? [laughter]

Well, why do you get this? He doesn't consider Blitz and Company auditing. He doesn't consider Blitz and Company as any difficulty. But he does consider that not getting auditing will produce an enormous difficulty.

The value which a pc assigns to auditing should be appreciated by you. It is terribly highly valued – very highly valued by the pc. And this is a great oddity, because actually, psychoanalysis was never highly valued; hypnotism is not highly valued; psychiatry, they spit on. They go back for their electric shocks like wound-up dolls. But you say, "Well, what do you think would happen to you if you didn't have any psychiatric treatment?"

"Oh, I'd probably be just the same as before. What's the difference?"

You say, "Well, would you walk across the street for psychiatric treatment?"

"Hell, no."

Well, that's an oddity in itself. See? This is an oddity. You're dealing with a commodity which is very highly valued and which the society has been trying to put into the field of psychotherapy, but psychotherapy is not highly valued. So what you're doing basically is very highly valued by the pc. So the more you don't give him of it, the more difficulty you're going to have with him.

If there's ever a crossroads of decision as to whether or not we're going to endlessly get on with this, even a crude remark of this character, "Well, I see you've got a present time problem. Yeah, have you got a little bit of an ARC break? All right. Well, okay. To hell with those. We're just going to run now ..." And you give him the process and you go on and run it.

And you'll be amazed how often the pc will say, "Hey, you know, he's right in there pitching." He might grump for a minute, you know, and say, "Well, it's not according to Hoyle, you know?" [laughter] But you'll just be amazed how many times that will win where the endless handling of rudiments won't win.
The endless handling of rudiments is a limiting factor in auditing, because it produces eventually the ARC break of obtaining no auditing. So the decision is, audit. You'll have less ARC breaks the more auditing you do. And of course, if your auditing is flawless from a standpoint of Model Session, and if some of these other things I'm bringing up are also present smoothly in the session, your days of having ARC breaky pcs end as soon as you recognize that point – that he is there to be audited, and his basic contract is the basic contract of being audited. And the more you audit him on the things his attention is fixedly on – I mean fixedly on, on the long track basis, you see – and the more attention you give to that and the more you handle that, the more he knows he's being audited, the less ARC breaks you're going to get.

It's amazing what a pc will put up with to get auditing, quite amazing what they will put up with to get auditing. Why make them put up with anything, but at the same time go on and audit. So the best, hottest message I can give you on that exact subject is audit! Don't fool with it; audit! See?

What a pc responds to best: "Oh, well. All right. You're here to be audited. Good enough. Fine. Now, we're going to go over the rudiments. All right." And you rip on down the rudiments line. And you notice there's a bad flick of some kind or another. You say, "What's that?"

He says, "Well, that's so-and-so."

You say, "Good," and you ask it again. "All right. That's good, good. It's still flicking. Is it still worrying you? Anything else about it worrying you?"

"Well, so-and-so's worrying me."

You say, "All right. Good." Get the next one, bang! the next one, bang! You say, "All right. Now, now let's get down to business. Now, this is the process I'm going to run, and here it is."

And he says, "Well, I don't much care for that process." (I'll take this up in a moment.) And you say, "I don't care." you say, "I care for it. Do it." you know, that kind of an aspect.

And he says, "But so-and-so technically, and it said in bulletin so-and-so..."

You say, "Well, all right. I read it, too. Do it." [laughter] you find the guy doesn't go into apathy. Quite the contrary – he goes spark, spark, spark, spark, spark, and you'll get good gains.

All right. There are some more aspects in that. But that whole first section of what I want to talk to you about is: for God's sakes, just audit the pc. Don't fool with it, just audit. You see? Just go right in there and saw it up and chew it up and push his attention around and get him through to the other end and ... Well, get 1A all straight and handle whatever you want to handle. I don't care what you handle, because this would hold, possibly, if 1A ever became ancient history this would still hold. Run the pc toward Clear and have minimal chop behind your back, you see, minimal unkind thoughts, minimal ARC breaks, minimal difficulties in sessions. These all just tend to disappear.
Because he might say, "Well, that auditor of mine is a cross son of a bitch, but, jeez, he sure audits!" You know, this would be kind of the idea. You got the idea? "He sure audits." It might be terribly profane, the opinion, you see? 'Well, you don't do right in a session, she's a real bitch, that auditor, you know?" You know, that kind of an aspect and that kind of conversation. "But I'd rather have her audit me than anybody else I know." you know, that kind of song.

The HGC – as soon as that became prevalent in an HGC, and as soon as HGC auditors… You just try and change the auditor on the pc. They had this auditor last year or something like that; and well, they just don't want to be processed unless they can be processed by the same auditor, because they're very sure that auditor can audit. But it's not can audit, although they always use can audit. The secret is will audit. And the auditor who kind of won't audit, they don't want. That's the secret of "being wanted by" as an auditor – is how much you get down to business and how much business you get done.

All right. Now let's take up something a little more esoteric here under the heading of "escape" as a philosophy. This is a very complicated subject. This is the orientation of an auditor – has to do with his orientation. This is the only point where an auditor's orientation can seriously get in his road. As long as he follows Scientology and goes on auditing and using the principles of Scientology, this one can get in his road. All those levels of the PreHAV Scale that have to do with escape – that is: Abandon, Leave, anything like that – if these are in any way, shape or form "hot" or if they're not thoroughly flat on an auditor, you'll get two aspects.

You'll get the auditor letting the pc escape. He wants the pc to escape, because this is the auditor's modus operandi of handling situations. And this is as wrongheaded as you could get, because the only way a pc will ever get Clear is by turning around and fighting down the devils that pursue him. And if the auditor's philosophy is "the only thing the pc should be permitted to do is escape," the auditor will never control the session. And this is why an auditor doesn't control a session when the auditor doesn't control a session. He thinks he's being good. He thinks he's being nice to the pc.

Now, let's go about this on a little wider basis. And oddly enough, under that same heading comes case reality necessary in an auditor. And we've got the same heading. It's "escape" as a philosophy. Case reality is necessary in an auditor.

Exactly what is this that we are looking at when we find that a Scientologist has never seen or gone through an engram? When we find that a Scientologist has never collided with a ridge? When a Scientologist is not aware of the thenness of incidents? If the Scientologist is not aware of those things, he will continue to make mistakes and no amount of training will overcome it. Knowing this – just knowing this – will overcome it, because it all of a sudden sees lots of light. Lights begin to flash in all directions.

If a Scientologist has never been through an engram, if a Scientologist has never been stuck on the track, if a Scientologist has never seen ridges or any of the other mental phenomena, it is because his basic philosophy in life is escape. Now, there is all the wisdom there is in it. I will go ahead and tell you all about it, but there is all the wisdom there is in it.
Of course, if he's never seen an engram, what is he trying to do? He's trying to escape from engrams. So he escapes so hard from engrams that he sees a little flick of a picture and he's away, man, he's away. He's off like a rocket. He's off like the Russian never went. See, he's over the hills and past Arcturus. There's a little twitch of a somatic and *pshew!* he's gone. Why?

His basic philosophy is that if you can run fast enough you never get bit. So, of course, he doesn't have what we call case reality, because of course he's running from his case. His basic philosophy is, "The best way to handle a case is get out of it!" So that's all he ever does with the pc – takes the pc out of his case. So therefore a pc will never be in-session with him.

Oh, lights begin to dawn, huh?

It is pure kindness. This auditor will find the pc getting interiorized a little bit and he'll know that this is the wrong thing to do. So he will take the pc's attention out of session. Some of them do it very flagrantly and some of them do it very pleasantly. It is nevertheless true. one of the ways of doing it is change the process. Another way of doing it is Q and A.

Pc says, "I don't want to be here."

The auditor says, "Of course, you dear fellow, you do not want to be there. Let's be somewhere else at once."

Pc shows the slightest inkling of digging into it in the bank and the auditor pulls him out. The auditor is selling him freedom. At what cost? The cost of never getting Clear. But the auditor sells him freedom; and it's a good thing. It's kindly meant.

This same auditor well might have a penchant – doesn't necessarily – but might have a penchant for going around opening all the canary bird cages in the world. But then, by George, never follows up the fact that the canary birds are inevitably eaten by cats or killed by hawks, promptly and at once. Don't you see?

The auditor is saying, "Escape, escape, escape." The auditor is actually saying, "Don't confront it, don't confront it, don't confront it, don't confront it." The processes he's running are saying, "Confront it, confront it, confront it," don't you see? But the auditor, with his auditing technology, prevents the pc from confronting it, and so therefore runs rudiments forever, does other things, doesn't quite let the pc go into session, (quote) "makes mistakes," (quote) "changes the process often;" (quote) "ends the session irregularly"- does something odd. And all of these oddities could be said to be backed up by this one philosophy, the philosophy of escape. The kind thing to do is to let him out.

The guy is settling down on the track in some fashion or another and he's going out of present time – oh! let's not let him do that, because that's the wrong thing to do.

Now, this is compounded – this is a complex subject, which is why I said this – earlier in the lecture it was. The auditor who has no case reality, of course, dramatizes this point. You cannot see engrams while you're running from them.

Let's take a model engram that this person is in, and let's take some of the things that this person has happen to them. The model engram he is in-he's being whipped. The Jesuit fathers, or something of the sort, have decided to really lay it into him on the backtrack, you
see, at some time or another; and they've got him tied to a post, and he's being whipped. So he cannot leave that post, so he fixes his attention on a section of sky and says, "It isn't happening." That's escape, isn't it? So what does he find when he gets into that engram? He finds an invisibility called "sky." He doesn't find any whiplashes; he doesn't find any post. He doesn't find anything; he finds a section of sky. That is the final mechanism: escape.

Now, he escapes mentally. He doesn't just run away, he escapes mentally. Don't you see? All right. So that worked; he didn't feel them after that. So it was a workable philosophy, perfectly workable philosophy. Unconsciousness is also a workable philosophy. So he's being tortured on the rack – ah! – he fools them all. He goes unconscious; he can't feel it anymore. We don't have, then, an engram of the rack, we have a period of unconsciousness. You see that? He's actually in the incident, but he's only unconscious.

All right. Now, let's go a little bit further here, and let's take a look at this – a little bit further – and we'll find this person has odd somatics and odd difficulties that he cannot account for. And if he never sees any engrams or sees them very rarely, of course he can't account for these difficulties at all. In Book One, it says they're all contained in pictures, and he doesn't see any pictures; and yet here are the somatics, and there's no pictures. Of course there's no pictures, because his attention on any given point is the solution "escape." Escape mentally, escape mentally by forgetting it, escape mentally by looking at nothing, escape mentally by saying it isn't there, you know? The various mechanisms of not-is.

Yet the somatics have not been not-ised. And this person, every time he (quote) "contacted an engram" actually contacted a nothingness, and then was left with a nagging somatic or a sensation that he could not then account for and which seemed to be very mysterious to him. And therefore didn't connect any of these sensations much with his bank, don't you see? And knows he feels uncomfortable, but can't really connect it with any given engram. Got it?

All right. Let's take an actual case in point. Person does in running on the track, contact an engram. And there it is, all 3-D and so forth – people standing on the bank throwing a spear. All right. Spear comes across the river, goes through the pc's ribs, and the pc has a hell of a somatic and that is the end of the picture.

This person, now auditing, says, "Well, why doesn't this pc handle incidents like that? Well, nothing to it. Spear went through you and of course phsst – momentary, you know? Flat and gone and you're out of it, and that's it. I don't get this idea of being stuck on the track," you see. "Hooh! Nobody should be stuck on the track. Why doesn't this pc just flick his attention out, you know? Well, I'll fix this pc up so he can flick his attention out. I'll pull this pc's attention out." Don't you see? This is the best mechanism.

You ask this same person (this is an actual case), you say, "Do you ever have a somatic in that area you just indicated that the spear went through during that incident?"

"Oh, yes, all the time."

"Well, does it have anything to do with that spear?"

(Person didn't say "all the time"; person said, "Yes, very occasionally, but ...")

"Does it have anything to do with the spear?"
"No, uh ... Well uh – or does it?"

"Well, do you have a lot of odds and ends of somatics of this particular character?"

"Oh, yes. I do."

"Are they connected with pictures?"

"No." (Actual conversation that took place.) "But I thought all that went out with Dianetics, and in Scientology you no longer had to confront all of these things."

Well, here immediately, of course, you have the tag end of every engram that the person has contacted is just stuck, stuck, stuck, and where are they all? They're all in PT. So what is PT to this person? PT is certainly just PT, but actually it's a jam of engrams; so therefore the pc should be in PT all the time – because the auditor is. The auditor is never out of PT, so therefore the pc is never out of PT. And this auditor will not actually guide the pc's attention through an engram, because there's no reality on it. The best thing to do is to yank the attention out of the engram. So the auditor will not control the pc's attention because escape is the better philosophy. Don't you see why this is? So there's the reality.

Now, there's a direct cure for this. And if you wanted to get anybody who didn't have (quote) "any reality on the past track, no reality on engrams, no reality on this and that" as far as these things are concerned, and was thinking people are being unreasonable who go into engrams and get stuck and whose attention are not in present time – this person, then, is not operating on a reality. They can't quite tell what the pc is doing, don't you see? So they're always worried about what the pc is doing. Because they themselves have never been in this identical situation, they get a little bit impatient with the pc, don't you see? So they're not actually doing a guided tour of a bank. They're doing a guided yank of a bank.

And if you were to run this process on that unreal case – it's just one process, a one-shot process – you would suddenly find that they would have an enormous shift of reality on what we've been talking about all these years. And the process is: "What unknown might you be trying to escape from?" That's the process. And at first glance, that would become a very brutal process, of course, because it'll just start unstacking this. And one of the first things this pc would see, who had this brilliant reality on the people on the bank who threw the spear, would be to find out the water was cold. And the pc, I happen to know, has cold feet all the time. Of course, there's that piece of that engram, see? So, that piece of that engram would be contacted. And you just keep contacting these pieces of the engram, because of course you're running the reverse mechanism now, not the philosophy of escape. But the only philosophy that works in Scientology is "confront it."

It isn't that you have to erase it; it is only that you have to become familiar with it. All you have to establish is familiarity with the bank; you don't have to establish an erasure of the whole bank. It would take endless time to do that.

And all of a sudden this auditor who's been having trouble guiding a pc's attention will not have that trouble anymore. They will recognize at once, "Oooh-ho-ho-ho-ho-ho, I've been trying to get the pc – oh, I see. My – my – pardon my red face! Oh boy, is this what it's like down here!" You know?
Now, what happens is every time this auditor yanks the pc's attention, the auditor is not aware of the fact that he has got the pc in one time stratum, called engram time, and is pulling the pc's attention to present time, and locks the incident the pc was in, in present time by an attention shift. Any kind of a mechanism, whether you call it faulty technology, changing the process, changing one's mind, doing something of this sort – whatever you want to define it or whatever rationale went with it – this is actually occurring. And of course, it is painful to the pc to have this happen; so the pc, of course, protests and this is a basic difficulty with ARC breaks. You get a basic difficulty at once, because the pc was there and now he's here, only he's not here and he's not there and where the hell is he?

It isn't that a pc should be regressed on the track and totally impressed by this past-time incident to a total point of overwhelm, but the pc is in another time stratum, usually, when he's being audited, even on a conceptual or permissive process. Pc isn't... appears to be sitting in present time, and the pc is not in present time. So, of course, the pc can neither be talked to nor handled as a person would be handled in present time. It is not a social tea party – auditing isn't. The pc is not there, really; the pc is in another time stratum. And if you practice the philosophy of escape on somebody who doesn't have to escape but is trying to do the bank, the auditor's goal is different than the pc's goal. And the pc is saying, "Well, I'm confronting it and I'm getting familiar with it, and here it all is."

And the auditor is saying, "Come away, come away, come away, it's dangerous." Reactively, this is what is happening.

So the auditor is saying, "Come away," and the pc is saying, "Let's stay here," and between the two, you get ARC breaks and arguments. You would inevitably, wouldn't you?

And as soon as the auditor takes a guided tour of this thing called an engram bank, you see, with the spears whizzing from both banks of the river – this particular person has probably never noticed that not only were there spears coming from one side of the river, but that probably there were whole volleys of arrows coming, too. Those somatics haven't appeared yet. You got the idea? There's other things missing in all this, and of course it all looks very mysterious. But the person gets down there and they're trying to escape from it – that would be their first action – spear goes through them, they say, "Escape." Boom! "Let's go."

Well, it's one of the basic thetan mechanisms. It's why he never as-ises much track. It's why he doesn't become familiar with his bank. So look how prevalent this thing is – very prevalent.

And a thetan would be in a bad way if, when you killed his body he couldn't exteriorize, see? So it's an absolute survival mechanism for a thetan. So, you see, it's not a bad thing to have escape philosophy or to be able to escape. But let me tell you, when a person is compulsively escaping, he of course never escapes. And when you get a pc that you're getting to escape all the time, of course he never escapes, and his case just winds up in a little black ball. You got the idea?

So, therefore, we can say that escape as a philosophy very much gets in the road of auditing when the auditor has this as a total philosophy, you see? And we can say also, then, that a case reality is very necessary in the auditor. But of course, what do we mean by "case
reality”? Well, "case reality" is willing to stay there and take a look, you see, instead of running out on the incident when it comes up.

These two things, then, are under the same heading and they are the same subject. A person who doesn't have a reality on the bank has consistently escaped from the bank; and then that person, of course, does odd things in auditing. And we say, "Well, that person is a bad auditor." "That person is not so good," or "That person doesn't get results," or something like that.

Well, we can say that much more succinctly and much more kindly now, much more effectively. We can simply say, "Well, this auditor has escape as a philosophy and hasn't got much reality on the bank. So therefore, when he audits a pc he doesn't know what the pc's doing." And when the auditor doesn't know what the pc's doing and can't fathom what the pc's doing; and the auditor thinks that the pc shouldn't be looking at all that stuff, too, of course we don't get any clearing. Because clearing depends on a familiarity with the bank.

I'm not telling you, you all stick on the track; I'm merely saying that it's necessary to have a familiarity of what can happen. You know, there you are in the middle of the river and the stuff is coming from all directions; and you're confronting it and you got it and you've got a sensation of fear or something, or confusion, already that's going with it, and all of a sudden the auditor says, "Well, that's the end of that process. Let's run something else." God, you don't know whether you're on the track or in present time or something like that. You've been betrayed, in other words.

But you could educate this auditor endlessly – just endlessly – without producing a single change in that philosophy, unless you hit the philosophy itself. Got it? You cannot educate an auditor who has that as a philosophy into giving what you would consider a smooth session of keeping the pc in-session and his attention on his bank. Do you follow that?

So that's exactly where that button sits, and that's exactly what button you press. And when an auditor makes consistent mistakes; when an auditor yanks the pc's attention; when the auditor is doing a lot of Q-and-Aing – there's more about Q-and-Aing – but when he does a lot of this, a lot of shift, we just assume that – that the auditor has a total philosophy and fixation of escape, and therefore is letting the pc escape.

And he isn't being vicious, he isn't trying to cut the pc to pieces. He knows what's best for the pc: "Get out of there, man!" Not even "Get rid of it," just "Get out of there." Pc starts to look a little bit indrawn, go into session, the auditor will pull him out every time.

You probably couldn't even list the number of mechanisms auditors use to effect this. So there's just no sense in putting up counter-laws to each one of these mechanisms that's used, is there? There's no sense in doing that, because we have the basic mechanism for it.

All right. Now, let's go a little bit further here. Here's another subject on this: Responsibility for the session. In The Original Thesis, way, way back when, you had the rules, the laws, the basic laws of auditor plus pc greater than the pc's bank. Pc less than pc's bank. Obvious, a pc must be less than a pc's bank or the pc would never be troubled by the bank, don't you see?
So that's why self-auditing doesn't work, by the way – the pc is less than his own bank. Also, he never can get in-session, because a bank won't go in-session. You can audit valences and that sort of thing. Oh, don't mistake me; I mean, there's... You can't say that self-auditing does not produce a result. It does produce a result but the result is quite minor.

And actually all self-auditing is, is remedying havingness on auditing. Self-auditing always, always, always begins on scarcity of auditing. A pc would always rather be audited than self-audited. But they could get to a point finally where auditing is so scarce... You know, people have been (quote) "auditing them" (unquote) without auditing them, and auditing thereby gets scarce. So, pc starts auditing and can come up to a point where the scarcity becomes so great that they begin to assume virtues, like the fox who loses his tail, you see? The great virtues of having no tail, the great virtues of self-auditing. Simply the lack of havingness of auditing can result to the fact where self-auditing can become quite a virtue.

Occasionally, once in a while, rarely, you'll have somebody say, "Well, I want to do it myself" – as far as self-auditing is concerned – "I really want to make the grade myself." And you look back over the history of the case and you'll find out they didn't feel that way a year before. They just didn't have auditing.

So you can actually have somebody sitting there, and an "auditor" (quote, unquote) there, and the person getting no auditing, don't you see? And this denial of auditing, denial of auditing – by being yanked off the track, by endless rudiments, by never getting anything on the road, by never really getting in there and pitching, you see, one way or the other, the person is being denied auditing. And the person will be denied auditing to a point where they self-audit. That's what self-auditing is.

You find a pc self-auditing, you can be sure that the pc has such a scarcity of auditing that your auditing is having considerable difficulty arriving. You don't have to do anything about it except just reestablish the pc's confidence in the fact that he is being audited and will be audited. That's basically what you do, is just audit, and the pc will come out of this. But it requires auditing.

But the pc less than the pc's bank – otherwise the bank would never be giving him any trouble. Yes, I know he's creating the bank, on how many vias and that sort of thing. But he's created a Frankenstein monster – and it's about to eat up Frankenstein, you see – called the bank. And Frankenstein's monster inevitably will eat up Frankenstein. He's created a bank. He's created all these various valences and that sort of thing. He's denied full responsibility for having done these things, and so on. And the result is that he's having difficulties with a bank.

This is not self-auditing now, I'm just talking about pcs in general. I'm talking about Homo sap; I'm talking about the farmer that's walking down the road; and I'm talking about this guy and that guy and the other fellow, you see? And these chaps are all in this sort of a state of less than the bank. When we say a man is aberrated, we say he's less than the bank. When we say somebody is psychotic, of course this person is not just less than the bank; this person is nonextant and is the bank. You see, he's done a... There's a total overwhelm, and that's all psychosis is: total overwhelm by own bank.
Now, the gradients of cases is the degree to which a person is overwhelmed by the bank. Now, recognizing this, that you're auditing somebody who is a bit overwhelmed by his own bank, and recognizing these laws in Original Thesis (simple and elementary as they are; they are, nevertheless, they're very sweeping in their truth in auditing), we get this kind of a condition here. The auditor has got to be cooperating and running the pc's bank, you see, and running the pc at the bank in order to get auditing done, inevitably. When the auditor withdraws from doing this, he collapses the pc's bank on him. You see?

When an auditor is auditing and suddenly stops auditing – like, you know, a shift of attention, spills the water glass, tips over the ashtray, something of this sort – he, of course, has to some degree withdrawn his control of the pc's bank, and you get a minor collapse. But there is a way to get a major one. And this has never been articulated before in Scientology and it's terribly important. Whenever you take a direction from a pc and follow it, you collapse the pc's bank on him.

[These poor guys.6] I know two or three fellows who will only let some weary, very weak auditor audit them, you see, and give the auditor all sorts of directions as to how to audit them. And of course this is just a self-audit. They don't make much progress. They make some, but they don't make very much progress. They're usually in misery. They've set up a booby-trap situation here, because of course the auditor is taking directions from the bank and following them. That's part of it. And the other part of it is, is the auditor has subtracted himself from the basic equation of auditor plus pc is greater than the bank. You see?

So, when the auditor takes the pc's directions, then it looks to the pc at once as though only the pc is confronting the bank; and he loses the illusion of the auditor's confronting the bank, and of course the bank then collapses on the pc. Do you follow this carefully? It's one of these simple arithmetical propositions. It's one plus one is greater than one and a half; but one is not greater than one and a half. And what you've done is subtract a one from the one plus one, and of course you get immediately the one and a half greater than the one. You've only got one left, you see?

You haven't now got a pc sitting in the pc's chair; you've got an auditor sitting in the pc's chair. So the pc is now both the auditor and the pc, only it doesn't add any ones. So instantly and immediately you, of course, get the bank greater than pc, and so therefore the pc is promptly and instantly overwhelmed.

Pc says, "I think you really ought to ask about that present time problem another time." Oh yes, pcs can do anything they like and they will say things like this, you see, in a perfectly good situation. They have sort of taken over – because of anxiety for auditing and other things – they've taken over the idea of auditing and they're afraid some auditing is not going to occur And so they sort of merge up and something in the bank is this and that and they sort of say, "Well, I think you ought to ask about that one more, because I think there is one." And the auditor does ask that one more. And instantly, pshew! the bank collapses promptly and instantly on the pc.

---

6 Editor's note: This sentence is not on the 1991 audio tape, but at the same time is contained in the 1991 tape transcript. It is not clear if this is a mistake or if it was in the original recording and was cut out.
Got an ARC break. You never notice it, because it takes an hour or so to swell up, but the pc thereafter is running on auto. All you've got to do is take one direction from a PC and you collapse his bank on him. You must understand exactly how that occurs, you see?

Here's the PC and the auditor and the pc's bank. And the auditor plus the pc are greater than the bank. Now of course, the moment that the PC becomes the auditor, even to just any tiny degree, you no longer have the equation of auditor plus pc. You have the equation of PC plus pc-being-auditor, which of course still adds up only to one person – the PC. And of course this is not greater than the bank. So you get a collapse of the bank. And I do mean a collapse of the bank. You can make the bank go psheow! – just hit him in the face. Blango!

Now, just look this over, because it's the first time we've ever examined this mechanism, in spite of the fact the laws are some of the oldest laws we have. I think the only two laws earlier than that is: Survival is the dynamic principle of existence; and the purpose of the reactive mind, purpose of the analytical mind – those are the only laws that are earlier than these laws – I mean, in terms of time and development.

So, let's take another example. Auditor says, "Do you feel all right now, or do you feel too tired to go on?"

And the PC says, "I feel too tired to go on."

And the auditor says, "All right. We won't go on." At that exact instant, you've collapsed the pc's bank on him. I mean, it isn't a simple thing, that the Pc is suddenly dismayed or goes out of session or something like this. An actual mechanical fact happens – whether the PC perceives it or not – the bank collapses on the pc. Of course, because the bank is being held out, basically, and the PC is being held in position and the bank is being held in position only by the equation of auditor plus PC. The presence of the auditor drops and the auditor ceases – that's what we mean by "ceases to take responsibility for the session."

Now, that's an esoteric statement; it hasn't any mechanics with it that give you any explanation. But that is the primary method by which the auditor does not take responsibility for the session. And that is the exact mechanism by which an auditor gets into trouble – the exact mechanism. It's down there to a hairline.

All the auditor has got to say is, "Is it all right with you if we run this an hour and a half?"

And the pc says, "No, I don't think so."

And the auditor says, "Well, all right. Then we won't."

Well, on the surface of it, it is the socially acceptable, kindest thing you can do. The poor fellow feels tired, so we just won't go on with it. And at that moment, we just picked up the stew pot and hit him in the face with it. See, we collapsed the bank on him. The bank will collapse – can be counted on collapsing – instantly that this occurs. He'll get a reaction from the bank, bang!

That means actually, probably, that the Model Session should be rephrased on a discovery of this magnitude. But worry about it until you see it in an HCOB, because it may be
and it may not be. Because basically the Model Session is written up just to get the illusion of courtesy. [laughter]

I say, "Well, is it all right if we end this session now?"

And the pc says, "No, it's not all right. I'm having a great deal of trouble here and I'm struggling around," and so forth.

I say, "Well, all right. I've made a mistake, and we're now going to end the session." It's always all right with the pc. I decided to end the session. If I decide anything else now merely because the pc told me something else, I've had it, because the bank just will go splat! Now, if I don't want this pc to be butchered up, I certainly better stick by my own ideas of what I should be doing, no matter how wrongheaded or inopportune or upsetting those ideas may appear to be.

So you just have to take fate in your own two fists on such a situation. You say, "Is it all right if I end this session now?" It's courtesy.

And the pc says, "Well, yes, it's all right. Except I'm pretty far back on the track." All this is, is a comment to the effect that "Well, you knucklehead, you didn't ask me where I was on the track before you sprung this other one." Don't you see?

Well, if you now say, "Well, all right. We will run it ten minutes longer in order to get you up to present time," you've had it at once! You'll never get him to present time. Why won't you ever get him to present time? Because you just collapsed the whole track on him, that's why! And then you probably didn't do anything to reassume the control of the session. Do you see what happens?

So you just never, never, never, never do what the pc says. You just never do what the pc says. You just never do what the pc says. I don't care how logical it is; I don't care how wrong you are. If you've given him a totally wrong, upside-down, incorrect instruction, you can do something more wrong than that.

You know, English doesn't permit the deepening of the word wrong. You can't be "wronger," apparently, according to English. But boy, I'm telling you, you can be wronger. It doesn't matter how idiotic the auditing direction was, how noncompliable the auditing direction was – it just doesn't matter. If the pc now gives you some advice concerning it and you take that advice, you are promptly and at once wronger. You have just lost the control of the session, but that isn't what's important. Mechanically, you've collapsed the pc's bank on him.

You just must never do it! That's just something an auditor must never do. He says, "All right if I end this session now?"

And the pc says, "No, it isn't all right. I'm stuck down the track."

And the auditor says, "All right. I'll run the process for ten minutes longer." Well, this is the kindest, most sensible, decent thing you can do, isn't it? And it winds you up every time in the soup. Then you probably will spend the next five hours trying to end that session.

Why? Because you are no longer auditing the session; the pc is. You haven't got an auditor plus pc greater than the pc's bank, so the pc of course can't come up to present time, so
he just struggles. See? The mechanics are just dead against it. That's the way the reactive
mind is, not the way I think it is.

So that is a primary method of getting into trouble. A primary method is to violate that
original equation. Auditor plus pc must both be there in order to be greater than pc's bank, and
when the pc says to the auditor, "Advice, advice," and the auditor takes it, of course then at
once, immediately, instantly, then, the pc becomes quasily the auditor. He is running his own
bank on a via, he's no longer greater than the bank; it only takes a split second to happen –
he's in the soup. Got the idea?

Well, it isn't that pcs mustn't give advice to auditors. By all means as a pc give the
auditor all the advice in the world. [laughter] You understand? Give him all the advice in the
world. If he takes any part of it, he's a lousy auditor. That's all. Because he at once passes over
control of the session. It's something tantamount to walking out in front of the troops and
handing your sword over, see? I mean, it's something of this order of magnitude. Promptly
and at once you've lost the war and that is it. There's going to be reparations charged and the
United States will be sending three-quarters of the national income over to rehabilitate the
country. But if the United States doesn't hear about it, then nobody is going to rehabilitate
anything.

Now, there's the whole situation in controlling a session. And there's the primary diffi-
culty an auditor runs into. Once more, it looks like pure kindness and it turns out to be total
viciousness.

All right. Let's take up one more point here. You can also put a pc at responsibility for
the session by a bunch of "pcs ought to;" and individual considerations about what ought to
be going on. This is a little more esoteric, but becomes less so when I say something like this
(this also comes under escape as a philosophy): "Well, he ought to be able to get out of that
very easily." See, the auditor says, "Well, he couldn't be in any great trouble. He ought to be
able to get out of that very easily."

Well, you see, what did he do? Even if he did it silently to himself, he says immedi-
ately, "Well, the PC is responsible for the condition he's in." And you will find the one plus
one greater than the bank also operates. That promptly operates, and the bank will cease to
behave. It's quite esoteric; it's quite odd.

You say, "Well, pc shouldn't be in that much trouble. A man of that age shouldn't have
all of those difficulties with women. After all, after you've lived for forty or fifty years, you
certainly should know something about women." You know, something like this. You have
some kind of a little unkind thought of this character. But it's an "ought to be," you see? And
you have just shifted responsibility for the session over to the pc, just as neatly as though
you'd suddenly crowned him with laurel wreaths. You see how you'd do that?

The Pc "ought to;" the pc "shouldn't ought to." Now, here's a whole class of things,
you see? "The pc shouldn't be screaming at me." Well, that would be the best way in the
world to bring the scream up four more decibels. Don't you see? That would operate at once
to put this PC at cause. So, of course, immediately eliminates and deletes the auditor plus Pc
over bank. It eliminates the auditor and of course, collapses the bank on the pc. You get how
this would work, you see? The pc "ought to;" "shouldn't ought to."
"Well, men are always like that." That isn't so bad, that type of consideration – it just
denotes an inability to do something about it, so an apathetic acceptance of a condition which
one is confronting. Well, this merely lowers control over the pc's bank slightly; it's not a very
great thing. Well, that doesn't amount to a great deal. It's when you really drop it out; when
you really say, "Well, the pc should be" or "the pc shouldn't be," or something of this sort –
Bang! You see, you've gone into the same old violation of this original rule.

No, a pc is doing what the pc is doing. And the pc ought to be doing what the pc is do-
ing. You see? And the pc oughtn't to be doing the things the pc isn't doing. And the pc does
what the pc does. You get the idea? And considerations as to what the pc should be doing up
on top of this, of course, interrupt responsibility for making the pc do something. You get the
idea?

Now, of course, so long as your intentions are totally wrapped up in what the pc ought
to be doing with inspecting pictures and so forth; you, of course, are making this occur! You
are doing this, you see, so it isn't an "ought to be" or a "shouldn't be" or something like this,
see? The pc is going up and down the track and around the bank. Well, he ought to be doing
these things, you see? And you know that he should be doing these things and he knows that
he should be doing these things. He should be following the auditing command and you know
that he should be following the auditing command, and all that sort of thing.

I'm not talking about that class of thing. I'm talking about another class entirely; that
instead of making the pc do or become what you want the pc to do or become, you add this
sneak one into it, you see? The pc "ought to," you know.

And you sort of said faintly to yourself, "Well, I'm not doing anything about it, and he
shouldn't really be upset about that ARC break. That's really nonsense. He shouldn't be upset
about it. He shouldn't be – oh well, it's a... Well, he shouldn't have that present time problem,
not now. We've only got two hours here and, God, he shouldn't have this present time prob-
lem. No, no. Heavens on earth."

No, the pc has got what he's got, don't you see? You just look at what the pc's got, and
then you can go ahead and you and the pc can make him "got" something else, don't you see,
with greatest of ease. But if the pc "ought to" without any further action on your part, of
course what do you wind up with? You wind up with a collapsed bank. Is that clear to you?
That is not as serious or as general as the other.

Now, Q and A – Q and A. Every time the pc says something you follow it, is the most
prevalent method of Q and A.

You say, "Well, how's your mother? How's that about your mother now?"

And "Well, it's not my mother now, it's my father."

"Well, how about your father?"

"Well, it's not my father so much, it's ... My father's okay, but it's actually my Aunt
Bessie."

"Oh, well. Well, all right. Now, how does that apply to your Aunt Bessie?" And by the
time you've done this of course, you of course are doing two things. You're letting the pc spot
what you ought to be auditing – you've dropped responsibility then – and you of course permitted him to escape from the original questions and you haven't followed it through. You're permitting the pc to escape. And the pc will go along a whole sequence and series of escapes. And if you follow along this sequence of escapes without ever once saying, "Whoa, now, pc! I asked you about Pop. I want to know about Pop and I'm not interested in Aunt Bessie. Now, Pop!" You can say it as rough as you want to. It won't affect the pc, because he knows confoundedly well that's what he ought to be doing.

And he says, "Oh, oh, oh, oh, I – ha-ha-ha-ha. Fly cops are on my trail, and I didn't get a chance to duck up that alley. Well, I guess I just better not. So that and I better come back here and take a look at Pop. Okay. Well now, what did you want to know about Father?"

You say, "Well, all right. I just wanted to know how that was about Father?" "All right. Well, it's all right about Father."

"Now, what else about this? Yeah, well, how is it all right about Father?" "Oh, kill the son of a bitch as quick as look at him, that's how all right it is about Father," and so forth, see.

"Oh," you say, "well, all right. Now, you got a picture there or something"

"Well, sure I got a picture there! What else do you think I have?"

"You've had a picture there?"

"Oh, yes, of course I've had a picture there!"

"Well, all right. Now, what don't you know about it?"

"Well, I don't know this and I don't know that and I don't know that and don't know that and don't know that and don't know that, there, there, there, and ..."

"What else don't you know about it?"

"Well, I don't know so-and-so."

"All right. That's fine. Now, you still got a picture there of your father?" "No."

"All right. Now, how about your father?"

"Well, all right. Take him or leave him."

"Okay. All right. Now, we'll go on to something else."

Got the idea?

The pc never wants to handle what you want him to handle. You can just put it down – he never wants to handle what you want him to handle. I don't know a pc yet that will handle exactly what you want him to handle! When a pc sits there smiling sweetly, I get very, very suspicious.

I say, "What are you looking at?"

He said, "The same incident you told me to look at."

"Yeah, well, what incident was that?"

"Oh, this incident about picking these flowers out here in the field."
And I say, "No, we had an incident there about burning down a house. What happened to that?"

"Oh, you caught me. Oh, well, all right. Burning down a house," and so forth. And somewhat grumpily they'll go back in and look at it. But they don't like you when you let them escape, because they know way down deep that it's wrong. They know way down deep that it's wrong. They know the road out is the way through, and the road out is not a bounce.

The guy has been running away for two hundred trillion years; and he's looking for somebody to stand and hold the ground and say, "All right. Let's pick up these devils one by one and fight them down."

He will say, "That is the most horrifying, shuddering thought that anybody has ever pushed in my direction, but I know damn well he's speaking sooth." [laughter]

Now, it actually hasn't worked for the last two hundred trillion years – running away. So, he says, "Well, here's a picture."

And you say, "Good. Got any other pictures?"

"(Ah, these guys are going to let me run away.) All right. Yeah, I got some other pictures."

"Good, you got any other pictures in there?"

"Oh, yes, I've got some other pictures in there."

"Oh, yeah. Well, how's your father?"

"All right, fine."

"And how's your mother?"

"Okay. Fine. Oh, yes," and so forth. And the fellow says, "Well, it wasn't my mother I was thinking about, actually. It was my Aunt Bessie."

"Oh, well, how's your Aunt Bessie?"

And the pc right at that time says to himself, way down deep someplace, "That's all we're going to do now is escape, and I know that it isn't the road out." So he has ARC breaks because he knows he's not getting auditing.

It's a very funny thing. Not overwhelming a pc, not pounding him down.

Pc says, "I have to go to the bathroom."

You say, "You damn well sit there and don't go to the bathroom," and so forth.

And the pc says, "Well, I have to go to the bathroom, it's a present time problem," and so forth.

And you say, "Well, I'm not going to let you go to the bathroom till 4:30. That's the end of session and that's the end of it," and so forth.

Well, you keep this kind of thing up forever and eventually the pc gets an overwhelm. He's pounded into a position. See, all of this stuff is moderated with reason, don't you see?
That isn't any kind of a session direction. Pc says he has to go to the bathroom. All right, say, "Go to the bathroom." All right. Now go into session. You'll find he's slightly out when he comes back. So put him into session again; put him into session again with a crunch.

But five minutes later he says, "I have to go to the bathroom."

You say, "I've heard that before. We're now going on with the session." He'll be back in processing again.

Invalidation is the basic overwhelm. The pc says, "Oh, it was my father doing all this!"

And the auditor says, "It couldn't possibly have been your father." You get the idea? Now, there's where overwhelm comes from: invalidation.

Pc says, "I think it's an automobile mechanic. I think it is."

"Couldn't possibly be an automobile mechanic," you know?

You could run a whole case, possibly, by saying, "Who's been invalidated?"

See? What's death? Death is invalidation – invalidation of a terminal. What's sickness? Invalidation of a terminal. What's punishment? Invalidation of a terminal. I mean, all things add up more or less to the invalidation of a terminal, don't they? And as a result, why, you've got a button there that you've got to lay off of, which is just invalidation.

Pc says, "It's made out of green soup."

You say, "All right. Solid green soup." As far as he's concerned, that's the way it is. It's just that's the way it is.

And this sort of a matter-of-fact situation is – in a few minutes the pc says, "I made a mistake. It is not green soup." The wrong thing to do is to tell him, "Why, I could have told you that earlier." [laughter]

You're taking him on a tour of a bank. You're getting him familiar with various things by various mechanisms. He'll wind up in the other end not afraid.

Now, what basically then, would best answer up these conditions? Certainly not escape. Don't let him escape. Make him face it up. You're always safe.

Pc starts using rudiments for escape – omit them. Always the better choice is to audit – always the better choice.

If the pc gives you directions as to what you ought to be doing in the session, give him the cheeriest acknowledgment he ever received and go right on doing what you were doing. Don't ever shift. Now is the time not to shift, because you've run into some kind of a valence or a machine which tells you "Change, change, change, change" and you start going change, change, change with the pc, it's a Q and A, and of course you're going to get no place at the other end.

Now, these are very important considerations in auditing. And if an auditor were to do these things, pay attention to them and handle those things, he actually could be quite ignorant of some other facets of technology and he'd still win. He'd be right in there pitching.
No, there is no substitute whatsoever for having a reality on the bank. There is no substitute for it at all, because now you know what's happening to the pc, you know where his attention is, you know where he's going, you know what he's doing. And you don't make the mistake of believing he's in present time and this is all a social chitchat that we're indulging in. We've known auditors who have thought auditing was that, and they always, of course, wound up with pcs with no gain and tremendous ARC breaks and rudiments out all the time and that sort of thing, because the pc's attention was never in session.

The basics of auditing, however, require that the pc feel able to talk to the auditor, so you don't necessarily shut the pc off about things like this or directions like this. You let the pc tell you. But it's a great oddity that when the pc has told you that the process is wrong and that he's having difficulty answering it – it would be a great oddity if, when you acknowledge this, and you say, "All right. I'm sorry, but that's the process we cleared, and here is the next auditing command." And the pc will say, "Oh, hell," then he'll go on and audit it. And you'll wind up, oddly enough, without any much of an ARC break.

But you say, "Well, now let's see; let's just shift the process. He says he can't answer this, so let's change the wording of the process." And of course, don't be amazed that for the remainder of the session, and maybe for the next couple of sessions, you get absolutely no change of case. Why? There's no auditor there. Why? Because the pc did the auditing.

So these various considerations are right there amongst the fundamentals, and they're things to pay a great deal of attention to. And if a pc is moving through a bank you should have some idea that people can get stuck on the track. And you'll get an idea of "other time-ness" than here and that things can happen, and that somatics and so forth are directly connected with pictures (which they are) and that sort of thing. There's no substitute for that sort of thing.

And in training auditors, one of the things you should always ask an auditor is, "Well, do you have any reality on an engram? Do you know what an engram is? You ever seen one? You ever had a somatic out of one?" Not necessarily "Have you ever had sonic?" or something like this, but "Have you ever seen one of these engrams?" and so forth. "Well, have you ever had a moment there when you were on the track when you did not quite know what was happening?"

"Oh yes. Yes, yes, I have. Yeah, ooh-oooh, yeah, ooh, well, sure, yeah. I was running this one about elephants and these elephants were walking all over me. Goddamn it. And I don't think it ever got flattened. Feel an elephant's footprint on my chest right now."

Ah, this is a safe auditor. Why? He's not running a big philosophy of "escape, escape, escape is the road out," don't you see?

If you asked this auditor, you say, "Well now, have you had any reality on the track?"

"Well, I've read about it in Dianetics: Modern Science of Mental Health."

"Well, have you ever run into an incident? Have you ever run into an engram?"

"No. No, I know they exist, intellectually. I have good intellectual reality on them. Ron wouldn't lie to me about that." [laughter]
No matter how kind this auditor appears, this auditor is not safe as an auditor. Why? Because this auditor practices escape. That is the only reason why the auditor has never seen an engram, you see? So if they've practiced the escape from the bank, they have practiced the escape in auditing, and they will yank pcs out of session. Okay?

These various considerations are very pertinent to training, to auditing, to understanding; and I give them to you at a time when they're easily remediable. There is no difficulty with these things. I'm not citing you any 120-foot board fence that you have to climb over with your fingernails. That process which I gave you is the most revealing process to somebody who has no reality on the track. That is most revealing. They say, "Ooh, wow," you know? "This is what I've been pulling people out of. And it was a good thing I did, too!"

[laughter]

Okay. Well, possibly many interpretations could be made of this particular lecture. But just remember that it, too, just means exactly what it says, which is do the auditing, get the show on the road, get the most auditing done in the least time that you can – your pcs will be very happy with you and they won't ARC break, either.

And you'll be amazed how seldom you have to put the rudiment in. When you come into session, you bang yourself down in a chair, you move the pc's chair slightly. You tell him, "Sit there. Hold the cans. All right. We are now going to start a session. Start of session. Good. Now, process we left unflat yesterday was so-and-so and so-and-so. The first auditing command is..." – bang! Pc will say (pant!) [laughter]... He'll say, "But wait a minute. I'm not even in-session. You haven't run any rudiments. You haven't done any this or that." "The first auditing command is..." – bang! "Answer it, answer it, answer it. Answer it!"

The pc says, "Well, let's see. What is it again?"

"You heard it. Answer it." [laughter]

"N-ohhh-uh... Yep, what unknown stomach. What unknown stomach."

You say, "Good. What unknown stomach don't you know nothing about?" [laughter]

The pc answers the auditing question. Chops back at you maybe a little bit here and there – says, "Boy, this is rough, man. You're rough, rough, rough, you know? Do you realize I'm stuck all over the track here; I got everything all messed up; I don't know whether I'm going or coming. And you just keep pouring these auditing commands at me."

You say, "Good. Here's the next one."

Pc, at the end of twenty-five hours – he may or may not tell you anything about it – goes around and tells the D of P or another student or somebody like this, "My God, that person certainly gets a lot of auditing done! We've certainly had a lot of auditing done. Yes sir, that person really will audit." And the whole aspect of the thing changes.

Now, I'm not recommending that you let the rudiments be out; I'm not recommending these various things. I'm just giving you the frame of mind in which sessions run well, and they do run well when they do that.
When the pc says, "I think I ought to be running something else," you say, "You probably should be. But right now we're running so-and-so."

Pc is all ARC breaky about not running something else: "But my last auditor... But my last auditor was running a five-way bracket on Mother, and it was never flattened. And I just keep telling you this, that it was never flattened."

You say, "Well, all right." And at this point you might think to yourself, "Well, maybe I ought to ask what part of it isn't flattened. What was the auditor's name?" Something of the sort. And, man, you are handling a twelve-inch stick of inch-thick dynamite with the fuse lighted. This is a booby trap; don't fall for it.

You say, "Well, good. Good." Even cheer him up. Say, "Well, I hope it gets flattened someday." [laughter]

I think you'll find that this is the winning card. And if you look this over and you follow some part of this and you get an understanding of this, why, I think you will get some fantastic auditing gains, and your days of loses will simply be in the long-distant past. Okay?

Thank you.

_Audience: Thank you._
AUDITING QUALITY

A lecture given on 30 August 1961

Thank you. Well, this is the what?

Audience: 30th.

Let's see if you're right – by George, you are. 30th of August, AD 11. The year of the Clears.

All right. There's probably a lot of questions you'd like to ask. The first question you should like to ask is whether or not if running an auditing session is so important, why, then that omits all of the rudiments, doesn't it? Well, I said yesterday, you see, that if – the – if you had to choose between the two, why, you'd run a session. And if the pc rudiments were very upsetting to the pc, and so forth, and he felt he was getting no place with rudiments, and so forth, of course you have a pc out of session, but I said there is an adjudicative thing here.

There is a point where you can have far too much rudiments, you get the idea, and far too little session. And there is also – and I said this yesterday and I want to point it up again – there's also a point where you can have far too little rudiments.

Now, if you expect 1A... I just got a subjective reality on this just a little while ago. If you expect 1A to handle all the present time problems and, therefore, not handle a present time problem which the pc has given you to be handled, every now and then you're going to make a terrible mistake. Every now and then you're going to make a terrible mistake, because you can put it down that a present present time problem – you know, short duration present time problem – is not necessarily handled at all by any process in 1A. You got that? You got that?

Here's an example. I just had this, matter of fact. Pc comes into session, gives the auditor a goal. He wants to get rid of a present time problem – and life and livingness – says, "Well, I'd like to get this particular person out of my hair," you got the idea? One, two. Rudiments are run, needle falls off the pin on a present time problem. Auditor goes ahead and runs 1A. Net result, no session. Why? Well, 1A is not addressed to the present time problem, so one doesn't feel that the auditor is participating at all in the auditing of the case.

The permissive wandering around looking at unknowns or present time problems or something of this sort – particularly a 1A version in which no problem is ever mentioned; you know, just "Look at unknowns, look at unknowns, look at unknowns" – and a pc could very well go out of session, very thoroughly. You see, he's really got it bugged. He doesn't want anything to do with this present time problem, so actually he's sitting there in a state of no-confront. You got the idea? So, of course, you run a permissive process, he will not then confront the present time problem even though he wants to get away from it. You see, he just bounces off the problem, and he's running a – you're running a case who has a present time
problem in wild restimulation. Got the idea? But of course, the reason he's got a present time problem is he doesn't want to confront some part of it.

So, naturally, you're permitting the pc, then, to do a non-confront on the present time problem even while you think you are busy running a process which handles all problems, so we won't bother it. You see, the very problem that he will not have anything to do with is a present time problem which he told you he wanted to get rid of and that you found in the rudiments.

Therefore, 1A does not scoop up a present time problem. You got it? Present time problem of a short duration, something like this, or actually a present time problem of long duration has a great deal of no-confront mixed up in it. And you got this tremendous quantities of no-confront. All right, you run a permissive process on that exact subject, the auditor is then not controlling the pc. And the only thing that comes through to the pc is that the session is not controlled.

You see how that would be? Quite interesting. Quite interesting. But, all of these things are subject to judgment. The safe way to play any auditing session, of course, is to have all your rudiments in, to get all of your rudiments in.

Now, I didn't say that you couldn't run a 1A-type process immediately against that exact present time problem. But the auditor is in there making the pc confront it, see. So that isn't then 1A. You're using a 1A-type process to handle a present time problem with a pc, which is what fell on the meter, and, of course, the pc'll be getting someplace if you did this.

Well now, a pc never feels he's wasting his time if the auditor is fulfilling one of his goals. It's when the present time problem, the handling of it, is absolutely no goal to the pc, and the pc sits down and hopes to God he doesn't have a present time problem. He isn't really aware of having one, but he hopes to God he won't have one. He wants to get on with his Pre-hav run on the goals terminal and get the show on the road, and all of a sudden the auditor looks up and he's got that moving-needle-look in his eye. [laughter] And the pc says, with faint heart and despair creeping over him, "Oh, no, there isn't a present time problem here?"

And the auditor says, "Oh," he says brightly, "yes, there is."

Well, the pc says, "Well I don't know what it could be."

And the auditor says, "Well, let's see what it is."

Now, the only thing that'd get you over that barrier is smart auditing. Pc says – he knows dimly they're going to repossess his car tomorrow or something of the sort and he doesn't want to think about it.

Well, I'll clue you: If you pass that up or if you pass up any falling rudiment, or any reacting rudiment, you've just set yourself up for no session. That's why there's judgment involved in this thing. It's one of these horrible facts of life. Every once in a while, why, Mama will get daughter and take her down, and sit down in the kitchen, pour her a cup of coffee and let her in about men. The horrible facts of life, you see. Or tell her about Father.

And this is – this is an analogous sort of thing, you know. "Yes, Gwendolyn, you were actually born in a cabbage patch. You weren't born, really, at all. You were found there." And
it's just one of the brutal things you have to face about auditing, is that as you come down the line you've got rudiments to cover. If your rudiments are out, assessment cannot occur, and also you're going to set up problems and trouble in the auditing session. Pc has a present time problem. Present time problem isn't handled, the immediate next result is an ARC break. I mean it goes one, two. ARC breaks always stem from a present time problem. The present time problem, however, should not be looked at by the auditor as always exterior to the auditing session.

If you preconceive what a present time problem should be, well, that's just an ought-to-be that you're running on the pc, don't you see. What is a present time problem?

I remember in one ACC I startled all of the students by finding that 50 percent of the class had present time problems known as an auditing session. It was the auditing session which was the present time problem to the pc, but nobody had ever inquired about an auditing session. I think it was the 18th. Nobody had ever inquired about an auditing session.

"Do you have a present time problem?"

"Well, yes, and yes, and so...." and they didn't know, and the auditor would guess at this and that, and the pc didn't know and the pc would be saying, "Oh, my God, don't tell me we really have to run a present time problem here. I want to get on with this Help on the Rock," and so on, and this was the way it was going, you see. But factually, the session itself had some present time problem factors in it and none of the auditors ever sorted these things out.

I looked over a few shoulders and realized that what was going on here is, the idea of asking for a present time problem sometimes restimulated a present time problem which was dormant up to the point it was asked for. And that can happen, too, you know. The pc's sitting there, he's minding his own business, he's being a pc, everything is going along just dandy, and splendidly, and he hasn't got a care in the world. And all he wants is an auditing session, and then the auditor says these fatal words, "Do you have a present time problem?"

And the pc says, "Let's see, now. Oh God, yes, yeah, oh-oh, yeah."

But he – would it – he'd tell you at the same time, "I wouldn't have unless you'd have asked me." You see, present time problem wasn't worrying him, and he sort of postulates it into view as a present time problem. You get the idea? Actually, he probably could have gone on to the end of the session and straight on out, and he never would have thought of the fact that he's supposed to take cake home to his mother-in-law, you know. It's always a present time problem to give something to your mother-in-law.

Well, I was very shocked one day. I was around and found out that this ancient joke about mother-in-laws wasn't necessarily true. I found a husband who was very enamored with his mother-in-law and hated his wife. [laughter] He and his mother-in-law got along fine, you know? Used to go around to the dances and everything. Anyhow, wife was very disapproving of the whole thing.

Anyway, he's got to take cake home to his wife and he hadn't thought of it, and he probably wouldn't have thought of it, except it's labeled under the heading of "problem." "Do you have a problem?"
And he sort of thinks to himself, "Problem – that's something that you're supposed to do something about. Am I supposed to do something? Yes, I am supposed to do something. I was supposed to take cake home to my wife. Well, God, I'll have to sit here for the rest of the session and remember this now, because I'd comfortably forgotten it, of course, and never intended to take any cake home to my wife." You know, some kind of a weird, oddball combination goes through, and a present time problem charges into view that wouldn't have been into view. So the subject is – sorts out amongst the facts of life.

The rudiments are dangerous ground.

Saw a picture the other day of a Ford Interceptor motor-powered boat. All the advertisement was about a Ford Interceptor motor going up the Grand Canyon, going up the Colorado River at some fantastic rate of speed. And the ad was all about this motor, see. It's had me in total mystery ever since. You talk about a not-know! What the hell kind of a boat is this that can go at about thirty or forty miles an hour up against the Grand Canyon, banging its stern and so forth, and it's bows onto rocks at a high rate of speed, don't you see, and actually make it 365 miles upriver? And the other thing is, who the hell did that? [laughter] You know? Had me in mystery ever since. I got a record up here that says the "Grand Canyon Suite," or something of the sort, and I sat there and during the whole time, you see, I couldn't hear the music at all. I was thinking about this Ford Interceptor going up the Grand Canyon. [laughs] Stuck me in total mystery.

But if I'd never seen the advertisement, I wouldn't be worried about it, you got the idea? And I'd probably be able to enjoy the "Grand Canyon Suite," and life would be marvelous. When somebody shoves this advertisement under your nose, you know, and you're being audited, and – so help me Pete, we never have realized before there was such an unknown, such a mess about it, and we postulate at that moment that it is a problem, and then we go on and have to handle it as a problem, and this becomes very boring. And we find tremendous amounts of auditing are being consumed on present time problems. And this itself – now listen carefully – is the only present time problem: getting auditing.

So it solves very nicely that the pc who is a – gets bugged every time you say to him, "Well, do you have a present time problem?" He says, "Oh, my God, oh yeah, oh yeah, I do. Hmm," and so forth. The only thing you're running into is scarcity of auditing. The pc is afraid he isn't going to get audited. There's a tremendous scarcity of auditing. All right, that amounts to a present time problem, so you have a pc there trying to make two sessions out of every one session. And as a result you get very slow gain.

There are numerous games that men play. You go out here on the golf course, other places, and you'll find they're playing all sorts of games. The Scots invented this game because it only requires one ball. And you'll find these fellows out there, and they have such an anxiety to hit the ball right that they go into the woods, the trees, knock the caddie off on the 18th hole when they're playing hole number 7, you see. But they have this terrific anxiety. I've heard pro after pro say, "Relax! Now just relax and go through the motions."

Every once in a while the fellow wouldn't have anything on his mind, and he would accidentally step up to the ball and go through all the proper motions and there goes a 265-yard drive, you know, right down the middle of the fairway, you know, right on to the other
green. One small putt and he's in. He's got an eagle, you know! Well, his anxiety now sets in. How did he do it? [laughter] So he's got a new anxiety.

I suppose golf pros never, never, never would get rid of this anxiety problem because otherwise they'd never have any pupils, don't you see. Because this particular pressure – you know, "have got to do it," "have got to get it," "have to press, to press" – somehow or another is just too much, you see. And it gets everybody upset and then they have to have golf lessons, of course, to overcome this but, of course, the golf lesson doesn't ever overcome it. It's quite remarkable when you look at it. The anxiety to do right often winds up, you see, in a total fiasco. You're just so anxious to do right, you see, that you wind it up and it's just a total fiasco, you know. The ball is in the woods and the pc is flat on his back weeping silently to himself someplace, you know, and there's been no session, no golf game or anything. It's just anxiety.

Well, it's the postulate. The trick is, about golf – and you'll understand it about auditing – the trick is – is a very simple trick: The guy has already postulated he can't do it. He must have, if he feels nervous about it. He's postulated that he can't do it, you see. So this fellow has an idea that he can't have a session before he starts getting worried about trying to have a session. So it's – it's just a red flag that's hanging up there with storm warnings from the truck to the foot of the mast. It's very obvious if you'll take a look at it. Anybody who starts pressing on the rudiments has a present time problem called "How am I going to get audited?"

So don't – from here on just don't worry about that phenomenon. You go down the rudiments – I say, well, it's one of the facts of life that you have to face that you have to go down the rudiments. And you go down the rudiments – don't make a big deal out of it – but you get to the present time problem, the pc starts sighing and moaning, and so forth, and he didn't know he had one and now he's got one. Don't you see what he's doing? He's trying to have a session and of course, this triggers the fact that he can't have a session, so the best way not to have a session is to have a present time problem that is mixed up in the session, and "Oh, my God, I don't want a present time ..." Well, what does all this add up to? Don't you see. It adds up explicitly, instantly to the fact that he has a scarcity of auditing. He's got such a scarcity that it's very, very valuable, therefore, it has to be done terribly, terribly right, do you see. And he's got to get the most session he can possibly get into that unit of time.

Well, he's pressing so hard as a pc that he will actually sit there and do additional commands and try to make a session out of it in some oddball way. And you the auditor often sit there watching a pc getting audited, not realizing that the pc cannot do the auditing command. But the pc is pressing so hard, trying to make a session out of it because of the scarcity of auditing, that he doesn't give any real evidence of not being able to do the auditing command. There's something wrong with the auditing command. There's something undoable about the session. And yet he's in there trying to make a session out of it.

Now, maybe you could do the process, but that is no criterion on whether or not the pc can do the process, don't you see. So he'll inevitably substitute a process in there that he can do in some fashion or another; he'll put additional auditing answers in there or commands in there or something of the sort, trying to make a session out of it. And all this comes under the
heading of "trying to make a session out of it." And if you've got a pc around who is desper-
ately trying to make a session out of it, you have a pc who has a present time problem called
the scarcity of auditing.

Now, it's perfectly all right, right off your bat to call for that one. Only it sometimes
may be phrased as a scarcity of treatment. You get one off the street – raw meat walks in off
the street, and so forth and you say this person has never been audited before, how could he
possibly have a scarcity of auditing? Well, of course, he's got then the greatest scarcity of
auditing there is: he's never had any; he's never even heard of it. But the point is, he does have
a scarcity of treatment.

There is a terrible scarcity of effective treatment. As a matter of fact it has been zero
on this planet as nearly as I can trace for about fifty thousand years. It's just been zero. There
was always a repercussion on the treatment. You go into the Aesculapian temple and they
slipped you the hellebore, and after you've had your fit and your dream and a few things like
that, why, you were all cured. You didn't have paraclosis, or something, but you certainly did
have – you went on having these fits. You get the idea, you know. And keep having these
dreams and these fits, and that's worse than the paraclosis, you know, and all these things.

So you go to a medico, and the medico, he cuts out your zorch and there you are:
you're zorchless. And you say, "Well, that was good. That was awful good to get rid of that
zorch, the horrible things it was doing," and so forth. Only now you're operating without a
zorch. And this'll catch up with you sooner or later because the body is designed to be run
with a zorch.

Every once in a while the medico elects some part of the body as dispensable. And
now it's tonsils, now it's appendix, now it's this, now it's that, now it's something else. One of
these days they'll elect the head.

And the – the general situation as far as this is concerned, of course, is – is a conse-
quence to treatment. So treatments which have consequence make, of course, effective treat-
ment very scarce. Bad treatment makes effective treatment very scarce, naturally. The person
is then frightened of having any treatment. He's frightened of having any treatment because
he's had so much ineffective treatment. Got the idea? I mean that's – in other words, some-
boby has run a "can't-have" on him.

You know, the medico up here with the chromium plated, zitherproof operating thea-
ter, where only two colleges of surgeons and eight universities full of students are cheering in
the amphitheaters as he delicately amputates a zorch. You know, nice, quiet, orderly operative
procedures, you see. And everybody knocked out cold unable to perceive anything that's go-
ing on, you know. And it's a real ball, you know. And you wake up in the hospital room with
no awareness of having gotten to the hospital room and you say what happened and you fum-
ble around and, by God, you've got no zorch. You know, something of this sort.

And you lie there and you can hear the blood dripping on the floor; nurse comes
around on her midnight rounds (she's been out having tea or something of the sort). You go
up at this local abattoir, pardon me, hospital, [laughter] and you find – you find accident cases
and everything else just trundled into the front room, you know, and skipped. And hours and
hours and hours will go by. Nobody ever comes near them. You think I'm kidding you but that's the way she rolls.

All right. Now, the more instances of that a person has committed, the more instances of that, you see, that they have received, why, the less treatment there is. Of course, because these things aren't treatment. So you can actually get somebody who gets terribly anxious for hospital treatment because he's never had any treatment in a hospital, you got the idea? He's kept going to hospitals but they never treated anything. And he just gets into a total anxiety, you know. He wants treatment, he can't have treatment, and – and there it goes. And he'll get into a terrific wingding. So it makes quite a problem. And it goes over into auditing. And auditing would almost inevitably have its roots in circa twentieth century maltreatment, instead of treatment, you see. Punishment instead of treatment.

They do some remarkable things of one kind or another. I myself have run into a few head-on. Had some sinusitis one time so they started pulling teeth, that was a great one. Had nothing to do with it, either. Became obvious even to the medicos a short time later, you know.

I was in a hospital one time and my stomach wall wouldn't heal. Been messed up. And so they kept feeding me custard. And after about the 465th custard, I just had some kind of an inkling – I was coming around a little bit. Actually, what was wrong with me was I was utterly exhausted. I'd just been in combat theater after combat theater, you see, with no rest, no nothing between. And it sort of came to me that this was not the sort of a diet that I myself would select of my own free choice. [laughter]

So I used to slide out with a good-looking nurse, and – beg your pardon, she was a WAVE. And she knew where there was a wonderful Chinese noodle parlor. And so after I'd eat my custard, she would come in and we would go out the back gate and we'd go down and I'd have several egg foo yungs. And you know, soothing things like sweet and sour pork, you know, and so forth. I started to feel better, started to get back on my feet again. And it was those custards – I kept telling the doctors, you see – those custards were absolutely marvelous, particularly when served in Chinese restaurants under some other name. You weren't supposed to eat anything else, you see.

So then finally, finally, through the connivance of a couple of hospital corpsmen and several pals in the Marine, why, I got the wrong meal ticket issued to me, and there was a special diet table where they fed people nothing but steak! [laughter] So I do know where all the steaks went that the civilians didn't get, because they were all served at that table. Huge piles of steaks would come in, you see, and I'd demolish four or five of these steaks and feel much better.

The medicos never found out about this. And I finally got restored to duty, "Certified for continental limits of the United States only. To stay where a proper diet and ration and adequate rest are assured." And of course, the next piece of paper back of that says, "Ordered to the Fifth Amphibious Force," you see. [laughter]

And next hospital, just same sort of nonsense going on in all directions. I walked in the front door under protest and they said, "Go to bed."
And I said, "Why?" And I said, "I feel perfectly all right, and beside I have a date tonight in Monterey."

And they said, "Well, Monterey is much too far away, and you're going to bed." And the nurses around there – these girls that got turned down for the women's teams on the Olympics, you know, they're really husky – and so I went to bed and, by damn, they put me there for two weeks. There was nothing wrong with me. I was just supposed to report to the hospital. Two weeks I spend in bed. Of course, you know me, I wasn't two weeks in bed, but that was what the orders said. Their windows open from the bottom and the top.

But after a while, you get – the dim notion starts to penetrate, you see, that there's no treatment available. You just get this dim notion. It somehow or other enters from – like a ray of light, through the upper windows of the cathedral. And it goes into your medulla oblongata and it goes splank! And you'd say, "There is no treatment being offered in any direction for anything. What do you know!" So you start checking around and find out this is true. Of course, immediately it's a "can't-have" on treatment of various kinds whatsoever.

Sometimes quite the reverse has happened. Some kid's born in a family that they're all sold on the idea that if you bite rattlesnakes or, I don't know, something, you know – I'm indiscriminate as to races. If you just bite enough rattlesnakes, why, you develop strong teeth, or something like that. And this kid happens to have very soft teeth, and they need to be pulled every now and then and nobody ever pulls his teeth.

There are probably people in this room who had parents who had bugs on the subject of medical treatment. Either you had to go and get treated – particularly right in the middle of the basketball season or something of the sort – or you must never go and get treated, you see. Both of these two extremes result in, of course, no treatment. So it gets to be a problem. And it's carried over into auditing. Just the long and the short of the thing. It's carried over desperately into auditing.

Where you've had ineffective healing practices running on a planet for a while, nobody thinks anything can happen. So that's a terrific scarcity, don't look at it in any other way, you see. The – a "no treatment at all" could be a total scarcity, don't you see, but it still adds up to scarcity. And now we're back to Scientology 8-8008, scarcity and abundance in all things, and that applies to treatment, and that's the present time problem to the pc who's having trouble in an auditing session.

This pc will get up to this kind of a state where he'll demand auditing and won't have it when he gets it. All of that stems immediately and directly from the present time problem of the scarcity of treatment. How do you handle such a thing? Well, handle it in any present time problem process. It is a present time problem of long duration because, of course, it's this lifetime. There's nothing to it, you just handle it. Just as you would any present time problem. Only you get it phrased – and the pc probably never thought of this as the present time problem back of all the present time problems he has every time you mention present time problem to him, see. He never thought of any part of this, so you've got to introduce some innuendo along about this point. It's not evaluation, it's innuendo.

And you innuendo him into the cognition that "My God, auditing is scarce!" Of course, you can run such a process as, "What auditing session have you been unable to con-
"What unknown in an auditing session would you want to escape from?" You can use any process that has to do with present time problems and wind up at the other end with the pc with no more problem about having present time problems. That would be the way to cure this particular phenomenon and manifestation.

Also the pc who continuously has present time problems has obviously not told you anything about his present time problem. It goes back to this: Those things that are known are not aberrative. That's where it goes. That's a very blunt, blanket, wide, wild statement. Even though I, myself, and you customarily forget that particular facet of Scientology. That is a fact: That which is not known is the only aberrative factor.

Those factors which are known are not aberrative. The individual sits there and he says, "Oh, well," he says, "I know, I know what's wrong with me, it's my mother. And she used to just be cross with me day and night, and made me drink Horlicks. And I did nothing but drink Horlicks from the time I was one to the time I was twelve, and I know that's what's wrong with me." Well, you can just write it off, right that moment. You just write it off, just overtly. There is one track where we know nothing is wrong with the pc. Horlicks and Mama. You get the idea?

Of course, now after a while in auditing, you start revealing certain factors in the pc and your processes begin to reveal certain things to him. Those things which are half-known can still have the unknown portion of the half-known, you see, producing difficulty. You see? So the second the pc says, "I know all about it," does not necessarily mean that he has recovered from it if he found out about it in auditing. You see, it does not necessarily mean that that is now a known sphere just because he said so. Never believe a pc.

One of the things you should operate on. The pc says, "That's right," we better look. And that's operative in all fields except goals and terminals, oddly enough. The pc who has a goal is hell on wheels in the direction of this goal. His attention is – just gets totally wrapped up in this particular goal and his progress toward that goal, and so on. There is his attention, and that's why people clear on goals and terminals.

Well, you probably, customarily treat a goals question in the rudiments quite lightly. You probably don't think too much about it. You say, "What goals would you like to set for this session?" The fellow gives you four or five goals for the session. And you say, "Well, I'll pay no attention to those things." You say, "We'll just go on and I decided what I am going to run in this session, and we've got to flatten off so-and-so in this session, and such-and-such in this session."

Well, if the case isn't running right, you go back over your auditing reports. And auditing reports are quite valuable and every auditor ought to keep them meticulously. And actually an auditing report should be written at the time the auditing is given, and it should not be written from notes taken at the time the auditing is given. It ought to be the actual transcript.
Now, if you've got to have a copy of an auditing report, put a piece of carbon paper underneath the actual auditing report that you are writing. But don't turn in transcribed reports because you'll tell yourself lies and you will omit data. You see, because it's only notes which you are taking during the session, you therefore don't make a full report because you're going to transcribe it. But when you transcribe it, that data happens to be missing, don't you see. So it's only notes, and then it becomes only an auditing report, and these things are very valuable, particularly now in goals.

If we did not, for instance, have all of the goals lists of all of the auditors who attended the course in Washington, we'd almost have had it, you see. And they were going to type up – I just got a despatch today – they were going to type up the first couple of hundred goals of each one of these lists and send it to these students. And I said, "Oh, no you don't. Whistle them up and bring them in and find their assessment and get their goal," because it's, of course, in the first – really probably in the first few goals: the first 40, first 100, first 150 for sure. Now you're really reaching out. But by keeping those records, well, we know something about it.

Furthermore, if a clearing goes astray these days we can always put it right if the auditing reports of the pc are available to us. We know what processes and levels weren't flattened and where the case was so – got submerged. We know lots of things about the case then if we can go back.

If a case stalls it's a very, very good thing to go back over all of the auditing reports of the case. Now, one of the ways you go back over all of the auditing reports of the case is to find out if there has been a consistent statement of a goal in each and every session or every few sessions, see. It's a similar goal. It's the present time problem of long duration that you somehow or another have not recognized was there, do you see? And he actually may not have recognized that it was there, but he kept giving it as a goal.

The goals given in the rudiments are important. They are important for the location of present time problems of long duration, and they are also very important for locating present time problems of short duration. And the biggest boost they give you is solving the present time problem situation. That's what that goals question gives you. Because the person nearly always announces his present time problem of long duration in his goals lists. And it'll just be session after session. It'll make you weep sometimes. You look over an auditing report, whole sheaf of reports, and the person says, "I want to get over my zorch operation" you know. And you look at this, and it's just sheet after sheet after sheet, you know, report after report – goals of the session: get over his zorch operation. And you look in vain to find anything that's happening about the zorch operation. And you do worse than that, you look in vain to see much improvement of the case.

So that's an interesting way to go about tracing a case, is using those goals. You should pay some attention to those goals.

Of course, you're plowing madly ahead in the direction of clearing him and getting in auditing and so forth, but remember auditing is what the pc, to a marked degree, considers auditing. It is what the pc considers auditing to the degree that he will stay in-session. And you can do anything you want to do with the pc as long as the pc considers it's auditing. What
does the pc consider auditing is? Auditing is the handling of his fixed attentions on the track. And that is what auditing is to a pc.

So you needn't ever quail at getting in a rudiment where the pc's attention is fixedly fixed because the pc will consider it auditing. And if you can't quite find out why the rudiment is out, and you insist on some half measure -- you say, "Well, we'll just audit this, you know, because we can't -- we're sure we must have found it." Ah, but did you? You see. The rudiment stays out, the pc isn't interested in running it, he's quite upset, and so forth. Well, we haven't got the rudiment. We haven't got the root of it. We're -- we're not really running it. There's something wrong with our estimation of that rudiment.

Now, we may find the pc is ARC breaking, ARC breaking, ARC breaking along a certain particular line, and we enter into some line of inquiry about it after a while, and we should enter into a line of inquiries: Why is he ARC breaking with us? Might he not be ARC breaking with somebody else? It'll be a present time problem of some kind or another that's causing him to ARC break. And the present time problem will always be scarcity of auditing.

It's just as -- actually as simple as that, but did somebody else make the auditing scarce before we came along? See. Has something else happened here? Is there something else? Now, maybe this pc was run consistently and continually -- maybe they had three hundred hours of auditing and during that whole three hundred hours of auditing their dislocated zorch was occupying the totality of their attention and the auditor was running them on, consistently and continually, their wife. But their attention is not on their wife. The attention is on the zorch. You got the idea?

So auditing is what the pc considers frees up his attention. And when -- when this pc is not being addressed where his attention is fixed, he doesn't consider it auditing. Also he doesn't get Clear.

I tell you every few lectures there's one thing you always do wrong, and you don't find out what the pc is doing. This is the oldest crime of the auditor. They never ask enough questions. They're always a little bit leery that the pc will ARC break or get upset, or have his attention dragged off in some fashion if they ask too many questions.

Well, of course, if they ask a bunch of irrelevant hogwash, the pc'll get upset. And the auditor gets educated into believing the pc gets upset by being asked questions by having asked pcs in his early career. This auditor has asked pcs a lot of hogwash that had nothing to do with it and, of course, the pc got upset. So they get the idea that if you ask the pc too many questions, why, the pc will get upset, and that therefore you should just sit there and run the session.

Well, the pc can become quite oblivious of you, he can become very upset with whether or not you're there. "Are you there? Do you know anything about what's going on?" And the big not-know of the session can become, very well, what the auditor is doing. The auditor know? No, the auditor doesn't know, so therefore the auditor has a not-know on the session. So if the auditor has a not-know on the session, the whole session becomes a not-know, you got the idea?
He gets the idea that he must be withholding something from the auditor because the auditor's never asked any questions concerning what was going on. Now, if you're going to ask questions, ask pertinent questions. But if you're asking pertinent questions, don't care how many you ask. Get very searching. I should give you more auditing demonstrations because I'll tell you I will just sit and ask a pc for minutes at a time, what he's doing, how he's doing it, what has been happening and if he's got any picture now and what he is looking at and if there's anything there that he hasn't noticed, and all kinds of things of this character, you know. And I'd ask him and ask him. Any pc I audit will always tell you that I'm very interested in the session, or I certainly am looking right down their throats. They get a sensation of presence, in other words. But, of course, these aren't just, thrown-away questions, they are very, very pertinent questions, always. Because I really do want to know.

I – I see a pc is going this way, I want to know what's this all about? I don't just say, "Well that's boil-off," and skip it, you know. "What'd you run into?" you know. "Oh, well, I just ran into the so on, so on and so on and so on."

Well, because you're asking him what he was doing, and not what's going on in the environment or what you're doing, of course, his attention is very thoroughly on his case. So, therefore he's in-session because you're keeping his attention on his case. By asking him about his case you keep his attention thoroughly on his case.

"What did you do with the last auditing command?"
"Well, I did so and so, and so and so, and so and so, and so and so with it."

And I say, "Well did you do anything else?"

"Oh, well, yes, I haven't found the auditing command was easy to answer so as a matter of fact right in the middle of the thing I always mock up a couple of matched terminals, you see, of the thing."

And I say, "Well, that's very interesting. And very, very interesting. Have you gotten anything out of that?"

"Well, as a matter of fact I have."
"Well, now what part of the auditing command haven't you answered?"
"Well, so-and-so and so-and-so."

"Now, what was the first time you failed to answer that point?"
"Oh, well, it was way back at the beginning of the session."

"All right, now you just answer that one again, here's the auditing command."

You'd think under this much duress that the pc would be saying, "Oh, Christ," you know, "am I really being kicked around the track!"

Oh, no, he doesn't feel that at all. I ask him a couple times later, you know, "You still putting those matched terminals up there?" I don't tell him he mustn't. "You still putting those ..."
"Oh, no, no, I ... as a matter of fact I hadn't, uh, hadn't been doing it. Hadn't been doing it the last few commands."

"Well, all right, haven't been doing it?"

"Hm-hm."

"All right, that's good. Then the auditing command is all right, now?"

"Oh, yeah, there's nothing wrong with it. Let's get on with the session!" You know, that sort of thing.

"Well, that's right. That's what we're doing now," and give him the next auditing command, and so forth.

Where is that attention fixed? It is something on the order of examining small search-lights that are playing around in the dark. And you can actually find out where these search-lights are playing inside that pc's skull. All you got to do is ask. Find out what the hell is going on.

Now, you can always mark it down that a pc who goes anaten has had a drop of havingness. So, it must be his first and primary havingness, is the havingness of an auditor.

So if a pc ever goes anaten he's lost the auditor. I always just use that as a rule of thumb. Pc blinks out on me, I blink in. I don't ask him anything as crude as, or I never have but I might – I wouldn't put anything past me in an auditing session – but just say, (you know, it's an understood question whatever you ask), "When's the first time you lost the auditor?"

"Oh, well, oh, hell, that was a long time ago. Uh, yeah, five, six minutes ago."

"What happened?"

"Well, I just – I just – didn't – all of a sudden I felt very lonely standing out here on this plain."

"Oh, you're standing on a plain. I didn't hear about that. All right, what about this plain?"

"Well, I was standing there and I answered the auditing question and all of a sudden here I was standing on this plain, all by myself, and these cold winds are going by, and so forth, just like they are now as a matter of fact," you know.

And you say, "Well, how'd the auditing question apply, just right there?"

"Well, it applied sssd-ssss, that's – that's gone! That's gone now."

And you say, "Well, how about these cold winds now; how did the auditing question apply about these cold winds? What did it have to do with being all alone there," and so forth?

"Well, oh, I see what you mean!"

"All right, what do I mean?"

"Well, here's the guy I was with, lying at my feet with a knife in his back, and you know I didn't notice that before? I didn't know that. I must have killed him! Let's see, there's
nobody else here and I must have killed him. Could – it must have been me! Of course I wouldn't do a thing like that, you understand."

And we just got one Christ-awful overt off the thing. What did he do, you know. Well, he went into some kind of an avoidance mechanism of some kind or another and it compounded the felony, and he'll pick up some rationale that he's lost the auditor. And if you don't give him an auditor back along about that time he'll continue to go anaten.

I could grade your auditing – A, B, C, D, E, F, G – simply to the number of minutes of anaten experienced by your pc in a session. I could just rack it up and just keep count of it, you see, and grade your auditing. And then you'd find out that the pc – the auditor auditing the pc who had the greatest amount of anaten would have the least auditing presence. The first loss of the pc is always the auditor.

Now, the pc gets himself into situations and you think that maybe, mono-centrically, that it's just things that you do, you see, that cause him to lose the auditor. But no. I give you a synthetic case in point: the pc has answered the auditing question, finds himself on this lonely plain, bounces like mad, goes someplace else carrying this terrific feeling of loneliness with him of some kind, and of course he is now alone. The auditor hasn't done anything but give him an auditing command, but the pc feels alone. So, of course, he's lost the auditor. Because he's alone.

Now, a pc can get into that kind of a situation and go on auto so quick it'll make your head swim.

The number of minutes or hours of anaten of a pc in any given intention [intensive] are a direct indication of the presence of the auditor. And the solution to the problem is: find out. Find out. Pc starts going anaten, the pc is alone, that's all. He's not with it. He's not with you, and something is wrong. He is doing a retreat, and it's more than a retreat from the bank. There's inevitably a certain amount of anaten, but it ought to get as-ised rather rapidly with the processes you're running now. And it ought to get as-ised without a fog-out in present time.

Anaten and boil-off on the part of the pc – I don't want to put ideas in your heads as pc, but I have to tell you the facts of life – over this cup of tea in the kitchen – and the facts of life are that auditors who are out of session, from the estimation of the pc, have pcs who go anaten, and that's about all there is to it.

And the way you get over that barrier is simply just get snoopy. And of course, if you're finding out where the pc's attention is, you naturally will free up a lot of the pc's attention, which after all is the purpose of auditing.

So you can do any God's quantity of nagging on the subject, you can become the damnedest bore. The direction to err, however, is the direction of too much. Never too little. Get awful yappy and questioning in the midst of a repetitive command process, see.

Give him the auditing command, "How many needles can sit on the head of an angel?" you know, whatever it is.

And he says, "Well, eighty-two."
And you say, "All right. Have you got a picture there?"

"Oh, yes, as a matter of fact got a picture."

"Well, what is it of? Is it black and white? Is it 3-D? Oh, 'tisn't. All right, all right. Now, what – have you had any other pictures just before that?"

"Yes, I did. I had a couple. As a matter of fact I still got it," see, "still got one of those, one of those. It's stacked up alongside of this picture."

"Oh. Well, is there any part of the auditing command you didn't answer that other time?"

"Well, as a matter of fact I was too busy to answer the auditing command the other time."

"Well, just you answer the auditing command, now, for the other time." "All right? Yeah, all right."

"The auditing command was so-and-so, and so-and-so. All right. Okay. Now, did you answer that one for the other time?"

"Yeah."

"All right, you answered the other one for the other time? All right. Now, answer it for now. And the auditing command is so-and-so, and so-and-so. Okay. Now, how are these pictures stacked up?"

"Well, they've changed."

"Good, all right. Now, what's your attention on now? All right, attention is on this picture. All right, here's the next auditing command."

You get this kind of a yip-yap. Sounds awful yappy, doesn't it? Doesn't sound like the auditing sessions you've been giving lately, either, does it?

You can conceive the pc's attention as a small searchlight of which you are handling the handle. And you can just take the searchlight around in his skull and you can turn it on anything and up and down, illuminate the pictures, and so forth. After a while you can get pretty good at it. You yourself, of course, are looking at something which up to the moment you ask is an unknown. How come you can tolerate this much unknownness? I can't. When I go to a motion picture show, I don't like to sit facing the back. Almost never do. Almost never take cotton for my ears either. I like to see the movie. I get very interested in this movie.

Now, this is what's going on. You're – you're looking at the blood, sweat and tears of the Churchills of yesterday. You're looking at the come-to-realizes. You got come-to-realizes in this pc that would make Bernarr MacFadden a deep viridian with envy. True Confession special. "There I was, a poor little innocent girl, sitting on my – the doorstep of my Astarte's Temple. Sweet, innocent, no overts of any kind. And these goddamn soldiers came up and here they are burning the temple down. And I didn't do a thing. We were kind of strangers in the land, you see, and I had nothing to do with this."

And "What are you looking at?" you know.
"Well, I'm just looking at these soldiers."
"Well, what are these soldiers doing?"
"Well, they're pulling down the altar."
"Good. What else are they doing? What else is there?"
"Well, there's nothing else there."
"What else is there?"
"Nothing. There's nothing in the place."
"What else is in the picture?"
"The dead body of their captain we stabbed – I stabbed." [laughter]
You say, "All right, and when did this stabbing occur? First time I've heard of this stabbing, you know. When did this occur?"
"Well, in the first reel, of course. It was after this night of orgy."
"Well, what about this night of orgy?"
"Well, it's like this. The local governor paid us to put on a hell of an orgy so the invading troops would get so loused up they wouldn't be able to fight the battle tomorrow and that's the only overt I had – except of course killing the general."
"Oh, it was a general."
"Yes, it's a general. Didn't I say?"
"All right, good. Well, who won the battle?"
"Oh, well, hell, I never stayed around to fill that out. They killed me."
"Oh? All right. Here's the next auditing command" and so forth, so forth, so on.
"What's happening now?"
"Oh, nothing much. I'm up here about fifteen thousand feet above this temple. It's a little tiny block."
And I say, "Fine. All right, come on. Here's the next auditing command ... What's happening now?"
"Nothing."
"Did you answer the auditing command?"
"No." [laughter]
"All right. Here's the auditing command, I'll repeat it ... All right. Now what's happening?"
"Oh, well. You shouldn't ask."
"Well, why shouldn't I ask?"
"Well, it's messy."
"What's messy?" and so forth.

"Well, am I ever going to get out of this temple? I was fifteen thousand feet up, and everything was all right, and I'm right back in the middle of the temple again!"

"All right, what's going on?"

"Well, it's something I forgot to mention before. We'd poisoned all their wives."

"All right, good. Got a picture there?"

"Yeah. Oh, yeah, yeah."

"All right, here's the next auditing command."

Got the idea? This is a conducted Cook's tour of the bank. And you can get away with an awful lot of auditing just sitting back and repeating the auditing command and never finding out what the pc's doing. Scientology is at a level today where this actually works, which is rather fantastic. But there are ways, man, of speeding that up, that make that kind of auditing look something like a rickety one-horse shay, compared to, of course, a jet airliner. And it's big comparisons.

And believe me, when some pc has been audited like that he knows he's been audited. He knows it. He'll tell you, too. "Well, we got out of that! Whoohoo!" You see, "we" got out of that. I've even, way back when, in running engrams, and so forth, used the word "we," consistently and continually. "Well, where are we now?" Pc probably winds up with a bank where Ron is ... [laughter] But you got to find out what's going on.

If you don't find out what's going on, the pc's attention does this: It hits and bounces. Now, this escape mechanism I was talking to you about is always present to some slight degree. And he'll leave a stuck and he'll leave a stuck and he'll leave a stuck, and these sticks finally all compound to a kind of a dizziness, and where is he at? Well, it'll come out free in the end. It'll come out, one way or the other, just on repetitive auditing, rather permissive auditing. It'll go on. And it only adds five times the number of hours necessary to get the same result, that's all. That's why I've never been down with a crusher on this stuff, you see. I mean, that's why I never really raised hell about it one way or the other. Because there's no point if you're going to get there anyway rather smoothly.

The only thing that restrains me from forcing this type of auditing on auditors – I mean just forcing it on them and saying this is the way to do it and you better not do it any other way – is the fact they can be so damn knuckleheaded occasionally.

This guy runs into the temple, see, and he's just now looking with horror as they pull the altar down and find the dead general back of it, don't you see. And at that moment the auditor has this horrible feeling – you know, got an engram just like it; maybe he was the general – and will pull a stupid one along about that time, you know, get stupid about it.

But the reason I'm mentioning this to you now so bluntly is because you've got the mechanism for that. If you aren't doing an escape mechanism of pulling the pc's attention out of the bank, pulling the pc's attention out of the bank, pulling the pc's attention out of the bank, you actually yourself will never ask a stupid question in trying to find out what the pc's doing. Because your question never has the hidden fact from you that you're trying to get the
pc to escape. Of course, it's damn dangerous to be in a temple which is falling down and where one has committed a murder with fifteen dozen soldiers around brandishing copper swords. Very dangerous to be in such a locale.

Well, the "kind" auditor says, [whistles] "Come outside! Oh, you're fifteen thousand feet up above the temple. Whew! [relieved sigh] Boy! Is there any other zone of life later than that where things were calm?" [laughter] You get the idea?

As long as an auditor experiences impulses, no matter how obscure, to rescue the pc from danger at every side, and pull the pc off the bank, of course, it isn't safe to have an auditor asking very many questions, don't you see? Well, that's the whole bug back of this. So that's why I today tell you about this other.

I've told you about the other from time to time. Well, I'm saying you better do it. You better do it. Pc says, "Well, here I am, ten thousand feet above this temple and everything is fine now, and good we can go on with the session."

"All right, is there anything you skipped there, just before you went up?"

"No, no, nothing, nothing."

"All right, and I'll ask another auditing command."

You've inferred that he go back and take a look, you see. And you ask him the next auditing command, "What is the most unknown thing you can think of about Astarte?" or something.

And the pc says, [sniffs] "You did it to me. Here I am right back in this temple. I've been trying to get out of this temple for fifty thousand years, and you – you're trying to get me right back in this temple again, and here I am."

You know, it's a little – little accusative feeling. Well, you, if feeling defensive and not knowing whether you're right or wrong, are liable to take this slight accusative thing as making you actually think you have done something wrong. Well, I'll tell you what's wrong is: Let him out of the temple and let him stick in an exteriorized bounce. And then run for the next fifteen sessions ten thousand feet in the air, not confronting anything. "Yes, I'm running the auditing command. Everything is fine. There's nothing but peace."

Well, the clue is that the bank is as it is because it has so much action and randomness in it. And if you can't keep the pc in areas of randomness, the pc won't clear up, that's all. And that's your five-to-one auditing factor which Julia here was been talking about for years. That's the bulk of that auditing factor.

I – I was never very allergic to action. I haven't got to have action. I used to drive somebody I knew very well completely stark staring mad because I used to go up and ... They say, "What are you going to do?" you know. Their whole idea of life you see was to be doing, you know, be busy, be working or something, you know.

And I'd say, "Well, I'm going up and sit down for a while."

"What are you going to do?"

"I'm going to sit down for a while."
"Yeah, well, what are you going to read?"

"Nothing. I don't happen to have a book right now I'm interested in."

"What are you going to do?"

"I'm going to sit down for a while."

"Well, what are you going to think about?"

"Nothing."

And the person would go absolutely, "Woogo! God, I could never do that. I just think of that. Awful, you know, terrible!"

And it's unthinkable, you know, just to do nothing. But at the same time it's also unthinkable in auditing if you don't get the pc to confront the action which has got him stuck, stuck, stuck. You do not audit the quiet points of the track. Just skip them! Although a scarcity of action is what is wrong with a pc, we have to ask how did this scarcity of action occur? Scarcity of action occurred because of the unpalatability of action.

Ask this horrible question: "Why is this pc sitting there on the plain, farming?" He goes out and he plants these beets, see. And then they come up very quietly, because it's a very nice climate. And the beets come up, and then he has the beets thrown into a wagon and they are dragged off to the beet store, see. And next season he plants the beets, and every Sunday he goes to the same church, and he hears the same sermon, and he listens to the same confounded hymns. And he goes back and forth, and he walks on the same paths. And if you talk to him very – very much you would find out that it was dangerous to do anything else. That's the keynote. The great payoff of being quiet. Of being still. Of never being in motion. The enormous bonus this pays is always: "You won't get hurt."

That's the superbooster of conservatism and such things, you know. "We won't go into any motion because if we do, we'll get hurt." What taught him this? So you find this pc sitting there, complaining about the fact that there is no action. There is, "nothing happens in life." He is bored. He is bored in life. Nothing is ever happening.

And you say, "Well, all right. Let's go join the Marines."

"Eh, well, no."

"Well, what are you going to do?"

"Well, next Sunday I'm going to go to church."

"What are you going to do Monday?"

"Well, I'm going to go out and hoe the beets."

"What are you going to do Tuesday?"

"Oh, Tuesday. That's my day to clean up the smokehouse."

And you say, "Well," you say, "life's pretty boring, huh?"

"Oh, yeah, life's awful boring. It just runs the same routes, the same routes."
"Well, fine, let's join the Air Force."

"Oh, well, no."

"Well, why not join the Air Force?"

"Well, you might get hurt," or "Things would run wrong," you know?

Action has been given a bad name. It's discreditable. Action is now discreditable. You'll find the whole literature of the society at this particular time is devoted to the discredibility of action. People go into action, they get in trouble. This is obvious. Read any novel if you don't believe this. Heroes no longer dash over the top and emerge unscathed with medals pinned to their bare skin. No, they're sort of sick in the trench, you see, and they crawl over the top because they're so tired, you know. And just the moment they stand up they are severely wounded, you see. And then they're carted off to a very brutal hospital, you see, where it's all pain and then they get a letter that Emily has left them. She's run off with the iceman. [laughter]

Now, action has been given a bad name. Why? Why? If the pc is so starved for action, if he's so bored with the dolessness, you would think offhand then, that there was just a scarcity of action – you see, you might think it worked out this way: that there was a scarcity of action because he wasn't in action. You know, there's a scarcity of action, because he's in a situation in life where he can't have any action. This is quite obvious, isn't it? I mean that's the first thing that you might adjudicate on the subject.

Of course, he has a scarcity of action because he's a clerk. And he sits in this office all day long, you see, and he doesn't even have any excitement on the lines. He doesn't have anything to judge or say or do or anything else. There's nothing really going on. He has figures he knows nothing about which he enters in a ledger that he knows nothing about which goes to a destination he knows nothing about. And you say, well, that man is suffering from a scarcity of action because he's not in action.

Now, what is he doing, doing that? That is the proper question to ask. Action must have gotten a bad name. How did action get a bad name? Well, he'd been working at it for a couple of hundred thousand years; therefore, it must be pretty desirable if it has that much of a bad name. And it is very desirable.

So, the faster you get a pc over the idea of the discreditable nature of action, the more the pc is going to move out of those quiet areas on the track, too. Because he's keeping those to make sure that he doesn't go into action. He'll keep those very closely. He'll have this whole long life, you see, as a beet farmer. He's got this beautiful life as a beet farmer and you ask him, "Well now, how many angels can stand on the head of a pin?" and you think you're getting someplace, you know. You just think you're just roaring around like mad because you're getting a little tone arm motion and everything's going along all right.

And you, however, along about this time should be asking, "What sort of a picture does he have? Where is he? What is he doing? What is he doing there?"

Well, he hasn't noticed what he's doing either. But he's asked – answered the question, "Well, eighteen."
"What sort of picture do you have there with that?"

"Well, I got a picture of this old country church, and the organ is playing rather badly and out of tune," and so on.

And you say "All right, how many angels can stand on the head of a pin?"

And he says, "Well, seventeen."

And you say, "What kind of a picture you got there?"

"Well, I've got this long country lane, and the quiet, white clouds drifting by."

Well, if you kept check on it, you'd find out he'd had these things for the last eight sessions. And he's going to have them for the next eighteen sessions. Why not? He's running all the safe spots on the track, of course.

You say, "Well, what does this picture look like?"

"Well, this picture looks like it's just a – just a picture."

"Well, how big is this picture?"

"Well, this picture is about uh – oh, it's about two feet by two feet."

"Well, does the picture have breadth in any way?"

"No, no, it's just, small little picture."

"Well, does it have any dimension?"

"No, it doesn't have any dimension."

"Well, is that the size your pictures always are?"

"Oh, yes, yes."

"Well, what color is it?"

"Well, there's no color in it."

"Is there any picture above or below it?"

Haaaarup! Blow the whole thing, huh?

Liable to have very quietly kept all of these very quiet lives there, and they're actually running through blood and guts, man, the whole way. Only he doesn't put any attention on those at all. If you start asking him to look around he'll find out some things. He'll find out how pictures ought to look.

You'd be amazed what the ideas people have as to what their pictures should look like. Though it's not up to you to correct them. But it's sure up to you to find out. You'd just be fascinated what some people think a picture is.

Had a pc had a cognition the other day just on this basis: "I always thought every picture I had should be 3-D in all directions, 360 degrees. And therefore, I didn't think I had any pictures because my pictures weren't like that. If I were looking at a book it was just a picture of a book." Well, what else was their attention on? How could they have anything but a pic-
ture of a book if all they were looking at was a book? What did they think? They had some kind of a machine that did a 360 degree CinemaScope that somehow or another put it in? No, they – they of course, they've got the pictures they got. They have the pictures of what they saw. Naturally. And only the pictures of what they saw. But they have some weird ideas about pictures, believe me. And every one of those weird ideas about pictures is backed up with the discreditability of action.

I'll give you a little sequence that you might be interested in on that basis. I think I've mentioned this to you before, but it's rather startling. It took me by storm. All right.

Auditing question.

Cognition: "The Greeks had books, printed books."

"How did the Greeks print the printed books?"

"Well, they printed the printed books this way," and so forth.

Auditing question.

"Well, what do you know, the Egyptians printed books, too."

"All right, how'd they print books?"

"Well, so-and-so and so-and-so and so-and-so."

And the auditing question, and so forth. And the auditing question, the auditing question.

"What kind of a picture have you got there?"

"Well, I've got a picture – it's a picture, it's ..."

Auditing question.

"What picture you got there?"

"Same picture."

Well, auditing question.

"What picture you got there?"

"Same picture."

"Has anything changed in that picture?"

"No, not for the last five, six auditing questions."

All right, what's the exact mechanic present here? Books. Is there anything more quiet than books? You're going down the middle of a roaring action chain, man. Except, of course, you're going down it on the basis of the stable datum. The quietude. The quietness is a core in the middle of some hurricane. You're going down books; where's the hurricane?

And this interesting idea was injected into the session, "Why don't you look on the other side of the picture?" And at that moment Boom!!! What was on the other side of the picture? Some of the goddamnest fights that anybody ever saw. But it was an awfully quiet picture about Egyptian books. You get the idea?
Well now, a pc will just stay there on that nice quiet chain, bouncing from one quiet Sunday to the next quiet Sunday, bouncing from "Old Hundred" straight into "Lead Kindly Light," until you tell him to look. And how do you tell him to look? By asking him what the hell is going on. Auditing question. "What's going on?" Auditing question. Auditing question. "What's going on now?" Auditing question. Auditing question. "You got a picture? All right, what is it of? All right, what's going on?" Auditing question. Auditing question. Auditing question. "Got a picture? Got a picture now? Has it changed any? What – what's it look like now? What's happened here?" See?

"Well, there's some more of these books."

"Oh, I see."

"There's this stack of books now."

Yeah, auditing question. Auditing question. "What's going on now?"

"Well, there's this small number of books. They're pretty books, you know, they're awfully pretty books."

Now, the danger point is asking the pc a question he can't answer, such as, "What are the books about?" He doesn't know it, you know. It's just books, see. Asking him for particularity that he wouldn't possibly have the answer to is the kind of question that will get you into trouble if any question of this character would get you into trouble. But even a question of that character gets you into less trouble than a total neglect of the whole situation. So you could very easily say, "All right, is there anything else around there?"

"No, just books."

"Well, where are all these books?"

"Well, they're just here in this bookstore."

"Okay." Auditing question. Auditing question. "What kind of picture now?"

"Oh, just this bookstore. I'm very grateful to you. You know, I hadn't realized it was a bookstore. It's very beautiful books. They're all down the shelves and everything."

Auditing question. Auditing question. "What you got a picture of now?"

"Oh, just this bookstore."

"What's outside the bookstore?" Boom!! He ran a bookstore on the Alaskan frontier. Three killed every morning before breakfast on the front steps. Got the idea?

You can do a certain amount of direction of the pc's attention by asking him questions. And as long as these questions do not yank their attention off the subject on which it is operating, he will get into no trouble whatsoever. As long as you don't say "Oh, look at something else. I'm tired of you looking at books." Or as long as you don't say some other auditing command; change the process.

And he says "Why?"

"Well, you aren't getting along well enough, you see, with that particular process, and..."
This is all invalidative of what the pc's doing. But just finding out what he is doing and what he is looking at, and ask him to look around a little bit more – this type of interrogation and questioning and so forth – can become more illuminative than anything you ever saw. And then, on top of it, any time you see a violent escape of some kind or another, scent that he must have escaped from discreditable action of some kind or another. And ask him if there was ever – did he tell you everything there was to know in that sequence which he just left?

"Is there anything that you left unknown about that sequence?", you know. "Is there anything in there that you didn't quite look over?"

"Well, I'm safely out of that now, and I don't think we need to talk about that anymore because – we got out of that all right."

And you say "Good, what did you get out of, exactly?"

"Well, there you've done it, you see. I mean, here I am right back in here, I've been trying for eighteen thousand years to get out of this temple and here you've got me back in this temple again."

"Well, what's going on in there, anyway?"

"Oh, this is where we tortured the victims."

"What victims?"

"Oh, these victims."

"Who tortured them?"

"Those high priests. I didn't have anything to do with it, you know. What am I doing with all these gowns on, you know? Yeah! Well, there's something I – I just realized: I – I was the high priest. Oh well, yes, yeah. I – I see what you mean. Yeah, this isn't so good here, is it?" and so forth.

"All right, I'll give you the next auditing question."

Of course it's the auditing question that got him into this mess. And it's the pc that's jumping out of a mess. And it's the auditor that gets him to apply the auditing question to the mess, you see, but he does it rather delicately. By just asking him: "What's going on? What are you looking at? What does it consist of? Is there anything else? Is there something you haven't mentioned?"

"In that sequence about the fur trade industry, now, that we just – you don't seem to be in now, is that gone?"

"Oh, yes. Oh, that's gone."

"Well, just a moment ago you had pictures of all these canoes. What you got a picture of now?"

"Sky. Got a picture of the sky."

"What sky is it?"
"Oh, it's the beautiful sky of Normandy. I don't have any more to do with this ... this fur trade industry, you see. I – I'm out of that, you see, I'm all out of that. All out of the fur trade industry."

Now, the wrong question, and the question the auditor would ask who thought it would be a good thing to get the pc out of all that dangerous area, would be, "Well, what does the Normandy sky look like?" [laughter] You say, "Well, what happened to those canoes?" You know, aside from the fact that you are interested and you're curious, they – there were these eighteen canoes going down the river, one after the other, and they were all full of painted savages. And that was the last you ever heard of it. Well, I don't let people run continued stories on me. I'm not expecting him to run into these canoes somewhere up the track in another fifty-seven hours of auditing I want to know about those canoes now.

"What happened to them? The last auditing command I gave you had canoes. Now you don't have canoes. What is this all about?"

"Well... I was an Indian. Hey, what do you know! I was in the canoes! Oh, this was just before they went over the rapids! Ha-ha! Yes!" Glug. [laughter]

And you say, "All right."

Next auditing question. Next auditing question.

"Yeah, we went over the rapids, and that was it, and we're all drowned, and now I'm back here in this beautiful Normandy sky."

And you say "All right, good enough, good enough. All right. Now, how many – how many people – did you see anybody else in the water there, in the rapids at all?"

"Uh, no no, no, no, no no."

Next auditing question.

"Well, as a matter of fact there were about twenty!"

And you say, "Well, that's good, that's good, that's fine." Next auditing question, next auditing question, next auditing question, that's fine. "Now, what've you got a picture of?"

"Well, this beautiful Normandy sky."

And you say, "That's good. Now, what happened to the canoes? Did they just drift away after they went over the ... oh ..." Auditing question, auditing question.

"Oh, God almighty!"

"What's the matter now?"

"Ugluh-ug-lu-gluh! I got terrible somatics in my throat."

"Well, what's the matter? What's happening? What's happening?"

"Well, after we got all dumped in the water, the fur trappers on the shore started firing volleys into us. Oh! Oh! Yeah, and they killed everybody. You see, this was a big lose for me. I was a big chief, you see. I had been over in England, and I picked up one of these Indians so I decided to ... I – I that's right. That's the way that went. Yeah, that's right, and then all of a
sudden the English attacked me and that was, so on. And I was Indian, that's right. And – yeah, here's the picture! Here's the picture you've been looking for."

You know, and all of a sudden the whole sequence – the unknowns vanish out of the thing, and the thing is all clear, and he can look at it and not look at it and he skips it and so forth, and he's not running away from it anymore. Do you follow that?

But it's very adroit auditing that does that. Because you can be totally knuckleheaded and ask all the wrong questions, but it is better to ask some questions than none at all. The way to err is being too yappy. And the way to make mistakes is never to say anything. Because the pc will just bounce, bounce, bounce, bounce, bounce, bounce, bouncing, never confront. And it's just like the present time problem I started in to tell you about at the beginning of the lecture. And that present time problem is simply there, and the pc knows he's got it. But 1A won't let him run it. So in that particular case you overtly direct the pc's attention, you see, with the auditing command. You say, "What is unknown about that problem about teacups?" He's worried about his teacups, you see, and you run that flat. He's interested the whole way. He knows he's getting auditing.

Well, now, if you keep directing his attention back into where his attention is really fixed and those points from which he's trying to escape, boy, does he know he's getting auditing. See, by definition, he knows he's getting auditing to the degree that his attention is being directed where it is already stuck. His attention is already stuck there, even though he's escaped out of there. So he knows he's getting auditing if his attention is freed from the spot and not permitted to escape from the spot. You see? And by asking no questions at all, your pc has no illusion of being audited at all, and wouldn't even really believe that a session is in progress.

So how do you get a person in-session? Well, you direct their attention, find out where their attention is, so forth. And they know they're getting audited. You find out where their attention is stuck – you guess where the attention is stuck. Put it back there. You say it must be still stuck there. You don't get Normandy skies – you don't get Normandy skies in the middle of a rapids in the North American wilderness full of savages. The Normandy skies are awfully quiet so the guy must have moved into a stable datum and must have escaped from action. Now, what on Earth was the action? And of course you yourself are interested. And if you yourself really want to know what the action is, you will find out. And of course that is what his attention is stuck on. And the pc winds up with action not being discreditable. He takes care of all this. Up to this time, he's got it all justified. Your computer is normally leading a quiet life and he is walking to church every Sunday and he is listening to "Lead Kindly Light" and the highest randomness that he runs into carefully is that some Sundays they play "Old Hundred." [laughter]

You find that sort of a sequence – here in present time he's leading that kind of a life – you have to suspect at once that action has become discreditable and that he can't have it, and that he's very carefully not having any action. Well, of course, the healing from that, of course, makes you direct his attention over into the zones of action and the zones of action then – becoming inspected, he becomes more familiar with it, he recognizes that he could have action. That action isn't quite that bad. He becomes more familiar with it and there he is.
Okay?

It's very simple. All you have to do is do it. Okay?

Thank you.
WHAT IS AUDITING?

A lecture given on 31 August 1961

[Part missing]

Well, this is the 31st of eventful August, AD 11. And the generalities which have come up to relieve auditing come into various new gains of some kind or another. I hope very soon that we can be through in Scientology with all bad auditing of every character, size, shape and everything else.

There is such a thing as poor auditing. There are two stages of it: Basically, the individual audits sort of naturally and then learns the rules of auditing and audits all thumbs with the rules of auditing. You got the idea? And then eventually, why, these rules drop back to where they ought to belong and the guy is now doing a very good job of auditing. There comes a time in any auditor's career where one audits with all thumbs. But the basics of auditing are what they are, which is to say you are auditing a human being, and this auditing is addressed to a case, and the road map which you have is better and better. And it's so darn plain now that you can almost walk out in an open field, you know, and you just can't miss the road. You will get to Tipperary whether you like it or not, you know, providing you do anything even sensible, but nothing discounts auditing. Auditing must be done. Auditing must be done. Now, what is auditing? What is it?

Well, it's the pc in-session. Definition: willing to talk to the auditor and interested in own case. Exact definition. We broadened that definition recently by saying "able to talk to the auditor." This becomes manifest in Security Checks – how you bring this about: able to talk to the auditor; interested in own case.

Well, interested in own case means interested in own case. Not interested in session. Get the vast difference here. Sessions should never be interesting. Never. Never, never, never interesting, the session itself. The pc's attention should never really be distracted from his own case. And then he will find that it's a very interesting session. He will say it's an interesting session, but what he means is his own case was interesting during that session.

Now, you'll find many a witch doctor has violated this to such a remarkable degree that they practically bang everybody into apathy. But this is the way a witch doctor runs an auditing session: He gets a couple of rattles. And you don't realize it but he's the immediate forebearer here on Earth. There hasn't been any therapy since the witch doctor. That which went in between didn't get the 22½ percent. The witch, the witch doctor, the witchcraft of Europe which extended up into – in England here – up to the maybe about the thirteenth, fourteenth, fifteenth century. Yeah, I know it's extended into the sixteenth century because that's where the doctors got digitalis. They got it from the witchcraft.
So it is a bit different being a witch and being a witch doctor, but their modus operandi was quite the same. They maintained such a compelling presence, their presence was so compelling one way or the other, that a patient didn't have a chance of doing anything else but being interested in the session. You take a couple of gourd rattles and a snake that leaps out of the middle of the witch doctor's bonnet, little things like that. As a matter of fact, I can scream like a witch doctor. Now, that's quite an accomplishment. I'll have to practice one of these days. Go down the woods and scare old Farmer Jones's cows. [laughter]

In old Irish mythology, there's a wonderful, wonderful line: Two giants are fighting, and they made the ground shake to such a degree that the cows shed their calves, even though they had none. [laughter]

But anyway, the witch doctor very often has a mechanism like this: Carries a little pouch. Normally, you'll see a witch doctor has a pouch. And this pouch is supposed to be an amulet. That's to keep the patient from knowing what's in the pouch. And they'll normally have things like Greek fire, gunpowder, pepper. You get the uses of these things. Gunpowder – well they've got a fire there, and the session is going very tamely, and they flip some of this gunpowder, you see, with a quick prestidigitation. Can't even see their hand approach the pouch, you see. They're making some motions in the air and suddenly pow! You see, the fire blows up. Well, it's interesting. It distracts people.

And a while after the fire's exploded, they make some more motions in the air, and nobody notices that the hand has approached the pouch you see, and it's come out and flipped something in, but the fire burns glaringly red with leaping flames, you see, and all this kind of thing. It's very interesting.

And the patient's sitting there minding his own business, and he looks very calm at this particular moment, and with some prestidigitation and fast hand passes calling on the spirits of the air, why, the patient starts sneezing like mad because, of course, he's just had a face full of pepper. It's very interesting to watch.

North American Indian – particularly amongst the Iroquois, they had various ... Well, as a matter of fact, the white man has so stamped out the Indian up there that there's practically no tracing any of the real old customs, but there were a few missionaries who went up there amongst the Iroquois and into the hinterland before the white man and rum and fur ever were a subject, you see. None of these things were a subject inland. And the Indian tribe was there as it was with all of their customs. They used to live – we think of them as living in wigwams, you know and all kinds of things. Actually, they used to live in bark houses in palisades. And very elaborate. A very elaborate civilization, and the Iroquois medicine clans were fantastic. They were something that would make the AMA green with envy as far as organization was concerned. They were really a complicated clan setup. And they had rituals of various kinds that you would have been very interested in, to have studied them.

These early missionaries, as I mentioned, did find most of the dope about this, and they reported it endlessly, before of course they got executed or something of the sort or exorcised themselves from either the Indian or the white society. And we find there are very few books of this character still extant; they are very rare. And I've had the privilege of reading some of them. Very fancy.
They had ideas of soul transference. They had ideas of exteriorization. They had a medical-type exteriorization, you know. You fed a guy enough of the proper bark, you know, and gave him enough fumes, well, he'd find himself out of his ruddy 'ead and way up in the air, you know.

And they apparently could do something with animals, such as exteriorize and do something with the animal, you know. Make an animal do something peculiar and then reinteriorize and so forth. Quite interesting. And of course, their religion is indistinguishable from Christianity. That's why they had such a hard time making the Indian into a Christian. The Indian was full of endless arguments, of course, because the Indian believed in one god. And there the missionary would come a cropper at once.

He'd come in there with the big news that there is one god, you see. And the Indian would say, "Mm-hm. Ug." Total agreement, you see. "And at one time there was an enormous flood, and there was a fellow by the name of Noah, and so on. And he built an ark, and all of the beings on earth all died and perished in the flood except ..." And the Indian will say, "Mm-mm-mmmm." And when the white man gets all finished telling him about it, why, he says, "Name not Noah. Name Hecton." Knew all about the flood, you see, but he had a different personnel in there.

Adam and Eve – knew all about Adam and Eve, except Adam and Eve wasn't quite the right names so the white man wasn't quite smart. He wasn't in the know. You see, all man had descended from Adam and Eve, and there had been a flood, and one god and, you know, the lot, you know. And God had created all the animals. Oh, yes, see, religion never had too much of a chance because the Indian never found out there was any difference.

But he had a very advanced medical technology that was around the subject of herbs, and so on, which was quite good. And it all got lost. Lost the lot because it wasn't a written technology, and it went down by word of mouth, and so on. And you had to have new people to be studying the thing in order to preserve it.

And as soon as the white civilization made an encroachment and disease like measles – which they call smallpox, but actually was just measles – reached, of course, from continent edge to continent edge and practically wiped them out long before they had even heard of the white man. So much so that Lewis and Clark could uncork a little bottle, or just pretend to start to uncork a little bottle, saying, "Now you will have peace with all the tribes here on the Pacific Coast, and if you don't I'm going to take the cork out of this bottle and empty its contents over the land. And it contains the red death." And all the chiefs went pale and said we will have peace and they did. Thereafter, they had peace. That was a peaceful mission. Blackmail. Or redmail.

Anyhow, they – technology of healing contained so many factors of such complexity that it required half a lifetime to learn how to do these things. Now imagine if you as an auditor had as a requisite, being able to scream loud and piercingly enough, you see, to be heard about three city blocks. See, you find yourself going out in the woods and practicing screaming. Actually, screaming is an interesting therapy. You can sometimes send some preclear out and tell him, go on out there someplace where nobody can hear you, and scream for a while, and he'll feel better.
But anyway, as a therapeutic measure, the scream is used in this fashion: A piercing scream is emitted followed by a total silence. You see, you have to be able to cut the scream off right now and leave a silence in there and then utter the magic, hypnotic words. You see, they're actual – just an hypnotic command of some kind or other, like, "You will be well" or, "You will die tomorrow." They didn't care which way they sent people. And then resume the scream at the same pitch and volume. So actually you have: Here's the scream, you see, and then here's the silence with the command in it. And then that gets totally buried in the rest of the scream. And the patient doesn't ever realize that the practitioner has ever spoken.

He just lays one into the middle of the scream. Well, of course, when you're standing two feet away from a guy screaming loud enough to be heard three city blocks, and then you cut it off suddenly and then you put the implant in and then start it up again and so forth, why, all kinds of interesting things happen because the audience that is watching this on the tribal ground, they never heard the stop of the scream and the start of the scream, you see. And after this witch doctor has screamed at the fellow, of course, he either gets well in three days or dies in three days, whichever way was the most profitable. And they had it taped. All kinds of wild things like this.

You have to be able to leap in a back somersault high enough to go through the top of the smoke hole of a wigwam and sit on the trees, you know. Those poles. So that you ostensibly in a smoky interior simply disappear from sight, so that you cannot be found anywhere in the wigwam. The way they did this was to do a backflip and go up through the smoke hole and sit there on the poles, you see. And then by projecting their voices downward, talk in loud voices – spirit voices which had different tones and incantations than their own normal voice, you see – and boy, was this a show. And some patient lying there next to death's door naturally would become so interested that he'd come back to life again. [laughter] Very abrupt.

The history and breadth of medicine or healing or religious healing, or anything like that, has gotten pretty well unknown to the white man. He is so self-sufficient in his belief that he can do a great many of these things. But actually, their percentage was pretty high. Very high. You combine herbs and magic and superstition and these things together, and it's pretty high. And right now the white man in his arrogance, doesn't realize that in South Africa he is only doing maybe 30 to 40 percent of the cure, even when he's paid. Because the native goes across the street to see the witch doctor to complete the cure. And he merely considers the white doctor is quite inadequate because he never gives the spiritual fillip to it, you see, that drives the cure home.

That white pill might be all right, but that split feather in the pocket is a guarantee that it won't happen again. And the white man, of course, he doesn't realize these things so he's just stupid. The white man had never really better find out what natives think of him. It would be very, very bad for his pride, believe me. It was an awful shock to me. The first time I ever ran across this was the Eskimo.

There was a fellow there, and he wasn't working. And somebody said "dudtha" to him, you know. And my ear cocked up, and I had heard this word dudtha or whatever it was. Nobody can speak Eskimo. It's a fact. Nobody's ever learned all of it. I'd heard this word thrown in my direction, so I wondered what the connection was. And I said, "What did you call him?"
"Oh," he said, "He's a loafer. He's no good."

"Well, what did you call him?"

"Oh," he said, "he sits there. He's not helping us load."

"Yeah. What did you call him?"

He said, "A white man." [laughter]

And wouldn't they get that impression. It's a good thing we don't hear these things.

Anyway, if you were practicing amongst such a people and you failed to follow these now-I'm-supposed-to's of what healing were all about, you see, why, you would naturally be suspect as a practitioner.

You couldn't flip backwards and disappear; and there were no spirit voices suddenly resounding where you had just left; and you would talk to somebody and he didn't start sneezing, you know; you got near a fire and nothing exploded; they'd say, "Fake, man, fake." Got the idea?

Well, you're walking forward straight into that in Scientology, but the fake is the guy who won't know Model Session and he won't know how to do this and he won't know how to do this and he won't know the proper form, so of course he isn't an auditor. Isn't that right?

You've got the now-I'm-supposed-to. Now these now-I'm-supposed-to's have very, very potent reasons back of them. They are tried and tested and true. But they also become a badge. And the ease with which a person can handle a Model Session is, of course, his hallmark of whether or not he's a pro. You get that? It's whether or not he follows the form. Now, he makes mistakes in the form; immediately the preclear thinks of him as a bad auditor. He omits part of the form. The pc is immediately upset.

It's in actually the same category as – he hasn't done a backflip and had spirit voices appear at the point he vanished, you see. So therefore, he couldn't possibly make anybody well, because part of the magic incantation is missing. The now-I'm-supposed-to is missing so the fellow must be illy informed as to what to do. Rather amusing, but you're walking forward to that.

Now this can become so much a thing, that it is only necessary to follow the form to be an auditor. You see the reverse side of the coin? And that can become so idiotic as to be the same as the old master who was teaching the neophyte, and the old master, every time before he gave the neophyte his lesson, tied his cat to the bottom of the bed – having nothing else to do with the cat, you see, tied him to the bottom of the bed. So of course, the neophyte – when he became the master, he starts to teach somebody, and he says, "Now," he says, "the first thing let's do is find a cat and tie him to the bottom of the bed," you see. Now, that old wheeze is not without good purpose.

But you can get so interested in tying cats to bottoms of beds that the soul and spirit of auditing can vanish. It's all right to know the forms. And you sure better use the forms, and you better go through the forms, but auditing comes back to something else. It comes back to running cases. It is almost more important – always more important to run cases than to run cases according to form.
That doesn't persuade you in any way to abandon form, but it does persuade you to be able to use form with such ease that you can immediately and instantly sail into a case and find out everything you want to know about the case and follow the case through. And your use of the form is very, very easy.

Your use of the form can be so easy as to not really be apparent to anybody as a form. And that is the real art. That is the real art. When you're really expert, it won't ever look like a form to anybody. It'll look like just you're doing something. And it'll look like you're doing something effective. And that requires real art, and it requires real skill.

And that's the point you're moving over into. And if you stop short of moving all the way over into total, casual ease... Actually you're running something that is as bound in rules, you see, as concrete. But you handle it with such offhand ease, and you handle it with such naturalness that it never occurs to anybody that it's a form. Now, that is really fantastic. You have to be terribly comfortable with what you're doing. You have to be completely comfortable. You have to be able to move within the perimeter.

It's like Japanese painting. A Japanese painting, you know, is the most stylized painting in the world. The laws which surround Japanese painting are so fantastic that when I was a kid I used to wonder how on earth anybody could remember all the rules and still paint a picture that looked like that. A great deal of, you see, the stroke that paints the tree must be stroked upward since the tree grows upward. And all sorts of odd rules of this character, you see. And you have to do it this way and that way and the other way. And there are certain ways to grind ink stones. And oh, it just goes on and on. But when they turn something out, when a real craftsman turns something out, it is quite a piece of art. It is really remarkable. But he turned it out according to the rules, which made it three times as hard.

And I should think that the rule – instead of making auditing easier, I should think you are now at the stage where you realize that the form makes it harder, because you have to sound natural, and you have to be interested, and you have to be in there pitching, in spite of the fact that you are utilizing a form.

Now, if you fall short of appearing totally natural, then you will fall short of total control. There is where this thing bridges. If you sound the least bit artificial while you're doing this one ... of course, if you don't use any form at all, you know you won't be a pro. That'll be – you'll be a fake, you see. You get the idea? I mean you wouldn't really be an auditor. "He's not a well-trained auditor. He doesn't use Model Session." You get the idea? "Doesn't run the rudiments right," and so on. "Tisn't in the proper order."

All right. That's not enough. If you can use this to a point where the preclear never notices that rudiments are being used in that order – ah-ha, now that's real art. That is real art. You've moved over, way over on the other side. And your ability to control a pc and hold him in session will be utterly fantastic because he has no doubt about anything. He is very sure that your mind is straight on him and his case and that he must comply with what you've said, because it is obviously addressed to him and is totally natural. It is so natural that it must be addressed to him. Don't you see? And it sounds like a communication. This is very compelling.
So your nadir, you might say, of professional appearance in auditing, is to be able to use the form perfectly, but to use it with such ease that it isn't recognizable as a form; with such casualness that it appears to be totally relaxed; and that there is no question in your mind as to what you're doing or where you're going or what you're going to achieve. And this very casualness seems to speak of reserved power – something on the order of a huge Rolls-Royce motor which is sitting at the curb idling. You got the idea?

Ease is power – always. Strain is never power. The soft voice will always compel more obedience than the loud one.

Man is in an utter rage with you. I mean you're bossing workmen or something like that. Walk over to the foreman and whisper something to him. Just whisper it: "Now, get these men back to work. Get them back to work." Walk away quietly. Boy, you'll have injected more enturbulence into that rage than you ever heard of. The next thing you know they'll all be back working, and they might still be muttering, but they figure that if anybody said anything to them like that there must be something to it, see. Try it sometime.

Don't just Q-and-A with him out of rage, you see. Then out of that results war. I imagine, that if some of the warring nations of World War II had found the method of submitting a quiet enough message to one another in a quiet enough way, they would never have been in any war. But all the messages were very loud, weren't they? And they got louder and louder, and there got to be more and more confusion.

Now, this is based on the fact that – of the Effect Scale, naturally. And it's very easy for you to audit a pc with tremendous control, providing you yourself are not anxious. Providing you yourself appear to have, and actually have, every confidence that you can control every part of this situation. And you just go on and audit in this particular way. And the fellow says something, and you take it up. And you give another command, and he says something, and you say, "That's fine," and "All right," "How about that," and so on. And he's purring along there like mad. Because you are not trying to interest him in the session.

He feels that there is nothing to look at all but the bank. There's just nothing to see around there but his case. Got the idea? And if there's nothing to see around there but his case, there's no great demonstration of rudiments, and there's no great demonstration of a nice, big fumble with the E-Meter. And there is big twisting of knobs and dials and the clatter of cans, and strained look on the face, and the deep concentration, and the this and the that, and the worry on the part of the auditor. All of these various things add up to no control to the pc.

The auditor sits down, takes the E-Meter, turns the thing on. He doesn't even bother to settle it in, you know. He settled it in before the pc got there. Hands the pc the cans and says, "All right. Good. Fine. Squeeze the cans. All right. That's it. Okay. Now beginning of session. All right. Start of session. All right now. Let's see. Where are we at today? Mm-hm. Mm-hm. All right. That's good. That's good. Now ..." And here we go.

You go on down the line with your rudiments, check them out, and so forth. You're not doing anything very important. That isn't very important. The pc's ARC breaks aren't very important. Now you get down to a point of where you got – you're going to run the process, see. Well, you roll up your sleeves, you know. Just about that much interest as far as the voice comes up.
"All right. We got that out of the way. Now, here's the process I'm going to run on you." And you give it to him, see. "Here's the first command."

I seldom ask the pc if it's all right with him. I assumed that it was if he sat down in the chair. If he's fool enough to sit down in the chair, why, I'm not going to trifle with it. [laughter] I'm not going to trifle with this any further, believe me.

And he says, "Wow! wow!" and "Gee whiz!" and so on and, etc.

And I say, "No kidding. All right. All right. What do you know about that. Yeah. Well, what do you know about that."

I don't say, "Yes. Good. Yes. Thank you." Much more likely to say, "Mm-hm. All right." Get the idea? Different attitude. It's the attitude of the fact that, all right, he's given, we're interested, and we're both in his bank running it, you know. And here we are and so on and that's all that's important that's happened around here. It's his bank. That's the only thing we're interested in. We're just interested in what he's looking at and where he's going and that sort of thing. That's where the interest is. Our interest isn't on sessioning. Got the idea?

Well, when you get that good, you all of a sudden will speed your results up. That's all. It's the ease with which you can do it. The ease with which you can do it is to a large degree born of confidence.

Your confidence is based, of course, on wins and ability. And when you have ideas that you're not going to win, naturally, your confidence drops. The reality factor has to be kept in. And if you're anxious about somebody's case, you will appear anxious about somebody's case.

I handle it another way. I say, "Gee, I sure am worried about your case these days."

And the guy says, "You are?"

I say, "Yes, Sir. I sure am. I was thinking last night. I was wondering what in the name of common sense this is all about?"

And he says, "You did?"

And I say, "Yes."

He says, "Well, I haven't been worried about my case."

I say, "Well, I have been."

"Well, why are you worried about my case?"

"Well, you never say 'Gee whiz.' you never say, 'Gosh, what do you know?' Nothing. You just keep running this stuff. I don't know. I – I'm worried." Much higher reality factor than, "Now we are going to audit you. You are going to sit there, and I am going to give you... Here is the first auditing command. Do fish fly? Good. Do fish fly? Good. Do fish fly?"

If you feel that way, it's much more real to say to the fellow, [slightly exasperated voice] "Well, I hope this is the right process to run on you." [laughter] "Let's see how it goes."
And you'll find all of a sudden the pc is right in there pitching with you. It isn't the fact that you're anxious about it that makes him anxious about it. He's liable to try to cheer you up. [laughter]

But, I mean, if you are looking confident apparently but are feeling very unconfident, he's liable to go quite the reverse. He's very likely to respond to your anxiety. Extremely likely to respond directly to your anxiety. And the more you withhold your anxiety, the less he'll go into session.

"I hope you can put up with me this session, because I feel a little bit tired. If that's all right with you, I'll go on auditing you."

"Oh yeah. Do you feel very tired?"

"Oh, not particularly. It's no overt. No overt for you to sit there and get audited, but if I flub a few times, why, you know what to put it down to. If that's all right with you, here we go."

No, he isn't getting ARC breaky. But you sit there, you're dead exhausted, dead beat, and you're saying – you know, brace – "Is it all right with you if I start this session? Good. Here it is. Start of session." He says, "What's the matter with this guy?" Thrown an unknown into the situation. The auditor's an unknown factor to the pc. Now, frankness on the part of the auditor is part of the auditor's communication. And this goes over to a borderline of evaluation. The auditor starts thinking unkind thoughts about the pc. Starts chopping up the pc one way or the other. And of course, this is very, very bad for the session indeed, and it jumps the code, and the whole situation is going to run sideways and backwards and upside down, and the session is going to drown. You can sure count on that.

Well, the answer to that is, if you're having bad thoughts about a pc, and you feel very antipathetic about this particular pc and that sort of thing, you better get one of your fellow auditors... It's a good thing, you know, to have friends because they'll audit you. And you better get one of your fellow auditors to flatten O/W or something on this particular pc. You'll feel better, and he'll feel better, before it's through, see.

But the reality factor begins, of course, in your actual command of your information. If you don't feel you have an actual command of the information and you're pretending to have an actual command of the information, your session will come a cropper every time. You cannot help it. It always will come a cropper. No matter how hard you try, it'll come a cropper. A session goes to pieces only on those points of unreality in the auditor. If you want to know why a session goes to pieces, analyze the points of unreality that the auditor had. It's interesting, isn't it?

You look it over sometime. If you're training a bunch of auditors, and you find one or two of the auditors having trouble auditing, find out what's unreal. Now, one of the ways you ask about what's unreal – I just give you this as a method of checking this down: "What were you disagreeing with in that session?"

You know, the auditor was auditing a session. Get him afterwards. "Now what were you disagreeing with in that session?"
"Well, I disagreed with this and I disagreed with that, and I disagreed with something or other."

And you find those are the exact points that the session went to pieces on and the exact places where the pc went astray. It is quite interesting. Because there was no R in the session. Now if there's no R; let me yawningly go back to 1950. There's no R, there is no A. And if there is no A, there is no C. Reality, affinity and communication: It is the triangle, and when one of those corners of the triangle goes out of balance, the other two go out of balance, and they go zip, boom. And don't think that they go out on a lag. The R doesn't go out, and then a little while later, like a half an hour, the A go out, and a little while after that, the communication goes out. That isn't the way it happens. That's a simultaneous triangle.

When you say the R goes out, and then the A goes out, and then the C goes out, you're actually talking in milliseconds. They all go out together. They're simultaneously operating factors. You may become aware of them later as separate factors. You may become aware eventually that the C went out. The C went out. Well, if you want to spot where the C went out – when the C actually went out – you had to go back and find out when the R went out. The R went out, and there went the A, and there went the C.

You feel mad with the pc. You'll find out that this was a gradient scale, that you actually started feeling mad at the pc much earlier, and it was at that moment when an unreality entered the situation from the auditor – not from the pc, but from the auditor – when an unreality was entered into the session. At that moment, the auditor started to get peeved with the pc. Just bing-bing. Happens right now.

All these things are sensible. Sensible factors. Now, a session, basically, is an ARC activity. And if a session has high ARC in the auditor – it's only necessary in the auditor – it will materialize in the pc. Now, a pc can look at his bank as well as he can communicate. A good auditor has a highly perceptive pc. That's interesting, isn't it? The same pc, audited by an auditor with low ARC, is not perceptive. Isn't that fascinating?

Now, we're getting back to the Iroquois Indian, practically, aren't we? We're getting into factors of telepathy and transference and rapport and empathy and all kinds of oddball factors. But actually these factors have always existed. No matter whether you call them good witch doctoring or good this or good that. These factors are always present.

Now, if you feel an annoyance, or an anxiety with the pc, basically, that annoyance or anxiety with the pc is going to drop R. And is going to cut C, and it can be very destructive to a session, be very destructive to the pc. The pc would find himself practically running in the dark. Why is he running in the dark? Well, the auditor has got a low ARC. Not with him, you see, but the auditor – who is actually the projecting force of the session – is projecting a low perceptivity. And the pc can't see his bank. You got this?

This is one of the first factors that got in the road of Dianetics. This got in the road of Dianetics. One auditor would be able to get a session going and run engrams, and another auditor couldn't run engrams, and there was quite a big lot of question marks flying around in all directions. How could all this be taking place?
Actually, it was auditor presence in the session. You could explain it in many ways, and these many ways do not have to be explained by telepathy, or any odd factor at all.

An auditor who is confident, of course, is furnishing an auditing environment in which it is safe to depart into the never-never land of the unknown. It's as simple as that, don't you see.

So of course, you can say, well, an auditor who's not confident has a pc then who won't see the bank. Well, of course, it isn't safe to look at the bank in an environment which has got a sort of an 'ostile flavor to it. You got the idea?

So it's the auditor, in the final analysis, and the emotional tone of the session. And this has a great deal to do with whether or not auditing takes place. I'm talking to you now about the real high-school basics of auditing. These are not just the mechanics of auditing. This is where this stuff goes.

Now, when you're - you yourself have been auditing for a long time and you haven't cleared anybody - you're not auditing in any high level of confidence. Now, you've seen somebody cleared, and you start auditing in a higher level of confidence that we would phrase as hope. When you've cleared somebody, you start auditing in something that could be characterized as confidence. And when you really have rung up a string of them, nobody will be able to live with you. You'll be totally insouciant. But that in itself is a reality.

Now, also it goes this way. When you have audited a pc up to results, you feel more confident about pcs. And when you've not gotten these results, you feel less confident about pcs and so you're auditing in an auditing environment which has a low ARC in it. Got the idea?

These things are very easily explained. They are simply observable. You can always detect the false note in somebody's confidence, always. The auditor is sounding confident but isn't at all confident. And of course, this is observable. The pc is nervous. The pc's attention goes off of own case on to auditor, because he feels there is something here he doesn't know. And we have an unknownness in the session.

Unknownnesses would be the keynote of this. The auditor doesn't know whether or not he can produce a result. He doesn't know whether or not he can hold a pc in session. He doesn't know what he can do. He doesn't know what is going to happen. He has no determination of the final result. These are all not-knows, not-knows, not-knows, you see. It adds up to the pc that the auditor is not-knowing. Therefore, there is a mystery in the session.

The pc may try to spot this not-know. Very hard and arduously. The pc may be trying to spot this and not know what he's trying to spot. But he gets stuck on the auditor. Why? A thetan stuck to anything is, of course, just a mystery sandwich. It's thetan, mystery, object. Mystery sandwich. And of course, the auditor then can't keep the pc in-session because the pc has got a mystery on the auditor, and we have the auditor plastered all over the pc. You get the idea? Because the pc is... See? And he doesn't dare see anything, and he doesn't dare act. These are the factors. These are the factors that are involved. They're all explained on the order of how much mystery does he smell around here.
Well, I disabuse the pc of mystery as fast as I can, as a method of operating procedure. I tell him how long we are going to audit, if this seems to have any importance — if it has a bearing on the thing, I say, "Well, we're going to run this session until such-and-such a time."

Of course, if you're running the session not against the part of a pc's day where the pc will have anything to do, you just say to hell with that. We're just going to run the pc, you see? Got the idea? I mean, you're running him from eight o'clock on, and you've got till midnight, as far as that's concerned, it just doesn't matter. The pc knows you probably may or may not start ending it at around ten. If he looks the least querulous about anything, well, you find out why. It's usually something about the time of the auditing session or something like that. So you'd set him right anyhow. Got the idea?

The rule of thumb is, if there appears to be a mystery about what is going on, you give the pc the dope. You just destroy the mysteries about the session. I can be counted on usually to give a pc a synopsis of what is going to happen. I've never gone so far as to say, "And at the end of that time you will feel much better," but I have gone as far as to say, "Well, we'll take care of that. I'm going to take care of this headache you've got." You know?

I ask the pc for his goals, too — it's polite — while I tell him what I'm going to do. Tell him what I'm going to run. If I ignore doing something, I tell him I'm going to ignore it. That is to say a rudiment. I'd say, "Well, there's a fall here on this ARC break with me. But that's what I'm running toward anyhow. And is there anything you want to tell me about this? I notice there's a little fall here."

"Yeah. Well, so-and-so and so-and-so."

"I thought it was something like that. Okay. Now we're just going to skip that at the moment because it'll come out in the session shortly. Okay?"

And the pc says, "Well, I guess so. Well, all right." And all of a sudden the ARC break disappears because so much R has been thrown into the session. Ha-ha-ha-ha. Get the idea?

And a quarter of the way through, you're running some kind of a process or other, and the pc seems to be floundering around and nothing's happening, I say, "I don't like the way this is going. I'm going to give you another auditing command. Going to change the auditing command. What do you think of that?"

The pc says, "Well, I don't know. I think it'll probably be a very good idea."

"Well, I don't like the way the other's going."

"I don't like the way it's going either."

"All right. Here's the new auditing command."

No bridge. Didn't stop any session, start any session. See why? I'd introduce an unreality into this situation — without telling the pc why, I'm going to stop an auditing command; I'm going to throw a bridge in; I'm going to start another auditing command; I'm going to go through the tortuous mechanics of everything, you know. You can hear the wheels click, you know, and the cuckoo is grinding his beak inside the clock, and all this kind of thing. The pc can be counted on to look up and say, "Well — hey what — what — what — what's the matter?" I know that I've been a very bad auditor. I know that I've been an absolute fool if the pc ever
looks up and asks me what's the matter. If I haven't filled him in before he thought of it, I figure I'm doing wrong.

"I'm going to run through this, and I'm going to keep up with this command until I think the thing is squared away. Is that all right? All right. And that may mean that we'll be overrunning this session. Is that all right?"

"All right."

There's never any doubt in his mind that when the session starts to overrun that the session was going to be overrun. He knows about it already. See?

And I always try to make the pc right, and never try to make the pc wrong. I never bother to make the pc right at the expense of my being wrong. If he says I said something that I didn't say, I acknowledge him. I don't say I said it. Because that would introduce another mystery in it, because he probably knows down deep that I didn't say it. You see this? So I just acknowledge it. I'm liable to say something, "Well, can we recover from that? Is that all right?"

"Yeah, well, that's all right."

If I'm challenged for flubbing an auditing command or repeating an auditing command – if it is valid, if it is perfectly valid, if I did repeat one leg of a process, you know, running without any tally or anything of the sort on a ten-way bracket, God knows, and so on – I will normally catch it before the pc does, and if I don't catch it before the pc does, I figure I'm kind of slipping, you see. "How many ways from center have you batted your – ? oh, I've said that before. Excuse me. How many ways has your grandmother batted you? That's the right command. Is that okay? You got it?"

Pc says, "All right." He says, "Well, anybody can make a mistake." That's his reaction to it if he thinks of it at all.

And you say, "Well, how many ways have you batted your – uh – your – urn – uh – your grandmother?"

Pc says, "I answered that before."

Oh, man, that is really a lousy piece of auditing, see. It's not a lousy piece of auditing because you made a mistake on which auditing command you were giving the pc. That's not necessarily horrible. But it was horrible because the pc found it out. You got the idea? You didn't find it out before the pc did. See?

You should know more about what's going on in the session than the pc does at any given instant. And therefore, you have more R in the session than the pc, and therefore you stay in control of the pc in the session.

When you have a pc wising you up as to what was going on, well, there's – something has slipped. That's all. It has slipped, and it slipped a long time ago, and it slipped badly, and there's – R-factors are out, and everything else is out, from the middle outward in a session. This thing was out. This has probably been out for days or weeks. Lord knows how long it's been out if that kind of a condition can exist.
The pc is not always right. But the auditor doesn't have to tell him he's wrong because the auditor's not trying to prove anything to the pc. There isn't a single part of auditing that consists of proving anything to a pc. You don't have to prove a thing to a pc. You don't have to prove him there are Clears, or that he can get Clear, or that he can get released. You don't have to prove to him that Scientology works. You don't have to prove anything to him. Got it?

"Prove" is one of the basic games of the thetan. And people are always – on the whole track, thetans have been running around telling others to prove it. And a pc can get this games condition very early. But if a pc wants you to prove something to him, you already have got an out R-factor someplace. Something has gone wrong earlier than this point.

You say, "Well, I'll show you that Scientology works. I will give you a session." See?

The guys says, "Oh, I don't believe it works and I believe it's kind of fraudulent and so forth. And I'm not sure. And, uh, I'm not sure and, uh, so on."

Not because you want to prove anything to him, say, "What withholds have you got?" You know, this is a social conversation taking place in the underground. "What withholds have you got?" You know, very puzzled. "What's with you and the rest of the human race?"

Bzzzzzzz. Boom. I never Q-and-A with whether it works or not. I wouldn't discuss for three seconds with anybody whether Dianetics or Scientology work. And I would never audit anybody to get a result that will electrify the community.

You know, the guy wants to be audited on this sole basis. He wants this young girl to be audited because it'll do so much for Scientology. And we hear that quite often. That's one of these "prove" things. Prove it. Prove it. Prove it. Sure, if we audit a young girl and get some result, it'll electrify the community. That's for sure. But isn't it interesting that every effort to prove the validity of Dianetics and Scientology, some of which efforts have cost as much as fifty thousand dollars, have all of them netted us not one single bit of gain.

It's given us lots of nice records, and I'm very happy to have the records.

The reason they have trouble with business is the president of the company is sitting there in his old slacks and his tweed coat that is out at the elbows – see, they no longer wear top hats because laborers knock them off. And he's sitting there at his solid mahogany desk, and he says, "Now you say," he says, "that this will up production. You say this will up production. Now, we could do it on a basis that if it did up production, why, then we would do so-and-so, and if it didn't up production, then we wouldn't do so-and-so," and so on.

That is the time to go yawn, yawn, yawn, because the old thetan game of "prove" has started stopping things. You shouldn't be selling him anything anyhow. Sit on his head and audit him. He'll come up at the other end, and say, "What in the hell happened to me? I feel better."

You say, "Good. Of course you do."

He'll say, "What is this stuff?"

And you say, "This is Scientology."

And he says, "No kidding." He says, "Does it always do this?"
"Yeah. Why don't you go to a PE course. I'm not going to give you one here. Or I'll give you some more auditing if you want."

The guy says, "Well, if you could just get me over my lumbosis, I would be happy to pay you four hundred dollars."

That is the time to go yawn, yawn, yawn.

You now say, "Well, I'm not trying to take any lumbosis away from you. But I'll give you some auditing."

"You don't want my lumbosis? You don't want this game? No game, you mean? No game? No game?"

And you say, "No game. Scientology's the game that everybody wins. The only game on Earth where everybody wins. So, we're not interested in your lumbosis, or proving to you or your wife or anybody else that Scientology works."

Because you've gotten the thing into a disagreement, an argument, and a games condition before you've even begun to audit. And an auditing session is not a games condition. You should know it. The one thing an auditing session must not become is a games condition whereby the auditor sits there and prevents the pc from getting a win, and the pc sits there and prevents the auditor from getting a win.

And this can be quite detrimental. But you should realize – and the only reason I've embarked upon this little excursion here is just this – that every Homo sap that is wearing out shoe leather or rubber soles on the metropoli of Earth is in a games condition. And all you have to do is just whisper, "games condition" and they're right there. It almost takes precedent over a session. And could very easily take precedent over a session.

So anytime a pc offers up anything that looks like a games condition, just let it fall with a dull plop in the middle of the floor. And every time you embark on anything that looks like a games condition to the pc, patch it up. Because from there on, your goal will be opposite from his goal. And if your goal is to make him better, then he'll get worse or try to. Because it's a games condition, he will try to do an opposite. He won't agree with you in this kind of a condition. And a games condition immediately and directly results instantly that you obey [disobey] almost any part – except the eating one; oh, I guess maybe that one, too – of the Auditor's Code. Those are all prevention of games conditions. They could be looked at that way in a loose, rough way.

Pc, well, get the shuns. The pc is sitting there to get smarter, so you educate him. See? He's sitting there to find out from himself, so you give him the information. Now let's put it a little more closely, and you'll see exactly how this fits. He's sitting there to find out something about his case, and he finds out something about your case. See, that just doesn't work. And it'll start putting him in a games condition whether you like it or not.

All right. Now, the pc says, "Uh, you said the auditing command before."

And you say, "No, I did not."
And you'll have a divergence of goals at that point in the session. At the least whiff of a games condition, a pc can be guaranteed to take off in that direction. They'll be knocking the tennis balls around the court from there on, man.

Disagreements, of various kinds, of course, lead directly into a games condition because the game is basically an individuated nonagreement. The only agreement there, is to have a game. And as soon as you establish the agreement to have a game, of course, all other things go into a disagreement. You've got certain rules of this game, but the pc is on one side, and you're on the other side, and you're not auditing now. Auditing is the one activity in which a games condition must not exist. That's for sure. And, as soon as you drop out R, of course, you've dropped in an ingredient that could lead to a games condition. So that a missing R goes into a games condition.

Now, you're sitting there withholding something from the pc with magnitude – you yourself might kind of get tricked into the thing, you're playing some kind of a game with the pc. You get the idea? It sort of reacts like that. You're withholding something from the pc, so obviously you must be playing tennis with the pc. You see? Just the fact that you are, will enter this type of atmosphere into the situation. Of course, C breaks down at once. Auditing is an activity of an auditor taking over the control of, and shepherding the attention of, a pc, so as to bring about a higher level of confront ability. He has got to be able to confront more of what he has done, is doing, and so forth.

You actually are not even changing the pc. Same pc. He's going to shed some valences, some various things are going to happen of one character or another, which will certainly appear as change. You haven't changed the pc, because his level of vision can remain at 249 degrees in direction, only it is now eight miles long. It isn't being stopped two inches from his nose by an automobile accident he had. You get the idea?

So you haven't even changed the direction of his attention. Eventually he will wind up with his attention in all those directions, only his attention will be free in those directions. What you're doing, actually, is extending and familiarizing a pc with himself and his bank and the universe, various dynamics.

And therefore, his attention very well has to be shepherded. You can't expect the automaticity of an auditing command to do all the shepherding of attention, because the pc is going to duck.

The pc's attention is on object A, and the pc goes into a dispersal from object A, and you don't want the pc at that moment to be dispersing from object A because you don't think object A has been regarded at all. And yet you think at the same time that the pc is totally capable of regarding object A. We're not going to throw him in over his head. But he just told us that, "Well, I have this stuck picture of this candy shop."

"All right." Time goes on. "Now what are you looking at? What have you got now?"

"Well, I got this camel."

"Camel? What happened to the candy shop? It's all right to have a camel, but what happened to the candy shop?"
"Oh, that just disappeared."

"Well, what was that about the candy shop?"

"Well, I don't know. It was just a candy shop. And it was just sitting there. There, there it is now."

"Well, did it come back? Has it still been there?"

"Why, I guess it's still been there. Actually, I have this camel. It's a small picture up to the right of the candy shop. I hadn't noticed that before."

"Well, what gives with this candy shop? How come? What's on the other side of it? What's in front of it? What's all this about?"

"Yeah, well, you shouldn't have asked. You shouldn't have asked, you see." This was the key withhold that was holding up the whole Security Check. He robbed it. That's all. And it just seems to have been totally occluded, and the only thing he's got left of it is a stuck candy shop. And the motion and action around there with the eighteen blocks he was chased by the police patrol car. There's nothing around the candy shop. Nothing, except policemen, guilt, potential prison, and an eighteen block chase, and a screaming police car, you see. Nothing around the candy shop. It's totally blank. That's it.

You can count on the fact that every stuck picture is in some degree held, but that the person is able to regard the action if he can regard the stuck picture. The indicator that he can regard at least some of the action or consequences in the scene, are indicated by the fact that he has a stuck picture blanking them out. So he can always do the gradient scale of looking a little bit further, and you can always do the gradient scale of looking a little bit further at what the pc is looking at.

You didn't ask the pc to look at the candy shop in the first place. You just found out that the pc was looking at the candy shop. You got the idea? And it's just a candy shop and a candy shop. Once in a while you'll have a pc saying, "Well, candy shop, candy shop, candy shop. Aaaahh. It's a picture of this cand – it's a picture of this damned candy shop."

"Well, what is that?"

"Well, I don't know. That's started to worry me. It's just sitting there."

"Well, what about it?"

"Well, it's just sitting there. There isn't anything about it. That's what's so mystifying about the whole thing, you see. There is nothing there. It's just a candy shop. And there's nothing going on. And I think I've had this for the last twenty auditing commands. I mean there's this candy shop. I mean there's just this candy shop, you know."

He's actually asking you, for God's sakes, let me investigate this thing or do something because I myself do not have quite the punch and power to do so. Don't you see?

So you say, "Well, look on the other side of it. Is there anything just short of it? Is there anything on the other side of it?"
You only have to do that once, something of that sort. And boom! He's looking at more, and this thing all changes and so forth. But changes on cases which are rapid, and changes on cases which are highly beneficial, very often come about from the shepherding of the pc's attention. Not from the permissive grind, grind, grind. But let's find out what he's looking at. And then let's get him to see it. That he's looking at something doesn't mean he can see it, because he doesn't know what's all going on with that situation. Now you're blowing more unknownness out of the session, aren't you?

The pc with an unknownness confronting him can become absolutely frantic. Utterly frantic. It is just an unknownness, and he can't seem to examine it, and he doesn't seem to know what's going on, and if the auditor at that particular time is deaf and dumb, and there's nothing happening, the pc can become quite upset. Why? Because he's letting the auditor steer his attention, and then the auditor doesn't steer his attention. You see?

He's granted the auditor permission to do a conducted Cook's tour through the bank, and then the auditor says, "Well, that's a ghetto over there, and we don't want to have much to do with that. And that there, that's the court buildings, and we don't want to go in there. And, oh, that's good enough. Well, fine. Just answer the auditing command, that's all. Now let's see, let's -- well, that's just a street. That's just a street. That's all right. Keep your attention about four feet off the pavement, and you won't see any bodies or anything on it."

An auditor isn't there to conduct a safe tour. The only safety precautions you utilize in the bank is to get the pc to examine what he's looking at. And that goes skip, skip, skip, skip, skip, skip, skip. Well, there's another somatic. Skip, skip. And there's another somatic. Skip, skip. And there's another somatic. Skip, skip, skip. Another somatic. Another somatic. I now have eighteen. Skip, skip, skip. And there's another one. Skip, skip, skip, skip. What are you doing then? You're just letting him collapse the bank on himself.

Well, somewhere along the line you have to say, "Son, as painful as it may be and as difficult as I know it is, on life's long highway, you will have to stop and turn around and stare, at least, some of the smaller devils down. And the time has come now. What is beyond that candy shop?" Have you got the idea?

Now, you can get into the idea that you can throw a pc in over his head much further than he is prepared to go, because the pc is always telling you that you have just done just that. How does he do this? He tells it to you by sweating. He tells it to you by screaming. He tells it to you by writhing. You got the idea? And all of these things are, of course, signals of, "We should get out of here." And the auditor who says, "Well, this poor fellow is in trouble. Let's get him out of there," of course, has just taken him and thrown him in trouble. Because the trouble he got into originally in that area was by escaping from it. And he's been in trouble about that area ever since. So all the indicators that the pc gives you, is the pc is in trouble.

And the only error you can make is let him slide out of trouble, let him automatically wander out of trouble, let him somehow or another fall on the pavement, and roll into the gutter, so that he doesn't have to look at the candy shop. You get the idea? And this eventually winds up to a very slow gain.
Yes, eventually the auditing command will come around again and take another sweetmeat out of the window of the candy shop. And then fifteen hours of auditing later, we take another tiny little flick off the top cornice of the candy shop.

Now, an auditor mustn't press and be anxious and be upset about anything but the pc looking and going. Case gains. He wants the pc to get some case gains. He should be quite pressy about that.

"Oh, this process is taking too long, and I think we'd better run another process, because we've been running this process for five minutes, and nothing's happened. So let's run another process now," and so on.

That is the wrong way to direct a pc's attention, because it's directing his attention off of what he's doing. It'd be much smarter – five minutes have gone by and nothing has happened with the process. And you say, "What are you doing?"

"Well, I'm doing so-and-so."

"All right. What else you doing? Whatcha looking at? Whatcha looking at?"

"Well, I got this stuck picture." That's usually the thing. Or "There's just nothing here. Nothing at all. I can see nothing wherever I look."

You say, "Is that so? Which direction are you looking?"

"Well, I'm looking up."

"Good. Look down." [laughter]

Got the idea? Don't change the process because it isn't going fast enough for you. Get the pc's attention directed, and it'll go fast enough to suit most anybody. And of course, you get educated against doing this, because you do it five times with great success, and on the sixth time, the pc lets out a piercing scream, and you are yourself restimulated into remembering that poor native that you shoved the iron spear through while upholding imperialism, so the communists could eventually knock it down, you know. And you are restimulated into believing that you have just impaled this poor native again. Obviously, there's a man in trouble in front of you, because he is screaming.

Naw! He isn't in trouble because he's screaming. He's in trouble because he's getting well, he thinks. See, he isn't in trouble. The only way to get him in trouble is say, "Now, come up to present time!" He'd be in trouble. He'd be in trouble right then. You get what the right way out is? The way out is the way through.

And an auditor who cannot get a pc to move on through is of course an auditor who is being oblivious of what the pc is doing. You can't get a pc to move through something when you don't even know he's anywhere. If the pc is exactly nowhere as far as you're concerned, you can't tell him to look up, down, sideways. You can't tell him to look further at something. You can't tell him to go – "Well, I don't know," the guy says, "I don't know. I just – I don't know. Ever since I ran that picture about the camel, I've had a lot of difficulty here. I just don't seem to be able to get the auditing command and so forth."
"Well, what about the camel? Did you miss anything around the camel? Is there anything else around that camel?" and so forth.

"Oooooooh! You shouldn't have said that." You see. You can count on it every time. Every time the pc stops running, the pc has started fixedly looking. The way to stop him from fixedly looking is tell him to look a little more or look a little better. And the next thing you know, you'll be getting resounding and horrendous results that you never heard of before. This case will be running that you thought was all slowed down because you didn't have the rudiments in, and all of a sudden the case will be running bang, bang, bang, bang, bang. Case will be very interested in what he is doing and so forth. Got it?

If I didn't teach you how to audit a pc, and if I taught you only how to follow a form, I would be doing very wrong. Forms are forms. But running a pc is running a pc. And that is all there is to it. Pc sits down in the chair, and you say, "Start of session." If you've got your ARC in and your R-factors are in, and so on, you go down there with the rudiments, you square them away, and you get the pc into the process, and then you run that pc – you run him.

Now, it doesn't mean repeat an auditing command and repeat an auditing command and repeat an auditing command. Yes, it means repeat auditing commands. But it also – what is the pc doing with the auditing command? What else is he doing with the auditing command? What is he looking at? What is happening? Tone arm all of a sudden isn't moving. Hasn't moved for about four or five commands. "What are you looking at?"

"Nothing but this stuck picture."
"Oh. How long have you had that?"
"Well, I don't know. Last five minutes or so."
"Well, what is it?"
"Well, it's a picture of a mosque."
"Okay. What's going on in the mosque?"
"Nothing. It's just a picture of a mosque."

Oh, right away, what do you know? He must have run into a confusion and a stable datum. And the stable datum is the mosque. And he's looking busily at the stable datum, and he is ignoring the confusion. And the only thing that's going to let him out of there, of course, is to pay some attention to the confusion. And if you can get him to look at the confusion, of course, there goes the stable datum because the stable datum is no longer necessary.

His security is totally bound up in the fact that "If I just stand here and look at this mosque, I'm all set." The hell he is. He's been all set. But he's been standing there looking at the mosque in the bank with his attention all bound up on it for maybe the last thousand years. Well, that seems to me to be a long time to examine mosques. [laughter]

Well, it hasn't done him any good for a thousand years to look at the mosque. How do you think it's going to do him any good through the rest of this session to look at the mosque?

You better tell him, "What might be around that mosque?"
"Well, nothing is around any mosque, of course. It is just sand in all directions."

"Yeah, well, what's around that particular mosque?"

"Oh, this one. Oh, well, nothing, nothing. Mossians or something, they come out and ... Well, as a matter of fact, there is a Mussian right now. He comes out and he says something or other. Well, what do you know, ha-ha, something happened to the picture. Ho-ho. Hey, what do you know?"

That's good enough. Give him the next auditing command. And he executes it, and you say, "What happened? What happened to the mosque?"

"Oh, it's still there. The Mussian's stuck now."

"Well, what's around that mosque? What is around it? Where is this thing located? What is it doing? What is going on? Anything you care to say?"

And he says, "Well, there's nothing around it." He says, "You see, the whole city has been destroyed. Everything except the mosque."

"Oh? Well, what are you looking at there now?"

"I'm looking at the destroyed city."

"Well, what else do you see there?"

"[Sniff] Nothing, except my whole family [sniff, sniff] dead."

But you see, the computation was if he could just stand there and look at the mosque for the next thousand years, he wouldn't have to notice all those corpses. Something of this sort, don't you see? It's always that sort of thing. Always. I'm not talking now about one particular case. The case that has the black field – wake up sometime and say, "What is on the other side of it?" The case that never sees a picture there, everything is invisible, and so forth – "Which direction is this invisibility?"

"Oh, it's all around."

"All around in what direction?"

"Up, of course."

"Well, look down."

So much for the invisible case. You got the idea?

It's up to you to direct the pc's attention. Why? Because he himself, in that very bank he has been in, has his attention fixed on these objects solely for one reason only: that he has been powerless to direct his own attention in that particular bank and those particular situations. And if an auditor doesn't come along and do some attention direction, of course, the auditing command alone will do the attention direction. Well, it will do something at a slow limp.

But unless the auditor says, "Look. See. What is it? What did you do with the auditing command? What else did you do with the auditing command? What is happening?" Unless
those things go in, you also don't have ARC either because the pc winds up believing implicitly that the auditor doesn't care.

If you want to run a session which has fast results, and you want to do fast clearing, I'm afraid you'll just have to get down to the fundamental, which is that the auditor is somebody who directs the pc's attention through his bank. Okay?

All right. I feel now like saying, "Go now and sin no more," but I won't. [laughter] I'll be back nagging at you again next week.

Thank you.
Principles Of Auditing

A lecture given on 5 September 1961

[part missing]

All right. This is 5 Sept., isn't it?

Audience: Yes. Right.

And 61. Saint Hill Special Briefing Course.

Now, I hate to begin on a theme like this. There are actually so many things to tell you, why, I don't think it'll ever get it done. I don't think they'll – these things can ever be told you; they are just too many. So I would like to invite your cooperation and initiative in sweeping up, surging forward and synthesizing some of this material as you go. There's no substitute for understanding and there is no understanding without experience.

Nothing was more wonderful than the North's total solution to the black slavery problem of the South. They were not encumbered by any familiarity with the problem at all, which is an optimum way to enter into any problem, of course. One is uninhibited by facts. And the South, of course, was totally uninhibited by any facts of what was going on in the North or what that was all about. The only familiarity they could establish between them, then, was war.

Let me point out that's a terribly, terribly apt example, because that in essence is an auditing situation where there is no understanding or familiarity. If you do not permit understanding and familiarity of the preclear with his bank, he will go to war. And if the auditor does not have understanding and familiarity with the pc and his bank and the mechanics of the mind, he will be at war whether he likes it or not.

The anatomy of hatred is totally based on the anatomy of noncomprehension. And noncomprehension is totally based upon a lack of familiarity and observation. If you want to not comprehend something, by all means don't look at it. But another condition applies: that a tremendous amount of pretended knowingness and pretended understanding can arise after one has not observed. The ancient example of the wise men and the elephant is a very poor example compared to an auditor attempting to audit a pc when the auditor has no familiarity with the mind.

Out of this you get such idiocies as Freudian analysis, which is just plain idiocy, and after some years will bring the patient – who has to be patient; that is why, you see, the term is applied – to a state, you see, where by being careful he can still live. That is the Freudian equivalent of Clear. That was their goal.
Now, a Clear is brought up to a point where he is free to act, which is just the other end of the spectrum. Now, the Freudian analyst sat there in his analysis on a busy, busy, busy pretended knowingness. He "knew" that the observation of children's sexual parts brought about insanity. Well, it must have been, because he looked in childhood only for sexual incidents, and that's the area of the least sex, isn't it? Yeah, fascinating. So he knew what caused insanity, and of course he went on and made people insane.

The Freudians never released it, but in the first three months of analysis, at one time, the astonishing figure of 35 percent suicide resulted. Never been made public. They never validated any gains in spite of the fact that they had the whole field of psychometric tests available.

Psychology is even more idiotic. The psychologist is born out of a school of science that observed dead tissue. The medico has all of his stable data from the area and field of dead tissue. The pathologist does observe a few bugs wiggling, but dead tissue is the source of medicine.

But there – the study of dead tissue – ah, the psychologist came out of this same field. After you've sawed the top of a corpse's 'ead off, all you can find in a skull is a brain, so they studied it. Oh, I suppose that's better than nothing. But let me point out something to you – that the thing they should have been studying had left. [laughter] And out of this, of course, we got a no-observation of the mind and the fundamentals of behavior because they were not observing what they were processing.

I'm not just giving you some tricks of logic here. What I tell you is absolute fact: that the whole theory of modern medicine is based on a study of dead tissue. They – in medical school all they do is cut up dead bodies. They have a ball. They whittle and chop and classify, and that's all very interesting, and I'm sure they learned a great deal about anatomy. But when it came to the mind and they opened up the skull and found a brain, they of course studied it and they haven't been anywhere since. Do you realize that a field is as vital as it makes progress, and a science is as vital as it makes progress, and it is no more vital than that. Let me point out that there has been no significant advance in Freudian analysis over and above the day of its origin in 1894. And there's been no significant advance in the field of psychology since its origin at Leipzig, Germany, in 1879 – they've not gone anyplace. So obviously they couldn't have been observing what the mind was all about. They couldn't have been or they would have found out something.

Now, the most novel thing that I introduced into the study of the mind was the observation of living beings. Very interesting. What a new thought! But you'd have to be able to confront motion to do that, and you yourself would have to be to some degree a man of action. You'd have to be able to confront some action.

You'd have to be out there slugging it along with the fellows who were sweating. And you would never have studied this in any ivory tower. And to withdraw to the highest peak of the Himalayas and regard with curiosity one's umbilical remains is of course not the way to do it because no familiarity ever occurs.

After a while, you would start saying, "Well, if you stretch somebody's umbilical cord far enough, why, you'll get a Clear." Inevitable. All right. Let's take a look at this, because we
can learn a great deal from this one fact. An auditor has two sources of familiarity – two sources – in processing. There are more sources of familiarity than this in general that he could work with but I'm talking now about sessions.

He has the familiarity we call subjective reality, and he has as well the familiarity of the observation of a preclear and his meter behavior while in session. In other words, while he himself is in session as a preclear, he has the opportunity of obtaining familiarity on the data and functions of life and thinkingness. And then as an auditor, you see, he has the opportunity of obtaining an objective familiarity on the behavior and activities and phenomena of the pc as viewed directly with his own eyes and indirectly through the electronic phenomena of the E-Meter.

In other words, there are two spheres there of observation as far as auditing is concerned. Naturally, there are more spheres. There's the sphere of observing life, observing living. There is the sphere of living, as well as observing living. Of course, it's rigged so that if you do too much living in this particular society, you wind up with too many withholds. And after that, of course, your auditor has a lot of trouble trying to get you in session.

I don't know, I think there possibly is some phase of life that is not punished. I haven't discovered what it is yet, but [laughter] – but speaking strictly and entirely in the zone of sessions, there are these two sources of observation and familiarity. You have an opportunity to become familiar in two zones: one as an auditor and one as a pc.

Now, certain laws govern auditing. And if you were in a state of mind where you believe that there are too many laws and that you were having to memorize too many laws and that you have to think of too many laws while you were busy doing it, then I can tell you that you have a vast familiarity on the subject of laws and very little familiarity on the subject of the mind. Ever stop and think of that?

Now, rules can only go so far as to guide you in the path of right and light on the road to making Clears. They can only go so far. The great oddity is that it can be done at all. That is the oddity.

But factually speaking, no number of rules can deliver into your hands a familiarity with what is going on in the pc at any given moment. You yourself should be able to experience that or should have experienced it and should have some knowingness on it. And the moment that you gain knowingness upon this particular subject, the rules will all fall into line and will all have proper value, and you will see the reasons for all of them. And you'll see which ones are important and which ones are not important.

All of that is very comprehensible; you have all been audited. This is obvious that you have familiarity with the mind because you have been audited. Oh, I've got a crasher for you. I've got a crasher for about 30 percent of the cases in Scientology: You have never seen a mind. That's a crasher, isn't it? That is only – the only source of very bad auditing, is no familiarity with the mind.

Now, of course, I have got the machine guns out and the cordons divided up in all directions on just one subject, and that is Clearing. And I am doing every possible thing that I can do to improve auditing, wherever it is, in order to make Clears. This is my push. And to
make them faster and more smoothly with a minimum number of flubs. This is, you might say, my current crusade.

We look at a broader track, I might have some other crusades of much broader significance; but right now this is my current crusade, and this crusade has been in progress now since the 3rd South African ACC. So all I've been doing, actually, is just making better auditors.

And every time I find another gate opening on this route, I am very happy about it indeed. And though I myself may sound somewhat condemning occasionally, just assign it to my urgency. On this line, I am eager. And I would say – having no actual survey present, but just at a – offhand estimate – that at least one third of the auditors in Scientology have never become familiar with the mind. They have no subjective reality on engrams, secondaries, locks, ridges, machines, circuits, time track, visio, sonic, tactile, kinetic – haven't any reality on these things. Don't exist. Horrible state of affairs, isn't it?

All right then. This requires a special technology, and the second that we get this technology, we of course can advance cases much more rapidly. Why are cases dragging their heels to Clear? Why? Why? Why? Why? Why? Why? Why? Why? Why are auditors being difficult to train? Why? Why? Well, they're only difficult to train in those areas where they do not have familiarity.

So obviously, the technical advance which is most needful at this present instant on this particular crusade and campaign is a type of process that will give one a great deal of familiarity with the bank and all of its aspects. And at the same time you would pick up all the hangfire cleared cases. All the cases that are hanging fire on the road to Clear are hanging fire because they are not going along the line they should be going in auditing. They are walking the far, far, far perimeter of the crater, operating so as not to fall in.

I don't know how many hours they could do this on current processes, but that would be up to the auditor. Now, the processes which we have, used in a skilled fashion by an auditor who has comprehension of the mind, would not possibly permit anybody to do this. They would fall in. Bang! That would be it.

Ah! But an auditor who has no familiarity on the mind will applaud this tightrope walk on the far, far edge of the crater. And so he makes very sure that the pc never falls in because that is the thing to do – to keep out of trouble.

All of man's wars, sicknesses, diseases, economic disasters, political chaoses and anything else which he has assigned to the various plagues of existence come entirely from one area: keeping out of trouble.

If this planet and civilization were ever to vanish, perhaps I will come back someday and put a sign in orbit on its exact track – just a single sign – no planet, you see. "There was a planet here once, but they were very anxious to keep out of trouble. They were awfully careful." Oh, that sounds like a grim thing.

Well, fortunately, I'm not going to have to do that because we're all going to get in and pitch. This is for sure. But it's just this. It's just this. It's just that diffidence, this withdrawal from session. It's just that diffidence which makes all that difference. You're not supposed to
keep a pc out of trouble if the trouble is in his bank. Yours is only the trouble you're supposed to keep a pc out of is session randomness, but you're not supposed to keep him out of bank randomness. If he's got a bank to fall in, you would do a grievous crime if you didn't unfasten the nails and bolts on one of the slats of the bridge.

Auditing questions are designed to take the drop; and if an auditor is administering them so that no drop will occur, this must be an interesting session. Here you have all the questions necessary to plunge somebody into a great familiarity with his bank – on a gradient, so that it doesn't overwhelm him – and are applying them in such a way as to prevent him from falling in. By that time, you will start misinterpreting rules. You will need rules, and you'll have to misinterpret rules, and you'll have to do all sorts of things, and you'll so on, and it all becomes very complicated and so forth. But your problem is a rather interesting problem: it is how to keep somebody out of the bank. It is how to keep somebody from getting in trouble.

A pc never protests at getting into trouble that presents him with familiarity – possible familiarity. He never protests against this. What he does is protest against measures which prevent him from becoming familiar with the bank. You can always count on a pc protesting measures which prevent him from becoming familiar with his bank. To this degree, every thetan is owed a considerable compliment. They will do this in session. But sometimes in auditing they are being kind, they are being nice, they are being pleasant and they are being confused; and they keep the pc's attention out of the bank, and you get instant and immediate Trouble with a capital T.

Where do you get this trouble? Pc's getting no auditing, and he knows it. Well, how does a pc get no auditing? He's permitted to walk a tightrope far, far from the crater, and he's never permitted to fall into anything. Pc goes along, "Well, there's an answer to the auditing question. There's the answer to the auditing question," and so on.

And the auditor says, "Good."
And the pc says, "Well, there's the answer."
And the auditor says, "Good."
And the pc says, "There's the answer."
And the auditor says, "Good."
And the pc says, "There's the answer."
And the auditor says, "Good."

And the auditor knows better than to ever ask him, "How are you doing? What are you looking at? Where are you going? How do you feel about this?" Because if he did, the pc might confront his bank and that would be terrible, wouldn't it?

To audit without curiosity as to where the pc is and what he is doing is a sure-fire method of keeping a pc from ever getting into any trouble. If you never find out anything about what's going on, of course you don't have to confront his bank, he doesn't have to confront his bank and the time can go up to light years and nobody gets any auditing done. See?
You don't find out what's going on. He doesn't find out what's going on. Here we go. Here we go.

Now, as a general rule, any mechanism that you introduce into a session – any mechanism that you introduce into a session which permits the pc to avoid confronting his bank or takes the pc's attention out of his bank or takes the pc out of session is going to produce every evil you associate with auditing, which is ARC breaks, heavy problems – all these difficulties of auditing. They're all produced on the same common denominator.

Now, having learned this common denominator, I'll try to teach it to you so that you can really see this for what it is.

The pc objects to not being audited, and that is all a pc ever objects to. Now, if you just write me a catalog of how many ways a pc could not be audited, I will show you then every ARC break that a pc could have. See? That's all you have to do. That's all you have to do is just deliver no auditing, and you get back every phenomenon that you associate as an evil. Pc ARC broke, pc this, pc that, pc not in-session, long grind, pc no gain, pc with a lose, pc not want any more auditing, all of these – oh, just ad infinitum. Anything that you could think of that a pc is liable to do that you would object to as an auditor is all from the same source.

It isn't the pc **thinking** he has no auditing. It has to be the pc is **getting** none. And as soon as this occurs, you've had it. The rocket is up, the lifeboats are out, because everything is sinking with seacocks wide open. That's it.

You audit in such a way as to prevent the pc from being in-session and you're going to get every single evil that you have ever heard of or seen or experienced in auditing. So you just have to figure out how many ways there are that you could do this. So you can't lay it out, actually, one, two, three and say these are the ways. You have to take it from this general, broad observation. That is the rule: You prevent the pc getting audited, and the pc is upset.

Now, this goes so far as an evil of this character: You always have a present time problem with somebody's wife while you're auditing him. Well, what's the basic source of the present time problem? It is always that the wife is denying him auditing. One way or the other, the wife denies him auditing, and this creates the ARC break. Get that?

I don't care what he said, "She went out with Joe, and they went to a bar, and she came home drunk, and I had to put her to bed, and therefore I am very tired, and I am having a hard time staying in session because I'm so tired, having been up all night searching the bars of South Main Street," or something of the sort. Whatever this is, it doesn't matter what the PT problem was, somebody is preventing him from getting auditing. See? So that makes a PT problem and that makes an upset. Got it?

Now, the reason she does this is another interesting reason, which is on exactly the same line; is she can't have any auditing. Just add it up. So the grades of cases are those that can't have any auditing, those that consider their auditing is being prevented and those who can have auditing.

Now, on the first two classes you're not going to get any clearing. So the obvious thing is to remedy havingness of auditing. That would be an obvious solution to any part of it.
This fellow's old grandma keeps nattering into her teacup all the time about how he is doing this terrible thing of getting some auditing and so forth, and so forth. And you say, well, what's the matter with her? Well, you just better sum it up, if you want to understand this old girl, is she just can't have any, that's all.

Why can't she have any? Well, there could be several reasons why, but the main one is if you so much as rattled the knob of her closet door, an avalanche of skeletons would spill all about the room. There'd be such a nasty pounding and bumping of skulls flying about that there would be a terrible dishabille. Isn't that interesting?

Some of this could simply be noncomprehension. Somebody's mother, I think it was, was objecting to a girl being audited and was causing all kinds of present time problems. And the auditor finally got very clever and cross-questioned this and found out that there was no comprehension of anything that was going on. And she didn't know what Scientology was. So he took an old folder we had which gave the dynamics and the laws of Dianetics (Remember? The eight dynamics) and gave it to the old – ah – person. [laughter] And she read it, and after that, auditing was fine. Just was simply the randomity of a missing datum. It was that wild.

Now, auditing for herself, however, would have run into the other barrier. She understood all about it now: There were eight dynamics. And this so gripped her as a concept that after that she knew all about it, and she became quite an authority. The only thing she actually knew was the eight dynamics, and she had gotten these totally on having been handed this leaflet.

I think the leaflet came into bearing on an identical situation or the same situation. I mean it came into existence because of that. We then started using this leaflet very broadly. I remember this instance well. It was marvelous. People knew all about it. There were eight dynamics. And they were one, and they were two and three and four and five and six and seven and eight and that was it! And they knew all about it, and that was brand-new, and now life clarified for them, and everything was fine and it was all good roads and good weather.

But as far as them getting auditing was concerned, this again would have fallen across the skeleton. But if they'd gone on – they'd read the eight dynamics and they'd gone on – its cou – only have been skeletons. So it could be missing data or too much data that they're holding on to, which again they make data missing for you, you see – withholds.

So that third party situation still comes under just that heading: scarcity of auditing. Why is it scarce? Well, it can't be. It can't be had. Either it doesn't exist, which is they have no understanding of it and therefore it isn't anything or if it did occur, why, there would be too many social repercussions of one kind or another because they've got too many withholds. So they can't have auditing, that's all. So you never audit these people unless you practically back them into the corner of the courtyard, you see, and at gunpoint demand what the withhold is.

Anybody start arguing with me today on the subject of Scientology out in the broad public, something like that – I'm sitting there enjoying my creme de menthe or something after dinner, and somebody – all of a sudden somebody jumps me on the subject of Scientology and so forth, "Oh, that. Oh, you're that Hubbard. Oh, I see. Yes."
I tell you what I would do. I wouldn't go any further with the conversation with that. We used to say put them in session, run an engram and so forth. That's still perfectly all right, but I would now take a different tack. I would look at them surprised and say, "Well, what have you done?"

And they would say, "What?"

"No, what have you done that you couldn't tell me about? What have you done that these people shouldn't know about?"

It'd be so non sequitur, [laughter] everybody would be terribly shocked, and they would look at me (they always think you're some kind of a swami with a bath towel wrapped around your head) and they'd – "How did you know?"

"Well, it's fairly easy when you have familiarity with the thing. It does something to the eyes." [laughter]

Every single one of the people present, the next time they were in the bathroom would gaze into the mirror. [laughter]

All right. The pc who is ARC breaky or who gets present time problems is in some fashion or other being denied auditing in some way. I know this sounds very funny. I know it sounds rather monocentric on our part to say that they are denied auditing, because auditing is apparently something brand-new that hasn't existed. Adequate treatment has not existed on this planet – period.

What's your first thought if you fall down and bust your skull, "Oh, God, doctors! Oh, God! Hospital bills! Oh, my heavens on earth! Well, they'll probably trepan me. Ooooh, whoa, wah, wah..." You're not worried about the fact that your car is wrecked near so much as the fact you're now going to be treated. Isn't that right? You get an injury, now you're going to be treated. You hope you don't get too sick because then you will have to be treated.

Rarh, you can see some sawbones coming around and taking cotton wads and sticking them on swabs and sticking them into your nose – which won't do anything, you know, but irritate hell out of your nose, you know [laughter] – and monkey with it and say, "Well, you take this prescription, which you go up to the drugstore where I get a cut, you see, and over here to the chemist, and he'll fill this thing, and then he can put it on 'national service' or something." And then after you've gone to all this trouble ... It's just enough trouble just to get some of this swill, you see, and when you take it, it tastes ghastly, and you know it won't do anything either.

Confidence in treatment on this planet is at its lowest possible ebb. The only planet I know of where it dropped any lower was the Marcab Confederacy, and it dropped much lower in the Marcab Confederacy. The way they taught medicine there, they had a number of drawers with dead, dried tissue in them. And they'd drag these drawers out, you see, and show the students, "And this is a dried head, you see. And this is tissue that's been affected by tuberculosis. And this is this ..." and it was all dried, and so forth, and that was their total command of medicine.
The only thing that was wrong with this particular activity is these really were infected tissues, and they were still carrying the germ spores, which I thought was always a little bit rough. But I remember giving medical lectures occasionally, and any student gave me any trouble, why, I'd just drop some tubercular tissue on his desk. This was all sort of raw. But there it got to a point where you weren't ever permitted to get a new body. And this is typical of many space opera societies and is getting typical of this one. This one will go along, too.

And this society has got it rigged up now where the best treatment for this and that and the other thing, you see, is to give some fellow an artificial medulla oblongata and wire him up, you see, for sound. And they're starting this evolution where they're going to replace the body with the mechanical parts – you know, that I've told you about before – and eventually they'll omit the printed circuit, and the things still work, and they'll say, "What's this?"

All right. Well, not to get off onto whole track, but you've got a point here where treatment is very, very poor. It's guesswork, it's unpositive, it is negligent. Little girl hurt in an automobile accident here in East Grinstead is taken up to the hospital. She lies there on a cot bleeding for several hours in an anteroom without anybody even coming around to put a tourniquet on. I mean stuff of this character just goes on all the time. Treatment has to be done by calloused people because it doesn't treat.

Now, the consternation which can spread through a hospital by a Scientologist walking in from bed to bed and doing Touch Assists and so forth has already been demonstrated on many occasions. And it is consternation. But nobody can confront it. The doctors can't confront it. Some of the nurses do, but never the doctors. Scientology has done some fantastic things in hospitals. Well, I personally have discouraged it. We are not in the field of healing. That doesn't say we can't heal better than they can. But healing is at such an ebb that if you cure somebody with a broken leg – I mean that, too, cure him – and he's been in bed for three or four days with this broken leg, and they're getting ready to come in and put a souvenir cast on him – I think that's why they put casts on things like that, it's so people can write their names on it and then keep the souvenir.

The end product of this is what? You cured him! My God, you never heard so many remarks as will be made by doctors which are further off base in your life. They are fantastic remarks! They are incredible! And it'll finally sum up to, "Well, the leg couldn't have been broken." And they will make this remark while they're looking at their own x-ray plate!

I had this advanced to me one time. A little kid was cured of leukemia by an auditor. In older days they did much more of it than they do now. And the auditor thought, boy, that medico's eyes are really going to pop out, see, when he finds this is all negative now.

It was an interesting engram, by the way. Mother's favorite phrase was, "It'll just turn your blood to water." And the auditor pulled this phrase out of the bank and the kid got well. That is, of course, leukemia. That was it. Interesting, huh?

But the medical pronunciamento is: "The child couldn't have possibly had leukemia because leukemia is not curable." [laughter] Just try to wrap your wits around this, you know. You get kind of groggy, you know, trying to make all corners of this thing. They just throw everything out of existence because they know it's not curable and they know themselves are not capable of curing. Hence, their callousness. They have to make nothing out of their pa-
tients, otherwise the treatment would be an overt. The psychologist has to make nothing out of man because treating him would then be an overt. They're just lessening the overt, is their professional approach ordinarily.

All right. What does all this add up to? Absence of treatment. You have preclears who are trained from – not the cradle – they have been trained since the Roman arena; they have been trained since the last pyramid – into the nonexistence of treatment. Well, that is then no cure, no auditing. But the funny part of it is – the very funny part of it is – the very large percentage that still hopes treatment can take place. That is what is amazing! If you're going to be amazed about anything, not amazed about the fact that the wogs never whipped themselves up any method of doing anything, but be amazed at the fact that after all this people still have hope. It's never been killed in a large percentage of the people.

Now, those in whom it has been utterly squashed, to get them into any kind of a session and so forth, oh, wow, man, wow, because you're going on a total no-have of auditing, don't you see? But if there's any hope there at all, that hope must therefore be rather thin. By this time it must be rather raveled. And all the auditor has got to do is make a motion in the direction of no treatment and he ARC breaks the pc.

Why? Because the pc's hope of treatment is already so thin. So you're doing, at first, kind of a cheerleader's job, you know? I am talking about before he gets into session, you know? You have to kind of reassure him. And then when you get him in session, let him have treatment.

All right. Now, how many ways could there be of not letting him have treatment while he's sitting in the pc's chair? How many ways could there be?

First and foremost is not permit his attention to go onto his case. And that's practically a common denominator of all of them. If he's sitting there in the chair, don't let his attention go on his case. Even though he's putting in chair time, he's not being audited, see, and he knows it.

Now, the oddity is that the most crude fumbling around with the case itself, as long as the pc's attention continues on the case, elicits no real protest from the pc. He never protests about this. You run him into some of the juiciest bits that you practically will never be able to get him out of without superheroic auditing, see (actually, you can get him out of anything), and he never protests. He never really protests! But don't let him go into it and he'll protest.

All protests of the pc, all difficulties of the pc, all stem from this same button I am talking to you about: no treatment, no havingness on auditing.

And when these are even vaguely aided and abetted by the auditor, you of course have trouble with the pc; you will always have trouble with the pc. If you're going to give pcs auditing, give them auditing.

All protests of the pc, all difficulties of the pc, all stem from this same button I am talking to you about: no treatment, no havingness on auditing.

And when these are even vaguely aided and abetted by the auditor, you of course have trouble with the pc; you will always have trouble with the pc. If you're going to give pcs auditing, give them auditing.

Now, what is auditing? Auditing consists of putting a pc in-session. And this has two things: able to talk to the auditor and interested in own case.

Now, interested in own case infers, of course, and means attention on his own case. So if you wanted to refine this and make that definition of in-sessionness even more workable,
you would say, "Attention on his own case and able to talk to the auditor." And that would be
an absolute necessity. So that would it be what auditing is.

Auditing is directing the pc's attention on his own case and directing his ability to talk
to the auditor. That would be the scope of auditing. And the only way, then, you could get
into trouble, if that is an auditing session – the only way you could get into trouble – would be,
take his attention off of his case and make it difficult for him to talk to the auditor. And
that would add up on both counts to no auditing. And you would run square into this other
button, and there is where you get the violence of the ARC break. It can be pretty explosive
and can be pretty violent because actually it is painful to have these things happen. But the
basics of the pain is, is there is no auditing, so therefore damage might occur which is irrepa-
yable.

You see, he knows – he believes now the auditing could cure any damage, but if
there's going to be no auditing then the damage isn't curable. And this is exactly which way
his mind dives. So he's in a state of anxiety. The moment you violate in-sessionness, he is in a
state of anxiety.

Now, there are many other phenomena involved with this. One of the phenomena con-

sists of this: He is looking at an engram. The only space in the engram, actually, is brought
about by his attention on the engram; and until the engram is desensitized, he will have to
keep some space in it to keep the engram off the front of his nose.

So that if you distract his attention suddenly from an engram, the space possibly may
disappear out of the engram, and he finds the engram on the end of his nose. And the engram
might have some bite in it. You haven't bitten him, but the engram has. By doing what? By
taking his attention off the engram.

His attention is on the engram, and his attention is on as much of the engram as he is
able to put his attention on it at that moment; and then all of a sudden the auditor betrays him
and pulls his attention off of the engram. And of course the engram will collapse on him,
bang! It's uncomfortable. He doesn't like this. It's physically painful; it can be. He'll develop a
somatic from it. There are various phenomena will occur. Sensations occur that he doesn't
like. And now he compounds it with an overt against the auditor – one, two. See?

Now, how could the auditor distract his attention? How many ways could an auditor
distract his attention? Well, once more we have a very long list. It'd be a dictionary full of
ways. There are numerous ways his attention could be yanked out of session. One is choosing
an auditing room, or permitting one to be chosen for one, which has action or activity in its
vicinity. Why? Because you've set up an auditing session then as the stable datum around
which action is occurring. See? That would be one. You can get away with a lot of that; but
don't try to audit somebody in the middle of a busy street, because there's motion going on all
around, and you'll find later that the auditing session is itself kind of an engram. Why? Be-
cause he got all this motion out of the tail of his eye, you see, and yet his attention is supposed
to be on the case, and so forth.

Well, you can get away with quite a bit of it. But you'll find out in – an operation in a
hospital which is located in a busy traffic area of a city is far more serious than an operation
in a hospital in the country where there is no traffic action. That's fascinating. That's how you
make an operation hang up. Just put a hospital right in the middle of four freeways, and then put its operating room out in a corner of the building, you see, where you've got the visibility of two freeways. Now, we're trying to run the operation and we have a hell of a time running this operation. It seems to be an awful sticky operation. We find out it was for removing a pimple on the left gluteus maximus, you see? It wasn't much of an operation, but, boy, is it stuck!

You see, I know that there was – now that there was larger scope in terms of cubic area to an engram. You'd think of the engram as taking place in the operating room, probably with a scope from the patient to the doctor, you see, or in the immediate vicinity, maybe a cubic yard of engram. You get the idea? Whereas, factually, it isn't even as small as the room, which would be something on the order of fifteen or twenty cubic yards of engram, you see? It's more like half a cubic mile. And as the pc starts running it, he becomes aware of more zone. And if there's activity in that zone, it pins his attention back into the operation.

One of the interesting ways of running an engram would be to pay absolutely no attention to what was going on, particularly, in the operating room – this engram taking place in the corner of the building – but just find out what he wouldn't know about the traffic around the hospital. You'd find all of a sudden the engram just goes fling!, you see? It's just the traffic around the hospital, you see. Oohhhohhhh! Boom. That was what was holding the engram in place. Actually, the engram wasn't being held in place in the auditing room. It was being held in place in the corridor. Got the idea?

If a pc has had a lot of auditing in a very busy, active environment or area, ask them what has been unknown about the activity of an auditing area. And you're liable to find their sessions blowing up much faster than on trying to run out auditors. Get the idea? Because the auditing sessions were maybe fifty cubic yards of zone, and he's only looked at the first cubic yard, and he – yet he was aware of the activity in fifty cubic yards. So the activity in fifty cubic yards pinned him down into the half a cubic yard. You get the idea?

Environment. Environment. Motion in the environment. Very, very interesting study all in itself.

All right. That would be the first thing that you would do about it, is guarantee the noninterruption of the session. That's the auditor's responsibility; no matter who made the room assignment, that's the auditor's responsibility.

All right. There are certain physical limitations against a certain thing like this. But any auditing room you've got around here, to give you some area of comparison, is fairly quiet. That's fairly quiet. Now – there's a little interruption, but it doesn't usually amount to a hill of beans. I'm talking about more motion than that. You got the idea? It takes a little more motion than that to really pound them down and pound them in. It takes something like – well, the most – as we've known for a long time, the most horrible thing you could do to any accident patient would be to throw them into an ambulance, open up the siren, and drive them at eighty miles an hour. And I think, I think that the boys know this down deep, and that they're just lessening the overt of treating him at all.

Basically, it'd – in most (quote) treatments (unquote), it would be kinder to leave the fellow lying on the battlefield or at the scene of the accident, you know – take him over the –
under the hedge and put a pillow under his head and say, "Well, are you as comfortable as possible?" Oh, yes. He's as comfortable as he could get under those circumstances. And if he gets well, he'll get up from the hedge, and if he doesn't get well, he'll die. But who introduced this idea of the scarcity of bodies? Well, there isn't any great scarcity of bodies.

Well, how all this treatment? Ambulances, you know, screaming sirens, eighty miles an hour, you know, traffic areas and so forth. And in the bustling reception rooms, you know, and up elevators and down carriage ways and halls and into a room that's gleaming full of all kinds of reflected light, you see? Oh, man. They're great. They're great. They're marvelous. They got it all taped. And then operate him on some kind of a gas with oxygen in it or ether with lots of oxygen, and have the oxygen tank explode or something like this. They do that very often. Anything to create randomness. Well, I'd say their mind isn't on their business, and we shouldn't make the same mistakes. All right. So much for the quietude of the room.

Now, an auditor who chatters endlessly about other things than the session while auditing a pc, or chatters at a pc in (quote) breaks (unquote) about other things than the session, of course, is actually setting himself up to get the pc's attention off of it. That is not a very broad error, but I have noticed it often enough in HGCs to comment on it. You're dragging his attention off of his case in the break, and then when he starts a session again or something like this, well, of course, the pc's attention is every place. The pc most normally wants to keep on talking about his case, if you ever noticed, during the break. Well, if you're tired of hearing of his case for the moment, excuse yourself and go get a glass of water. He won't object.

But now, in the session itself, an ineffective or unworkable process, of course, is no auditing. But we've got the technology of this thing pretty well taped, and you can almost neglect it. Just do a good technical job. Use the tools which you have. Learn how to use them and so forth. That is an easy one. And that is actually not too much of a barrier. And yet it is the barrier at which you mostly strain. It is not the major barrier of keeping a pc in-session. Certainly, anything we have had since February run on a pc – just chosen at random almost and run on a pc with – inside the limits of what you can do and what you can't do – would keep the pc in-session. I'm now just talking about smooth sessions, don't you see? Almost anything. An old Dianetic engram would keep him in-session. So, technical – technical is a separate compartment to these other things I'm talking to you about.

All right. Our next big hurdle then – let's just lay aside technical. There it is, and it's very important, and that is what we're doing after all, but it is not the main source of auditing bust-ups. Even when poorly done, it is not the main source of auditing bust-ups, because it is auditing. It's administration of that technical which is the main source of difficulty.

Now we get to our next one – our next one, and by far the most important one: the prediction factor. This has all sorts of things such as surprise. Surprise. What is a surprise?

Well, first and foremost, people who have low tolerance for the unknowns are surprised easily, much more easily than you would think. And the degree that a person can be surprised is in direct proportion to his intolerance for unknownnesses. The less a person has tolerance for the unknown, the more he can be surprised.

Now, what is a surprise? And the reason I'm talking about surprise rather than not-know is to give you a little better look at it. A surprise is not having known. A surprise is not
not-knowingness; a surprise is not *having* known. A surprise is a past tense knownness. Now, I've been trying to crack what a surprise was here since 57, and there's what it is. It's a not having known, and that gets at the root of every surprise, and that just rips up all the surprises on the track, *zippety-bap*. That is very rapid for running surprises.

Not having known – not-knowingness. "What isn't known?" doesn't run surprises. "What wasn't known?" runs surprises. You see, the fact had existence before he found out about it, and he is shocked by the fact that he didn't know about it by some weird prescience of some kind or another when it was going on. So therefore, the death of Uncle Zorch is uniformly a surprise, because Uncle Zorch died a week or so ago and we didn't know it. And that is the source of surprise.

Of course, the basic anatomy of surprise is elementary. It is just change unpredicted. So a surprise is an unpredicted change. That is your technical background definition, but how does this register in the mind?

An unpredicted change is not of any consequence unless there was a knowingness present which the pc didn't know and then finds out. See, like the death of Uncle Zorch: Uncle Zorch has been dead for a week, and now he suddenly finds out Uncle Zorch is dead. Now he is very surprised. You see? This amazes him. He's surprised. What's he surprised about? Well, actually, he tries to go backtrack into all that unknowingness of a week. And of course, he gets the impression of himself floundering around for an entire week in a not-knowingness, which is an invalidation of his knowingness and his permeation. And that is the only thing a thetan ever objects to: an invalidation of knowingness. Then he objects with violence, but it's on the basis of surprise.

He thinks of himself as going around all that week – he thinks of everything he did that week with Uncle Zorch dead, which of course does what? It's actually a pretended unknowingness. He didn't really not-know it during that whole week, you see, but it was a fact that existed somewhere of which he was not aware. So he gets a future that looks like this: that all sorts of things he doesn't know about are going on in his vicinity that he will maybe find out about and they will be a terrible shock to him. See? So he starts living in an environment in a state of anxiety. Because he has now had it demonstrated to him clearly and brilliantly that facts not known to him which are quite destructive can exist in his environment without his awareness. So he starts fighting the black thetans every night. You got the idea?

See, he's sucked back into the whirlpool of unknowing yesterdays. Well, the truth of the matter is he knew his environment in those yesteryears, but he looks back at them as not-knowing the environment. So he doesn't know whether he knows it and he doesn't know whether he not-knows it, and things of horrible portent might be going on at just this very moment.

Do you realize – I'll give you an example of this. Do you realize that your nearest and dearest and best loved one right at this exact instant might be in terrible trouble and you wouldn't even know it? Can you get a little spark of anxiety out of that? [laughter] Well, that's what anxiety is and that's what nervousness is. And the fellow who's starting to get nery about things has simply been taught this lesson: that facts can exist without his awareness of them, and he moves over, as a protection-survival mechanism, over into: "I had better be very
alert because it can happen again, you see, that facts can exist without my knowing anything about them. So therefore I am living in an unknown environment."

And this, by the way, is the greatest destroyer of IQ there is. IQ goes down in direct ratio to the amount of unknownness which the individual conceives the environment to hold. It isn't how stupid he is. It's how much unknownness does he conceive to exist there, which is quite amusing. So this then will also apply to a subject.

Fellow can't learn German. He's stupid on the subject of German. Well, why is this person stupid on the subject of German? Well, there must be a lot of feeling that there's terrible unknownnesses in the zone and area of German. I think you take somebody that fought in World War I, World War II and tried to teach them the German language, I think you'd have a ball. See? After he – he's sitting there minding his own business eating his bully beef or something of the sort, and all of a sudden somebody says, "Well, there was an attack yesterday over on A Company, and Bill is dead." It isn't even really the shocks and shells, don't you see? It's Bill is dead, but he should have known it yesterday. Get the idea? See?

If he was any good as a thetan (this is his self-criticism) he'd know these things. Got the idea? He doesn't know these things, so therefore he's stupid. His – his conception of the amount of unknownness on any subject gives you the direct ratio of his intelligence on that subject. So in the environment at large you get an additional one which is, the amount of unknownness he conceives might exist in the environment at large, regulates his intelligence about the environment at large.

Ah, you get people in insane asylums where this has gone all the way out, and they don't know those walls are there, ooohhhhhooohhhhh. Might be something else, you know? Ooohhooohh.

Watch them, you know. And then they get to a point where they don't know. They don't even dare look at the wall. They don't know they don't know about the wall, and so forth, and uhhhh there might be spooks present and – and then they very often will solve this whole problem. The anxiety factor, when it comes to solution, gets to be gruesome indeed. They will mock up unknown presences so they can be known presences, you see? They solve the whole thing. They say, "Well, the way to conquer all this unknown environment, or this unknown about what the people are going to do, is just put the people in the environment. And we will say they are there." Don't you see? Now, let's solve it with a total delusion.

I saw such a fellow. I was up at Lowestoft inspecting a couple of motor fishing vessels not long ago and there was a war veteran there, and he came aboard one of them, and he was evidently using one of its cabins to change his clothes. And he came aboard and he changed his clothes and he went out and with the most vile language was having violent arguments.

First, he tried to have a violent argument with the boat guard, but this didn't work too well. But he had the most violent argument going along, and I listened to it. And, of course, everybody said, "Well, he's been crazy ever since the war, but – " and so forth, "and it's just something he does," and so on. But I looked at him rather interestingly from a standpoint of exactly what he was doing, you know, as a Scientologist would. What is this fellow doing, you know? And he was scolding back at somebody who was reprimanding him – probably a sergeant – very defensive, snarling, vile, violent kickbacks. There was obviously somebody in
his environment that was just scolding him all the time and reprimanding him all the time and
telling him all kinds of things all the time, and sometimes the person would be over on
the right and sometimes over on the left, and he'd have to bop and turn in that direction and shake
his finger at this fellow and curse him out and say – and tell him off, really tell him off. And
he'd walk a few more feet, and the fellow would be over here by now, and he'd tell him and he'd tell him off, and so forth.

Well, what was he doing? He was putting a known in an environment which had be-
come intolerably unknown to him. He could no longer tolerate that much unknown in his en-
vironment, so he had put a known into it. In other words, he had gone through the line of just
merely being insane on the subject of the environment, and he was now in a pretended know-
ingness on the environment, which was really gone. You get the mechanism? Well, that's the
mechanism of surprise.

Well, this applies to sessions, very closely and very directly applies to sessions. Most
of what a pc is going through is accumulations of unknownnesses that he suddenly found out,
and nearly everything he's got in the bank is a prevention against being caught unawares
again. I won't bother to give you any examples of that. If you're interested in examples of it,
look in Dianetics: Modern Science of Mental Health – any engram in there that is detailed –
and you will find out that it is the intolerance of the unknownness that causes the person to
get the reactive computation that will act without his finding out about it.

You see? He's got some kind of a mechanical setup that any time – you see, it's very
dangerous. The little fish gets bit in water that has yellow stones on the bottom. So, of course,
when he sees yellow stones on the bottom, why, he must have a mechanism now which tells
him to get the hell out of there because he's in danger, and he just does this automatically.
And he (quote) doesn't like yellow stones, don't you see, (unquote). So he never goes near
yellow stones, and this keeps him out of ever being bitten in water where there are yellow
stones. And then, of course, he starts to go kind of daffy because the next time he gets eaten
up, he gets eaten up in water that has blue stones. "You can't win," see; that'd be his motto
after a while.

Do you follow this rationale of how all of this comes about, exactly what occurs when
a pc finds out something in session from the auditor which existed before he discovered it?

Now, let's look at a mechanism of what could happen in something of that order. The
pc is sitting there interiorized into his bank. All right. That's all very well, he's sitting there
interiorized in his bank, and he's going along and he's looking at it and so forth. And then all
of a sudden the auditor reaches over and diddles with the E-Meter cans, and says, "Well, the
meter is out so we have to stop the session." This happens more times than you'd think.

Well, the pc is given the datum that the meter was out and he didn't know it, so there
wasn't a session when he thought there was one, and this has possibly been going on for a
little while, see? And the little while that this had been going on, of course, is an unknown
area, so that's what pins him in the session – not his consequent overt so much as what was
unknown. Got the idea?

Now he's finding out about his case, and he's going along fine about his case, and he
thinks the auditor is satisfied, and all of a sudden the auditor stops the process. The pc thought
he was doing all right, the auditor didn't think he was doing all right, so you've got an un-known.

That's a come-to-realize more than a surprise, but it's a come-to-realize that an unknown has existed – an unknown has existed – and those are the damaging points of the line. They're not complicated otherwise. See this?

Of course, surprise is based on change, and sudden change is the anatomy of all surprise, and so forth. But we're interested in the more – the living phenomena connected with the change, the unpredicted character of it. What do we mean by unpredicted? We mean not known. It's the not-known character of it that is the sticker, and that's what sticks them in surprise. It's not the fact that change occurred that sticks them in surprise. It's they didn't know it. And you better learn that one well as an auditor.

You can change a process fifteen times an hour on a pc without damaging him, but you can suddenly change a process on some consideration he doesn't know about once in two hours and ARC break him across the boards. See? The unknownness. He thought he was doing all right. All of a sudden he isn't doing all right, or something like that, don't you see?

He thought he was going to run this thing flat, and the auditor isn't going to give him a chance. The auditor has been sitting there, possibly with some critical thought – because the pc will add up and put supposed knowingness and all sorts of things in the way, and therefore he gets accusative of the auditor. He'll try to solve this problem. What's he trying to do? What are all these accusations against the auditor? They're just efforts to solve the unknownness which existed before the fact of change. What the hell was all this about before the change occurred? You see? He's left in a zone and area of noncomprehension.

All right. That's very messed up. That can get very messed up in a session. That can go blooey-blooey-blooey. Do you see what the exact mechanism of it is there?

All right. Then you could do auditing along in this style or you could advise the pc well in advance of what you were going to do and what you intended to do, and if you did this in a way so as not to yank his attention too violently off of what he was doing, well, it'd be fine. So, your one-two-three would be something on the order of find out what he is doing and then advise him what you are going to do.

You say, "Well, what are you doing? What are you looking at? What is it?" That's perfectly all right. You can ask him all kinds of questions that you possibly care to along this line. "What is it?" "What are you doing?" "How is it going?" "How did you answer the question?" "What did it apply to?" "Did any picture come up?" "Is a picture there?" "Have you seen any pictures for a little while?"

Any type of questioning like this, of course, is directly putting him in-session, isn't it?

All right. Now, if we only do this just before we throw in the bridge and end the process, this becomes a signal that he didn't know the process was going to end at this moment; so you ask him how he's doing – this can get this silly – you ask him how he's doing, and he'll tell you that he didn't know you were going to end the process. He gets upset because he didn't know you were going to end the process. See?
So if a pc is getting into that state of thing, auditor patter can move over onto this as a
cure of the not-knowingness of the pc; and you can say, "Well, I'm not going to end the proc-
ness just now, but how are you doing and what are you looking at?" You get the difference?

"Oh," the pc'll say, "Well, that's all right," you know?

"Now, I want to find out what you're doing, because it's getting toward end of session.
I just want to find out what you're doing so that we can get this patched up okay before we
end the process."

Why, that's okay with the pc, too, don't you see? See, that cures his notknowingness.

All right. Now, you can ask him how he's doing before you tell him to do something,
and he'll be fine. But if you start suddenly on an auditing command – this isn't ne – this does-
n't get people into much trouble – you start suddenly on an auditing command without telling
him you're going to do so or clearing it, he will normally go ahead and run the auditing com-
mand. That is not a very fruitful source of trouble about it. But if the auditing command does-
n't work after you have done that, of course, he thinks you are impetuous or rash. See? So this
is just one other way that you're denying him auditing.

Now, a pc is only one kind of victim. There's only one victim – only one victim com-
plex in a pc. He's a victim of no auditing. That's the only victim complex he's got. No matter
how many victim complexes show up on his case or motivators or anything else, these things
are minimal. What's important is that he's the victim of no auditing and – because out of that
becomes all your auditing difficulties, and we're talking about auditing difficulties in this lec-
ture, see? So it's just that one thing. It's no auditing. See? You're making a victim out of him.

All right. Now, this reads to him on this basis: that an unknown exists that he doesn't
know about in the session. That's why you have to keep the R-factor up. Pcs know. They can
sense these things, you see? And unless you keep them genned in and keep the R-factor in
and keep the knowingness factor in and so forth while you're auditing, you get into all kinds
of trouble that's very mysterious to you. And you say, "What in the name of God is happen-
ing? I mean, what is wrong with my auditing?" Well, your auditing might be practically flaw-
less except it'd omit these points. It'd omit the basic point of denying him knowingness. See?
So your auditing becomes an unknown, and that's why you've got to keep an R-factor in.

You're tired. You don't want to audit him. In a very short period of time he's going to
find this out, and of course that makes a new surprise, because the mechanics of surprise are
there no matter how gently the news broke. See? So breaking the news gently, to hell with
that. Just make sure that when an unknowingness is about to occur to the pc, you turn it into a
known as far as you're concerned as an auditor – from your viewpoint as an auditor, as far as
the session mechanics are concerned. Warn him. Keep him aware of what's going on. Got the
idea? What you are going to do.

Now, of course, you can err perhaps in being too verbose about telling him what you
are going to do, but that error is not serious. It just consumes a little time. The error is in try-
ing to make time in an auditing session by omitting this. That is the error which causes your
ARC breaks and upsets. Omit this. Why do you say, "Now I am going to audit you"? See?
Why do you say such things as that, except to gen him in. "Now this is the process we're go-
ing to run." Well, whether you have his agreement or not, for God's sakes give him the knowingness.

Now, you can audit a pc without his agreement, but you can't audit him without his knowingness. So move your importance from agreement over to knowingness, and you'll start running awfully smooth sessions. Get smart at this. Get real smart at this.

Right at the beginning of session, give him a whole timetable of the session, then keep it. Tell him what you're going to do, step by step. Keep him genned in as to what's happening. Now he'll relax about the environment, because his main difficulty is he thinks the environment is full of unknowns. Well, don't make the auditing session another unknown to him. Give him the gen. Give him the gen.

Now, ARC breaks clear up most rapidly on not-know processes. These are killers. And you want an ARC break process that works, man, that is one of them. But remember that a not-know process run in that wise is always run past tense. Don't ever run it present tense. Run it past tense.

"What wasn't known," you see, "in this session?" "What wasn't known about what I was doing? What didn't I know about what you were doing?" Didn't I, you see? Past tense. Not "What don't I know about what you're doing?" Always past tense. Always past tense, because that's the element of surprise. That's where the track is collapsed. It's that an unknown existed which he found out about. And it's the find-out-about point that you are hitting now in auditing and that is not the damaging point. When you try to clear an ARC break you're trying to clear all these find-out-about points, the known points, and they are not the difficulty in the session. The difficulty in the session is the period which preceded it. So he is thinking of this not-known always in a past tense.

This doesn't apply to Security Checking or anything like that. I mean you're not interested in – we're just talking about sessions. Doesn't matter what tense, as this doesn't influence the use of not-know elsewhere. You use those past tense or present tense or the other ways, you know, any way that it's supposed to add up. I'm just talking about patching up ARC breaks and keeping a session running.

So you keep the knowingness in, and keep it in good and heavy. And you keep in, at the same time, a fairly predictable activity. Well, that gives it, of course, Model Session. You're asking in certain order and you're asking in certain ways on the basic bones of a session. And this is predictable to the pc, so an auditing session becomes known to the pc; and every time you jump this in any way, the pc is liable to object. But it is possible to jump it providing you genned him in enough. You just gen him in. You don't even have to have his agreement. Just gen him in. Don't be so propitiative. Just tell him. You know? You say, "I'm sitting here thinking of doing something else with this particular thing we're doing. How is it going to you? How is it doing?"

"Well, it's not doing badly. It's doing fine. I'm right in the middle of this engram here."

"Well, do you think there's anything we could do to make it go a little faster?"

"Yeah. There possibly is because I sure stuck up here."
"Well, what are you doing right now?"

"Well, so-and-so and so-and-so."

"All right. I'm going to vary the auditing command so-and-so and so-and-so, and it's going to be so-and-so and so-and-so now. Do you think that would get anyplace with it?"

"Oh, yes. I think it would."

Well, apparently, you're seeking his agreement. Actually, you're filling him in. See the difference? He'll never ARC break on you on something like that. He'd know. It's not that he'd agree or not agree. It's that he'd know. Do you follow that?

All right. Now if "unknown" is that vital in a session and if "unknown" plays this enormous part in the existence of a thetan, don't you suppose that an unknowness about the constituency, size, shape, general characteristic, name, rank and serial number of his bank doesn't register on the pc with exclamation points? Man, don't it! It really does!

If you don't know about banks, if you don't know about engrams, if you don't know about secondaries, if you don't know about ridges, and you don't know about the time track, and you've never collided with any of these things – you'd carefully skirted that volcano – of course, you're auditing from what pedestal? From the same pedestal that the North declared war on the South. You're auditing in the grand, vast deserts of the unknown. And, of course, it registers straight across to the pc that you don't know your business. And, of course, after that you'll have nothing but trouble with pcs. Interesting, huh?

So if you don't bother to ask pertinent questions that make sense to the pc, and if your questions don't make sense to the pc, of course, the pc doesn't think you know what you're doing. And your ability to control and command a session is directly proportional to your familiarity and knowingness on the parts of the human mind. Directly proportional.

Ah, you've long muttered and thought about this, of how come I could audit pcs that you might have trouble auditing? Or how do I get results faster than you do? It is basically just that. It's right on that basis.

I very often leave a pc gasping as to how I found out that this was about to occur. Well, that's an all right kind of unknown. That's perfectly all right to him because he now knows something else: He knows he's in safe hands. Even though he doesn't know that there is an arquebus pointed straight at his midriff around the corner, why, obviously the auditor already knows that the arquebuser is standing there.

I even demonstrate this to a fellow every now and then. I move him up a few more minutes – I can realize that he just isn't going to go near the part of that engram at all; he isn't going to go near that part of the track, that there is something there, and he is not even approaching it. And I keep saying, "Well, is there something else there?" you know? "Which direction is it?" and so forth.

"Yeah, well," he says, "I am looking to the left."

And I say, "Well, why don't you look to the right? Why don't you just look over to the right?"
And, of course, he gets it straight in the midriff, and he's going to say to himself, "How the hell did he know that arquebuseer was standing over to the right?"

Well, of course, I might or might not have known that the arquebuseer was standing over to the right. But I sure know that if he's going to look over to the right he's going to find out more about the engram, and how do I know this? Well, because he's looking to the left. [laughter]

And it gives you a strange aura of omniscience to the pc. He feels that you must see all, know all.

Well, let's give him a reverse look. Let's give him a reverse look. He's looking at an engram, and he's about to get his head chopped off on a chopping block, and there he is, and this is all very grim, and so forth.

And you say, "Well now, how about that lock there that you're looking at?" and so on, and so on. "Uh... uh, look around the room and let's see if you can have something." Instantly and immediately, he thinks you're the most stupid character he ever ran into in his life. So therefore the unknownness is resident in the auditor, isn't it? You didn't ask the right question.

Get familiar with the mind and make the session familiar to the pc, and you'll be a bearcat of an auditor.

Thank you.
SUBJECTIVE REALITY

A lecture given on 6 September 1961

Okay, this is 6 Sept. 61. Which is more properly AD 11. Special Briefing Course, Saint Hill.

Well now, I was early for the lecture today and I had a complete lecture to give you, and I forgot it. [laughter] So I'll now have to dream up another lecture.

The difficulties of auditing that I covered yesterday, if you will remember, had two ways that you could learn something about auditing, that is to say, as an auditor observing the pc and being audited – the subjective reality. So today's lecture is definitely on the subject of subjective reality, and this then perforce includes numerous parts of the mind and what it's all about. It's a very restimulative lecture, so if you're easily restimulated why you'd better put some earplugs in. [laughter] You better get your earplugs in because this is very bad stuff, you know; I mean, engrams, secondaries, things of this character, they're just horrible. Shouldn't go near them! Might get stuck in them.

The earliest days of Dianetics still expresses some of the awe and almost fear with which the reactive bank is regarded. The viciousness of the subject matter, the – what an engram can do to you, what a secondary can do, the horrors of being stuck on the track, and that sort of thing, of course immediately drops down intention, and so on, the more command you have of the subject.

Now, we have tools today which make the tools of 1950 look like moving mountains with a teaspoon, and there is no great difficulty in getting somebody out of an engram. For instance, England, on the 5th and 6th London ACCs, Scientology almost bit the dust in England asking people to go into the bank and look at engrams and secondaries and try to learn how to run engrams and that sort of thing. It was completely beyond them, much to my shame.

Well, basically we didn't have tools enough to move an engram through on somebody who was having a terrible lot of difficulty looking at an engram. Person was having a great deal of difficulty looking at an engram, he didn't want too much to do with the engram. This gave a great deal of difficulty to the auditor, who himself had no reality on the engram, in holding him in it and pushing him through. So this compound difficulty of the auditor with no reality on looking at the pc in an engram and the auditor with no reality on being in an engram, and the difficulty the pc was having being in and staying in an engram, made a dog's breakfast. Made a pluperfect mess. Well, just because it fell on its head in this degree is no reason under the sun why it should continue to be on its head. Because you could run an engram today with no difficulty at all. You could get a guy stuck in an engram and unstuck in an engram, and so forth, as quick it'd make you spit.
Just nothing to it, believe me, believe me. And in this lecture I'm going to give you some processes that get people over their allergies of the bank.

Now, an auditor who believes that there is such a thing as an engram and there is such a thing as a time track, and who has the idea that there are such things as masses and has a good intellectual approach to the subject, and who is totally aware of pcs having been out of present time, but himself has no slightest idea of ever being in another time stream than now, is a dangerous auditor. That is a dangerous auditor. Because that auditor is doing an escape. He is escaping from then. And now is only an escape from then, by definition. Therefore he will do everything in his power out of kindness to give the proper solution to the preclear. And the proper solution to the preclear is escape from then.

This is directly in reverse to what makes Clears and what makes people well and what recovers things – is you have to show somebody that he doesn't have to escape from then, because he can confront then, and once he can confront then he is no longer stuck in then. You see, that's very simple. In other words, you have to show somebody that he can stand and fight his demons down. You see. You have to show him that he can survive in spite of. You have to show him that these things which are traveling after him were the shadows of life, not the substance. Now, that's what you have to show him. And if you're sitting there showing him how to escape from life, of course, you're teaching him to be worse off.

Now, an auditor who is permitting a pc to escape from life, from the bank, will make mistakes from a standpoint of auditing. And this is the most fruitful source of mistakes. Auditing mistakes, auditing mistakes, auditing mistakes. Pc has no feeling that the auditor is pitching with him; the pc has no confidence in the auditor; pc ARC breaking – all of this kind of thing is all mainly caused by this mechanism of the auditor is not getting the pc to confront the bank. And the pc down deep knows this is wrong. So the pc objects. Pc knows he isn't getting auditing in some vague, dim way, don't you see? And you get all these ARC breaks and upsets, and so forth.

Now, as I say, you can learn a thousand rules. Well, just – I don't know, what are you going to do? Keep a dictionary open alongside of the E-Meter and look up the rule for every auditing command? Or are you going to have understanding and instinctive knowingness adequate to what the pc is fumbling around with? Of course, there is no substitute for an understanding, and understandings are all built on observation and familiarity. There can be no understanding, actually no basic deep understanding, without experience. And a person who has not had any experience of a reactive mind trying to get somebody to handle a reactive mind, of course, as I said, just makes a dog's breakfast out of it. That is a mess from there on.

Now, it has long been said that a Scientologist is harder to audit than raw meat off the street. You hear this every now and then. You hear this left and right. Well, may be several reasons for this, apparent reasons. One of those is the Scientologist knows how it ought to be and how it ought to go. He is also accustomed to handling an auditing session. So as a pc, of course, he is more accustomed to handling the session than a pc would be. He knows which way this thing is. Actually, he audits faster. But he ARC breaks more, you see. Don't get these two things mixed, don't say that a Scientologist gets less case gain than raw meat, that is not
true. He gets more ARC breaks than raw meat. He is more critical as a pc. Why? What is the basic reason for this criticalness as a pc?

It is all in the zone and area of duplication. He just cannot sit there and permit himself to duplicate a bad session. All of his training tells him not to duplicate bad sessions. You see, he's supposed to run a good session. So he sees a session running badly, he becomes totally unwilling to duplicate it. So therefore, his havingness of the session disappears. Havingness and duplication are almost synonyms. So his havingness of the session vanishes much more rapidly than somebody else's because he recognizes what the session should be. And if he doesn't conceive the session to be what the session should be, why then, he is unwilling to duplicate the actions or activities of that auditor. So as a result he ARC breaks. He loses a session faster than raw meat, even though he's in better shape. The apparentness is that the amount of ARC break would be a case indicator. It is not a case indicator. He has a professional specialty, and all of his training says, "Do not duplicate bad auditing." So he, of course, cannot duplicate a bad auditor. So if he feels the auditor is doing a bad job, he refuses to duplicate the auditor and of course, duplication and havingness, being the same breed of cat, he of course loses his session much more rapidly. That strike home? That sound familiar to you? All right. You're just unwilling to duplicate a bad session, so therefore you put up quite a show as a pc. Has nothing to do with your case, but has a great deal to do with your professional attitudes or aptitudes.

All right. Nothing shows up faster in the auditor than an unfamiliarity with the bank. And if a Scientologist who is familiar with the bank is being audited by a Scientologist who isn't at all familiar with the bank and hasn't any idea what the bank is all about, you're never going to get a session, and that's it. At every side this thing is going to ARC break. Naturally, because a Scientologist is supposed to duplicate a bank-handling procedure which is reliable and good, the pc, being a Scientologist, will not duplicate a bad handling. Quite interesting. It's an interesting function, manifestation. A rather effective process to get over a bad auditing session would be, "What part of a blank, or an auditor or a person's name, would you be willing to be?" or "What about so-and-so would you be willing to be?" "What about so-and-so would you be unwilling to be?" You get the idea?

Well now, that shows up with great subjective reality at once, that there are certain things about the auditor that the pc is unwilling to be. And it is his unwillingness to be which makes it almost impossible for auditing to occur.

Now, a Scientologist will respond much faster to routine auditing which does so – show some insight than any raw meat that ever walked off the street, I'll guarantee you. If this other factor is introduced, however, he will not move at all. Because, of course, he can't communicate in the session. Communication-duplication. You have to have duplication in order to have communication. The auditor gives an auditing command, the Scientology pc is out the window. If the command has absolutely nothing to do with what the pc is doing, raw meat thinks he's wrong, you see. He thinks, "Well, I – I don't know, something new to me."

Therefore he says, "Well, the grapevine, the grapevine? I'm supposed to climb the grapevine."
The auditor has said, "Well now, take a look at that grapevine." Well, he's never really ever mentioned a grapevine, you see. There wasn't any grapevine in the session, and suddenly out of the blue, why, the auditor says, "Take a look at the grapevine."

Well, raw meat just says, "Well, grapevine," he says, "There must be a grapevine here. There's obviously a grapevine here," so he mocks up a grapevine or something of the sort. Tries to make something out of all this. And he's a little bit confused, but he doesn't dare protest because of the altitude factor. All right, so he'll go on and do an appearance of pc-ing, you see.

You tell a Scientologist – he's sitting there and he's looking at this railroad track and the auditor says, "All right now, what about this grapevine?"

And Scientologist says, "Grapevine? What – what the hell are you talking about? What grapevine?"

"Oh, a grapevine you mentioned a few minutes ago."

"Grapevine I mentioned a few minutes ago? I don't recall mentioning any grapevine. Oh! Oh, oh, oh, you're talking about – No, I said it was on the grapevine. It was rumored."

"Oh."

And you'll get something like, "Christ almighty, why the hell don't you learn how to audit?" [laughter] Almost instant response, don't you see. And the auditor has not been in good communication with the pc. He's made some little flub of some kind or another, you get this razzle-dazzle going, and whambo, see?

Well now, if the auditor has a good familiarity with the bank, he will know exactly what he has done. So therefore he can handle it. And therefore the ARC break doesn't continue very long He understands, don't you see. See, instantly he'll say, "Well, this pc must have been looking at something else and was quite absorbed in it and I've distracted his attention and I must be writing script here. See, I must have written a little script. Now, let's find out what the pc is doing" So right away the auditor finds out that he's had the wrong look at the situation, he says, "Well all right, what are you looking at then?"

"Oh," pc says, "This railroad track."

"All right, all right. What about the railroad track?"

"A railroad track, and it goes on to infinity," and so forth, and it so-and-so, a cognition and this and that, and so forth, "and that was what I was trying to tell you."

"Well, all right, I heard you now."

There's no more ARC break.

But the auditor who has no reality on the bank will go this way: the pc says, "Grapevine? What the hell, grapevine? Good God, why don't you learn how to audit?" See. Well, he's thinking; he's almost going into this, you see, and this other person says well – takes up at once the flub. Puts the pc's attention on the flub, you see. And the flub isn't anything because it's not aberrative. But what's in the bank is, see. So he puts his pc's attention back on what is aberrative, see. And the auditor isn't so self-conscious about this.
But the auditor who has no familiarity with the bank will say something like, "Oh, well a couple of minutes ago you talked to me about a grapevine. What did you mean about a grapevine?"

"Uh, well, I don't know, it was this grapevine, I mean, I said it was on the grapevine, and that meant some kind of a rumor, and so forth."

"Well, I misunderstood you. I thought you said that – I thought you said that you had a grapevine there."

"Well, I didn't have a grapevine here!"

"Uh, oh well! Well, what kind of a rumor was that that you were talking about?"

"Well, I don't know, I've forgotten about it now."

See, the auditor doesn't have the dimmest concept. He sees the pc, the pc is apparently there in a body, is apparently there in present time, is apparently able to talk, and so forth, and has no idea that the pc is not in present time, but the pc is on the backtrack and the pc is actually expressing displeasure at having his attention flicked off of what his attention is on, you see?

Well, the auditor that has some experience with the bank, he says, "Well, this pc's attention is on something else. What the hell is his attention on?" Don't you see? He says at once, "Well, the pc's attention must have been on something else. Well, what is the pc's attention on?" And, of course, the session continues.

But if the auditor thinks that this ARC break is terribly important, the mistake is terribly important, he'll put the pc's attention over on the mistake and we get an entirely different situation going because now we have nothing to talk about but the mistake. Now, we'll get off with TR 5N, and so on, and all this adds up to what? This adds up to no auditing. Ah, but that is the only basis of the ARC break. Ha-ha! So the more we handle the mistake, the less auditing occurs, so apparently then you can't blow an ARC break. Look simple? You see?

So the auditor who has no familiarity with the bank does not see why the pc is going kind of zzzz-zzzz. See? He hasn't any subjective reality on the idea that somebody can be there and absorbed in something and looking at something and trying to do something and trying to follow out maybe an auditing command and has his attention on something. If he understands this and if he knows this, and if he has subjective reality on it, of course his first thought – rules or no rules, you see – his first thought is, "Well, what the hell is his attention on?" See. Not self-consciously, "What horrible mistake I have made. Now I will have to remedy this terrible mistake I have made." Well, of course, the person isn't projected on the pc, hasn't any reality on what's going on, he hasn't any idea that the pc's doing other than just sitting in a chair. See, he thinks the pc's sitting in a chair so the pc's there to be sat in a chair, so therefore the pc is a person sitting in a chair in present time, who is just nastily and out of the meanness of his disposition or her disposition is having an ARC break. You get the adjudication, see? So you get an overt on the part of the auditor and an overt on the part of the pc, and then you get a dog's breakfast for a session. Get the idea?
You can make a fantastic number of flubs if you know what you're doing. You actually can. You can just go on, flub, flub, flub, and you know what you're doing, you can always grab them. But if your flubs are being made and you have an understanding of the subjective situation of the pc, you can straighten them up so fast that they're just there.

Yeah, you give the pc a wrong auditing command, or something like this; you miss an auditing command, and so on. And pc starts to answer it. Don't stop him, let him answer the auditing command. Then give him the right one. Don't keep dragging the thing up to PT. But you see, a person who has no subjective reality on the bank has no idea that he's dragging a pc up to PT. You see, he's not using any process that drags a pc up to PT, except put attention on the session. So actually the pc now gets present time collapsed on the track. Well, he's rather out of control. He has a hard time orienting himself.

Now, disorientation is for one thing the source of dreams and delusions. Disorientation. Person has a dream – Well, if you have a dream – you're worried about having nightmares, something like that; you want to cure yourself of having nightmares – or when you wake up, out of the nightmare, well, look it over and figure out how the nightmare spotted you somewhere, how it located you. And figure out where you are, and locate yourself. After you've done that a few times you become so unanxious about locating yourself that you don't have nightmares. Interesting, isn't it?

Thetan's in the skull and he can't find out where he is, the eyes are closed and the body is asleep, he can't find out where he is so he puts up some pretended or false knowingness as to where he is. And so the false knowingness as to where he is then makes this sequence known as a dream or a nightmare, or whatever. And that's all that is. It's a pretended knowingness about location is what a dream is.

Old Papa Freud were around, why, I'm sure he would contest that. He'd say that's – "Actually a dream is the expression of inhibitions, because everybody knows man lives with a horrible, ravening beast, barely repressed below the censor." I think the guy must have been on a naval vessel during the time of war and after duty he always had to censor letters or something. He had some engram running there.

But the upshot of this is, of course, you'd get a totally wild idea. If you were processing a brain or something of the sort, and you – and there was a thetan present, why, you'd choose the thetan for your randomness and after that you'd, of course, believe that there was a primitive being of some kind or another which lay down below the intellectual surface of the mind and you'd get all sorts of wild ideas, and so forth.

Well, the second you disorient a thetan you give him the only real shock that he can get. You've sort of chosen him out for your randomness. You sort of told him, "Get lost. Get confused. Get lost."

Now, when you're auditing, with the processes you're using and so forth, you're in direct communication with the thetan. All right, now, this guy, he's got problems and they're disorientation problems of various kinds and most of these problems are just disorientation. He doesn't know where he is, you see. All right, so he's down the track someplace, groveling around, and looking under odd corners of things to find out where he has been and you spring a surprise on him and his first reaction is not to know where he is, so his next action is delu-
sory knowingness. He'll put up a pretended knowingness. He knows he doesn't know something, but the first – his first reaction is to tell you that he doesn't know something. He doesn't know what you are doing. He doesn't know this, he doesn't know that. You get the idea? Well, actually all of he's – all he's saying is, "I'm disoriented. I was in one time stream and now you've got me back in this other time stream and now what the hell are we doing?" It's as simple as that, don't you see?

He thought he was going through the back alleys of Timbuktu, about to be knifed, don't you see. And you've got him all persuaded that he's in Timbuktu with your auditing command. Whether you realized it or not, you were persuading him he was in Timbuktu. You've said – you've given him an auditing command of "What unknown alley could you confront?" see, and he's obediently confronting some unknown alley, and then you give him an unknown room, because he's not aware of the room very much, and you give him the room suddenly, don't you see. And then you insist he stays in the room while he is still in the alley, and he'll put up delusory arguments. See, just like a dream or nightmare, you know. He'll put up all kinds of reasons why you did this.

And the only reason why the auditor did this is because the auditor didn't have enough subjective reality on the bank to realize that the pc is in another time stream, and that's it. That's the only thing that occurred. He didn't have enough reality on the pc's bank. And he fostered a disorientation and the pc becomes confused thereby. And the delusory character of a pc who is telling you all sorts of extraordinary things about your auditing, and so forth, these things are simply delusory. He's trying to orient himself, he's trying to find the unknown. But, of course, he's in the unknown of thinkingness because he's confused enough not to be able to confront the unknown of whereness.

See, the unknown of whereness, you know, location, always requires more on the part of the pc than unknown of idea. You see, solids take much more ability to confront than an idea. See, a thetan finds it very easy to confront an idea because he generally even thinks of himself as an idea. You see, so he finds it very hard to confront suddenly the masses, which is to say location. His location factor is the last thing he'll confront, so therefore he gives you delusory ideas as to what is going on, when as an actual fact he's looking for a factual location as to where he is, don't you see?

And if you don't put him where he is in a hurry he will go on delusorizing as to what you are doing and what he is thinking and what this is all about, don't you see. He just adds significance, significance, significance, significance, significance. And this is all an effort on the part of the thetan, believe it or not, to orient himself. It doesn't sound like it at first collision, but it is just an effort to orient. Where he is – all the auditor has to do to shut any of this off is to find out where the pc has been and where he is. That's all. It's so elementary, you see.

But an auditor would have to have an idea that there is a place to be, called the bank, before he could ask the pc where he is in it. See, if he didn't have a good, solid subjective reality on the is-ness of a bank, he could be startled enough not to remember the textbook rule of "always ask the pc where he is." He would never think of this because it's one of seven thousand rules.
An auditor who has a good subjective reality on this – the pc says, "What? What the hell? What – what was – what – what are you doing?" so forth. He knows what he's looking at. He knows he's – pc's attention has been on something, and therefore he's had an orientation called a bank orientation, don't you see. And he now no longer has this orientation. He is groping for an orientation, he can't find himself in the room, he can't find himself in the bank and therefore he feels very confused.

Of course, all the auditor can do is to find out, "Well, where are you?" see. "Where are you? What are you looking at? What were you looking at?" Not even, "Just before you said that," you see, "Just before I made this mistake, where were you?" Now, of course you've done this sequence. You've put the pc's attention on the mistake, and then put them on the whereness, and now he doesn't know where the hell he is, see. You've given him a via.

You can cure up an ARC break and then by mentioning it in your next question, ARC break the pc twice as bad all over again. It's very simple. You're asking a Security Check question of some kind or another, and you say, "Well, now, just before that ARC break I was going to ask you this question now, and you..." See, what'd you do, you disoriented him again. See, he thinks he's supposed to be looking at his bank and getting auditing, and you seem to be insisting that he look at a no-auditing called an ARC break, don't you see.

But if you've got a good reality on the bank and the thenness of things, and so on – which is a rather simple reality to attain, actually – why, you get this other response. And he rather grumpily says, "Well, I – I was looking at this alley."

"What alley?"

"This alley!"

"All right. How long is it?"

"Well, it's just an alley alley. It isn't very damn long. Alleys normally aren't." He's still nattering. He's a little bit disoriented, and so on.

"Well, does it end? Does it run between two streets, or what?"

"Yeah, well, it ends between two streets," and so forth.

"Well, where is it there, exactly?" and so on.

"It's here in Cairo. Oh, this is Cairo!" he says. "This is Cairo! Yeah, I got it. This is Cairo. There's the mosque, and there's the street, and there's the fiacres, and there's the anti-British slogans, and... [laughter] Yeah, I see where I am now."

"Oh, fine. All right, that's dandy." And he forgets all about the ARC break.

Orientation. That's all it is. But if, of course – as I say, stressing again – if the auditor has no idea that there is a whereness called the bank or the time track, of course, he doesn't – he isn't actually capable of finding the whereness in the pc because he only knows that it exists intellectually. So, yeah, having a look at a time track, and having a look at some pictures and engrams and secondaries, and getting a sensation of thenness, and so forth, is worth a thousand hours of TR 0 to improve auditing quality. See that?
All right, now, I'll give you a few processes by which an auditor could be audited and would wind up with a reality on the bank you couldn't shake with a bat. And actually he'll have to attain this anyhow before he even vaguely gets Clear. He'll – an auditor who is skipping out of the bank and skipping out of the engram and skipping off the track and skipping into PT – he reminds somebody of a parachute, you know, with compressed air blowing up against the top of the chute. He's – never goes down, he just always floats up. No matter what you do, he comes up. And he'll have to get over that before he gets Clear anyhow, so this is a great kindness.

Here's a command: "What unknown would you escape from?" and "What unknown would you attack?" This is simply a basic command form. And this is, of course, reach and withdraw on unknowns. Any verb form on either one of them is just "escape the unknown," "attack the unknown," see?

Now, you put it over into the valence rules and you say, "Think of an unknown. Who would escape from it? Who would attack it?" Got the idea? That gets valences coming into it. And you can go at this in reverse and you could say, "Think of a being. What unknown would he escape from? What unknown would he attack?" All kinds of command forms. But it's just escape and attack from unknowns.

And, of course, you – the pc in this particular case is sitting in the middle of some wild unknown incident of some kind or another, and he'll start attacking and escaping from engrams. He just cannot help himself from doing so. And he'll plunge around in the track like a bumblebee in a bottle – won't know what the hell's cooking. Of course he's never realized that he's right in the middle of the track; he is not in present time. He has kidded himself for years. He is not oriented at all because he's totally surrounded by engrams he isn't looking at. And anybody who's obsessively in present time is simply stacked up with engrams and that's all there is to that.

People who have obscure somatics or not-so-obscure somatics are, of course, sitting in an engram. Now, when you find that person who has somatics, who has also (quote) "never been back on the track" and has no awareness of thenness in the bank – you know, has no awareness of yesterday in the bank – of course that person is not in present time at all. That person has escaped by total withdrawal from some environment which may be two hundred billion years ago, see, so they're not in present time. Not even vaguely. And, of course, this type of auditing command, "Escape an attack from unknowns" – well, of course they're trying to escape from the unknown of what they're in, and at the same time they must be trying to attack the unknown of what they're in, and it'll just unfold engrams like a bunch of picture postcards you buy in Venice. That's one of them. That's just one of them.

Now, you could have a valence-type process: "Who would escape from things? Who would attack things?" Milder process.

Now, you can throw this over into beingness – you can throw it over into beingness – and you'll also throw up track that comes into view. I'll go into this in a minute as to why, but you can write it down. Beingness: "Who would you be willing to be? Who would you rather not be?" will show up track. Your first one is the beefiest one. These others are simply variations of one kind or another.
Now, the reason why a beingness is functional, is that valences are packages and part of the package of a valence is a track. A valence has a track. This is a great oddity, but every once in a while you find somebody without his own bank. He isn't running in his own bank. Any pictures of himself will be wildly out of valence. He is never, never, never in valence. He always sees himself from afar. If you do get him on the track he sees himself from afar, and he gets the vaguest and thinnest impressions imaginable of being in anything – it's very unconvincing, don't you see. I mean, well, he has this picture of himself as a child; well, ask him, "Well, how do you see the picture?"

"Well, the child is down there."

Well, you can immediately assume you have somebody out of valence who is therefore having valence trouble. If he does have any pictures of his bank, you would not be able to find them at first glance. Why? Let us say he is in Mother's valence, so of course the only pictures he gets of himself are the pictures seen by Mother. He always sees himself through somebody else's eyes. So he has the bank of each person in whose valence he has gone. And this becomes the most disorienting, confusing sort of a thing that anybody ever had anything to do with. But first and foremost thing that it does is promote an unreality of location. Because, of course, the fellow knew he was in himself as a child, but as he gets the picture of it he does not see himself below his eyes, he sees himself over there on the other side of the room. Well, obviously he's seeing through somebody else's – this must be a picture in somebody else's bank, immediately, you see. Quite curious, some of the phenomena here.

But every valence is a complete package. A valence has a bank, has all these now-I'm-supposed-to's, has skills, has disabilities, and so forth. It's just a package person, don't you see? It's a package person that does not exist in fact, but is only resident in the mind and is mocked up by the pc.

Now, the pc, of course, entered this on the basis of not being able to have the person and not really controlling the person, and so if the pc doesn't have or control the person in any way, of course, he cannot have or control any of the mechanisms of the person. So you cannot move that bank. It's not his bank. See, he hasn't enough ownership of it to run it as an engram, don't you see how? He hasn't any ownership of this bank, because it's somebody else's.

He doesn't have any – there's no way he could change that person's personality. You could audit him practically forever, and you're trying to change somebody else's characteristics. Never his own ideas or characteristics, they're all packaged characteristics of the other.

Now of course there was a point where this person did enter or did accumulate or collect this other valence, see? And that's the only point where the valence will break. By following this principle that a valence is a total package, and then by the dealing with beings, who, you see, and persons, rather than ideas – the auditing of beings rather than the auditing of ideas and conditions, the auditing of beings rather than the auditing of pictures – these views of other banks, you see, will suddenly blow off. And the person will be left with some of his own pictures. Or you get two or three of these things blown off.

And one of the most effective ways of doing this happens to be Routine 3 complete. And that's why it clears people, of course. But there's a shorthand way of doing this. And you can really shake up a bank – you can really shake one up – just by running any beingness
process. Just any beingness process, just like: "Think of a being. Thank you. Think of a being. Thank you. Think of a being. Thank you. Think of a being. Thank you."
This'd be the most idiotically – it's a long drag sort of a process, it may not be very stable, may not be anything happening, but it is going to shift the bank. It will shift the fellow around, and it will cure somebody of standing outside looking in at his own life, and it'll give him his own track back.

You're every once in a while auditing pcs who have a tremendous number of pictures that they dimly recognize as not theirs. They don't have much familiarity with these pictures; they've got no real recollection of these pictures and it seems sort of dull, and sort of thin. You get a hell of an unreality going.

Well, there's – I run across a case in point: there was a person had a whole bunch of pictures of sexual activities. He couldn't fit them on the backtrack, he couldn't fit them on the whole track. This is one of the mechanisms by the way which invalidates past lives, every once in a while an individual gets into it and sees some thin pictures of past lives, of some kind or another, he can't integrate them in any way, and he says, "Well," dimly, "well, I, sort of have some pictures on the track, but I don't know," and so forth. The person's having beingness trouble.

Of course, in his past life he was another being. And his other beingness is so flagrantly a fact that it's the same as somebody else's bank when this has occurred: that when the other being he was being in the past life was in another valence. Figure that one out.

Now people that have valence trouble go very easily – accumulate very easily other valences, and go into other valences very easily, so he probably has been doing it for a number of millennia. So it's not just one life's worth of pictures that are wrong; it is utterly thousands. I'll give you an example of this, a subjective reality on the thing. This really had me puzzled for a while. Back about 1605, something like that, I was set up – I won't go into the story in any great degree. But it took a warship and a company of marines and a broadside to kill one girl. And it's such a fantastic ferocity, you see, to launch against one girl. She was protected by four redcoats and me. And of course, we caught it in the first three seconds of play. Don't you see, that was the end of us.

But it was such a terrific ferocity against this girl, who by the way, was blind. Now, this really starts pouring it on, see. She was! And her face was so disfigured through a bomb assassination attempt, when she was a child at seven, that she had to wear a mask. And she was a rather pathetic little character. A whole man-of-war and a company of marines landing in boats and a full broadside to kill this one girl.

She was the last of the family of Charles V. She was the granddaughter aspirant of the old Holy Roman Empire, and one of the innumerable French that lived down here about sixty miles had decided she was a great menace to the throne. So they set her up to be assassinated. Well, that was quite an assassination. It was with – it was skyrockets, see.

Well, I was being audited one day. I found myself sitting around with a picture of a girl on a rock, apparently about 1870. Didn't compare with any track I had. Nice exterior view. It just didn't make sense. Didn't have any track I knew anything about. Here was a girl, sitting on a rock in exactly the same location, in exactly the same place, and I knew what
happened to the girl and I knew all about it and so forth, but I hadn't ever known the girl. Fascinating.

What this was all about was very, very simple. Apparently I'd kept a spot of attention on this person as a thetan for the next couple of hundred years. I didn't have the girl's valence particularly, but there was a – there was a cross, there, right at the moment of confusion, don't you see. I had her future bank. You know, I'd tracked the bank of this particular – which gave me a whole set of totally disrelated pictures that had absolutely nothing to do with my pictures and nothing to do with the track. It was very intriguing. They were very thin, very unreal. I knew all about them but they didn't have any real substance, don't you see.

And right now I could say, well, possibly this is the way the track looks to an awful lot of people. Don't you know, it's very thin, and there's nothing much to it, and so forth, and it's all just kind of an idea. Well, it was this girl's track, from the time she had been killed, straight on up. I still had it on file.

Funny part of it is that this girl, picking up another body after that, had gone along for a very long time and had then happened accidentally to be taken by her parents to exactly the same rock that she was killed on in 1605. And she became very ill and she sickened and she died! Just keyed her in complete. You possibly know the place. It's right across from Gib., and the Hotel Reina Christina is on the Spanish coast side. And it's one of those rocks right close to the Reina Christina Hotel. And of course, it's a tourist resort and her parents had taken her back there. What a dirty trick. That must have been some vacation, man! [laughter]

All right, so you take an incident of vast confusion of motion that one is not willing to tolerate. Well, one is willing to tolerate such motion in battle perhaps, one – in a naval battle and it's all the way it should be. But the motion occurs at a moment, or with a target, which isn't suited to the motion, don't you see? There's this much bombardment and yippity-yap, and it causes a hell of a disorientation. And you say, "Well that shouldn't be," you see, and big protest about the whole thing, and therefore you start tracking it.

Now, a valence could occur that way. And ordinarily, however, what would have happened is that whoever had been there would have picked up the girl's valence, don't you see, and would have gone ahead with the girl's valence, and that would have been the person who died because her parents took her back on the rock, don't you see. That would be what a valence – a solid valence picture would look like. And this person wouldn't have any more pictures than the man in the moon. They'd all have somebody else's pictures, don't you see? It'd all be something else, and it'd all be from the wrong point of view, and what would this add up to? This'd add up to a disorientation, all of which springs from a spot of total disorientation. Some incident which has in it total disorientation, then is liable to breed a total, out-of-valence situation from there on up.

All right, somebody who's in that kind of condition of course is having valence trouble. And an auditor who's having too much valence trouble, of course, has no great reality on somebody else's bank because he thinks this bank is not a bank, you see. It's kind of – well, it's about as real to him, you know, as a thin, indistinguishable picture cast up on that wall with the room lights on, with a cracked magic lantern slide. Never bothers him to look at pictures. Doesn't bother him at all.
You start running this person back, however, they wind up in the middle of some kind of an explosion. Eighteen spacecraft all of a sudden collide instantly and immediately on one point in space, because as he was picking up his paperweight off of the chart room desk, you see, it wasn't the paperweight, but it was the fleet signal alarm, or something, you see, and he shouldn't have done this! And you'll find him at this point of disorientation. And he'll be in – and there was a cabin boy there, or something of the sort that he was quite fond of, and you find him in the valence of the cabin boy. Only he isn't quite sure, maybe it's the captain, you know, and it's all a tingletangle, and it goes back to such a point.

That is the type of incident it takes to make a valence transfer. They are not just the conditioned reflex. Well, Joe just keeps hammering at Mary, you see, and keeps hammering at Mary, and pretty soon, why, Mary goes into Joe's valence. That's ordinarily how we look at this thing. We're too prone to believe that aberration is a gradient scale because it can be taken apart by a gradient scale. Aberration is no such thing. For Joe to go into Mary's valence there is either a long track association with plenty of violence, murder, poison and sudden death on it, or there is a very similar person or something, and there is some fantastic overt of some kind or another against such a person which contains a tremendous amount of violence and motion. That's what it goes back to.

But, of course, the "psyrologist," looking at the tame, stupid life that he himself leads in our modern world, you see, sitting at his hydraulically operated desk with his chromium, self-pushing graph pens, and – he couldn't concede of this much experience, don't you see. And he doesn't find that there is anybody in life ever has any real experience, so of course it just must be the business of living itself, day-by-day living, is what is aberrative. This is what he winds up at.

And of course, you take this character, he would have no reality on the backtrack. He'd have no reality on anything of that character. You shove him back on the backtrack and he finds out there was experience of some kind or another on the backtrack. If he continued to see it through an other-valence bank, you see, of some kind, you wouldn't wind up then with any kind of reality on it. He wouldn't have much reality. But of course, the keynote of the case is he doesn't have much reality anyhow. So he never conceived of this sort of thing.

Now, one of the things you want to watch for in auditors is the auditor who says that he has no reality on past lives. Watch it. Because that person has not collided with his bank very hard. He has a touching acquaintance, he has, you know, sort of a polite hat tip. You get him in the tonsillectomy and he's out there on the outside of the hospital, you see. And he knows how to run a tonsillectomy: You get on the outside of the hospital and you just watch the picture, you see the picture of the hospital, and you kind of look through the window and that's fine, and that's it, you've run the engram, you see.

"Have you ever seen a picture of an operation?"

"Yes," he says, "yes." You see, and that line of questioning is not very productive of anything. But the line of questioning of, "You have any reality on past lives?" – that is productive, see, because he'll tell you quite frankly he does not have. All right. Well, that's not reprehensible. Nobody's trying to force anything on him. I'm just giving you a symptom of the thing. This fellow is having valence-bank trouble. And having valence-bank trouble, you're
not now likely to discover an in-the-middle-of, 3-D sort of picture, unless you look pretty hard. All of a sudden, if he gets in the picture, he'll come out of it. See, there'll be no idea of attention stuck on pictures or attention in pictures or anything like that.

Well, until he himself has got some kind of a reality of this character, he will worry about his auditing flubs, and these auditing flubs ... He knows that he has a perfectly decent wish to help his fellow man. There's nobody disputing that in any way whatsoever. And he'll wonder why pcs ARC break or why he can't quite handle this pc or handle that pc and this will be very mysterious to him, and hell say, "Well, I better have eight thousand hours more of TR 0, see. And I'd better grind the midnight oil," you know, "and I'd better read Scientology 8-8008 or something. Or maybe there's something on a tape I haven't heard, or..." And he'll get into a considerable anxiety about this particular activity. Why does he – why do his pcs blow up? And then he'll get a lot of loses, and then he'll decide, "Well, I maybe shouldn't audit," you know, and so on. What's he trying to do? He's trying to orient himself with a datum or something of the sort. Well, the datum he's actually looking for is just this: As long as he has a low subjective reality on a bank, of course, when a pc gets into one, his understanding is not instantaneous, so he will do a fumble. He'll do a little fumble, and a little comm lag, and this little fumble and little comm lag will be just that instant necessary to permit the ARC break to go bloom! See. The pc drops down in tone and is not making very much forward progress and then maybe blows up or blows session or something of the sort.

This is the – a common experience. It is not true that this person was trying to do something bad to the pc. That is not true. It isn't true that this person didn't know his Scientology – he did. None of these things that you would normally consider true are true. It's just this one little fact – is the individual's mechanisms of handling life have been: "Escape from self into others," "escape from situation," "out," "up," "don't get any real good contact with the horrors of yesterday, because they're just too 'orrible, man! And the best thing to do is just stay out of valence and out of picture and out of thenness. And if you just stay out of thenness enough, you'll be all set."

Alcoholics Synonymous have themselves a considerable time with this, they have little mottos like: "Live twenty-four hours at a time," and so on. They also have another little motto which gets in your road occasionally, and if you don't know about it you'll have trouble processing alcoholics. They have another motto which – "Alcoholism is incurable. And that's the first thing you have to know and that's the first thing you have to admit to be a member of Alcoholics Synonymous." You can get in the wildest arguments with an alcoholic. Well, you say, "Well, we'll audit you for a while, and then you'll be all right." And you wonder what the devil's the matter with the man, you know. What's the matter with him is he had to swear on a stack of – well, I don't know what they swear on, actually – I guess empty bourbon bottles, [laughter] that they will never be cured of alcohol. It's – practically amounts to that. When you read the textbook of Alcoholics Anonymous your hair stands on end. All looks fine right up to the point when you read the fact that they can never be cured, they will never get over it, and they've had it, and they must just succumb to the whole idea that they are an alcoholic. They have to admit this. Ah, you're digging somebody out of that, what are you doing? They're just plowing him in, harder and harder and harder, into the valence of somebody that he thought was an alcoholic.
Anyway – that aside beyond the point – the difficulties which you encounter all come under the heading of auditor comm lag. And you yourself will recognize it, looking back over the times when you've had pcs ARC break on you, that if you'd just been in there a little faster it wouldn't have happened.

And if you yourself have been ex – inexpertly audited, you can look it over, and you can look at it very bluntly, and you realize that if the auditor just said something before all of that silence, and so on, or, you know, if they hadn't fumbled and given the appearance of fumbling, there wouldn't have been any ARC break. Well, what's that fumble? Now, we're really getting down to fundamentals, see.

Well, that fumble is just the unreality that he has on what the pc is doing or going through. And the fumble is sufficiently long to permit the pc to get out from underneath his control. So actually you don't have time to look up the datum in the textbook, or even to remember it, don't you see, your response must be instantaneous. You must be in there, so on.

So when I say there is no substitute for knowing your business, of course, you've got to know Scientology, but you've also got to know instinctively the reactions of the mind. "What is this guy doing?" See? "What goofball situation is this?" you see. And you haven't even got time to say, "Well, let's see, what is hap-pen-ning here?" you know. Well, the only thing that teaches you data to that degree is experience. A race driver who has read a lot of textbooks on the subject of racing car doesn't take Dead Man Bend, you see, out of the textbook. He feels the wheel slipping, it's gone off and it's hitting just slightly into the gravel, it's only an inch deep in the gravel, and he's back on the track. Ah, but if he read it in a textbook, and it said, "When you feel the wheel hit the gravel on the edge of the track you should turn the wheel slowly to the opposite direction."

"Oh, yes, I remember that now. It was on page 73."

Well, by this time they are of course are putting him in the ambulance. [laughter]

And that's just exactly what happens in your ARC breaky auditing difficulties. When you get into these you don't yourself have enough subjective reality. This isn't true of all auditors, you see, because they do have subjective reality. The edge of the wheel hits the gravel, and they of course, they say well, the edge of the wheel has hit the gravel, but they're already doing something about it, you see. They've already turned the wheel. Pc isn't going in that direction anymore.

It's very simple. It is so simple that an auditor who has good subjective reality hearing this tape will wonder what the hell I'm talking about.

They say, "Of course. Naturally. Yes. Well, so what?" And then they sit down opposite Mr. Doakes for an auditing session. They're the pc in it. And Mr. Doakes, in the auditing session, the wheel edges over, and one inch of wheel – tire moves over into the gravel and Mr. Doakes looks up in the textbook on how to drive racing cars – how to drive a Mark Sixteen racing car particularly – and the conditions of the track. And that's all on page 173, and so forth, and he happens to get stuck on the datum of the worm gear of the steering wheel, and so on, details of, you see. Well, of course your poor auditor at this point is being picked up in pieces and put in the ambulance. That's about all that happens. Because really, you – what –
what the hell is going on, see. And then you have great difficulty settling back and feeling relaxed enough to go into the bank. Because you know the next patch of gravel he's going to do the same thing.

No amount of explaining on your part, and no amount of teaching on my part or anybody else is going to teach him anything – enough data, and enough textbooks, and enough huge plots and blueprints as to how you do it, to overcome that little comm lag, see. You could maybe drill him that every time the pc says, "What are you doing?" he says, "Where are you?" But I think this would lead to an instantaneous ARC break, you see, because he really doesn't want to know. You get the idea?

So, the only basic, fundamental cure is to get somebody over the jumps.

Now, auditing has to be done before clearing. That, of course, is the fundamental problem. Everybody can look at this and say, "Well, of course, that is the problem. Let's clear everybody and then let's audit. Let's clear everybody on Earth and then let's audit."

Somebody figured it out the other day that you couldn't possibly clear everybody in New York City because it would require so many thousand auditors, working so many thousand years, and so forth. And they figured it all out, and they had it all taped, and this was conclusive fact that you couldn't clear New York City. They had absolutely, totally omitted the fact of making any new auditors. [laughter] This had been omitted from the calculation.

It isn't true that an auditor has to be cleared before he can audit. That is definitely not true. And if it were true it'd be "God 'elp Earth!" That would be a stopper that nobody could get around. It'd be nice, you see, and where auditors do get Clear you find out they make Clears very rapidly.

I'll give you a datum here. Brenda Scott, who was cleared on the last Australian course, back in Sydney, has cleared two more people. Well, she's hardly been home any time at all. But similarly an uncleared auditor off a South African course who didn't get Clear has also cleared somebody in South Africa. See? Get the idea?

So it isn't – a requisite to clearing is not "to be Clear." It's nice. It's nice. It's always nice when you're out in a storm to be in nothing but a Camper and Nicholson vessel that is fully equipped with all stabilizers and is fully proofed against everything, and so on. But at the same time, why some old hooker that you picked up in a back bay with half its bottom falling out, it'll very often ride storms, too, you see. But it would be nice if you were in this other yacht but not absolutely necessary.

Well, anyway, the road toward making a good auditor is to get the auditor a subjective reality on the bank. Now, don't think that that is going to occur automatically by reason of straight auditing. That is not going to occur automatically. Because people can be audited for many, many, many, many hours, with no reality on the bank, without getting one. This has been demonstrated time and time again. And where Routine 3 is being terribly, unthinkably, ghastly, awful, slow, it's just that this particular facet of a case has never been hit. The escape mechanism of the case has not been triggered off. It is still very much in full bloom. And so the case, as he runs the processes, of course, never does take any kind of a tour of the track but is dealing with other things and you still got an escape mechanism going.
Now, the escape mechanism is not necessarily a difficult mechanism to overcome. It is – surrenders rather easily because it is based on another idea than that which degrades or aberrates a thetan. Escape is simply a method of handling a bank. That is all, it's just a method of handling a bank. It's not a method of getting aberrated.

Now, you can go reductio ad absurdum and trace it back and say, "Well, yes, and if he'd only stood and confronted it at the time..." But I'm sure that there are Clears and they will not walk out in the middle of Market Street and say, "Well, I should be able to confront all this oncoming traffic from the middle of the street." I'm sure they won't carry this on as a practice. They find themselves in the middle of Market Street in San Francisco, they will go over to the curb. Got the idea? Well, you could say, "Well, they're practicing an escape mechanism. They didn't stand there and get run over."

No, the deterioration of a case is based on another mechanism. The individual no longer has confidence in himself as himself and so he adopts another packaged beingness which could handle the situation. And then this beingness he conceives to be useless in the handling of life and it is not a solution, so he adopts another packaged beingness in order to handle life and then that one is thoroughly invalidated, why, then, of course, he gets another one and when that one is thoroughly invalidated, why, he gets another one. See how it goes? And your backtrack of clearing could not be followed by the idea of escape because that's much too simple a statement of the situation. A person can find themselves inadequate in numerous ways besides the fact that they are trying to escape. I know lots of things that a man would be a very foolish fellow and a thetan would be a very foolish fellow not to escape from.

When you're wearing a body which is inflammable, it is not good sense not to escape from fire. That is what comes under the heading of preservation of property. [laughter] But the deterioration of self-confidence in being able to handle life in all of its facets and aspects goes down into a degradation, and it makes one believe that he now must have another beingness in order to handle things for him. And now he starts living life on an irresponsibility. And that being goes out and he gets another being on top, and that being goes out and eventually this goes into the life-death cycle that right now is so normal and usual on this planet.

Well, it's of course about as normal and usual as a girl in pink tights standing out on a – on a Buckingham Palace's flagpole. It is not at all usual. You don't have to kick the bucket every few years. This is not any part of your contract.

But life, invalidating the body and the beingnesses, the valences, gets down to an invalidation which says, "Well, the best thing to do is to chuck the mock-up." Well, that just marks a failure.

A person ages to the degree that they feel invalidated. And this could be stated processingwise: The age of a man in any lifetime is directly proportional to the accumulation of unknowns. Which, of course, is invalidation. You could almost measure the physical age of a person on this basis.

Now, of course this is exaggerated in childhood, and probably in childhood that is why you get fast growth. Kids have a terrific amount of unknownness, and they move up rapidly through this unknownnesses, and so forth. But you're getting proportionate aging. You're getting very rapid aging, actually. The change but – of six months in a child's life in his first ten
years makes a considerable difference. Well, frankly, he's getting a lot of pretended knows and unknowns, and all that sort of thing. They're pounding at him one way or the other. But he's carried through all this with hope and confidence, you see, because he's going to grow up. And his growing up process, of course, doesn't necessarily carry with it all this validation of this confidence he felt. He possibly shouldn't have been quite so confident. Unknowingnesses start to accumulate. Unknowingnesses now that he has no hope of overcoming. And these go on and on, and the unknowingnesses get greater and greater and greater and greater, and he finally kicks the bucket.

Aging, the amount of gray hair, and so on. People are sometimes amazed at me. I get gray hair and then few weeks later I don't have gray hair and then I get gray hair, and then no gray hair, and so on. It's the Central Organizations that are doing it, you see, I don't... [laughter] It's how much I know about their operation or how many not-knows they're running on me, see! Directly proportional.

Anyhow, all joking aside, I think you would do very well – if you're seeking to prove up the auditing skill and – of an auditor – I think you would do extremely well to just check into this factor of reality on thenness and what he considers a picture is, and so forth. And then use those processes I gave you, or some other process, similar, to whoop this thing out, and all of a sudden – straighten out his track, in other words. Do a track straighten-out activity of some kind or another, and you'll all of a sudden find his auditing ability will suddenly go zzzoom! He won't necessarily get Clear, but at the same time he will clear faster. Get the idea?

Now, this pays benefit completely aside from auditing in that it permits an individual to experience more benefit per unit of time in auditing.

Now, one of the ways you grope with this situation is in doing Goals and Terminal Assessments. The more valences a person is in the more goals he is likely to come up with or have, or the more submerged his goal is likely to be. But if a person is susceptible to invalidation, then you do have a coordination between roughness of case and length of time that it would take you to find the goal if you didn't take up the invalidation factor with rudiments. In other words, a person's goal is so easily and so swiftly invalidated that it plunges out of sight with the greatest of ease. So as the goal vanishes, you apparently then have many more goals than you should have, don't you see. But it'd be a susceptibility to invalidation.

Well, his susceptibility to invalidation is directly proportional to the number of valences he has accumulated, because of course the invalidation of valences – of self was what caused valences and then the invalidation of valences is what caused more valences, you see. So if there's anything going on, it is a basis of invalidation. If you wanted to draw a common denominator of all aberration, it would be – it could be said to be in the vicinity of invalidation. The person is as aberrated as they are invalidated – as they feel invalidated.

It wouldn't be proportional. You could take a whole line of men, invalidate them all equally, you'll find out they'd all react differently to the same amount of invalidation. It would be how much invalidation a person feels, not how much a person has. And you just breathe on some people – you're just passing by them accidentally and you just breathe; you don't even breathe at them – and they're promptly invalidated. You see how this would be. And some
other fellow, you walk up to him and you slap him on the back enough to break his spine and you kick him in the stomach, and he looks at you admiringly and says, "Come on and have a beer!"

I know that would be rather foreign to your experience in this particular lifetime, but out on the frontiers I've run into such men. I hauled off and hit a guy hard enough one time to knock him from one side of the ship to the other. He went on bragging about people – he bragged to people, "God, he sure can hit!" you know. Never bothered him at all! It was very invalidative of me, you know! [laughter] It was quite a remarkable experience. Never occurred to him, you know.

Had a dog one time, his name was Al for "Albino." And crazy old Al was a malemute. Half malemute, half Spitsbergen. Pure white, meaner than mean, you know. Big, tough, strong. And my poor old mother used to try to make this dog do something, you know. And she would beat at this dog with her fists, you see, and she would push at the dog and she would maul the dog and she would drag at the dog and ... of course, all this dog knew how to do was the second he felt weight against his chest he knew what you're supposed to do, you're supposed to pull. And if anybody was crazy enough to have him on a leash which had a harness on it, you see, you just – just the second you tighten up the leash he'd mush! [laughter] And he could really pull! Of course, my mother weighed about 110 pounds – wringing wet.

And I have seen her just practically clean up on this Al, trying to get him to do something, you know. Trying to get him to walk on up the road with her or something out in the country, you know. And he's busy barking at cats or something like that. And all Al would do was stand around and laugh at her, you know. And he'd pant, and he'd just be so happy about the whole thing, "I'm getting some attention!" is about the only thing that ever registered on him. He'd just be so happy.

And when I first ran into Al one day, he – I was a stranger. He'd been around there for quite a while and I hadn't been home, and he showed, oh, 1,652 sharp wolf fangs, you see, and he came at me with a low charge, and he was ready to eat me up, and of course he meant to stop two or three feet away, you see, and just scare me half to death. And you learn about dogs, living in Europe and Alaska and things, and I just grabbed him by the jowls, you see, on the loose skin on either side of his teeth, and then using his impetus coming forward, then swung him sideways, you see, and threw him about twenty-five feet. He landed in the flower bed with a terrible thud.

And Al got up and he came over and he looked at me, and he spent quite a bit of time looking at me, and then he finally started to smile about the whole thing. [laughter]

He had a very short memory. I was home every few months so I'd have to repeat the process. [laughter] But we always stayed friends. Yep. By God he'd – you could just hear him say, "I swear by this Ron!" you know! [laughter]

He didn't have any clue – he didn't have any clue of ever being punished; you couldn't do anything to Al. And he was about the healthiest brute you ever laid your eyes on. Now, he's probably still living yet. They sent him up into the woods to live with lumberjacks. I know he was at it for five or six years and just thriving. So you can imagine.
So from animal to animal, person to person, being to being, the factor of invalidation is entirely different. And, as invalidation is rather a common denominator of aberration, therefore you find the factors of clearing are registering on people differently, but more important to this lecture, that a person's responses as an auditor or as a pc measure up this invalidation factor to a large degree – but not so much a pc, much more the auditor.

An auditor who is terribly susceptible to invalidation has a dreadful time of it. If this auditor at the same time has no quick, instantaneous reality on the whole track, ah man, I feel for the person! This practically breaks the person's heart all the time. Because he makes a mistake, triggers the mechanism, the pc disorients, cusses out the auditor. Don't you see the cycle? Then the auditor being susceptible to invalidation feels very, very upset about the whole thing, feels it's very personal, takes up the ARC break, gets cussed out more, has pcs blowing session... The auditor's already susceptible to invalidation; this is practically killing him, see.

Well, the right way to do it is for the auditor to get some auditing in some kind of direction that gives him a validation of the track. Gets some idea of the track. All of a sudden his invalidatability will decrease. But more important, his sessions all of a sudden will get very mysteriously smooth.

And you watch this happen. You watch this happen. It's mysterious magic. All of a sudden on Monday she can't audit, on Thursday, audits gorgeously.

See, on one Friday, why, this person, this fellow, gives a session in the Academy, and God almighty! God almighty! If you'd stood back and made a list of the number of flubs, you see, you just would have run out of paper. There was hardly enough paper in the Academy to list them all. Person gets an orientation on his own bank, gets a subjective reality of the track, gets out of present time, back into present time, gets ideas of pictures, gets ideas of these mechanisms. A few days later they give a session to the same pc – person's been taught no more – and all of a sudden [claps] they can pick up the session every time it starts bogging down. They're in there doing a job, and now they're know – now they know what they are doing.

And I think this is the main factor that's standing in the road of a large percentage of auditors.

Thank you.
Reality In Auditing
A lecture given on 7 September 1961

[Part missing]

Ah well, first time I ever missed a Thursday bulletin, I think. I didn't write a bulletin today. I was up all last night till about six A.M. looking at pictures that had just come back from a production on Tahiti. Looking at rushes. And had to write a whole picture last night and this morning, and I more or less did, so maybe that takes my mind well enough off things and changes the scenery enough that now I can get to work again.

You know, every once in a while I get stuck on your mind, you know. [laughter] Let's see, "What problem could Ron have about my case?" Why don't you run that? My attention will free up. [laughs, laughter]

Okay. What is this? The 6th?

Audience: 7th.

Seventh? Seventh of September AD 11.

Well, it sort of seems like old times telling you how to get pcs into an engram. It just seems like old times. We're back at the old stand. I mean there's the brass rail there, and there's the dusty bottles back of the bar, and there we stand amongst the spittoons discussing this ancient problem.

Well, it works like this. Engrams never ran with the pc (quote) out of valence (unquote). You could run a pc who was out of valence for just ages and ages and ages. And all long engram running stems from the pc being out of valence.

Now, there's two things to keep in mind about this. And one: "when pc is in own valence" – this is a misnomer. We merely want him in the body he was in when the incident occurred, but this doesn't put the pc in his own valence. You see, he's Joe Jinks. He's being Joe Jinks in that particular life. The primary swine merchant of lower Chicago, see. And there he sits. At least, for God's sakes, if he's Joe Jinks have him in the body of Joe Jinks. You got the idea?

That's what we meant by "in valence." Simply in the valence he was in when the engram occurred. Understandable?

Now, when we say "out of valence," we mean simply and entirely the pc was not in the body he was occupying during the incident. But as Joe Jinks, the swine merchant from lower Chicago – he has trouble this lifetime, he keeps going oink, ung, oink, and so forth. He only killed seven or eight billion swine in that lifetime, you see. And he says he couldn't pos-
sibly have done it because he did it all from a mahogany desk, you see. So he didn't kill any swine, so it doesn't have anything to do with him. You get the detachments about that?

So anyway, there he is with a picture, see. You've got your pc with a picture. So he picks up this reprehensible life – not only reprehensible since he came from lower Chicago but reprehensible on the basis of being a swine merchant, you see – and he wants nothing to do with any part of this.

So we pick up pictures of Joe Jinks, a body, sitting at a desk. And he is always over there. And we try to run the life of Joe Jinks, and if the auditor's not aware of these things, and he hasn't got good subjective reality on what can happen in the bank, he does all kinds of weird, oddball things, like said, "Well, go through the incident again." So the fellow looks at the picture again. It's way over there, it's very thin, there's not much to it, you know. Doesn't bother him.

So he goes through the incident again, and that's hun-hum. Well, not only does it have anything – nothing to do with the pc, but that is the basic postulate in it: It has nothing to do with him. That is his solution to the problem.

And that's what we mean by "out of valence." He's always seeing himself from the area of the reception couch, or he's seeing himself from the chandelier, or he's seeing himself from someplace else, and the picture's very thin, and the body that he was in that lifetime is over there. You see, there is no virtue in being in valence, but the pc has to be in valence in order to run a picture.

And I repeat, this does not mean that he is being himself. Pc in valence and pc being himself are two entirely foreign, different statements that have nothing to do with each other, because as long as he is occupying a body and thinks of the body as himself, he is of course not being himself but is being a body, and that body, of course, is a valence. Do I make my point?

All right. So you're running him "out of valence." That is, it has gone to this *reductio ad absurdum* and complete abstranormity – extremity that not only is he not being himself, but he is also out of valence. Now, how does this express itself when he sees a picture?

Well, it's sort of thin and there isn't much to it, you know. And it's a little thing and it's over there and it's pretty black, you see, and nothing to do with him. And it doesn't have any somatics in it. "This stuff Ron talks about about somatics, ha-ha-ha-ha-ha! I never had any somatics, and so forth. Actually, my lumbosis is a physical illness. This thing that is gouging me in the back, you see, has nothing to do with engrams, you see, because I'm not in any engrams, you see. There's that thing way over there. It has nothing to do with me," you see. This is quite remarkable.

Now, if the auditor is not aware of the phenomena of this character, he can make some of the most classic errors ever made. That is, he runs a pc this way and he runs the pc that way, and he goes through this and asks the pc, "Do you have a picture?"

And the pc says, "Yes, I have a picture."
And the auditor never says, "Well, what do you think a picture is? Well, where are you viewing this picture from? What mass of meat are you occupying during the script of this picture?" See?

That's interesting, isn't it. You never ask this, so of course, obviously, the pc is running off his pictures, and obviously the pc is handling his bank, and obviously it's all going all off all right, right according to textbook.

And we say, "Well, do you have any pictures?"

"Yes. I have a picture."

"Well, what's happening in the picture there?"

"Well, there's a fellow standing there with a headsman's ax, and he's about ready to chop off the – my head, and so forth."

"All right. Does the ax fall?"

"Oh, yes, yes, the ax fell. It's all right. Everything's fine."

And the auditor says, "Boy, are we really making knots." And he just never finds out that the fellow with the headsman's ax – well, he's sort of thin, you see. He's actually kind of an idea of a fellow with a headman's ax, and is way over there where it's good and safe. [laughter] Way, way over there. Fascinating.

Of course, nothing happens with the picture. Why? Because you were not running the picture the pc saw. You are merely running some cooked up, safe version, you see. And the safe version, of course – it isn't that the text is different. The text'll be the same, but the safe version is, we never view it from the same viewpoint that it was viewed from. And if we don't do that, the thing never as-ises. So pcs who are run in that condition, no matter whether it's some old process or Routine 3, apparently never get anyplace.

Don't pay any attention to a picture – the pc is not in his own valence. It's not a picture. Won't do him any good. You could run them by the hundreds of billions. It won't do him any good. You're not running engrams. It has nothing to do with it. He won't even be able to get off grief charge.

Now, the funny part of it is that all this phenomena I'm telling you about is very old and very well known. Way back. But it has never been punched up. Never been punched up. Because we haven't connected the pictures and anatomy of Dianetics with the conceptual processes of Scientology.

Now, the conceptual processes of Scientology have this magnificent virtue. They will move a guy straight back into the picture he is in that is charging up the chain he is stuck in that make him out of valence from that point there on. And no matter what pc you're running, no matter how many pictures he sees, and so forth, eventually he will wind up in his own valence. And now if the auditor doesn't know his business, he won't make him handle it.

Now, we've run and run and run, and all of a sudden the person is in a picture, and he is in his (quote) "own valence," don't you see, meaning some body that he's in, with eighteen valences stuck inside of it, don't you see. But as far as the picture is concerned, he's at the
point of view from which he viewed the picture while it happened. See, that's important. And he runs back to this, and he goes zoomoomp! and out of there. "Ha-ha-ha-ha-ha. Well, I got out of that." Well, of course, he did exactly what he did before. The way to get out of that was never again to be in that body. That was the solution to the case as far as he was concerned, and so we don't then try to persuade him in some particular fashion, by directing his attention mainly and only, to stick with it, until the process you're running knocks it out. Because they don't sort out endlessly. They don't do it. That is all there is to it.

Now, there are several approaches to this if you understand it. Actually, you can build up little cardboard models and demonstrate this to students if you wanted to. You could show – oh, I don't know, get some of these kid cutouts of some kind or another, and you say, "Well, in own valence is the thing viewed from inside this body and the pc was occupying this body and therefore if you get the idea there, you look and you will see that everything he sees is from the viewpoint of this body here. Now, of course if you are trying to run this engram with the pc's viewpoint up here, while he was actually viewing it from down here, of course you are not running anything that ever happened. See? You're running an entirely dislocated thing."

Well, all right. That's fine. You could make a very graphic representation of this. It becomes very simple. And make sure that you say, "Well, the pc is not himself if he is in any valence. So don't confuse being himself with being in a valence or having his own valence."

You see, anybody who's sitting there looking at the scenery from inside of a body has a valence. That's for sure, but the pictures he is making from where he is looking at them, of course, is the track. That is the track. And trying to run a bunch of branch railroads – you see, where he's never looking at things in pictures from where he looked at them in the actual incident itself, of course this is just running branch railroads. This is running the shunt line from south Birmingham to north Colchester, you see, which had nothing to do with the railway, and you won't get anything even vaguely resembling an erasure. And so these things last forever.

This is the secret of a hanging engram. Of course, it isn't a hanging engram. The auditor never asked anybody about it. It isn't an engram. It's a picture of an engram. And you're running a secondary situation – misuse of the word secondary, but you're using a removed situation. You're trying to erase a picture that never occurred.

Of course, the incident that the picture is of occurred, but the only safe thing to do about this is to get off someplace when he sees it in the bank, you see, and be way over here someplace and look at it very safely. It's not going to erase.

Well, how many ways would there be to remedy this situation? Well, actually, practically countless. I'll tell you one of the oldest methods of re – of handling this situation, and then you can see a little bit more about the mechanics of it.

Maybe I ought to tell you the simplest method first. That'd be best. I'll tell you the simplest method.
You say, "Have you ever seen a picture from inside the body that you were in at the time the thing was occurring?" You know, explaining own valence to the fellow. "Have you ever seen a picture of this character? Have you ever had one during processing?"

And very often some pc who has been a long time in processing will say, "Aye, aye, I have. I have. Yes."

"Well then, which ones are they?"

"Well, there was one there when I was in this automobile, and there was this road and – out in front of me, and the other car hit us. And I ran into that one."

"What did you do at the time?"

"Well, I ran into that one, and that was – hasn't very much to do with the case, you know. Ha-ha-ha-ha!" Hasn't had anything to do with it since. Great.

And now, what that was, is a restimulated engram. And of course, the restimulation died out in a few days, but he still remembers this.

All right, and you say, "Well, were there any others?"

"Well, I had an – I had a thing that really upset me. I was very shaky on the subject of past lives till one day I was sitting on this horse, you know, and this chariot ran on from the right, came in from the right and knocked me off the horse. And that was quite real."

And you say, "Well, what was the picture exactly? Were you seeing the picture from where you were sitting on the horse?"

"Oh, yes, yes! That was what was upsetting about the whole thing. Ha-ha."

And you say, "Well, all right. That's good. That's good now. What did you do during processing about that?"

"Well, I answered the auditing question. That was it."

Ah-ha! We've got two of them in the pc right now. We've got two of them that we can lambaste and finish up. All right, let's take the earliest one. That is always the best thing to do unless it's too early – you know, like the rock or something. Take the early one, and – which is the guy sitting on a horse. And you say, "All right. Now, do you remember the auditing session in which this occurred?"

"Well, yeah, vaguely, dimly."

"Well, I don't want the exact date. But you do remember that? All right. And do you remember anything about the auditing question that you answered for that? Good."

"Yeah. Well, so-and-so and so-and-so."

"All right. Well, what is unknown about that incident about the horse?" and so forth.

"I – well, just what you asked me. I really don't know what auditing session it was."

"All right. Good. And what else is unknown about that incident with the horse?"
And "Well, the auditing command. I actually haven't really remembered the auditing command."

"All right. And what else is unknown about that incident with the horse?"

"Well, it's uh ... Zzzzzzzzzz. You know, if you keep this up, I'm going to have a horse over here."

"Well, don't worry about that, you know, don't worry about it; everything will be all right. Now, what else is unknown about this?" Crash! See. Aaaaaaaaaaaa.

Man, he'll be out of present time. And don't you do a bad job of auditing right at that point, see. Just run the incident – the command I was giving you just flat. "What else don't you know about that incident with the horse?" see.

"I don't know this, and I don't know that, and I don't know something else, and I don't know something else, and I don't know something else." And in a very few minutes, that'd be flat. But also he will find out something: that he'd skipped out on it; that it did exist; that it was there; and not only that, but has been with him ever since, and has always been with him, and he's never been anyplace but sitting on this horse. This will dawn on him eventually if you run it good and flat, with just Unknown. You can also run, "What shouldn't be known about it?" and "What should be forgotten about it?" or any other variation of the Not-Know, see.

And you'll have yourself quite an incident there. And it'll build up 3-D and scare him half to death. And remember, boy, will he be out of present time. That's the time to do real smooth auditing, and yourself have a pretty good reality on the fellow actually being in a thenness which isn't a nowness. And it will keep you from collapsing his thenness onto nowness by adjusting the cans of the E-Meter because they might be getting too warm. It's these kinds of things that collapse thenness and nowness and keep the guy from running an engram. You got the idea?

All right. Now, we look at this: There is a fundamental method – I don't at this time know of any better method than this. And I'll give you an old method. It's a simple method of doing it. Just find out if he ever has been and put him back into it.

Well, if he's never been in one of these things and he can't recall any and it's all just garbage and black and invisible ink, well, there's something else you can do about it. There's an old process that does this, rather arduously, but it eventually accomplishes this exact thing, which is, "Recall an ARC break." Now, that's an awfully stylized auditing command, almost totally limited to processing Scientologists. But "Recall an ARC break" would be pretty well guaranteed to unstack a track to a point where he would find himself in the incident that was upsetting to him. It's an interesting one, isn't it?

Don't interfere with whether he's calling these things from motivators, he's calling motivator ARC breaks, motivator ARC breaks. Well, he'll get it back to a motivator incident. Don't try to put him in the overt side of the sequence. Don't do anything about it at all. Just run "Recall an ARC break" and pay attention to where he's landing on the track, and he will eventually land at the base of some chain where he is in his own valence and something is happening. That is pretty good.
I suppose you could vary the auditing command so that it'd make it comprehensible to a non-Scientologist, but I've never put in any time on that. And I'm giving a lecture now to Scientologists, so let's skip it.

That one will do it. All right, there's another one that will do it.

Had a fellow last night, and I noticed that he kept asking me about his eyes. I didn't tell him it was a Security Check question that cures up eyes and eye difficulties faster than anything, is what – the exact auditing command I've given you in lectures before. It's something on the order of: "What shouldn't be seen – what have you done that shouldn't be seen?" And that will just ruin more glass prescriptions than anything you ever had in the way of eyesight. Just keep security checking on that basis and clear the meter left and right and in the middle, and so forth. "What have you done that shouldn't be seen?" And, of course, he's preventing seeingness like mad of something he's done, that's all. People hearing this lecture probably have just now thought of what one of them is, and others have heard a ticking automaticity, because it'll very often send off an automaticity. Well, it's restraint of inspection. But I didn't tell this fellow about it. And instead of that, he was complaining about a mass that seemed to be resident behind his eyes someplace. So I gave him the easy one. Here is another method of doing this exact thing. And I said, "Get the idea of some action going on way out there in front of you two or three hundred yards away." He did.

I said, "What was it?"

"Uhh!" he said, "Well, oddly enough," he said, "I get my mother and driving a car."

And I said, "All right. Good. Now, conceive of an action two or three hundred yards behind you." And he got a dog or something.

I said, "What's happened to this mass that you're complaining about, back of your eyes?"

"Well, it's shifted. It's moved."

I wasn't processing him and told him so, but obviously, the man was stuck in the picture, wasn't he. But as near as he could look toward the picture he was stuck in was way out, and that is quite common. Action that is that far away is safer than action that is up close so people will see it.

Now, you could just follow this thing through – which I didn't. I just moved the somatic around and changed it all around and did something with it and explained to him that these things are pictures. He was quite amazed. He had been processed, but he was quite amazed to connect up these odd sensations he had with this, you know, with the idea of pictures, see. He couldn't conceive of himself being stuck in a picture. He obviously was stuck in a picture or he wouldn't have had a mass. That was it.

But he could look at that distance. And you could follow this through and take a process of this type, which is inspection at distance, and you would eventually wind up with the guy in the picture he was stuck in. It would peel it right on down to where he was. Interesting idea, huh?
If you yourself have a somatic, and you're prone to self-auditing, why, you can always inspect something way out. Only make it two or three hundred yards. Of course, your attention at once will start collapsing on two or three hundred micro-millimeters, but uh – I mean in close, you know. You look out there, oh-uh-thu-thu-du. And the next thing you know, you're floundering around, you don't know what's happening to you, you know. Get your attention out there again, you see. Get your attention way back there and way over to the right and way over to the left and way below you and way above you, and so forth. And you're peeling off some environment of some kind or another that has been a stuck environment.

You can also get in lots of somatics and lots of trouble and have to have auditing, and be able to gasp[laughter] – be able to gasp over the telephone to a friend of yours, "For God's sakes, come over and audit me before I die in the middle of the living room." I – this – randomness can set up with something like that, but you'd survive it.

Anyhow, there is a method of peeling one down. Now, because you are extremely devoted to repetitive processes and we have to have repetitive processes and they are the thing to do ... But when you get into handling a case, you have to interrogate and do other things, and a repetitive process is not enough. It has to be punched up. But I'll give you a repetitive process. I'm not running them down.

Pc has a disabled leg. We discover this by interrogation of the pc and observation of the pc, and we are limited in this solely and entirely by this one point. It is obvious to us that he has a bad leg, but the pc never mentions it. He keeps talking about his burning ear.

Well, we'd better not go into bad legs because it's not real to him. But the pc tells us he has a bad leg, we observe that he has a bad leg, and so forth. Or if he tells us he has a burning ear, and we happen to observe this, we could run exactly the same regimen on either of these.

Now, what we're asking for is if he has any odd pressures. Now, these could be his face, his chest, his stomach, his legs, his back, his gluteus maximus, his mea culpa, anything, you see. It doesn't matter what, anatomically. This will be what is called a psychosomatic and will be his chronic psychosomatic illness. And will also be probably his hidden standard and will also be numerous other things that we wrestle with. See.

All right. Here's the way to handle it. This is brutal, by the way. It is quite brutal, and the auditor has to be very good and stay in there pitching with the pc.

All right. Now, it's "Who would have an unknown motion around his leg?" We use this new thing, this valence thing, and it is the valence, you see. And then we could compound the felony by asking what. "What would have an unknown motion around it's leg" "Who would have an unknown motion around his leg (her leg)?" I wish English was a little more adaptable on genders. English is gender happy. You can usually become colloquial and say "their leg" and this covers the whole thing.

English actually – the people do try to put a dual gender pronoun in there. You know, they say "their," making it plural.

All right. This sort of question will knock out infinite numbers of chronic somatics providing you flatten it. And it's flattened on the tone arm just as any other process. Now,
you're getting into something you're more familiar with. This is an easy one to do. But it is quite brutal. It is quite brutal.

Pc complains all the time that he's got this sensation in his nose. Well, this would be what you did with his nose, see. Got a sensation on his nose.

All right. Pc complains all the time that there is no – absolutely no sensation around the right arm. Same process. No sensation – absence of sensation and presence of sensation both respond to the same process.

Now, there's a way to amplify this idea and be a little more positive about it, and that is to shake down on the E-Meter what is the most real to the pc. Motion or confusion or some other thing, some other word, meaning action. Could be the word action, don't you see. It could be lots of things. Anything denoting commotion, action, confusion and so forth. Find the best word.

The Secondary Scale of the Prehav Scale at the level of Motion gives you most of these synonyms. And you would assess out the command, and then you would use the same command form. You would say, "Who and what unknown ..." whatever word you found, you see, commotion, confusion, action. I suppose you'd find some pcs that have attitude. I'm sure that'd be as close as they could get to anything like motion would be attitude. Because the idea – they pull back into ideas. They're down below effort and into think, you see. Don't omit attitude.

I should say in passing, by the way, there's a way of running the whole Prehav Scale without assessment. If you were ever caught out in the middle of the bush, the veldt, or the deserts of New York without a Prehav Scale, there is a way of running it, rather crude. Use "action or attitude". Just use the words "action or attitude" for any level. Got the idea?

"King." All right. You're running – the pc's terminal is "king." And you say, "Action – what action or attitude would you have toward king?" or something of that sort. "What action or attitude would the king have toward you? What action or attitude would king have towards another? What action or attitude another toward a king? What action or attitude would a king have toward himself?" You get how you could do that?

Actually, it runs the whole Prehav Scale in a very haphazard, impositive but workable fashion. It's probably only five times as long as a proper assessment. But if you ran total out of assessment material, and you couldn't get an assessment, and the pc wasn't going Clear, you see, and the needle was stuck, and the tone arm hadn't moved for ages, and so forth, and you assumed there must be some level that you knew not what of or wasn't on the scale or something of the sort – after you made sure the rudiments are in, and after you've made sure you'd handled any hidden standard or anything like this – psychosomatic, present time problem of long duration, all this sort of thing – after you had all this straight, you still couldn't get anything on the thing, you could still use action or attitude.

What it is, is just doingness pure and simple. It's the idea or doingness. And the whole of the Prehav Scale is devoted to idea or doingness. So action or attitude phrases it up so that it can be run as a sort of a blanket command, and it's an interesting thing for you to know just in passing. It's a datum you should have. Remember it isn't good, it merely works – to no
great, high level of workability, but it goes on through. Extends the auditing time rather tremendously, but it will work.

Okay. When I find these little bits and pieces of this character, I like to pass them along to you whether they have vast usages or not, because you may sometime or another be, as I say, in the deserts of north Hollywood. I don't think anybody in Hollywood has been able to read for the last hundred years. They deal exclusively in pictures.

All right. Now, let's get a little bit further on this line. This would be then a method of handling the hidden standard, the chronic somatic, the complaint of the pc, the difficulty which he is always bringing up, and so forth. It'd be something on the order of "Unknown (assessed word)" which adds up to motion. What you're heading for in that, I'll point up to you again: You're heading for motion. You want unknown motion; that motion itself may not express itself well to the pc. See, it'd be best – work much better with "unknown confusion."

For instance, I was dealing with somebody who had no concept of motion. That can be run into. Wouldn't bang on an E-Meter, nothing like that. "Motion? What the hell is motion?"

"Well, motion is a vague idea that people have that something is changing position in space."

"Well, yeah, but what is motion? What is motion? Have you ever seen a motion?"

"Oh, I'm sure that I've seen a motion. How silly. Of course, I must have seen a motion at some time or another. Naturally. Everybody has seen a motion at some time or another."

"Well, name a motion you have seen."

"(sigh) Name a motion I have seen. Well, I don't know but everybody has seen a motion."

Didn't have any concept of the idea of motion at all. Had no concept of motion. I don't know what all these – this person did a lot of driving. That's why I resigned finally from the Road Safety Committee. [laughter] People never would undertake any program that had anything whatsoever to do with road safety. I'm saving the fact that I resigned in order to send in a scathing statement at some time or another which lays down a program which actually just puts more punch to the program I've had in mind for some time. "Why I resigned as Road Safety Organizer," see, I mean, this is the keynote of the thing. Then everybody pays attention to it because this is obviously a complaint, you see, and is a bunch of entheta and... Somebody's mad, you know, and that's fine.

All right. Now, we look over all of the – these aspects, of bank and pictures, and so forth, and we find out at once why the pc will not view his bank. He will not view his bank because he has tremendous intolerance of two things. He has a tremendous intolerance of motion and he has tremendous intolerance of unknowns.

Now, his intolerance of motion is best expressed to you on the basis of: motion can become intolerant to somebody – he can become intolerant about motion – to somebody who is extremely fixated on the subject of pain.

If this person is fixated on pain, then he believes that all motion adds up to pain. He has no other concept of motion than it is pain. Well, motion, of course, makes pain possible.
And pain cannot occur without motion. And you see somebody that you're kicking in the stomach stiffen up and try not to have any motion. Next time you're kicking somebody in the stomach (out of session, of course) notice the fact that they are trying to stop motion. Well, that's very interesting. The reason they're trying to stop motion is incomprehensible unless they love pain. Because that's the only way pain occurs.

If you had a thetan who wasn't trying to stop motion around the body, the body would experience no pain. It's just as simple as that. If he weren't trying to stop motion, he wouldn't suffer from motion. Of course, he's picked out motion as randomity and there he is.

And the next time you have an ache or a pain, why, notice the fact that it seems to occur from two opposing motions. Just get analytical about it and observe it. It's two opposing motions and they sort of grind against each other or something of the sort, and the sensation on that tiny, tiny, tiny motion between those two opposing areas gives the sensation called pain. That is what pain is. Pain isn't anything more than that. And there hasn't been enough of it so thetans don't like it. Well anyhow – it's true of all things – there haven't been enough of, why, people don't like them. Okay?

Now, in handling a pc who has no bank visible, these factors then must be present: that he has an intolerance of pain, therefore an intolerance of motion, therefore an intolerance of unknowns. Not necessarily therefore – these two things are different spheres. But doesn't like motion; doesn't like unknowns.

He has a fantastic importance attached to motion. And he has a fantastic importance attached to unknowns. He'll give you a fabulously exaggerated idea of the importance of an unknown. And you'll find him nattering something like this: Well, if he doesn't know about what all the fish are doing off of Dover just now, why, anything could happen. And you say, "Well, wait a minute now. He's not in Dover. He's not in the fishing business. He has nothing to do with Dover. He had never been clear – or near Dover and Dover has nothing to do with him," and so forth. Here he's talking about the fish off Dover, and he's worried about what fish are doing off Dover. And he wants to find out about what the fish are doing off Dover because it is very important and you can't quite make out how it's important. Well, don't assign the fact that the fellow's crazy. Just assign the fact the fellow has one Christ-awful intolerance on the subject of the motion of fish and the unknowns of fish, and that's it. It just sums up to that. He has intolerance of these things. These things he can't confront, and he happens to have picked out for his randomity the vast importance connected with one body of motion, i.e., the fish off Dover.

You finally plumb into it and he learned when he was a little boy that they had soles off Dover or something. He's never quite sure about this, and in church, why, they were telling him all the time he had to save his soul, and it's as close as he could get to the souls are those fish off Dover. You know, it would be some squirrel cage – I mean it would be as idiotic, you see, as this. But it'll be some superimportance about this particular unknown. We see this all the time and we pass it by. We just sort of not-is it. We see people terribly, terribly worried about the terrible, terrible conditions of the natives in Upper Slobovia. And don't be too surprised sometime to go to Upper Slobovia and find the happiest natives you ever ran into. You got the idea?
And similarly, everybody's very complacent about the natives of southern East Germany. Nobody's worrying about the natives of southern East Germany, and they're in a terrible condition, you see. So it's just a fad. It's what – it's – "What natives we are worried about at the time" and "What natives we are not worried about at the time" are regulated totally with how much unknown seems to be connected to these things and how important that unknownness seems to be to the person. And the most unknownness there can be is the unknownness about motion. That is the most important unknownness.

You'll find the fellow is suffering a somatic all out of proportion merely because he didn't even know he was going to be hit. And he was hit. And you find out that he'll stick with this somatic, and the somatic is there. Yet he's been run over by a truck, and that somatic isn't sticking. But somebody has walked up to him suddenly and said, "Hello, Joe," and slapped him in the face hard enough to crack his jaw, see. And this somatic is stuck. But it wasn't actually a very brutal thing, and five minutes later, why, he didn't even realize he'd been hit. You know, I mean he didn't have any physical damage from the thing. And you find in vain trying to evaluate the importance of an engram to the preclear is the most fruitless task you can possibly engage upon, because he's been run over by trucks since time immemorial, and he just never, never, never, never, never seems to attach any importance whatsoever to this fact.

Oh well, yes, he was run over with a truck when he was a small boy, and they sent him to the hospital, and he had a cast on his arm for a couple of weeks, couple of months, couple of years – depending on what doctor he hit. [laughter] And, yeah, he had another accident. He was run over by a truck when he was seven, and he was run over by a truck when he was ten, and he was run over by a truck when he was eleven. Well, he's become accustomed to it. [laughs] And you won't find these somatics very rough.

But a switching he got when he was five he has exaggerated into the most familial battle royal that anybody had ever heard of. My God, to hear him tell about this thing, why, there was blood plastered all over the ceiling, and the only reason the neighbors came in is because of the bits of flesh that kept flying [laughter] out of the woodshed, you see. This kind of thing. To hear him tell it, you know, this was the wildest activity, you know. They imported an executioner from Italy just specially, you see, to whip him. And you boil this thing down and you in vain try to find any real brutality about it. All you do is find a switching that you yourself would not have considered very important. But it's very important to him!

In the first place, somebody blew up at him that he didn't ever expect to blow up, you see. So that's unpredicted, which gives you the unknown. And somebody switched him for something he didn't do, which, of course, is not-known, too. Unjust. Injustice is just an unknown penalty of some kind. It's a penalty for an unknown crime or a not-existent crime, you see.

So there was injustice connected with it, there was unpredictation connected with it, and in addition to that there was no real familiarity connected with it, and amongst these various points we get the unknownness and the motion all adding up to tremendous importance. He's still trying to figure it out. You can say the importances of anything is as great as the individ-
ual is still trying to figure it out. And you'll find those engrams which are most seriously stuck on the track are those engrams which are composed of incomprehensibles.

The fellow went – kept calling on this girl, and he kept calling on the girl, and he'd wave to her from the window, and so forth. It was rather a strict planet on the subject of sex, they didn't have much. See, he keeps calling on this girl, and it seems all right with him, you see. And he thinks he's getting someplace with... He didn't intend anything very gruesome, you know, and he was sort of paying court in the way they were doing on this particular planet or country, and it all seemed very routine and regular. And one day he drives up and runs into an ambuscade. A real one. A real ambuscade, you see, complete with muskets, you know? And he's slaughtered!

Well, he didn't have any intentions that match this slaughter, and he doesn't know what would cause that family, you see, to be this upset about somebody paying court to their daughter. And he adds up – tries to keep adding this up. He keeps adding this up, you see. Keeps adding it up. Keeps adding it up. And it doesn't ever add up, of course. And he'll get some kind of a fixed idea about it, and he'll say, "Well, that's it." But the number of times he tells you that is the fixed idea about it and that is it, you can start being suspicious about that time because, of course, if he has to have a fixed idea about something, the unknownness of it must have been terrific. He says, "Well, in actuality her father and she practiced incest and they were afraid to find it out. And nobody could quite discover what this was all about. And if I had paid court to her much longer, why, something like that would have happened, and that is the way it was, and that was the thing, I think. I guess. No, no. It's actually a fact. Everybody in the neighborhood knew that she and her father practiced incest and, therefore, her father set her brothers on me, you see, to shoot me down in order to keep me from finding this out, and that is what it is. That's true, it's true. Everybody in the neighborhood knew it. As a matter of fact, it was in all the papers, so forth – I think, I guess, or something else. But that was the way it was! I guess."

And you audit a little while. All of a sudden he comes out of the, out of a fog and he says, "You know, she'd actually been pledged to marry the local duke. And this was all being kept secret, you see, because the duke's politics were completely contrary to most of the people's politics, and there might have been quite a revolution, you see, and they had me figured out as an agent that was merely trying to reach the duke. I think. I guess."

All the time he's telling you this, why, these musket balls are still lodged in various portions of his anatomy, and he has got somatics from all of them, you see. And every time he gets on this subject, he gets hectic because these musket balls were hot at the time, and he's never quite dared to feel that littleness of the motion of the heat, you see. And these musket balls start warming up every time he gets onto the mystery of this. So therefore he solves the mystery, but he never solves the mystery right.

So he's just been floundering around in this engram – I can see him now. He's on some other planet, and he is a member of the space guard of this particular planet in its polar caps. And he has an igloo in which he's supposed to stand by, you see, as a warning, and he's sitting in this igloo. And life has been going on fairly well while they were building the igloo in the station. He's sitting there, and about two months later, all of a sudden he starts to wonder,
"Well, now, I guess it was that she was going to marry the... No, it was father's incest with uh – the uh – uh – uh – situation. I wonder what that was. Now, let's see, it must have been..." you get the idea?

And eventually he gets an illness of some kind or another and has to be carted out of the polar caps and hospitalized for a long time. And the medicos issue very learned papers on the subject of "Polar caps cause illnesses which are hot, burning spots in somebody's chest." And they, of course, become very learned on the subject, and they have very, very vast conferences, and so forth, and they bring this up at their meetings, and they read papers on it. And you've got this piece of pretended knowlingness borne as an effort not to face the unknownness of it, you see. And this goes on and on and on. And the primary recipient, of course, would be the medical profession. I think there's probably a fact or two in their books, but most of them are based on some wild effort to solve what: A psychosomatic with a physiological explanation. And what could there be a wilder lie than that?

The fellow has got hot musket balls in his chest, so they say, "Well, there's a new illness called 'polarolosis,'" and here it is.

It's very amusing to read medical records when you know a great deal about the mind and so on. They present you with everything but the facts. They sure give you a lot of learned names to back it up, too. And if you want to know a real piece of pretended knowlingness, look at the heading on it and see how many authorities had to be called on to vouch for it. And then if you get four or five authorities or hospitals which have vouched for all of this, you can just be sure at that time it should have been garbage cans at the beginning, and somebody should have audited the patient. You see how this thing goes?

It is the idea of the importance of the unknownness, and the idea of the importance of the motion. And these things drop back to the degree of threat to survival. And then this, therefore, goes back to the idea that one must survive. And you start taking this apart from all lines, and you get down to the basic idiocy. A thetan who can't help but survive – he just couldn't help himself. He may be surviving kind of deadly and in different forms and out of valence, and so forth, but the one thing he cannot do anything else but, is survive. He always will survive. That is for sure. The one thing he can absolutely count on is the one thing he is always trying to solve, which is, of course, itself is a basic idiocy. And, of course, everything else which follows from that basic idiocy, of course, is idiotic.

But if you want to take this apart, you take it apart along the road of unknown and motion, and these two items give you a very broad four-lane highway right down through the middle. And of course you combine any phraseology that has to do with unknown – which is not-know, forget, forgotten; any of the odd numbered postulates – and you combine this with any word which sums up to a motion or transplantation in space, and you will get a process, which is a wild one.

Now, if you put that against valences, you will get pc in pictures, and it gives you your basic magic formula for getting the pc into the track and onto the track and in the bank and moving on the track and out of detached views and all these other ills that we are – have been discussing. Make any sense to you?
When you see one of these things wheeling off, it's a lot of fun. This gag of telling somebody to look out there two or three hundred yards in front of him and two or three hundred yards behind him is not very new. But let me warn you against having him look ten or twelve feet in front of him or ten or twelve feet behind him. That's too close. He'll jump like he's shot. Usually in space opera when they are conditioning thetans – or when thetans are conditioning others – they – sometimes there's a tumbler incident, that nearly everybody has some cognizance of or is stuck in or something like this. It's quite common.

And they throw somebody in a body down a shaft, and of course he's spinning, so the bottom of the shaft is lighted and the top of the shaft is lighted, and he is falling in the shaft. And therefore, the image of the top of the shaft and the image of the bottom of the shaft leave an awful lot of bright spots because he's trying to stop himself from falling all the way down. So he gets a vast number of bright spots stuck around him at varying distances, and he doesn't quite know what these are afterwards. And that is the way the picture looks.

Well, these are not very far from him, and some of them are quite close to him, naturally, because he fell only a short distance to get the closest ones, and he fell further to get the further ones, and I haven't made any estimate of how far one of these bright spots would be, but probably something on the order of about – well, I don't know – a hundred feet, something like that.

And you tell anybody to look in closer than a hundred feet just on casual inspection, he's liable to run into these things, and they will really hit him. Very casually, you could be riding on a bus and tell some dear old lady, if you felt particularly diabolical, you say, "Close your eyes. Do you have any bright spots around you ten or twelve feet away from you?" And she'll get it right there. Splank! She'll see one of these things. She'll get the sensation of motion, you see, and she'll stop herself suddenly. And it'll be a jolt. That's an interesting phenomena. That's an old, old space opera installation of an engram. And practically everybody's got that one.

There's whole long – oh, there's long, long lists of these. Any possible way you could get somebody, what? Dislocated.

Now, I told you the other day about dreams. Dreams. An effort to locate oneself. Then what is a delusory bank? Let's carry it just one step further. Instead of dreaming it asleep, how about having it in the bank awake? Effort to locate oneself.

Out of this you get the workability and magic of 8-C, TR 10, other things. They have some workability because, of course, they're locating somebody and they feel better.

But how about locating somebody in the bank. Well, nearly every picture he's got is an effort to locate himself in an area where he felt dislocated. So unknown locations could play a considerable role and unknown times could play a considerable role in other processes. I don't particularly mean to cover those now, but I should mention to you that you can have unknown locations, and you can do weird things with pictures. Have the pc spot unknown locations. Of course, he shakes up every delusory effort to locate himself by pictures. And you'll get pictures flying by in all directions.
"Are there any locations you don't know about?" You see, that type of interrogation. Bing-bang, and all of a sudden you get a bank shift. It's quite amusing – then the fact that an individual is sitting in a bank which locates him so he'll be in the wrong place.

Now, if you went further than that, *reductio ad absurdum*, you could get down to this interesting supposition that a universe is an effort to locate oneself. And you'd possibly get the basic consent of why a thetan is willing to be in a universe.

It's an effort to locate himself. Therefore, because a thetan doesn't have to be located, and it's totally idiotic – I point out the 1954 HPA tapes when this is mentioned – it's totally idiotic to have to be located. There's no good reason why anybody would have to be located. It must be a dirty trick then to locate a thetan, and it is. It is. Give him the idea that he has to have a location.

But that is such the fundamental idea and goes back of every universe, and is back of every bank, and is so wrapped around and hedged around with reasons, explanations, valences and all the rest of it, that we must assume that it is practically unreachable as a concept in processing. And there are many such very senior concepts in processing, that if you could just think them and realize them, flash! you see – not on any gradient but just suddenly say, "Well, there's no reason I should have to be located," and bang! you're Clear, just like that, you see.

These are the thoughts that you think you should be able to think. But of course, you set all these other things in motion every time you think those, but then you stop them if you have an allergy to motion. See, so you think, "Well, I ought to be – why, I could be cleared, very easy, all I have to do is get the idea that I don't have to be located." Diiing you see, and things go bzzuuup and bzzuuup, and you don't like all that motion, so you say, "Stop." And also you stop it because you don't know what was moving. So there's again the unknown and the motion which blocks the road out to the release of a concept.

Now, you go a little bit further than this, and it must have been some kind of overt to locate thetans. And all of you must have been busily locating thetans madly, viciously, and so on, in order to pile up enough overts that the thing would stick with you to this degree, you see. Well, that's all very fine, but this must be prior to the overt act-motivator phenomena. So you think the thought and you run into the overt act-motivator phenomena just up the track a ways, you see, bang! And you try to think the thought again or the concept of "Well, I don't have to be located," and bang! you get into the overt-motivator phenomena. And that is another blocker which is a cousin to what I have been talking about.

Now, you could run somebody: "Think of locating somebody. Thank you. Think of locating somebody. Thank you. Think of locating somebody. Thank you." For a little while, why, the thetan says, "Gee," you know, "that was good of me, you know? This old lady. she couldn't cross the street. She didn't know where she was, and I told her where she was, and, ah, that's nice of me, you know." And he gets all these "nice of hims," you know, and these "nice of hims" and these "nice of hims" and then he finally gets nailing this fellow down, you see, to this plank, you see. And "What's this? Well, I – I don't know why this fellow's being nailed down to the plank. I didn't have anything to do with it. Actually, my men wanted me to do it, and I didn't have any choice. No, I didn't have anything to do with it. It's torturing him
for some reason or another," and all of a sudden it dawns on him, "I'm locating him. But they – they wanted me to locate him. I – I didn't have anything to do with it myself, you see. I'm just an innocent bystander. I was an officer on this ship, and the crew had mutinied, I think. I guess. And that was why we were nailing this fellow down, I suppose." So you get this and then you get another one.

"Well, as a matter of fact, that – that – that's locating somebody. Yeah, I can get the idea of locating somebody, pretty vicious, you know. Get the idea of locating somebody. That's pretty mean, you know. Get the idea of lo – . Gee, that's mean, you know."

Then the fellow goes into a total dispersal on the whole thing, and he himself can't feel he's located anyplace, and he becomes very difficult to audit. In other words, it's not a very good track for auditing, but it's just a potential road.

It's one of these potential roads that is very nice, that you could drive from – straight from here to Italy with no difficulty whatsoever on a straight line. You wouldn't have to mind falling off many precipices, or running head-on into any mountains, you see, or drowning in any rivers. If you didn't mind that, why, the best way to get to Italy, you see, is just to drive straight to Italy. You take somebody who has a tremendous allergy to unknowns and tremendous allergy to motions, combine these things and then ask him to run one of these senior concepts, you see – and of course, he'll run into the other one all the time and bing-bang.

Now, the reversewise works: If you've got the unknownness and the motion allergy is cleaned up pretty well – which of course cleans up valences and gets him in his pictures and all that sort of thing – why, then, of course he starts reaching back and changing his mind concerning these various things. And we get back to Change of Mind Processing.

And the route we're looking for is the route to just change of mind. The thetan can change his mind, and that is it. He just gets another idea about it, you see. He just as-ises the idea he's got and gets another idea about it and he feels fine about it.

Well, what booby-traps this? In the first place, he must have escaped from innumerable pictures and he's off-track in numerous places, and he doesn't have a concept of where he's been or what he's done, and the unknownness of that must be very important because actually he does have the – he has set the example to himself of having escaped from these things, so therefore they must have been dangerous.

You get how he proves it to himself? He proves it to himself reversewise. "I ran away so it must have been rough." See, it proves the point, see. If he ran away, it must have been rough. Not, it was rough, so he ran away. You get the idea? But, it must have been rough because he ran away. And he's also always proving these things to him. You say, "My God! That must be a terrible engram! Prima facie evidence: It must be a terrible engram is because I can't get in it. See, I'm outside the thing. I'm not in my own valence in the engram, and it's way over there, and it just must have been a bitch kitty. This must have been a rough-rough. There must have been nothing there but big jagged rocks being pounded on somebody every three seconds, you see. Shame, blame, regret and degradation are being poured into that area with coal shovels. That's obvious. Proof of the thing is I'm not in it."
Now he gets in it and he finds out that nothing happened. Yeah, there wasn't very much in it. He just struck it at a time of life or a frame of mind when he thought unknowns and motion were terrible. And so therefore he didn't want anything to do with it, and he didn't want to be in it.

People do not escape to the degree that things were dangerous. These are not proportionate statements. You know, the more dangerous a thing is, the more escape you will have from it. You get that? That doesn't work that way at all. The most dangerous thing there is, is war on this planet, for sure, in terms of human activities, and yet you never have any difficulty getting people to sign up to fight a war. That's interesting, isn't it? And you never have any difficulty getting contractors to build things for war. So what does this mean?

Well, the most dangerous activity man engages upon has the most recruits. Well, this is kind of backwards, isn't it? It's – then it's not true that man escapes to the degree that things are dangerous. He escapes to the degree that he conceives they are motion-ful, that he doesn't like – motion-that-he-doesn't-like-ful – and the degree that they are unknown.

Now, actually a war may be very dangerous, but it's fairly well known. Man, you've got sergeants and captains and generals and general staffs and governments and presidents and kings, and so forth, and their whole effort is to locate you.

And the whole effort of the enemy is to dislocate you. So you've got an effort to dislocate being resisted and an effort to locate being obeyed. And, of course, danger hasn't anything to do with it at all. It's just the degree of location involved with it. And of course, you get all kinds of recruits for a war. You could probably dream up and synthesize another activity that would be just as attractive as war if you put your mind to it.

It would have to be something where you were supremely well located. Marvelously located. You'd just have to fix it up so the guy was – could locate and was being located. Known whereabouts, you see. Known whereabouts. Known whereabouts. Known whereabouts. You just have to play that one off the middle with efforts to make the whereabouts different. In other words, to fix and unfix. The whole idea of power – this is an old one from way back, Phoenix – the whole idea of power stems from the ability to hold a position. All power derives from the ability to hold a location. When I say position, of course, that gives you a double entendre. It's location. The base is what derives power to the electric motor. It is the base. It is not the spinning armature – armature. It's what keeps positive and negative separated that is deriving the power.

Now, you can conceive an electric motor with a positive and negative terminal in the thing that would have enough rotation through magnetic fields applied to it that it would collapse its base. Now, you've got two little things, and they're sort of pinned up there on little weak pot metal. There are two heavy magnets pinned on weak pot metal pins, you see. And you get positive and negative going between these two magnets at a hell of a rate of speed, you know. You turn your armature through the field and those two poles will collapse on each other.

You take a powerful magnet, and the reason things come to a powerful magnet is to the degree that it can stay still. Otherwise, your magnet will race forward toward the thing. These are various laws in the fields of mechanics which actually derive from the ideas of
thetans. All mechanics derive from the ideas of thetans. All matter derives from concept of thetans, and the behavior of matter is based entirely upon how a thetan thinks it ought to behave.

Chemistry is very interesting. There isn't a single product that doesn't have a set of postulates connected with it. There isn't a single chemical compound or a single chemical element that you cannot take apart into the number of postulates that the thetan put in it. And you can find out what the postulates of it were. It's quite interesting. An interesting study.

No more of that. That's rather dry.

The idea of holding a base or holding a situation. All right. There's these – a body of troops is holding a hill and they cannot be dislodged. Well, the degree they cannot be dislodged does not have anything whatsoever to do with the number of troops on the hill. It may be influenced by that, come to think about it, but that isn't actually it. It's whether or not they believe they can be dislodged. That is the first requisite and whether or not they have enough weapons of one character or another to resist dislodgment. It only takes one man to fire an electronic cannon.

Now, you need lots of men to the degree that the hilltop can be approached. So the power generated by a body of troops on a hilltop is totally dependent on their ability to make the enemy hold his position, and their own ability to hold their position. And that body of troops actually has to take responsibility for holding the enemy where they are. And bodies of troops almost never take this responsibility very wholeheartedly. They think they will shoot at the enemy if he approaches. It never occurs to them too much – although this is part of tactics, strategy – to pin the enemy down where he is.

Now, of course, they have won the war to the degree that the enemy cannot advance and that they can continue to hold their position. Wars are won on the basis of held positions and dislodgments from positions.

Now, countries look very weak after wars because one of the countries has dislodged the other terminal, and there's no power resulting.

The whole subject of electricity, flying saucers, the electric motor that turns over your fridge, whatever is running your automobile is merely based on the ability to hold a location and to resist an encroachment upon the location. You look at an internal-combustion engine in this wise, and you learn a great deal. Of course, the pistons are trying to blow the crankcase down, you see, and the crankcase, however, is held up with bolts, and the crankshaft goes zzzzzzz, you see. It doesn't go psst down, so this must be the thrust bearings and the main bearings, and so forth, of the crankshaft that are holding a position, and the piston isn't holding the position, but it's being dislodged, but there must be something that keeps it from coming up all the way, you see, and something that keeps it from going down all the way.

You'd normally conceive that the power of an engine is based upon the thrust of the piston. And this is the way they normally calculate the power of engines, and that isn't why the engine is powerful at all. It's the degree the base can be held and the amount of effort that can be applied to dislodge something from base, and then the amount of effort that this base has to resist being dislodged, and it's an interplay of held positions.
And if a mechanical engineer were to look over motors from this exact way, he would arrive with very advanced power plants of one character or another. It's the ability to hold things apart and the ability to thrust them at each other while holding them apart, and so on.

You always get generated energy by thrusting something at something that will not move. If you don't believe it, start an argument with somebody. The power of the argument is totally proportional to the degree that they won't relent, you see. Well, you'll see actual power being generated. It can get pretty sparkly, pretty sparkly.

All you want to do, if you want to keep generating sparks, why, just keep pressing against the held position. And of course, you know how to settle any argument: in the final analysis you could always run away. Can't dislodge the position so you could always move off, and of course that – there's no more power being generated. You see how that would be?

No more power being generated at all. There's no more argument. Nobody's shouting. Nothing happening, and so forth. You're just gone. You were one of the terminals, you see, and you were holding a position there, too. So you abandon the position, and you don't have all of this upset. All you have after that is detached pictures. [laughter]

Now, a thetan's friction with life and his crush against life, and life's crush against him does generate energy. You know, he himself has got masses of energy, and he is holding a position, and so forth, and that's where the energy basically comes from. But you want to know where a picture comes from, the characteristics of pictures and masses and all that sort of thing, well, they're to the degree that he is resisting a position. Therefore, if you want to get a three dimensional picture in some pc, which is 3-D in solid, man, solid, well, get a time when he was ... Well, I'll give you an example. I had a good subjective reality on this.

A company of men lined up in company front firing at a company of men lined up in company front. Neither one of them giving way. They just stood there for hours and fired at each other. And boy, the fronts of those uniforms were just absolutely solid, all standing-wave electricity, of course. They thought it was guns that was generating the power in the battle, but it wasn't at all. It was these two bodies of troops confronting each other, neither one of which would give away, both of which were trying to drive the other away, you see. And neither one of them was driving away. And it was pretty combustible. And of course, when you run into a picture like that and you start to run the picture like that, the thing actually develops a considerable amount of zing.

See, there'll be all kinds of electricity running around, and you'll see it register on your E-Meter. The effort to hold a position.

All right. If you want to see an E-Meter go bing-bang, take somebody that is real to the pc in this lifetime. And then find an argument between the two. And you'll get the same phenomena and you'll get a discharge of energy, and that discharge of energy will be registered on your E-Meter. The study of the mind goes in, unfortunately, without – and you don't have to feel bad about this and think that you should learn more about this. Girls are very – mostly upset by this.

I start talking about electric flows and so forth. And I'm inferring ohms and ergs and all that sort of thing, and girls get rather distressed. They think that, "While I was in physics
class I got A on all those things, but I didn't understand any part of it. And I don't have much
to do with mechanics." And they start thinking. "Well," rather sadly, "well, I can't really grasp
this because I don't know much about electricity," and so forth. They back down on this par-
ticular point, and they think that in order to understand Scientology, they have to know some-
thing about electricity, physics and mechanics. Well, I'll let you in on something. I'll let you in
on something.

In order to understand something about electricity, and mechanics, and ohms and ergs,
electrical engineers would have to understand Sc ientology. See, it is a completely reversed
idea. But a girl in this particular lifetime is not too much or too averagely dedicated to knock-
ing guys' blocks off and knocking positions out and holding the front line trench, and so forth.
They haven't been doing it for a few centuries and are out of practice. And so they think that
the subject of power or force is something that they shouldn't have too much acquaintance
with. And that's about all there is to it, is they're just out of the habit. And this is why they
say, "Well, I really ought to know something about this but he's now talking about something
very technical that I really shouldn't know anything about," and that isn't the case at all.

I think that girls in this particular society probably generate more power and more
sparks than anything else. Kipling's comment upon "The female of the species is more deadly
than the male." I would amend this to reading "The female of the species generates more
sparks than the male." There's nothing like a girl who just can't seem to get a different idea in
her head and insists on hanging on to that one particular timeworn idea. You can explain to
her inevitably and at long length how that idea is moldy and went out of style and it hasn't
been worn in Paris for generations, and so on. And you can go on, and you can get quite elu-
cidative on the subject. You can flower it up and use rhetoric and threat and so forth. And she
finally succumbs, and that's too bad, and it's all set now and we've now agreed, you see, until
the following morning when she brings up this idea again, you see.

Yeah, there's an awful lot of energy hanging around one of those things. So don't think
that a girl won't hold a position or try to drive somebody else from there.

No, a thetan will do it, male or female. And banks have energy in them and are
charged. And a person has masses in his bank and is being bothered with masses to the degree
that he has experienced this interplay of energy motions and has tried to hold positions and
knock people off positions, and so forth. And you will get resultant bank. I mean, that's all
there is to that. A bank is a sort of a mold of what you were trying to hold a position against
or a mold of what you were trying to dislodge from position.

Well, of course, when one is dislodged from position, in actuality, even conceptually,
the person then dramatizes this to the degree of having a picture from another position. Now
do you understand where I've been going here?

So you'll have an out-of-valence view of the situation. And you'll see these energy
masses all right, but they're parked over in some safe place, and they don't have too much to
do with anything. And it's better just to have a picture of those energy masses, don't you see,
rather than to confront the energy masses. And you start to move anybody in toward this place
where he was dislodged or where he failed to dislodge somebody else from a position, you try
to move him in that with duress and command and hammer and pound and argue with him
and that sort of thing; well, that's what the substance was of the engram. So of course, it doesn't work. See, the more hammer and pound and duress that you put in to getting him to hold this position again, from which he can view the engram, the more you restimulate the resistance of the engram, the more you blow him out. It's very – see, it's very comprehensible. It's just a one, two, Q and A, direct.

But if you can take him on a gradient of what led up to this solid state, he'll find himself in it again. And when he finds himself in again, he'll find that these are masses of confrontingness, and the reality connected with it will be high, and so forth. And then he finds out that he did confront it, and then it properly gets into the thenness where it belongs and doesn't influence the nowness in which he is living, and the engram discharges. You see what this is all about?

It's actually a very elementary subject. And it just boils down to the fact that universes may be universes, I guess, but in actual fact thetans are thetans. And that is far more true, you see, than universes are universes because universes are simply the creation of thetans.

And if you can subscribe to the idea that you had nothing to do with the creation of the universe but it was done by a big thetan, [laughter] why, that's all right, but processing will catch that up, too.

Well now, in handling pcs, let me warn you against handling them with no idea of how a bank works. Two auditors, neither one of whom have any idea on how the bank works but both of them trying to find out how the bank works can probably audit each other rather successfully amidst the various ridges which build up, because one is trying to hold the position and the other is trying to blow him out of it. So they would probably get there nevertheless. But good skilled auditing toward clearing would have as a requisite some reality on all these points I'm making.

Now, the only realities you have to get on these points is just what is a bank, what's it look like, and what is out of valenceness – because anybody has out of valence spots on the track, that's for sure – and how does a picture look, and where would a pc be when he is down the track, you see. And do pictures run consecutively from one part of the track to the other, and is there a thenness as well as the nowness? And do energy masses exist? And what are these strange masses and feelings and sensations which the pc has around his body?

You have reality on those various things, and boy, you'll be able to audit.

You don't have to go into the esoterics of why they're there. You just have to get the subjective reality of the fact that they exist. And as soon as you see that they exist quite plainly, of course you are able to handle them, not only yourself, but you are able to handle them in somebody else.

Now, the oddity is that you can handle them in somebody else much more easily than you can handle them in yourself because you are not being affected by the various byproducts that the pc is being affected by. You see, it was the pc that was having the argument, and you were the – you're not even a party to the argument. So therefore, you can direct attention and see the reasons that the pc cannot see. The pc cannot redirect his attention because if he was totally regressed into the incident, his attention would be totally fixed in the incident, would-
n't it? But you didn't happen to be in the incident, so therefore it is very, very easy for you to
direct his attention in the incident because your attention with regard to that incident in which
he is in, is free. And oddly enough, the bank will always obey you much better than it will
obey the pc.

And these are the fundamentals of why auditing works. And this is how auditing
works. And if you don't know what you're directing his attention toward, or away from, and
so forth, you will occasionally make flubs, get into all kinds of tangled skeins of auditing, and
have to run ARC breaks; 99.44 percent of the auditing session will be devoted to present time
problems and ARC breaks. See, the pc actually will have as many present time problems and
ARC breaks as – to the degree that the auditor cannot direct his attention. The auditor has no
idea of where he is directing his attention or how he's directing the pc's attention or if the pc's
attention is being directed, why, of course, he has a great deal of trouble handling the pc.

Now, you have an idea of "Controlling the pc is very necessary to the conduct of the
session," don't you? Well, you just redefine what is controlling a pc beyond keeping his body
in a chair and keeping him from getting up. There is no other control of the body that you're
trying to accomplish or attempt.

It must be, the control of the pc is simply the direction of the pc's attention by the
auditor. And that would be the whole statement of how do you control a pc. Well, you control
a pc by knowing where his attention is and doing things with his attention, and of course that
controls the pc. And that's all there is to controlling pcs. You can go endlessly into the subject
and you won't thrash up any more data than that.

Well now, if you don't know where his attention is, can you control the pc? See, it
can't be done. So of course, then the pc is left to flounder on the track and flounder with this
and flounder with that, and his attention is not under any kind of control, and as a result, what
do we wind up with? We run – wind up with endless auditing. And auditing takes as long as
the auditor doesn't control the pc.

Well, when we say this, then it must follow that the auditing takes as long as the audi-
tor does not control the attention of the pc. To control an automobile on the road it is rather,
well, and you really should, know where the automobile is. Works much better that way. And
"in driving a pc," you might say it's much better to know where he is and where he's going
and what he's doing And a repetitive command will do a great deal. We shouldn't undermine
these things. It does a great deal. It is directing the attention of the pc left, right and center.
But also, the attention of the pc may be doing some other things which are rather fantastic.
And we have to find out about this.

And we're only trying to get the auditing command executed. But in order to get it
executed, we have to find out where the pc's attention is, and where the pc's attention is going,
and keep track on this.

Otherwise, he has the idea of running under a driver that doesn't know where the road
is, much less where the automobile is. Both are missing. And he sort of goes around, and he
goes through it, and he doesn't quite know. It almost might be enough simply to create the
illusion that you know where the pc is, and so forth. This might be all right, but there is actu-
ally no substitute for a subjective reality on what a picture is, what a real picture looks like,
what an energy mass is, what a track looks like, the sensation of thenness, and these little odds and ends of phenomena go along with subjective reality. Once you improve that, your auditing will go up in a steep climb like one of these new aircraft they're building over here. They don't take them off on runways anymore. They set them up on their tail and they light a match, and they go off into the sky. [laughter]

Okay? All right. Well, I wish you good luck tomorrow and this weekend. And you're overdue for clearing somebody, and I will have to have a Clear Tuesday morning. Okay?

Thank you.
Thank you.
Well, what's the date?

Audience: September 12th.

This is the 12th?

Audience: Yes.

Twelve Sept. 61 AD 11, more properly called.

Well, it's very nice to be able to come down, have a quiet cigarette and talk to you about nonessentials. [laughter] And to discuss a few things with you.

I have, actually, a complete new plan of clearing, which makes this a rather interesting day.

Practically everything that has been done or known in the last eleven years – perfectly valid. But an integration of all this material is periodically necessary because new discoveries are made and these lead to new simplifications. They don't lead to new complexities.

As you look over the history of Dianetics and Scientology you'll see a cycle is in operation. We get more and more complicated, more and more complicated, more and more complicated and then suddenly we get to a new, higher level of simplicity. And then this simplicity gets complicated and more complicated and more complicated and then we get to a new, higher level of simplicity. That's just a history of me outguessing you. [laughter]

Probably the only games condition which exists in Scientology is along those exact, direct lines. [laughter] Auditors can find more things to do wrong that aren't explained and you lay down new rules for these things, you see, and these new rules all become much more complicated and then they find new things which they consider vagaries or differences and then these become much more complicated. And then all of a sudden, why, a common denominator of all these things is arrived at and you have a new plateau of simplicity.

So we've been climbing a mountain which consists of a number of tables stacked up, each table higher than the next. And we have arrived at such a table. I can give you a new plan of clearing, which will probably be the title of this lecture. It's very elementary. Extremely elementary. It's Routine 3, just as you have learned it or as you haven't. And it is only possible because there is no shadow of a doubt now of any kind as to why people could not find goals readily and smoothly in preclears. The rudiments are out, that's all. I mean, that just
the rudiments are so wildly out that the goals submerge in their readings. That means it's very rough auditing has been the history. It means this auditing must be awful damned rough.

Now, a new simplicity has been found in that particular line: Why is auditing rough? Auditing is not rough because your TR 0 is out. Auditing is rough because you haven't a clue what a bank looks like, where your auditing is bad. I can make that just as a didactic, horrible statement.

The remedy for it is to give an auditor a reality on the bank. As soon as an auditor has a reality on the bank, ten thousand, seven hundred and sixty-five million rules all disappear. And he said, "Oh," he says, "that's the way it is."

He doesn't have time to think of rules when he's handling somebody's bank. He just doesn't have time, that's all. He's got to know. And he's got to be able to understand what is going on and if he understands what is going on, he does the right thing. And if he doesn't understand what is going on, all the rules in the world will not make him understand what is going on.

Well, that's a rather tough beef that you are suddenly assigned in Scientology and throughout the world. Because it means that the initial and basic auditing will have to be done by possibly the bulk of auditors with no reality on a bank. So that means that's going to be a rough spot, overcoming that, in any given area of the world. You've got a bunch of people, they're perfectly willing and they fumble around and finally one of them manages by some mystery and at vast torture of the pc to get the pc actually through an incident with good reality on the bank. After that, that pc will be able to audit. Now, that pc can turn around, of course and audit somebody else and give them reality on the bank. But what have you got now? That's an easy progress.

What is the first hump? The first hump would then be, with no reality on the bank, giving somebody a reality on the bank. Great!

All right, but that one has to be overcome. Now, there's probably a thousand ways that can be overcome, but it is the main point and that is the hump. That is the one where the wheels slide. That's the one where it's all grease clay as the jeep tries to go up. Do you understand? Once that one is overcome, the rest of it becomes very easy. I think we will get a lot of reality on that in very short order.

All right. So much for that.

Routine 3, in essence, remains unchanged. But that of course, Routine 3, simply consists of finding the goal, finding the terminal and giving the person Security Checks. Now, to that old Routine 3, we add this one: That we run some incidents. When? When the pc has been run long enough on the Prehav Scale that he's found himself in valence in several incidents and skipped handily and neatly out of them. And the way we handle that is very easy.

I'll give you that again in very, very brief review. And this time I will give it to you exactly as it would be done in an HGC. Exactly as it would be done.

Pc comes in, we give him the pc Assessment Sheet. We tie into them at once on a Goals Assessment: we have him bring in a list of goals. All right. We start a goals check. At
the same time, during a different period of the day, we do a Security Check. Only we do an ordinary, routine Security Check. On an old-time Scientologist we do HCO WW Form 6, old-time auditor Security Check. On a staff member we do some of these staff member checks. You're going to see them, more of them. There's more Security Checks coming out. There's even an Executive Check. But we do that kind of a Security Check.

What are we trying to do? Why are we doing this kind of a thing? We're just trying to get the fellow's withholds off so he won't blow. I'll tell you the liability of doing a bad Security Check or not doing a Security Check. Recently a girl in Johannesburg sat down in the HGC and the auditor read his ashtray and missed a withhold.

All you've got to do is miss one withhold as you go by and you've had it doing a Security Check. It's just no good from there on. The pc knows now that you can't find out and you've had it. You must get every withhold off of every question that is available at the time of the Security Check. Normally a case improves and more withholds start to appear.

That's the way you tell whether or not a case is improving, is whether or not you do the same Security Check again and find out he's now got more withholds. That doesn't mean that it wasn't clean the first time you did it. It merely means the case has improved in terms of responsibility and now has more withholds.

All right. This auditor sat down there and he asked something on the second dynamic and the girl said, "Oh, no, nothing like that." So he read his ashtray and he went on to the next question. And she went around telling everybody there was no such thing as Clears and it was terrible and she wrote lots of letters to people and she got very excited, she got very upset and there were all these rumors were floating around for a day or two or three. And finally our detective corps got into action, ran it down, found her, made her sit down in a chair, went back over the same Security Check, pulled the second dynamic withhold and that was that. Interesting flurry, isn't it?

Well, your pc will blow. All kinds of weird things will happen. The pc will ARC break. You'll get all kinds of upsets, and so forth, because you're not doing a Security Check.

So it's necessary to do a Security Check. That's the point I'm trying to make here. And it's necessary to do the Security Check well. And it's necessary to get all the withholds available at the time the Security Check is being done without going on to the next question.

Now, this means, with the routine I'm giving you now, that we're just returning to the old-time Security Check. It's just a straight Security Check. "Have you ever raped anybody?" and that's it. You get the idea? Asking it any way you can to get the thing reading and clearing up and getting off any of the material. Don't bother with Not-Know. Don't bother with anything on that Security Check. It's just a straight Security Check. You got that? Because I find out auditors can do that very, very easily and because the Not-Know version has now moved over into a tremendous difference [different] importance and I will tell you about that in a moment.

All right, we go right on and every session that we run this person in the HGC we just beat the rudiments to death. As of today you've got a whole new set of rudiments. They have come out in a bulletin and there's no reason for me to go over them right now. I've given you
more satisfactory rudiments. Having told you a few weeks ago that they were necessary, why, I got them in line and they're very good rudiments. They will clean up ARC breaks and they will do various things. All right?

There's only one difficulty. One of those rudiments will walk the person right straight into the engram necessary to resolve his case. That is, "What would you be?" and "What would you rather not be?" It - it's rather gruesome. So if "there's something wrong with the auditor" and you run that till the tone arm ceases, you will actually find the pc sitting in the engram necessary to resolve his case.

Anyway, that's beside the point. [laughter] It's just a point in passing. The rest of them have no great liability to them at all. And I have done the anatomy of an ARC break and I find out exactly what an ARC break is. An ARC break is the inability to tell an auditor. I don't care whether it was a withhold or otherwise and it isn't necessarily the auditor who is running the session. It's an inability to tell an auditor something. Inability. Not unwillingness. Inability. You pick up ARC breaks that go back for years with this exact process and the pc feels that the auditor has done something or has not done something. Actually the way it is given is "What has an auditor failed to do?" is the other side of the question. "What have you been unable to tell an auditor?" "What has an auditor failed to do?" Actually, there is a third question that can come up, which isn't mentioned in the original bulletins and that is "What did an auditor do?" You see? It isn't necessarily only what an auditor failed to do, it is also what an auditor did. So you ask these two questions. It doesn't sound like a dichotomy, but it is to the pc from the viewpoint of an ARC break. In other words, "What have you been unable to tell an auditor?" and "What has an auditor failed to do?" That is the way it is given. And that can also be "What did an auditor do?"

All right. Now, that will cure up ARC breaks. In other words, you can get the rudiments in and as far as present time problems is concerned, well, there's a new process for that and we won't bother to go into it because it's all in the bulletins.

All right. Now, there is a new set of rudiments. You can get the rudiments in. There is no excuse now for not getting the rudiments in. And it is very important while doing a Goals Assessment to get the rudiments in and keep them in, keep them in, keep them in.

Now, there's such a thing as middle rudiments. Not only end rudiments and beginning rudiments, but you have middle rudiments. Middle rudiments, however, don't get articulated as middle rudiments because what you actually do is end the session and give the pc end rudiments and then give him a break and then start the session by giving him beginning rudiments and so forth. But those two sessions are only five minutes apart and what it consists of is two cracks at the rudiments in the middle of the session. You get the idea? It's really middle rudiments. But it's end rudiments, beginning rudiments. You see that?

All right. While keeping these rudiments in gorgeously, you take that first list of 150 goals and you find the pc's goal in that list and don't monkey with it. Let's not go to 5,782 goals, eighteen weeks, rarr-rarr. To hell with this racket. That goal was in the first 150 goals. The pc gave it to you. You've got it. Now, what can get in the road of these things? Rudiments. Pc's got a present time problem. I'll give you one right here. (Person is present, but I don't care.) Pc was being audited on the second deck (for the benefit of Americans, that's the
third floor) and [laughter] – that's right. They have a ground floor, first floor and second floor in England. And that's because, I suppose, at one time or another there was a floor tax. But anyway, it's actually the third floor and it was fairly high and the pc could look sideways out onto the terrace. And the terrace was a long way down and the pc was so afraid of height that during the entirety of the Goals Assessment only this goal would come up: something to do with not falling, whatever it was. Some oddball goal that had to do with not falling on her 'ead or something That's the only one that would come up.

Well, why do I have to furnish all the genius? See? You have some latent quantity of genius back on the track someplace, dig it up, man. [laughter]

So I suddenly said, "Well, this is odd." That I got the report that had nothing to do with this, but the goal was something to do with falling and every time the pc was checked out on the goal the goal wouldn't stay in. So I said, "Well, where is the pc being audited?"

"Well, the pc's being audited on the second floor."

"Where's the pc being checked out?"

"The pc is being checked out in the basement." [laughter]

So I said, "Well, audit the pc in the basement." So they did and they found the pc's goal. Which wasn't "falling." Had nothing to do with falling.

*Female voice:* It was the first one on the list.

You see how this thing would mess up? Well, there's all kinds of screwball things, but do you realize that should have showed up as a present time problem every session? It should have shown up on the room. "Is it all right to be audited in this room?" Well, every time, if anybody had been looking at the meter, he should have been able to read, *pang!* "No, it's not all right to be audited in this room! This room is several feet above the height where I like to be." See? Should have shown up. Present time problem. Should have shown up. "Do you have a present time problem?"

"Yes, I'm scared I'll fall out the window. We're already ten feet from the window, but I'm liable to pitch out of it at any minute." [laughter]

Had absolutely nothing to do with the pc's assessment. It just had to do with the pc's case. See? Assessment's different than case.

All right. Now, let's take a look at this. It means that any pc goal can be found in the first 150. And it takes me an hour and forty-five minutes, so you shouldn't take more than fifteen or twenty or thirty hundred hours. [laughter] Sarcastic, huh? But that's only in revenge because all summer long I haven't been able to figure out, "What's all this?" See? "What's all this? What's all this? Why this long, long, long Goals Assessment?" Well, it just boiled down to just one thing: rudiments were out. Every pc on a Goals Assessment being run with the rudiments so badly out that the goal disappeared.

Now, a goal is very easily invalidated. Very easily knocked in the head. And so is a terminal very easily invalidated and knocked in the head. So you've got to have these rudiments clean as a whistle in order for the thing to emerge and keep on reacting. That's as sim-
ple as that. Pcs are delicate on the subject of goals and terminals. But you can find it providing you don't knock the rudiments out and providing you keep them in.

So, all right. This pc is put immediately into a Goals Assessment. And we find the pc's goal and then we put him into a Terminals Assessment and we find the pc's terminal. This is HGC auditing I'm still talking about. Anything odd that is coming up about this, it all centers around the rudiments.

The rudiments – there aren't – there aren't more rudiments that you should get in. There are just those rudiments which already exist in Model Session even though they have new processes to run them. Nobody has changed the number of the rudiments. The last addition was withholds and it looks like that's static from there on out.

All right. This means, then, that a pc would not be audited on 1A or any other breed of process which is preparatory or anything else. You just audit them into the goal and the terminal. When you have the pc's goal and the pc's terminal and when these have been proven up totally, checked by another competent person... Always have your goal and terminal checked by some other auditor, no matter whether you're in an HGC or otherwise. And the other auditor should simply check the rudiments and if the rudiments are out go no further.

The way you do a check like this, you just check the rudiments, you don't run them or get them in on yourself, see, if you're checking some other auditor's. You then pass the thing back to the original auditor and say, [whispers] "Your rudiments are out, and when you get them in, I will check the goal and terminal."

And he says, [whispers] "Oh, well they weren't out for me." You can always – always depend on him making that remark. "They weren't out for me!" Well, maybe they weren't out for him but they were out for you doing the checking. And when the rudiments are then put in, the pc is turned back for the goals and terminal checkout. Okay?

Okay, if there's something odd about it and they're going out and they're going in and the auditor hasn't been sure and he's sent the pc to you with two goals. You say, [whispers] "There are two goals reacting. End of check. When you have one goal reacting I will check it out."

Same way with terminals. If he turns a pc over to you with two terminals reacting and doesn't know which one. You say, "Well, after you've got them flat, I will check this out." Simple.

That's the way you do one of these crosschecks. You don't audit the pc. You find out what should be done with the pc in order to check it out. Don't you see? And then you get the other auditor to do it whose pc is that. Otherwise you get cross-transferences and all kinds of oddball phenomena.

All right. When you've got the pc's goal and terminal and when the pc has successfully completed the HCO WW Form 3 Security Check, you will have a Release on your hands and that is all there is to it.

So redefine the definition of Release. You cannot have a Release who has not found his goal and terminal and who has not completely passed through the most vigorous of the
Security Checks. That is not the basic definition of Release and that is not in its original intent a Release. That is just meanness on my part. So just assign it to that. Because you cannot guarantee any stability on a pc whose goal and terminal have not been found. So therefore, you cannot say that the pc will hold that state at all. You see? But if the pc's goal and terminal had been found, even though no runs have been made on it one way or the other, you have already changed the living daylights out of this person. This person now knows they are going in some direction or another and you can say safely, "Well, the person's a Release." Got it?

So it doesn't take very long to make a Release, does it? Remember, a Form 3 Security Check, totally completed and the pc's goal and terminal found.

Now, you'll find out that along about this state, and along about this stage, they don't want to pause long enough to get checked out for Release and other oddball things of this character. They will go right straight on along the line. So we're not going to worry about this particularly.

But supposing somebody was in the HGC and they could only be there fifty hours and the D of P had been careless with auditor training and the Assoc Sec had been careless with auditor training and the HCO Sec had been interested in the congress or something like this and it took fifty hours to find the goal and terminal and complete the Security Check. Well, and the person has to go now or something like that. Well, you can at least give him a Release certificate if these things have obtained. If they are correct. So that gives you something you can do there.

But mind you, everybody would have to be sort of asleep at the switch in order for this kind of a condition to obtain. Don't make any mistakes about that or settle for the fact that fifty hours to finish one Security Check, do a Goals Assessment and a Terminal Assessment is anything like good, fast technical auditing. It isn't. But at this time it's acceptable. It's acceptable as of this time. Why?

Because we have an awful lot of people around with no great reality on the bank, don't you see? And we have a lot of people around who are studying at the same time they're doing and all this kind of thing is going on. So you can expect this sort of thing to happen. Okay? All right.

Now, we've gotten this fellow this far now. We've got a Security Check – and, by the way, the Security Check doesn't have to have been completed by the time we start running the goals terminal. The Security Check is just something we do as industriously as we can do and devoting as much time to it as seems natural, but devoting never any more than fifty percent of one's auditing time to the Security Check. You see, that's the maximum, and the minimum would be one hour in five. So you've got a maximum and minimum for how much to security check the pc.

Now, if there's a hell of a hang-up in this case one way or the other and the case has been around for a long time, you, of course, do more Security Checks. The way to solve a case that is obviously hanging up on the goals-terminal setup is more Security Checks, done better. You understand? Don't just keep slogging at them with goals and slogging at them with terminals or something like that. Let's get down and get smart with Security Checks. Let's find out the actual conditions where this person ran into Scientology. Let's find out the
actual circumstances of this person's association with what's happening. And then let's security
check accordingly. Got the idea?

Well, let's say we found out this person had been around an aunt who was interested in
Scientology for five years and herself was never interested and then all of a sudden one day
came in for some auditing oh, this sounds awfully interesting. What was going on during
those five years? And we're liable to get all kinds of upsets, resentments, negative postulates
with regard to Scientology. You see? And the whole thing is holding up. It's all a holdup from
here on.

See, all kinds of things like this can occur. So if there's holdup, look in the area of
withholds via Security Checks. Even if you have to tailor up some kind of a special check for
processing. You understand?

A person – you'll get cases like this. You will get cases like this. A person has been an
assistant instructor in psychology for the last eleven years and suddenly has come in for some
processing. You'll get cases like this. Every time a ship is going to sink, why, just look at
those hawsepipes, you know and those mooring lines and you'll see shadows on them.

But eleven years? Hey, wait a minute. He's heard of Dianetics, he's heard of Scientol-
ogy, he's heard it lambasted. He himself has engaged in some of it or he has been in a "Well I
don't know, I keep an open mind." They do, they do keep open minds, drafts go through them,
and ... [laughter] Well, look at this. Look at this. The guy's actually hung up on his own overts
of some kind or another.

But I wouldn't bother too much with this. Just except in the normal course of auditing,
it suddenly looks like this person is hanging up badly with goals and terminal. Well, the ru-
diments are out and let me point out something to you: that withhold is part of the rudiments.
So to get that one in, you sometimes have to be a little bit extraordinary if the case is hanging
up badly. And you have to actually look over the circumstances and conditions of the case in
order to find out what kind of withholds the person might possibly have had during a period
of time. Hm? You see that? Is that very evident to you? Yeah. The person isn't coming into
session because somehow they've forgotten all about it but, at one time, you know, something
was going on and so on.

I saw a case held up on this instance. This was a very interesting instance. A fellow
and his father. And Dianetics: Modern Science of Mental Health had come out so they both
read it – you know, read it, read a couple of chapters and decided to try some auditing. So one
audited the other and then the other audited the one and then they both agreed it didn't work.
Then the person went on and read the book completely and came in and got to be not too bad
an auditor and went on for years and years and years, but his case never moved. It was the
weirdest thing.

And then one day an auditor – very, very smart – got the earliest overts on Dianetics.
And that was it. Both he and his father both agreed that it was just bunkum and it didn't work.
That was enough. And it had actually held him up in processing something on the order of a
thousand or fifteen hundred hours' worth. How do you like that! And all of it was being done
across that basic postulate on the subject and of course, it never worked either. Grim, huh?
I get a letter from somebody every once in a while that is lambasting HCO and screaming about things being returned and all kinds of wild things occurring. And I'm saying, "Well, I wonder who that person's auditor is?" Because this person has just fixed himself up but good. I get them in every once in a while. Has nothing to do with us, particularly, but there's a person chattering around madly, lambasting everything in all directions. And, of course, it's usually a totally uninformed lambaste. Oh, we do lots of things that could be criticized, there is no doubt about that whatsoever. You handle this much volume, you certainly are going to make some mistakes, but they're very seldom intentional mistakes. Now, here — here's just a bunch of overts.

Now, somebody's going to get that person and they're going to be in session, they're going to be trying to find their goal, and remember it's the goal that's submerged. Ordinary auditing on a chronic somatic or something like that or a present time problem, this will all work, you see. But the goal is delicate. And it can actually submerge or disappear on this kind of a background of overts and withholds. See, that's all it takes. Interesting, huh? And unless you get that straightened out, you're not going to find the goal and terminal. Okay?

All right. You've gotten up to this stage now, you've got a Security Check done or in progress. You've got the goal, you've got the terminal of the pc. Now, what do you do?

You assess it. Now, let's enter into another very factual part of this particular rundown. You assess it on the Prehav Scale, just as always, doing your good assessment, running from the bottom — the lowest point of the Prehav — on up to the top, and then marking those points that reacted on the needle and then going back only over those points which reacted and marking again that they reacted on the way back and now taking up only those that have reacted twice (now got two dots after them) and separate those out and we'll wind up rather rapidly with the proper level. That's very easy. And we run him, just as before, five-way legs, and so forth. And we run this pc.

Now, I don't care how long we run the pc. It hasn't been established yet how long you should run the pc. But this must be very, very, very clearly understood. When we run the pc on the process, we must include in that statement that the pc is doing that process and not something else or something also. You see? When we talk about a run on the process, we include in that that the pc is doing the process and not something else. You got it? In other words, we actually process this pc.

Now, at this stage of the game we don't care whether he's in valence or out of valence or anything else. We're not worried about that or interested in that.

But we go on and we audit him very happily and cheerfully and time goes on. We might run him this way for, heh, ten, fifteen, twenty, twenty-five hours. He's making progress the whole way. Don't think about that for a minute because he is. But at some time, the exact method of determining same cannot be laid down at this moment. I suppose it'll emerge one of these days with a whole new series of complications. At some stage, why, we assume that he's been through some pictures. He couldn't have helped it, not with the Prehav Scale and so forth. And we probably will have run an emotional level and we will have run some odds and ends. I mean just on your ordinary assessment, flattening your levels. And now we're going to ask this pc a burning question. And if we ourselves have not had an engram run and have no
reality on the track and never been through one from Hell to Halifax and don't know it, we're now in trouble. We're now entering the land of never-never. Now, we can make more god-damned mistakes and upset more pcs and get more ARC breaks, and so forth, in this exact stage I am talking to you about, if the auditor hasn't got a tremendous reality on the situation, than I would care to list in a long Encyclopedia Ron-on-ica.

The only solution for it is as soon as possible yourself get some reality on this thing I'm talking about. And after that you won't be going into the theory-theory of it all. See? Because it just is what it is, that's all. And with Not-K now versions and the Forget, Not-Know, Unknown types of commands we chuck him into it.

Now, this is the exact way we do this. We ask him if he's had any pictures where he himself was in himself looking at the things that were going on around him. And we check these over very carefully and we ask him very searchingly about all these things, and we actually determine that there probably have been by now two, three, four, five or maybe just one picture in which the pc was in himself and something was going on and that answered the Prehav level command. And so he answered the command out of that picture, maybe once, maybe twice and that was it. But that picture existed and he was in himself.

Now, we're going to count those up, find out how many of them there were and we're going to assess them on the meter. And we're going to take that picture which produces the greatest needle reaction, because that is the picture which can be run.

And then we are going to roll up our sleeves and getting the rudiments in very nicely and finding out if all is wonderful in all directions and we are going to run that picture with Unknown, Not-Know, Shouldn't-be-known, all the rest of the categories.

And you're going to come along and ask me what are the commands that you should use for this and I'm going to respond – I hope I, my patience holds out – I'm going to say, "Goddamn it, get one run." And then you won't be asking me how many repetitive commands of this, that or the other thing. It's the number necessary to resolve that particular phase of what it's all about. Do you understand?

And you're going to get that picture run from beginning to end and all of it complete and all resolved and that is going to be that. And then you're going to find the next picture. And if there is no next picture, if he's only had one, you're going to have to give him another five or ten hours of Prehav run. Got it? And then you're now going to have another assortment of pictures. And you're going to take them apart like – just like I said. Got it?

And then you'll find all of a sudden the case starts to accelerate and the terminal blows and you're going to have to find a new terminal, but you can't find the new terminal because it's gone. And then you're going to have to find a new goal and then the new goal goes. And then the pc is going to be hung up in another picture and you're going to have to remember that and run that thoroughly. And then try to do another Goals Assessment. And then you can't find the goal because they keep blowing. And then you can't find the goals and they blow and you can't find any more goals. And meantime, you're trying to do Security Checks and the pc is doing them on a whole track basis. And you're in a mess! Next thing you know the meter's broken. [laughter] Won't operate. Won't operate. You could ask him questions and the needle just floats.
And you keep this up, actually, for a long time. And you try to locate any residual pictures and so forth. Keep on trying to audit the pc. You got the idea?

The end product of all auditing is fruitlessly trying to audit the pc: pc is cheerful, the rudiments stay in, everything is going along gorgeously, the pc stays well in-session and the meter's busted. Once in a blue moon the needle reacts. And yet when it reacts now you generally will have an incident of some character. And you run it just the same way that you ran the other incident. You're locating odd bits of track that are still extant.

Now, the length of time necessary to stabilize a Clear has not been established. But I'd say the only safe figure is, after the person goes Clear, at least another twenty-five hours of auditing and preferably another fifty. You've got it made then. Audit the twenty-five or the fifty hours with your broken meter that won't work. Got it? Because they will run into things and they will run into incidents.

All right. Now, there is a new plan of clearing, now. You'll find that is a much more rapid, much more factual plan of clearing. And it comes up and confronts for the first time the fact that an auditor must handle incidents and that the Prehav Scale will not handle incidents, except on a run of such tremendous length as to make it unprofitable. To shorten up clearing, you've got to handle the pictures they're stuck in. Okay?

Now, that is the setup. And that will clear. And that will clear fairly rapidly. The goal will be found as rapidly as the rudiments are in. The terminal will be found as rapidly as the rudiments are in and the pc will run as smoothly as he's got his withholds off, particularly in the zone of Dianetics and Scientology.

And then in running it, there is a point where running generally on the Prehav Scale ceases to produce much of a result. And that is because the pc has been in and out of one, two, three, four, five good solid 3-D pictures of one character or another and he actually is now hung up in every one of them. He feels much better, maybe, but he really is hung up in every one of those pictures and the easy way to get out of it is to run them.

And if you yourself have never seen a picture and you're trying to run somebody who has a picture, you're going to be sitting there trying to run TR 0 and thinking about giving the proper acknowledgment and how do you get in a bridge and you're going to be thinking about all these things. And hells bells, you shouldn't be putting in any bridges. You shouldn't be doing a thing but just in there pitching with the pc, you see and taking his attention and shifting his attention around and running the various phases of it all. Now, that's what you ought to be doing.

And you'll see at once the folly of putting in a bridge because you're going to run a different command. You've been running "What is not known about that incident?" and you're going to shift to "What is not known to others about that incident?" And you go and the wheels creak and if you have never yourself been through one of these things, why you're liable to put in a bridge and yank the pc's attention out of it all and fiddle with the E-Meter leads and worry about a lot of things, when all you ought to be doing is just simply say, "Well – here's another version of this command now and – What shouldn't be known about this to others?"
"Ah, well, that's so-and-so, and so-and-so," and the pc's right in there pitching, see. It's just smooth as glass.

And then eventually when you get to be an old-time expert, you will be able to do such things as we have learned over the many years, as you find out there's a hell of a fall in this thing and you know at once that the way to resolve the fall is to put the pc at the bottom of the fall and make him fall to the top. And after you've done this four or five times then he can complete the fall down, but until you do this he very often cannot fall. Why? Because his resistance is against falling. And his resistance against falling is run out by making him fall in reverse. Sounds weird, but that's very good.

Pc is going around in a circle counterclockwise, why, make him spin the engram reversewise. And you'll find out the engram will spin ten times as fast reversewise and this will be very, very funny. The pc won't comment on it's being funny but you've got all the resistance of going forward on the spin. Don't you see? And you can't slow up that resistance. And after that, why, the spin runs out. It's very simple.

And then there will come a time in the engram when you will say to yourself, "Well now, Ron said you had to run Not-Know on this and that's all you're supposed to run." And the pc will tell you there isn't anything else unknown about this whole ruddy, cotton-picking engram. And you'll keep on saying, "Well, what isn't known about the engram?" And, of course, he'll come right out of session and you'll have had it.

Now is the time you've got to run the "knows" out of it and run through it a few times. Just let him talk to you about it and the engram will just discharge from a certain point. And it just discharges from that point there on out, providing you keep the pc's attention on it, keep asking him questions about it and letting him tell you all about it and adding it all up and how it got that way, and so forth.

Now, that is the running of engrams in clearing. Now, why is this all of a sudden so important? Why do we make this shift? It isn't much of a shift, actually; it's a simplification of what we're doing. Why?

Well, I'd better give you this why now so that you won't be asking me again – you can if you want to.

Well, I've learned something new. I've learned that a somatic cannot be unburdened. Hmmmm. A somatic is where it is at the tension and velocity that it is, and it is nowhere else and is totally independent of all other incidents. I finally got the gen on it. A somatic is where it is on the track and is what it is and discharges only as what it is and not as any lock or any other additive. And a somatic, no matter how thoroughly it has been unburdened, will come on with the same intensity when you find it where it is. And that all the pc's hidden problems and present time problems of long duration stem from the first engram that you will be able to contact and run after the assessment. All the pc's chronic somatics and difficulties are in the first one that you will contact. Contacting it just as I gave you just a moment ago and sorting it out. You'll find all those – all those somatics and everything else, and so on. Nothing under the sun, no generalized process has ever made them less. They've put them out of the way and they've kept the pc living, but when you finally contact them again in the actual incident
where they reside, they are just as tough as they were the first time. And they are there and they are rough and you've got to run them through.

And when you discharge that engram, the pc's present time problem of long duration will vanish and that is the only way that thing can be solved. And I know that's very adventurous for me to say so but in actual fact it's true. The is-ness of the situation is in the time and place of the situation and nowhere else.

Of course, one could have concluded that years ago, but we do have success in unburdening, we do have success in doing those other things. And isn't it interesting that after we've done all these things, we go back and find the exact incident from which it all came and find it just as rough in that incident as it ever was. And then the whole thing blows up and that's it. It's still the engram necessary to resolve the case.

All right. Let me give you another datum here. The engram necessary to resolve the case didn't resolve in 1950 for one very excellent reason. The only reason an engram never reduced when run was because it was not on the goal-terminal line of the pc. It wasn't an earlier incident. Earlier incidents supported it and so forth and you could undercut it, but the engram necessary to resolve the case is on the goal-terminal line of the pc and unless you've found the goal-terminal line of the pc, the engrams aren't going to reduce rapidly. And if you find the goals-terminal line of the pc you're in for an hour's run. And if you're not on the goals-terminal line of the pc and he's not in valence, you're in for seventy-five hours to no reduction. Now, that's something to know, isn't it?

So, of course, the engrams that come up by running the Prehav Scale are the engrams that will resolve within an hour and they're very resolvable. They're not dependent on anything else. The somatics in them blow and everything else goes and the motion in them runs and all the difficulty you've ever had running engrams disappear. Because you've got the engram on the goals-terminal line of the pc. You've got the pc in the terminal valence that was the destructive valence of his case and of course, you're running him in that valence because it's on his goals-terminal line.

And what you've solved – in essence what has been solved here is how do you get a pc in valence on an engram and also how do you find an engram on the case that will run and also what is the engram necessary to resolve the case? You got those things? Those are all very important things.

Now, the reason you have trouble with engrams in the past in auditing and have difficulty with them is they didn't lie on the goals-terminal line, the pc was not in valence in them and they would not resolve independently because they were associated with some other chain. But on the goals-terminal chain they resolve, bang! And they are the engram that is producing the present time problem of the pc. So this is a terrific solution here. This is a big jump. See? And it's quite cute.

Anybody now can keep the rudiments in and run the – find the goal and find the terminal and run the terminal Prehav level, find it and run it. That's a very mechanical auditing job.
But, now, something else is needed when we take off from that point and that is a reality on what a bank looks like. You'll never ask the right questions unless you know. I could just sit here and tell you by the hour what a bank looks like and all that kind of thing and maybe should because it might help you out in the first stages, but at the same time one hour's reality on going through an engram with all the screaming fits in the engram and after that, you'll never ask any silly questions about, "Well, should I put in a bridge?" you see or a silly question like, "Well, maybe the pc wasn't getting my acknowledgments." Hell, he's not interested in your acknowledgments and you'd know that then! Nor would you be sitting back in your chair, comfortably and somewhat pompously, going off like a wound-up doll. You'd say – that would be about the cruelest thing you could do to anybody while he was running an engram. You realize that?

Because the only reason you can get through the engram is because you have an idea that the auditor is right there with you helping you out and so you can confront it. That's it. And you can go through it and you know that he'll go – ask you questions. And you'll be feeling snappy toward the auditor probably the whole time or you'll be feeling something toward the auditor the whole time. It'll all be kind of misemotional. Right up to the time when you find the misemotion is in the engram.

And then when you've located that – then the old line which Suzie just dug up in the old Book One: the auditor shouldn't pay much attention (rough paraphrase) to the emotion of the pc, because whatever emotion the pc is expressing while he's running an engram is to be found in the engram. It hasn't anything to do with the auditor. If there's antagonism in the engram, the pc's going to be antagonistic right up to the point when he as-ises the antagonism. If the engram is full of apathy the pc will be apathetic right straight through. Not anything the auditor's doing. But the auditor can compound it, you see, and snap the apathy in on himself or snap the antipathy in on himself by, of course, just not knowing what the hell he's doing. And the only way he can not know what he's doing, of course, is to have no reality on what the pc is doing. When he's got a reality on the thing himself, why, that's it.

I can tell you something else about this. There are people around who tell you all about their engrams. This isn't true of everybody who tells you about his engram. But some of these people are telling you glibly that during a Prehav run they ran into this situation and so-and-so, and such-and-such, and so-and-so, and so-and-so was the case. Now, they didn't run the incident and it's an engram hotter than a firecracker. And they haven't been near it and they haven't been in it. And they tell you that's an engram.

Oh, if you've run a real one you'll know that's – you'll know that's not true. Because a real engram is only an engram because one doesn't know and can't seem to find out a damn thing about it. Now, of course, after it's been run expertly by somebody else and the person has gone through it and knows all about it now, naturally he can give you the story. But the story of an engram is never [snaps fingers] quite like that. Oh, yes, a person can give you sequences off the backtrack that aren't engramic. But the engrams necessary to resolve the case are not in this kind of condition. They're complete not-know hodgepodge. They're a mess. A person just hasn't a clue. And that's the first thing that the auditor contacts about the engram – that there's just nothing known about it.
And then you'll get some kind of a silly interchange like this if you haven't got a good reality on that. "Well, what is unknown about that engram now?"

You see, you've got it – this person with the stilts. There's a pair of stilts and they seem to be sitting out in the middle of this plain and a snake – very Freudian, you see – and a snake seems to be between the two stilts.

Well now, Papa Freud or some of the boys in psychiatry run into this sort of thing and they would build a mountain of pretended knowingness on top of this.

No, it happens to be a pair of stilts out on the plain and there happens to be a snake between them. And what this is all about and why the person doesn't know anymore about it is this doesn't make any sense at all.

So the psychiatrist has been busily pretending all sorts of knowingness about all this. Well, you'll also find pcs who won't go near an engram telling you all about it. Ha-ha-ha. They're no better, you see, they're no better. They've still got this burning right ear, you see. And they still go like this all the time. [laughter]

"Yes, I was running this engram the other day in which I sunk Britain. I destroyed it utterly." Oh, man! How the hell could they run any engram at all unless they ran the engram necessary to resolve the case? And if he ran the engram necessary to resolve the case, they wouldn't be doing that. Got the idea? So it totally – it totally disproves itself.

And you get this silly situation – just to continue with what I was saying – you get this kind of an oddball, silly situation. And the auditor, who has no reality on engrams at all, you see, says, "Well, all right. What is unknown about that?"

And the pc says, "I don't know anything about it."

And the auditor says, "Well, come on now, certainly you must know something about it."

Well, of course, the oddball thing is, is the pc answered the auditing question, which is perfectly true, he didn't know anything about it! And the auditor takes this literally, you see and says, "Well, we couldn't possibly run the engram because he doesn't know anything about it." You got the – you got the kind of cross play that can go on here?

That – because the auditor wouldn't understand that when you really enter one of these bitch kitties on the time track that that is about your first reaction: "What the hell?" you know, "A pair of stilts and a snake! How Freudian," you know, "What is that all about?"

"I don't know. I don't know anything about it."

"Oh, come on, now," the auditor, you know, "you should have..." Yahyahyahyahah! What he could say is, "Well, all right. What else don't you know about it?"

"Well, I just – nothing. Nothing at all. It is just a total blank."

"All right. Good. What don't you know about it?"
"Nothing. Not a single thing." And the pc isn't ARC breaking or anything else. He's just answering the auditing question. This has got him totally baffled. He has never looked at anything in which there was no information of any kind before that could be extracted from it.

And a pc could go on this way for a half an hour. Perfectly happy. He's looking at it. He's getting his head kicked off, of course, there are somatics in the thing and he's being bisected and trisected and a few other things. But the nice part of it is if he's running the engram that is found in the fashion that I just told you – on the goals-terminal line – if he's running that one, when he contacts one they go and they don't come back. Isn't that nice?

Now. What we've really done with goals-terminal Routine 3 is find the direct route to find the engram necessary to resolve the case and find the engram in a sufficient condition that it will resolve and it's only an hour's run. It's nothing. It's nothing. It's agony but if the auditor's got some idea of what an engram is, the pc's perfectly willing to go through the agony. You just never saw anybody so anxious to go through the agony. He also never saw anybody quite so upset as an auditor who doesn't want him to go through any agony. Hm? "Oh, well, the poor fellow, he's uh – I don't know, he seems to be in trouble. Are you in trouble?"

"Well, for Christ's sakes, what do you think!"

"Well, I don't know." Auditor says to himself, "How can he be in trouble? He's sitting there in the auditing chair and this room is a perfectly quiet room." [laughter] And he has no idea whatsoever that the pc is in a thenness which is more real than nowness, but actually to the pc it appears to be now. And the pc is in the middle of this thing which might be a torture chamber, it might be a Safeway store and on the other hand it might be the cockpit of an airplane. Who knows? Lord knows, he doesn't.

And then you say to him something on the order of "Well, I don't think really that uh ... Seems to be too rough for you, you know, and uh, you ought to really, uh, come out of it somehow and you realize that we've only got a few minutes left till the end of session."

This would speak, you see, with absolutely no reality on the auditor's part what the hell the pc's going through. That's the hill that's got to be climbed. Because in a lot of places and a lot of times, these things will have to be run by somebody with no damn fool reality on them of any kind whatsoever. And somehow or other they'll have to muck through and get the thing run. They'll have ARC breaks by the ton and snapping the guy out of session and collapsing the bank on him and getting him twice as confused as he should have been and turning somatics up five times as high as they ought to be. But somehow or another it'll get run. You understand?

But in the bulk of cases we've just taken off maybe, oh, I don't know, a thousand hours of running to Clear. This is why people aren't going to Clear.

They go into an engram on a Prehav run and they say, "Well, that answered the auditing question. It's perfectly all right for me now not to have anything more to do with that. Good." They don't notice it's all their chronic somatics or anything like that. They're too glad, you see, to just hide the thing under the chair seat and skip it.

And they run into another one. And there's a bunch of arquebus men standing on the palisade and they say, "Well, when have you failed to endure?"
"Well, I failed to endure right there in front of that palisade. Yeah, there they go, plu-zoom! you see, and boom. And so on. I sure failed to endure. Yeah. Well, that's the end of that engram. Okay. Let's see. Let's have another one." Another command. "I answered the command. That's it. Nothing to do with me." Because, of course, the keynote of these things is total irresponsibility. "Nothing to do with me."

And then he goes on and he goes through another one. By the time he's hit about five of these things, why, man, it's about time somebody threw him a lifeline. Because he will now hang up from there on out and ordinary Prehav runs will not do a thing for him on any kind of a progress line that you would consider a fast progress line. So they could just actually be audited for weeks. Why? Well, they'll see these things again and then they say, "Well, I ran that once," and so on. You get what happens?

They're running an escape mechanism of some kind or another on these incidents.

Now, you sort them out on an E-Meter, find the engram necessary to resolve this out of these five the person has contacted and you just have to start talking to him about the incident, you don't have to do anything fancy about going into it. Well, hell, he's in it. He's got all the somatics of it. Where else would he be? How could he have the somatics of it if he wasn't in the incident?

Well, there's no trick in putting him in the incident. And, of course, the keynote of all engrams is "not-know." And you ask him all the not-knows out of the incident and what shouldn't be known and what isn't known and what he doesn't know and all of a sudden it starts to run. It starts making a story and he builds it up more and he can tell you more about it and does. And then you run more "not-know" and get some more stuff off of it. And then you find out that he just seems to be stuck in one particular place and he isn't going anywhere now. And no matter how much "not-know" he seems to run and you say, "Well, what is happening there? What is going on?"

And, "Well, I'm sitting at the wheel of this car and it just doesn't seem to be going anyplace."

"Well, where is the car?"

"Well, I don't know."

"Well, what don't you know about it?"

"Well, I don't know – I don't know where this embankment leads to. Car's halfway up this embankment."

"All right. Run the car backwards onto the track."

"Huh! I can do that!"

"Good. Run the car backwards onto the track. Thank you. Well, good, run the car backwards onto the track again. Do that a few times. Back on the track. Back on the track. Back on the track. Back on the ... All right. Now, what don't you know about this?"

"Oh, God!"
What you've done is run the resistance, the tremendous resistance toward going over an embankment into a crowd. Don't you see? And the resistance is such that you've got to run it backwards. You've got to get the pc's effort not to go into the crowd off. And the engram will now start running again. And all of a sudden the car does go up over the embankment and turns over eight times and comes down squash on the head of fifteen spectators. The pc very cheerfully will do that then. Got the idea? And you just have to keep it moving, keep these points of hang-up resolved and you have to know what you're doing, that's all. There's no substitute for it.

And we know all the tricks there are to run engrams. And there aren't very many. And you've got the common denominator of engrams. You know how to find the engram necessary to resolve the case, the engram that will run and the engram where the somatics are all residual that isn't dependent on any other engram for its somatics. You've got all those things. What the hell more do you want?

Well, what more do you want is actually a subjective reality on what they look like and how they go and where they go.

Now, it hasn't anything to do with the occlusion of a case. This is another piece of news. Case is occluded, "smuted," to hell with it. What is an occluded case? Stuck in an engram which is an occlusion engram.

You've got this fellow down in the engine room of a spaceship and the lights go out and he doesn't know what happens. Three seconds later his engines blow up and they've never blown up before. There he is. Of course, he doesn't ever move forward into the blowup of the engines. He sticks there at the point where the lights went out. He has a black field. "What don't you know about this?"

"Well, I just don't know anything about it."
"Well, what are you looking at?"
"I'm looking at nothing."
"What's the nothing look like?"
"Well, it looks black like any other nothingness."

Idiotic type of questioning that goes on, you see. If you've got a subjective reality on it, you know what questions to ask.

You say, "Well, all right, what happened just before this?" Because the auditor can always move to the somatic strip faster than the pc can. "What happened just before this?"

"Whew! What happened before this? Oh, oh, that's another thought!"
"What don't you know about it?"
"I don't know why the lights went out."
"Oh, you got lights on there just before that?"
"Yeah!"
"All right. Well, move back into that area there. All right. Now, what don't you know about that?"

"Well, I don't know where the ship is going."

And, of course, we've got an engram running right there, bangity-bangbang And this was an occluded case. Or the case with the little rockets that keep going across the line, the little rockets that keep going across the line. It's just a section out of an engram.

There is a condition here of pretended knowingness which can get in our road. And this must be looked on by you simply as an escape factor to end all escape factors. When the knowingness is too horrible and the not-knowingness is too thick and then the person feels too stupid about it, they're liable to dream it up. And these dreamed-up ones all go off like hot butter. There's nothing unknown about any part of them.

That's an engram?

Ha-ha-ha-ha-ha. The hell it is. This is dub-in of Book One.

Now, you're not going to find any of it running this way because you're going to get the guy into the engram necessary to resolve the case. You're going to ask him if there were any of these pictures that he was in, in himself, and what he was looking at, at the time. You're going to get it located on the meter, you're going to hold him in that instant of time and so on.

Your Prehav Scale normally discharges obsessive change and other things of this character so that these things are to some degree taken care of. But you are going to run into people that are pretty hard to settle down into that one. Just the second you say, "Well, which one were you actually in and looking at the scenery? And the scenery was in 3-D during this Prehav run."

"Oh, you're talking about that one I ran into a long time ago, the last – couple of weeks ago. Oh, yeah, well, that one, that's nothing to that. Actually that was a time when I was a young subaltern and we were over in France and uh – I uh – was... I know what I was responsible for there, you see. I was uh...."

Well, just look at it. What is this? This is defense, defense, defense, defense. He doesn't know a thing about it or it wouldn't be an engram. It wouldn't be acting on your meter when you asked for an engram.

You say, "Well, now, just as you – where, where'd – how did you pick up this picture? Just what's – what did the picture itself look like?"

"Well, I was there, and there was – well, there was a trench in front of me. Parapet. Periscope. That's the picture."

Oh, "Is that the picture?"

"Yes. And I know what it was because, you see, I made a mistake in the firing parapet, and I telephoned it all back wrong, you see, and then the whole regiment was wiped out. And so forth. I feel very guilty about the whole...." [laughter]
"All right. Good. Thank you. Thank you very much. Well, what don't you know about that parapet?"

"Oh, know everything about it. Uh – except uh – where it is."

Now, you know you are getting somewhere. "Where is it?" "What else don't you know about it?"

"Well, what it's made out of. Is it concrete or something?"

"What else don't you know about it?"

"Well, why it's so fuzzy."

"Well, what else don't you know about it?"

"Well, what I'm supposed to be looking at."

"Well, what else don't you know about it?"

"Well, where I was."

"What else don't you know about it?"

"What I was."

"What else don't you know about it?"

"Who I was. Where I was. What this is. What am I doing here?" You know?

And we find out it is not a trench, it was not World War I, he was not a subaltern, it was not on this planet. It's an atomic power plant observation parapet. He was guilty of something, he did get the right angle there. [laughter] But that was about it, see. That's as far as the data was factual. Get the idea?

The keynote of an engram is the pc knows nothing about it. Pretended knowingness is going to get in your road and you're going to buy garbage. And then some day you're going to invalidate some pc's straight dope. You'll be sorry. It wasn't garbage, see? It was an implant script. Something weird, you see, this kind of thing.

But you can find these things and you can run them. And you can run them with no great reality on them providing you don't keep jerking the pc's attention out of it with a bunch of technical nonsense – like, "All right, is it all right with you if I give you two more commands of this unknown process?"

"Dad um-dad um."

"Is there anything you would care to say now before I end this process?"

"You're goddamn rights there's something I would care to say!" [laughter] "Here I was a here in the middle of this whirlpool minding my own business and where are you?" The pc can get pretty revengeful.

All you've done is a painful shift of attention. When you start running an engram, you'll run an engram.
Well, you can ask all kinds of oddball auditing questions. And you'll actually use repetitive questions in streams or bursts like you fire a machine gun. "What isn't known about that? What isn't known about that?" You know? "Thank you. What isn't known about that? What else isn't known about that? Well, what isn't known about that? All right. Is there anything else around there that isn't known about that? Is there anything else that isn't known about that? Thank you very much."

There isn't anything else known about that. And he seems to be kind of slowing down on this now.

And we say, "Well, is there something there that others don't know about that? All right. Thank you. That's good. Anything else others don't know about that? All right. Anything else others don't know about that? Anything else others don't know about that?"

Now, we seem to have that kind of cleaned up and we say, "Well, is there any effort to forget anything in here? Oh, there isn't? All right. Thank you very much. Well, what isn't known about that? Good. What isn't known about that? Good. What isn't known about that? Good. What isn't known about that now? All right. Is anything known about it? Do you know anything about it now? All right."

"Oh, so-and-so and so-and-so."

"All right. What are you looking at there? All right. Good enough. Is there any spot there that's consistent, that just stays there, or anything else like that?"

"Yeah, well, this rock projection on the wall, that seems to be something."

"Well, what don't you know about that? Okay. Good. What don't you know about that? All right. What's unknown about that rock projection? Thank you. What's unknown about that rock projection? Thank you. What's unknown about that rock projection? Thank you."

"Oh. Oh, oh!"

"Oh, that's where you hit your head."

"Ooohhh!"

"Okay."

It's pointless to ask any further because the pc, of course, has got the unknownness off it.

You say, "All right, now what's unknown about that incident? Good. What's unknown about that incident? What's unknown about that incident? What's unknown about that incident? What shouldn't be known about the incidents? Good. What shouldn't be known about it? Good. Oh, all right. Well, what shouldn't be known about it? All right. Well, what else shouldn't be known about it? Oh, thank you. All right. What else shouldn't be ... What's you doing? What do you run into? What's happening? Oh? What are you looking at? What's it look like? Oh, all right. Well, what shouldn't be known about that? Okay. All right. Now, what shouldn't be known about this incident? All right. What shouldn't be known about that incident? Good. All right. What's unknown about the incident? Oh, you say everything's known about it now? All right. Well, what happened? All right."
He tells you, you know. "So-and-so, and so-and-so, and so-and-so."

"All right. Are there any other unknowns in there that you can spot, one place or another?"

"Yeah, well...."

And of course listening to him you know damn well he knows nothing whatsoever about a certain sequence of it because he hasn't noticed that at one time he is standing on a cliff and another time he is standing on the top of a spaceship; he never noticed that he has never transited between these two places so it doesn't make sense.

You can ask him something blunt, you know. Don't be unreal about it. "Well, how did you get on the cliff?"

"What cliff?"

"Oh, the cliff. The cliff you're standing on every once in a while."

"Oh, that's right, I was on the cliff. Standing on the top of a spaceship. They're two different places. Ha-ha. I didn't know they were two different places."

"All right. What else don't you know about that?"

"Well, how I got from one place to the other."

"What else don't you know about that?"

"Well, the condition I'm in on the cliff."

"Okay. What else don't you know?"

"Ouch!"

"What happened then?"

"Well, I don't know. Gee whiz! There's a whole other sequence up here on the cliff. I didn't know I got up here on the cliff. For heaven's sakes, I must have gotten blown out of the spaceship and ... No, I didn't get blown out of the spaceship, no, I walked. No, I didn't walk. There was another space... No, there's a space... oh, I see, there's the space lifeboat down there wrecked at the bottom of the cliff – I get it. Oh, I see."

"Well, what else don't you know?"

"Well I – don't you see, you idiot?" [laughter] "You know, I – I – I thought I'd get away in a space lifeboat. And I didn't make it. But actually I teetered on top of the cliff and then just as I got out of the thing I was hit with this withering blast of fire. That's what that is all about. See, simple. That's why I got all these face somatics I've got right now."

"Well, what else don't you know about those face somatics?"

"Well, I don't know where they came from."

"Okay. What else don't you know there? Good. Thank you. What else don't you know? What else is unknown? Good. What else is unknown about the top of the cliff there? Good.
What else is unknown about the top of the cliff? Good. What else is known about the top of the cliff? What else is unknown about...."

"Well, I guess I've got it now."

"Well, what have you got?"

"Oh, well, there are a bunch of natives up there, a bunch of wogs and so forth, armed with electronic cannon."

Wogs armed with electronic cannon. Doesn't makes sense, but you say, "Well, all right, what don't you know about those wogs?"

"Well, I don't know if they're wogs." [laughter]

See, you'll see his impulses to write script. And then all of a sudden you'll see he does find out what happened. And you'll see the gradual as-is-ing of the situation and the gradual integration of it. Pretty soon all the somatics will be gone and the whole thing will be clear from beginning to end. Ask him to run through it a few times. Just – just running an engram as offhandedly as this. This is – of course, the thing is all cleared up. There's no pieces left in it that you can detect.

And you say, "All right, why don't you start in at the beginning of this engram and run on through to the end a few times, see if you can pick up anything else." He does. You don't say, "Go to the beginning of the engram and run through the engram to the end of the engram. Now, give me the phrases necessary to resolve the case...." See? Just go on, run through it a few times. He does. He does. He does.

"Oh, there is something here!"

"What?"

"Well, I don't know why this ship was only equipped with one lifeboat."

"Oh. Well, what else about that?"

"Well, there's two lifeboat hatches, you see and one is empty."

"Oh? Well, is there anything happened before this incident that you have omitted?"

"Oh, I get what this is about. The pilot of the ship had already deserted the ship and left me and I didn't know anything about running the ship." Now, it makes sense. And, bong! he gets the rest of the somatics.

And you say, "All right. Now, is there anything else that's unknown about that incident?"

"No, no. I've got it all taped now. Got it all taped."

"Well, run through it a few more times and see if you can get anything out of it that you might have missed."

"No, I've got it!"

"Well, just run through it anyhow."
And he does and he says, "Well, it's all gone. There's nothing else there."

And you say, "I'll check over these various points. Now how about the top of the cliff?"

"Oh, yeah, I got that."

"How about the wogs?"

"Well, they weren't wogs, you know. It was the other part of the army. We were mutineers, you see. I thought I told you." [laughter] And so on and the guy got that and we got this all straight. All fine. It's all running okay. It's fine.

"Well, you got any somatics?"

"Nope. Nope, don't got any somatics."

"Got any sensations?"

"Good. No sensations."

"Any places where you don't feel anything at all?"

"No. Well, come to think about it, I don't have any sensation from the waist down." [laughter]

"All right. Is that in this incident?"

"Well, how are your legs now?"

"Well, they feel all right."

"Well, what did you pick up there?"

"Oh, I just picked up crashing."

"All right. Is that okay now?"

"Yeah."

"Well, what are you looking at?"

"Oh, the ground down there about five feet."

"Well, is the ship on the ground?"

"No. No, it's about five feet up from the ground."

"Well, it hasn't hit yet, is that right? All right. Good. Crash backwards a half a dozen times."

"How do you mean?"

"Well, just – just go backwards from the crash spot."

"All right. Okay." Move. Move. Move. "Oh, I see. I see what you – I was stuck!" He had a big, big cognition, see. [laughter]
"All right. Now, how are your legs?"
"Well, they're all right."
"Now, tell me about the crash."
"Oh, went down and so and so. Oh, there's the last of it. Now, that's it."
"How are your legs now? Got sensation in your legs?"
"Yeah."
"Well, are there any more somatics in this thing anyhow? Look it over carefully and tell me if there are any more somatics in it?"
"Nope. There are no more somatics."
"Any more dead feelings? Any more sensations? Anything else in this incident at all? Good. Well, do you have sonic in the incident?"
"No. No, I haven't heard anything."

Leave it alone. Don't bother to turn on the perceptions any higher than they're turned up. Just mark it down in your book that after you've run two or three more incidents off this particular case, you're going to go back and find the sonic in this incident. Okay?

Perceptions are the last things to turn on. There will be a sense of smell in there somewhere and so on. You just – a careful auditor makes sure that he just gets all the perceptions out of it eventually. So he should keep it in his auditing record that he didn't get the perceptions out of this, such as smell. Got what I'm talking about? He didn't get the sound out of it.

Sometimes pcs will really flash back at you if you start asking them for smells or sounds or something like that. You're turning it up too real on them. That's just turning up too damn real and actually can be suppressed one incident to the next. At the time they had this crash on the plane, their sonic had been off for the last eight or nine trillennia. See, their sonic isn't off in this – is off in this incident, but didn't turn off in this incident. Got the idea? Because perception is something that declines gradually over a long period of time, but somatics are something which are right now. See how that would be?

It's very funny when the pc's sonic starts coming on. Of course, he hears everything all played backwards and upside down in one hell of a jumble. So he – his natural impulse is to turn it off promptly.

You'll get somatic impulses turned off during auditing. And if you're eventually smoothing the case out and giving him sonic and all the rest of this thing, you'll have to pick up the turnoffs in the auditing, too, you know?

There was this awful crash and they decided they didn't want to hear any part of it. And the sonic went off. Sonic is very easy for a pc to turn off. Okay?

Now, running an incident is your fast way out. And that shortens this down considerably. And we continue on with our efforts to shorten clearing as much as possible. And I think when you see this thing in action you will really know you've gotten someplace. The first thing that you've got to learn, however, is how to do a good Security Check and how to do a
good "keep the rudiments in." How do you keep the rudiments in, in a session? And then how to do a good Goals Assessment. How to do a good Terminal Assessment. How to do a good Prehav Assessment.

If you've got these things, why, you've got the thing taped right up to that point where you have to know how to run an engram. And the one thing that's going to teach you that is running one, yourself – inside, you, with somebody else auditing And that will teach you everything you want to know about it.

And then you will be telling me all the knuckleheaded stunts auditors can pull. Well, that's fine as long as you get through it and as long as you push pcs through engrams.

Shouldn't take more than an hour, two hours, something like that, to run one of these incidents. If it's taking longer than that, your rudiments are so wildly out, you shouldn't have been running it in the first place.

I'll give you an example. I was doing this last night and before I started the session I took up for the fifteen or twenty minutes with the pc – this was auditing but it was not in session – why the pc did or did not deserve auditing. I just wondered if the pc deserved auditing or not. And so we discussed this for fifteen or twenty minutes in oblique ways and got a lot of locks off and did a lot of little Straightwire stunts, and so forth. Cleaned this sort of thing up and then started the session. Because I was going to run an engram in that session, I didn't want anybody running an engram in a session who didn't think they deserved any auditing. Okay?

Do you see this is a finite package of skills?

It is a finite package of skills. It is not very many. Of course, we assume that you can do your TRs. We assume that you can do a Model Session. We assume you know E-Meter essentials. We assume these things.

And I'm almost of a mind to just go on assuming them and kicking people's heads in who don't know them. Because I'll tell you, for all of these things, a person's got to know how to run an E-Meter, a person's got to know to do a Model Session before they can do any auditing at all and their TRs have got to be in before they can do any of these things at all. But these you can look on as elementary skills.

Now, you're looking at another level of skill. The level of skill of keeping rudiments in. The level of skill of actually finding somebody's goal rather rapidly. It's easy to do just to the degree that they're not ARC broke with sessions. Finding somebody's terminal very rapidly. Assessing the person. And then, first and foremost, of course, after that comes the ability to run an engram. These are finite.

But, of course, that whole thing falls down if you can't do a Security Check. I think that whole package there sort of rounds it up. If you can do these things, you can make the grade. If you can't do these things, you can't make the grade.

Clearing consists of that. There is what clearing consists of. Because every case I find now that is hanging up in clearing has contacted incidents and these incidents are now blooey – you know, they're unrune and should be run – or the pc has not done any of the auditing
commands. That's part of the basic skill of auditing, is making sure that the pc does the auditing command, isn't it?

But in this one lecture I've actually discussed all of the elements of auditing. I may not have given you all the details. I've given you an awful lot of the engram running and, actually, the engram running is not really more complicated than I have given you; it is no more complicated than that.

Using these materials you should be able to clear. Clearing is overdue. Overdue in a lot of your hands and so on.

And now I have an announcement to make. That anybody who makes a Clear from scratch automatically gets a DScn. And there's no other way to get one.

Thank you. Okay?
SEC CHECK AND WITHHOLDS

A lecture given on 13 September 1961

Okay, well, how are you doing today, huh?

_Audience: Fine. All right._

All right. It's apparently the what? The 13th?

_Audience: 13th._

September AD 11.

All right. Now, you're well immersed into the idea, and one or two of you into the practicalities, of running an engram. I don't know how you got away with it or how good it was or wasn't, but did it run all the way out? Is it still reacting on the needle? This engram. Speak.

_Female voice: Evelyn, she had one._

_Another female voice: Well, I ran several._ [laughter]

How long did each one take?

_Female voice: Well, they certainly took. Unfortunately, I had to watch the time of the next preclear coming, so that got in the way a bit, but we flattened off quite a bit. And one did go completely flat._

That was the first one?

_Female voice: Well, I had two preclears running, you see. First one didn't, because his session came to an end, so I popped him out of it. But the second preclear ran one flat, and there's another one still sparking on._

How many…?

_Another female voice: She's auditing two people._

Well, I'm talking about one pc. Now, did one engram get run on one pc?

_Female voice: Yes._

And did one engram get partially run on one pc but not flattened?

_Female voice: That's right. Oh, yeah._

When's it going to get flattened?

_Female voice: Next session, I hope._

All right. Who's the pc that's got the unflattened engram? Oh, you!
Female voice: Yeah.

Ah, well. That accounts for you not speaking up, I suppose. [laughter] All right, well, so much for that.

The routine I've been talking to you about, a plan of clearing, is a very important thing. I have been very leery, you see, of putting too many sawed-off shotguns in your hands. But there is no way to walk around this. And we have to just front up to it, and realize that you've got to use all the weapons and tools that are at your command in order to do the job. You can't fool with it. Apparently there is no shortcut to clearing, any more than there is a royal road to geometry.

Well now, the only way that you can front up to the fact of Clears, is to clear people, and apparently there is no short road by which this is done.

There is a fast road in terms of exactly what you do, and I gave it to you in yesterday's lecture. But there is no circuitous, easy road. Do you get the idea – the difference here?

There could possibly be some milder, more in keeping with repetitive, command – less demand on the auditor is what I'm talking about. There could be.

I've been looking for something like that all summer and have been testing with it and trying to do something about it. And cases make progress, but I will tell you that this is a final conclusion and I don't care to make any further conclusions on the matter.

Unless you have found the pc's goal and terminal, you're auditing a hodgepodge and they get better, they don't get better, and they go up, and they go down, and they – you know, and so on, etc., blah.

If you find their goal, and find the pc's terminal, why, they're on the road. And if you run the terminal on the Prehav Scale, you can only run it just so far, and the person runs into a certain series of engrams and gets well into a chain of engrams, and these engrams then are available to be run. And they have to be run and that's that. Because a pc all by himself, puttering around, is going to play – I don't know whether they do schottisches on the outskirts of these engrams, or what, but they certainly don't do anything in the engram. It requires an auditor's skill to push them in.

There is no substitute for Security Check. A Security Check has to be well done. But again, a Security Check done on any other version than just a straight Security Check form runs into this other phenomena of just running random engrams and stirring up the bank and that sort of thing. And although you get off more withholds, and although there are very tricky ways to run Security Checks, just on the straight things, the best Security Check is the straight Security Check, for my money.

There are various things you have to do sometimes, because not all the questions are present on the Security Check, and pcs can think of a great many random things to do with a Security Check.

There is no question on it that says, for instance, "Well, have you ever made a pc guilty for giving you a withhold?" We just ran into that one. And that was hotter than a pistol, wasn't it? And the Security Check wasn't working. Wasn't working on this person, and finally
Mary Sue, with a large, long, blue spark – I think her sparks are usually tinged with slight pink – said, "Well, let's see if he's done anything unusual with the pc's withholds." And he had done something unusual with the pc's withholds, and it was keeping the Security Check from working. In other words, you have to be smart to run a Security Check, but the best and fastest Security Check is just a straightforward check. All right.

In running engrams, you again have to have a good subjective reality on what an engram is all about in order to run an engram well. But that doesn't say that you cannot run an engram without any subjective reality because that is going to have to be done, and remember that I have run engrams with no subjective reality of any kind whatsoever. 1947. Never been through birth, and I'd run people through birth, and so forth. So this can be done, you see.

Now, as we look on the pros and cons, and the pluses and minuses on this type of an approach, it is a very blunt approach, and it demanded certain tools. And – the Instructors of the Washington course, by the way, are – I just smell it – they're just being a little bit sparky. They don't believe that the goals possibly could have occurred in the first 150, because none of the thirty people on the course were able to find a goal on the first 150 given by the pc, you see. They didn't believe their rudiments were out. They just didn't believe their rudiments were out. They can't believe it. They can't face up to it.

Yet, on that course, they were not cross-checking rudiments. In other words, student A on the course was not taking student B's pc and checking to find out if the rudiments were out, and then telling student B. You see. That routine was missing. And the most Clears were made in the South African course where that was done. Cross-checks of rudiments.

So rudiments are not always out for the auditor. See, it isn't that the auditor is being careless. They're not always out for the pc's particular auditor. The pc gets into a frame of mind where he believes that this auditor is skilled or confident, and he swears by this auditor, and therefore doesn't feel ill at ease at all, you see. And knows that if he gave up a withhold, that the auditor isn't going to chew him up with the withhold, you see, and he gets into this state of somnolence with regard to rudiments. They're wildly out. He's got present time problems and everything else, but he has confidence in his auditor and so he doesn't register. You get the idea? He'd just as soon go into session for this auditor, apparently, but in actuality the rudiments are out.

Another auditor checks the rudiments on that particular pc and they are wildly out. They're not necessarily now wildly out for an auditor or another auditor, they're just out. It's the fact that the pc's confidence or attitude toward his auditor or lack of confidence in the auditor or something else, has put him to a point where he just doesn't have present time problems and withholds while being audited by Joe, don't you see? He just doesn't have them. They are affecting the living daylights out of his case. It's just a peculiarity.

Now, we haven't even really gotten to the bottom of the peculiarity, and probably there are a great deal of odds and ends of mechanisms involved in this that haven't been brought to view.

One of the mechanisms I did bring to view on it, however, is that an auditor-pc, as a team, get withholds. You see, they get withholds on the rest of the world. So that anything given off by the pc to the auditor is looked upon as a further confidence. See, it's not being
given up. It's just being passed to one person carefully, so as not to be passed to anybody else, don't you see?

So eventually they get a whole bunch of, (quote), "withholds off," but how far off are they? They're off on the understanding that they won't go any further. And just to satisfy and placate the American Psychotic Association, we put that "keep the secrets of your pc," you see, in the Auditor's Code. Well, it's a good idea, everybody's been doing it, and so forth. But that's the only part of the Code of a Scientologist or the Auditor's Code which I just wouldn't, myself, much believe in. Because right away it's defeating, isn't it? It says, "Well, this withhold can go one person, and that's it."

Or on the other hand, you start making hay with somebody's withholds, and another evil develops, so on, so ma – because a person is being punished for his withholds by the society which is all triggered to punish people for their withholds.

Now, a little bit more further than that, several times in research we have found this to be the case, but I don't know if you're aware of the fact that pcs quite often get off withholds which are total lies. And they go on reacting because they are lies. And they get all messed up because they've told a lie.

And there are some people around who get off withholds to get other people in trouble. (Quote) "Get off withholds" (unquote). It's quite interesting. I mean you – some auditor is guilelessly auditing this pc and this pc says, "Well, yesterday Joe stopped me in the hall and kissed me and slapped me on the gluteus maximus and told me something or other, something or other." And the auditor says, "What do you know!" you know?

Well, he can't quite get it to clear, and he thinks there's more to it, and it goes on and on, and then it finally just sags out of view somehow or another, and he isn't reading his meter carefully, you know. And he goes around with the complete idea that this has occurred.

Well, of course the pc has now put himself out of session by miscommunicating to the auditor. And the auditor unfortunately will very often go around and say, "Well, that Joe, he's really a character, you know? He makes passes at women in halls." Nothing like this ever occurred.

I mean, there are "withholds," (quote) (unquote) circulating around in Scientology which have never occurred.

It is used by some pcs to spread entheta which isn't true. I'll tell you where this is most prevalent. I'll tell you how to spot this. You get a pc who never tells what they've done, but always says what somebody else has done. "Did you ever rob a bank?" "No, but my father robbed a bank." You know, that kind of thing, you know. And you watch this going on any length of time with a pc, and if it's consistent, you can be fairly sure that some of that pc's withholds that he gives you are just lies. And you want to cross-check on withholds for lies. And you can just put it down as a little rule. Because a case can hang up by having given you a false withhold. That's something to know, you see? And you say, "Well, have you lied to me about any of these withholds you've given me today?"

Well, we have a little, pint-size pc. He's about as big as a suitcase. And so help me Pete, if he didn't give his auditor – I don't know how many withholds he passed out the first
day that he was being given a children's Security Check, but it was something on the order of fifteen, twenty, maybe something like that. Comes back in the next day, he's more honest than most, and he says, "Well, I – huh-huh, huh-huh. Two of those withholds I gave you yesterday are lies." He woke up to it.

So you want to cross-check on this sort of thing. Be particularly leery of anybody who's always giving withholds about somebody else. See?

"No, I have never held up a bank, but my last auditor uh…" [laughter] I'd be particularly alert to this one. In the first place, that's not a withhold. A withhold is what the pc himself did. That is a withhold. Plus, the pc being an accessory to a fact. That is a withhold. Now, the pc being the accessory to the fact does not include the pc passing on all the bad data and all the rumors, and so forth, the pc has ever heard, because of course the pc's not an accessory to the fact of any part of these things. No, the pc didn't rob the bank, the pc stood out on the corner and made sure the police weren't coming while the bank was being robbed, don't you see? All right, that's an accessory-to-the-fact withhold, and which is part of the withhold. It's quite a valid withhold.

But it is something the pc did, isn't it? See, the pc did stand on the corner. The pc didn't rob the bank, but the pc stood on the corner. You'll get this sort of thing. You'll get as a withhold occasionally, "Well, I sat and listened to some violent criticism of…" And that the pc considers an overt – and it was. Pc didn't speak up and shut it off or put anybody straight or anything; they just sat and agreed with it all, you see, and all of a sudden, why, this turns up as a withhold, but remember that was something the pc did. The pc accepted tamely, or agreed with, you see, or didn't do anything about, a situation. But again, it's something the pc did, don't you see? It isn't the information that was given the pc. That had nothing to do with it.

So you – and then you always want to check as I have said. Check the Security Check for lies.

"Have you told me any lies during this session of Security Checking? Are any of these things lies? Have you misrepresented the facts in any way while I have been security checking you?" Well, of course, let the pc take umbrage. But the harder the pc umbrages, why, the harder I push. Pc says, "What, no such thing! I've never told a lie in my life."

I said, "Well, all right, which one of these withholds was a lie?"

"Well, but I've never said anything like that. I – oh, I never! Well, I've never been so insulted in my life!"

"All right, well let's check them over. Now, let's take the first question. Did you lie on that one?"

"Well, not much." [laughter]

That's the usual routine, one, two, three, four. The more upset a person gets about a Security Check, up to the point of refusing to take one, which is the ultimate upset with a Security Check, the more withholds the person has. It is a proportionate scale. It is directly pro-
portional. The more protest, the more withholds. Right up to refusal to have any check of any kind whatsoever that's – that's up...

Now, listen, that's not some punishment mechanism I'm thinking of. I have never had it fail, now, in much more than – well, it's two years and more experience now with Security Checks, I have never had it fail, that the person who refused – I don't care if that person was straight off the street – the person who has refused to have anything to do with a Security Check was the most loaded of the lot.

You say, well, how do you find this out? Well, that's not necessarily a secret. You take a non-Scientology staff, or a non-Scientology personnel, don't you see – we've had a lot of experience with these, not just here – and they're pretty wild. The person who has got a fairly clean slate or a halfway clean slate will come in and sit down and have a Security Check. But the person that you can't even see the black for the chalk, you know, and they say, "No, well, that's against my rights. We have rights here. You might not understand it, but we have rights. Rights!"

Now, at first I sort of bought this. But as time went on, and I got crosschecks on these people, I found out the more rights the more crime. Soon as somebody tells me something like that anymore, I just, "Well, what do you know! So that's where the sugar has been going." In fact I'd be perfectly liable to say that right out loud to them. "What else have you done around here that I don't know about?" And oddly enough, they'll start breaking down, drrrrrrr, boom!

"Ah, I didn't mean it," and so forth. "And the spoons just leaped off the sideboard and into my pocket." [laughter] "And what do you mean by having spoons that do this?" [laughter]

That is something to know. That is something to know.

Now, the general mechanism of the Security Check – in that withholds can be abused: A person has the horrible choice of remaining static as a case from there on out or getting them off, and taking the chance that it ruins his reputation, that he'll be hanged, and so forth. Well, in two years of experience I have never seen anybody hanged for getting rid of a withhold. I have noticed, occasionally, on staffs, and so forth, an HCO Sec or somebody reading down a sheet of withholds and finding one that's so damn contrary to organizational regulations or what we're supposed to be doing or something of the sort, that the person just goes up like a small skyrocket and lands on the person's head in a gigantic atomic explosion, and the person is rather taken aback by all this.

"What do you mean, stealing mimeograph paper? Don't you know that stuff costs money? No wonder I've never had any mimeograph paper around here," you know?

Well, that's actually bad. They're abusing a withhold. But why do anything about it? Why do anything about it?

Another thing that happens with regard to withholds is very, very funny, and it was happening to us down in South Africa. I'm looking at a student right now who was very baffled on two or three occasions, but I think he came in on at least one occasion that I know of, maybe two occasions, and found his desk as Director of Materiel, Johannesburg, practically covered with unidentifiable, nonsource items. [laughter] All kinds of weird things. Organiza-
tion property, don't you see? And I think this one thing was terribly mysterious, awfully mys-
terious, was that his office was locked [laughter] and nobody had a key to it except two or
two top executives. And yet, he came in in the morning, the office still locked and desk cov-
ered with all kinds of litter, bric-a-brac, you know, missing tapes and missing books and miss-
ing this and that.

And somebody, you see, trying to get out from underneath it – being found on the Se-
curity Check, or something. I don't know what all that wound up on, but sooner or later of
course somebody would collide with it anyway.

But when it comes to health, or case advances or a decent society, and so forth, actu-
ally a society which makes it impossible for a person to take any road out, of course, is a
doomed society. That society can kiss itself goodbye. It will go along with Chaldea, Babylon
and Egypt any day.

And, of course, this society, the present society, is absolutely boobytrapped. Well,
goodness gracious, the police are running around in circles up here right now, I'm sure, trying
to solve some vast crime or another, and get back some property or something. And there's
probably some thief sitting someplace saying, "Good heavens, why on Earth and what pos-
sessed me to steal a Queen Victoria hat? I'm sure I don't know, you see, and all this other
junk. And what am I going to do with it? And the fences will have nothing to do with it, and
I'd happily give the stuff back," but he can't. The police couldn't accept it back, and – oh,
they've got a big ridge going of some kind or another.

I'd pull a different deal if I were figuring out which way to go on such a thing. I
wouldn't let people off scot-free on such things, but I would sure send them someplace where
they could get straightened out. In other words I would make a road out. But in the existing
society there is no road out.

Well, handling Security Checks in a society of this particular character, then, runs into
a little bit of heavy weather. And you very often run into some heavy weather. Somebody's
sitting there and, good God, they're the fellow who did it, you know, and what are you going
to do as the auditor, you know? Well, one of the things that occurs to you at once is they're
the one who did it, and so forth. They, therefore, are guilty and they're a criminal involved in
the situation, and what is your responsibility as an auditor?

Well, it's – your responsibility as an auditor is first and foremost as an auditor, is get
the person out of it. You're not the police force. Don't you see? And then you actually are not
honor bound from that point there on to be under a stamp and seal of total secrecy with regard
to the fact that the First National Bank was robbed by Joe, you see.

But don't go calling up the police. They're on the wrong road. Cops never get a society
anyplace. Cops are a short-term proposition, strictly. The more cops, the more crime. Not the
more crime there is the more cops. See, it's the reverse. Quite the reverse. If you had a totally
lawful society, all you'd have to do is look around and hire a thousand police, and you'd have
criminals. Well, these fellows have to have something to do, don't they? There's a game called
cops and robbers. And if there aren't any criminals, we're going to make some. And they don't
protect the society.
Various times on the track when I've done police work, always operated on one basic mechanism: that the responsibility of a provost marshal or a military governor or something like that was to public security, public safety. First and foremost, public security. That was the target. Not criminals, you don't have anything to do with criminals, you had to do with public security.

Of course, that makes kind of a vigorous kind of law if you look it over. And you find somebody standing on the crossroads with three people in the held up coach with bullets in them, and he's got bloody jewels in his hands right at that moment, well, you don't bother the courts, you think of public security. And of course if you think of public security you also think of public economy. [laughter] That's a sort of a vigorous kind of justice. But nevertheless is a much more positive kind of justice than hire a thousand cops in a lawful society…

Oh, somebody has sent me a whole series of clippings on this, by the way. This had escaped my memory. And there's some town in Texas that had a jail, and they had two or three police officers. And they finally cut the police force down and they noticed that the crime disappeared to some degree, so they chopped the police force out entirely and haven't had a crime since. [laughter] A whole series of clippings on this. Quite amusing.

But you're not in the business of justice with a Security Check, is all I'm trying to impress you with. You're not in the business of justice, you are totally and completely in the business of straightening somebody out. Now, if you later on are in the business of justice, you have to reconcile with your fact you've used an auditing confidence or something that you forced the fellow to give you. And if you use this later on, wearing some other hat, well, you just have to reconcile it somehow or another, or figure out whether you should or shouldn't. But it would be while wearing another hat that something like this occurred, don't you see?

This society is rather goofy. Along one line, it believes second dynamic withholds are far more valuable and more important, you see, than other types of withholds. And the second dynamic is one of eight. And I don't know that second dynamic withholds have any vast importance. Of course, sex is a little bit closer to creativeness, and creativeness is a little bit closer to reactivity than other things. But I'd say that a man who created bad machinery on the third dynamic, don't you see – this shouldn't have any – should have about the same weight as somebody who is doing some weird second dynamic activity. What's all this emphasis?

Well, the society gets this from Papa Freud. And Freud brought this up and said the single source of human aberration was the libido theory. You didn't get that joke. Wasn't sex, it was Freud's theory. And they've been playing it on their zithers and guitars ever since. That was just what the Victorian age needed to top itself off with and finish itself off. And they bought it, and that's it. But you find a great deal more freedom being expressed along in these lines.

And if you think the case is going to get better suddenly by getting off some bad second dynamic withhold, be prepared to often be disappointed. Case gives up a second dynamic withhold and doesn't get any better. According to Freudian theory, you see, once you found the childhood sexual abnormality… Penis envy, I think, was one of the greatest crimes of the whole setup, you know, that kind of thing. Terrific, awful. And you get this off, you know,
and you say, "Well, gee," you know, "that ought to really make a difference with this case. This case really ought to run now," you know? Case doesn't run any better. [laughter] Wrong target.

You find one fine day that the case had an unkind thought about a pc in session. And you get that one off, you know, and the case all of a sudden starts to run. And if you don't recognize – recognize that the value of a withhold is the value assigned to it by the pc; and the value of releasing it is the degree it assists auditing – the way it assists his life or something. And if you recognize those principles, why, you won't get carted astray with all this nonsense and so forth.

Now, I suspect that in some group or another they could start vying with one another about the meatiness of the second dynamic withholds that they could get off, and I – about the time I saw some of these things, I would say, "Oh, hell, why don't you people stop lying and start auditing, you know." Because, pooh! it's not that important.

The whole world, its perpetuity as far as bodies are concerned, is based on certain now-I'm-supposed-to's, all of which are self-protective. And if you're trying to hold a unit together like a family or something like this, there should be now-I'm-supposed-to's, and they should hold together. And if that is the game that's being played, it should be played by the rules.

But as far as the total aberration of man – you got off a second dynamic withhold off of somebody, like he was the fellow who set up the perpetuity of bodies for any given planet, and he's been sort of feeling guilty about that ever since, of course he'd be the source of all second dynamic withholds or upsets or aberrations from there on out, wouldn't he? And yet that would be a social activity in the field of science. It's not a second dynamic activity at all. It'd be a fifth and sixth dynamic activity.

Well, it can't be very aberrative. I was a party to something like that once.

But the upshot of it is, the withholds that you get off are what they are, not what the pc embroiders them into, and they are as good as they assist auditing to take place. You're just trying to put the pc in-session, that's all you're trying to do with withholds. And you could overvalue this.

As a matter of fact, they have, here and there, you get a tremendous resurge when you're doing Security Checks. You find out some mechanism or another, and you release this thing, and you get a big case resurge. And it is a good thing to have happen to the case. There is no doubt about this. But remember, he won't go Clear on withholds. And that's all we're interested in.

You get off of – all of his withholds off the length and breadth of the track, the whole distance, and you wouldn't have a Clear. Isn't that interesting? You'd just have somebody that audited better. So look at your relative values.

Now, a case will not progress unless a certain proportion of the withholds are off the case. And you'll find any case that is holding on to withholds, hard to audit and hard to clear. Getting off withholds does not make a Clear, but having withholds can prevent clearing from occurring. Now, do you follow that? You see, it's just like building barricades across road-
ways, and the person's trying to travel on this road. Well, actually removing the barricade doesn't get him much further on the road, it just permits him to travel on it.

Therefore you have to know how to do these things, and you have to know how to do them well. And it is a subject – I won't mince around with it – it is a subject which requires cleverness. You have to be clever to be a good Security Checker. You have to be clever. You can't sit there and run over and over and over like a wound-up phonograph and say, "Well, have you ever cooked a company's books? Thank you. Have you ever cooked a company's books? Thank you. Have you ever cooked a company's books? Thank you." That's not going to get anywhere. You read the question, "Have you ever falsified a company's accounts?" And the person, well, looks a little tense, and the meter might or might not have reacted, and you say, "Well, what do you know. Well, have you ever juggled a company's books? You ever juggled any accounts?" Bing! "All right, when was that?" you see.

A security question sheet can never be put together to answer up to all human beings at all times and all places. Just skip it, you can't do it. Couldn't be done. You've got to ask the question so that it applies to the pc.

Now, supposing you did a Security Check in Oxfordian English with polysyllabic address at all corners? And then you were checking a Bantu? Right away, of course, your Security Check breaks down because all these beautiful words go over his head and that's it. Of course you don't get any reactions, he's innocent of everything including being a Bantu. Doesn't think of himself as a Bantu; he's a Zulu. See, so, "Are you a Zulu?" He'd fall on that, but not on "Are you a Bantu?" You got the idea?

Has to be adapted to the person. And when you give a Security Check, you have to give a Security Check to the person you are giving the Security Check to. And the list of questions are never to have any omissions. Always ask them all the questions on this sheet and any others you think it would be good to ask them.

Auditors are always adding. Well, let me open the gates right there; let me open the gates wide: you can add all the questions you want to to a Security Check as long as you ask all the questions that are on the sheet. So your "prolixity for additity," [laughter] can be given a free and complete rein. I don't care how many security questions you interlard into a Security Check. I just don't care.

And you're going down the line, and you say, "You know, I bet this fellow has an awful lot of Security Check questions on the subject of horses. I bet you he's been stealing horses, and beating horses. I just – cause – because every time he blows his nose he goes 'Hyn-hyn-hyn-hyn-hyn!'" [laughter] Good lead. All right. Do a bunch of little questions about horses. Next time you open up the session on a Form 3, why, just sail into your questions about horses. And get them cleaned up and go on with Form 3, you get the idea. You can throw questions into a Security Check anywhere.

Very ordinarily in handling cases, why, I will dream up a series of Security Check questions that'd exactly fit that case and ask the auditor to run them, and usually there's pay dirt on them that would have made the forty-niners look pale. Well, I'll give you an example. Well, let's say cigarettes are disappearing around upstairs, and – you know, packages of cigarettes are disappearing – and I read an employment Security Check to a staff member. Only
I'm worried about cigarettes. I don't say "Have you stolen anything?" I say, "Well, have you stolen any cigarettes around here?" Get the idea? In other words, Security Check is being given against a series of known circumstances. So those known circumstances which are current, of course, are interlarded into a standard Security Check.

There's one exception to this, and that is Form – HCO WW Security Check Form 7. Because that is so deadly, it mustn't be added to. The Security Checker there is taking the fellow's life in his hands. He can deny him a job or he can suspend him from staff just from failing one question, whether the question is cleared or not. So you start adding a bunch of questions to that thing and, of course, you close the gates in all directions. Because there isn't a human being alive, nor a doll on some other planet, or any human beings on some other planets, that could pass a Security Check from beginning to end without – well, Security Form 3 – without about a 30 percent casualty. There isn't anybody alive who hasn't got about a 30 percent casualty on that thing – you know, flunk that. And if you're just giving the Security Check, you see, de-de-de da da, ba-da, da da, and just flunking just because they had a needle reaction, an instant read reaction, of course you'd flunk everybody. Everybody in the universe would become unemployable at once.

So don't mess up a Form 7, but you might – somebody might pass a Form 7, and then you still aren't sure. Well, if you're still not sure, why you, after they've passed the Form 7, why, you get somebody else to do something about it, or tip off their auditor or something of this sort. You're not sure. But if they didn't really give an instant read on Form 7, Versions A or B. You can't do anything about it. And those are read verbatim, and they are read just that many checks. But of course, that is a Security Check for the purpose of security. And we're talking about Security Checks for the purpose of processing. And purpose of processing, that's another reason. You're much more cognizant with Security Checks from the basis of processing. And that's the viewpoint from which we're looking at it.

Now, if you were doing a Security Check from the standpoint of police work, of course, you would know exactly what questions you were looking for, because you were asking from a set of known conditions. And therefore the Security Check should be dreamed up for whatever activity you're engaged in that way. You're trying to find a thief or something of the sort. Well, ask the questions necessary to find the thief.

There's another rationale about Security Checks that I should say something about; and that is, that rights shouldn't be invaded. Now, of course you get that from the people with all the withholds. But you should have this datum, if somebody ever argues with you consistently and continually on a broad public front, like a meeting or something like that about the Security Checks and invasion of privacy, and so forth. The answer to that is contained in, in an essay I wrote in a bulletin, "Honest People have Rights". That has been so neglected on this planet that only the crook now has rights. Honest people have rights. There is no doubt about that. And that is not part of any police curriculum, rule book or mores on this planet today.

I was very amused. I followed for some weeks newspaper stories about crimes, and I found in each case – I was out in Arizona – and I found in each case the total interrogation was of the person who had been robbed. Fellow had had his car stolen; they'd have him right
down to the police station, being – interrogating him under the lights. It started out a fellow had parked his car momentarily alongside of a road, and a couple of tough guys had come up and beaten him up. And I think, drove off with the car or something like that. And the police came along very shortly afterwards and they shadowed this fellow who'd had his car stolen. They interrogated him, they took him down to the police station, and then thereafter shadowed him, cross-questioned him, had his name in all the papers, until reading the stories you would have been absolutely certain that there was something very wrong with this man that he had committed the crime of being beaten up by two toughs. You see how it gets bent around?

I wanted to see if things were going that way, so I followed the press rather rigorously for a while on just that one theme. Honest people have rights.

Now, give you a consequence of that. Any domestic difficulties there have been at Saint Hill amongst domestic staff, which of course are non-Scientology staff, have been occasioned by people who had fantastic withholds. This was a long time ago. And it worked like this: They immediately got rid of good staff members. You can always count on a staff member who has a great many withholds and who is doing criminal things, getting rid of good staff members. You can always count on it. When you see good staff members disappearing, look for the guy with the withholds. Because they will tell lies about them. They will try to get rid of them. Because they can't bend them down to their level.

And a person, for instance, in some large British company right at the – this instant, you see, who has a criminal background, who has lots of withholds of one character or another, is a terrible liability to the rest of the staff. He's a terrible liability to them.

The situation is not a faint one. They let these boys ram around inside of a – the perfectly good employees, and that sort of thing, and the next thing you know the place is a dog's breakfast. And it isn't that management should be suspicious and mean, but management that is going to protect their working people and their employed people, must use security measures. They must. They must not employ criminals. They just mustn't do it. Because they are victimizing the people they are supposed to be protecting.

Well, I'll give you an idea. I imagine there's a student or two that was given a fancy story around here not too long ago about how horrible Saint Hill was thought of from the region of East Grinstead. You know, the people in East Grinstead are – boarding houses or people in East Grinstead thought that Saint Hill was terrible and Hubbard was terrible and this was an awful place and that sort of thing. Well, this type of story had been current mostly around here, and some staff members had been upset by this. And if you remember the "death lesson" gag – that piece of nonsense. Well, I finally turned a private eye loose in East Grinstead for a period of about ten days to interrogate one and all to find out if there was any slightest libelous or slanderous things taking place, and whether or not any of the parents of those children were still upset, and see if we could get down and find out if there was – anything had developed along in this line.

Well, you know, a private eye who gets on a hot lead (actually they don't have too many clients; their pockets are always wide open for the next five-pound note, you know) and you give a private eye carte blanche and tell him to carry on, and he'll sure carry on as long as
he can find out anything. But after ten days this fellow had been totally overwhelmed. And that was the maximum that he would put in on it, and he quit. He was overwhelmed. Everybody in East Grinstead – he contacted everybody he could think of: trades people and boarding houses and hotels and restaurants and everything you could possibly think of. And all he got was, "Saint Hill? That's a wonderful place. They do very good work. Doctor Hubbard? I know him. He's a fine man. Oh, yes, oh, they're nice people. Yeah, that's fine, Saint Hill is lovely." I can show you the report. It goes on page after page after page. And this poor fellow, you see, looking for slander and libel, you see, is getting overwhelmed by all of this good opinion, and it finally just drove him out. Too much theta on the line.

So we find out that the rumors were coming from just one person who happened to be on staff here. These rumors never came from East Grinstead, they just came from an insecure person. That's what we have to assume from this, don't we? We put it to the total test. That person isn't here now and there are no rumors. Isn't that fascinating?

Yes, but what is the end product of this sort of thing? Well, good staff members are made nervous, upset; they think they're working for a place that is not worthwhile; they think they're liable to be under criticism from this; they get nervous; they don't know quite what's going to be said about them. And all of a sudden they lose a job, something like this. Or, factually, they will be lied about to a point where they're falsely accused and do lose their jobs. But inevitably you will find this kind of thing taking place in the absence of Security Checking.

Honest people have rights. And if I were working – knowing what I know about Security Checks, and so forth, if I were working for some large office of some kind or another which had no security system of any kind whatsoever, I'd sabotage the joint. I mean I'd sabotage it. I'd go to the top and find out why. Why there was no security program. Just as bluntly as that. And fellow would say, "Security program? What are you talking about?"

And I would say, "Well," I'd say, "got a contract with me to hire me, and keep me on the job, and let me do my work, and I can't do work without a security program. Can't be done."

"Well, how is this?"

"Oh, well, people come around all the time and say you've just swindled a quarter of a million pounds, and people drifting around by the water cooler, and giving you all the hot dope about all the wrong contracts that didn't get signed, got thrown out the window. And nobody ever types my letters, and so forth. And you've got some sour apples in here, man, you expect me to associate with this scum? To hell with it." I'd tell him bluntly, "Get them processed. Get a security system in here. You – maybe you got something running. Maybe it might even work out that your ulcers wouldn't be bothering you so much."

It isn't that – it isn't that it's a nice thing to have. You can't work without it. That's as – it's just as blunt as that. I've proven it time and time again. I've just proven it over and over and over. There'll be one, two, three characters who are just so damned aberrated that they should be inside looking out someplace, and they'll just be tearing the place to pieces. And they can have twenty, thirty people just going in a circle, just bum data, bum data, bum data, bum data, alter-is, alter-is, bum data. Oh, phooey! Everything is in a commotion all the time.
Well, all of a sudden you have to wear the wrong hats. All of a sudden you're wearing a police hat or you're wearing the management's hat. And under these circumstances you'll get so uneasy about management that you feel you don't have any direction, so you feel you don't trust the direction, and so you don't have any orders. And whether you're doing right or wrong you don't know. What the hell, nobody can work under those circumstances.

If I want to fight a war, I like to fight a war with machine guns and mortars – honest tools. Not lies. Not lies. I just don't like to fight wars with lies. Or fight wars with covert investigations or fight wars with other backslaps or figure-figures, or intelligence services at work or something like that. I like an honest war. Of course, honest war has gotten discredited. I don't know why it's gotten discredited. I suppose the munitions makers discredited it or something of the sort. But they got in there, too. If two guys want to stand up and kill each other, well, what the hell. Who are you to tell them they can't? Well, that's a point. But just the point of them standing up and killing each other shouldn't enturbulate the rest of the world.

There's all kinds of sides and general descriptions about this sort of thing that rather escape the eye. On a broader look, there's nothing more fun to hunt than submarines. They're the biggest fish there are, and they can shoot back. But some guy down here is hunting – fishing for some perfectly good marlin. I have a little bit better than a fourth dynamic attitude toward these things, you see. And somebody's fishing for marlin, and they take this perfectly good marlin and they yank him around in the sea, and sink pieces of steel into his mouth and they drag him up and knock him over the head so they can mount him on a wall to show how big and tough they were. Well, he was being a good marlin. Well, what the hell? What more can you ask of him? He's being a good marlin, so they punish him. That's silly, you know? It's a deeper significance than you would first glimpse.

Well, what's all this? What's all this about? Well, that seems to be all right, but it's apparently – it's only all right because the marlin can't shoot back. I think it's much more fun to hunt submarines. You can get in real trouble hunting them. You've put up as big a stake as they have, don't you see?

Aircraft, too. I like ducks. I have absolutely just gotten more disgust from duck hunters, you know. My father still tells a wild tale about me being in a duck blind when I was about twelve, and they said "You have the first shot," you know, and I was supposed to put up this big double-barreled shotgun with smokeless powder and projectiles made by Remington under vast scientific process. And a couple of teal were coming in and one came in and suddenly saw me in the blind.

I was just standing there with a gun; I was supposed to be holding it. And this teal was a very pretty teal, and he turned around and… He misinterprets the whole thing. I merely said, "That's a pretty teal," you see.

And he said, "Well," he said, "why don't you shoot?" (The way he tells the story.) "Why didn't you shoot?"

And I said, "Well, he's too pretty."
That isn't what I said at all. I just said he was a pretty teal, you know, meaning "What am I supposed to be doing shooting teal," you know? In the first place, I don't like duck to eat, and that's it. They raise plenty in Long Island that are dedicated to dying for humanity. [laughter]

I admit, this is a little bit too broad a view, don't you see? But airplanes, that's different. The guy's out there to kill you. Well, if you can kill him first, well, fine, that's a game. That's a game of comparable odds. And if you're going in for sports, you notice you always have to have comparable odds and that's it. He loses a body, you lose a body, you know, and the government loses some property. [laughter]

I'm not holding any brief for war, but you notice that war has been just stamped on as being a most terrible activity, you see, and it's been not-ised and not as-ised to such a point now that the little baby in his crib up in London is going to fight the next one. It's not going to be troops any more.

All right. This all comes out from the basis of withholds and individuation. And people get individuated, and they back up further and further and further, and they become more and more individuated, and they become more and more and more individuated. Well, how do they get this way? They get so individuated they're eventually not even themselves. How do they get this way? Just withholds and overts. Overts and they withhold, and overts and they withhold, and overts and they withhold, and eventually you get a guy who can't be a duck. See? He shoots ducks so he can't be a duck. So therefore, that's the reason he should shoot ducks. Proves itself, doesn't it? Self-proving proposition. If you have enough overts on something, you can't be it, then you should shoot it. Silly, isn't it?

So you get this superindividuation. And the more individuation that occurs, the less likely a person is ever to be able to walk out of anywhere. It's just like he's backing up down a long corridor. And the corridor has – is actually not so much a corridor but an endless succession of isolation rooms. And it's further and further and further from communication, and it's further and further and further from being anyplace. And the way he gets there is a very simple route. He has overts which he then withholds. That puts him in room one. Now, while in room one he commits another overt which he then withholds, he goes to room two. You get the idea? Now, while in room two he commits more overts, because now it's the best reason in the world he should commit overts, you see – because he's in room two. And he commits another overt, withholds that, and moves to room three.

And he's just going on, not necessarily apart from the human race, but apart from life. A person to be in some kind of shape must be able to be almost anything. He must be able to be almost anything. And the degree that you can't be things is the degree that you have overts on them that you are withholding. And that is the whole equation. There isn't anything more significant about it than that.

Now, you find out that if you've wrecked enough cars that you find it damn near impossible to be a car. You can drive one and run it off the road and run it into the bus, but you can't be a car. It's as simple as that. Therefore cars seem to go to pieces around you. You get this mysterious thing.
Motorcycles, which are much more touchy, are noted for this. In the motorcycle world, rather, this fact is very well known, terribly well known. You get certain guys [laughter] and the sequence and how they got that way, is overt against a motorcycle, then they can be the motorcycle less, and then more overts against the motorcycle, and they can less be the motorcycle, and they're totally individuated from the motorcycle and they've withdrawn. It gets to a point of where to touch a motorcycle is to have an overt against the motorcycle, and then you – you do that by dumping it in the nearest ditch or something of that sort. [laughter]

All the automobile accidents that are the subject of the diffident interest of road safety committees – all automobile accidents occur just through this mechanism. Because you can stop a person from having automobile accidents by making them run Reach and Withdraw from a car. It proves itself backwards, you see. You just make him run Reach and Withdraw, Reach and Withdraw and Reach and Withdraw and Reach and Withdraw from various parts of a car, and the next thing you know he not only can drive the car but he won't have accidents with the car and the car will run. It's quite interesting.

Person want to cure this sort of thing up – he might feel like he looked like a silly ass doing it, but he ought to just stand alongside of a motorcycle and run Reach and Withdraw on the motorcycle, and then take and drive the motorcycle and actually consciously run SCS on the motorcycle. While riding the motorcycle, you run SCS on the motorcycle. It's a very interesting activity. Do it very slowly, and so on, and the next thing you know you get horrible feelings like you don't want to ride a motorcycle anymore, and you get somatics and you get all kinds of things. Well, what you've actually done is put a motorcycle back under control and the mechanism by which it goes back under control is the overts start blowing. You start blowing overts.

Well, there are many ways to blow overts, but the best way to blow overts is the Security Check. Because the overt only remains bad if it is withheld.

All right. It's an overt to go to war in this society, so-called, that we have today. It's an overt to go to war. So therefore, one must withhold going to war. All kinds of nasty words: "jingoist," "warmonger." Oh, there's a whole dictionary of these things, you see, of anybody who thinks of going to war.

Do you see what's happening? Commit an overt called war, and then they withhold another one. You see, so therefore they commit another one, so therefore they withhold that, and so forth. And they're more and more individuated so therefore they can less and less control war, until you get leaders that get up and bleat from over the radio and microphones to the nation, "I hate war." [laughter] And he's building up a war situation. Year by year, he's just building up a worse and worse war situation. He's not doing anything at all that'd avert war. He's just telling people how much he hates it.

I remember the marines on Guadalcanal had that down, boy, they had that down to a very fine point. They could give that speech from one end to the other. "Eleanor hates war, James hates war," they had it all down, taped. See some guy – all you had to do for a laugh is just start giving this speech; it was the standard humor. The US was involved in one of the nastiest wars it had ever fought under the leadership of somebody who hated war.
Now, it's quite interesting, isn't it? International peace and the destruction of this particular playing field is at stake against this exact mechanism. You see, war is so terrible it cannot be fought. Yeah, what's that make? What's the next immediate step? Fight it! Because it's on automatic. Nobody can stop a war.

You know, you sit back, and after a while you don't know whether to laugh or cry, you know? This Berlin thing, Berlin. All right, so the Russians wanted to fight about Berlin. Of course they'd want the city, and so forth, because somebody's free in it and they can't stand that. And so there's this pawn sitting out there. Well, it was set up by somebody who hated war, so he set Berlin up there so that it would create a war. That was the way they divided Germany, you see. Start another war, inevitably.

And has anybody all through the years that Berlin has been sitting there as a crisis – potential crisis, has he ever gotten a counterpawn? All you'd have to do is say, well, Budapest, actually, or Vienna, or something like that. Start agitating for the Russians to give up Vienna, you see, or – after the Hungarian thing, and so forth. Just start treaty talks at once with them: How far they withdrew beyond the Hungarian border, not how much Hungary they could have, you see, but just a reverse, you see.

"How much of Russia are you going to give up beyond Hungary? Now, that is the point." Well, it's a counterplay, don't you see?

And the Russian says, "Berlin."

And you say, "Well, we're not too interested in Berlin. How about this Hungarian border? This Hungarian border? You see, there's an old treaty, the treaty of Budapest, that was made by the early Huns, which were your people." [laughter] You get the idea? And everybody's just all built up on this idea, and the Russians start worrying, and they say, "Well, better talk about Berlin, you know. Dangerous thing to talk about. What the hell will these people think up next?" [laughter] Just counterplays.

Has anybody bothered to pick up a pawn? No. So we must decide then that they are heading for war. They're not playing the game, so the game is going to occur. And it won't be a game. Interesting viewpoint.

But that's individuation from a subject which then no longer becomes controlled.

And that is true in all life. That is true in all life. When a person totally individuates, he can no longer control anything. A good garbageman sure has to be able to be garbage, let me tell you, man. But the idea of being able to be garbage immediately wipes out any possibility of his ever becoming garbage. Isn't that interesting?

Now, way to make little kids have accidents is just keep telling them they mustn't have accidents. Simple. Simple mechanism. Just say, don't touch this, don't touch that, don't touch something else. What would happen to a pc if you stood around saying, "All right now, we're going to run a little process on you. Now, stand in the middle of the room. Good enough. Now, don't touch that wall, and don't touch the ceiling, and don't touch the floor..." What's going to happen? Well, yet parents run this on little kids all the time and they fall down, bark their shins and that sort of thing.
What's very interesting is our kids around here don't get much of this run on them, and, well, they haven't to date had very many accidents. They don't have the usual childhood accidents, and so forth. But I see people worrying about them every once in a while. Little Arthur or something will be walking along a high wall, you see, with disaster on both sides of him, and I've seen somebody go "Ughhh," you know, like that. Why suggest it to him? He doesn't think he's going to fall off. He won't. He doesn't either.

So there's the basis of individuation. The basis of individuation. If you're going to make beer, you've got to be able to be beer, you know? All right, you've got overt's on beer and withholds on the subject of beer, why, you of course aren't going to make any good beer. Now, another mechanism takes place – to give you a broad view of this; although this sounds very chatty, Security Checks are a very vital thing to understand in their full panoply – and that is, that after you have gotten to the end of the corridor, room one, room two, room three, room four, room five – what do you know? You can't stay out of the place you left. It is impossible. Having backed up to the end of the corridor, you now find yourself at the entrance to the corridor but unable to leave.

In other words, you snap terminals and obsessively become the thing of which you have overt's against. And that is what is a valence closure. And as a result, the individual gets stuck in various things, obsessed with various things, you know?

Now, you take one of these dear old ladies that's protecting cats. Brother, man, I've seen them around, and after they've talked to me about... Well, you got to realize the reality of a cat. In the first place, to have much to do with cats you've got to know cats. And cats are a package of a certain I'm – series of I-am-supposed-to's. And these are neither bad nor good, they're just the I'm-supposed-to's of a cat. And cats have a whale of a time playing with half-dead mice, and half-dead birds, and they kill certain things (they're supposed to), and they have certain habits which are not necessarily very endearing habits at all.

And on the other hand, they have certain admirable qualities, and so on. And this is a cat. And it isn't a "Poor dear little pussy." [laughter]

Well, how does a cat's I'm-supposed-to's suddenly become this poor abused little thing which must be superprotected from life. How does it get that way? Well, the person who did this must have been hanging cats, shooting cats, beating cats, and then not telling anybody about cats. And then as a child in some life, you see, he strangled cats as a pastime and then kept saying that it was done by the boy next door, don't you see? Had to be withholds on this thing every time. And we just keep going like this, and after a while, why, "De poor dear little pussy," you know. And you look at this lady who's telling you that, you notice the way she's wearing her hair, and you look her over. She won't buy a fur coat made of anything but cat fur. But it mustn't be of cat fur, you see, so therefore it's even synthetic cat fur, but it's very con – involved.

But what she has done is back up the whole corridor, don't you see, and then found herself in nothing but a cat. See, she – you can only get only so far, and then it snaps back. That is the mechanism which actually takes place, and that is a very general mechanism of life.
The police officer who is an honest cop and resists criminals and then gets withholds – the withhold is an absolute necessity to individuation. And he gets overts on criminals and then withholds and then goes a little bit wrong and withholds that. And life after life, why, this thing goes, and next thing you know you've got a criminal police officer. And in the next life or two you'll find him being a thoroughgoing criminal. See? He – overts on criminals and he becomes a criminal. That's the mechanism.

You look at some fellow who is a criminal, trace it back to a time he was a police officer and you won't always be wrong. You won't always be right, but you won't always be wrong either. But it's a cop who went crooked by starting to withhold. He's been withholding. And of course that's one of the best things police forces do.

I've been very hard on cops in this particular lecture and I could be accused then of having something against cops. But I don't have what I – people usually have against cops. I am just running a supposed-to-be, a bit of an ought-to-be, on a cop. I think in a society that has any order to it, this kind of a situation should exist: that the people who are being what they are being should be what they are being, you know? That's an awfully innocently crudely look at things, you know? If the fellow's the mayor of the town, he ought to be the mayor of the town and he ought to be a mayor of a town, see. You shouldn't have police who are criminals, you see? All kinds of weird mishmashes. I believe in the simplicity and purity of it all. All I'm saying is I'm against pretense.

But anyway, where you have a pc who is loaded with withholds on a Security Check, you have a pc who is very individuated. Got the idea? So therefore you have somebody who can't be. And you're trying to find valences. And of course you can't find valences easily on somebody who can't be. But you can pick out and find the fixed valence the person is in. Because it's been this mechanism which has led up to his becoming that valence.

So you could find a person's terminal without completing his Security Check. But you will find that where a person's individuation – forced on him, or actual and so on, to such a great degree that he's loaded with withholds – you'll find he's very hard to get into session. He ARC breaks, he gets very upset in sessions, and so forth. Well, he can't be a preclear.

Well, now there are two routes by which he could approach this point of beingness. You find it in that he's critical of the auditor. This means he has withholds. It also – that also means then that he is having beingness trouble. And he can't be this thing called a preclear. And you have your first rudiments process on that, which I choose – I believe you have by now, which is the Shakespearian approach: "To be or not to be. That is the question." What's he willing to be and what he'd rather not be.

Now, you'll find out that will walk forward but if you run much of that, two things will occur. One of them beneficial and one of them harmful. The first of them is that it will soften him up on a Security Check. You'll find out all of a sudden he'll be able to do a Security Check better if you run that process, see. Because beingness and withholds, these things are counteropposed and one tends to solve the other, see. All right.

And the not-so-beneficial part of it is, is of course it walks him into his valence chain without the valence chain being identified. You don't know that this fellow is being a beer-maker. You don't know that he's – that is his terminal. But because you've run an awful lot of
this process, you have walked him into the engrams on that chain. And that process walks people into engrams. So don't make any mistake about it and be alert. That isn't any reason why you shouldn't use it. But you can get to a point of running where the person is not ready to run an engram. He's not ready to run the engram. You haven't got his terminal; you haven't done any Prehav runs; it's not sorted out at all. Yet there's your pc sitting in an engram.

Well, at the moment, call it one of the risks of the business. Because man, you're going to turn on some fancy somatics if you don't watch it. Thing to remember is, the somatic that the pc has, is where he is on the track, and it is only at that place on the track, and won't release from any other place. So you can walk him away from that place on the track, which keys it out, or you can walk him into that place on the track and as-is it. And these are the two things, the only two things, that processes do with regard to somatics. They either walk him away from it by getting him closer to PT and in other channels, or they walk him into it, where he as-ises it. And of course of the two there's no choice. The second one is easily the best solution.

Now, withholds will very often soften up and knock out present time somatics by walking the person away from the area, and maybe that's a good thing, see? The person could be tightly into an engram – in life, you see. The engram is just keyed in a hundred percent and there he is in life, in an engram. So that means he has very harsh somatics. He's got arthritis. He's got what you commonly call psychosomatic illness of some kind or another. Well, he's right in an engram.

All right, well you can walk him out of that engram, by moving him off so that you can then, when you've found his terminal, move him back into the engram. You got the idea? You might say the fellow's so close to it he can't see it. Well, you couldn't see it either and the possibilities of getting him there – of course, you find his goal and find his terminal and then run him for a while on the Prehav Scale, you'll find him landed in that section of the track, that's for sure.

But he might be so tightly in that section of the track that he couldn't even put his attention on the auditing session. See, that would be an interesting state, wouldn't it? I mean you'd find a pc then who's unauditable. Well, let me tell you the best approach to this, until others are found, the best approach to this is simply a Security Check.

Now, you can even run a Security Check on the basis of the chronic somatic that is making the person unauditable. Person's got so much eye trouble that you can't possibly – well, you just, see, all he does is talk about these eyes. And it's just a chronic present time problem. He talks about eyes and he talks about eyes and – his eyes. And you run into it, and you try to run a session and you run into eyes, and so on.

Well, that's boring. Because the truth of the matter is you've got to have his goal, and you've got to have his terminal, and you've got to run him on the Prehav Scale and then the engram will eventually turn up where his eyes are loused up. See, it's one, two, three. That's the way the thing stacks. And there he is sitting with bad eyes with a present time problem. And it's a present time problem so his case is not going to make any progress, and you can't find anything because he's got a present time problem. You see the knotty mess that this makes, see. You can't get it because he's got it.
And a very excellent way of getting at this and making him auditable, is to security check him. And you give him Security Checks and then he walks off from all this because you've knocked out this obsessive individuation, see. And he can walk off from the track then to where his eyes are being butchered and he'll tell you. Don't be taken in by this. He'll say, "Oh, my eyes are cured. They're well. I mean I've never been so well before in my life. Everything is fine, and so forth." Well, take it with a grain of salt. Pat yourself on the back for having temporarily relieved it.

Don't bother to tell him that he's not going to experience permanent this and that. Maybe it never will get that good or that bad again. Nobody – who knows? But for sure, when you get his goal, and you get his terminal, and you run him on the Prehav Scale, and you're running him on the track, why, one fine day you're going to do an assessment of the engrams he's run into, and there he is with those red-hot pokers in both eyes. And the somatics come off right there in that exact incident and that is the end of it. You see?

So up to that time you've done an assist, an alleviation. Which means you've walked him away from the valence in which he was obsessively stuck. But don't kid yourself that you cured him, because you haven't. And that would be the history of all chronic somatics we've run into in Dianetics and Scientology. They key out, they key in, they key out, they key in. And we sweat ourselves to death keying them out. And then after a while they key in. And then sometimes we're lucky and we key them out and they stay out. Marvelous. Now, somebody's going to get ahold of that person one fine day, is going to find his goal and his terminal. And even before he has a chance to do a Prehav run or anything else, bang! All the somatics around again in a thud. Disheartening, huh?

Well, the thing to do if that kind of thing happens, Security Check. Knock out the individuation and you'll knock out the chronic stuck in the engram. Why? Because he's backed up to the end of the corridor until he is at the front of the corridor, you see? Well, if you can at least get him to the back of the corridor and up – halfway up the corridor again, toward it again, see, you can do it with a Security Check. And he can be audited halfway back up the corridor again. You got the idea?

Of course, he's always got the chronic somatic on the chain of the valence which will be his terminal. That's why you must always have it correct. That's why you must always have a correct goal and correct terminal. Because there's only one valence chain in which he's stuck. And that is the way the cookie crumbles.

So the use of a Security Check is what it is, and don't be bemused into thinking a Security Check is more so. By rendering tremendous numbers of Security Checks, of course, you put the person into better communication; of course, you put the person into feeling better about life; yes, he isn't going to get that bad again; he's going to feel good about a lot of other things, and that sort of thing, but basically you've made him auditable. Because after you've gone all the way around, give him the Security Check, straightened him all out; you find his goal; you find his terminal; run it on the Prehav Scale; assess the engrams that he has run into where he was in valence; you run one of those engrams; and bang, you run right back into the chronic somatic he was running from. Only now it's on full and will run out.
So you get the circuitous routes here by which you can take to alleviate chronic somatics or banish chronic somatics. And you sometimes have to alleviate chronic somatics in order to get the case into auditing condition so that you can banish a chronic somatic. Now, does that make more sense?

We have all these years of experience behind us about all the various routes, and I'm talking to you now about a route, and throwing it into your lap and saying, "Well, you better be good at these things."

Now, I could have told you a great deal about how to do a Security Check. But there have been lectures on that sort of thing, you've got textbooks on it, you've got bulletins on it. What I'm trying to tell you today is simply why you should do a Security Check, what a Security Check will produce, what to expect of a Security Check, and, more or less, its general use in auditing.

I don't think you could do the type of auditing you're doing smoothly now without Security Checks. I think it'd be impossible. So the Security Check is very, very valuable. But don't overrate it, and don't underrate it. And don't, for heaven's sakes, go riding a hobbyhorse that if everybody in God's green earth confessed, it would be a paradise. I think it'd be a mess.

The end product of no withholds is good communication. The end product of no withholds is not Clear. It's just good communication.

So you use Security Check to set somebody up for auditing. Person's difficult to audit, think of Security Checks. That's one of your best ways out. Trying to resolve all the present time problems and all the rudiments of the pc and all of that sort of thing and going on over this is absolutely necessary. You've got to do this. But there's one positive tool that does do this. We have tested some other tools and they're nowhere near as positive as Security Checks. So that is its value.

A Security Check well done keeps rudiments in. A Security Check badly done and rudiments will be consistently out. The Security Check can be tailored to represent the area of the person's present time problem so as to key it out so that you can get him back down and actually get at the source of what his difficulty is.

Those are its uses, and I hope you will find what I've told you of some value.

Thank you.
GOALS AND TERMINALS ASSESSMENT

A lecture given on 14 September 1961

Okay. This is 14 Sept., AD 11, Saint Hill Special Briefing Course. And there's nothing much to talk to you about today. And probably you should all go home. There's hardly anything to learn. It's too much. And besides, if you did learn it, what could you do with it?

People would get Clear. Just people would get Clear, that's all. Something horrible happen.

You got a new routine that is going to require of you some additional skills. And that routine, I repeat, consists of: setting the pc down, finding the pc's goal, finding the pc's terminal, assessing the Prehav level and running the Prehav level. And then assessing for engrams the pc has been in valence in. And then handling the various engrams one by one.

And now we come to a question mark. How soon we return to the Prehav general runs after we've done that? It's not been determined. But I'll tell you this: you'll see a pc's needle get awful loose after you've run a couple of engrams. Boy, it starts getting awful loose. I'd say offhand it probably depends on the pc to a marked degree, how many engrams you run him before you run back to the general run of things. Because after you've run one or two engrams, of course, the pc is going to be in some sort of a – well, he's going to have all kinds of locks and everything stacked up and a whole new set of engrams. And you find the pc changes gradiently. They lose their chronic somatics at first. And then they lose their chronic emotional difficulties. And third or fourth engram, why, they probably lose some other things and start to get down to cases on the thing.

And then if you do another general run, assess again on the Prehav level and do the general run on their terminal once more, you'll probably come up with some more – an interesting series of engrams again. And then you have to do the same thing.

Theoretically, the engrams should run faster and faster. They should do better and better. And we're into a phase of it which we've had trouble with before. And that is getting somebody to run an engram. And we have the answer to that. Get subjective reality on being in some engrams and you won't have any difficulty running them. Trying to run an engram without any subjective reality winds up in ARC breaks and upsets of magnitude, but nevertheless can be done and will have to be done in some places of the world. All right.

Now, that general a rundown, of course, is flanked by Security Checks.

The whole thing is flanked by Security Checks. Everything about it: Running engrams, general Prehav run, terminal checking, goals checking – just to run it backwards. That's all flanked by Security Checks.
What ratio of Security Check and so forth? Well, the more difficult it was to get a pc in-session, the more I'd concentrate on Security Check. See, the more – that's a proportionate amount. If the pc is difficult to get into session, or difficult to keep in-session, I would just come down on that Security Check with spiked boots, because that's where it lies. That's where you're going to get the fastest release of anything.

And if you can't seem to get anyplace on a Security Check, there is an extreme form of Security Check known as the Not-Know version of Security Checks. I wouldn't advise running it. Now that you're running engrams, there is no point in running the other, because you'll run him into two or three different chains. If you start running Not-Know, you see, on engrams and that'd carry forward one set of engrams and then the terminal carries forward another set and it's all kind of messy. And if you're going to run anything like engrams, I'd just run them on the terminal line. That's where they appear.

Now, let's look it over. What's made this – what's made this activity possible? We were steered widely out of course by auditors taking forever to assess, or auditors taking no time at all to assess. This is – lecture is on assessment, Goals Terminal Assessment. I'm just following the routine down. Yesterday I took up Security Checks. Today, why, I'll take up Goals and Terminal Assessments.

We were steered wildly out of our course by auditors – number one, first instance – just assessing I don't know what! Get some old tomato can off the shelf and gaze at their reflection in it or something and say, "Well, that's your goal and that's your terminal and you've had it."

And then that went to the other Aristotelian extreme of, well, 285 hours later we're still assessing for the goal.

Somewhere in between that is the best amount. But if you take more than ten or twelve hours for assessing for a goal, I can tell you very, very plainly that your rudiments are out.

Now, Washington course, you know, had thirty students and throughout the course – in the course of thirty hours; they probably only got about thirty hours of auditing per student in that six weeks' course on goals – and during that thirty hours, they found not one goal. There was no cross-checking on rudiments in that course, unlike the 22nd American, unlike the South African course. Similarly, very few goals were found on the Melbourne course and I don't know positively whether or not they checked rudiments on each other or not, but I would say not. If they did, it was very ineffectual.

And it boils down to this. Although the Instructors of the Washington course are very incredulous – they are sort of uhuag-high on the communication lines now. "Well, were certain people in the course that we found the goals and terminals on – well, were the goals and terminals in their first 150 list and – ?" you know, they're just – just don't believe it. They just don't believe it. It just is not possible for them to comprehend that every one of their students had their rudiments out.

Now, what they're not estimating is the delicacy of the goal and how rapidly it disappears from sight. And you've either got to be a very skilled auditor with terrific altitude or you've got to have the rudiments in. Take your choice. I can get goals and terminals with the
rudiments out. All right. That's simply a question of altitude. The degree of altitude you have over your pc is the degree you can keep him in-session. And that is the whole story of how to get the goal and terminal.

But if you sit there and apparently don't know what you're doing and you're very un-positive, you know, you take the E-Meter and say, "Well, let's see, now. Where's -- see the instruction book over here. See and so on and so on and so on. Hm-mm-hm-mm-hm-mm-hm-mm-m. What's this? Oh. Oh, I haven't got the cans plugged in. Now, here are the -- these are the what? The uh -- cans. I don't know -- why are these called cans?" you ask the pc.

You haven't got any altitude anymore. [laughs] It's gone. You just poured it down the sink. And that's the end of it. All you've got to do is sit there, unconfident and you get an unconfident preclear. All you've got to do is look stupid and sound stupid and you'll have a stupid session as an auditor. That's the whole works.

You've got to know your business. And the degree that you inspire confidence in the pc is actually just the degree that you know your business, the degree you could do the TRs, the degree you can do Model Session, the degree of familiarity with which you handle the E-Meter, the positiveness and directness of your questions to the pc. These things are all altitude. If you want to know what altitude is, it has nothing to do with your past record. You can have the most marvelous past record in the world. And you sit down in front of this pc, fumble with the E-Meter, fumble the command, be unconfident in your handling of the pc and you have no altitude. So altitude is never automatic.

Altitude is made. And it is made right in session, every session, by the expertness with which you do the session. And if you want altitude, all you've got to do is do a letter-perfect session. And that's all there is to altitude. Because that itself inspires confidence in the pc. That's well worth knowing, isn't it?

Don't let me ever hear you say, now, any of you, "Well, if I were just Ron I could get this done in a hurry." You just say instead, "Well now, if I acted like I knew my business well enough, I would get this done in a hurry." Okay? Because look, I've got no altitude with some of the Pullman car porters I've audited. They don't know me from Adam. You know? Lots of the people I've audited -- they never heard of me, they never heard of Scientology, they never -- nothing. Yet they respond immediately and at once. Bang! Well, why? Why? Well, because I don't fumble. That's about the only thing you can say about it.

Also there's very high R. I keep a very high R in a session. Reality up, up, up. I don't get chatty or nonsensical with the pc, but I am apt to be slightly didactic in a session. Not overwhelming, but just to keep the R up. If I don't think the pc is acting right, I'm liable to ask him "Why aren't you in-session?" You know? I'm sitting there wondering why they're not in-session, so I ask him why they're not in-session.

This R-factor is such a tremendous factor and is so little appreciated and so little understood, that a person's auditing will be incomprehensible to him in that it's apparently good with one pc -- or on one day and not good on another pc, or on another day with the same pc. You see, it's his auditing skill is -- goes over the roly coaster. Well, that's because his R goes over the roly coaster; his reality on the subject goes over the roly coaster. A pc can always tell. And so forth.
Well, I gave a session last night, if the pc doesn't mind my remarking on it. And the pc was at once struck with the fact that we were not going along as smoothly as we had the session before. Well, there's no question about the fact that the R was out. But it was out between me and the session. It wasn't out with – much with the pc, it was out between me and the session.

Now, how was it out between me and the session? I didn't know what the hell to do! Two nights before I had this pc in an engram – night before – had the pc perfectly, right there. Had it all spotted and identified, all ready to run.

Next session I was going to take it up. Of course, that's a little mistake in itself (to locate an engram and not run it, see?). But not much of a mistake. You'll find yourself doing it quite often. It's unavoidable. And set the pc down and, "What do you see?"

"Well I see blackness."

"What's going on?"

"Nothing."

What reactions can a guy get on a meter? Nothing. I start talking about this incident. Nothing. I get nowhere and I suddenly say, "Where the hell am I and what are we doing?" Well, I didn't express it aloud too much and the R went out just like that. But I myself was totally baffled. What the hell was going on? Pc was of no assistance whatsoever. Quite – quite usual in running the type of engram you run into.

The pc says, "Well, I just don't know." And that's it. You're not even asking him a not-know question. "I just don't know." And then the pc will get restive, too, when you've located an engram perfectly and the pc right in it and then you hit the same engram and the pc can't find it.

Pc says, "What's happening?"

Well, of course, to some slight degree, they blame the auditor. "Why don't you take me and shove me into this engram?" You know, that's the kind of a thing.

Well, what engram? How could I shove a pc into an engram I couldn't locate, identify, do anything with? I mean that engram was a szszszsz.

You say, "What are you looking at?"

He says, "I'm looking at blackness."

"Yeah. Well, good. Now, where's this – go to the point where something or other was happening the last time," or something like that.

"What do you see?"

"Nothing. Blackness."

Well, let's see what we can find in this. Well, in the first place, you're not – you're not looking for a needle in a haystack. A person who's looking for a needle in a haystack is looking for a needle. See, he knows it's a needle. Well, looking for an engram, you don't know what the hell you're looking for a lot of the time. You just don't know what you're looking for,
GOALS AND TERMINALS ASSESSMENT

because that's the keynote of an engram: "Don't know." Pc can't tell you. He can't find out on the meter and you yourself don't know. Now what?

All right. So the R-factor went out and it was a little bit difficult to keep the pc in-session. Because my reality factor went out because it startled me. And then I never remarked on it to the pc, see? It did startle me. Was the pc in the engram? Wasn't the pc in the engram? Had we lost the engram? Was there something else? Were we on some kind of a chain? What was the matter here?

Of course, it worked out the pc was in the engram and the engram didn't have anything much about it. It was just totally dark. It was all black. It was black for a whole lifetime. The pc was blind. [laughs] There were no remarkable somatics. There was nothing very dramatic except how the pc had lost her eyesight and that was done under an anesthetic and that was unrecoverable. Took three hours to run the engram which was kind of a championship run.

And I finally even resorted to lock scanning and some other tricks. Not lock scanning. I scanned the pc through that whole lifetime several times, trying to make the pc hang on the point of trauma. Pc never hung. Just the pc would keep running into these things and learning more about it and ran emotion and things. "When were you apathetic?" Yeah, you know? And so forth. Ran off emotional curves. Did everything I could think of. And we finally got it. And we got it all straight and it was the damnedest story anybody had ever heard of. It almost made me sick at my stomach. But there it was. There it was.

But the R-factor went out, basically, because I wasn't too frank with the pc because I was taken totally by surprise. You find the engram, there it is. It has the somatics, it's all properly registered, it's got a picture, it's got visio – there's everything with it. And you say, "Well, well catch it next session." Next session, "What engram? Where?" Pc was right in it. That was the trouble with the whole thing. Nothing ever happened. Pc totally dependent on visio – no visio. Sonic shut off. Emotional downcurve, everything else. All right.

Now, I could have done better on this. You can always do better. You always have a six-foot rearview mirror with a tiny little peephole in the front.

And I could have said, "Well, this is awfully odd here. It's a – we had it and – where is it? Where is the point we had last night?" And, you know, "I'm puzzled about this," and possibly the R-factor would have gone up. I don't know whether it would have or not, but it would have made an easier session. Well, it wasn't difficult to run this session. Nothing happened except it just wasn't a very high-powered session. And it took about three hours to run the thing, see. But I think it would have taken three hours to have run it anyhow, because it was a whole lifetime from earliest childhood to complete adulthood, all blind, on a pc who was totally dependent on visio. Well, that was a rough one to crack. Not many somatics connected with it. Nothing very dramatic that way. All right.

The R-factor has a great deal to do with this. The auditor in this case was suddenly uncertain. You wouldn't have been uncertain. I had a horror when I got halfway through running this – "How in the name of God one of these auditors in the class would run this thing, you know?" Because, brother, I was using the whole lousy lot, you know? I was using the whole book of tricks from A to izzard. You know, I was running emotional curves and I was running Not-Know in all different kinds of fashions and I was using scanning – not scanning through
engrams, but scanning through a lifetime. And you know, you scan somebody through a lifetime and he'll hang up in the moment of trauma, see.

And you say, "Well, go to the beginning of this thing. Now scan rapidly on through to the end of that life," and he'll hang up in the engram necessary to solve that life, you see?

And the engram was a whole lifetime and I'd never expected this breadth. I thought I had about – you know, I didn't think about it very hard. I thought maybe I got an hour or two, see? An hour or two of a lifetime. Oh, no, no, no, nothing like that. Something on the order of – I don't know – sixty, seventy years. Pc finally had a cognition and the pc exteriorized from the body and could see again. Why, she had the cognition – well, she said to herself, you know, "Well, why didn't I do that a long time ago, you know? Why did I live that lifetime at all?" That was what it amounted to.

But the pc was on a chain, where the pc's taking it all for granted. See? It since – that chain is very usual to the pc and is very outrageous to the auditor. It's fantastic! See?

And the pc says, "Oh, yes, yes." Something on the order of "Well, they took the Empire State Building and parked it on a cloud and it sailed away, you know?"

And the pc is going on with perfectly usual, ordinary activities, you know. "So they took a drink of water," you see, is the way it sounds to the pc going through it, you see? And to the auditor it says, "Well, so then they took liquid fire and poured it into everybody's ear-drums," you see. It's just going – just completely jarred out. So the R-factor couldn't have helped but be out in the engram. And only somebody with a natively high R-factor, you might say, could have kept it in. But I had horrors. I said, "How in the name of God could they run this one?"

In the first place, they would have said to the pc, "What are you looking at?"

Oog-h! And the pc would have said, "Blackness" and "I don't know."

And just about ten, fifteen minutes with that type of questioning after it, you would have been absolutely certain – almost all of you – would have been absolutely certain there was no engram there. And the pc is sitting right in the middle of it. And you would have gone off and tried to run another engram, your pc would have ARC broke and that would have been that! So it was a dynamite situation. It's tricky. It's tricky.

All right. Well, you can confront that in due course, but confront first how to find a goal. And the R-factor is terribly important when you run an engram, but it is even more important when you are running goals.

In the first place, Homo sap, apparently, gets in a games condition about goals, so the R-factor will drop.

"What goals have you had? Go ahead. List your goals. I dare you. Oh. Oh. Ha-ha." I tell you, auditor reality would have been pretty bad to smother them, but auditor reality can be very bad while doing somebody else's goals because it's sort of a native games condition. Won't let the pc have a goal. Apparently, that's what it adds up to. So you just have to overcome this and somehow or another keep a high R and do everything you're doing very positively and very confidently. And the way to do things positively and confidently is very sim-
people: just know your business. In order to be positive and confident, all you have to do is be superlatively good at your business.

And what is your business? All right. This is very simple. Got to have your TRs, your Model Session and know exactly what you're doing with a Goals Assessment. If you know those things, you look confident and if you're willing to let the pc have a goal – and if you're having difficulty getting the pc's goal, why don't you just ask yourself that question? "Am I let – willing to let this pc have his goal?" Why, you'll find out you can get this goal. Now, that is a different approach than rudiments in.

I just call it to your attention here that this is another approach. This comes under the head of altitude. How much altitude do you have while you're auditing the pc? Well, you have as much altitude as you are competent. And that is all the altitude you will ever have. You're competent also in that session. Your competence cannot go on automatic. All right. Now, that is another approach and if you can keep your competence level up and not stumble and bumble about the whole thing and do a proper job of it, you'll find out that the goal doesn't disappear. See?

Now you've got another whole angle of it, is you buck this up with the rudiments and you make the rudiments very good. And you make it so the pc doesn't have any immediate withholds from you. Pcc is willing to talk to the auditor, able to talk to the auditor. And get those rudiments in. Get those in real good. Make sure the pc doesn't have a present time problem and so forth. You can spend quite a bit of time on that. And then get your Goals Assessment done.

Now, let me call to your attention a mistake that was made on the Washington course, which was just conducted. And that is, they were evidently, from the records Mary Sue was looking at, were doing a tremendous amount of Security Checking under the guise and heading of rudiments.

Now, how the hell anybody managed that, I don't know. But it had nothing to do with the price of fish. The withhold that you are looking for while doing the rudiments, is the withhold from you personally which will make the pc unwilling to talk to you in the session.

You aren't looking for all of the withholds of the life. That is why you run a Security Check entirely independent of your normal sessions. You are not trying to do a Security Check while you are doing rudiments. And of course, you would foul up like mad.

As much as eighteen hours of the thirty hours devoted to looking for goals, in the Washington course, was devoted to rudiments. And that is just balderdash! I don't mind saying so, but it was all devoted to doing Security Checks.

Can you think of any better way to deny a pc a goal? Isn't that interesting? You get up so far in the rudiments and you say, "Well, are you withholding anything from me?" something like that.

And pc doesn't have any fall at all. There's no reaction.

And you say, "Well, come now, you must be withholding something from somebody."

"Ah, well, put it that way, yes."
See, you'd never get around to doing a Goals Assessment. Hm-hm-hm-hm. Smart, huh?

Now, if you go on past that withhold button, you want to know what the pc is withholding from you. Right now! And you see, the rudiments are all nownesses. The present time of the rudiments and so forth – the present time problem, as addressed in the rudiments – means a situation which exists now in the physical universe. Whether it's long or short durations, it must have a nowness about it.

Now, the one thing we have stepped a little bit wide from on this is the rudiment concerning ARC breaks, because you'll find that the pc has had a limited auditing track, a very limited auditing track: a few hundred, at most, a thousand or two at the absolute outside. Some old-timer might possibly come around with a fifteen-hundred-hour auditing track. In view of the fact that you've got a pc who has had many ARC breaks with other auditors, it is better to ask, "What haven't you been able to tell an auditor?" and "When?" You see, it's much better to approach it that way.

But you will find out that you can also play this one to death. After you've done that with a pc once and have gotten the backtrack off, you should shorten that rudiment to "me," not "an auditor." "What haven't you been able to tell me? When was that?" You see. You just cut down your track.

Now, the other's under the heading, sort of a crossed-up thing, of straightening up auditing with the pc at the same time that you were running rudiments. So remember that it's got a double barrel. The proper rudiment is just "me."

See, the rudiments are actually addressed to keeping the auditor in-session with the pc – reversewise. Now the auditor has confidence that the pc is not going to go out of session, so of course he keeps the pc in-session. That's the basic purpose of the rudiments... Nobody laughed.

No, it just has to do with that session. The rudiments ordinarily have to do with that session, that auditor. And then, on a gradient scale, it's that session, that auditor, auditors. Don't go outside the realm of the auditing session or auditing sessions, if you really want to start doing fast rudiments and keep them in. Because that's the rudiments that will be out. All you're trying to do with rudiments is not solve a case. You're trying to set up a session so the pc will be in session during that session. That is all.

Now, you will find it necessary to establish a willingness to be a pc, on a lot of people. Well, what's he willing to be and what is he unwilling to be? That goes a long way. That becomes a process. If you needle-flatten it, it is adequate for your purposes. If you tone arm-flatten it, of course you run the whole case.

You get the difference between these two things? So don't – I've altered that little thing in my notes. I don't know if I passed it along to you in that form. But it is just needle-flatten all rudiments. Rudiments get needle-flattened. Processes get tone arm-flattened.

Well, what's needle-flattened? Well, when you don't – when you ask the question again, do you get a needle reaction? You don't get a needle reaction, so you don't ask the question again. Now, that's fairly simple, isn't it? Nothing much to that.
So, let's take a look at this and realize that the first and foremost necessity is a competent auditor, who does know what he's doing and a pc who is in-session with that auditor, even though he might not be in-session with some other auditor. That's your second requirement.

And then actually let the pc have his goal. Don't go cat-and-mousing around about the thing. Let him have his goal. The goal will appear, ordinarily, in the first 150 and boy, that is a wide figure. I mean, that is a big figure. I think it ordinarily occurs in the first 50. But I'm just saying 150 just to take care of exceptions.

Let him have it. If you haven't found it in that length of time, then assume, one, that you apparently haven't any altitude with this pc and two, that the rudiments are out.

Well, now how do you solve the altitude? Well, you solve the altitude with the pc by doing a competent job. And you get the pc in-session, of course, by getting the rudiments competently done. That's all.

And if I didn't get his goal within the first 150 goals a pc gave me, I would just go back and beat the rudiments to death on a whole basis. In other words, I would just hit this willingness to be a pc, you see, with – that particular facet. What's wrong with the auditor is the unwillingness of the pc to be a pc.

I'd make sure that the present time problems and so forth were at least kicked out a little bit. I'd make sure of all of these various points in the rudiments. I would just beat them to death and I'd go back and do the same Goals Assessment all over again. Got it?

I don't know that I would let somebody else check the rudiments, but – seem rather dull. But you might have somebody else check the rudiments just in case they're only in with you or something, but aren't really in with you, or some goofball situation like this that you can't quite undo the lock of.

What is this? Means the pc has become wary of giving you his goal, or the pc has become very distracted from the subject of goals. That's all it means. You haven't got the pc's goal in the first 150? Well, the pc has become distracted.

Now, Goals by Elimination is a perfectly valid way of finding goals. But this can be carried to much, much too great a length. You can do Goals by Elimination just by reading the list, each goal once. Do you realize that? Read the list over and over and over. And you'll still do a Goals Assessment by Elimination. You don't have to add repeater technique to it. It'll eventually work out. Actually, there's hardly even any time to be won. And if you find the pc is getting edgy about repeater technique, well, just start reading the goals list from beginning to end. Simple. Check each one and say, "Well, that one's in and that one isn't in," and so forth and so on.

Go back to the beginning of it and read the goals list again. You'll find those that were in have now dropped out. And gradually it'll boil down to the one that's in and that's it. Because only one goal is going to register.

Now, there is a worse crime than doing a long Goals Assessment and finally finding the goal. There is a worse crime. And that is doing a stinking, lousy, hit-or-miss, who cares,
wrong Goals Assessment. Now you can really louse up a pc. That just wastes the whole works. And it does worse than that. It actually harms the pc.

So do a careful Goals Assessment. And I won't say then that you should rush the Goals Assessment up just to get within ten hours or that sort of thing. At the end of ten hours, you're not sure, well, keep on going. But remember, you've already got the pc's goal when you've had the first 150 and that's for sure. It would be a very unusual and rare case that it went any further than that.

You keep asking the pc for goals, you're just bludgeoning him. You're bludgeoning him with more goals you want. More goals. More goals. More goals. More goals. You can always add goals to the list. But don't knock a person apart, because he can't think of any. And that was one of the symptoms that was turning up on these endless assessments.

Auditor would finish the list and then demand more goals. He'd say, "Well, have you got any more goals?" and the pc would get a needle reaction.

Look, the needle reaction was on "For Christ's sakes, I haven't got any more goals!" See? It was a needle reaction on an ARC break.

And then the auditor would sit there and say, "Well, what is that goal?" What goal? Hell! I could have given it to him if I had been the pc at the time, you see? "I'd wring your neck, man!" You see? Just as blunt as that. Because that's what it amounts to.

You get an ARC break read and you say, well, there's more goals. And that nonsense can actually continue by actual test for about 150 hours. Pretty grim, huh?

There aren't any more goals. All there are, are ARC breaks but they never get cleaned up, don't you see? Every time your needle falls, well, you say, "Well, there must be more goals," but actually it's falling on an ARC break. And the pc does want to find what his goal is, so he somehow or another holds him in-session and he's more or less on auto by this time. See, the rudiments are wildly out when you get into this kind of a situation.

No, sir. You go over a very elementary routine here and without adding anything much to it, why, you will find the pc's goal. It is – of course, from my viewpoint, I'm explaining to you how to find a white pebble in the middle of a black desert. You see? It just isn't possible for anybody not to be able to do this, you know? Because of that impossibility, I eventually had to assign it to that one. There's some kind of a goals condition going on here – which is a super games condition. It's a specialized condition that relates to one human being letting another human being have a goal. And it's even gotten into auditing, which shocks me, you know, because I've never seen anything else get into auditing like this. Must be, though. It was happening all the way around the world.

The first list of how you got the pc's goal is so simple; there's nothing much to it. I mean, so you got the pc to give you a list of goals and then you went over them and found out the one that fell the most and that was the pc's goal. Auditors couldn't do that. Don't think they can. I don't think they can now, because they read cognition surges and all sorts of things on these things. Pc gets a new goal and he gets a hell of a surge, you see. "Hey, what do you know? I – when I was nine years old I wanted to blow up the local bank! Hey, what do you know, you know? I did." You know, he gets a big fall.
And the auditor says, "Well, that's his goal" and writes it down. That's it. And then says, "Well, all right. What's the terminal for this? Who would blow up a bank?"

"Bank robbers would, huh? Well, who else would blow up a bank?"

"Well, I guess uh – most anybody would blow up a bank."

"Oh, anybody? Good, I'll write that one." [laughter] "Uh – uh – who – who'd be capable of blowing up a bank?"

"Well, my mother would be."

"Ah! Your mother. Good. That's it." [laughter]

And of course they got a big fall on it because the person had a – "That's odd. My mother. It flashes into mind she'd blow up a bank. That's very peculiar." And you get a big fall, you see. The fall's never repeated, by the way. The fall would never repeat on the bank and it'd never repeat on this terminal.

So they assess mother on the Prehav Scale – this usually with great care, taking eight or nine hours to do this one. Get all the levels totally reacting, you see, and then pick out one, kind of at random and then run it, you know?

Next time they do the assessment, why, they got 15 levels live and they run on that level for a little while. Next time they do the assessment, they got 24 levels live and they do the assessment and run it again. And now they got the whole scale live and the pc is spinning in.

Just – this is actually the way it was going. So I developed Assessment by Elimination and I found out it worked and proved it out to myself and found out that this was the way it worked and I could do it very easily and it actually made my job easier, too, and that was dandy. And that is to say you took these 30, 40, 50, 60, 100 goals the pc gave you and you eliminated them. And you found out oddly enough that they would all eliminate. Every single one of them would eliminate, except the pc's goal. And I figured, well, nobody could make a mistake doing that, so that was released that way. And the immediate response to that was to go on doing an endless Goals Assessment. Just keep asking for more goals and then more goals and you who were here, you know how that was. It was – it was pretty grim. What was this?

But I was operating on a datum that you don't know about. And that is that people have been assessed – some very rare cases have been assessed to Clear without finding the goal. They must have been by former auditing, you see, just within about three or four centimeters of the top. And then you did an assessment and they cognited on these things and blew forth to Clear. It has happened. Well, in view of the fact that it happened, I thought this other could possibly happen, too, then. But it didn't and it doesn't. And a quick recapitulation on the whole thing showed that the goals were always within the 150 and that was it. So the upshot of this is that it's just Assessment by Elimination.

Now, the person is going to rephrase goals and is going to think of different goals. Of course, you have to put those things down. But it's mostly when the pc volunteers them that
you put those down. You're not beating him to death trying to find vast new numbers of goals. And you'll find that you've got the pc's goal. And that – that's it, because it all eliminated and only that goal is falling.

Now, the speed with which you can do this is totally dependent on your skill, not the pc's difficulty. See, you've got a big altitude factor, you'll at once pull this pc's goal up and there it'll be, you see? But if the pc's feeling a little bit queasy about goals and is getting ARC broke and other things are going off and the rudiments go out, all of a sudden goal ceases to react.

Evidently, it's a very delicate thing. Evidently, the rudiments out can suppress the goal. And in the absence of very much altitude, this happens easily.

You got the pc's goal. The pc gave you the goal, but it disappears off the meter. So do the other goals disappear off the meter. Everything disappears off the meter. Why do they disappear off the meter? Well, because the rudiments are out. That is all.

Rudiments are out; of course, altitude has gone to hell and pc isn't in-session or anything else.

So the proper way to do a goals list – the best way I know of to do a goals list at this time, is to ask the pc to come to session with a list of all of the goals they have ever had. And then sit down, take the various categories of goals, like secret goals, withheld goals, any other kind of category of goals that you can think of and ask him for a few of those. And you ask him for a few more of those and in the next category and get a few of those. And run it down so you're not getting wild needle reactions on the thing. You'll wind up with a goals list there that will be maybe – maybe as much as 150, maybe as little as 60 or 80. And then having gotten this, why, you – well, I just start in doing an Assessment by Elimination.

Probably the best thing you ought to do in view of the difficulties we've had on it, is to check the rudiments. Now that you've got the goals list, check the rudiments and start in from the beginning. And just mark the goals that react as you pass them by. And some of those goals will be quite null.

Now, there are two ways you can do it and both of them are quite valid. One, you can repeater technique them – repeat the goal 2, 3 times. If it's still in, leave it; and if it's gone now, scratch it. And the other one, is just go over the list. Just read the list, one goal after the other goal. And those that are still in, mark them as still in. The next time you read the list, those that are out, you omit. If they all disappear, consider that the whole list has been muffed and get the rudiments very thoroughly in and go back over the whole list again just as though you've never assessed. Now, that would give you the pc's goal. See, I don't think you could miss.

Now, once you've got the pc's goal – once you've got the pc's goal – you want to be very sure that that is it. And the way to be very sure is to get somebody else to check it.

Now, the way to check a goal is to take this goal against some of the others that were reacting last – you know, some that were still in, the last ones that disappeared, something like that – and read it over in comparison with the ones that were still in. You know, go by it casually as though it's just one of these other goals, see, not giving it undue emphasis. And you
may be reading 5, 6, 8, 10 goals there, you see? And you just go over this list, read them
down, see if any of these other goals now react. And then find out if that goal is consistently
reacting.

First thing you want to do when you're checking is to check the rudiments. And then if
the rudiments are out, get the pc to go back and get the rudiments put in. And then check the
goal. Don't check goals with rudiments out. And you'll find that the goal, if that is the pc's
goal, will react very nicely and very neatly and that's all there is to it.

Now, pcs often get very sure that such and so is their goal and if I catch any student
off of this course – I don't care, you can do it maybe off of a course in lower south Ambria or
something. Don't for God's sakes, Q-and-A with this. Don't – don't Q-and-A with a pc, please.
If you learn one thing here, please learn: Don't Q-and-A with the pc.

The pc says, "Well, I just know that's my goal. I just know it is. I just know it is. I just
know it is."

Look, that had nothing to do with the price of fish. The E-Meter knows. Maybe it's
their goal and maybe it hasn't – isn't their goal.

I've had pcs going around this very place saying, "Well, that's my goal: to blow up the
First National Bank and that's it. We know that. Yes sir, that's my goal. There is no doubt
about that," you see. And that's out tomorrow. That disappears. And their goal is something
else. But they can get hung up on one of these goals. But this doesn't mean that because they
get hung up on one and keep on telling you that that is the goal, that it isn't the goal. You see,
the goal they're telling you about may be the goal and it may not be the goal. That's beside the
point. Works same way with terminals. It may be the terminal, it may not be the terminal.
What the pc is telling you had nothing to do about it.

When you check it out, you know. What the pc says has nothing to do with it. That's
all. You just never take what the pc says. That's all, man. You just don't do it! Because you're
going to make some serious damned blunder that's going to wind up somebody in one awful
mess. I'm not kidding.

You take the wrong goal just because the pc said it was that: well, you're playing an
awful overt on that pc. And you take the wrong terminal just because the pc was absolutely
sure that it was a bank president – that was the terminal, yeah.

"Who would rob the bank?"

"The bank president."

All right. That's it! Because that's the most logical one. Of course, that's it. And so
forth. Well, you buy that just because the pc says so?

You run that on the Prehav Scale and the next thing you know, you have more levels
live. And you run it on another level and you've got more levels live. And you're just making
the whole scale go live. And what you're doing is bringing into play every bit of the Step Six
phenomena. Step Six phenomena only took place when you were operating with the wrong
terminal. Whole bank beefs up. The whole bank goes live if you start running the wrong ter-
minal. So it's a very dangerous thing to do. And it's not a mild thing to do at all. And one of
the easiest ways to fall from grace on this is to take what the pc says is his terminal, regardless of what the E-Meter says.

The E-Meter knows. If it doesn't check out on the E-Meter, it isn't it. And if it – if it fails to check out on the E-Meter, it may still be it but it means just the rudiments are out. Get the rudiments in; it'll react.

Now, you assess a terminal exactly the same way and there's tricky ways of assessing terminals. You can ask for both the cause and effect end of the goal, now, under the heading of terminals – cause and effect end of the goal.

I'm not scolding you, but actually my temper has been sorely tried in the last few months on this subject. It's looking for this – not a white pebble; it's this white mountain in the middle of a black desert, you see.

It's very simple. You just take any goal and it usually has a cause and effect. You consider the goal cause-distance-effect, like a communication line, don't you see? And there's something that does it to something in almost every goal.

In other words, "I," you see, "want to rob the First National Bank." All right. There's "I" who wants to do the robbing and there's the terminal to be robbed. See? There's two things there. So you can get two lists and it'll appear on either end. But don't worry about that too much. And if you find it too difficult to reinterpret, just do the simple list.

You just say, "Well, who would rob the First National Bank?" or "What would rob the First National Bank?" You see? And something on that order. There is no point, however, in avoiding this. But you – I'm only – reason I'm putting this reservation in there is because I imagine there can be goals that it'd just try your wits trying to find out which is the cause and which is the effect end of the thing. Like, "to be myself" Well, who is trying to be what? And you've opened up the whole field and you're nowhere. Of course, this is just a nowhere goal. It's quite usual. It's quite an ordinary goal for a pc to wind up with: "To be myself".

Great. "Who are you?" Now you've got a tough terminals run, man. It's a tough terminals run. You've got not a clue. Nobody's got a clue. "What is the terminal?"

"Myself."

"Who are you?" That's the obvious thing you have to ask. "Well, I..." "Who – who are you?"

"Who is trying to be who?" is the double one, see? "Who are you trying to be who?" See? It's quite amazing that you can do a Terminals Assessment on it at all. Yet it's a very common goal. All right.

Now, you mustn't omit – you mustn't omit – things as terminals. Because to a pc here and there, you're going to find a spacecraft is more real than a spaceman. And although we have always so far broken the what over to a who – you know, found spacecraft and it wound up to be a spaceman – I imagine from just that indicator that sooner or later there's going to be a what that doesn't break down to a who. It's going to be the First National Bank and that is it. It isn't any who robbing anything, it's the First National Bank, see. That's it. That's the goal – terminal. It's a what. We've found enough of them.
Well, here's a common sort of occurrence on the track. Fellow is riding around, minding his own business in a spaceship – only blowing up planets and doing other minor things – and hardly troubling anybody, you see, hardly at all. And terrific numbers of overts, you see? And he smashes up a spacecraft 1, spacecraft 2, spacecraft 3, spacecraft 4, spacecraft 5, then starts putting spacecraft 6 in danger, sort of impulsively and it starts getting chipped up. And the next thing you know, this fellow will not assess as a who. This fellow will assess as a spacecraft. Good enough. If you can't make it come out to a who, well it's obviously – that's it.

What's he done? He's sort of splattered all over a spacecraft and is being one.

Now, when you realize that a body is a vehicle this is not as odd as it might look. A body is a vehicle. Thetan carrier.

Now, you've got to use some sense in making a Terminals Assessment. But like, in doing an assessment on goals, you don't prompt. You don't prompt. Just lay off prompting. The safest thing to do is to just leave it alone. That's the safest thing to do. If the pc doesn't say it, it isn't said. You understand? Because you can feed him something weird and get a reaction on it and it isn't quite right and then you have a lot of trouble, then you get an ARC break. And I think most of the ARC breaks on goals is prompting. See, I think that would be the most fruitful source of them. So although I have prompted successfully, it doesn't mean that it always works. He says, "Well, I don't know. To be a denizen of the frozen north. Yes, that's the goal." "That's the goal you're operating on – to be a denizen of the frozen north." All right.

And you say, "All right. Well, give me a terminal for that." It's always a very safe question.

"Uh – I can't think of any."

And you say, "Well, who would be a denizen of the frozen north?"

"Well, I can't think of any."

"Uh – well, who would occupy the place?"

"Well, can't think of anybody at all."

Oh, what a temptation at this moment, you know, to say – because you know you've got it on your own branch line of terminals – goals terminals, you know – say, "The Royal Northwest Mounted Policeman?" [laughter]

Well, of course, the pc has to reject this. Pc has to reject this and to that degree rejects you as the auditor. And every time you give a pc a suggestion of that character and he has to reject it, why, you – he's thrown you – had to throw you out of session. In other words, he had to go on auto, you see, to some slight, tiny degree. And this may be – the source of these ARC breaks may be straight out of the area of prompting. I almost never prompt.

But I've had four or five auditors sitting behind me while I was doing a Goals Assessment on somebody, passing me notes. "It's his wife," you know. "It's his – it's his wife." [laughter] This isn't distractive at all to the pc, you see. [whispers] "It's his wife." [laughter] They don't realize that it's just because I'm trying to hold the pc in-session that I don't turn around to them and say very impolitely, "Why don't you shut up! If it's his wife, it's his wife. And if it isn't his wife, it isn't his wife. And that is all there is to it!"
Now, the auditor's phrasing – the auditor's phrasing of the goal won't run, much less assess. It won't run. It's got to be the pc's phrasing of the goal. So you start feeding him leads – oh, wow! See, you've just opened up the doors to all sorts of errors. He's got to reject the auditor. He can't rephrase it himself, you see. So just knock off the prompting and you will be a very much happier auditor. You know what's wrong with the pc. The pc is always looking like this, you know? Always looking like this. And he says, "Mmmmmmmm. Mmmmmm. Mmmm. "You know, he always does. You say, "He must be a robot." It's very obvious he's a robot. Very, very, very obvious.

And he sits there and he can't think of another terminal and he doesn't know what would be in a factory, see? He just hasn't any idea, you know, what would be in a factory.

"Factory, factory. Nobody in factories. Factories are always empty."

You know and he goes, "Mmmmm, hmm."

You say, "God Almighty, why didn't he fall wise to this thing?" And a terrible temptation, you know, to say "Could it be a robot? Could it be a robot? Could it be? Could it be?" Well, he gets all wound up. [laughter] He's got to reject you. Got to reject you by rejecting the suggestion, don't you see? And he's got to look at it. Now, he's got to get his own thought channel straightened out and back again. He doesn't quite know what he's doing. And you can waste a half an hour session time, just like that – bang. That is the least that will happen with prompting.

Turns out it wasn't that at all. The terminal is a derrick. He'll finally fall wise to it.

Now, in view of the fact that the terminal has got a lot of not-knowingness connected with it, don't expect them to come up with rapidity. Expect a lot of comm lags. Expect a lot of comm lags on something of that sort.

Now, wherever you have a pc in session on a Goals and Terminal Assessment, your temptation, because it is apparently a very loose action – not a very tight auditing situation, don't you see; he isn't running anything and so on – your tendency is to be loose in your auditing. You let down your barriers. And when you let down your barriers, your altitude goes right along with it. You've got to be more careful during a Goals and Terminal Assessment of proper adherence to a professional appearance than in any other auditing situation.

It's obvious that auditors haven't done this because they've taken forever to get terminals and goals. So casualness or lack of discipline in carrying out the routine must itself be very poor.

Now, there is no routine designed that does solely a Goals Assessment. I thought of designing one time – and I said, "Oh God, that's too" ...something or other – a special Model Session, you see, for a Goals Assessment. I thought afterwards, "Oh, that's going too far, man. Another Model Session?" and that sort of thing. You don't have to have one. But you certainly have to keep up a professional demeanor and you have to be very crisp and you mustn't let it down and you must carry it forward competently or the goal will disappear. And later on when you get the terminal, it'll disappear. Anything is liable to happen in this line.
So, you take your E-Meter and you put the pc on it. And you read things off in a very businesslike fashion. You acknowledge every time, whether the pc speaks or not. It is not necessary to have the pc say one single word while you're reading a Goals or Terminals list back to them, but always acknowledge as though the pc has spoken. Always acknowledge. You say, "To rob the First National Bank," he says absolutely nothing. You say, "Thank you."

Sounds kind of odd to you, but you'll find the pc gets hung up. He's kind of answered it, don't you know? He kind of, you know – he's thought it. Now, that's enough.

Now, for a pc to be required to speak or answer up, or say very much while you're reading a list like this, is quite distractive. And you think the pc may not be in-session. So you may be trying much too eagerly to get the pc to look like a pc while you're reading this list. And it's not necessary at all. All he does is sit there on total irresponsibility, holding the cans. That's enough.

All I expect of a pc is the goals list and the terminals list and to sit there in some kind of a – of a state of attention, no matter how slight. That's all I expect of a pc in doing a Goals and Terminal Assessment. You know? He isn't supposed to say, "Oh well, yes. Oh, rob First National Bank? Well, yeah. Why, you just read that goal. I see. Rob the First National Bank. Let's see, I'll think about robbing the First National Bank for a moment. That's fine." Oh, bunk! You don't want to have anything to do with that. See?

So you tell a pc before you start reading the list, "You do not have to speak. You do not have to say anything if you don't want to. It is only necessary that you sit there and listen to me read this list. That is the only thing I actually expect you to do and if you want to say something, why, by all means, do so."

And you just say that to the pc before you start any kind of a list. And you'll find out you'll just make hay left and right, you know. Ram, wham, wham, wham, wham, right on down the line. All right.

Now, on reading a goals or terminals list, you of course read only instant read. You do not read latent read. If the read takes place more than tenths of a second after you've read the goal or terminal, it is a latent read. It must read now. And you'll find the further the terminal is off the line – the further the goal is off the line, the further the terminal is off the line – if you could time the meter reaction with a microsecond meter alongside of it, you would find there's a direct relationship to how far the goal is off the line to the length of time it takes the E-Meter to respond. Unfortunately, it's measured in microseconds.

The further it is, the slower the read. Until this gets over to total idiocy. You see, it's dropping fifteen or twenty seconds after you've read the goal. Why, that has nothing to do with it. Nothing to do with it – pay any attention to it. It isn't even a read. It's an afterthought. Remember that the goal and the terminal are the sum and substance of the reactive mind. And if anything is going to instant read on a meter, it's the goal and the terminal. They're going to read right now. Instantly! So you ignore latent reads.

Well, now to be on the safe side, what do we mean by a latent read? It's any read that takes place from one-half to one second after the question is stated. Anything that takes place
one-half to one second after the end of the question or the end of the terminal reading is a latent read.

An instant read is anything that takes place up to a half a second. That is just to make very sure that you don't miscalculate it because you can be speaking to somebody who has difficulty with English and you've got a little comm lag. The comm lag won't be much, though. That will just be that little split-second comm lag. You're reading – you're doing the Goals Assessment on somebody from Germany. And you're doing it in English and their native tongue is German and they're having difficulty with English and haven't spoken it for a year or two, or something like this. And you'll find out there's just a little wheel turn. But you'll find out this will occur on everything so that you can quickly measure it up. And it's no more than a half a second, let me assure you. So that would be for a very special case.

And the more it is close to the goal and the more it is close to the terminal, the faster the read is going to occur. And as I say, if you had a microsecond meter you could probably establish a Goals Assessment instantly and immediately by a second meter that is sitting alongside of this meter, you know, plugged into it. There was no current there after your voice impulse. It would be a very complicated meter, which is why I don't advocate building one. It would have to take voice impulse and measure the length of time from the voice impulse to the meter's impulse. In other words, it'd be slightly connected to the auditor, in that his voice would actuate it. And when his voice ceases, it would have to instantly measure the length of time from his voice ceasing to the – a current going through the E-Meter. I'm merely stating this just as a – as an indicator. You'll see this as you get more experience on the thing that it's fast. It's real fast.

And when you've got the person's goal, you say, "bank pres – " you got a read. See, you don't even get a chance to say "bank president."

"Bank pres – " read.

And it's a cashier, is the next terminal on the thing. And you say, "cashier" – read. See, cashier isn't it. You could establish that, actually, with due attention to the E-Meter but nobody is asking you to do that and that is not a part of the routine or regimen. It's just a little indicator that you can – some nonsense that you can pay some attention to. It's not even very valuable nonsense at the moment. All right.

The characteristic of the reactive mind is that it hasn't a concept of time. That is the first thing that goes out in an engram, is the concept of time, so that the engram becomes all time. So of course, that thing which reads with the least time is the most reactive. That is the total rationale. All right.

Now, if you've gone all the way through a terminals list and you suspect there may be some more terminals, why, by all means get some more terminals onto the list. But this itself can be a defeated activity. When you start getting up to a hundred or two terminals, this just starts getting to be nonsense. Somebody has missed. I'd go back and I would take the whole group that I had gotten, before I noticed the pc was having trouble giving them to me – I'd take the earlier group – and then I would cover that one with the rudiments in. I would get the rudiments thoroughly in and then I would go over it. And I would pick the terminal out of it.
Now, a person's terminal will only bury if the rudiments on the sessions in which it
was found were out. That's the only thing that will bury it. You clean up the sessions, it'll re-
appear. And therefore, you're interested in getting the thing checked, basically to find out if it
still reads elsewhere.

Now, in doing Goals and Terminals Assessments, you can run into odd bugs. You can
run in to some interesting, odd propositions where the present time problem of the pc, which
he doesn't actually realize, is getting in the road of his Goals Assessment. And his Goals As-
essment is not his present time problem, or something is crisscrossed up like this.

Well, it to some degree has something to do with his rudiments being out. But that
goal which has to do with his present time problem will read sporadically. It will read very
sporadically. It'll be in and it'll be out and it'll be in and it'll be out and then it'll be out and it'll
be out and it'll be out. And then all of a sudden it's in again and so on.

It's not any instant read connected with the thing. A thing just lurking. So you can sus-
pect that there might have been something wrong with the auditing room or might have been
something wrong with the auditor. Or there might have been something wrong with the ses-
ssion's present time. That's the first thing you ought to suspect on something like that.

And as I say, we had the example of somebody being assessed up on the second –
British second floor and what do we find? We find the person's fear of height was getting this
and I'm – I was told afterwards, after I mentioned this last time, that being audited in the
basement had something to do with kicking in dungeons or something of the sort, see? So that
wasn't so good either. We still got the person's goal, so it's all right.

But a present time problem of the auditing environ – it wasn't a present time problem
in life, having to do with life or livingness; it was just having to do with the auditing environ
– was kicking in and raising the devil with the Goals Assessment. Well actually, that should
have been discovered on the question, "Is it all right to audit in this room?" So it goes right
straight back to rudiments out. See, a rudiment was out and the rudiment that was there – "Is
it all right to audit in this room?" – and that should have been caught.

And all that difficulty would have been avoided, don't you see? And you wouldn't
have had any questions at all on the thing. All right. To recapitulate: to do an assessment, it is
best to tell the pc to go off someplace and sit down and – you know, tonight or something –
and do a full list of goals. And you can also give him withheld goals and secret goals or any-
thing else you want to give him on the list. And say, "Give me goals for all of these subjects,"
and so forth.

And he'll come back with a large sheaf of paper and he sometimes has a hundred goals
on it. And then you yourself look at the meter and ask if he's got any more on this subject, that
subject or the next subject, you see? And you've made sure that he doesn't have any ARC
breaks on this, and you just drain down the needle reaction. And you get a few more that he
might not have mentioned or might have been too reticent to tell somebody about, or some-
thing like this. And then that's about it. Just consider, well, you've got the list. All right. That's
fine.
Now, your reading of that list can be done by repeater technique, going over and over and over, which is the common, most accepted way of doing it but which can wind up some pcs in difficulty. Or just reading the list over and over and every time you get an instant reaction from a goal you mark that it's still in. And you no longer get an instant reaction on another goal and you consider it's out. And you just scratch goals and check goals and scratch goals and check goals. And that's all you do.

Then you finally have got it down to the end of the thing. You find out you've got two or three reacting and maybe that was the end of that session or something of the sort. And catch it the next time and go over that. And then maybe go over the whole list again before you get real sure. Find out if they're all null, you know? Then you got it down to one goal and there's one goal that just is consistently reacting and it reacts very nicely and very consistently and that's it. Well, get somebody else to check it.

Now, if that goal has not appeared, the first thing that you must assume is that the rudiments were out in that session. So you laboriously put the rudiments in now. You put them in with a thud! Don't try to do a full Security Check when you get to withholds, but let's find out if there were any withholds while that Goals Assessment was going on. And let's find out if there are any withholds from you particularly – you know, that kind of thing.

And get this thing in, get it back real good and then do a Goals Assessment from scratch. Well, this is less difficult than you'd think. Much less difficult than you'd think because most of them will be out now anyhow. And he'll only be left with a handful of goals and you'll come right on back and you will find the person's goal again.

Well, what if this happened again? Well, by this time, get the rudiments in! And do it all over again. And set the case up. And just keep doing that, not getting more and more goals and going on and on and on and on and on with the compounding errors. You got it?

All right. Now, same way with a terminal. Same way with a terminal.

You've got the person's goal? You're going to do a terminals list. I actually don't care what wording you use to do the terminals list. There's a cause end of the terminals line, an effect end of the terminals line. There – apparently there are two lists. But you can get far too mechanical for this. And you could say, "Well, who wanted to be a baseball player?"

Fellow says, "I did."

Well, that's not informative. Because you certainly can't run "I" as a terminal.

And all right, you – it's an oddity for you to say, "Well, what's – what would – so you call a baseball player?" or "What – who would play baseball?" or something like this. And you get some more of these and some more of these and some more of these. And the reason you do that is because the pc's statement, "baseball player," might be just a hair out. It may be "a pitcher," you see. It may be "a batsman." It might be something else, see. It's just enough out that it won't quite run. And you get that thing straightened out and you usually got it.

But a goal of this particular character – now I'm taking somebody else's goal in vain, but I'm sure that she won't mind – a goal of this character: "To have a particular kind of body." Well, that leaves the doors wide open, don't you see? "What's a particular kind of
body?" And you get a description of this body. "What would you call such a body?" you see? "Who would have such a body?" "What kind of a body is it?" See, that gives you two lists, you know? "Who would have it?" and "What is it?" And you get that list and shake that list down and get that all straight and you've got it made.

And that's the proper way to do one of these things. When you've got that taped, it will make a considerable difference in your pc.

And your final tests, of the thing, are these: Did it make much difference to your pc that you found that terminal? Does it make any difference to the pc? Well, if it didn't make much difference to the pc, there might be some question on it. Not enough question on it, however, but to cause you to do the final test. And the final test is such an elementary test that it is hardly even worth describing.

You assess the pc on the Prehav Scale. And assessing the preclear on the Prehav Scale, you find a level for that terminal. All right.

You run that level until the tone arm motion slows down; you're not getting very much tone arm motion left. Sometimes you have to run the level for a while to get some tone arm motion to appear. But let us say the tone arm motion has appeared and disappeared off the tone arm and you do a reassessment. Well, the first time you assess, there were only 4 levels live of the Prehav Scale when you did it. And this time you do an assessment and you have 12 levels live on the Prehav Scale. You'd better drop that just like a hot potato because that is a wrong terminal! And if you persist in running it any further than that, the pc is going to go into the soup.

So what do you do at this time? You get the rudiments in and you do a Goals Assessment using the original list. And you find the pc's goal. And you're much horrified because it's the same goal, probably. And then you get the Terminals Assessment on the thing and you will find that that was wrong.

Now, it can only be wrong if you did it wrong. But something slipped. It's the wrong terminal. And that is a positive proof.

If you want to get a good auditor reality on this sometime, pick a terminal at random on a pc. You know, you pick a terminal. You know? You make up your mind now that this person looks like a robot. So you say, "That's fine. Now, we're going to run 'a robot' on the Prehav Scale. All right. Now we're going to do an assessment on a robot. "Would a robot be serene?" and here we go, see – whichever way you assessed it. "Would a robot have faith?" [laughs, laughter] Go up the list very nicely, do a proper assessment; you will find that the robot will assess by elimination. Yes, the robot does have a level. That's fine. Now we're going to run this level.

Note carefully, however, how many levels a robot was alive on the Prehav Scale. Note that carefully and mark it down, an arithmetical number. There were 5 levels live on the Prehav Scale when we assessed a robot. There are the pencil dots that say which levels were alive. There were 5.
Now we're going to run it. And we give it a 2½-hour enthusiastic run with all the rudiments in and everything going along just perfect, you see, and the auditing command perfect – five-leg bracket; everything is fine.

Now reassess it on the Prehav Scale. You're going to find about 10 levels live. Well, good. They will assess, too. So you assess those things down to just one level left. Now we're going to take this one level and we make a perfect command. We get the rudiments in (if we can). And we're going to take this one level and we're going to run it on the preclear.

Robot. Good. And we're going to run it for 2½, 3, 4 hours. Oh, the preclear will be getting gains. Pc will be feeling much better. Odd somatics, but very much better. Not quite sure, but probably all right. (Confidence in the auditor, you see.)

And now flatten that second one. And now you got 5 and 10 written up there in the corner – do another assessment on the pc on the Prehav Scale and you're going to find anything. You're not going to find 5. You're not going to find 10. You'll be finding 15 or 20 levels live. Actually, works out. Works out every time. It's just a mysterious little slide – empirical fact that moved in sideways on us. Your arbitrary terminal is not the pc's terminal.

Well, you haven't heard me saying too much lately about auditing Prehav 13. A little of it goes an awfully long ways. Why? Because you're running arbitrary terminals. Oh yes, they're assessed terminals to some degree. Oh yes, well, you can't get into too much trouble with it. But let's really make a good, hot, fast run. We decide the trouble with this married couple is each other. And we take the husband and we're going to run him on the wife.

And we assess the wife on the Prehav Scale and instead of giving it a light run on the needle as I was advising earlier, we give it a tone arm run, with full tone arm tests for flatness, you see, and everything and so on. It hasn't anything to do whatsoever with his terminal line. You see, it's way off. His terminal line is a ditch digger and you're running wife, see. Great day in the morning.

He's going to get worse and worse. He'll get worse and worse toward his wife, too. This situation won't resolve at all. Why? You are running another terminal than the pc is in. And he's not on that terminal line and because you ran it, you of course are creating the Step Six phenomenon. You are beefing up the whole bank.

Now, you can do it for a little while and get away with it. But it's almost too close a borderline for you to do it at all. It's something you can do and something you can get away with, but isn't something I would advise you to do. Because it's – several tests on it – very recent tests – have been confirming the fact. And it seems to be quite invariable that if you run the wrong terminal the whole scale goes live. And of course, then, this would apply to specialized terminals of any kind, which weren't the preclear's terminals.

Now, if you run a level flat on the Prehav Scale and you reassess, the Prehav Scale – current, that you're using; not the rewritten scale which you will have very shortly. The one with just 65 levels is the one I'm speaking of. There's another one that is slightly longer, that's all. There are just a few little additives and changes on it. Modernized it. But there are several harmonics on that 65-number scale. And of course you will usually get 4 or 5 levels when you assess. You get 4 or 5 levels falling and then they separate out and they fall down to one. All
right. That's normal. But if you're running the right terminal, the next time you do the assessment, you'll get four or five levels and they assess down to one. And the next time you assess the terminal, you get 2 or 3 levels and they assess down to one. The next time you do it, you get 4 or 5 and they assess down to one, you see?

It's never increasing. You don't get more and more levels the more assessments you do on successive runs. And if you're running the right terminal – the right terminal will only drop on a few levels and the next time you assess, it won't have increased. There won't be any more levels than that.

So that is a good way to know whether or not you're running the right level. That is always the first question I ask after there has been a Prehav run on somebody's terminal. How many levels went alive, see? Because if an additional number of levels went alive over and beyond the first assessment, we know he has the wrong terminal. So that confirms and proves up at once the goal and terminal of the pc. So there is a way to prove it up. Well, that's a good thing to know, isn't it? You're not swimming in the dark there at all.

Now, somewhere along the line, if the sessions are very bad, if rudiments have been consistently out, the pc stops making progress on general runs. Once more, the invalidation of the goal, the invalidation of the terminal, still hold true during the run. It wasn't true that they just disappeared during the assessment. It is also true that they can disappear during a run by reason of out-rudiments.

So goals runs which are undertaken with out-rudiments tend to suppress the goal and terminal of the pc. And you get up to a point of where you can't get the goal to register and you can't get the terminal to register and you can't find a level on the Prehav Scale and you don't know what the hell is going on. And you say, "Well, the pc must be flat on that." Before you declare it flat, knock the rudiments to pieces. Go back and get those rudiments in and try to get them in for every session he's been run on, too, you see?

Just ask him – well, actually, the ARC break process, using the word auditor will take care of the background of it, you see.

"What were you willing to be? What are you unwilling to be?" will take care of the pc, that is, the willingness to be audited – takes care of that point.

ARC break was the one I meant first; takes care of the ARC break with the auditor. "What were you able to tell?" and "What shouldn't the auditor have done?" or "What didn't he do?" This for all sessions, see.

So these rudiments which you have now and which just came out on an HCOB today should be put in. And then the whole picture should be examined again. And check him again for his goal and check him for a terminal and so on. And if they're gone now, now well, that's dandy. You've got to do a brand-new Goals Assessment and a brand-new Terminals Assessment, because you've actually closed out one goal, one terminal.

Now, the way you do this second run, when you think you have that terminal flat – the way you do that second run – is of less interest right now than it was. But you of course always first check for an additional terminal for the same goal before you go assuming the goal
is dead – totally. You may find there's a second terminal on the thing. And if you don't find one, why, dandy.

Now you will get to the successive situation whereby the person does give you goals and does give you terminals and this is what starts looking now by – the actual, reliable, endless assessment takes place now. Well, you've got a terminal flat and a goal flat and now endless assessment can be expected. Any time now.

You may find another goal. You may find another terminal on the second time. That's quite probable. And you may get it over on the Prehav Scale – your terminal over on the Prehav Scale – and get it assessed there. And you may get it run. And it may take a while to run it. Not necessarily; it just may. But when you've got that one gone, it is much less likely now that this same cycle will repeat. But you're going to have to try to find a goal – just as I have told you and just as you did originally – you're going to have to find a terminal and you're going to have to try to get it over onto the Prehav Scale before it evaporates, going to have to try to get it run before it evaporates and then it's gone and there's nothing you can do about that. So, you've got to do another Goals Assessment and you apparently now are in the stage of endless Goals Assessments. You get into that stage right about then. And you just, "Any more goals? Any more goals? Any more goals? Any more goals?"

And the fellow finally says, "Well, yeah. Yeah. There's – yeah. Oh yes! I had a goal once. It was back in Arslycus and that was to bash the foreman in the head."

"All right." And you check it and it stays in and you say, "All right. Now, let's find a terminal for it."

"Foreman." You didn't make it. Disappeared.

Looks like an endless Goals Assessment, don't you see? What's happening is, the fellow is doing erasure and clearing by Goals and Terminals Assessment. But that occurs normally with most cases only after a tremendous amount of work has been put in on the original goal.

Now, of course, you've speeded this up and accelerated it when we get into the running of engrams. You run the goal for a while, a lot of pictures have come up, the pc has avoided these pictures (and they all will); you've got to get in and run some engrams. And you get these engrams cleared up. Now you've probably accelerated and brought much nearer the idea of the endless Goals Assessment.

And there's one pc who was almost Clear but couldn't check out as Clear – reacted on certain things that the HCO Sec said. You know, gave him certain questions, reacted on them. And was told that he didn't make it. And he says, "To hell with this," and he went home and he wrote three pages of terminals and came back in, checked out Clear. Quite interesting. Happened down in Johannesburg. In other words, he apparently just had been left with one terminal cycle hung up, possibly on his last goal or something like that and he just went home and wrote the terminals and went Clear. Didn't even require an auditor. Well, by that time, you can be dispensed with. [laughter]

But anyway, looking over all of the nuances and oddities of assessment, I don't see how you can make a mistake. If you follow these various directions and if you do a good
workmanlike job, I don't see how you can err. I really don't see how you can err. And I don't expect you to manage it. Okay?

Thank you.
Thank you. How you doing today, huh?

_Audience:_ Good.

Okay. Now, the state of affairs today is that you have now decided that there was something you needed to know about Scientology, and questions are in order. The date is what? The 19th, or....

_Audience member:_ The 19th of September.

19 September AD 11. All right. And I am in the way of questions. Questions. One, two... Yes.

_Audience member:_ How much of an Assessment by Elimination do you do on the Prehav Scale?

How much of an Assessment by Elimination do you do on a Prehav Scale? This became a burning question back in July. So burning that there is at least one person who has scars. You do a repeater technique on the Prehav Scale and you have a pc in more trouble than could ordinarily be gotten into by the Income Tax Bureau. Now, that's a lot of trouble.

Now, he's all messed up. You know, all of the data we have actually answers these questions from away back. If you knew the progress of data, and your subjective reality and your validity of the data's good, you can work these things out, normally. But there's an old rule from about 1950 that you can ask an auditing question two or three times. You can ask it two or three times and then skip it. You can do it. Three, well, that's borderline. Two, sometimes you wish you hadn't. One, certainly. One, always.

Now, when you're asking these questions on an assessment on the Prehav Scale, you're running straight up against this old rule. How often can you repeat a level _without running a process_? Now, that is the question which leaps up there. How often can you read a level to the pc without _then_ being guilty of auditing him? Do you understand?

Now, if you do a repeater technique or you do too many readings of levels, you of course have audited the whole Prehav Scale on the preclear and of course he's in a mess. So, the governing factor is a simple one: is how do you get an accurate assessment on the Prehav Scale without actually auditing the Prehav Scale on the preclear? Now, that is the question.
And the way you do it is a very precise way. And this is the way I do it, and I have always
gotten away with it and – auditing, you know, is what you get away with – and I've never had
any difficulty with this. But other approaches have brought about difficulty, uniformly and
routinely, have brought about difficulty, and therefore, this is the one I recommend which is
probably the first one and the earliest one of these things. I have great confidence in this
method of assessment.

You take the whole Prehav Scale, the Primary Scale, and you start at the bottom of the
scale, the original one. I – by the way, I will give you the very, very original one just to start
off with. This is not the one, but this is the way I used to do it. And I never got in trouble with
this one either. I'll give you the earliest, shall I? I just remembered there was another one.

You started at the bottom of the scale and you read up scale to the pc until you got a
rising needle, and then you quit, and went back down the scale again. And you just took the
one which reacted the most going up and reacted the most coming back, and if it was the
same level, why, you had it made. And if that wasn't it, then you separated out with just a
brief read of the one, read of the other one, found out which was the most, and that's the one
you took. That is the original, by the way. I remember that. That was Johannesburg.

All right. Now, auditors had trouble with that one, and when the Prehav Scale became
very expanded, we ran into the first method of assessment for the new, expanded Prehav
Scale – Primary Levels. And that's – this is the proper one. And this is the one I'm going to
give you now, and this is the way you do it. Now, you won't get into any trouble if you master
this particular method of doing it.

You start at the bottom, and you just read the levels up the scale all the way to the top.
And wherever you get a needle reaction, an instant reaction of the E-Meter needle, you make
a dot at that level.

Now, in view of the fact that you're going to use the mimeographed sheet several
times, sometimes you make crosses, sometimes you make circles, sometimes you make dots,
you know. But use one symbol for one assessment so you'll be able to differentiate it. And
every time you get a reaction just on one read, you put down your symbol. And when you've
gotten all the way to the top, you will find that you have gotten several levels reacting. Sev-
eral levels reacted.

Now, this has an added advantage and at this time you could count and find out how
many levels were active on this preclear the last time you assessed him for a level. And if you
now have more, you know that you're in trouble. And you had better assess the goal and as-
sess the terminal and check these things out. And particularly the terminal because you may
not have a proper Terminal Assessment. You may not have a proper Goals Assessment. So
that is a very close watch you have to keep, the first three or four assessments on the Prehav
Scale, because that tells you whether or not your Goals or Terminals Assessment was right.
That's the way you check it out. That's aside from exactly how you do it routinely, assuming
you had the proper one.

You have now reached the top. Now, you go back down and you don't hit every level
of the Prehav Scale. You don't read it all the way back down from the top. You simply read
those levels that you made a mark on. And you read those on down to the bottom.
And now you go back up, and now you only read those that have two marks after them. And at that time, unless your rudiments are out, and everything is nutty and going wrong, you've got your level. There's only one reacting. There will only be one that accumulates three. There'd be something quite wrong if you got three or four accumulating three. But it sometimes happens that on the last read up, you will get two levels that have three marks after them.

Now, what you do is read – do the same system. You read the one, you read the other one. And you'll notice one dropped out. And it'll drop out right now. And when I say read it, I mean just repeat it once to the pc. Now, there is a complete assessment on a Prehav Scale. The length of time which this takes is very, very short. There is practically no time involved in it at all. This actually is a totality of about six or seven minutes at the absolute outside. And somebody that tells me they are taking fifteen minutes to assess on the Prehav Scale, I know they are doing something wrong.

And if somebody that takes a session to assess on the Prehav Scale, boy, I know they're wrong. I have no doubt about that.

But let me now tell you the numerous errors which auditors make in doing this. Number one, they expect the preclear to answer, so they wait after every read, see? And they say this, "Would a king have faith?" Now, they wait for the preclear to answer and the preclear has nothing to do with the assessment. We care not for the preclear's opinions of assessments. We care not for the preclear's opinions of the rightness and wrongness of anything. Assessments, whether they're goals, terminals or level, are totally between the auditor and the E-Meter. They are not anything to do – the preclear had nothing to do with this. He might as well be on a long distance lead and in the next county. That's just if you just figure it just to that degree. You do not have to be in good communication with him. Nothing has to be there. You just read them. And you get an instant reaction. He does not have to say anything. You don't tell him to say anything. You don't ask him for his opinion. Nothing These are all methods of wasting time. How fast can you read these things? You can read these things almost as fast as you can talk.

How fast can you read the scale from the bottom to the top? Without any pauses. The funny part of it is that you would get the same reading because it's only going to require a tenth of a second for that level to react. If it's going to react, it's going to react and that is it. And if you were very, very sharp and you were very close, you could actually catch the reaction while catching your breath to say the next word. See, that's how close together that thing could be. But that's an extremity, and that looks like it's too much strain, and it isn't a good auditor presence to do that, so you rather easily read them, you see.

That's the first and foremost. They expect the pc to say something, and the pc shouldn't say anything. To hell with it. I mean that's nonsense.

Now, the next error which they make is to get a one-way flow started, you see? "Would a king (blank)? Would a king (blank)? Would a king (blank)? Would a king (blank)? Would a king (blank)?"

Now, what are they doing They got a one-way flow, and halfway up the scale they're going to get a stuck. A very tricky way of doing this, and by the way this is just trickiness and
this is not a pat method of doing it – this is not a fixed method, this little thing I'm about to give you here which is just a way to do it – is you read "Would a king (blank)? Would you – a king?" "Would a king (blank)? Would you – a king?" You got the idea? "Would you have faith in a king?" You see, for one level. So it's back and forth, back and forth, so you got a two-way flow established as you go up the thing. You got the idea? So you don't get him on a stuck flow anywhere.

In other words, pc to the terminal, terminal to the pc, pc to the terminal, terminal to the pc. You see, you just – you get how that is?

Somebody got a Prehav Scale? I'll show you what I mean. There will be no slightest doubt. I felt a little doubt, a little dark cloud of doubt went up over your heads at that moment.

All right. "Would a king have faith in you?" You see, that's one flow. King to you. "What would you cause a king?" Bum auditing command. "Would a king prevent you from knowing? How would you have no effect on a king?" See? "How could a king affect you? Would you run an obsessive can't-have on a king? Would a king make something of you? How would you create a king?" Get the flip-flop, back and forth? All right, that prevents a stuck flow from happening as you assess this thing. Using "how," you will find uniformly as you do this, is much more easily done.

Now, I'll give you how I would actually ask the pc these things. I would ask a pc these things. I would have him on the meter. Let me give you the next error. The next error is to be looking at the pc or the list when you're saying the word. Because an instant reaction occurs before you can shift your eyes from the list or the pc back to the meter. So you have a little drill which you should develop in yourselves that runs like this.

You look at the list to get the level. You look at the meter and you say the list. You speak while looking at the meter. Got that? Now, actually that's just a little bit tricky. You'll find – some of you will find that's just a little bit tricky to do at the first few trials, and you'll find it sort of seems odd to you. See? You're not reading the paper. You're apparently reading the meter and you've actually had to put the list over here on the meter. You know? It's like this.

All right. I'll give you an example of it. We've got to form this up in our minds, you see. "Would you have faith in a king?" See? But actually you don't do it that way. You look at the list. You say, "Would you have faith in a king?" "Thank you." ... "What would a king cause?" "Thank you." ... "How would you prevent a king knowing?" "Thank you." Got the idea? Paper, meter, pc. Paper, meter, pc. Paper, meter, pc. Got the idea?

Now, reading it at about that speed permits the pc to keep up with you – so he analytically can keep up with you. His reactive mind is keeping up with you the whole way. You see that? That's just about that speed. You just go paper, meter, pc. Paper, meter, pc. Paper, meter, pc. Read it off the paper mentally, say it while looking at the meter, and then look at and acknowledge the pc, and then come back with your pencil and make the dot. So you've made a little circle each time you do this. A little circle. And you keep doing that, and all of a sudden it gets very natural. There's nothing much to it.
Now, I punch these things. All right. "Would you have faith in a king" "Thank you." "What would a king cause?" "Thank you." Got the idea? Cause. Well, we don't care about kings. When you're assessing something, hit it with your voice.

Now, that's a little circular trick on how to do an assessment. When you get that thing down, grooved totally, you find out your assessments become much more positive and reliable. Why? Well, you're doing it on a positive, reliable basis.

Of course, we don't expect anybody in this course to look at the meter fixedly for quite some time. Be sure you look at the meter for some time first. It makes the meter calmer. [laughter] And if you look at the meter – you look at the meter, and then you look at the list and you'd say, "Well, have you got faith?" ... [laughter]

"Well, wasn't any reaction on that, was there?"

Just avoid the E-Meter. Never confront the E-Meter and you'll have messy auditing the whole way.

Now, it's very easy for a human being to confront a human being. They're fixated on bodies anyhow, so they all too often will be fixated on a body. And they all too often get their TR 0 about half flat and it leads them into a fix, you see? And there they are auditing TR 0, you see, while they're doing an assessment. And actually, any Scientologist can be knocked totally out of session by suddenly noticing that at no time has the auditor ever looked at the meter while he was asking the question. And he immediately – his own training gets in his road. He doesn't like to duplicate a bad auditing activity, so he's liable to call the auditor's attention to the fact. "You didn't look at the meter. How do you know whether that is right or wrong?" Now, of course, this has never happened in this unit. [laughter] But you see how that would go.

All right. Now, that's about all there is to know about one of these assessments. Anything else about one of these assessments is pure "additity." And some people do have an addectivity – an addictivity to additity. [laughter] Additity, that's right. So don't do it. Don't put a lot of other things on this assessment because that is the way you do one, and your assessment will always be right.

By the way, on general assessments of goals and terminals, do you realize that Mary Sue catches you out something on the order of 50 percent of the time? Wrong goal. Wrong terminal. Did you realize that was happening? That's something to be worried about because there's only one way you can louse up a pc and that's to have the wrong goal and the wrong terminal.

Everything is a negative gain. Not only is all auditing from that point wasted, but it actually worsens the pc to audit the wrong terminal. Okay?

So you got to be sharp on this. You've got to be very good on this. And you've got to be very good. You've got to know how to get the right goal. You've got to know how to get the right terminal. You've got to know whether or not they're right. And you've got to know what to do when you find out they're wrong.
Now, those things are paramount in importance. They're paramount. I just couldn't emphasize them enough. This you must learn how to do here if you learn nothing else. For heaven's sake, learn how to assess. And as I say, Mary Sue is finding you out about 50 percent of the time. That's too many, man, that's too much. And has never found a perfect set of rudiments, I don't think, to date. And never found all rudiments in on the pc to date when checking and doing a cross-check on a terminal. That's a commentary. It's not a good one.

So get all of your rudiments in, keep them in. And after you have found the person's goal, run your end rudiments, check the person's goal before you get somebody else to check it. Same way with terminals. Do identically the same thing with terminals. And you won't be making so many misses.

It's quite ordinary for somebody's (quote) "goal to be found" (unquote) or "terminal to be found" (unquote), and then come down to get it checked, and for two or one rudiment to be out; the goal or the terminal, whatever's being found, not just slightly incorrect but totally incorrect. And for the goal or terminal to be found which had already been null – (quote) (unquote) "null" – that was just liver than a pistol. But there is something else that is happening which is of considerable interest and that is you are not inquisitive enough. You are not inquisitive enough. You must be more inquisitive. You are afraid of ARC breaking the pc by asking the pc enough questions. That tendency is everywhere manifest. You must ask the pc more questions. Now, I'll give you an example.

A student's goal and terminal had caused a week or so of auditing, fruitless auditing – search, search, search, search, search, search – and Mary Sue checked it out only to find that a previous auditor had ARC broke the goal so that it was not now registering. And the second that the ARC break was taken off, that goal went liver than a pistol, and it took her only in a matter of maybe an hour or an hour and a quarter to do the whole job. Now, that meant that the auditor, who just found that goal and terminal, that meant that that person was not at all inquisitive. Had spent a whole week grinding on a goals list without ever asking the pc, "How did your last Goals Assessment go? Did anything peculiar happen in your last Goals Assessment? How do you feel on your last auditor's attempt to find your goal?" No question of that sort was asked. But a whole week an auditor could sit there and try to find a goal and terminal, knowing from the auditor reports which were all in the folder that the pc had been assessed previously for goal and terminal unsuccessfully.

Ah, but the auditor before that had found the goal, and the pc had blown session instantly saying, "No, no, I don't want that goal. I want nothing to do with it at all," or some paraphrase thereof. And apparently this auditor must have said, "Well, she doesn't want anything to do with that so it must not be her goal," and went on with the remaining list. And then another auditor came along and assessed for a week without ever discovering this other incident. All you have to do is ask questions and your E-Meters react.

Now, there's another thing about assessment that you must know – all of this is slightly a prelude to it – and that is that when a pc has been badly audited on levels but the right terminal, you have to take off the auditing in order to get any assessment at all. It's part of getting the rudiments in.
So before you do an assessment, you must get the rudiments in. And particularly you must ask – if the pc has had a previous auditor auditing on the Prehav Scale or has had any auditing on the Prehav Scale whatsoever – find out if there's ever been anything wrong or anything ARC broke or anything upset about any former assessment, and clean that up, slick as a bunny, and you'll always have a bang, bang, bang assessment.

You can always do easy auditing if you set the pc up to be audited. And you can always do hard, impossible auditing by not setting the pc up to be audited. So the first rule, in answer to your question, is get all of your rudiments in by which we also mean get inquisitive about any earlier or former assessment or what the pc has felt about assessments of the type we are about to do. And get the ARC breaks off of that. And whether you're doing a Goals, Terminal or Prehav Assessment, you will always get a reliable assessment 100 percent of the time. You see? All right. That answer it?

Male voice: That answers it.

All right. Okay. Is there another question? Yes?

Male voice: Yeah. Does this three-way cycle of paper, meter, pc prevent the establishment of the one-way flow that you mentioned?

Does this cycle here of paper, meter, pc prevent a one-way flow from occurring? No. No, no. You've got one-ways and two-way flows mixed up there. I'm sorry, but you've got a wrong idea of a two-way flow. I would recommend that you read Scientology 8-80. You go ahead and get that book. I think that's the one that covers it, isn't it?

Female voice: Yes, it is.

Scientology 8-80. And it tells you all about flows. There are flows, and they are bank flows. And this flow has nothing whatsoever to do with anything but the terminal that you are assessing and the pc, and the interrelationship between the terminal and the pc. And that is the stuck flow we are talking about. Has nothing to do with the auditor's relationship to the pc. Has only to do with the terminal's relationship to the pc. And that is the flow that can get stuck.

You cannot run on a terminal "Would a king cause anything? Thank you." "Would a king cause anything? Thank you." "Would a king cause anything? Thank you." "Would a king cause anything? Thank you." Now, all of a sudden, this odd phenomenon will suddenly disclose itself. The needle will stick. And it'll just get stickier and stickier and stickier and stickier. And all of a sudden go stuck. And your tone arm will get stickier and stickier and stickier and stick. And you'll say that's it. That's it. The level is flat.

No, it isn't flat. That is a stuck flow. And somebody else comes along and say, "Well, what could you cause a king? What could you cause a king? What could you cause a king? What could you cause a king?"

All of a sudden, the thing gets loose, the needle gets loose, the tone arm gets loose, everything is loose, everything is flying around beautifully, and you'd say, "All right. What could you cause a king? Thank you. What could you cause a king. Thank you. What could you cause a king?" And it'll start to get stick, and "What could you cause a thing – king?"
Thank you." And all of a sudden it gets stuck, stuck, sticker, sticker, frozen-y, and the tone arm will freeze. Now, that's a one-way flow, don't you see?

You've got to think of commands in terms of flows from the person to the terminal, from the terminal to others, you see? And you've got to get what a pattern of flows is, because if you stick any leg of that flow, you don't flatten the command, but you simply freeze the meter. And this is not the same as flattening a level, you see, that's a different one. So you can run an unbalanced command and make a level look like it's flat, but it isn't. You understand what I mean?

Male voice: All right. I do.

Yeah.

Male voice: Come back to establishment of a one-way flow while assessing. I got the impression just now that you didn't tell us to flip-flop on this, saying "Would a king cause... Would you cause a king? Would you run an obsessive can't-have on a king?" I got the impression that you didn't tell us to do it that way. You only told us that as something fancy in auditing.

No, no.

Male voice: Oh, you didn't? A-ha. Well, do you want us to do it that way?

I think you ought to listen to that tape played back. I said that is not a vital necessity ...

Male voice: Ah!

... to do this kind of a thing. But you will cause a stuck flow if you don't do something like that. [laughter]

Male voice: Okay.

See, there are other ways you could prevent a stuck flow. You could read a whole five-way bracket. But now we are getting above the auditor's ability to keep track. You see, you could read a whole five-way bracket. You could say, "Would you have faith in a king?" "Would a king cause anything to happen to you?" "Would a king prevent another from knowing?" "Would another prevent – would another have no effect on a king?" And "Would a king have an effect on himself?" You see, now there's a five-way bracket, isn't there? All right. You try to audit a pc and keep track of a five-way bracket and five different commands. Now, do I make that clear? Do I understand what you are asking now? That's the main point.

Male voice: Yeah. I've got it now.

All right.

Male voice: That we do have to do something on the line of changing it back and forth.

That's right. You can also assess this way. That's why I say this isn't vital. I just say you have to do something about it. This is a point you have to take up.

You can also do this. Now, "What do you think of faith in regard to a king?" You see. "How does cause relate to a king?" That's not a particularly good one. Not a particularly good
one, but it does get around this because it can flip-flop. You see, cause-king. But you're not saying king causing anything. It's just cause in relationship to a king, and he will turn the command around one way or the other or some type of permissive command like that might get over the whole problem. That's why I say that that exact method, which I gave you, is not the only method by which this is done. But the fact of a stuck flow is always present during a PreHAV Assessment. It can always happen on an assessment.

And all of a sudden, you haven't got an assessment, have you? You see, here would be the way you would cause a stuck flow. "Would you have faith in a king? Would you cause something to happen to a king? Would you prevent a king from knowing? Would you have no effect on a king? Would you have an effect on a king?" See, you-king, you-king, you-king, you-king, and you've done this sixty-five auditing commands. Although there it's an assessment, they still operate as auditing commands, and you've done it sixty-five times; you're going to get a stuck flow. See? That's for sure. See, that's an awful lot of times to say you-king, you-king, you-king, you-king. Outflow from you to the king.

I think you really ought to look over flows. I think you ought to look over flows. I think all of you should pay some attention to this, because otherwise why you put a five-way bracket together would be complete mystery to you. You can do this, you know. Just draw little arrows. You see, you're trying to break the valence, which you have already found in the pc, off of the pc. You're trying to individu – to knock off the individuations and other phenomena with relationship to the pc and this valence.

Well, that is done by flows because the pc is already stuck on the valence by some type of stuck flow. Sergeant orders troops. Sergeant orders troops. Sergeant orders troops. Sergeant orders troops. Sergeant orders troops. Nobody ever orders the sergeant. Get the idea?

Eventually, he either gets stuck into being a private, you see, or he snaps terminals in some way with troops, or he can't leave camp, and nobody can figure out why is that sergeant never leave camp? You got the idea? He's just on a flow from sergeant to troops. Sergeant to troops. Sergeant to troops. Sergeant to troops. See? And he'll eventually snap on that flow. You cannot continue something flowing that long in one way. If you do, you get into all kinds of weird troubles.

Now, you eventually would find this sergeant had an officer, and the officer would come along, and he would say – well, let's take it the way officers would normally handle a sergeant – they'd say, "Well, sergeant, what do you think? Sergeant, don't you think it's a good idea? Don't you think it's a good idea? Don't you think we shouldn't uh ..."

And we get a different kind of officer one day. And he said, "Sergeant, stand there. Hand me that. Write up the orders. Drill the men."

Right away the sergeant can't take a single order, see? He'd said, "Blublublublubala. No. I just –." Actually can't even hear this officer. See? Positive orders, a stuck flow. So anything that flows the other way runs into a jammed stuck flow coming in, and he can't actually accept an order from an officer. And he goes around nattering about it. He goes around being very upset about it, and so forth. We would-say, "Well, there's something very wrong here." Yeah. The only thing very wrong is we have – we've connected with the phenomena of stuck
flows in life. Now, oddly enough, with this officer around long enough doing that, he would remedy the flow.

Three years – after three years of service, you would have this sergeant saying something like this: "Well, I certainly hated Captain Jinks when he first reported to this post. But there's one thing you can say about him. He knows what he's doing." Something like a year and a half ago, Captain Jinks finally ran out the stuck flow, you see?

All right. Five years later we find the sergeant wearing his hat. See, we now don't have any troops. The government has interfered and decided that in view of the fact that we're getting rid of all the territories and turn the country over to the Ban the Bombers or something like this – in view of that, we don't have any troops anymore, you see? We just have a skeletal force and the sergeant doesn't have any troops, but he's still got Captain Jinks. And this has been going on for about two years. And Captain Jinks says, "Sergeant, stand there," and the sergeant goes off and wears his hat exactly in the same position and carries his stick in exactly the same position as Captain Jinks. He's got a stuck flow in exactly the opposite direction. He's snapped terminals in now to Captain Jinks. You got the idea?

Just like you had these troops, who themselves never gave any orders, eventually all looking like the sergeant. So now you'd get the sergeant looking like Captain Jinks.

Now, we're talking about the valence closure mechanisms when we're talking about flows. These are the mechanisms by which a person becomes somebody else. There isn't anything odd about it. It's this stuck flow mechanism. You run a body. You run a body. You run a body. You run a body. You run a body. You run a body. Body never runs you. So you're in a body.

And then one day you get a reaction from a body. So you succumb. Because the stuck flow has now snapped. It is looking for some excuse for the body to run you in some particular way because you've run the body too long, don't you see?

Now, you have most of the drivers out here on the road being driven by their cars. If you ran a questionnaire, they would answer it quite broadly. "Where should a car take you?" They would all answer that. They wouldn't even think twice about it. And yet the essence of all excellent driving is taking the car somewhere.

I taught somebody to drive a Jaguar by taking the Jaguar down the road, and it almost killed the person. I made the person take the Jaguar down the road, turn the Jaguar around all corners. You see, do everything, think everything, and do everything to the Jaguar that they were supposed to do. Very interesting. Almost killed the person for a while, but I made him do it consciously and so made him discharge this stuck flow by running it consciously.

In other words, 8-C on a Jaguar. If you in driving start doing this, watch out, because you're liable to have almost anything happen. You all of a sudden lose your ability to drive right in the middle of a long straightaway or something, you know. You say, what's going on? What you've run into is a stuck flow. What you've done is take over analytically the stuck flow mechanism. If you start consciously driving a car that you've been so carefully driving unconsciously. Because in driving a car unconsciously, you have already succumbed to a stuck flow.
We have at this particular time the idea that all skills must become unconscious. Well, isn't that a fascinating idea, a skill is unconscious! See, a footballer, for instance – all of his actions with a football must be into some kind of a reactive groove so that he never even has to think. He just always makes the perfect goal, you see. He never has to think. He – that's the modus operandi of the day. If you wanted to improve his football, you would go out there and bring it all up to the surface. Now all of a sudden, he never would miss. But before, it was all unconscious but he missed occasionally. But that was just the fortunes of the day, you see. The automaticity doesn't always work. Leaves us all on the subject of stuck flows. And this is a very, very, important mechanism. Because it is the mechanism which you're trying to cure with Routine 3.

You're finding out what thing it is that the person has total stuck flows on in all directions and has been submerged into and has become. And then you are separating this thing out, and you are separating it out usually running with a five-way bracket, which runs all flows and all conditions with regard to this terminal. And when you have flattened all flows and all these conditions of the Primary Scale, and whatever else you had to do, and incidents, you will find out that you have discharged the compulsion to be interiorized into it or to run it or to command it or to be unconscious about it. When you've discharged these things, you, of course, have gotten rid of most of the person's case. You follow that? Did you know all that?

Female voice: Ron, how does this affect you? Always instructing students.

What's the question? Huh?

Female voice: The stuck flow. You're an Instructor, always instructing the student.

How does this affect me?

Female voice: Yes.

A stuck flow? Oooh. [laughs, laughter] I got a long way – I got a long way to go before this gets to be a stuck flow. I remember one space academy, I think the curriculum was two thousand years, I was a student there. [laughs, laughter]

Female voice: All right.

Remember something about Scientology. Scientology is the only thing which undoes its own spells. Scientology is actually the only science on Earth today which undoes all of its own rules. It's a very peculiar thing. That is the only reason we have any business doing anything with it. Anything we do in Scientology can be run out.

Do you know the only overt that you can pull with Scientology lies in the field of instruction. To fail to pass along the materials accurately becomes an overt. Bad auditing isn't much of an overt. Not on the long run, on the long run. But bad dissemination is an overt because this makes it impossible for Mr. Jinks that was badly audited to get it run out a couple of lifetimes later. See, there's always some hope for Mr. Jinks as long as there was good dissemination.

No, but that's a – it's a joke with regard to me. Actually, I've had a great deal of trouble with schools. Schools are always teaching me, oh, things like my own subjects, and so forth.
And I've had to learn my own speeches. And they're – the difficulty is they're wrong. And there's one whole series of speeches that are commonly taught in schools and they're all wrong. They've got now the wrong place names and the wrong people, and they don't make sense, but they're good oratory. And this is crazy, you know.

But you get a goofiness on the subject after a while. And about the only thing that you find difficult about instruction is being taught principles that are contrary to truth. And when somebody's pushing principles which are contrary to truth or contrary to fact, or which are just made up out of thin air or something like this, then you have – will encounter a great deal of difficulty. Both the Instructor and the student will eventually get in trouble because of this. And as Suzie will attest, I've been laughing, and you, of course, have heard me in lectures laughing about certain subject matter that is taught on Earth today as incorrect.

We didn't realize that every physics textbook in England at the elementary level has rule after rule and law after law incorrectly stated or that is totally incorrect.

There was a scientist, who has made a hobby of this, has been checking up all of the English textbooks and was on "Tonight" last night, and he had wondered how much we had held back British science by teaching Newton's laws backwards and things like this, and they were all in the textbooks, and the textbooks keep on getting reprinted and issued, and so forth.

Well, now, that's an overt. And an Instructor would suffer from that. But now you, for instance, start teaching a student correctly somewhere; because, well, there isn't one of you who won't teach somebody sometime or another something about Scientology, you see, whether in a broad mass or single individuals. You couldn't escape it. But let's say you were pushing a bunch of misconcepts. That would then add up to an overt, wouldn't it?

All right. Now, the overt act-motivator phenomena has to be part and parcel to this stuck flow phenomena. See, you have to get an individuation, there has to be an unease, there'd have to be an unconscious reaction, there has to be something unknown, there has to be something hidden. All of these things have to occur in order to make the stuck flow phenomena come about.

For instance, the sergeant is telling the troops that they're actually going to go on a picnic, and they get out there and they find out that the picnic baskets happen to be baskets for dirt. And they're actually supposed to build a fortification in the burning sun, you see. There's always this kind of thing going on in the army.

So you've always got people snapping into people and valence closures, and so forth. But they must all be accompanied by lies or prevarications.

And right on that subject, there's only one thing that becomes an overt with regard to the instruction done here: is when I tell you clearly, with exclamation points and underline it and underscore it, that you must read an E-Meter, and then you proceed to read the pc's shoes – well, I get some overt thoughts. And in the field and region of those overt thoughts, I suppose I could get into a stuck flow situation.

But every now and then, I run out my overts and unkind thoughts about you, so you're safe. [laughs] Okay. Right. Any other questions? Yes?
Male voice: On this withhold, on the new rudiments commands, you have "To whom wasn't that known" and "To whom shouldn't that be known?" How does that apply if you ask the pc "Are you withholding anything?"

Give me that – give me that bulletin right there. Instead of answering that question, why don't I give you a brief rundown on the new rudiments. On what you can get away with and what you can't get away with, with regard to it, huh?

Male voice: Good.

And that'd answer it in the process. Ask your question once more though, however.

Male voice: When you ask a pc "Are you withholding anything?" and you get a tick, how do you apply that question there "To whom wasn't that known?" How does – this doesn't even make sense to me.

All right. All right. Let's take up the whole thing. Number one, Room: that is very, very easy. These are the new rudiments. Room: TR 10 or pc's havingness process. If you have found the pc's havingness process in the list of thirty-six Presessions, you naturally use that to orient him with regard to the room, and he will be able to find out and differentiate why he doesn't like to be audited in that room. He will pick it up. Now, you've – the safest thing is to have the pc's Havingness Process. That is the safest thing. That's the best thing.

But to break down at that point when you're clearing rudiments to find the pc's Havingness Process would be a very clumsy way to go about it. So just sooner or later when auditing a pc, you should find the pc's Havingness and Confront Processes. It doesn't take very long to do, and all the materials and how it is done have all been made available this long time. It's a rather simple action.

Now, I have something to say about this, this is why I wanted to go over all of the rudiments. I have something to say about this auditor process.

You realize, of course, that a beingness is in the middle of a confusion. And that a beingness is pinned into a confusion, so this is one of these limited processes. "What are you willing to be? What are you unwilling to be," of course, is picking the stable datum out of the confusion which is reverse auditing. And it's very good, run on a very limited basis. But if you wanted to run a case with this, you would have to run much more broadly, and you would have to run your 1A processes as part of the auditing command – you'd have to introduce 1A. You'd have to bring it right in on the heels of this thing.

This one for a long run now, not just for two dozen commands to settle the pc into session. You see, you can get rid of – you can get away with it, you know, for just a rudiments process for a little while. You can get away with it, usually. But remember, to run it broadly, you would have to introduce the whole idea of 1A and get the problems out of the road. Because he obviously has problems, and the beingnesses are the middle of confusions about problems.

So you'd say – have to say, "What would you be willing to be? What would you rather not be?" "What would another be willing to be? What would another rather not be?" "What confusion could you confront? What confusion could another confront?"
Now, the best way to sort that out would be to sort out problem, motion and confusion. And use the word that reacted the most on the pc for those two confronts. Now, that is quite legitimate and is one of these dynamite processes.

Now, if you wanted to run a whole case with this, you would have to add two more commands. "What confusion – ," you've sorted it out whether it's confusion, problem or motion – "would you rather not confront? What (confusion, problem, motion) would another rather not confront?" You'd have to have the plus and the minus confusion. Now, I suppose a whole case would run with that. I suppose a whole case would run Clear with that without an assessment. Well, after all, you've picked up the beingness which is the stable datum. And you're handling the ability to confront a confusion. And you're handling these various elements that create a reactive bank anyhow. And maybe if you ran a case with that for a thousand hours, the case would go Clear. You got the idea? But it's one of these looong, arduous propositions without much differentiation.

But running it just "What would you be willing to be? What would you rather not be?" All right. Now, let's just sit down and run that for two hours. Well, all right. Well, all right.

And then next session, let's sit down and run it for – start to run it for two hours. I don't think you'll make it. The pc's going to be right splang in the middle of an engram. Because that runs pcs into engrams if run very long. Otherwise, it's a very limited process, and you must know that about it. But it's a nice one to settle the pc into auditing session. Oh, you'd run it a couple of dozen times, you know. You say, "Well, what would you be willing to be?"

"I wouldn't – wouldn't ..." And all of a sudden he'd "Ha-ha-ha-ha-ha. I'm not willing to be a pc."

"Oh, all right. So you're not willing to be a pc. All right. Now, what would you be willing to be?"

"So-and-so."

"What would you rather not be?"

"So-and-so."

"What would you be willing to be?"

"Oh, I'm willing to be a pc."

"All right. I'm going to audit this – ask you this question two more times and end this process if that's all right with you. Thank you." And you're out.

In other words, it will do that job. But going much further than that, you're going to get into trouble with the process, so you might as well know that. I wouldn't give you a process that you could get into trouble with, without that.

Now, if you do get into trouble with it, add "another" and "beingness," "another" and "not beingness." Just in the commands I just gave you. And if you're going to sit down and clean this thing up till A to Izzard, you're going to have to run "confusion-confront," "confusion-rather not confront" for self and for the other, too, making this whole number of package
of commands. It's going to be one, two, three, four, five, six, seven, eight commands. It's an eight command process to run the thing all the way out.

But the way to get yourself out of trouble on it, you would only have to add the two confusion commands, see. "What confusion can you confront? What confusion could another confront?" That would get you out of trouble without getting elaborate. You get how this would be done? Pc says, "Oh, I'm going into an engram," and so forth. Well, you haven't got his terminal. You haven't – you're not running him on the Prehav Scale. You just made a boo-boo. So on. Just add the command "confusion-confront," and he will come right on out of it just as nice as you please, okay?

So you've got the command; you've got the remedy. All right.

Let's take up the next level which is the one you're asking about. "What is unknown about that problem with Joe?"

This is perfectly all right. It's perfectly all right. Now, what did you find wrong with that?

*Male voice: No. It's the withhold. The next one. I must be confused a bit.*

Oh, you got – that was what's marked with a question mark. Oh, I guess, I guess what you're talking about.

All right. "What is unknown about that problem with (blank)?" Now, that is good enough to clean a present time problem because you've located the fact that he had a problem with (blank) – his boss.

Well, you ask him, "Do you have a present time problem," and the meter goes clang! And the blue smoke starts coming out of the corner. We going to put a little smoke hole there. And oh, he says, "I don't want anything to do with the problem, because I want to get on with the session," and so forth. Well, that's not a good enough question. I mean – you'd better audit it. And the best way to get rid of it, and the fastest way to get rid of it is just ask him the plainest version of it all, which is "What is unknown about that problem with your boss? What is unknown about the problem with your boss? What is unknown about that problem with your boss?" Just repetitive command. Nothing fancy. Nothing further about it. That makes it. That makes it. All of a sudden, the guy go abloom! And you only run that, you see, long enough so that you get no reaction on the meter. And you say, "How do you feel with the problem of your boss?"

"Well, I think I ought to do something about it!" That isn't long enough. The test of a PT problem, if it's flat, the pc doesn't have to do anything about it. That's the primary test of a PT problem. That's an old saw in auditing – pc feels he still has to do something about it, it's not flat. I've had an auditor tell me, "Well, I've got the PT problem flat because she said right after the session she would go out and phone up her husband and make peace with him."

And you say, "Yes, but you didn't get any gain in this intensive."

"Oh, well, it couldn't have had anything to do with that!"

Yes, it had everything to do with that. He didn't apply the basic test of a present time problem. She still wanted to do something about this problem with her husband. Therefore,
the present time problem was not flat and didn't answer the required rudiments. The pc has to take care of something in present time. The pc has to move in present time toward a certain target. Well, if the pc has to move in present time toward a certain target that has nothing to do with session targets, the pc is out of session. Simple as that. So if the pc has to do something about this, you still have not flattened it. And you just run this until the meter goes flat on that present time problem. And then you ask him if he has a present time problem about anything else, being very specific about \textit{anything else}, meaning we're through with that one.

And if he's got one on that, then you clean that one up. And then you ask him, "Do you have – now have a present time problem?" You get no reaction on the meter, carry on and go to your next rudiment.

And we run to withholds. "To whom wasn't that known? To whom shouldn't that be known?"

Well, that is about the nastiest withhold process anybody ever dreamed up.

Now, the question – I don't know quite how the question comes up now. How – repeat the question again.

\textit{Male voice:} Well, the question is when you ask the pc, "Are you withholding anything?"

Yeah.

\textit{Male voice:} And you get a tick, and you ask him, "What was that?" – "I don't know." \textit{Then how do you apply that uh ...?}

I get you.

\textit{Male voice:} ... end?

I get you. I see. And the pc doesn't know?

\textit{Male voice:} That's right.

Ah, this is a special case. This is a special case. Well, let me see, I have to kind of pick it up here somehow or another, because I can't imagine a pc saying that to me without my following straight on through... You know, these – the Germans developed dachshunds, you know, to go down small holes.

Well, I don't know. Let's see, you're asking me to clear this up with a command. I would clear this up differently. If I ran into that and I said, "Well, what isn't – are you withholding anything?" and the pc got a tick. And you say, "All right, what was that?"

And he says, "Well, I don't know. I haven't got a clue."

I wouldn't run a process. I would say, "Well, before session ..." or just any kind of thing, you know, the who, when, what type of questioning.

"Well, before session was there something that came up that you thought you ought to tell me?" Don't accuse him of withholding, you see?

He'd say, "Oh, yes. Oh, yes, yes, I did want to tell you that actually last night I had quite a headache after that session."
And you say, "Well, all right. Thank you. Now, are you withholding anything?" And you very often will find the tick disappears. That's as easy as it is to clean them, see? So that's a two-way comm clean. Any question about what, when, where. That classifies as two-way comm. You're supposed to try to clear a withhold with two-way comm. "What was it? When was it? Was there any time when you thought of withholding anything from me? What sort of thing would it be that you would find it very difficult to tell me?" That's a very nice one. Run it into classes.

"What would I be most likely to get angry about?" You see? Never confronted that one before, you see. "You get angry about, let's see. Ho-ho-ho-ho-ho-ho-ho-ho-ho, yes. Ho-ho-ho-ho-ho." Of course, he's got you, the auditor, mixed up with somebody who's censuring him. So he'll get a whole type of class of withhold from you as an auditor. Got the trickiness with which this can be done?

Cleverness is speed when getting a withhold off of the pc. Cleverness is speed. Now, that doesn't mean there aren't other ways of doing it. And that doesn't mean you can't do it with a repetitive process.

The earliest repetitive process for a withhold was "Think of something you've done. Think of something you've withheld." "Think of something you've done. Think of something you've withheld." "Think of something you've done. Think of something you've withheld." "Is there anything you'd care to tell me about that? Oh?"

"No."

"Well, all right. Thank you."

"Well, think of something you've done. Think of something you've withheld." "Think of something you've done. Think of something you've withheld." "Think of something you've done. Think of something you've withheld." "Think of something you've withheld.

Now, is there anything you would care to tell me?"

I was down in the Melbourne ACC, and I was giving a whole bunch of lectures on O/W and advising the auditor to run this sort of thing, so he went covert on the whole deal, you see. And he started running the pc, saying, "Think of something you've known. Think of something you've withheld. Now, is there anything you would care to tell me?"

See, well, the pc's already loosened it up and it's rattling around in his skull and it's about to come out through his eyeballs if he doesn't get rid of the thing.

Now, that's the earliest repetitive process which was directly leveled at getting withhold off of a pc, or beyond just the idea of getting withhold off of a pc.

Now, that's usable. That's a rudiments process. See. It's quite usable.

You say, "Well, are you withholding anything" Tick. "Well, what is that?" "I don't know."

And you say, "Well, is there anything that you thought you should tell me? Is there anything that you haven't told me in earlier sessions? Is there anything you think I would ob-
ject to being told?" Any type of questioning. And it's still going tick, see? He hasn't given you the gen.

Of course, you can go off into repetitive processes. And the earliest one of them is, "Think of something you've done. Think of something you've withheld." "Think of something you've done. Think of something you've withheld."

Now, a much more modern version or a much more modern process would be to search it out along some line and say, "What is unknown about my reactions? Thank you. What is unknown about my reactions? Thank you. What is unknown about my reactions? Thank you."

Uh-uh-uh-all of a sudden he, of course, uhhhhhh! He suddenly realizes you're going to get ragingly angry if he suddenly tells you something. See that? But that's sort of clearing the auditor so the auditor can be talked to by the pc. You get the indirect method? So there is a direct application of Unknown to that exact situation, which is a special situation.

This is a highly general situation. Now, this withhold in the rudiments – it's up to you to get the rudiment off of him. Now, what you use to do that, we're not particular about. You can get the old "do, withhold" process. You can stir it up one way or the other, and so on. You're not trying to run a Security Check on this pc, however.

And if the pc is adamantly holding up the whole progress of the thing, yes, that's a special case and you can go in and run any process which you think will eventually get him to get loose and turn loose of that withhold.

He obviously has got a withhold from you because he's afraid of your reactions to the things, you might say, and as long as he's afraid of your reactions to the things he might say, he is not in two-way communication with you and so is not in-session. So this is an in-session type of withhold, not a Security Check type of withhold, that we are more interested in. So that makes it a little bit different, doesn't it?

_Audience voice: Hmm._

Huh?

All right. Now, this is directed at this. Remember these are a list of processes to be run on something found which can't be cleared by two-way communication. That's what these Rudiments Processes are. So we say, "Are you withholding anything?"

And the pc says, "No," and we get a tick and we say, "What was that?" And the pc said, "Ooooh, well, oooooh, yes, oooooh, well."

And you, "Well, what was it?"

And the pc, "Ooooh."

"Well, what – what – what's this all about?"

"Well, last night down in the restaurant, three other students and I were discussing your auditing, and I don't want to have to tell you this, but we decided and so forth and so on, and I said, and that was an unkind thought."
You're not interested in what they thought. You're only interested in what he thought. And then you say, "Well, come on now, what did you say? And what did you think?" That's always the keynote of withholds. You can waste eighteen thousand years of auditing on running off other people's statements, and so forth, with regard to the withhold.

"Yes, I had an aunt once who drowned a puppy."

"Oh, Christ... all right. So you had an aunt that drowned a puppy. That has nothing to do with our auditing session. Did you help her drown the puppy?"

"No, I just heard about it."

"All right. What did you do and where did you drown a puppy?"

"Oh, do you suppose I could've?"

"Well, it says here something about it." Got the idea?

"Did you ever drown a puppy?"

"Well, no. Clang!"

"Where did you drown the puppy?" Clang!

"Oh, I had forgotten all about it."

You see, that's a Security Check type of situation. Now, you saw into this Security Check situation. You clean this up and get this drowning of puppies so that it doesn't react. And this thing works the same way. If you were to run that on a Security Check withhold, you see, you would clean up the whole withhold. You wouldn't leave the guy stuck in some kind of a withhold.

Now, let's supposing that this was just an auditing session situation, see? And you said, "Well, what's this withhold?"

And he eventually said, "And I was down at the café and we were talking to three other auditors, and I said, and I thought, and so forth ..."

And you say, "All right. Are you withholding anything?" You still get a clang You say, "Was it – is it about that, that you are withholding?" And you still get another clang.

Well, there's no sense of sitting there for the next two and a half hours trying to beat to pieces something which is apparently an almost traumatic incident. See?

The thing for you to do is not to run responsibility on it or something like that. The thing for you to do is to run this one. "To whom wasn't that known?"

"Well, you, of course." You see?

"To whom shouldn't that be known?"

"You, of course."

"All right. To whom wasn't that known?"

"Well, it wasn't known to the other students."

"Well, to whom shouldn't that be known?"
"Well, it shouldn't be known to your preclears."

You get how this would be answered? And so it eventually cleans up that traumatic situation.

And all too often this is being run into by auditors. You say, "Are you withholding anything?"

And the pc says, "No," clank!

Then you say, "What was that?"

And "Well, I guess that was the ... oh, yes."

And you say, "Are you withholding anything?", you see. And you still get a reaction. You try to chase it out as an ARC break or something of this sort. Actually, it's the same withhold, but it didn't release.

Now, this is how you release a withhold and that is why it is a process. Does that make sense now?

Male voice: Yes, very much so.

Otherwise, the weapons by which you get the pc to give you the withhold, this is another story. All right? Does that answer it?

Male voice: Yes. Perfect.

All right. Now, this becomes – next one is ARC break, and this is one of the most important developments that we have had for a long time. And this is a honey, this process.

"What didn't an auditor do? When?" "What weren't you able to tell an auditor? When?" And that is a bitch kitty because that cleans up basic-basic on the ARC break chain, and that will smooth a pc into session faster than scat. There are variations of this command.

There is no variation of, "What weren't you able to tell an auditor?" That is nonvariable.

If you're cleaning it up for the session only, you, of course, say, "What weren't you able to tell me in this session?" That is not as good as, "What weren't you able to tell an auditor?" but would still keep him within the finite ranges of the session rather than run it all up and down the line and would clean him up for you. Just now.

Let's say you run into the end-of-session ARC break. Well, you're not going to sit there till midnight, for heaven's sakes, running this other process because this is going to be a longer process. You can clean it up for the immediate session in which you are involved. And the immediate session in which you are involved is simply me, not an auditor. "What didn't I do? When?" "What weren't you able to tell me? When?"

That's a specialized use of it, and the specialized use of it is limited to trying to get on with the session, trying to get the pc out of session, and something ended; this gives you a very short run. But if you had to do something like this to keep the thing squared around – of course, the pc is hot on the subject of an auditor.
But this is quite a remarkable development. And let me go into the background and the network of the development itself.

You're seeing here the final, great-great-great-grandson of the discovery that communication is the most important corner of the ARC triangle. See? Communication is the most important corner. And what do you know? As long as you run a recall, it is perfectly safe to say, "Weren't able to say?" That's perfectly safe as long as it's a recall. "What wouldn't you be able to say?" will wind the pc up in more soup. Why? Because it's saying, "What weren't you able to – what aren't you able to go out of ARC with?" See, same thing. So it is quite a delicate thing and you should know this about this process, that that is very, very solidly and completely and only a Recall Process. It only works as a Recall Process and then does lots of good. And if used as a conditional process, you know, "What aren't you able to tell me?" I'm not so sure, see? You've got to run that as a Recall.

Now, psychotics have gone sane on this single auditing command, in spite of the fact that it was a stuck flow command and everything else. "Think of communicating with somebody. Thank you. Think of communicating with somebody. Thank you. Think of communicating with somebody. Thank you. Think of communicating with somebody. Thank you. Think of communicating with somebody. Thank you." Run for twenty-five hours. And it's made some people go sane, see? I mean it's that powerful a process.

It could be refined. You could have said, "Think of somebody communicating with you. Think of you communicating with somebody." See? Something like that, and you would have had a considerable resurge on the part of a case. But it wasn't communication that aberrated anybody. It was the not-communication that aberrated them. So a recall on the not-communications operates as a very powerful process, and it is extremely powerful just as a process itself.

We don't need it at the present moment. We don't have any real use for it at the present moment. It would have made a considerable splash four or five years ago, you see? Everybody would have thought this was marvelous. And you would have run it something on this order.

Fellow has trouble with his mama. Fellow always had trouble with his mama. All right.

"What weren't you able to tell your mother? When?"

Now, to round it out as a total valence process, you would have had to have said, "What wasn't your mother able to tell you? When?" Got the idea?

Now, that run, both ways would be a very rapid-fire valence splitter. And it'd split up valences like crazy. That's a real, real wild valence splitter. A marvelous one. So Prehav 13 you can lay aside and forget. If you're trying to clean up ARC breaks with a present time environment, just use this, and you've got a better, faster run than Prehav 13.

Only you do it like this. You'd write down everybody the person knew in present time and then you would assess the list and find out that Harry was real hot. So you'd say, "Well, what weren't you able to tell Harry?" and "What wasn't Harry able to tell you?" Now, that would be one version, see?
You could run it as a pure ARC break process and keep the flow going. And now we get a booster. A pc is in a position where he is expecting somebody to do something because he is dependent on somebody doing something. And if somebody doesn't do something at the right moments, he is left in the soup, so he is in a dependency situation.

So for a pc in auditing sessions, for the auditor not to have done anything, and for not to have been able to tell an auditor, picks up and runs out all the times the pc was audited when not in-session. And, of course, that blows the sessions. So what you're really doing is blowing the sessions. You're just cleaning up auditors and sessions here just like mad, when you're running this process. I don't know, I suppose you've used it in the last day or so, and you might have found it extremely valuable. Have you, any of you, used it? Worked good? Work fine?

_Female voice: oh, yes._

All right.

Now, I'll tell you the additional steps which you would have to take to make a long run out of this. You would have to, to get this long, arduous line, you'd say, "What didn't an auditor do? When?" "What didn't you do? When?" Of course, this now broadens it out of session, doesn't it? "What weren't you able to tell an auditor? When?" "What didn't an auditor tell you? When?" Get the idea? And that would make a well-balanced process. So your process would become quite well balanced and you would just be cleaning up sessions in all directions.

But this is enough to actually knock out auditing sessions because there isn't very much auditing track, so you don't need too complete a process to fix it up. And you'll find out that's quite workable just the way it is. "What didn't an auditor do? When?" "What weren't you able to tell an auditor? When?" And you pick up the basic-basics on the ARC breaks which the pc is having with you right now.

Now, for short-term use, "What didn't I do? When?" "What weren't you able to tell me? When?" That would be a workable form unless you had had a long, personal acquaintance with the pc. If you'd had a long, personal acquaintance with the pc, like well, auditing your husband or something like that, you'd have to add in "In this session." See, to clean up the ARC break and get the session off you'd have to say, "What didn't I do in this session? When?" "What weren't you able to tell me in this session? When?" See? Now, that pinpoints it right on down the line, and you've run the session out. See, that's good enough. That's good enough. You'll find out that's broadly workable.

If you wanted the full dress parade of the process, you would run Doingness – you would run Not-Doingness and Not-Communicatingness, both sides, in general or on a specific Prehav 13 type terminal.

Remember how we used to run Failed Help sometimes? Well, you could use this same thing with Failed Help. You could separate the guy's whole family off of him. Everybody in the family is certain he shouldn't have come into the HGC to be audited. And it's all we hear about, see? And we know that there's lots of stress and strain with regard to this.
Do you know it was an early discovery that a person who had a non-Scientologist on the other side of him raising hell with him because he was in Scientology, would ordinarily be expected to not quite be aboard the bandwagon and sort of squirrel. Well, he's listening all the time to a bunch of overts.

That is the source of a squirrel.

A fellow like, oh, let's take some real championship peanut-whistle squirrels, Van Vogt. Now, he never actually would have been a squirrel, Van never would have been a squirrel, if it hadn't have been for – what the hell was her name? Mayne. Mayne. I think she's got connected up with an electric circuit someplace. But Mayne's also over there curling her moustache. And saying, "Natter, natter, natter, how bad it all is, how bad it all is," and actually, apparently aboard the bandwagon but actually just cutting everything to ribbons. You get that? I mean that, therefore, keeps the guy from not really being with us and not really being against us and being sort of in the center and not really knowing what he's doing. And he's going around in small circles all the time.

All right. That kind of a condition comes in. Or the whole family had decided that if he went to that place or went to see that person again, they were going to be through with him, and they mean through. See? And what's really very interesting, he usually is the one in the family who controls the money and would be through with them. But he never does, see? Through, you see?

All right. You run into that kind of a situation, that's a whole series of developing ARC breaks and their incipient PT problems. So you just get rid of all your PT problems by assessing all of these people, finding the one that drops the most immediately, running this needle action out of this particular process on that person, see? You'd have to take Van Vogt. You'd have to take Mayne. You see, just substitute her for "auditor", see?

All right. "What didn't Mayne do? When?" "What weren't you able to tell Mayne? When?" See? Obviously, the individual is in some sort of a subjective state with regard to the person, so the person has some sort of a supercontrol over them, and you'll just move the valence out that much so you'll let auditing happen.

Now, that's a sort of an interesting approach and an interesting use of this particular process. Fellow comes to you for auditing, and you are doing all this. See, you're making out his assessment sheet there at the beginning. You're getting his preclear assessment data, and, "You married?"

"Yes." And so on.

"How does your wife feel about Scientology?"

"Oh, well, ha-ha-ha-ha-ha. As a matter of fact, I was going to have to ask you not to tell her I was being processed."

Oh, man! He's just set himself up for two hundred hours to no gain, you see? Because he's got a consistent withhold in present time. He's got a continuous present time problem. All of these sort of things. So you make it your business to find these things out.
Now, you assume then that there will be ARC breaks. So you assume then, if he's had that much trouble with this person, there have been ARC breaks with this person. All right. Your smart approach to this as you're starting him out as an HGC pc or a personal preclear, your smartest approach is to clean up all the people in his environment, just before you assess him or do anything with him at all. And it's perfectly safe to do it with this process, because you're not going to run very long on these people.

And you understand that it is a liability and that you are liable to run into danger by running anything but the pc's terminal, Routine 3 type terminal. You realize that's a dangerous thing to do. So don't run it very long. You should be able to clean up his wife or something like this. It takes a very fast process.

And there is a very fast process. And you're in and off of it in maybe twenty minutes, half an hour, something like this. And you've gotten a grief charge or you've got the traumatic situation, it's all gone, it's all smoothed out, and so forth. That's the – you're through with that person. You stack – unstack these persons off of the pc, spend a couple of sessions doing this, and then assess him, and you'll never have any trouble with the rest of your rudiments. But that is only, of course, for a preclear. That is only for a preclear, entirely, who is having this kind of trouble – people who object to Scientology.

Not necessarily object to him, what the hell, there isn't a human being on Earth that isn't objected to one way or the other, see? But he's going to have trouble with this person about Scientology, you certainly should move over into that bracket. A D of P doing this as a system would get minimal blows, minimal upsets, minimal PT problems and maximal profile gains. You just clean up the pc's environment. And that's the process he would use or just any version thereof.

But remember that Not-Communicate has to be a recall version. It can't be a conditional present time version. That I can't stress too hard because if you ran it as a conditional present time ...

All right. Like, "What don't you have to communicate with? What aren't you able to communicate with now?" Oh, man, you've had it. Of course, you immediately say to somebody, "What aren't you able to communicate with?" Well, you've just asked him, "What part of your whole track is unknown to you? How many populations, temples, airports, companies, regiments, families, parents have you had for the last two hundred trillion years? Thank you. Now, get the idea of not knowing anything about any of them. Thank you very much. Now, stay out of communication with them. Good."

Has to be a recall. Has to be a straight and direct recall. This discovery is basically hardly won, and it amounts to this: this is what the pc is actually objecting to on the subject of auditing; whatever else the pc says, those are the things which the pc objects to: The auditor didn't do something, and the pc was not able to tell the auditor. And these are all that the pc really is objecting to, whatever else he says.

Pc says, "Yap, yap, yap, and you should've, and I feel terrible, and I am all upset, and I don't want any auditing or anything else."
Immediate rejoinder is not, "Well, if it is all right with you I will now run a process on you." That is no time to be taking this up, let me assure you, you see?

That is the time that a pc says, "I don't want to be audited, nothing else, and so forth, and I've just had it, and you're going to run any more engrams on me today? And I – ha-ha-ha-ha-ha-ha. No thank you."

And you say, "Well, what weren't you able to tell me?" See, you haven't even started the session. "What weren't you able to tell me?"

"What wasn't I able to tell you? What was I able to tell you?"

"Well, what weren't you able to tell me?"

"Well – oh, I see. You're auditing me."

"Well, yes, if you want to put it that way."

"Well, you haven't started the session yet."

"All right. Well, what weren't you able to tell me?"

"Well, that you haven't started the session yet."

"Well, what else weren't you able to tell me?"

"Well, you remember yesterday, I was right down there in the middle of this dang thing and this spaceship had just crashed, you know? And actually, I was hardly able to talk, and you keep on running the same flubbing, flipping process on and on and on, and there were no answers to it. And all I could do was palely nod my head, but I actually didn't feel like nodding my head at all! Now, that's what I wasn't able to tell you! There!"

"What didn't I do?"

"What didn't you do? Oh, God, you ... That's easy," see? "You didn't ask the right auditing command, that's what you didn't do." And back and forth, flip-flop, and all of a sudden the pc's in-session.

Now, you should get back and put him on the E-Meter and actually say, "Now, if it is all right with you, I will begin this session ..." That's what you should do, isn't it? Because the whole end of your last session must have been invalid. He's still in-session. What are you doing starting another one? You didn't end the last one.

Right? So what the hell, you don't monkey around with a bunch of forms. You know, "If you just swing that incense pot, you know, you swing that incense pot, and if the people down there in the choir box all say, 'Ohm, mani padme hum, mea culpa' at the right time, you know, you'll get Clears." Well, let me tell you, they've been swinging incense pots and saying "mea culpa" for two thousand years and we got – haven't got Clears. We got something else. Right?

So you go putting ritual ahead of getting auditing done and you will always be wrong! Now, there are times to use good form, and that's when everything is sailing along fine. Anybody can use right form. But I will say something about my ancient familial lineage and my dear cousins, the British. They very often continue to use form when they ought to be doing
something else. And this has been a failure, hasn't it? You look down the line. That's just a failure. They're going to do it this way when they ought to be doing something, right now, desperately. You got the idea?

Form can get in your road. Form gets – got in the road of Roman administration. It's gotten so much in the road of American administration today that if the form of asking their wife that night isn't obeyed by the American diplomat attending the conference, of course – he, of course, can't have anything to say in the next day's conference. You know, the dirty crack about Versailles that set up the Second World War to fire, was that all the wives were consulted every night by the diplomats and so they had a changed treaty state every day. Nobody else brought his wife but the Americans. And they blame that on the American woman. [laughs]

Now, that's form. That's ritual. Ritual of some kind or another. It's not whether or not we do something now about Berlin. It's whether or not we have a ruddy, flipping conference about Berlin. You got the idea?

_Audience voice: Yeah._

Now, what the hell is this conference? Well, the foreign ministers all have to get together, and then you have to set up dates, and you have to do this and that. You don't do anything like that!

If you're going to do something about a situation that is all flying off at all angles, and so forth, well, you do something about the situation. You don't do it by form.

The whole world of diplomacy, not just British diplomacy, but the whole world of diplomacy is just a bunch of form in lieu of doing something, You see?

The safe thing to do is to adhere to ritual because then you are not responsible. And that is the whole basis of diplomacy. If you adhere to ritual, you can never be hanged.

It is brought up as a point of the late – well, he's at least late – Dag Hammarskjold that the man never made a statement because then he would have to be responsible for some of his commitments. If he had stated something, then he would be responsible for having to execute something, so Dag Hammarskjold made a business of never saying anything positive. And according to one of his best friends, would always take fifty minutes to tell you what he could have told you in five minutes in the first place because he was afraid of making a definite commitment.

Well, what did we see of all this? We saw a perfectly good idea go further and further adrift and more and more astray, and then we saw the Congo, and then we see this, and then all of a sudden we've got sabotage and everything going to hell in a balloon.

You know that the United Nations permitted its first soldier – its first soldier – to be killed? Did you know that? The Israel war. That's an interesting thing, isn't it? The first United Nations soldier that wore the white belt of the United Nations was killed in the Middle East without protest by the United Nations. And he was a few days later followed by the United Nations Chief Administrator in the Middle East. Do you remember that? After that do
you think they could ever make anything stick? Well, they're just catching up with their own overt, which is not to back up their own authority.

Now, that's simply beside the point. I'm giving you a little bit of a roasting. And the roasting is this: That if you go around thinking form is going to get you out of trouble, but you should be getting out of trouble by wit, you're going to be wrong. Always put getting the job done ahead of doing it according to the rules. Because the rules will only fit the majority of cases. But remember the majority of cases leave a minority that the rules don't handle. Always the case.

You've always got to remember that no matter how much you know about auditing, how many rules you have learned about auditing, how disciplined you get, how you can finally get to a point of where you put the key in the chest and wind yourself up, and then run for two hours, that you're going to run into situations which will not get you out of because you are disciplined, because you are well trained, because you do know what you're doing, you can keep your wits about you when anybody else would have gone to hell in a balloon. But that you can do that, does not excuse you from using your noggin. It doesn't excuse you for a moment for not being clever, for not realizing and reading the handwriting on the wall.

There are many ways to handle human beings. Many, many, many ways to handle human beings. There are some right ways and there are some wrong ways. By the way, any trick that you use can always be done within the realm of the Auditor's Code. You don't have to go outside that. The pc is ARC broke. The pc does not want a session. The pc has to have a session. The pc is in trouble. The pc does not want to have you start the session. The pc is in a confusion.

Well, your job is to get a session going. Your job isn't to sit there and do it by the rules.

Oh, well, two hours later, the pc suddenly wakes up and realizes you never started the session. But if you've straightened it all out in those two hours it'd be "Ha-ha. That's one on me! You never started the session, did you?"

And you say, "Well, that's right, but not having started it, I'm now going to have to end it. Is that all right with you?" [laughter]

Now, the pc's nattering around and saying this and that, and they walk out in the hall, and they won't even come into the auditing room or something like that, that is your time to blow in here with ARC breaks! Got the idea? That's your time to start sailing, not your time to say, "Well, do you want a session? How about my giving you a session?" That's all part of ritual.

This guy has just been struck down by a truck and he's lying there and he's half-conscious and he's bleeding. Now, do you say to this person, "Is it all right with you if I give you a little auditing with Scientology?" See, it doesn't make sense when you put it in that category, does it?

All right.
SEMINAR, QUESTION AND ANSWER PERIOD: WHAT IS KNOWABLE TO THE PC

A lecture given on 20 September 1961

Well, your day today is – what day are you in?

Audience: 20th.

You're in the 20th. Well, hello, I'm glad to see you're in the 20th.

Now, those that have been in engrams, in either session today, this is the 20th of September. [laughter] So come up to present time. Come on, come up to present time. Come on, present time, 20th September 1961. Okay? Did anybody come up to present time? [laughter]

All right. Well, it's your turn to tell me what you don't know, and ask questions about what you want to know. Don't ask questions so somebody else can find out. That is a common trick in Academies. Students are always asking questions in order that the others can be informed. I'm not interested in that; I'm interested in the direct communication. Okay. Anything? Yes?

Male voice: we know in Security Checking we're not using "forget" or "not-know." Equally we're not saying "in this life." Therefore, if a pc has a certain amount of not-isness on his case and we ask a question, get a reaction on it, but the pc doesn't know what it is, and it probably is a past life, what are we to do?

Pull it. If it reacts, he can know about it. You've asked whether or not, when we're doing a Security Check and not using a "not-know" version and not using "in this lifetime," we get a knock on the E-Meter, what are we to do about it. That's a very good question. Let us take up immediately the datum that most applies to this, which is, why do you get a reaction on an E-Meter at all? All right. That is a very simple thing.

That which is in the ken of reaction is in the knowledge of the pc. That which will react, is knowable. That's the first and foremost rule of an E-Meter's reaction. It doesn't mean that it is known at the moment the question is asked, but it means that it is knowable. Because an E-Meter can only react on those things which are instantly and immediately restimulated by the preclear himself. So therefore, on a circuit version, of course, it is reactive, but it is knowable.

The reason why you assess for an engram is not to find the hottest charge. The reason you assess is to find out what is real to the pc. This would be the realest goal to the pc. Therefore it reacts. This would be the realest terminal to the pc, therefore it reacts. This is the real-
est level of the Prehav Scale, therefore it reacts. This is the realest incident to the pc, therefore it reacts.

It isn't really even what the pc is in. It isn't what is wrong with the pc. It's what the pc can connect with. And I would say offhand that with a great deal of clever interrogation – E-Meters always require to be backed up by the clever interrogation. And a Security Check must always be done by variant questions. You must never use a Security Check with a repetitive-question approach. If I find anybody in this unit saying, "Have you ever raped anyone? Thank you. Have you ever raped anyone? Thank you. Have you ever raped anyone? Thank you," I will let the floor disintegrate under you! [laughter] That's what I will do. I will not-is the floor. [laughter] So if you feel yourself falling in the middle of a session, you know what you've done.

Now, there is the score on anything of this character: if it reacts, it is knowable. Reaction means reality. And you can just put those two together. They're easy to remember because it's so alliterative. Reaction is reality.

Now, although you know what's wrong with the pc, although you know what incident it should be, although he's sitting there going glup, glup, glup, and every once in a while tightens up the space mechanism and it turns out to be a shepherdess. Well, that violates your reality. But remember that the pc was read by the E-Meter's reality. That's why we use an E-Meter. It's reality-reaction. If it reacts, it is real.

Sure, you have to get the shepherdess off before you get to this space mechanic. You get the idea. So therefore you, at no time, must be guilty of enforcing a reality on the pc which is contrary to what the meter says. Pc's reality is what the meter says. Always what the meter says. And it is never what you say or what the pc says.

But in interrogation – a clever interrogation on any given question – "Have you ever raped anyone? Have you ever thought of raping anyone? Have you ever remembered having raped somebody? Have you ever had consistent dreams of having raped somebody?" And this needle keeps falling, you see. And all of a sudden he says, "Well, I had a dream about it once."

"Oh, you did? All right. Let's go in for Freudian dream analysis. And give me what it is."

And "But it's not in this lifetime."

"Well, all right. So, it's not in this lifetime. Who did you rape?"

"Oh, well, you're being direct about it. That's not fair."

And he all of a sudden will have some foggy recollection of something or other, and the pc says, "It isn't real, but I sort of remember, but it's somehow or another, and I've got a picture of..." and you go – he goes on like this.

And you say, "Good. Who did you rape?"

And he finally says, "Well, I guess that's the right answer." And it clears on the meter. Well, you don't care if his reality is any greater than that.
And you can clear those that do that. But I'm glad you asked the question for two or three reasons – we haven't covered this subject of why does an E-Meter react, for some time.

And an E-Meter would only react on a past track thing that was sitting right there ready to be triggered. You know that you can have a pc sometimes, half out of their chair – leaving. You know? They just suddenly say, "Ahhhhh! Buuu." And they want to blow. They want to run. They want to get out of there, and so forth. And you say, "What's ...?" And they've hit something, you see.

Well, the space police have been looking for them for two and a half billion years, and it'll come through with that much charge. It really will. They know – they're being looked for right now. If somebody found that out, that would be that. And they've been consciously alert. You know, they haven't known why they've been alert, but just that you asked the question, triggered it. And when you can get one of those off the case, you've done the case an awful lot of good. Because it was right there. If it reacts, it is real. It is attainable.

Now, you compare this to your ordinary experience as an auditor that past track is almost out of sight where any ordinary person off the street is concerned. You say, "What were you doing in your last life?" You can't ask that as a casual social question. All right, you're not going to get an answer to that. So you compare it with that experience, and this other experience then seems frightening. But every so often you're going to get one off the street, and you're going to say, "Have you ever robbed a bank?" And it's going to go bang! And you're going to say, "Well, when was that?"

And "I don't know."

And you're going to say, "Good." It falls again. You say, "When did you rob this bank?"

"Oh, well, umm. That's another story. Uh ... I don't know. When I was a little boy, I used to have dreams about this sort of thing. Used to have nightmares about this sort of thing." And he's liable to get a sudden terrific reality on having robbed a bank and been in prison for eighteen years in Cook County prison, or something like this, in his last life, you see. And he's been scared ever since. But he may get a direct recall. And when you get one of those, you've actually freed up a considerable amount of track. So it's very valuable to do that.

Don't limit your question on a Security Check to this lifetime. Those directions do not apply on a processing Security Check. And don't bother to run a "not-know" version. Why? Because you've moved the whole thing up. You're upgraded now to where you're going to find a goal in an HGC. Straightaway, you're going to find his goal, you're going to find his terminal. Simultaneously going to be doing his Security Check. And what's this going to amount to? This is going to find the guy on the backtrack, straightaway. And it'll only be, maybe, the first couple, three sessions with the Security Check that you might have much trouble with. And next thing you know he'll be running engrams. Within the twenty-five hours he might very well be running engrams.

When an HGC auditor gets real hot; first day, he gets the Assessment Sheet and he gets the person's goal. Next day, why, he gets the person's terminal. That's by noon. Two o'clock, the fellow's on the first run. That's the way it ought to be. I won't settle for anything
less as expertly done. The amount of floundering which is being done with goals is technical floundering. It is not anything to do with the pc. It is technical floundering.

Similarly, the Security Checks – the length of time it takes to do a Security Check or clear a question is just technical floundering. It's just not looking at the needle, not getting a reaction, not asking the question, not pressing it home. You're sitting there security checking a sheet, you're not security checking a pc. You get the idea? All these various conditions are present. It's technical that slows it down. I hope that answers your questions.

Male voice: Yes, it does. The only doubt I have now is how to help the pc to have this as more knowable when it does react, when I know there's something now that is potentially knowable to him.

I wouldn't do a thing for him.

Male voice: Just sort of keep on questioning around him?

I wouldn't do a thing for him beyond clever questioning. On a straight Security Check, that is it. You start auditing a Security Check, and hard and running repetitive-command processes while doing a Security Check, and that sort of thing, and it's never paid off here. We've just never had it pay off. It sounds like it might be a good idea.

But the way you'd help him is to point up your questioning. And that is by compartmentation of the question. "Have you ever robbed?" "Have you?" "Have?" "a bank?" Bank doesn't fall. "Have you ever robbed?" falls. "Have you?" that doesn't fall. "Robbed?" "Well, what have you robbed?"

"Oh, well, you get down to that. It was never banks, you see. It was just clothing stores." And the locks will blow off. He might have robbed a bank on the whole track, but you'll actually blow the question on compartmentation. It won't bother him then. That is how you help him out. Is that more of a specific aid to you?

Male voice: Yes, I've got it now. Thank you.

All right, good enough. What other question do we have? Yes, Virginia?

Female voice: You might have no reactions on a question, but what happens when you do a Prehav assessment, and you don't get very much reaction? What error has been ...

What happens to a Prehav assessment when you don't get very much reaction?

Female voice: Hm-hm.

Go on.

Female voice: That's all.

Just that?

Female voice: What error has been made, or what can we do to get it ...

What error has been made?

Female voice: ... so that it will ...

Well, the error could be that you've cleared him! [laughter]
Female voice: ... back up a ways.

Just back up a ways. All right, all right.

You don't get much reaction. Well, there's several things that can happen. And that is that during the entirety of the last run of the last level that you were running, your rudiments were out. That is the most common suppressor of a Prehav assessment. The rudiments have been out during, maybe, hours and hours and hours of the past run. And this has made that level submerge. And now, it is the only level that's alive, and the other levels are not going to react. It's not flat, it's submerged. You see what I mean?

If you run a level with the rudiments out, it's just like doing an assessment with the rudiments out. The level submerges. It drops out of sight. It doesn't go flat. It invalidates.

So you get, number one, your goal can disappear because rudiments are out. Now, we know what to do about that. You put the rudiments in and reassess on the goals list.

Terminal disappears because the rudiments are out. We know what to do about that. All you do is get the rudiments in and reassess on the existing terminals list. You've already got his terminals. Get the rudiments in, go over those, and you'll find the terminal lives up again.

Now, it's just the same with a Prehav level run. You're getting no tone arm action on running the level. And you think it is flat. And you think you had better reassess. And you try to reassess. And you can't get any reaction on the Prehav Scale. Hmmm!  

Female voice: Can you be more specific?

Now, what you've got there is rudiments out. And now the rudiments have not been out just before the assessment. The rudiments have been out all during the run.

Female voice: Mm-hm.

Aha! So, what do you do? You take up every session the person has had on that run, and you put all of the rudiments in – the whole lot. And now you do a reassessment. And either that level will now be alive again, at which time you keep on running it, or you'll have a new level that will pop up, ready for running. Does that answer your question? It's the same in each case.

Female voice: Mm-hm.

It's exactly the same action. Except what you might overlook, is the fact that the rudiments have been out ever since you've started the run.

Female voice: But I got one reaction. And the other times I had had more reaction. Though I'd had four or five levels reacting, well, I got just a tiny tick on one and nothing on anything else. And this was one that had dropped before.

This was one that had dropped before?

Female voice: Mm-hm.

I don't understand the question too tightly here.
Second female voice: Well, what she's worried about is that she says she went through, and she had five levels reacting before.

She had five.

Second female voice: And she found the level, and she ran the level, and she flattened the level. And now she did an assessment again, and she found one level only reacting this time on the E-Meter, and that level stayed in and stayed reacting, didn't it?

Female voice: Mm-hm.

Second female voice: It stayed in.

But that's what's supposed to happen.

Second female voice: I know.

Female voice: No, back up a little bit more. On the last time when I made an assessment and ran the Prehav, well, there were several that dropped. Well, so then I made another assessment. And on this assessment only one level dropped at all.

Well! What is wrong with this?

Female voice: Well, it seems to me like there ought to have been ...

Has the sky been blue all day?

Second female voice: It's all right that way?

I mean, that's the same order of magnitude. You're complaining because the sky's been blue all day.

Female voice: Okay.

That's what you should get.

Female voice: Good.

You shouldn't get anything else, Virginia.

Female voice: I should be so lucky! [laughter]

Yeah. You should be so lucky! There's nothing to sort out. However, if something like that did happen – and I'll tell you something to keep you from worrying. She needs a magnetic compass!

Female voice: I've got problems.

She's got problems. I'll give you something to keep you from worrying. You've assessed the Prehav Scale, and found only one level dropping. You should be so lucky. That's what's supposed to happen. Very often you find four or five levels dropping, you have to sort out the one. But you go into a Prehav Assessment and find just one level dropping. Great! All right. Your work's been done for you. So everything is dandy.

But, I'll give you a stable datum. When in doubt, check rudiments. And that's a good stable datum for anybody to have. You say, "Well, there must be something real wrong with what I have just done. There must be something wrong here, because I've only found the per-
son's goal, and they eventually had just one goal. And then I found their terminal, and they only could have one terminal. And then I found their level, and they only could have one level. There must be something wrong here." Check rudiments for every session you've given the pc.

*Female voice: I could do that.*

Check rudiments for every session you have given the pc, from beginning to end. Just check rudiments all to pieces, in all directions, consistently. And then just find out if those rudiments have been in all the time. And you still only have one goal. And you still only have one terminal. And you still only have ... You've got no choice but to go on clearing the person. All right? All right.

Yes, Bob?

*Male voice: Ron, what are the mechanics involved when a preclear flattens a level? What's happening?*

What are the mechanics involved when a preclear flattens a level?

*Male voice: Yeah.*

It is, everything pertinent to that level has been pulled out of that chain. It doesn't mean you have discharged the whole engram chain or the bank on a terminal, but it means that that – that the significance of that level has now been nulled out of every incident that the pc has contacted while doing a five-way bracket. And it simply means – no more, no less – (let us say, "failed leave") let's say there is no more impulse on the subject of "failed leave." This, however, may leave the whole bulk of an incident. See, a whole incident may be there, and the only thing taken out of it now is "failed leave." You got the idea?

*Male voice: Yes.*

All right. So what we've done, in running Prehav levels, if you get an idea – get a mental image picture here of a whole bunch of picket fences. And here's a picket fence, and then on top of that we'll put another picket fence, and then on top of that we'll put another picket fence, and we call each one of these picket fences an engram.

All right. Each one is the whole Prehav Scale. And each picket there is a level of the Prehav Scale. So we run "failed leave." Well, eventually when the level is flat, in these three picket fences we're not going to find any "failed leave." That's going to be gone. So this many pickets is going to be missing. One picket out of each engram. Got the idea?

*Male voice: Yes.*

All right. Now the way you clear, eventually, is that you just pull all the pickets off all these fences. And, of course, you have run all of the engrams. Now, there's a shortcut way to do it. That's a shortcut, is after you've got these things stirred up and the pc is doing an escape mechanism on these things and really isn't pulling up many pickets, you put the pc wherever the pc was in valence and run that particular fence. And run all the pickets off of the fence but not with all of the levels of the Prehav Scale. "Not-know" runs the whole lot.

Now, don't be amazed if later on when you're running the Prehav Scale, there was one picket left in that engram. He says, "What's this? I thought we ran that." This would be quite
common. "We thought we ran that, and here I am parked at this crossroads." Well, it's gone now.

And you say, "Well, how about parked at the crossroads?"

Well, there's nothing to it now, but there was that part of that engram left of being parked at the crossroad. What you've done is left one picket on the fence. And that is the whole thing. So there would be two systems of running a bank. They're both successful. But independently, taken one from the other, they are not adequate. Neither one is totally adequate for all cases. So you can run both systems.

Now, both systems in combination, are totally adequate for all cases. So you've got the system by which you remove a picket from engram one, a picket from engram two, a picket from engram three and then a picket from – oh, eighteen hundred pickets from the remaining locks, and so forth, that have to do with these things. All right. And that is the end of a level. There's no more postulate of that character left in those pictures.

Next, you take your new level, and you pull all of those pickets out. And then you take a new level, and you pull all those pickets out. And theoretically, at the end of all of this you've pulled all the pickets. And the pc is capable now of blowing pickets faster. So any new bank that shows up, he as-ises it.

All right. Now, that system is one system. And the other system is, you find the person's goal terminal and now find all incidents relating to the terminal. Assess the engrams – this is no level running, you see – assess the engrams necessary to resolve the case and run those as engrams, one after the other. No Prehav levels, see? Run them one after the other, after the other, after the other, and get rid of engram after engram, and lock chain after lock chain. All having to do with that. Well, the odd part of it is, if you did a very good job with that, you would wind up with a Clear.

All the pickets gone, with Prehav levels, you wind up with a Clear. All the engrams gone, with this other type of engram running, you run – you wind up with a Clear. You're addressing the same thing, only there are two different ways to handle them.

The best system is to take both systems and mix them. Use a mixed system. Why?

Well, you use the Prehav runs and that throws the engrams into very plain relief and gets rid of a tremendous amount of locks, and then finds the pc sitting in places that aren't easy for the pc to blow. So we pick up an engram – or two or three – and we run them. Differently or indifferently, it doesn't matter much as long as we get them relatively flat.

Now, we go ahead and go back to Prehav level running and when he hits these pins again, of course, the only thing that's left is something like a card house. And all that's left in there is "faith." See, we didn't hit any "faith" while we were doing an engram run. And we hit "faith" on a general Prehav run, and bang! That is the end of that engram, and he gets the delayed reaction on the benefit you think he should have gotten from having run the engram.

You will very often find yourself sitting around having just run an engram that explains the whole pc's life condition, everything else. We know everything now about the pc.
The pc has run it fully. And they say, "Oh, that's fine." And they don't change very much, they think, and it never really lifted, and so on, and you get kind of disappointed.

All right, you go back to a Prehav level run. And you'll be running along very happily and all of a sudden you've assessed him at "faith" on this terminal, see. And "faith."

The pc will say, "Well, I could have faith in ..." It was an engram with a polar bear, you see. He and the polar bear were fighting over a fish or something. And he has faith in his ability to get this fish away from the polar bear. That's the answer, see. And he'll go ...

You say, "What's happened?"

"It blew up."

"What blew up?"

"Well, that – that whole – you know the engram we were running last week? Well, you know, I hadn't really ever noticed, but I never really did get the fish away from the polar bear, you know? And there's nothing left of this thing. You know, here we are, out on the ice. And you know, ice isn't bad. You know, I'd always figured before it was bad. And fish tastes pretty good, you know? What do you know!"

And you'll get the relief on the Prehav run, after the fact of running the engram, see. Delayed reaction.

So these two systems work to do the same thing. Which is what? Get the pc to confront, as-is and handle his reactive bank.

What actually does happen, is the reactive bank gets confronted and handled, understood and within the realm of control of the pc. As soon as this occurs, he no longer has one. You have a Clear. Okay?

Male voice: Right.

All right. We won't go into the technicality of he's got these things and standing ridges of electronic waves, and they have flow systems connected with them. And that we're really running an electric eel in the first place. There's too – we have too great a stress these days on the scientific balderdash. You know, the ergs and the ohmiwhums go whoom-pa-poom, and now we know something. We don't know anything. Okay?

Yes?

Male voice: Are the Change Processes still being used in auditing – straight auditing – and what is their importance in auditing today?

Well, the Change Processes ... You're asking if they're still being used in auditing and what their status is right now?

Male voice: Yes.

All right. Tell you that very briefly.

Simply been relegated to the Prehav Scale. On assessment, you run into Change, you can still move over into the Secondary Scale, and you run it. But you will find that general runs on the Prehav are nowhere near as beneficial as specific runs on the exact terminal of the
pc. In view of this fact, it is actually practically a waste of time, in comparative times of running, to run anything but the pc's terminal.

So the whole idea of Change, Change Processes and everything is still in, but it operates only against the preclear's terminal only at that time when the preclear, in being assessed on the Prehav Scale, gets a reaction on Change. Change is the level, so you run Change. And everything you know about Change is applied to running Change at that level that you find the pc at. Okay? Right.

Yes, ma'am.

Female voice: Ron, can you give me some more data on how to unravel the grouper?
Can we get some more data on how to unravel the grouper? Have you got a grouper? Did you yourself get whammoed into a grouper?

Female voice: I have, but also I've had pcs who have, too.
Has your grouper unraveled?

Female voice: No.
It hasn't?

Female voice: At least I can hope on tonight! [laughter]
Hmm?

Female voice: I hope to have it unraveled tonight.
You hope to have it unraveled tonight. Well, I won't tell you that grouper is one of the most insidious, one of the most horrible, one of the most fantastic ... [laughter]

But I actually will tell you that a grouper can be a thoroughgoing bitch. It is mean. And when you run a pc into a grouper, his apparency is that all time jams. In actuality, he has come up against the whole time jam. He is confronting something.

What is a grouper? A grouper is a number of incidents becoming located, apparently, in one time instant. A number of instances have apparently all occurred in one time instance. So we have a number of incidents located at one point on the track.

Now, I have had pcs say that they felt them all pull in. Or that it all collapsed on them. No, no, no, no and no, no. They ran to that point of the track where it all collapsed on them. But the collapse occurred at another time than it occurred. They think it happened in the session. It actually happened a few million years ago. You get the slight difference here? All right, now that time misnomer, all by itself, would throw a red herring at the pc, and he would be thinking about his grouper having occurred in auditing. When it – as a matter of fact, it didn't occur in auditing.

Now, I'll give you a number of ways of taking apart a grouper. There is no doubt about the fact that groupers are fairly serious breeds of cat. First place, let us look at the anatomy of the grouper before we worry about how to take it apart. Let's find out what we're taking apart. Let's not do the Egyptian stunt of repairing radios before we know that they receive broadcasts. Civilize... I mean, the psychiatrist, the ancient physician, all alike, were guilty of this.
The grouper most commonly is a vacuum. It is a cold installed vacuum. And a grouper is normally found associated with implants. And the person who has a grouper has implanted people.

*Female voice: Oh-ho-ho-ho, ho-ho.*

There you are. Now, that is what that is all about.

Now, I didn't mean to make you ashamed. I see you blushed. Because ...

*Female voice: I ran an incident doing that Saturday.*

You what?

*Female voice: I said I ran an incident doing that. Of implanting people.*

That's what it is. All right.

Now, you have to know what you were doing. What were you doing? Now, that is the main thing. Because, of course, a grouper cannot hang up on a pc unless the pc has done it. A grouper – anything that can mash electricity – the only thing which can mash electricity with a crunch like that or cause an individual to slam pictures into his bank like that is a cold vacuum.

There are many systems of doing this. For instance, the Russians – ha! – talk about brainwashing! Ha! If you wanted to go ... After running into a grouper, it'd be very, very hard to convince the pc that he ought to engage professionally in brainwashing. I think it'd be very difficult to convince somebody that had hit a grouper, that he ought to go ahead and fix himself up for new groupers.

But the way it is done is this way: is all you'd have to do is take a handful of dry ice and throw it – and smash it into the fellow's face and hold it there and that would be that. That's a twenty-second brainwash. He'd have very little memory of what he was doing, his whole bank would collapse and that would be it. Just get a handful of carbon dioxide and smash it into the person's face. That is the way a grouper is done. Now you know.

Now you can – it takes the Russian seventy days and it should take you something on the order of seven seconds. Cold. Cold is an extreme stillness. Time is a temperature. Therefore, you must not run no-motions, in the vicinity of a grouper. You must not run no-motion anyhow, but don't run it particularly in a grouper. Don't start asking somebody who's in a grouper, "Who is that standing there?" Because the only thing in a grouper is supreme no-motion. It is no-motion fringed entirely with motion.

Now of course, the tiniest temperature, such as forty degrees below zero, is hot compared to the vacuum in which a grouper is sitting. Think it over. That's a hot – that'd be a hot day. Because most of these groupers are at the temperature of about minus two hundred centigrade. So you see, forty degrees below zero, Fahrenheit, would be a warm spring day. But that is motion. There is enough motion in that temperature to cause motion and a stable datum. Follow that? That's an unhappy fact.

Look, you look at extreme cold as extreme motionlessness. All temperature is based on the phenomena of motion. If you have motion you have temperature. If you don't have
motion, you don't have temperature. Time is a temperature. If you don't have motion, if you
don't have temperature, you don't have time. This is the way a thetan has got it all figured out.
Now, you understand that?

So if you say extreme coldness equals no motion equals no time, then you will see that
the only thing that you can run in the vicinity of a grouper is motion and time. So a grouper
can be taken apart, laboriously, by motion and time. Do you see how that would be?

All right. This fellow's sitting there in a whole bunch of plastered up pictures and he
can't make any sense out of it whatsoever. Now, the way to get him into it very solidly would
be to say, "When have you been cold? Thank you. When have you been cold? Thank you.
When have you been cold? Thank you. When have you been cold?" It would group and group
and group and it'd be tighter and tighter. And then to vary the agony, say, "All right. What in
that grouper isn't moving? Thank you very much. Is there anything else in the grouper there
that isn't moving? Thank you very much." And he'd really be in the grouper tight. See, you
could actually take somebody and audit him this way, and he'd get tighter and tighter and
tighter into the grouper. You understand that?

Well, understanding that, then the road out of a grouper should be very plain. All you
have to do is ask him about motion, or ask her about motion, and ask them about time. So
questions about motion and time will free any pc from a grouper. But don't consider that it's
necessarily a fast action. It does not necessarily take place in two minutes.

All right. Motion and time will free up a grouper. Now, if we put unknownness in
connection with that, now we really have something interesting in the way of processes, see.
We got time and motion as our basics. Now we're going to add the ingredient of unknowing-
ness. So these three, now, would be a double-barreled whirl devil as far as a grouper was con-
cerned. And we could ask somebody a question of this character about a grouper: we could
say, "When was the time unknown to you?" Yeah, "When was the time unknown to you?"
"What time was unknown? What haven't you known about time? To what person has time
been unknown?" You generally get the most delinquent and procrastinating member of the
family, you see.

It doesn't matter how you phrase these. I'm just giving you the skeletal structure of
commands.

All right. Now, we take motion. And we'll say, "What motion wouldn't you care to un-
dertake?" Now, that will lead in the direction of a grouper. "What motion ..." I mean if you're
processing somebody who has a grouper. "What motion wouldn't you care to undertake?"
Which is the idea of motion and restraint at the same time. Motion and restraint. Motion and
restraint.

All right. That has some workability. Give you another nice one, is, "What motion was
unknown?" And you'll run every surprise the person's ever had. Now, people who are in
grouper are very allergic to surprises. They don't like to be startled. Their hair stands up
straight. When they have long blond hair it reaches the ceiling, practically. They don't like to
be startled.
So, "What motion was unknown?" will produce some of the bitchier, meaner somatics that you have ever had anybody run into. "What motion was unknown?" "What motion was unknown to you?" "What motion was unknown to another?" This kind of thing. And you'll get all sorts of bank phenomena of various kinds. And you'll get a grouper – looks like the grouper's stacking up. And it isn't. All you're doing is running off the instant when it stacked up.

Now, this is what makes a grouper hard to run. Because no matter what you do to it, it looks like it's stacking up. Do you see why? Because you're running a moment when it stacked up. So that every instant that you're running in the grouper looks like an instant – looks like it is stacking up now. There is no time in it. So therefore, the stack-up then is what the pc sees and conceives it to be a stack-up now. So it always looks like the grouper is getting worse. And pcs become very disheartened when they start seeing one of these groupers start going to work. All you have to do is keep running the stack-up.

If you had an idea – I'll give you an idea of what a grouper looks like to a pc. But this is a rather poor view of it. We've got an art gallery. We've got an art gallery. The Corcoran, the Metropolitan, some such art gallery, and you got pictures all over the walls, everywhere. And there's a fountain in the middle of the art gallery. And suddenly and mysteriously, every picture flies off the walls and hits the fountain and sticks. And you have nothing on the fountain but a mound of pictures.

Now, having hands and a truck, it would be very easy to pick up these pictures. So to get a little more sense into this grouper idea, we have to go just a little bit further. If, after they all flew off the walls and hit the fountain and laid there in a pile, the fountain then began to spurt permanent glue and was left to do so for some years; we now go back to the fountain to pick up the pictures and put them back on the wall. And that's about the way the pc looks – to it – it looks to him, you know. And he says, "This would be the grimmest thing that ever happened to me. This is terrible."

The horror of it is, is he thinks it happened in the session. See? It looks to him like it happened in the session. Why, he triggered the incident, didn't he? In the session, didn't he? It's obvious. Didn't he? Only, of course, he didn't trigger the incident in the session, he ran into an incident where all the pictures were flying into the fountain. And he ran into this in session, and because it's got timelessness, he gets fooled at once.

Now, if you wanted to relieve the pc of having run the grouper, you would run the auditor that ran into the grouper, and you'd run the session out. And the grouper would disappear. And then the pc would get audited, very carefully, by somebody else, and the grouper would appear. And the person would think that this collapse again occurred in this next session. And of course, it never occurred in the session at all. You see where we're going now?

Now, if you wanted to free up a grouper, all you have to do is find the picture the pc isn't grouped in. And run it. Don't keep running the pc through the grouper. Find another picture. Because although you will find there's a grouper, there are other pictures north and south of the grouper in which the pc is in valence and which will run. So you rehabilitate the pc's confidence in the ability to run a picture. And eventually the grouper itself will work out.
What does a grouper look like? Well, I've just told you. In action, that is the way it looks. But how is the engram – what is the actual engram which contains a grouper? The actual engram – well, I have personal acquaintance with one of them. A rocket jockey lying on a bed being hit by electronic rays. He's strapped down to this bed, and he's being hit by electronic rays so as to disabuse any further idea of him exteriorizing and going out and running one of those confounded planes that's been strafing the capital so regularly. Get the idea? They want him pinned, and they want him there, and that's it. And they do an implant.

Well, he thinks he is being hit by moving rays. Where, as a matter of fact, they move in a cold vacuum on him and plow it straight into his body. And of course a thetan doesn't move out of that very easily. Particularly, if he's done it. See that?

All right. So you'd have an incident where the person was actually – the incident, really, is a person lying on a bed with pictures flying at him. All you got to do is keep the pc's attention on the bed, not the pictures.

If you're going to run the grouper, find out where the pc is located in the grouper – whether as a person who was administering groupers (the overt), which is the better one to run, or the motivator (lying on a bed) – and then keep his attention on that.

All right. "What don't you know about that patient?" See? Not "What don't you know about his pictures?" or "... your pictures?" or something like that. "What don't you know about that patient?" or something of the sort. Now, all this is very interesting. Not very serious. You can unbale – I have seen this done; I have subjective reality on this – you can unbale a grouper by running ARC Straightwire. "Recall an ARC break. Thank you. Recall an ARC break. Thank you. Recall an ARC break. Thank you. Recall an ARC break. Thank you." And the person will unstack right down to the actual incident in which the grouper occurs. That is an old process that happens to do this exact trick. "Recall an ARC break." Doesn't matter what time or place they're recalling the ARC break, they will eventually wind up in the grouper because that is an ARC break to end all ARC breaks.

All right. So you could unstack the case and find the case lying there.

And now your auditing must be very careful. And you must go on running, "Recall an ARC break." Don't go switching it off just because you've found the incident. Flatten "Recall an ARC break," while having spotted where the grouper is. Don't go Q-and-Aing. Just because you run into an incident, don't ever stop the auditing session and run the incident and then run a little more Prehav, and then he runs into another incident, so you decide you'd better run that incident. Aww! That is – that is for the birds.

Run what you're running according to your plan. And when you have flattened it, now take up what has happened, perhaps in the next session. Got the idea? That's the way you audit.

You always assess engrams. You never at any time run an engram just because it seems hot, or the pc seems to be in it, or something like this. You assess them. If the E-Meter says so, they can be run. If the E-Meter reacts, the engram can be run. If the E-Meter doesn't react, the E-Meter is right, the engram can't be run. No reaction, no run. So you always assess engrams. You never switch off in the middle of a Prehav run to do this.
Now, you're in a rather deep and complicated subject when you're into the subject of groupers, because it has to do with the fact that somebody's collapsed a bank on somebody with a thud. It has happened to everybody. And there's practically everybody who has got a grouper at one time or another. And it needn't become fashionable. The truth of the matter though, it requires good, well-skilled auditing to handle this kind of thing.

Just in the common course of human events, a grouper would come apart anyplace. But the first rule I would lay down on it is, don't run the grouper. You can uncover it, that's all right, and so forth. Don't bother with it. Find an engram that the pc can run and get the pc to run it. Because the pc can be moved out of that grouper area as easily as out of any other engram. But a pc is so fixated on it, and a pc believes so implicitly it happened right in the session when they were being audited, that they say that the session should cure it. And that, of course, is what is intended when you're implanting people: that if they ever run into it, they're not going to get out of it.

Now, what kind of person applies groupers? Almost anybody in space opera is liable to one fine day take his finger off his number and decide that the enemy's habit of exteriorizing from bodies shot down, and going back and picking up a doggone Woolworth second-hand body, and picking up another scout craft and coming over and attacking again with all of his information must cease.

So space opera very commonly develops practices by which the enemy is made to forget. Forget what? Well, that's very essential because after you've captured somebody or shot him down in your operational area, of course, he knows it. And if he simply flies out of his ruddy 'ead and goes back to base and picks up another body, he'll bomb you out of existence. This kind of thing was quite common on the track. All right. Sounds pretty wild, but it nevertheless was very common. Far commoner than being a streetcar conductor.

Now, the answer was specialized implanting. And it became very, very specialized. Now, what is the most antipathetic thing about space? It is cold. And the next most antipathetic thing about space? Female voice: Black.

Hm? What?

Female voice: It's black as tar.

You see? You get what it is. So you just take the elements that the – space opera doesn't like, and you put all those things together, and you've got a grouper, a very nice one. Naturally, somebody's sitting in a scout craft all by himself, and it's only two and a half years to the next system, you see, and he's being sent over there, and he sits there for two and a half years. He'll start to self-audit whether he likes it or not. Yeah! The only memories he's got, the only thing he can see, you see, is his own pictures. And he'll pull his own pictures around, and so forth.

And then space itself does a lot of brainwashing You're hoppity-guppitting along at umpteen light-years per whump, and there's a meteorite shower.
Well, the manufacturers were very good. They were very good, reliable people, but remember it was war when this craft was built, so there is no shock absorbers for meteorites in the nose. And the windscreens, and so forth, have nothing like a double panel. And you're traveling at such fantastic rates of speed that when you hit the meteorite shower, all you know about it is that you are in space someplace, probably falling quietly into a sun. One moment you were traveling at three light-years per *oomph*, and the next moment, why, you were falling into the sun. And you hardly know what the hell happened.

Well, what the hell happened is that the meteorites came through the ship with a *whoosh*, you see, and even though they missed you, they took all the air out of the ship. They took everything out of the ship. And having done so, they let in this tremendous cold.

Now, what becomes very interesting is, is the meteorite is very often hot when it does this. It was cold a moment ago, but it has just hit, remember, a very fast traveling object. And the disintegration of the meteorite and the disintegration of the object, alike, have heat. So it's nothing to be standing on a ship and be hit with a red-hot object, after which you're instantly very cold because space is cold. Red-hot, ice-cold. Boom-boom. And they're not a split second apart. You couldn't even measure the microseconds, you see, of difference between them. All right, that makes a nice, hefty engram. It makes a nice one. It makes a lovely one.

Well, of course, when they start really implanting the boys, they naturally will ARC break it as much as they can, because that really makes it stick. They make it betrayal. And they tell this fellow, "Now, you have a good rest, because we're going to exchange you tomorrow. And you can go home, only we're having a hard time putting your ship together, you see, because it was so badly shattered by our ack-ack. And you have a good rest, and so forth. And here's a book to read on our ideology, and so on. And when you get back home..." They build him all up, you see. "And here's some nice electronic soup to eat, and you're a nice boy and a whale of a fellow." And the chaplain usually comes in and talks to him about his soul. And it's all wonderful, you see. And he's just in this beautiful mood, where these fellows are the princes, they're just the princes of space. He really – they've almost won, if they only knew it, you see. And so he stretches out on his bed with a deep, relaxed yawn, and a panel drops on the other side of the wall, and red-hot soup hits him. Which then turns ice-cold, and there goes his bank.

Now, what he never knows is whether or not he is hit by pictures created by them or created by him. That's what he doesn't know. Are they his pictures or their pictures? Well, he thinks he's being hit with an assortment of pictures. Why is he being hit with an assortment of pictures? Well, they're all of the same class. Well, he's in that kind of a circumstance, isn't he. So the pictures he's mocking up actually are all of a class. They'll be something like 180 pictures of deaths stacked up on 180 pictures of wrecked ships stacked up on something else, and he's sure that somebody shot these pictures at him.

Well, this is a nice trick, because he disowns them. He says, "They're not my pictures." Well, who the hell else was around there making pictures? Just him! So another characteristic of the grouper is that it's totally disowned, and the preclear is totally irresponsible for it.
Now, he dramatizes this irresponsibility by saying it happened in the session. He dramatized the irresponsibility by saying he can do nothing about it. Don't you see, all these things add up together. Because these things, when they are vicious, always go in as an ARC break, the ARC break — "Recall an ARC break" process unstacks one, and so on.

If you worry about them too much, you're at fault, because the pc who is in a grouper can be run, I assure you, in many other incidents which will react on the E-Meter, and you needn't pay any attention to the grouper at all. A grouper is a grouper. And sooner or later the pc will fall wise to the fact that while being a space jockey, or something of the sort, he was one fine day recruited as part of the propaganda corps. And he was supposed to take the little people they were fighting and lure them in by some kind of statements or another, so that they walk straight into a red-hot electronic cauldron which goes ice-cold, and then they don't go back and pick up new bodies and keep the war going. And sooner or later, you'll run into some kind of an implant like this.

I see I have certain people present who don't like this idea at all. [laughter] Well, why get emotional about it, I always say. It's just a space opera. It's not real. There's really nothing to it. Of course man has never lived before. We know that. He's never been up in space before. These, by the way, are just the common defenses of people stuck in space opera.

You get some fellow telling me that he never under God's green earth would read that trash called science fiction. I'll say, "Okay, get the idea of implanting somebody," and leave him in a grouper. I mean, it's easy. [laughs] Scientologists should not be antagonized. [laughs, laughter] You have too many weapons.

Anyway, I repeat, the best advice is to find an incident the pc can run, and run it very nicely. And all of a sudden, light will dawn and bells will ring, and so on. Of course, the keynote of any grouper is not-knowingness.

Now, a grouper that turns on with a hell of a somatic accompanying it, is another horse of a different hue. So this grouper turns on and it's — the pc finds it uncomfortable. All right, so it's uncomfortable. But the grouper turns on and starts ripping a hole in his stomach — I don't mean this literally, but it sure feels like it, something of this sort — and it is hot and it is heavy, and he does not like any part of it — Ohhhhh! — I can give you a process, fortunately, which happens to handle this exact circumstance that applies only to a grouper and applies only to one that is running hot and heavy, with a heavy somatic. A special case. And that is, "What was unknown about that pain?" Interesting target, isn't it? "What was unknown about that pain?"

And before I give a — get off this subject — you'll find out that's good anyhow. That's an awfully good assist. All by itself. It's that pain. It's the one he's got right now; that's the only one you're interested in. You're not interested in what was unknown about pain, because you've got the whole track flying now. It's just that pain.

And on this same subject, allied to it: A pc who is suffering a tremendously fixed attention, as he is in a grouper, becomes very hard to audit. And if the pc has gone into an incident, which is a grouper, and then you are trying to audit the pc, you may have a time on your hands. You may have a bit of trouble on your hands keeping the person in-session and not
recognize that you have a pc in a grouper. And the pc has a horrendous somatic of some kind
or another.

    Well, it's time to investigate what the pc is in. And if it is this action of there's pictures,
pictures, pictures all over the doggone place. They're all plastered up a la art gallery, and it's
all gone black, and that's what happened and God knows, it's all terrible, and so forth. Then
you use these same mechanisms that you use to take the grouper apart. Okay? Use the same
mechanisms I've just given you. If he is in a serious somatic condition this other one handles
it. "What about that pain was unknown?" or "What is unknown about that pain?"

    Now, you must have this datum with regard to running engrams: How did the engram
chain come up? How did it come up? Why are you handling this particular engram?

    Well, let's not try to look it up in the encyclopedia. You were running a terminal,
weren't you? So a continuous mistake that could be made in running engrams is to forget that
they are on a terminal chain and to run them as "you," "you," "you," "you," "you." "What
don't you know about that picture?" You get the idea? Because remember, you're running a
terminal chain, here. The only reason the thing came up is because of terminal. Well, you are
now trying to get the pc, as "you," to run something which is a package called a valence. And
I've already told you the reason you're running valences is because the pc has disowned the
somatics and so forth, of the valence.

    So if you remember this when you are running engrams, you will get into much less
trouble: that the engram is actually the engram of the valence in which the pc is. And there-
fore, therefore and thereby and thereunto, you should mention the valence while you're run-
ing engrams.

    Well, all right, we get fifteen engrams. The pc's been in and out of fifteen engrams;
we're running Prehav Scale on "a looper". And now we sort these engrams out very carefully,
and we find out which one falls the most, and now we run it all as "you." Does that seem odd
to you? Now that you look at it, does it seem odd to you? He – you found it by running a
looper. You were running a looper, "faith in a looper." "How could you have faith in a
looper?" you know, and so on. And now you've got fifteen engrams sorted out. Well, of
course, they are the engrams of what? They're not the engrams of the pc, except secondarily.
They're the engrams, primarily, of a looper.

    So we would have to remember this if we wanted an engram to free up. And although
we can of course use "you" copiously, in running the engram – "What don't you know?" or
"What wasn't known to you? What wasn't known to others?" and so forth – for heaven's sakes,
let's mention a looper. "What wasn't known to a looper in that engram?" See? Saying that was
the terminal – just so I won't restimulate you, because I'm sure none of your terminals are a
looper.

    So you get the idea? Now, this also applies to running one of these groupers. Not
"How would you get such a grouper?" but "How would a looper get into one?" Got the idea?
"Now, just how would a looper go about getting himself in that kind of a fix? All right. What
wouldn't a looper know about it?" See? "How would a looper get somebody into that kind of a
fix?" "What would a looper make unknown about such a thing?" Got the idea? So use that
terminal when you is running engrams and you will get a faster run and you won't have quite so much trouble.

Now, I'll give you a much more serious situation with regard to a grouper. Somebody is run into a grouper that you do not have the goal or terminal of. Aah! Or you pick up a pc off the street and he is in one and you don't know his goal or terminal. Now, what are you going to do about that? That's pretty grim. Isn't that terrible? He's obviously in a grouper. It's all black and the pictures are plastered all over, and you don't know his goal and you don't know his terminal, and what can you do about that? ...Come on, tell me.

Huh?

Female voice: ARC Straightwire?

Huh?

Male voice: You find his goal and terminal first?

Yeah, that's right, you find his goal and terminal, of course. You're not in the business of running groupers. And a grouper has nothing whatsoever to do with finding a pc's goal and terminal. You can find them in people with groupers and snoopers. It doesn't matter.

Almost on a dare, I'd – if insane asylums were open to human beings and other – and people and so forth, if I could – I used to have a collar that was on backwards. Used to put a collar on backwards and had a card printed, "Reverend Witherspoon," and used to go in to console the dear, dead benighted, and so on. I should exhume this celluloid collar. I suppose it's still in good condition. Because I think you could probably find the goal and terminal on every person in that institution, just whimity-bam. I imagine they'd just audit like a well-oiled dream. Because you can run engrams on them, why couldn't you find a goal and terminal? Ought to be very easy.

No, if you find somebody whose case is all jammed up and has been jammed up this way in former auditing, they tell you – in other words, they've run into a grouper on the track – what should you do? Q-and-A with a pc, or go about your job of auditing? That's right, always.

So, it works out similarly. Similarly, if you've got somebody's goal and terminal, don't neglect the fact that you have the person's terminal in trying to undo a grouper, see. And you would say, "Where would a looper go to get warm?" Be almost a lead-pipe question on a grouper, because of course its basis is cold. And he gets cold, all over. He has this – chilled!

You in England are very lucky. You don't have restimulative weather. [laughter] All the same, all the same. We have very nice, mild weather. No snowstorms in the summer, none in the winter to amount to anything. No sunshine in the winter, none in the summer to amount to anything. [laughs, laughter]

Actually, we did very well this last past summer, I was very proud of the climate. We did very, very well. Only gone through a couple of hurricanes lately, and Carla is still to come. Carla will be here about the 2nd of October, I think. I was calculating her speed. But I – that was many days ago, and she may have changed course since then. And it wouldn't be so
bad if it was still carrying some of the furniture, and so forth, from the gulf coast, but uh ...

[laughter]

All right. Now, I've given you a very long and arduous dissertation on this, and actually there's quite a great deal to know about it. I hope you don't treat this information lightly because a grouper is an interesting phenomenon. It is one of the many phenomena of the track, and it is an interesting thing. But it is cold! It's cold in there! And you say to somebody, "Now, how cold have you ever been? Recall another time you've been cold. Good, good." If you ran that long enough, they'd almost certainly wind up in a grouper.

Okay. Time for one more question. I guess I've overwhumped you. [laughter] People are looking rather sick. People are looking rather sick and ill and pale. One more question.

*Female voice: How would you go about cleaning up every session a guy's ever had?*

How would you go about cleaning up every session a person has ever had? Well, in view of the fact the auditing track is not a very long track, that's a very easy thing to do. If you simply ran the ARC break process which you now have in the present rudiments, you'd clean the lot. Okay?

It's interesting sometime to take off the auditing by whatever means or process. We had a student one time, in Washington, in the Academy, that was auditing somebody, and came down with measles. And he was promptly and immediately rushed to the nearest sawbones, and the sawbones couldn't find any measles. He looked around but the pc was not "measing" very much. And it finally came down to my desk, and I said, "Hey, hey, hey, hey!" I just said "Let's see, what was he doing two or three days ago?" And they said, "So and so," and I said, "Well, run the session off." And so they got hold of him, and ran him running the session, I think, or something like that, and the measles disappeared within the hour.

Measles seem to be something that goes into very easy restim. I notice in old Dianetics – I've had a letter from somebody that picked up the book, read, I think, half of the first chapter and then audited his wife. Ran her into measles, and she was instantly taken to the hospital with measles. Only the doctor couldn't find any measles. And she was all broken out, and three to ten days later why it all ceased and she didn't have measles anymore.

It's of interest to get off an auditing session where something like that has occurred. Now it sounds like auditing is dangerous, doesn't it? Well, actually, it usually passes out. If – what's restimulated by auditing is much more easily restimulated by life. And let me point this out, that there isn't any auditor presence as he's walking through life. That's the only reason that you should be good auditors is because it's very easy to do things that life will restimulate.

Okay? Anybody particularly worried about these groupers? Well, I'll tell you, you should be worried about these groupers. The idea of going on down there... In the first place the whole war started in fun. There was nothing much to it. They were just blasting a few cities and – you know, it – as fellows will – and there was no sense in getting serious like this about it. And then picking those poor prisoners of war and sticking them in that room.

*Female voice: Well, what happened to them after that? [laughter] That's what I want to know.*
Well, they just kind of threw them out on the trash heap. I had an instance of that character. Not a fellow who was given an implant, but a fascinating instance. It's the funniest engram I think I'd ever run into.

Fellow was in a spaceship, and it had hit something or other. He'd gotten shot up and the cold air had gotten in or something of the sort, or the cold lack of air. The air had been let out and the cold had come in. And anyway he'd been orbiting around as commonly happens in a space wagon. And he'd been orbiting around, not minding his own business but with nothing to think of, nothing to do, and plastered up against the side of the spaceship.

So finally a rescue team – you know, like one of these Air Rescue Squadrons they have up in Alaska or something – spotted this ship orbiting around before it ran into a sun and warmed him up for good. And they picked him up, and he was still in his body, you see – doll body. And, of course, the rescue team didn't pay any attention to this and didn't test for this or anything else, [laughs] but salvaged his shoes, you see, which were these magnetic, walk-on-the-hull-and-don't-drift-off, put-out-by-the-Little-Bide-a-Wee Space Jockey Society authority stamp. A good spacing seal of approval, you know. And they took off his shoes, and the rest of it was just so much scrap tin can, and threw it over the side. He was still in it. And this pc just went on and on and on about his shoes. [laughter] And by George, we just couldn't get him unfixed from those shoes. And it seems like ever since he'd had trouble with shoes, you see. He had trouble buying shoes; he had trouble in getting shoes fitted, he had – shoes, shoes, shoes, shoes. That's how serious it all was. Left a terrible trauma about shoes.

You say what happens to them afterwards. Well, they throw them on the garbage dump, or they do something like this, and don't very often suspect the guy is exteriorized.

Very often when a guy's been hit like this, if the intentions were right, he wanders away from his basic team. Or he doesn't go back to his base. He feels very degraded, so he shoves off and gets on another planet someplace and becomes a juvenile delinquent.

You'll find after a severe battle you'll find people in space activities feeling very degraded and so forth. And they can't explain why, and they'll tell you that space is very degrading, and so forth. Well, yeah, they just blew up a planet or fortifications and cities and fields, and they've just chewed up Lord knows how many people, and then they wonder why they feel degraded, you know? Silly things.

But you should cheer up about a grouper of that character. [laughter] You should cheer up on it. Because if anything is calculated to release a lot of memory, it's one of these things taken apart.

Now, that's no invitation to get into one; that's no invitation to run one or otherwise, but they just are what they are.

You'll also find out that all the other phenomena mentioned in Dianetics are present in engrams. There are bouncers, there are call-backs. You get a guy to the end of the incident, and he's at the beginning of the incident, and you say how the hell did he get there? Well, he's got a call-back at the beginning of the incident. Usually, however, serious engrams have these
There'll be somebody at the beginning of the engram who's making this sort of a motion, see. And he gets to the end of the track, and all of a sudden he remembers that, and he goes back to the beginning of the thing. And he gets to the end, and he goes back to the beginning. Finally you see this guy waving, you know, tell him to come on. Or he thinks he ought to leave, and it's nothing more than an open door in front of him. You're running him on down the line, all of a sudden he isn't in the incident. And you say, "What happened?" and, "What happened?"

And he'd say, "Well, nothing."

"Well, what happened just a moment ago?"

"Well, I was running down this thing, and – oh, there's that door!" You see? [laughter]

It's an invitation to leave. So he bounces. Bouncers, groupers, call-back, denyers. This idea of "there's nothing here" can be expressed in various ways. And the guy will run through something, and part of it's blank. And he'll go on through to the end of the thing. And then he'll finally recover a piece of it. And it's some symbol to the effect "there is nothing here," you know. Or somebody has disappeared at that point and he Qs-and-As with it. And so that part of the engram is, of course, missing.

There's all kinds of oddities in running these things – phenomena, phenomena. You can get phenomena-happy about the whole thing. You follow the rules, you'll get out of it.

I am happy to be able to say a word or two about groupers. I have very intimate acquaintance with groupers. And they're a little bit hard to run, occasionally, but the main reason they are, is just those reasons: The person thinks it turned on in the session. It didn't. He thinks it's some other kind of engram. It isn't. It's just an engram. But pictures accumulate to it, so it's in a confusion as to what picture do you run. See, if there's five thousand pictures flying around in the air, well, which picture do you run to run it? Well, instead of worrying about it, why, go find another picture.

And the basis of them are cold. The only thing that can hold anything together like that is motionlessness with an exclamation point.

You know the trick, don't you, of directing the pc's attention to the motion beyond something he is stuck at. Now, I heard a remark here the other day by an auditor that demonstrated they didn't know this, that this was not known. Said all we could find there was a picture of somebody standing still. And I don't think they ran it, because that wasn't adequate. Well, there was a picture of somebody standing still. Well, all the auditor would have had to have done when he found this still picture is just say, "What motion is going on behind the picture?" and all hell would have broken loose. Because the only reason you get a severe "still" is because there is a tremendous motion. And the pc will always look at the "still" and ignore the motion. So if you just put the pc's attention on the motion in that zone or area, the "still" will disintegrate.
People who have still pictures are not "stuck on the track" but withdrawing from motion. And the "still" is a remedy for the motion. So the pc will always take refuge in something that is motionless when the pc believes that the motion is too much for them. And remember, all pain is motion.

All pain is motion. So in painful incidents, you find the plethora of motionless pictures. And you'll find them stuck, stuck, stuck, stuck, stuck. You run him two feet and he's got another stuck picture, and so forth – some holdup. Well, what's the holdup? Well, you've got to direct the pc's attention to the zones and areas of motion. That's all. Just direct his attention to it.

I'll give you a subjective example of this. The Egyptian area is one of the worst for anybody to get anywhere near because it's confusing and violates their beliefs. Why? Because Egypt was space opera from one end to the other. And you'll have somebody standing there on a pyramid, and he's very worried about his cloak blowing open because it exposes – might expose the butt of his ray gun. And he says, "Well, uh – cloak – ray – ray gun. Well, that has nothing to do – I must have a collapsed series of pictures here, or I must be in some kind of a state, because this doesn't agree with any reality that I've been taught in the history books."

Actually, Egypt was a battleground between two space groups, and they set up all this nonsense one way or the other, and all the supermagic, and all that kind of thing. So every once in a while you even find a – you'll even find a science fiction writer trying to run back the coming of Christ to space opera or something. He's just talking straight out of his bank, you see? Marvelous what these fellows will actually pick up.

But the sum and total of this is, it's such a disagreement. It disagrees with the history books. It disagrees with everything and it's sort of got the guy – every – he's – reality is being violated, violated, violated, violated.

So it's these areas of violated reality which give you all kinds of trouble, because the pc doesn't feel that this is very good. And he doesn't feel that he's playing it straight. And he feels the pictures must be dub-in, and he invalidates himself, and all kinds of wild things go on. Where, as a matter of fact, if he just sat there and ran the picture that's turned up, and so on, that would be that. He would come through it on the other end, and then you'd know what the whole thing was all about.

Well, anyway, with that little preamble, I was being run one day on books. And all of a sudden encountered the fact that the Greeks had books. Well, this is not generally known, of course, they've disintegrated these many years, and nobody has anything to do with a Greek book. They don't exist anymore. But actually they were books. They had little wooden covers, and a wooden spine, and they had a printing system. And the printing system consisted of having a bunch of slaves with the alphabets, and the fellow would read these things out, and they'd hand another guy the letter and he'd stamp it, and they'd read out another word and they'd stamp it, and finally they'd get a block print set up. It'd be a block in a frame, and they'd crowd the thing together, and then they would take a piece of papyrus, and so on, which was quite available to them at the time, and they'd spread it over the top of this, inked, and they'd roll it down with a roller and that was a page of the book, and they would then put it in the
book. They're kind of hand-made books. They're making a thousand copies of this thing, "Manual for How to Get Along with Alexander," or something. [laughter]

They would put them one after the other, make them up, and then they'd break this form apart, you see, because these were carved letters. Well, they were all out of wood, the books were out of papyrus, nobody ever preserved one, they've never come forward to present time.

So it's quite startling to find yourself sitting in a Greek garden reading a book, don't you see? This must be dead wrong, you know?

So anyhow, that – I got that all cleared up, and said now, "What do you know, there are books in Egypt. Only the Egyptian system of printing went this way." And you know, the Egyptian system of printing suddenly turned up, and I remembered what that was.

And, of course, that was all pictograph, and so it was a very complicated printing system. Fantastic printing system. You had to have a whole bunch of slaves. And they all stood around great trays of various kinds, so classes of pictographs were arranged according to tray. And a reader would sit up on a platform and he would read a word, and the slave – you see there were thousands of these pictographs – and a slave that had that type of pictograph in charge, see, he would pick it up, and he'd join the circle. And he'd just stand in line, and actually your words were all in line in a number of slaves. But they'd bring them in and they'd put them in the form. And as the slaves would come by they'd keep putting them in the form. And then when you had the frame, you made it up just the way the Greeks did. And you'd ink the face of these pictographs, and you'd run it off on a piece of – so on, and so on.

And I got looking this over and I said, "This is very funny, because you'd think they'd have more light." And what started worrying me, the picture wasn't moving. I'd got into a stuck picture, which was quite unusual for me. And I'd go on, about the printing. Yeah, but printing what? And for this thing to be this stuck, must have been a lot of not-knowingness there. Well, they were printing the orders of the day. For who? Well, for the invader force. The orders of the day. And this was a printing shop that was publishing space orders for issue to space agents operating in Egypt.

Of course, the second that I started realizing something like that, I said, "Space opera. Well, hell, back of this picture there must be the wildest motions that anybody ever heard of." So I just put my attention on the other side of the picture and, of course, that was the end of the print shop, that was the end of everything else, and here we were out there in a good, solid, lovely battle.

The pharaoh had just died, you see, so the boys from the other side wanted to get their candidate in quick, you know. And we wanted to get our candidate in quick, and everything was going off in the usual bombastic fashion, and right there out in the Valley of the Dead, why, you had some boys in khaki uniforms blowing the living pants off of everybody else they could see and anything that moved. And then the funeral procession was coming, so everybody in the battle by common agreement had to pack it up and get the hell out of there, because you didn't dare let the public in on it. You talk about secrecy, man, that was secrecy!
Well, there's a nice, calm subject – books. Pc feels very scholarly about it all, you see. And there is a stuck picture. And then, of course, somewhere in the vicinity of that stuck picture there must be action. And the second he spots the action, all is explained. And, of course, this type of action is a very deep level of don't-know. Nobody must know about it, and as a matter of fact, except Scientology, I don't think anybody ever does, right up to present time.

But they're now flooding the palace of Thebes.

Female voice: Yeah.

And the location of this particular print shop was on the – in back of the lowest dungeons of the print shop. And anybody coming in would, of course, go through all of the prisoners, all of the cells, they'd pass through the lot (and a smelly lot it was), and then they'd get to the back end of the thing and they would run into the telecommunication system to the space command – and the print shop. And I'm sure it is still there. I'm sure it's still there.

But they're flooding it, and I don't know whether that's bad or good. Because think of the horrible shock historians would get. Think of the histories that would have to be rewritten if historians started to tell the truth.

So you see, the picture is held in place by an avoidance of motion or a not-knownness on the subject of motion, and that is what holds a picture in place, and that is all that holds a picture in place. And if you want to look for stickers, or somebody says, "Stay there," in a picture, that isn't really good enough. You don't audit that. You audit the motion which made the picture stick. You got the idea?

You always audit the motion, never audit the "still," and that is one of the basic rules of auditing today: *Always audit the motion, never audit the "still."* As an auditor then, always call for the motion. Always call for the heat. Never call for the "still" and never call for the cold. And your pc will be kept very nicely out of groupers.

Okay? Well, I said I'd give you a short one today, and almost kept my word. That's it. Thank you.
SMOOTHNESS OF AUDITING

A lecture given on 21 September 1961

Thank you.

Well, this is 21 September, 1961 and you, I trust, are a little closer to Clear – I trust. This is not grading a great probability about it because, after all, something that's been going on for the last – I don't know, when were you Clear last? About two hundred trillion years ago? Something like that? Well, it's been going on for this long, I suppose you can suffer with it a while longer. I suppose.

But unfortunately you won't have to and if your auditing would just improve, why, you would find that it would be of mutual assistance for your auditing to get better. So this is a – not a demand, you understand, but just a pathetic little plea for your auditing to get better. [laughter] I see Bob, here, is taking that bad. Your auditing isn't perfect either. Yeah. Nor is mine. Once in a blue moon, you find yourself taking your finger off your number.

But I will say this, I will say this, I take my finger off my number less often than you do. And there are some of you going in the direction of perfection to such a degree, however, that you find it difficult to achieve mediocrity. Now, those are bitter words, but if you keep going in the direction of perfection, absolute, never errored perfection, you're going to miss that interstate known as mediocrity or even passable. Do you get what I'm driving at?

The fellow who keeps hammering in there about perfection all the time – you know, they've got to have – the auditor who sits there saying, "Well, I'm – now I've got to get this acknowledgment across. Well, what am I going to do? Well, let's see now, I had better get this order across to him. Now, let's see, was that too Tone 40? No, I guess that wasn't too Tone 40. Figure-figure-figure-figure-figure-figure-figure-figure-figure-figure." See, he isn't auditing the pc. See?

And I would rather you did a personalized job on the pc first and a technical perfection second. You got the idea? And then all of a sudden you'll get some horrendous win or other, you'll find out you can do it and then you'll find out that it's very easy.

The wrong way to you can go at this, you know. You can say, "You have got to be perfect before you can do anything for the pc," and you sit there giving a session being too perfect and then nothing happens with the pc. But of course, you aren't auditing the pc, you're auditing your own auditing. You see how that can work?

No, audit the pc. The pc comes first. And all you want is a majority of rightness, that's all. Just be right more often than you're wrong and you'll get there. It's as simple as that. It's the percentages. Auditing – the percentages are rather cruelly high. You have to be about 92 percent right. Life you only have to be 51.
But what I tell you is true, that the pc forgives anything but no-auditing. A pc doesn't forgive no-auditing. And if he has a problem that is bugging him or bothering him or he's worried about something or other and the auditor is mainly worried about the ritual, you've got the source of the bulk of ARC breaks.

The auditor is so worried about the ritual; worried about, "Let's see, is it the sensitivity knob that's supposed to move? Or let's see, I guess you take the reading at the sens... you know, the sensitivity knob on my meter hasn't fallen ever since I started the Security Check." [laughter]

And the auditor is so, so, so concerned about what he is doing, that the pc never has an opportunity to impart the fact that he's worried as hell. The pc never forgives it, see? Because the pc is sort of talking to a bundle of technology, not a person. And with – the pc finds himself talking to a bundle of technology, he goes out of session.

So auditing comes first, you see, and technology comes second. And that's all very well for you to say, because it will be used here and there as an excuse to do very horrible auditing. You see, you get me both ways. I mean, I can't be right along all these lines, but the point is that the pc sits ... This kind of a situation is quite common in an auditing session: pc comes in, he's bubbling over with the fact that he's just been shot by a howitzer and the auditor sets up the E-Meter and adjusts the cans and adjusts the needle and tells him to sit there, and then starts in and asks him if it's all right to begin a session and so on, and all it looks to the pc like he's being denied auditing. That's all it looks to him, no matter what the auditor's doing.

Pc meets you in the hall and says, "I've just been shot with a howitzer." Well, don't say, "What do you know!" and then go through the technology of starting a session. The pc is already – by imparting this horrendous piece of information to you – has already announced the fact that he is already in-session. It's obvious, because he's considering you the auditor and that's all you're trying to achieve with your ritual – is to get him to recognize you as the auditor. Well, if he's already done so, what the hell, man? What the hell?

So he meets you in the hall and says, "I've just been shot by a howitzer." And you say, "Well, where?" and "How was that?" and so on. And steering him gently by the shoulders, steer him into the chair, and "Where was this howitzer? Where did it hit you? Oh, yeah. Well, have howitzers ever been a problem to you before? You may have a habit of being hit by howitzers in some fashion." "All right, well, what do you know about that! And this howitzer – how big was this howitzer?"

"Oh, 55 millimeter."

"Oh, well, that's a pretty big howitzer. All right. How do you feel about that now?"

"Oh, I don't know, I feel a little better about it."

"Well, all right. Now, let's recall the first time you were ever hit by one of these howitzers. Well, all right," and so forth. "All right, recall another time. Okay. Now, how does it seem to you?"

"Well, it's better."
"All right, now you think we can get on with the session? All right now?"

"Yeah, I think we can."

"All right, what goals would you like to set now?"

Your rudiment was reversed end to, wasn't it? Rudiments should have been in one place, but the pc was in-session. It's a delicate line between a Q and A and that sort of thing, but you're liable to go right on through to the end of the session and he never discovers that you've never started one. You obviously start one the moment that you steered him toward the auditing chair.

And the technical question comes up: When does the session start? Well, the session starts when the pc recognizes that he has an auditor — that's when a session starts. Pc recognizes that he has an auditor and goes into session, that is it. See, he's obviously willing to talk to you as the auditor, so he obviously is in-session. He's obviously interested in his own case, so he obviously is in-session.

Now we're going to make difficulties, see, now we're going to adjust the E-Meter cans and tighten up the leads and see whether or not the sensitivity knob is moving properly and read the maker's name plate. Have him get down on his knees — the way they'll be doing it a hundred years from now, unless you disseminate properly — get down on his knees along side of the chair and say a prayer to the — of the Auditor's Code before he begins the session. Unless I get some of your terminals run out, that's what'll happen. [laughs, laughter] I'm being mean today, you know?

But anyway, just look it over. Look it over. What's a session? Your point of view as a moment ago, why, your point of view of a session might have been two people sitting in chairs and the auditor going through a routine and a ritual called Model Session, see? Well, you just alter that point of view and you will be right. Some pcs practically don't get out of session; so the main problem is trying to get them out of session overnight. See? They are just in-session, bang, you see? Well the difficulty is ending the session.

Now, the difficulty in starting a session always comes because the auditor doesn't recognize the start of session. It always is in that category. Something wrong here.

Now, there's two ways this can happen. The pc is leery of going into session because he too often has been denied a session. All right, that's good. We start one anyway and just run out his auditing ARC break, that's all. Something like that and you've got him started and you've got him in-session. But in-sessionness is a technical condition. It has nothing to do with placement of bodies or a ritual. It's whether or not the pc has recognized his auditor and is willing to talk to the auditor. Of course, that's part of recognizing the auditor. And is inter-ested in his own case. And that's what a session is.

And if you recognize that as a session, the suddenness with which a pc will start talking to you in a streetcar or on a bus or something, is amazing. Now, you have certain rights as an auditor and that is not to run a session while traveling on the upper deck of a two-decker bus, you see, in areas where one can't be heard or where you're going to get off at the next stop. You see? You have certain rights about that sort of thing. But nevertheless, confidence
has been imposed on you – in you as an auditor. And therefore you should make an appointment for the session. That's the least thing you should do.

People start telling me their troubles and I haven't got time at that moment to listen to them, I never say, "Well, I can't listen to your troubles now." That'd be a silly thing to do, wouldn't it? "I'm sorry, I'm too busy to hear all this tale of woe that you're giving me." A week later we try to put the person in-session. Well, it has to start with an ARC break. You got it?

So, it's always a good thing to have a card handy, like an HGC card or a private practice card or something like that. And somebody starts telling you their troubles, say, "Well now, it's very interesting" – but you're going to get off at the next stop. And you say, "Right now, I've got to go. And I'm very sorry but I've got to go see this friend and so forth. Now, here is my card. And you make sure that you come and see me at two o'clock next Tuesday."

Well, that's fine, you're still interested, aren't you? That's the proper acknowledgment. You've acknowledged the person. You put him on wait, yes, and so forth. He hadn't even realized that he's in-session. But the mechanics of this will work. You'll find the mechanics of it will work. And then if you do start auditing that person as a pc you haven't got to start it with an ARC break.

The main problem is preventing sessions from happening in the wrong places. If you only knew it and if you were very smooth as an auditor this would be your main difficulty, is preventing sessions from occurring in the wrong places where you can't audit, like the second deck of a double-decker bus. So, you should give a little more thought to how you're going to get out of a situation like that, rather than worrying all the time about how to get a pc in-session. My difficulties is how do you get pcs out of session, not how do you get them into session.

Now, that's how far a look you can have on the subject of the technical practice of auditing. I mean, it can be totally the reverse to what you've been worried about.

Not that you have a sympathetic face or anything, but somebody says, "Oh, my," and you say – you knucklehead – you say, "What's wrong?" [laughter] That's it. You've had it, he goes into session. You're an auditor, you're a pro, you've said the right thing and there he is in-session. Now, how are you going to get him out of session without him running something, see?

It's a very natural thing for you to do – well go ahead and do it. But also have the panacea for correcting it, which is to say, at least a point of continuance of the session, or hand him to a substitute. Send him to the D of P or something like that.

You say, "What is wrong?" You've started a session. How easy is it to start a session? Well, it's much easier to start a session than you think. But if you were working hard to start a session, you almost never start one. You see how this would be?

Now, if you just work real hard and you fumble with the leads and you get it all set and you adjust his chair and you get it all set up and so on and the scenery is all okay and then – so on. You hang a sign on the door and you clatter around one way or the other and you come back and you sit down and you heave a long sigh and you say to him, "All right. Is it all
right with you if I begin this session now?" All right, that's fine. Now, that's perfectly all right, providing the pc is not in-session. And then, of course, that is totally wrong. There isn't a single thing you have done that is right. Not a single action you've undertaken is right from the pc's point of view, because you didn't handle the session as having started.

You probably didn't end your last session with this pc. Something like that is it what's in error. Pc still had a present time problem, pc still interested in case, pc still back on the track and so forth. He's been awake half the night thinking up the answers he's going to give you to the auditing question tomorrow. He sees you; his instant response is to give you twenty-five answers to the auditing question in rapid-fire order. Well, attribute that to your prowess as an auditor. It isn't something to be neglected. Pcs do this sort of thing – you're good, that's all. Either you're bad at ending sessions, or you're good at being an auditor, one way or the other. You have inspired confidence. Well, don't abuse the confidence once you've inspired it.

How do you handle a situation like that? Well, you hear the pc out – not all the way out. Now, there's a vast difference, in auditing, and letting a pc talk and auditing a pc. And some of you have never differentiated between these two things and you will waste a lot of auditing time. Letting a pc talk has nothing to do with auditing a pc.

And if you sit there and you find out, in thinking back over sessions, that pcs have been very verbose, they sure do talk, they run on and on and on – and if you have had that kind of experience, chalk it up as a slight miss on your part. Because you haven't audited him, you've let him talk.

I'll tell you a liability about letting a pc talk. They talk their havingness down. You can get a pc to tell you your troubles – his troubles and go on with an improper acknowledgment and just letting him run on and on and on, and you'll see him go down from antagonism to anger, to fear, to grief, to apathy. And you'll see him go right on down the Tone Scale. That's because you're not auditing him; you're acting as a camouflaged hole.

Now, auditing consists in directing the attention of the pc. And when a pc is just sitting there talking – gab, gab, gab, gab, "And it's so and so on. And I did this and I did that and so forth and it's so on." Well, then something is in error with your questions.

Do you realize that by the interjection of questions into what he is saying, you can direct his attention and throw him right back into session. And you must be in some kind of a mental paralysis where you don't think of a question to turn all this off. You're not trying to turn it off, you're trying to direct it. And if you just sit there and let a pc gab, gab, gab, gab, gab, talk, talk, talk, talk, and tell you all of his troubles and so on, you're just asking him to run his havingness out the bottom. The way to handle that situation is always interrogation. If the pc talks too much, interrogate.

How do you interrogate? Well, your knowledge of the human mind should be adequate now to the address of the situation. You can be far too abrupt with your knowledge of the human mind. He is saying, "And my Instructor did this and that and the other thing. And I was feeling so bad and then, by George, he came right in and dropped the bulletin right on my head," and so on and so on. You say abruptly, "What did you do to the Instructor?" That shuts it off effectively – creates a nice ARC break, too. But in essence, you've got to ask him what
he did to the Instructor. But how smoothly can you do this? And then that has to do with how smooth an auditor you are.

How smoothly can you ask him, "What'd you do to this Instructor that caused all this?" See, there are various gradients by which you approach this: "When was the first time you noticed there was some difficulty with this Instructor?" He's only been able to tell you by this time about two motivators – one motivator, two motivators, you see? But you can see by all the signs that he's going to go on for the rest of the auditing session telling you all the motivators. Well, that's not going to help him any. So by the time you wrap around this and figure out just about what he is talking about, you should be thinking of directing his attention. And when a pc is talking too much, direct his attention.

Now, every once in a while, a pc goes off in a high spate of interest of some kind or another and starts telling you about a gimmegahoojit or the interplanetary customs of the Z People. Well, very often also, you're interested. I had – some auditor here the other day said, "And he was telling me about this spaceship" – and the auditor is report – doing the reporting – "And he was telling me about this spaceship and how it really operates, and you know if I'd had money right at that moment, I would have bought one!" [laughter]

Now, there's a pc doing a high degree of salesmanship, the auditor quite interested. [laughter] We're not talking about that kind of a situation, you see, that's perfectly permissible. [laughter] If you shut that off, you've had it.

No, we're talking about a different kind of yap, yap, yap, yap, see? We're talking about a pc who's complaining and going on and on and on. The auditor that sits there and lets a pc go on and on and on and on and on just isn't auditing. It's the auditor who isn't in-session. The pc's willing to talk to the auditor but the auditor's not willing to direct the attention of the pc.

And the most obvious type of question that could occur to you is just "When did that trouble start?" He's saying, "And they shot me and they hanged me and then they dragged me across the field and then they brought all the cows over and made them stare at me." And he's going on and on on in this direction whamnity-wham. And if somewhere along this line about the time they shot him, you haven't asked, "When is the first time you had any trouble of this character?" you're remiss. And your pc's going to run his havingness down. See?

You should be in there directing the attention of the pc. All right, now, let's go back to this first situation I announced. The pc meets you in the hall and the pc's going gab, gab, gab, walla, walla, walla, telling you all about it, see? Now, you've got the problem of getting him into the auditing room, getting him into the chair, getting the E-Meter set up and getting it all fixed up and so forth. What are you going to do? There is no pat solution, except one – and that is direct the pc's attention. How do you direct the pc's attention? If you direct it too savagely, you have operated as a sudden shift of attention, have surprised the pc.

What are you going to say to the pc? Well, you're going to say to him something that directs his attention. Not necessarily onto the mechanics of the session – probably certainly not onto the mechanics of the session.
One of the tricks I use is put him in a comm lag and set him down. Ask him a question he can't answer right away. That gives you time. See, there's all kinds of things you can do. And they're all quite real and they're all quite convincing and they're all quite effective. He meets you in the hall and he says, "Gab, gab, gab, walla, walla, walla. And I thought up 365 answers to the auditing question which you were asking me last night. And as a matter of fact I've got them all ready to give you and so forth and we're all set and...

Well, what the hell? You're not even in the auditing room. Now, what are you going to do? Well you're going to do something to direct his attention. That's what you're going to do. Now, how are you going to direct his attention? Reprovingly? Surprisingly? Oh, no. Nothing like this. You're going to say to him something on this order: "Uhm, by the way, did you have a present time problem when we ended session yesterday?"

And he's going to say... And I'm going to get the E-Meter set up and going to give him the cans, sit him down in the chair, put a sign on the door and so forth. He's sitting there looking at it. "Yeah," he says, "Yes. It was how to answer that auditing command."

And I say, "Well, all right, was that much of a problem?"

"Well, as a matter of fact I sure struggled with it until about last night about nine o'clock or something like that," [laughter] "I happened to think that you were asking – you were asking me about a man. And you know I didn't realize before that you were asking me about a man."

"Well, what did you think I was asking – how did you define that?"

And he will say, "Well, I defined it, actually, as an island."

You say, "You did? Well now, how would you get those things to compare?" Finish it all up and so forth, say, "All right, now what goals would you like to set for this session? That's good. All right. Now, is it all right with you if I begin this process now? Thank you very much. Now, here's the auditing question," bang: "But, let's define it. Let's define it now. What do we mean by *blah, blah* and man?"

We actually have done a tiny shift of attention without distracting him too much. Now, we've asked him the pertinent question. You've always got to ask him the right question. You got the idea? You ask him the right question. Obviously he had a present time problem about the auditing or he wouldn't have been answering the auditing command all night. Obviously, you didn't end session. Obviously, there was some unconfidence involved in the thing, because he obviously, too, must have gone on self-auditing to some degree, so the session couldn't have been ended.

In other words, you've got to size up the situation. That's not a pat situation. The only thing pat about it is, is you've got to direct the pc's attention. You don't let a pc go on talking forever. It is a dirty trick. The pc will feel silly after a while. He will feel very out of session. Direct his attention and not crudely, suddenly or accusatively. You get the point?

Now, when is a pc in-session? Pc is in-session when he is *able* to talk to the auditor – change that over from "willing" to "able" – and is interested in his own case. Those are the only real requisites to being in-session. Given those things, you've got it. Now, if a pc is talk-
ing to the auditor, he obviously is able to talk to the auditor. If he's talking about his own case, he obviously is interested in his own case, so obviously there is a session. And you've got to handle it as a session. Because he's suddenly apparently elected you as the auditor. And maybe he's being audited by somebody else.

All right, this pc says to me, "You know, in that session yesterday – I was having a session yesterday – and all of a sudden we ran into a society where all they did was cook. And I got to thinking about cooking and I got more and more worried about cooking and so forth and I just realized in this lifetime I've never been able to cook," and about this time I suddenly realize that I have been elected the auditor, don't you see? He is not just talking about his case conversationally, but is actually talking a session, see?

So I say, "Well, what did your auditor do about that?" In other words, I give him right back to his auditor. Just mention his auditor and I've shifted his attention. Well, obviously his attention is stuck there.

Now, when you get very, very expert, and when you seem very smooth to pcs, it will be because by interrogation you can shift the pc's attention. And when you can shift a pc's attention smoothly, why, he will get an idea that you have terrific altitude. And it's all in the expertness with which you can shift the pc's attention. You use that with questions.

Now, every once in a while in giving a Security Check, you ask Instructors, "How do you give a Security Check?" Well, that's fine, you give a Security Check by reading the question, finding out if there's a drop on the meter. All right, there's a drop on the meter. That's where you fall down, if you're going to fall down on a security question. There's where you fall down. Right there at that point. You've asked the question which is on the printed form, you've gotten a fall on the meter and right there a large percentage of auditors lay an egg. They do not direct the pc's attention. They read the question again. They do some version of question-reading; they don't direct the pc's attention with a question.

Now, just look at this little tiny microscopic trick here. You say, "Have you ever pushed over any tall buildings?" And you get a fall on the E-Meter. Now, instead of directing the pc's attention, you say, "Well, have you ever – " you know, substituting emphasis for brains, "Have you ever pushed over any tall buildings?" And you get another fall on the E-Meter. And then you say, well, it requires a different emphasis, so you say, "Have you ever pushed over any tall buildings?" [laughter]

Now, you see that hasn't anything whatsoever to do with shifting the pc's attention. You see what – why it's wrong?

Now, even a banal shift of the auditing thing tends to shift the pc's attention. "Have you ever pushed over any tall buildings?" You get a fall. You could say, "Well, what was that?" Well, now if you point too emphatically to the meter, you'll get an out-of-sessionalness on the part of the pc, because his attention is being pulled out of the session, out of his bank, onto the meter.

I as often as not will assume that the pc is not interested in the meter, but at this moment is very interested in having had an odd phenomenon of some kind or another. If you get a fall, it's usually accompanied by some electronic shift of some kind. You know, the fellow's
going, "Tall buildings, I never thought of that before," you know. It's kind of a – maybe it's a lurch in his stomach or he gets a twitch in the end of his nose or his hands feel kind of sweaty suddenly. Well, I don't refer to this, I refer to that. I'm just as likely as not to say, "What happened just then?"

"Well, I had this lurch."

"All right. Does that have anything to do with tall buildings?"

"Oh, I can't stand tall buildings."

"Well, have you ever pushed over any tall buildings?"

You get the shift? You put his attention more on him, more on the bank and then reiterate the question that we want to know. And he says, "Well, it just seems like it might have happened. It seems – it seems possible. It's – it just seems like it's something I would do."

"Well now, why do you think you would do that?"

"Well, I have this fear of every time I see a tall building, that it'll fall over."

"Oh. Recall a time when that was that way."

"Yes, yes, definitely."

"All right. Now, have you ever pushed over any tall buildings?"

"Augh, it's an awful question you're asking me."

He gets the idea that his attention actually by this time is being actually ground right straight down on the bank. He'll get a sensation that he's really being shoved into it, but you have not changed your intonation, you haven't changed the starkness of the question, you haven't lightened it up, you haven't made it more accusative, anything else. But the pc gets the sensation of you have just taken his attention, and you have said, "Stop looking at me, stop looking at the E-Meter, stop looking at this beautiful bright day around here and look at that bank, damn you. Now, did you or didn't you?" He'll actually get this kind of a [makes a clapping sound with his hands] pressure – sensation.

What have you actually done? You've restimulated the channel. You've restimulated the whole chain. You've got the whole chain of tall buildings now in total restim both by your security question, by asking if there was some sensation that went along with it. By asking him if he ever has any difficulties with tall buildings. Is there anything he's ever noticed, recalling a time when he noticed that and so forth. And now the security question again, "Have you ever pushed over any tall buildings?" And boy, he'll feel by this time as though he has been run into by a Mack truck. And he's going to give!

"Well, all right, if you put it that way, I pushed over the Empire State Building. That's why it's in ruins. That's why New York's never been the same since," if he ever did. He'd give it to you right now. "Ohh!" You get why? Because your ability to fix attention has been horsepowered up to his inability to fix attention and you have made him able to fix his attention on the thing which his attention is dispersing off of And he gets the idea just as though you've backed up a Caterpillar tractor back of him and shoved. "Get in there and pitch. Let's you and him fight." This is what the thing sort of adds up to.
All right. I'll go over another instance of this. Now, "Have you ever whistled at a girl?" You get a reaction on the E-Meter. Don't say, "Ah, I have a reaction on the E-Meter here. Um, let's see, is there any other way I can pull your attention out of session? Do you have any present time problems?" [laughter] "Are you worried about your wife or anything like that? Don't you realize you've been far away from home? Your children might be trapped in a burning building." [laughter] Don't go on this particular course of action. That is the wrong course of action. That is the escapist approach. Letting the pc escape. You don't do that at all. You do it quite in reverse. You say, "Have you ever whistled at a girl? Did you have any sensations just then?"

"Yeah, as a matter of fact I had this sensation right across my head."
"Oh, well, what do you suppose that might have been?"
"Well, I don't know. I don't know."
"Well, what would it have to do with whistling or pretty girls or something like that?"
"Well, I don't know. Why, how could it poss – ah, there it is again!"
"Well now, did you have a picture just as you did that?"
"Oh, yeah, well."
"Well, all right. Well, have you ever whistled at any pretty girls?"
"Well, no, not – ow! Not that I know of, so forth. I don't recall. Uh..."
"Well, do you remember any pretty girl?"
"Oh yes. Oh, yes, yes, remember a pretty girl."
"Did you ever whistle at her?"
"I get – there it is again."
"Well, what's going on here? What are you looking at there? What are you looking at there?"
"Well – well, if you must know, I whistled at this pretty girl down on – ouch! – I went down on – ouch! – down on Main Street – ouch! – one day and it was somebody's wife and he – he socked me."
"Oh, all right, you did whistle at a pretty girl, then."
"Yes, I – I did."
"All right. Ever whistle at any other pretty girls?"
"No – ouch! Uh – well..."
"Did you ever whistle at any other pretty girls?"
"Well, if you must know, I have never done anything else. It is just something that I just can't keep from doing. I try and I try and I try and I keep standing there on drugstore corners, whistling. I whistle and I whistle!" [laughter] "What are you going to do about it! Hey,
you know, it's a funny thing, I never remembered that before. I never noticed that about myself before." [laughter]

All this type of phenomena falls out of the barrel by just the direction of his attention. And you eventually will put it right onto the chain of withholds and overts. You see? But it's all in handling the attention. And as I give you again, I'll give you the wrong way to.

Now, if you "Have you ever whistled at any girls? ... Did you object to my lighting the cigarette now while I was auditing you? Oh, you didn't? All right, that's fine. Good enough. Are those leads far enough apart? Okay. Now, let's see, what were we getting at? What was I just asking you? Uh... oh. Mm-hm. Well, there couldn't have been much reaction on that; I didn't notice it. Let's go to the next question."

Now, that would not be a good sound auditing approach. [laughter] Why? Because it's demonstrating not-knowingness on the part of the auditor, the reverse of which is all-seeingness. All right. Let's get to the next point.

A person who security checks as though he's in the dark will always be in the dark with a Security Check. A person who pretends knowingness to too great a degree when he is doing a Security Check is also violating the R-factor. The R-factor is simply this: you want to know and you're going to get him to find out. And that is all the R-factor there is. And if you're in that state of mind you will direct his attention neatly every time. Not, you want to give a perfect Security Check; not, you want to follow the perfect technology; not, you want to always do your E-Meter right. See, those are not R-factors.

You're interested and you want him to find out. If those are the only R-factors present, boy, can you security check. You'll find out that a Security Check that ordinarily would take you thirty-six hours to get rid of – and some of them do take that long to get rid of – you could cut it right on down to about a four-or five-hour Security Check and you'd get the lot. It's just that difference.

You notice a fall on your meter, you know at once the pc is interiorized into some kind of a withhold. He's on a chain. It's live right now. Well, you take full advantage of that fact. You call his attention to the subject matter of the Security Check. You ask him to define the subject matter of the Security Check. You ask him what's been going on in this particular de-

And if that is the only R-factors with which you're dealing when you do a Security Check, you'll find out they really whiz. "Here's an interesting question, you know? It says, 'Have you ever raped anyone?' Have you ever raped anyone? When? You ever been worried about rape? You ever thought about raping? You ever been raped? What just happened just then? What did you feel just then? No, are you looking at a picture?" Get this kind of an approach, you see? It's all in, in, in.

And you get his attention all the way in, he'll pick it up. And he'll suddenly say, "Oh, I forgot all about her. It was Betsy Ann. I was two." [laughter]
And you say, "All right, let's see if she is clean now. You ever raped anyone?" [laughter] You got the difference of approach?

You've got to handle the pc's attention. Now, the reason why you very often fail to do this is because you do not perhaps have a sufficient reality on the weakness of a pc's ability to handle his attention on the subject of the buttons which make him aberrated.

Those things which have aberrated the pc have overwhelmed him. It's always a case of overwhelm. Overwhelm, what is that? Push in too tight. You could say, overwhelm, pushed in too tight. All right. Well, naturally, his attention must at one time have been a restraining factor on keeping things from coming in on him. That's a thetan's primary weapon. So he's restraining things from coming in on him.

Now, what do you think that we're going to have here when he gets on this subject again? We're going to have somebody whose attention cannot be controlled on that particular subject, because his attention has been overwhelmed on that subject. So therefore, if the auditor does not steer the pc's attention on the subjects in which the pc is having difficulty or on which he's having difficulty, the pc's attention does not get directed and thereby just wanders or just disperses. The pc is not capable of directing his attention on the subject of his aberrations. That is why he stays aberrated. That is why it remains unknown to him. That's the simple mechanic of the thing.

He's a man of iron in all such places except as appertains to his terminal line. And there it's solid custard. And the custard runs to the right and his attention runs to the right and it runs up and his attention runs up and it runs down and it just doesn't matter what the custard does, that's what his attention is going to do. And unless there's somebody around the auditing session who will direct the pc's attention, it isn't going to be directed by anybody but the valence. Now, isn't that fascinating?

This person, let us say, has a terminal – I'll have to pick one now that nobody here has – has a terminal called a streetcar conductor. All right, streetcar conductors are always directing things one way or the other, so we don't have the auditor directing any attention and we have a pc, of course, who is in the middle of the valence called "streetcar conductor," so the pc can't direct his attention, so we have left the session in the hands of a streetcar conductor. [laughter] Well, isn't that right? You can see it very graphically. That's correct. That's who's running the session.

Now, if this session runs overboard, of course, you say, "Well, it wasn't my fault. I was just sitting there going through the rituals, swinging the incense in the right directions, making orbital star patterns with the incense pot. And the pc, he was sitting there in the chair and we had him on the E-Meter, so it couldn't have gone wrong."

And there's a mysterious third party present called a streetcar conductor and he has said, "End of line, everybody out," and the pc says, "Well, that's the end of that."

And you say, "Yes? All right. Here's the next auditing question." You get the idea? There's nobody directing any attention around there but the valence. The mysterious third party.
And when it's a streetcar conductor everybody gets in and everybody gets out and they
get to the end of the line and they go back to the beginning of the line. And when you run an
engram with the streetcar conductor running it, look what it'd look like: You get to the middle
of the engram and lose a lot of passengers; [laughter] personnel of the engram would disap-
pear at the beginning or the end or someplace; and then all of a sudden there'd be a tremen-
dous number of people present that hadn't been present before. Trolley would come off the
wire and stop for a while. And then you ask the question, "Why is it taking so long to clear
this person?" Well, that's because streetcar conductors aren't trained auditors. You see?

Now, maybe there's a lot of bitterness and sarcasm mixed up in this, but there's a little,
a little truth to be found there, if you scrape at it. Unless the auditor directs the pc's attention,
we have a valence that will do God knows what with it, and we have the pc who can't.

So out of the three people present, in a clearing session, we've only got one person
who could direct the pc's attention, correctly, to get auditing done. And when that person
doesn't do it, no auditing occurs, except by accident and the grace of Ron. [laughter]

Now, I will admit that things are put together well enough that some auditing is al-
ways occurring. But just a minute. This is a special person who is running a special terminal.
Every pc is a special case – every one of them.

All right, now you get a pc who has a terminal of a lion tamer. And if you, the auditor,
don't closely direct the pc's attention as you're running the terminal "a lion trainer," you're
going to be trained as a lion. [laughter]

Now, don't come around and tell me that the session keeps going off the rails, because
I will always tell you that obviously you aren't directing the pc's attention. That would be the
pat answer which any Instructor could give any auditing session that started going haywire.
Now, the auditor at no time should leave a session on automatic. You leave a session on
automatic and you're just asking for it. But what are you asking for? You're asking for the
session to be taken over one hundred percent by the valence that you are running out of the
pc.

So now, don't keep complaining that the pc is a difficult pc or that the pc ARC breaks
easily or that the pc won't go into session, because pc be damned; there is no pc practically.
When you – when Newton and Watt and some of the other – and I think an Italian named Erg,
[laughs] got themselves all fixed up, in measuring energies, they didn't get a small enough
unit to measure the actual energy-attention output of a pc who is stuck in the middle of a va-
lence. It is too slightly microscopic to even be measurable.

So if you're blaming this one one-millionth of a grasshopper-power of a person that is
left, you see, after you've given full play to the terminal and then you're blaming this tiny, tiny
amount of residual remaining energy for everything that's going wrong, it'd be something like
saying, "This roaring torrent of a raindrop went down the side of Cleopatra's obelisk and split
it in half." And that just doesn't make sense, you see? It isn't possible.

Now, this pc may be a very forceful person. This pc may be able to do lots of things.
This pc is not totally a slave to his valence. Nobody ever is. But remember, you've got him in
a situation where all the mechanics of auditing have made him again a total slave to this va-
lence. And now you're going to blame him for what goes wrong. Well, there isn't any blame connected with it, unless the pc's attention – the one-millionth of a grasshopper-power left of it – is very closely directed by the auditor, of course what is left there – it's the entire investment of the pc's energy, via the valence. And you will see that valence all of a sudden materializing and going all over the place and doing all sorts of wild things with the session and so forth. You see what you've asked for?

You can almost predict how a pc will operate in a session, once you have his valence. If you know his terminal, if you're doing a poor job or if the pc is out of session or if your pc's confidence in you as an auditor is low, the session is going to be run by his terminal. So therefore, if you're going to run a bad session on him, we know at once how the pc will operate. He will operate just like that terminal.

So when this sort of thing shows up, don't say, "Well, the pc is a difficult pc." That is a – that's nonsense. No pcs are difficult pcs, but some valences are bitch kitties.

All right. Now, let's take somebody who has a terminal "surgeon." Now, wouldn't this be very interesting to audit, if you didn't run a session? If you weren't running a tight session? And you didn't have the pc in-session? Something around there is going to get sawed up, that's for sure. [laughter]

Because the terminal knows how to run a session. The terminal knows very well how to run a session: You get the anesthetic mask, and you lay it out, and you get the sutures laid out and you get the oxygen put out properly and you lay out the saws and knock some bits of rust off of them. See? And it would all depend on what part of the track, what condition of operation would take place in the session. [laughter] So some would be rougher sessions than others. [laughter]

And, of course, a surgeon is liable to do all sorts of weird things like hold the patient down. [laughter] But who's the patient around here? Well, it's liable to be the auditor, it's liable to be almost anybody. So if you're running a surgeon some time, as a terminal on a pc, and you find yourself lying on the floor, [laughter] with both of your shoulder blades pinned to the floor and him fishing around for a pen knife to cut your throat, you will at least have the satisfaction of remembering that you once heard a lecture [laughter] in which it was stated that this could happen and you will at least know what you did wrong. You didn't direct the pc's attention. That's the whole lot. I mean, you can't really say much more of it than that.

When you cease to direct the pc's attention, there's only one party left in the session. And of course, the session will go exactly in that direction. I shudder to think what would happen up on the second floor if we had a chariot driver! [laughs, laughter] You can see there that we have a point, though. Maybe put that way, maybe some of these incomprehensibles will cease to be incomprehensible.

There's an old rule, an old law, that's found in the Original Thesis. There are three laws in there. But it just amounts to the fact that, the auditor plus the pc is greater than the engram bank. And the auditor minus the pc may or may not be greater than the engram bank, but certainly minus the pc minus the auditor, and you've got nothing left but an engram bank. You get the idea? So it takes both the auditor and the pc in there pitching to hold a terminal
down and run it out. And that's about all it amounts to. Takes them both. And the way you get them both is to direct the pc's attention.

How many ways are there of doing this? Not to labor the point particularly, but how many ways could you direct the pc's attention? Now, you just think of some of the ways you have misdirected the pc's attention. Can you think of having misdirected the pc's attention? Sometimes you can be quite inadvertent. Drop the ashtray. You certainly have directed his attention. But to the wrong place. He doesn't have any bank in the vicinity of the ashtray. That's the wrong place for his attention to go to. So of course, then, the tension built up by the session explodes, the pc drops out of the session, you feeling guilty for having dropped the ashtray, drop out of the session and what do we have left? We have a lion tamer, a surgeon, something like this. Everybody quit the session but the valence.

And that's the trouble with valences, is they're educated never to quit. You see, you've come very close to the basic dynamic principle of existence of Dianetics when you come to the valence. What is trying to survive? As soon as we realize that you don't have to try to survive, as soon as you realize that survival itself, the effort to survive, is a complete idiocy in a being who can't do anything else.

The most native natural skill a thetan has is survival. So now he's got survival on a via. He's got survival all built into a beingness. He doesn't have any survival left and he has become so concerned and worried about survival that it's all built into the beingness. Well, of course, these beingnesses on a via have a tremendous amount of survival mixed up in them. And they can be very resistive. But they are only very resistive when you get two willful missings in a session: the auditor and the pc. And then of course you have survival rampant.

And, of course, the survival of such a being is interesting in the fact that none of its actions ever add up to survival. That is what is peculiar. Once you get survival on a big via, of some character or another, it winds up as a non-survival. It winds up as a succumb.

So if any valence was left to ramp and roar across the boards of life, totally undeterred by a person's native good sense, well, naturally, it would wind up to the most destructive activity imaginable. In the first place, a valence's actions and packages are usually out of time. In other words, this person is all adjusted for the French terror. All geared up. All the now-I'm-supposed-to get one through a certain period of existence – there it is. Only we aren't in the French terror. Do you see?

Now, a road – a highwayman of yesteryear – he knows how to survive. You go out and you stick up coaches. See? And you go back and spend it on the babes. That's how you survive. We don't know why – he probably had a lot of fun at that time. But that was all a very good business to be in, perhaps, when we had nothing but cavalry for police. But now the odds have mounted up. And things have changed. And you just try and disassemble a .45 automatic with the same field-stripping procedure as a flintlock pistol and you'll fumble. In other words, the skills are all out-of-date, all out of time and so on. So the actual activities of this fixed valence add up to nothing but succumb. The fellow's out of money, so he goes out and he buys a horse and he puts on a plumed hat and he rides out to Ashdown Forest, waiting for the coach to come through. And it's a wet night and he gets pneumonia and that's it. [laughter] See, it's all as idiotic as that. And I do mean as idiotic as that – if not more so.
Now, you take some fellow, he's liable to believe that being a good.... Well, let's say he was a designer, a clothes designer. And in this lifetime he's been trying to be a clothes designer. But his valence is clothes designer and he's tried to be a clothes designer in this lifetime and he just somehow or another can't be a clothes designer in this lifetime. That's one of the most remarkable points about valences: is those people who have tried to be their valences in this lifetime have laid the most gorgeous eggs. It's fantastic. I mean, how far off these things can be. Why? Because they are valences rigged up to live in another age and time and they are incapable of change.

Now, why is a valence so incapable of change? That's because it's rigged for survival, so all of its facets and aspects are fixed. It won't change.

Now, let's say at some time or another you've had a serving girl. And you've tried to teach her to set the table. Day after day, week after week, you try to teach her to set the table. And somehow or another she is never able to set the table. She just cannot do it. She either breaks the dishes or spills them on the floor or trips over the edge of the tablecloth, or... And she keeps putting the roast pans on the table and the platters back in the oven, and she keeps spilling the soup and it just is a mess. And you say, "Now look, with a little good training – with a little good training – now we'll be able to make this grade." And two years later you're still trying.

Well, past civilizations have handled it this way: They have broken the valence with punishment. And in a past time the way that servant girl would have been trained is after she broke her first dish she would have been whipped for half an hour and then sent back again to set the table. And you know the funny part of it is, that didn't work either.

They take criminals and whether they use the whip or the jail or the stock or anything else, they just keep going back stealing cabbages. The guy keeps on stealing cabbages. That's what he does. And they put him in a stock, you put him in jail, you fine him – in more modern times, why, you deny him his social security or do something rigorous like this – and he still goes and steals cabbages. Why? Because you're working against the survival pattern of a valence. And there's nothing can break it.

Now, when you finally do break the person down, the person now is nothing because all you have is a broken valence. You don't even have a person anymore, see? See, it's possibly even better to have a good operating valence, you know, than to be nobody at all, but it's much better to be yourself than an operating valence.

In handling criminals – I'm very prone to be very careless with people and so forth, because I myself am seldom in any grave and terrible danger from their actions. But I have had, as I've mentioned before, I've had a whole shipload of criminals, and I never tried to make them into honest men. It was not necessary. In the first place, they were doing a criminal thing like fighting a war anyhow and just the simple matter of saying, "All right, it doesn't matter what you do on this ship, nothing is ever going to go into your record. We're never going to make another mark in your records." That was enough. "If there's any punishments, you have to be satisfied with the punishments I hand out, and that's all right." And, of course, the punishments I handed out were as freak and unique as any jail kangaroo court. You know, very freak. You know, like, "Well, you'll have to paint that gun all over, all by yourself, and
so forth, and when you get that gun totally painted and so on, why, we'll inspect it. And if we
find one single fleck of rust on it anywhere that hasn't been adequately handled and covered
up, why, then you've got to paint the whole gun again." This was very satisfactory to that type
of mentality. Very satisfactory.

Well, what was the net result? You had no broken valences. I suppose they stole each
other ragged. But they couldn't object. And that was the way it went. And it was the most
pleasant calm vista you had ever heard of. Why, there were ships full of honest men all over
the place that were appetite over tin cup and at each other's throats day and night – but not
this ship. There was no pressure exerted. Interesting, isn't it?

So you'd say that an operating valence is better than a broken valence. But a person is
better than a valence. And you get your gradient scale. Of course, I say better than a valence,
that's an understatement of magnitude. There's a tremendous difference between a person and
an operating valence.

Once in a while you ask what is a GE? Well, a GE is just a valence. A GE is some
kind of a superpackaged valence that has been set up one way or the other, that can continue
to be regenerated. Now the particular form that man has adopted is no longer very useful to
him. Various things happen to this particular form which shouldn't be happening to it. This
form is perfectly all right in a meat-eater society. You can go out and eat and be eaten and
slug animals over the head and be overwhumped, and your main difficulty is with bodies.

Well, you get a human body trying to duplicate a machine. Ah, well, that requires a
different type of body. That's right. A thetan is not very happy running a machine in a meat
body. He just isn't. He's much happier in a robot, doll body type of setup. Why? Because it's
made out of metal and is animated and the machine is made out of metal and it's animated. So
he does a perfectly nice duplication, he never gets sick running machines. Get the idea?

And, of course, you get a society now that has a high velocity. If you're in a car out
here going thirty miles an hour and you hit a tree, the body you've got will have had it. It'll at
least get bruised. Now, in a high velocity society that runs something on the order of fifty,
sixty miles an hour on the highway and so forth, you don't want bodies that go streaming all
over the road. Why, they bleed, and all kinds of things. And furthermore, they're not good
survival for machines. Machines can't eat bodies. They're not good fuel, they're not good any-
things. You have to go bury them someplace because they start putrefying and so forth. It's a
total waste.

You take a doll body, a doll body, a crash at sixty miles an hour in a doll body would
be something like a mosquito bite. So you, of course, can perfectly afford to run a sixty mile
an hour vehicle while you're in a doll body. You got the idea?

All right, so you have man protesting, very ineffectually, about machinery. Oh, well,
there's – it's almost died out, everybody's sort of overwhelmed by the machine, but it's a big
lot of trouble. You have man organized into safety councils and all sorts of things in order to
restrain traffic and so forth.

Well, he's unhappy, because he's in a fixed-valence state. Now, at no time am I advo-
cating anything like a pastoral return to nature or that we all pick up doll bodies and carry on,
because it isn't necessarily true that a meat body – a humanoid-type body – it isn't necessarily true that it's a bad body form. It is not a bad body form. As a matter of fact you should be able to take a meat body and throw it up against a brick wall that practically flattens it till it looks like a pancake, pick it up, shake it out, put it back on again and it's perfectly all right; there isn't even a bruise.

You have the evidence of this. What holds a broken leg broken? Have you ever healed anybody's broken leg? Have you ever speeded up a healing or an injury of any kind whatsoever? Well, what was holding it? If you could help it without doing anything with it, all you had to do was run out the engram or something of this sort. If you've helped somebody get well, then it must have been that the thetan himself was slowing down the process of healing.

Ah, but let's take that just a little bit further and say, then, the thetan must himself have been perpetuating the process of destruction. So it takes an entirely different type of orientation to run a meat body in a scientific, machine, high-speed society. There's no liability in doing so, but there is one where the body is oriented to fight lions and there aren't any lions. You look every place and you look under the sofas and back of the hedges and you can find no lions. But there are a lot of things out there running up and down the highway that make a lion look tame. I'll tell you, a pat from a ten-ton truck is much more serious.

So, a fixed condition of a valence which is so fixed and unalterable that nothing can change it, not even punishment, and which is out-of-date, will of course make an unhappy person. Inevitable that it will make an unhappy person. Now, that these things have survival potential, nobody will dispute. They have tremendous survival potential. In that the entire history of healing has never been able to do anything with a valence is something on the order of an attestation. They've never been able to do anything with them either.

They've had all sorts of campaigns like "Be nice to the insane," you know? Doesn't work. There's nothing – there's been no way of handling a readjustment of beings.

Now you have a method that does handle the situation. All right, well don't be surprised that while you're applying this, the valence objects. It will.

You let a valence run on auto, be totally neglected and you're in for trouble. Now I'll tell you that I have learned a great deal this summer. I have learned a great deal this summer. I have learned, not by treating people experimentally but by doing what we have always been doing, the best that we could do at that time, I have learned that not even the basic processes of Scientology will do more than a patch-up when it comes to clearing – not even the basic processes of Scientology applied to a preclear whose valence has not been located. They won't do anything very much. It's not a permanent proposition.

Oh yes, you could cave it in, oh yes, you could change it around, oh yes, you can make some shifts; but you can't clear them. You can make an alteration of case, but you can't make a regain of case. You have to apply the route of "find his goal" and that permits you to find the valence chain and then audit the valence. Now you can get someplace. Now you can whiz, because you are right there where you should be.

You have a pc who is unaware of being somebody he is being. They don't know they're being this person. So what use is being this person to them? It's no joy to them – to-
tally unknown situation. And this sort of thing is something – is getting in their road and making them succumb on certain projects and is tripping up their lives and is messing them up in general, and they don't even know what it is.

Well, there's just an addiction to another period and zone of life, another time of history, another skill package. Fortunately, not all men's skill packages hang up as valences. You shouldn't say that everything a man can do or every package of skills a man gets is the result of a valence. It is not. It is not. A thetan is totally capable of doing these various things.

For instance, I don't think I ever got into – I probably never had a valence of when knighthood was in flower – that type of valence. Those periods come and go. On every planet you get everybody tired of doing anything and you'll get a period of when knighthood was in flower, you know, and it goes through the same pattern lines and all that sort of thing. All right, that's fine.

You arrive in a society of that character. Now, if you can excel in any way in a society of that character, then it must be that you can't be operating with a valence. How can you excel if you're operating as a valence? Because the operation of a valence is nonsentient operation. It is operation in the absence of knowingness. Well, you try to take one single run down the lists without knowing consciously how to do it. Just try it. And you're going to wind up in the middle of the damnedest scramble of tinware you ever were in. [laughter]

There are never any two runs just alike. There are never any two jousts alike. So you can't even form a good valence to do that. But when a thetan is totally overwhelmed and when he has totally given up and when he decides to totally become this thing which will thereafter be him forevermore, he's now had it. He will never be able to do it again. Isn't that interesting?

He will never be able to be a good priest if his valence is a priest. Why? Well, the basic underlying impulse is what? How did he get to be the priest? That's interesting. How did he get into this valence? It must have been by resisting and trying to knock off priests. And he must have worked awfully hard at it. And he must have scuppered an awful lot of priests. Man, the landscape must have been littered with them.

And the basic impulse of the preclear toward the valence is destruction of the valence. So, therefore, every time you don't let the pc get at it, why, you get a valence takeover, because the pc has lost – what is the first thing he thinks he loses to? He must be losing to the valence. Although he might be blaming the auditor, he thinks the auditor has now ganged up with the valence, you see? It's the valence which has overcome him again. So his basic impulse toward a valence is destruction. So you ever think you're going to get anything but destructive action from something which is being operated now by a thetan which has its primary impulse of destruction? It's primarily a destructive impulse.

So you have people who are living in valences toward which they have nothing but the most violent feelings. If they have any feelings left at all way down on the lower realm, they have the most violent destructive feelings toward that valence.

Now, this valence is going to succeed, is it? Ha, ha, ha! The dickens it is! So if we had a valence of a jousting knight and the person were totally in the valence of a jousting knight,
we would put him out on the lists, and we could put him on the horse, and we could pretty him up, and we could polish his armor, and we could give him the most dizzle-dazzle of devices for his shield, and we could give him the very best ash spears, and we could have the prettiest girls tying their most suggestive underthings around his neck, and he'd wind up in a pile of tinware. [laughter]

Because every time the thetan wakes up, even slightly, to call for a decision, he makes a destructive decision with regard to the action which he is doing. Halfway down the lists, the thetan says, "Let me see, where am I? Oh, this!" – crash! See? It just requires the slightest rekindling of the actual intelligence and personality of the being to cause a destruction to take place.

Now, it doesn't have to be in anything as romantic or as bombastic as jousting knight. This fellow's a machinist. That's the valence. He's been totally overwhumped by machinists. So this life, he's moving through Coventry, see, and there's no jobs anyplace but that of a machinist. And he finds himself there and he sort of trains as a machinist. And at first, it looks like he has a little facility of it, but he doesn't, but he does, but he doesn't, but he does. And then one day he's standing up at the machine and suddenly the thetan wakes up slightly and says, "Where am I? Oh! Machinist!", crush, you see, and into the machinery he goes, that's it. Get the idea? And he finds out he can't push him into the machinery because the machinist gets well and is back at his platform again. Now he could make him sick. See? He could make him feel bad. He could make him lazy. He could make him inactive.

And you might say the primary battle of the universe is the battle between the thetan and the valence. And the impulse of the thetan is total destruction of the valence, which ought to make your job as an auditor awfully damned easy.

Because you're auditing somebody whose first wish is to get rid of this thing. And as soon as he has, he's won. He'll come back to being himself and he'll be able to walk with his head in the sky again. But until that time he's defeated. He's defeated from the moment that he was overwhelmed way back a hundred trillion years ago, right up till now. He's been defeated the whole ruddy lot.

So that ought to make your job very, very easy. And if you look at it like that, you'll see. You'll also be able to understand the activities of men. You'll understand why this fellow is dramatizing being a bank president and always going bankrupt. Now, there's another fellow who is a bank president and he isn't going bankrupt. But he has trouble with a boat. You see? It's all kind of unexplained and all hit or miss.

Well, it's just that very solid fact of what valence is he in? Because that for sure he will commit suicide with. He'll commit suicide with it because his primary foe is that valence and that's all there is to that; that is the thing he is trying to kill.

And when you find that, the valence will ebb and flow and he will go through all the propitiative attitudes toward the valence and it will look for a while as though he really wants to keep this valence and so on and all kinds of misemotional reactions toward this valence. And it'll get on up the lot and when he finally comes out in the clear he is not any longer overwhelmed. So that is what you're trying to do, basically.
So, that is the attention you are trying to direct. You are trying to direct the pc's attention toward eradication of all of the points which made him a slave to a valence. And if you fail to direct his attention, of course, there is nothing else there to be directed. There is nothing else present except this valence. And if you overwhelm the pc in some fashion, he will dramatize the valence. So don't blame anybody but yourself if you have a rough session. And you can always predict how the pc will operate.

If you had somebody who was a trancer, let's say he had a valence called "a trancer" – you know, it's a person who went into trances. You'd know whenever the pc was out of session. Because the pc would trance. Pc isn't any longer present, the valence is present. You see that, as an immediate detection? All right, get the rudiments in. The rudiments must be out because the valence took over. See? It's as simple as that.

The more you know about the valence, the easier it is to audit the pc. And the more you know about the valence, why, the easier it is to predict what the pc will do and what you've got to do. Now you could sit down and have yourself a nice thought about that, if you know the valence of the pc you're operating. Just have a nice thought about it. Say, "I wonder what this pc would do," and just mentally forecast, what would be this pc out of session? What would be this pc as the total valence? What would this pc do as the total valence? Because that's what the pc is doing as a total valence when the pc is out of session. So anytime the pc does that, you know you should get your rudiments in. See how tricky that is? This information can be used.

All right. So, the first signal that you have failed to direct the pc's attention and that you have complimented the overwhelmingness of the valence, is a breakdown of the rudiments. Well, now you should be a clever enough auditor not to let it go that far. You shouldn't let rudiments break down. You should be able to catch them before they fall.

Now, some people have a fast reaction time and when an egg falls off the table, they are very able to catch it before it hits the floor. And other people, when the egg falls off the table, they have to go get a mop. And the auditor who has to go get a mop all the time, which is to say put the valence in [rudiments in] just isn't reacting very fast. See, he's got a slow reaction.

Now, what you want, when you're adding all this up – what you want in the final analysis, is ways and means of observation, of observing a pc to know what is going wrong and why it is going wrong. To know when the pc is in-session, when the pc is not in-session.

Now, I've just given you ways and means by which you can do that and it'd make you appear pretty clever if it.... Well, you know what the pc's valence is; pc's valence is a robot. Don't think you're really getting down to it when he starts to clank. No, the valences [rudiments] are out when he clanks. The pc doesn't clank. You can have a pc sailing all around and he doesn't clank. But a robot clanks, and you must have brought that into total replay. Must be a valence out – I mean, a rudiment out for the valence to be in. See that?

The pc who dramatizes his valence has a rudiment out. Simple? There are many ways of looking at this sort of thing. And, of course, one of the ways of handling this wrong would be as follows: Pc's terminal is a robot, so you've got it all figured out how the pc would operate if he suddenly went out of valence, he's going to go *whir-clank*. All right, so the pc is run-
ning through some terrifically heavy stretch of engram or something of the sort, and he starts going "Rrr-rrr-rrr-rrr."

You say, "Rudiments out. All right. Well, that's the last command of that particular process. Now let's get these rudiments in."

I don't think that'd be the way to handle that. As a matter of fact, I think that would have let the valence totally overwhelm the pc. Don't you see? No, the way to do that, is just be a little more positive, a little more direct, and direct the pc's attention. You forgot the pc someplace along the line, that's for sure. And you start directing the pc's attention and that whir will turn right off. You caught the egg before it went splash.

These are all the nice little niceties of auditing. These are little tiny thingamubumps that makes the difference between clearing in ten thousand hours and clearing in a couple of hundred. See?

It isn't enough to say to you challengingly, "Well, now, if you just had sufficient powers of observation and if you would just learn to look, why, you would be a good auditor. There. Now, I've said it, and that's it." And anything you did wrong, why, then just say to you challengingly, "Well, you just don't know what you're looking at, and so forth, you see, and so on." That would be a Germanic method of teaching.

I went to Heidelberg once. They specialized in it. When they could get you into class. But fortunately at Heidelberg there was no compulsion of attending class. But the favored method of handling a student was just to show him continuously that he was wrong. Give him some wide generality of observation, you see, something that could be interpreted in fifteen dozen different directions, and then give it with complete German didactiveness – usually an involved paragraph, you see, where everything modified everything and then all the clauses modified the lot. And then just with the most contemptuous, lordly tone of voice, call the students' attention to that, as though that solved all the problems of the universe, you see. It's quite a method of teaching.

Well, we don't pursue this method of teaching, and I would feel I was doing it to you a little bit if I didn't tell you what you should be looking for and what you should be looking at. And if you as an auditor have an idea that you're looking for anything else than compliance of the pc for the auditing command, direction of the pc's attention to his case, keeping the pc in-session – if you think you're doing something else, you ought to shed it as excess baggage. You ought to drop it over in the canal. Because the canal's a long distance from here. And because it's just so much excess baggage.

Anything that doesn't contribute to this exact situation of getting the pc into session, directing the pc's attention, getting the valence plowed out, and bringing the thetan back up to where he can breathe light and air again, is not auditing. Anything that detracts from it, you can jettison, at any time. If you do those things, man, can you get a case to run! And a case can really run.

You would be amazed how thoroughly and how solidly and how much of a sprint of gain can be done in one session, with the pc totally in-session and the auditor in there pitching the whole session all the way through. Wow! I mean, tremendous changes can occur just by
never letting the pc's attention wander. You say the auditing command and he says, "Whir, whir, ah, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir, whir," Well, from about the second whir on you are wasting time. He hasn't got your auditing command; that's what's wrong. The least you could say is, "Did you get that?"

"Oh, uh – wha – hmm?"

"Well, here's the auditing command."

Or, "How'd you do that? What were you looking at? Okay, that's good. Good, here's the next auditing command, bang. What are you looking at now? Did anything happen then? All right. What's going on?"

For a while he'll say, "Nyyrrr, nyyrrrr," and he'll act like a robot or a lion tamer or whatever he is. And all of a sudden he'll say, "You know, there's somebody in here looking over my shoulder. Maybe I'd better start working on this. Do you suppose I ever could... Do you suppose in some slight – do you suppose that there's some tiny, tiny, tiny, faint little chance that at some time at some undetermined future I might possibly get up parallel with this lion tamer? Do you suppose? I don't know, sounds pretty – pretty something or oth – . Ah, yeah. It's not true. Couldn't possibly be...."

And then the auditor's back in there again saying, "All right, you can lick that lion tamer, you know," kind of a thing, "You can direct your attention around," and so forth. "You don't have to do what the lion tamer does. Now, what I want you to do is so-and-so and so-and-so." The next thing you know his confidence starts coming up and his confidence gets bigger, you know, and there's less and less lion tamer, and there's more and more pc.

But it can ride for a very long time if you just let th – matters take their course and remember to do everything technically perfect and think to yourself, "Now, let's see, let me make sure that I get the acknowledgment across to the pc. I wonder if he got that acknowledgment. No, I think the next time. Now I'll give a more forceful auditing command this time. Now, let's see, is the E-Meter all tuned in properly?" and so forth and so on.

You go on worrying about how you're running the session, you won't run one, because you're worried about directing your attention. And you couldn't possibly be worried about directing your attention and worried about directing the pc's attention at the same time because now we've got two pcs. And two pcs don't make a session. And the only thing which is in your favor and the only reason auditing can be done is, you very seldom have the same terminals. [laughter] But wouldn't that be a ball!

You know, auditors will sometimes deny a pc their own terminal, or become upset because the pc has a terminal similar to theirs. All kinds of wildball things can happen. But fortunately, there's an infinite number and the chances of match-up are very slight. So you fall amongst – you fall in the sunlight that lies amongst the shadows and you can do your job very easily.

Thank you.
TEACHING THE FIELD SEC CHECKS

A lecture given on 26 September 1961

Okay. This is the what? The 26th of September AD 11.

And some are departing and some are arriving and some are getting Clear and some are spinning in. That's the majority, of course – the majority, of course. And the fate of the world is in your hands. I say that very lightly, but that happens to be true. Interesting state of affairs, isn't it? And here we are congregated in a little basement room at Saint Hill and the fate of the world is in your hands. Well, look, that's very interesting.

There isn't a single Saint Hiller has gone home to date without getting into a very high state of indignation at what is being called Scientology in the far corners of the world.

How would anybody know about Scientology, whether it worked or didn't work, unless it were practiced? Now, you're going to come in under, when you leave here – after a long series of this – you're going to come under some heavy fire. If you get Clear, you're going to come under some heavy fire. If you simply go home released, you're going to come under some heavy fire.

And, by the way, I – we have had some Release certificates in the process of being printed, and I think there's only one or two students have left here that haven't been a very high state of Release. I'm going to start issuing those certificates.

The state of affairs is, there should be something that signalizes this fact, because I don't like to see anybody go out of here who isn't in a – in a pretty fine state of knowingness and whose case won't be able to stand up to it a bit because of this other factor. And this other factor is that if you go home and in the vicinity in which you will be operating, you are bound – and it is inevitable that you will stand up to some fire. Why? Because your own state of indignation will invite it.

Female voice: Yeah.

That's perfectly all right. Be indignant. You'll find Scientology, she ain't practiced in that area, you're going to raise hell. That's for sure. I know. And I can see the bodies strewn around now.

And this is going to cause what? This is going to cause the people you shoot at a small amount of unhappiness. People are going to demand of you that you promptly sit down in their immediate vicinity and their auditing chair and process them and take on the immediate
responsibilities where they are. And, of course, you probably won't do that and that will make them unhappy with you.

That's just one source of things. That's already happened and so forth.

But there hasn't been anybody left here who had a course completion, there have only been two students left here without a course completion that haven't found a great deal to be very hot and snarly about in the way of Scientology practice, because it practically hasn't been done. And you might want to know at this stage what is the thing you can put people to doing that will produce the best results in your immediate area? Would you like to know that?

_Audience_: Yes.

All right. Well, get them to – this is technically – get them to doing TRs and get them to get down pat the E-Meter and Security Checking. Get them to get down Model Session and the new rudiments processes.

Now, if you do just those things with them on the technical basis, you will find there's an enormous increase in it. It's not all the doodle-daddles and theory. You see, people who are low on the effort band most easily go to thought, not action. You see? And they'll just sit around and figure forever and ever and ever about the difference between two theories, you see, whether or not the theta-MEST theory is correct or something like that. And they just can't even do their TRs, don't you see? And you'll find there are a lot of people very learned on the subject of theory who can't audit. That's because it can't go any further than theory, you see?

Well, let the theory fall where it may. If they can perform these technical actions at a professional level, they will get auditing results. And if they can't, they won't. And it's as simple as that.

Now, I'll add one more to that as an afterthought. They should know how to do the CCHs, because they are inevitably going to run into this problem. Somebody is un-security-checkable. And so they're going to have to know how to do the CCHs. That is the prime indicator as was just practiced and just discovered – not newly, but rediscovered and so on. But again when you cannot security check – and we're talking now about field auditors; we're not talking about you. We're talking about a practice way out someplace, where they can't security check. Person gets off all kinds of things that should be withholds and there's no needle reaction. Got the idea? And you say, "Well, did you ever rape anyone?"

"Oh, yes, I raped fifteen girls and twenty-seven men and seven dogs and – and so forth. I remember bashing a baby in the head one time after raping it and so forth and…" There's no needle reaction of any character on any of this. It's never been audited before.

But these things are not withholds; the person sees nothing wrong with these things at all.

Security Check is _an answer_. It is a good, positive answer, until it runs into that null, no-reaction.

The person's never been security checked, don't you see? And no social misconduct is a withhold – you've got the CCHs. All right. And they can be applied in that particular cir-
cumstance with success. And you apply them, of course, the way the CCHs are supposed to be applied. Not flatten CCH 1 and seventy-five hours later be sending a telegram to Saint Hill to find out whether or not you now flatten the left hand.

Female voice: Jesus!

Happened – it has happened.

You run each one flat – as flat as it looks on a twenty-minute test and go on to CCH 2, CCH 3, CCH 4, flattening each one on a twenty-minute test and if it produces no reaction within twenty minutes, of course, you go back to the beginning and CCH 1 – start all over again. Flatten them in rotation and you'll find out the CCHs always bite like mad.

All right. Now, that becomes a borderline, a bridge point. If you can't security check, you've got to have the CCHs. So the person technically should be able to run the CCHs properly.

All right. So that gives you actually the totality of the technical list. There are – there are no other items here of vast importance. You get many second grade items such as Auditor's Code, the various odds and ends that are the old HCA/HPA standbys, that sort of thing. But I've – just gave you the list of paramount importance.

All right. Now, what do you give them as a process then? What do you give these people as a process? Do you say, "Well, all you do is find the pc's goal and terminal and then you assess it on the Prehav Scale and then you run it and then you run some engrams when they come up after you've got a level flat." you tell them this? Well, no, you've just picked them up by the scruff of the neck and thrown them in the sea of tar as far as they're concerned. They're from nowhere.

In the first place, they're probably in a games condition with pcs. And they're not about to let anybody have a goal and they're not to let – about to let anybody have a terminal. And they're not skilled enough to put rudiments in easily. Well, all right. There's an old gag occurs to me about somebody or other and swimming Lady told a bunch of little boys who wanted her son to come swimming with them, "Well, my Abie can't go swimming until he knows how."

Now, that's very applicable here in auditing. You say, well, if the thing to do to really get a case on the road is to find the person's goal and terminal and assess it on the Prehav Scale and flatten a level or two and find some engrams and run that. And if that's the way the person will go out fastest and yet you can't do any of these things unless you're a skilled auditor, how do you ever get any auditing skill in order to do this? Well, you've got the Security Check. And what you teach them how to do is a Security Check. And boy, do you teach them how to security check. And you just keep at it and you use these various skills. And that's why you have to have this CCHs, you see, in case they can't be security checked.

You know, the person just gets no reactions on anything. They've been a – they've been a social evil, the kind that Billy Sunday lectured about for his whole lifetime and yet they never have a quiver. They get reverse actions on – you can tell this with null questions, by the way. You can find this out before you find it out. Those null questions on Sec Check 3 – if they get reverse reactions, if the person reacts every time he tells the truth – that goes
along with the reverse can squeeze. Actually, the needle rises when they squeeze the cans. You can suspect that if either of these two phenomena occur… You say, "Well, am I sitting – are you sitting in that chair?" and they say, "Yes," and get a steep fall. And they're supposed to answer – what is it – no to each one of these questions, you see?

Well, they're supposed to – if they were supposed to answer yes to each one of these questions and you asked them, "Are you sitting in that chair?"

And they said, "Yes." They would get a steep fall.

And you say, "Are you on the moon?"

And they'd say, "Yes." And there would be absolutely no reaction on the needle at all.

In other words, lies don't react but truth does. Well now, these boys around in "psyrology" who are fooling around with personnel security checks, police, (quote) experts (unquote).

By the way, they've already been legislated against in the state of Massachusetts. The unions have managed to bring in legislation dead against doing any lie detector checks of any kind on personnel for employment. I thought that was quite interesting, but it shows how the thing can be muddied up by a bunch of guys doing something they don't know what they're doing. That has no significance beyond the fact that it is a sign of the times. Such legislation, of course, could practically wipe you out eventually. A trained operator must always be part of any such legislation.

But anyway, these boys would, of course, never get a Security Check reaction – the psyrologist – he'd never get a Security Check reaction on the most irresponsible people. And if the only criteria for employment was no reaction on the machine, you would only employ psychotics or neurotics, you see? You'd only employ the totally irresponsible people. Quite interesting, isn't it?

Now, the thing to do when you walk into an area is you tell people to get these things straight. Get these things straight that I just gave you a list of there. Get those things straight. Their TRs and the E-Meter and Model Session – the things I gave you there – get those straight and do those extremely well while security checking, because they can't mess people up doing Security Checks even if they audit rather badly. And Security Checks are the single most certain case gain we know of below Routine 3. See, easy to do; positive results. Good, good results.

Now, you can do all kinds of weird things with Security Checks. Including tear up the Security Check that might compromise the auditor. You'll find that being done occasionally.

Well, this Security Check 3, they wouldn't want to give that to people, so they have something: "Do you have an ARC break with Tom?" That's a "Security Check" question. "Do you have an ARC break with Bill?" You see, those are "Security Check" questions, because you see, "Security Check 3, that's too accusative, you know?" "Have you ever cooked company's books?" you know? "Have you ever been a bad boy?" "Are you working under an assumed name?" Crash! Crash! Crash! Crash! You see, this is invading privacy with a bull-
dozer. And you'll find that people here and there just couldn't confront invading privacy to this degree.

As a matter of fact, I myself hate occasionally to run a Security Check into the teeth of somebody just off the street that are from nowhere, see? And we just drive up with a Security Check Form 3, you see and start asking him these questions. If my primary goal with the person is to preserve ARC, I find it very, very difficult to start in like that, so I do a word of explanation about it. There's nothing personal about this, I tell them. [laughter] But that's as far as I will compromise. And you'll find that other people will compromise further than that, such as tearing up all of Security Check Form 3 and substituting such things as, "Have you ever eaten candy and spoiled your appetite?" Well, that's a big withhold, yeah, you see? So they'll grade down a Security Check. So you must convince them that they can always add to a Security Check. Take out all of their proclivities for additivity on Security Checks. They can always add to Security Checks but never subtract anything from a Security Check. Ask everything on the Security Check and anything else they want to.

But the best method is to write out a predetermined series of questions as an additional thing which is for that person particularly. You figure out about what their relationship to life or something of the sort has been and then you write a little special series of questions.

We do it all the time for you here. Every once in a while you'll be sitting in the pc's chair during a Security Check session and you'll find yourself being asked some questions that are peculiarly native to your case or might be. And generally, I've written them up or Mary Sue has written them up and handed them to your auditor to be asked.

Well, so it's always possible, you see, to write up an additional list. Now, don't make that the only Security Check – this additional list, you see? Give that along with a standard Security Check. So you can always add questions to a standard Security Check. So you teach people to do this, you see? And this is getting additives and this is getting very clever and this is getting complicated enough. Now, you recognize that people who are having a little bit of difficulty in life are having difficulty because they're slightly complicated. And it takes more complication to form a reality.

You'll find that the – I've forgotten what you call him – alienist. No, no, that's not the term being used. An electrician, no that isn't it. Well, whatever we call him, he's the fellow who handles the electric shock machines and the prefrontal lobotomy lives in the nut houses.

Well, this gent doesn't believe in Scientology because it's not complicated enough. Now you – you try to convince him, you say "Well, it's simple, you can do this." He knows you can't, because it's not complicated enough.

So is – there's the old cycle – 17th ACC is my reference on this. This was gone over tremendously in the 17th ACC. I think it was the 17th, wasn't it? Complications and Simplicities.

So, you'll find out that in trying to teach somebody something that you say, "All you have to do is sit down and read this series of questions to the preclear and then if you get a needle reaction, then you keep asking him the question in various ways until you've cleaned up the needle reaction." Well, this might not be complicated enough, see? It might not be
complicated enough to – and they wouldn't think it was effective unless it was more complicated. Do you see how this is?

So, there are other complications that you can teach them about a Security Check, which is a good thing, because it measures the level of complexity. And they're all very factual. They're not anything you're just adding to make it up, because it's a good thing occasionally with a case here and there to dream up a half a dozen questions or a dozen questions and add them to a Security Check.

This fellow has been auditing for quite a while and we're giving him a Form 6. And we happen to know that he has been auditing in a very peculiarly specialized zone. And there are a lot of security-type questions that might come up on the subject of auditing for that peculiar zone, don't you see?

Like we had somebody that was just in the navy – just got out of the navy. We'd give him a straight Form 6, you see, but we could interlard it with special questions or attach to it special questions or begin it with special questions about auditing in the navy, see?

"Did you ever audit an officer in a certain way as to make him think that you ought to be promoted?" or something like that. [laughter] Oddball angles.

These things come up. So anyway, you then kind of get the idea of what kind of a life your preclear's been leading, what his professional or domestic zones are and you adapt security questions to that and you add it to standard forms.

Now, there are, at this moment, eight distinct security question forms, one of which has a subdivision making, actually, nine. We are up to HCO WW Security Form 8 right now, which I think is the number of the children's check.

Female voice: That's right.

Well, there are several more that we haven't released yet, so there are lots of them.

And, these – these all have their special usages, don't you see? And you could actually pick up any one of them and you could teach people quite a bit about just any one of these Security Checks, you see.

Like the children's check. Teaching them how to use a children's check. That's quite interesting. You, of course, mustn't ask a question which the child can't understand because you will have an immediate ARC break. He thinks he's being accused of something; he doesn't know what you're talking about. So you have to rephrase all of the questions in the child's Security Check, you see, so as to reach the comprehension level of a child.

Now, you can give that check to an adult and clean up his childhood and accomplish what Freud was trying to accomplish with – I think his standard course of psychoanalysis was 180,000 hours, wasn't it? Three lifetimes. That was optimum. At sixty dollars a week for four hours, something like that. Or four hours of psychoanalysis per week, sixty dollars a week. And they spent the first two years finding out if they could do anything for the person. Yeah, it's quite interesting, quite interesting swindle. Anyway – because it was a swindle because they knew very definitely at the beginning they couldn't do anything for the person. They just hoped.
But what were they trying to do? They were trying to plumb the secrets of his childhood. Well, you could use Form 8 to do just that fact and it'd be quite interesting. You could lay open childhood. Let's say – we quite normally run into people who cannot remember earlier than eleven. That's quite astonishing. And if it's astonishing to you, why, you just haven't asked them. But they very often have some kind of a ceiling on the number of years of their life that they can remember. Well, they remember well back to five, you see. Or they remember well back to eight or something like that.

Well, all of that is quite aberrative because it's simply unknown to them and it influences them in this lifetime and so they worry about it. And they'll have a lot of think about it one way or the other. They won't be worrying about the lifetime just before that perhaps to the degree that they're worried about their childhood in this lifetime because they're still connected with it.

And the other can drop out of sight and may or may not restimulate, but their childhood certainly will sooner or later, because they are running into the same zones and sceneries.

The only time a past life really starts hitting you in the head and gunning you down and so on, is when it's being lived in the same surroundings – it was lived in the same surroundings you are now living in. Like we had somebody, I think, on the 6th or 7th – 6th – it was the 6th. And I think she had been born three times in the same house and lived her life the whole time in that house and that was the three lifetimes immediately preceding this one and she was still in the house. Something on that order. And that was quite upsetting. Because, for some reason or other, she didn't get more familiar with it. She got less familiar with it all.

But anyway, a Security Check can be slanted in the direction of opening up somebody's childhood. Now, that actually makes very interesting auditing. It might not be the finest auditing as far as hour for hour on Routine 3 is concerned, but we have to front up to this factor. What is the most result that an auditor – an auditor, a particular auditor – can achieve per hour of auditing?

Now, that isn't necessarily the best process for the preclear. You should understand that, because this has a tremendous bearing on the duties of a Director of Processing. It is not necessarily what the pc needs that will achieve the greatest result, but is what the auditor can effectively apply to the pc that gives us the greatest result. Now, that is – there's a difference there and when you're directing auditors in auditing, it is a factor which you must not neglect.

Well, we had an auditor one time that could run nothing under the sun but SCS-Stop. [laughter] And it was quite marvelous. She even invented a new – a new bit to it. Called it Stop Supreme. Took it off of an old drill I had and that was it. But boy, could that auditor run that and that auditor could always get results with it.

And if you put that auditor to running anything else on a pc, you got no graph change, which was quite interesting. Or you even got maybe a graph cave-in. So the thing to do, obviously, was any pc that this auditor had was going to get SCS with Stop Supreme finally added, too, don't you see? And to that degree, she was a good auditor. She could do this.
And another auditor, 8-C was about all this auditor could do well. But anyhow, there is a way of even adjusting this – this is an old one in HGCs – is you get a new auditor, you've just taken this new auditor on. And, of course, people are paying for processing and you've got to have some kind of a result and you've got to have it right now. And you actually are setting up all kinds of upsets if you don't get them results instantly.

Doesn't matter what is wrong with the pc. If the auditor can process a process with confidence, he will get better results with the process the auditor can run, than the process which the pc ought to have. And that isn't just a compromise. I mean, it's a stark reality. And you ask an auditor just brought on staff that you've got to give to a paying pc, you ask this auditor, "What process have you had best results with in auditing?"

And the fellow said, "Well, I've just had absolutely marvelous results with Rising Scale Processing. I just wouldn't use anything else."

You say, "That's fine."

And during the weeks necessary to train him up into current rundown, you let him run Rising Scale Processing on any pc that sits down in the chair. And you'll find out that you have continuous wins. You get wins.

Now, you try not to give him a pc that can only be run on something else. [laughter] And then in that way you will win. And that is a method of doing it.

So now, with Security Checks you get fast wins. And that is what it takes to make an auditor reality. We are now talking about auditors auditing rather than pcs recovering, you see? And it – a fast reality.

Now, any auditor who has gotten tired of auditing and is upset about auditing has had a lot of loses. And you can just add those two factors together and they fit like the Geminis. Not interested in auditing: had a lot of loses.

It isn't necessarily true that an auditor has a lot of loses and then becomes disinterested in auditing. But it is true that if an auditor is disinterested in auditing, he's had a lot of loses.

It's true in life that when you say to somebody, "Why don't you learn how to audit if you want to really handle your staff well?" or something like that. "Why don't you learn how to audit?" you can ask him.

And if he says, "Well, no, learn how to audit. Oh, I couldn't do something like – I mean – pat – I'm a professional man who then – I'm just an administrator," and so forth "and learning how to audit."

He's just telling you, "I have many times failed to help people!" That is what he is saying in great big exclamation points. "I have failed so often in my efforts to help people beginning with my father, continuing through with my mother, my sisters, brothers, cousins and aunts; going out into all of my schoolmates; going out into my best friend – my best friend in college. I remember I helped him all one night and he went out the next morning and had an automobile accident and got killed. And life has been one long disaster in trying to help people."
That is what he is saying. If you ask him and say, "Well, why don't you really learn how to handle people and help people and know what makes them tick and so forth, if you're going to do a good administrative or foreman's job or a boss job or an executive's job or something like that?" And he tells you, "Oh, no, I couldn't do that." That's – the parallel statement is "I have many times failed to help people."

Now, you get auditors around in the field who aren't doing very much auditing. They are phasing off of auditing; they are running away from auditing. Well, God knows what kind of auditing they were doing and what they were calling auditing and what they were running on people and how many thousand times they changed the process during one session and how many goofball things were going on here. But we don't care about that.

But we do know that the person failed many times in auditing pcs. We know that. And this brings about hecticness in changing processes; hecticness in getting results. "We have to get a result in one session, you see or we should get two or three results in one session." And this tremendously exaggerated idea of what we ought to be doing for the pc is totally built on failures to help. And the more failures to help, the more anxious they get and then eventually the more they fail. And they eventually will dramatize failure to help and they sit down and it's as much as your life's worth to be audited by them, because all that they're going to audit you with is Failed Help.

They're going to sit there and prove to you that you can't be helped. Now, auditors seldom do this, but psychoanalysts do. And the most aberrative, broad, general disease, so-called in the society, is alcoholism. Although heart failure, I think, is the top dog alcoholism as a (quote) disease (unquote) comes in there somewhere. And isn't it interesting that their main society now has as a principle and primary datum that alcoholism is incurable and that you could do nothing for an alcoholic? And they prove it to their people as the first thing they have to accept is that nothing can be done for alcoholism.

You see how far a person can go with help? See, as they go down scale, they get less and less eager to and then they eventually wind up preventing it. So they've almost… Well, you could ask one of these Alcoholics Anonymous people, "What if the cure for alcoholism turned up, just like that?"

"Oh, well, that can never happen and so…"

"Oh, wait a minute. You mean to say you're going to predict everything the human race is going to invent for the next century? Oh, come off of it, man. That's – that's a little bit broad."

And yet they will just stand there didactically on that point and say, "There is absolutely no way. And the first thing you've got to know about alcoholism is nothing can cure it and nothing…" And of course they've had it, because we move in on the line and we can do something for alcoholism. And yet practically every member of Alcoholics Anonymous will be a stranger to you, if you're running a center. They won't come near you, because that's a stable datum on which they operate.
And if you say you can help alcoholism or do something for alcoholism, they stay away in droves, you see, because their first datum is that you can't. And that's just failed help, failed help, failed help.

Well, the hardest person in the world to help is an alcoholic. I don't know if you've ever tried to help an alcoholic but, holy suffering catfish, that is a marvelous way to spin yourself in, you know. They lie, they cheat, they will do anything under the sun to get another swig out of the bottle. Boy, I'll tell you, it's mad. And their baby is without shoes and without food and without milk and could they please have a dollar? You give them a dollar and you can smell their breath in ten minutes and they've had a drink, you know? And it's just marvelous. They'll do anything.

It's – the dope addict probably is less observable in a society, but does more or less the same thing, you see?

So it's a great source of failure, alcoholism. And it winds up now with the stable datum that help is impossible.

Well, an auditor is going that same route when he is getting (quote) "tired of auditing". Then "when he doesn't audit well," all of these other things. So, if you're going to teach somebody to audit, you've got to give them something that gives them a fast result now and catch up with that anxiety rate.

And the funny part of it is, if they can do a Security Check well and the Security Check is well adapted to the person's case and circumstances, they will get fast results with a Security Check.

Now, I don't know if you have any terrific reality on that or not at this stage of the game, but you pull a withhold off of somebody and he suddenly feels different.

Now, it's all how you stack up the questions of the Security Check, how fast you're going to get a "Well, what do you know" on the part of the person. But the most dogged, plugging, never cognite, slog pc – the kind that just drive you batty, you know? They sit there and they run the process and they run the process and they run the process – what Smokey used to call "good pcs," or "educated pcs." They just keep running and running and running and running and just run commands and they answer commands and they never say – and I – this – old John's comment: he said, "You know," he said, "I get suspicious of somebody that never says 'Well, what do you know!'" And it would be that absence of a "What do you know," you know, about his case that would make very sure that the person was making no progress.

Well, one of the most fruitful zones and areas of "What do you knows" is a Security Check. That is – that is very fruitful if you choose the right check.

Now, of course, here in your security checking, you're going over general Security Checks and you're keeping Security Checks parallel to case advance with Routine 3, see? So the pc's whole attention is on case advance, Routine 3. And you're not getting a very real look at a pure Security Check, because the person is all interested in finding his goal and interested in finding his terminal and interested in getting it run. He's being security checked while he is stuck in the engram, you know? You get all that kind of thing, you know? And you're security checking him as an extra. And this is a different view.
Now, a person who is pinning all of his hopes on the Security Check and that is his auditing, doesn't act this way – if you've chosen the right Security Check. Now, that's why there have got to be lots of Security Checks. And you will see more of them. I mean, there won't be any finite number of Security Checks.

Because you can do this with a Security Check: You can cure a psychosomatic illness. Just that way. I mean, it's that good. You just use the present time problem of long duration of the pc as the subject of your Security Check and you dream up a whole Security Check that has to do with the present time problem of long duration of the pc. You're looking for hidden standards.

All right. A hidden standard. Now that – very succinct: A hidden standard is that which the pc uses to find out whether or not he's making progress. So, of course, you've gotten the one thing on which his attention is fixed. I'm sure right now amongst you, you've got more than one case that has a hidden standard that you as an auditor haven't spotted. You know, is he worrying less or is he worrying more? See? This would be a hidden standard. And unless you – unless you really take these hidden standards apart, you're going to have a case stalling. It's a present time problem of long duration and they use it as a hidden standard. And it's the standard by which they know whether or not they are making progress or retrogressing.

So a present time problem of long duration becomes also a hidden standard. And you've got people that have two or three of these things maybe and they're sitting around on them. Now, the easiest way to knock them out is Routine 3: Find their goal, find their terminal and audit it. That is the easiest way to handle any hidden standard, but we're talking about another zone and area of auditing now. We're talking about auditing that can be done by almost any auditor.

And we do this kind of thing. This is quite effective. We saw around on the case until we find a hidden standard. Now, "What – what would have to happen for you to know that Scientology was working on you?" is the clue question. That is the key question to it. And the person has to think a long time, because they very often have got these things very buried.

The person says eventually, "Well," the person says, "oh, well, uh…"

"Yes?"

"Well, my arm would have to stop hurting."

Now, sometimes you get a hidden standard answer on the subject of this, and this will baffle you and you are liable to miss it, because I missed it the first time I ever heard it. I was down in Greece, by the way, when I heard this the first time. In order to know that Scientology worked, first one person and then another person would have to improve in some fashion. Only the second person had nothing to do with and no connection with Scientology.

In other words, for this lady to know that Scientology was working, her daughter would have to get better. But her daughter is not an auditor, not part of the center, nothing of the sort. Isn't that a fascinating one?
In other words, the hidden standard is totally projected, has nothing to do with the person anymore, but has to do with somebody else. And that is a hidden standard. But of course that's an *impossible* standard. Actually, we know in fact that it is not an impossible standard because we have had people get well by straightening out other people's PT problems with them. But they will come up with something like this. "What would have to happen for you to know that Scientology works?"

"Well," they'd say, "well, my son would have to get a job." Now, you could twist this around saying, "Well, in other words, I would have to audit your son. And your son would have to come out of it and get a job." That is not what the person means at all. It means, "If you process me, my son would have to be able to get a job."

So admit that into your rundown of what hidden standards can consist of. The hidden standard can go on any of the eight dynamics. "God would have to be happy." [laughter] I swear someday somebody processing somebody is going to get that one. That's right. "God would have to be happy again to know that Scientology worked."

Now, there's your extensional action. Now, an extensional action is a Security Check bait to end all Security Check baits. And when you can find one of those things, you can really start straightening somebody out *whamity-whamity-wham*. Because that is a natural for a Security Check. That is a perfect Security Check.

Naturally, you security check them on their son. See? You just run down a whole series of questions about anything they might possibly have ever done to their son and ask those questions; clear it as a Security Check. And they all of a sudden will have a case gain, because they've got some individuation which has made us – a terminal closure. And when you get those withholds off, you'll snap the terminal closure. You know, it will snap out. And they all of a sudden will become more themselves. And they will get a "What do you know." You see how you can do that?

So that any time you search down a hidden standard, don't consider that it's going to be on the person's body or in the person's own immediate psyche. It's liable to be tremendously projected. "For me to know that Scientology worked, my business would have to prosper."

Well, you can almost understand that, can't you, except that they don't. [laughter] You very often make the mistake of understanding something the pc doesn't. He has no grasp on it at all. You think immediately that he has said, "Well, if you made me more effective, then I would do my job better and therefore my business would prosper."

And this is not what he has said at all. He has told you, I am my business. And this lady down in Greece told me that she was her daughter. So what you're doing there is doing a terminal spring. And you can actually do a terminal separate. Nowhere near as good as a Routine 3 assessment, but nevertheless it is a terminal snap. Get the idea?

Now, wherever you can find one of those things, you can adapt a Security Check to it and you've got results. You're actually running the equivalent of "What have you done to – ?" "What have you withheld from – ?" on a highly directive, specialized basis. Because "What
have you done to – ?” and "What have you withheld from – ?" is a part of the Prehav Scale. And if you run too much of it, you are just overrunning a certain section of the Prehav Scale.

Now, withholds don't add up to withholds. They add up to overt, they add up to secreties, they add up to individuations, they add up to games conditions, they add up to a hell of a lot more things than O/W, although we carelessly call them withholds. We're asking a person to straighten out their interpersonal relationships with another terminal – is what we are doing.

Now, our normal Security Check is addressed to the individual versus the society or his family. If you'll notice, practically every one of them except 6, is addressed to the society or the family. Because it's what people would consider reprehensible that makes a withhold.

In a Catholic society, not having kept Mass would be a reprehensible action. And in a non-Catholic society, nobody would think twice about it. So that most of our Security Checks are aimed at transgressions against the mores of the group. And that is the basic center line of the Security Check as you see it normally. Do you follow that closely? Do you see that as a specialized thing?

Now, do you see as well that you could have a special mores between the son and the mother? A special mores between the husband and the wife? Just as you have a special mores, of course, between the auditor and the preclear to which Form 6 is devoted. That's a special mores. That's what a pc would consider reprehensible or what other Scientologists would consider reprehensible as actions by the auditor.

Now, that is based on good sense. And that it is reprehensible, from the standpoint of human behavior, is incidental to the fact that it is simply a specialized mores. It's a moral code that you're processing one way or the other. You're straightening out somebody on the now-I'm-supposed-to's. And they've transgressed against a series of now-I'm-supposed-to's. And having so transgressed, they now are individuated. And if their individuation is too obsessive, they snap in and become the terminal.

So all of these cycles exist around the idea of the transgression against the now-I'm-supposed-to. And that's what a Security Check clears up. And that is all it clears up. Now, you see, it's a great deal more than a withhold.

Now, you can just see some blood-dripping priest of the Old Testament asking how somebody has transgressed against the ark of the covenant or something of the sort and having some member of the cult, you see, practically faint at the idea of having to come up with the fact that one day they accidentally spat as it was being borne by. And yet this would be a very aberrative fact, you see?

Now, having released this into the open air, we get less individuation involved.

Now, the Catholic confession is only one type of Security Check that is a kind of an automaticity trick, which doesn't depend in the least on interrogation, but just depends on whether or not somebody out of the goodness of his heart is going to spill the goods and get a few paternosters or something and go his way happily. And it actually has ceased to have very much punch.
But it's transgressions against the Catholic mores. Only that. And there is no wider perimeter to it. And it isn't actually a Security Check at all because it's just whatever the person feels guilty about, which means that no criminal would ever walk near the confession box.

And, of course, the whole Catholic religion was done in by criminals. The reason it hasn't the worldwide sweep that it has today is they just had a few too many, particularly in their own high places. Alexander the Fourth is a very good example. He made lots of money for the Church. The Church became a big business under Alexander the Fourth, but I don't think he'd have anybody in occupying a cardinal's hat or a bishopric unless the fellow had a long and involved record of some kind or another.

He held his position by poisoning. You know it today as a cliche of Lucrezia Borgia. That was his, I think, niece. Anyway, he used her in that fashion.

So you see, that type of Security Check lets everything go by the boards that doesn't register, because if the person doesn't feel guilty about it, it isn't freed. Don't you see? So it requires the factor of make-guilty in order to make the process work. Right?

So, any Security Check may have this factor added to it. If they're all based on frail mores of peculiar constructions and now-I'm-supposed-to's, then making people guilty of these things is another parallel check, isn't it? Hm?

_Audience_: Yeah.

Yeah.

Now, crippling somebody's right arm is, actually, an overt, but we have somehow or another made the man guilty of having a right arm, haven't we?

All right. Now, let's move in to the finer points of how you would free up a chronic somatic with a Security Check. In the first place, the person would have to have some reality on the fact that that was wrong with him.

In other words, they would want to do – have to want to do something about it. You, out of your own fell swoop, couldn't say this fellow shouldn't have leprosy.

This is the medical code, you know? The medical code assumes immediately that everybody thinks they ought to be well. And this is a hell of an assumption, because it's a long way from true. And you pick up fellows in various parts of the world and you ask them – that have various difficulties and you ask them whether or not they should recover from those difficulties and you're liable to practically get stoned.

You ask some beggar in some far off part of the world whether or not he ought to get rid of his blindness – which is simply some ophthalmialitis or something of the sort – and he's liable to be horrified. You're trying to take away his livelihood and all kinds of things. Or you ask somebody who has been successfully getting out of every war with a heart murmur if he wants to get rid of that heart murmur just before conscription is ordered for the next war, you know? And you're going to get "No."

Well, the medical doctor's whole idea of psychosomatic medicine is based on people not wanting to get well. And that is what the medical doctor considers more or less psychosomatic medicine. It – he thinks all difficulties are an unwillingness to get well. Because he's
bucked into this so often and he's been defeated by it so often that he's closed terminals with it. So he wants the psychic trauma removed to make the person well. Well, that is quite interesting, too, because he is again assuming that the person wants to get well.

You can't assume this. You can assume that anything that is wrong with the person has some chance – no matter how slight or remote – but has some chance of being desirable to the person. Something that's wrong with them is desirable to them – some chance of this exists. But largely, in the main, something exists in their life that is wrong that makes it necessary for them to take this odd course of solution. And there is a confusion of some kind in their life that they are solving with this particular difficulty. And we have the old concept of the service facsimile. Getting back to an old friend.

Now, how do you get rid of that? How does this confusion start in? How does it exist? Well, it starts in with withholds. So somewhere in the zone and area of a person's life, there are a series of withholds which wind up with a psychosomatic as a solution.

Now, let's take the wife who is ailing. He has an ailing wife. Very, very, very fashionable – 1870's, very fashionable. It was dramatized enormously in the play about Camille and so forth. For any girl to be an upstanding piece of femininity, she had to have consumption or something like that. And you're practically a social outcast, I suppose, even today in the Bible Belt of the Middle West, if you don't have some horrible disease of some kind or another to complain about to your neighbors. Never met any of them yet that didn't have a misery. If you read their letters to one another, it's some of the most fabulous, misspelled, misdiagnosed medical hotchpotches that you ever wanted to read.

"Well, Zachary, across the road, now – well, Zachary, he's had a misery" – only they don't call it "a misery," it will be an umbilicus or something – "for some weeks now. And he hasn't been able to work." And it's just paragraph by paragraph. Have you ever read any of these letters?

I mean, it's impossible. Maybe that sort of thing is fading out, but I know that just a few years ago on a casual investigation of this I suddenly – I almost started laughing myself sick. These people don't communicate. They infect each other. [laughter]

So anyway, those things are all a protest against life. Protests against life. Illnesses are protests against life. And if you look at it from that point of view, you can then tailor up a Security Check to match the zones of difficulty a person has had in life. And they all come out clean and slick as a whistle and the psychosomatic will disappear.

Now, as you can see readily, this is not a simple thing to do. This requires a lot of figure-figure. See? And you find out lots of auditors are very fond of this, very fond of it. Trying to figure out this preclear, trying to outfigure him. Well, God bless them. More to them. I've been right there in their same boots. But it's something to do about a case. It is a problem and something to worry about, but it's something to be very effective with and they will win. They will win.

Now, this woman with the daughter. All right. Her daughter would have to be well – that's her hidden standard. That would be the first thing you would tell the auditor to try to establish. What does the person want to accomplish in processing? In other words, with this
question, "What would have to happen for you to know that Scientology works?" That's the same thing. That would be an immediate processing goal of some kind or another.

Then you would trace this back to some area or zone of existence or personalities or some activity. Now, this would appear very, very smart to the preclear, but we know that those activities which had to do with changing the position of mass – the heavier the mass, the more change of position – is the most aberrative. That's a fascinating factor.

We find somebody that all of his life has been a railroad locomotive engineer and he's now complaining about something of the sort. I'm afraid I would just tip my hat in passing to the amenities of auditing. I would be right in there pitching, getting off a Security Check type of questioning, whether I had it written down or not, on the subject of locomotives. I would want to know all of his withholds from locomotives, his withholds from everybody about locomotives. I'd want to know everything there was to know about trains in that particular zone and area. And I would give him a train Security Check of some kind or another that would suddenly wind up with the most unlikely recovery of his hearing. Do you see how this would work out? In other words, I would go straight to the person's handling of masses and changes of space or lacking a clue in that direction, would go into his most confused motional areas – not emotional areas, but most motional areas.

This fellow has been a recluse ever since he was twenty. He has not done anything since he was twenty. He hadn't ever been anyplace since he was twenty. There is certainly nothing much to security check, is there?

Well, his hidden standard is he would "get about more." If he would find himself getting about more, he would know that Scientology was working. Well, where the hell do you start with something like this? He's been a recluse since he's twenty and he isn't getting about more. And you conclude immediately that it – as I had with error in years past. I tried to get people out of houses by security checking houses and to some degree succeeded – to some slight degree succeeded.

But there was a better answer and a faster answer. What area was he in before he was twenty? See? Staying in the house is a cure for something. So we put him on the E-Meter and now we can't find areas of moving heavy masses or changes in space before he was twenty because he wasn't working. Probably lies in the zone of maybe – maybe he was in the service? Maybe he was in a boarding school? Something like that. So all of a sudden we hit the jackpot. And we find an area of considerable activity. And we're looking for the area of activity which lies prior to the difficulty.

And then we run a Security Check on that area of activity. And we trace it back to boarding school. He's – there's one boarding school that he absolutely detests, he suddenly remembers. Boy, does he detest it. He was there between the ages of thirteen and fifteen. Well, that's what we security check.

Every question we ask has to do with this boarding school. Well, just add up the factors. Well, how many factors are there in a boarding school? How many things can go on in a boarding school? How many people are present? What is there in a boarding school?
Well, of course, there are students and boys and instructors and coaches and headmasters. And there's buildings and there's athletic equipment. You see what you're running into here. And probably there's transport from there to home. And there's probably a sick bay of some kind or another, to go nautical on you, and maybe a hospital orderly and a floor master. And let's just try and get all of this down and let's find out all the types of crimes that he might have been able to commit against these items. In other words, we can dream up a whole Security Check, see? We've got the guy on the E-Meter and we've sorted it out and we know what his hidden standard is and we know now the zone of heavy masses or we know the zone of most commotion, deestation and activity – we know all these things. Now, having done all those things, we're content with that session. And now we go dream up one. Don't just start running it off the cuff right at that point, because that gets to be nonsense. Because it looks like a big Q-and-A with the pc and so forth. And it throws the pc out of session and out of control.

But let's dream up one and let's get a nice Security Check all tagged around this thing one way or the other. One of the ways of doing it, crudely, is to take an existing Security Check and Hobson-Jobson it over – take an existing Security Check and just move it over into the zone of the school. But that's not as satisfactory as just scribbling down a – whole things that you really think he probably did in this school that he is never going to tell anybody.

And of course, you will be absolutely amazed at the life of crime he lived during that period. [laughter] Because inevitably it will be an area of tight mores.

The military is an area of tight mores. You see, there are many things – many crimes, that you could do in the military that never occur to you in civilian life as crimes, but are crimes in the military.

And it's some tight mores of some kind or another and he has cut up against those mores, so has individuated himself from the school, so cannot as-is any part of the track. Of course, he gets trapped in that particular zone and activity.

Now, I know one pc – I've heard Mary Sue say, "I know what's wrong with him" – this is from way back when, way back when – "I know what's wrong. He's stuck in college." And she pointed these facts out to me and by golly, she was right. And we've never security checked that particular person against college. And we certainly should. We certainly should, because he makes practically no case gains. He is a – he is a marvel at no case gains.

Now, he'd make – he'd make terrific case gains if you ran him under Routine 3. Don't get the idea he wouldn't, see? You find his goal and you find his terminal. And you'd run him on a whole track basis and he'd come up at the other end of it fine.

But we're talking now about trying to get a fast result on this particular case, not being able to well do Routine 3. Now, Routine 3 is something like handing a fellow a couple of Lewis machine guns, say, and put a burp gun in his lap, cock all of them and tell him to juggle them. And that's the way he feels, you know? He's asked to make like – what are some of these Indian gods that have fifteen arms? He can't do it, he thinks. See, it's just all too much. It's all too sudden. And you're not going up against the same intensity of training that you're undergoing here, see? You're trying to train this person to do something effective. Well, you
can train him to do the various things which I have said. You get him on that technical routine and then you teach him about Security Checks.

Now, I'm just trying to give you, today, some kind of a concept of how many things you can teach a person about a Security Check and how many ways you can do a Security Check and how many targets you can have with a Security Check. And which way you can go with these things.

And let me tell you that if you could get all the auditors of an HGC doing excellent Security Checks on everybody who walked in, more or less on the basis that I've been talking about right here, if you could get them first, just first, to do nothing but a straight Security Check – you know, you just read the questions off, see? They're going to get some results, aren't they?

All right. Now, you can teach them as a gradient how to fancy this up. Let's adapt the Security Check to the pc. Now, this pc has lost his memory, he says. Well, of course – you – "Something you wouldn't mind forgetting" as a repetitive process. You can tailor up repetitive processes as D of P and get over to something like that. But let's get a very fast result with this character. Let's get a fast result.

He's lost his memory, has he? Well, the first thing that you could do on a broad basis, less effective, would be to run O/W against a deaf person.

Female voice: A deaf?

Deaf person, yes. Run overts/withholds. "Who in your family was deaf?" and so forth. "That's good." "Who in your family didn't recall things well?"

"Oh, well, that's different, isn't it?"

"Well, all right. Good. Now, who in your family was always losing things? – Oh, that's good," you know. You cover all the zones and areas of shut-off communication. "Who in your family was blind?" What is forget but non-observe? Or an occluded observation? So that any set of cut sensory perceptions would operate as overt bait. Do you follow me? I see you looking a little puzzled there.

Forget, is a version of not-know, isn't it? So that any sensory perceptive cutoff is an effort not to know and you have a target. Now – person has overts against that person, he's liable to inherit some of the characteristics of the person.

Now, you've got a thing like "recover my memory," you're going to have a hell of a time getting him to remember the person who couldn't remember if he's in the valence of the person who doesn't remember, aren't you?

So you could approach it obliquely and you could take all sensory cutoffs and get this type of action going. And you find out that he inadvertently really messed up a boy playmate, eventually, on a Security Check. When he finally remembers this which is totally occluded, he heaves one horrible sigh of relief and his memory returns. He blinded a boy. Well, that would operate as a side panel of forgettingness, wouldn't it?

Any version of not-knowingness. You don't have to go this far afield to get this esoteric. I probably have erred in giving you anything as widely esoteric as this. But the person
comes in. He's got a goal. He's got a goal to recover his memory. Well, you could find out not when he could remember well or what zones he could remember well, but you could find out who wouldn't remember well or who insisted on his remembering or something of this sort, don't you see? And as a subsidiary to this, who didn't want to perceive, which would be the most able method of never knowing, is never perceiving.

You could break this thing down, in other words and then you could security check the person in that zone and area where this or that person occurred. Now, we find out that his whole family – he eventually remembers that his whole family was noted for never remembering anything. They were blind, deaf, dumb and halt, you see? [laughter] And yet your pc doesn't sit there and say, "Well, what do you know." Sometimes he'll say, "Ha-ha. No wonder I've got a bad memory. Ha-ha. I just remembered the whole family couldn't remember. They were known all over the neighborhood for not being able to remember anything, you know?"

And he doesn't do a "What do you know." That'll be very rare. Well, you don't get a "What do you know" so you get a lose, don't you? Now, how often have you known exactly what was wrong with the pc and then pointed it out and that was what was wrong with the pc, but the pc never said, "Well, what do you know" and never recovered from a thing. Have you ever done that?

Audience: Mm-hm.

Hm? Well, do you know how to get him to say, "Well, what do you know?"

Take everything that you've worked up to right there and now do a Security Check on it and you'll eventually get a "what do you know." He's too in the thing to see it. You can see it because you're outside of it. So you say, "Well, you lunkhead, why the hell don't you see this thing?" you're sort of thinking to yourself, you know? You kind of grit your teeth and strain so the guy can, you know, see it. But he just doesn't.

"Well," he says, "I've always had trouble with women. I do everything I possibly can do not to have trouble with women. I never go with them if I can possibly help it. I never make myself personable to them and so get them in my hair. And I remembered that when I was married a long, long time ago, why, I just did my best. I did my best not to have any trouble with them. I never came home." [laughter] And you've pointed this all out, you see? And he finally realizes that, you know and he says – and so on. You – you – you punch it up, you know?

You say, "Well, could it be possible that you've been trying not to associate with women?" or something like this, you know. You go over the edge just that far, you know? And the person says, "Oh, yes, yes, yes, that'd be possible."

That's all. I mean, the curtain rings down on a flop. There's a way to prevent this flop is, you just take your quill pen and your very best gray carbon and water and make yourself a list of all possibilities of overts on that subject. Because if you're running it on an automaticity basis of just very permissive, "What have you done? What have you withheld?" and "What have you done with women?" You're running levels of the Prehav Scale against a terminal that may not have anything to do with his case. Actually, his terminal may not be women.
This just happens to be as real as he can get. Let's do a tremendous lot of security checking on the subject of women, the family, girlfriends and so forth.

Now, we have a very good example in Sec Check Form 3. There are all kinds of things in there that you could do to women, you know? That he might have, you know? Well, if you were to give him then Form 3, he'd probably recover from all of this, see? It's just Sec Check Form 3, slog through and he would eventually recover from some of this if you got them all as you went through. This is rather a long process. And you've already isolated the fact that it has to do with women, don't you see? So you do a little special Sec Check that goes along with this.

"Have you ever thought an unkind thought," you see, "about a woman?" "Have you ever thought an unkind thought about – ?" how many things are there about a woman, you see? The way you build one of these things up. How many things are there about women? Well, there's clothes and there's houses and cookery and there's children and there's shopping and there's various activities that are the common ordinary ones, don't you see? And they have heads and feet and – you know? And you go into this various list of items or actions that a woman might engage upon. And then you make a Security Check around this thing, you see?

And it's like this, "Have you ever done anything to a woman's head?" See, you just put "Have you ever done anything…?" to a whole list and you've got a formulized method of getting together a Security Check. You see how you do this?

You write up every noun you could possibly think of on the subject of the zone, area, dynamic that he's having difficulty with and he fails to cognize on in any way, shape or form. You can immediately assume that if he doesn't cognize in that zone or area, that he's really pinned down and that he has withholds from you and from the area, on the subject of the area that not even he knows.

See, a cognition is totally dependent upon a freedom to know. And overts and withholds are dedicated to another thing. And these are dedicated to not-knowingness, aren't they? So if the person doesn't cognize, you can immediately assume that he has a large area of not-knowingness on the subject.

Well, how do you relieve this large area of not-knowingness? Now, you could run some kind of direct not-knowingness on it, perhaps, which would be your not-know version of a Security Check. But it'd still take some guidance like a Security Check to do the job neatly and rapidly. He doesn't even suspect. You as an outsider to his case, you see, can suspect. You see where this fellow is having trouble. Well, you dream up a Security Check to match it.

Now, the formula, I repeat, for dreaming up a Security Check is just make a list of all of the items you can think of that has anything to do with that target. Let's say his family, see? He always has family trouble.

By the way, you know, you can get this from a pc's PTPs. If you look at the type of PTP that the pc has, you'll know that it is a present time problem of long duration if he adds up to having – four times in a row or three times in a row or something like this – a PTP about his family. Then it must be a problem of long duration. And if you relieve this problem of
long duration, he will feel much better. That's for sure. And it must be one of his auditing goals, see? Because he keeps putting it up as a PTP, it must be one of his auditing goals. He hasn't really inspected it. And the hottest way to get rid of that particular zone – flick, flick, flick, flick, flick – is security check it.

And again, the way you security check it is make a list of all of the nouns and all of the doingnesses which you can think of. And just ask the person if he has overts against any of them. Has he done anything to, has he interfered with anything about… You get the idea. "Have you ever interfered with schooling?" See, schooling is part of the family activity, see. So you put down "schooling." "Have you ever interfered with schooling?" You look that over. "Ever done anything to schooling?" "Have you ever prevented schooling?"

"Oh, well! Oh, well. It's funny that you'd ask that, but…," you see. And he gets it little by little. And it's little by little that this cognition will take place. It's not all going to take place on a bang, you see? It might suddenly appear in the long run as a bang. In the long run, it'll be a bang. But the bang only took place because you took the pebbles off the top of the thing, you see? And when you finally got the thing uncovered, why, he could look at it and blow it. Got the idea?

Now, any zone or – this is the rule: Any zone or area of life with which a person is having difficulty, if he realizes he is having difficulty in that zone or area or if he doesn't, it doesn't matter, is a fruitful subject for a Security Check.

Any zone or activity with which a person is having difficulty in life or has had difficulty in life is a fruitful area for a Security Check. And you'll find out, every time, he's got withholds in that zone or area.

One of the indicators of that is a present time problem. He gets present time problems about this. Well, therefore, you know it's a problem of long duration. Three problems of short duration equals one problem of long duration. You got the idea? It's a good detector mechanism. A person has three times come into session (according to his past auditing records or something like that) late because of lunch. "Oh," you say, "well, it's natural." The transportation is difficult and he doesn't have much time and that sort of thing. No, no, no, no, no, no, no. You're way off beam. How come he's in a situation where the transportation is difficult? See?

All right. So we can immediately assume that he has trouble with food.

*Audience voice: With food?*

With food. Just like that. And that's your next rule, is take the most fundamental expression that you can get of his difficulty. The most fundamental expression. In other words, if a person has a problem with lunch, we don't say he has problems with lunches. No, we don't say he has problems with lunches, breakfasts and dinners. It might not be really that he's having a problem with lunches. Let's isolate it on the E-Meter. He might merely have problems with appointments. But if he has problems with lunches, we can be pretty sure that he has problems with breakfasts and dinners. If he has problems with breakfast, lunches and dinners, he has trouble with food. And if Freud in 1894, by the way, instead of announcing the libido theory, had announced instead the chow theory, why, he would have had it made. He would
have had it made, because food is a tremendous regulating factor. And this was actually what discredited his work where it was discredited, is you'd hear this long, drawn out argument and some psychiatrist or somebody would be sitting down and argue with another psychiatrist about Freudian analysis and it'd all come out to basis: "Well, if you put a naked – put a hungry man down at a table and you took a naked woman and you put her there..." This all seemed to titillate them, the idea, you see. I've heard the – I've heard the thing expressed time after time, I mean, by these Joes. "And you put a plate of hot food in front of him, he will eat the food." [laughter]

Well, I have very often upset their calculations by saying that they have selected a careful number of factors which led to a proof of their own point. Now, this sailor had been well fed over the three months' voyage at sea. And you put a plate of ship's fare in front of him and put a naked woman there. He isn't going to eat. [laughter]

But despite the academic aspects of this problem, the truth of the matter is that to Homo sapiens food is more fundamental than sex. It is. It's more aberrative because sex is not necessarily a continuous line of overts and food certainly is. Right? All right.

So, the rule here in Security Checking is break the problem down to its most fundamental expression. Then write down those nouns associated with it and those basic doings associated with this fundamental expression. And then just phrase up your Security Check on the basis of "Have you ever...?" and any other verb you want to put in. You know, "Have you ever done this? Have you ever prevented this? Have you ever...?" You know, you could run all parts of the Prehav Scale against all the nouns if you want to really get fancy. But you don't have to be that fancy, because that needle is going to fall whenever you come close to it. And you ask this series of questions one after the other. And there are things that he just never has dreamed of, man. He just has never dreamed of these things, you know? They're just out of his ken. "What – have I ever done anything to food? Food, food, food. Ever done anything to food?"

Well, that's a very broad thing, you see? Has he ever done anything with a plate? Has he ever done anything with a knife or a fork or a spoon? Has he ever done anything with a table? Has he ever done anything to a table? You got the notion here? Has he ever done anything in a grocery store? Has he ever done anything to a grocery store? Has he ever done anything to a grocer? You get the idea? Then all of a sudden it comes out he spent his whole career, as most children have, as a shoplifter in Safeways. [laughter] And since that time he's never been able to eat chocolate without a feeling of guilt. And you, all of a sudden he'd say, "What do you know, I'm not allergic to chocolate now. Hey! You know, that's..." See that's positive gain in processing. It's a win. You see that?

But it's just based on these fundamentals. That any area where an individual is having difficulty, he's stupid. What is stupidity?

Female voice: Not-know.

It's not-knowingness. How does not-knowingness occur? Through overts. But the overt has to be hidden, so it must be an overt which is withheld. So these withholds, then, add up to stupidity, so of course he has trouble. I mean, it's as – it's as – it's almost as stupid as he's being in its simplicity. There isn't anything complicated about it at all.
All right. Now, that's so much for a zone of activity in which a preclear is having difficulty which would constitute a present time problem of long duration.

Let's take up the other branch of it now, since there's two branches of this and that is the psychosomatic difficulty. And you must always assume that a psychosomatic difficulty is a solution after the fact. A psychosomatic difficulty is a solution after the fact. Of what? Of a confusion.

A confusion consists of two things: Time and space, change of particles in, predicted or unpredicted. And if they're unpredicted changes in space, you will have a confusion. And to resolve the confusion, he puts his attention on one particle and says that is it and all other particles must be ignored. That's confusion and the stable datum. It's best represented by you tearing up half a hundred little tiny bits of very lightweight paper and just throwing them up in the air. Of course, you have a confusion if you do this. That is a confusion of paper. But it doesn't look very confusing to you because you have it in relationship to the still walls of the room, the ceiling and the floor.

Nevertheless, if there were no relative stillnesses with relationship to this cloud of paper which is swirling, you wouldn't know what the hell to do about it or which one to put your attention on or anything else, if that was all there was to look at. And the solution to that is to put your attention on one piece of paper and consider that all other pieces of paper are in motion in relationship to the one piece of paper. And that is the solution that the thetan always takes. It's a good solution, except it eventually winds him up with such things as chronic somatics.

He's got a war. War to him is a problem in confusion. It is a confusion to him. So out of all of the factors of war, he has chosen one on which he is now fixed. Well, what is the one fixed factor? What is the one fixed factor? Very simple. The one fixed factor, of course, is the fact that people get hurt in war. That is the most confrontable thing because they're the only undangerous people in a war: Officers are dangerous; even your friends are dangerous because they're all armed; the enemy is dangerous; everybody is dangerous. And what do we wind up with? Everything dangerous but a wounded man. So that makes a good solution, doesn't it? Now, when we add this up to the fact that if he is a continuously wounded man, he will never have to be in that confusion again. Oh, that's marvelous. So he puts himself immediately into the confusion forever. He gets betrayed by his own solutions. And there's his chronic somatic. So it's the difficulty after the fact. The chronic somatic is always after the fact.

So all you have to do to resolve a chronic somatic is not find out how the man broke his leg, but find out what confusion existed in his life before he had trouble with his leg. And then when you've got that confusion sufficiently taped and squared around, what do you have? You have a fruitful Security Check which when executed will free him from the chronic somatic which solved the confusion. Because it was his overts in the vicinity of that confusion that made the confusion stick and made it necessary for him to select a chronic somatic to solve it with. You see how simple this is once you look at it. So always look before the fact.
This person has got sinusitis. All right. He wants to cure his sinusitis. That's why he's being audited. Sinusitis. That's the thing. That's the stuff. If he can just cure his sinusitis, that's his present time problem of long duration and so forth. Well, hell, let's not find even somebody who had sinusitis. Let's go at it in a much broader way. Let's do a much more positive, thorough job of this thing from all ways and shape and form.

Let's find out when he had an onset of sinusitis and then let's just take from that period back in this life to find zones and areas that he considered intolerable. And every time we find one, let's make a Security Check for that zone or area, run that Security Check and the next thing you know, bango! We're going to have some freedom from sinusitis. It'll get a little bit better and then it'll get a little bit better. And then all of a sudden, we will have the zone or area which made it necessary for him to have sinusitis and now it'll just cure just like that. It's just gone. Because it's no longer necessary to have it because he no longer has overts against the confusion. Do you see how it works out?

*Audience:* Yeah.

All right. All of these things can be taught as I think you will see here, clearly. All of these things are teachable. And all these things are doable. The first thing you need to do is to tell people to get up with their technical presentation and then use the technical presentation against the interestingly simple format of a plain Security Check. Then they can get more complicated with this and actually have wins right on up the line with chronic somatics and everything else. And they will really be telephoning you to tell you how wonderful it all is. This is for sure.

Right here, right now, you're not seeing a Security Check in any stellar role. You aren't for one reason, is that your attention is definitely on a broader, faster line that requires infinitely more skill and care. But nevertheless, you're running a Security Check parallel to this. And as you're doing Security Checks, you yourself get a reality on what you can do with a Security Check. Go ahead and run the Security Checks that you're supposed to run on the person, but at the same time examine what that person is doing; examine their present time problems of long duration; find out what they're really trying to get done in auditing; find out what their hidden standards are; and trace it back with the two systems which I have given you here.

One, is to find – if it's a chronic somatic – to find the confusion which exists before the fact and in the other one, find out what area of life was intolerable to them. And if you do that and tailor up Security Checks immediately against those and ask some little brief line, you'll find, my God, there are withholds there you never dreamed of and actually the pc never dreamed existed. And you'll suddenly get rid of some of the chronic difficulties of the pc ahead of the fact of the pc running them out where they actually exist, which is on his terminal line.

Now, all Security Checks add up to very thorough key-outs. That's what a Security Check adds up to. It doesn't add up to a cure. It adds up to a key-out. But it'll stay keyed out. Don't worry about that, because the individual would have to accumulate this many overts and withholds again. And once he's been security checked on it, he probably finds out that he should know better next time. But it really is a key-out, because don't be too surprised if you
run into the same somatic on his goals line which you got rid of on the Security Check – you ran into on his goals terminal line and you find out that the reason he keeps adopting a broken hip or a busted skull or something of the sort – you'll find the engram. The basic engram on the whole thing. You'll find eventually the overt, you'll find everything about this, running his terminal line. The somatic will turn on sharply, as-is and be gone. You'll hit it again. But because you've done a Security Check on it, it's very reachable when you're doing a goals run. Okay?

All right. I hope some of that is some benefit to you.

Thank you very much.

*Audience: Thank you.*
QUESTION AND ANSWER PERIOD: STATES OF BEINGNESS

A lecture given on 27 September 1961

Thank you.

Now, I suppose it's about time you asked me questions. This is the what of what? What year? [laughter]

*Audience*: Twenty-seventh.

Twenty-seventh? I've been dating letters all day 26th. What do you know? 27th of September AD 11.

Well, you'd better come up with some questions. I'll count to ten. One, two – yes.

*Male voice*: Would you say a little bit about how obsessive individuation makes the person eventually become the thing they're individuating from.

Will I say a little bit about how obsessive individuation makes a person eventually become the thing he is individuating from.

*Male voice*: Please.

Right. All right. It's a very simple mechanism. An overt act is an effort to individuate. It is a withhold of oneself from. And if you get an idea, let's say, of – well, let's see: Br'er Rabbit and the Tar Baby – this is a pretty good example.

If you had a huge lump of tar and you didn't want to be part of this piece of tar, so you didn't permit yourself to come near the tar, every time you came close to this lump of tar, you say, "Well, no, I'm not going to become that tar." You would eventually find yourself slightly misemotional about this tar, because you're cutting communication with it. And you would try to push yourself off from this piece of tar, because you would find yourself drifting in toward the tar. You would one night go in the room and it's dark and you accidentally touch the tar and this is a counter of one of your postulates, you see. And so you push yourself off and away from the tar and the more you push yourself off and away from the tar, of course, the more tarry you get. And eventually you get into a state of affairs where you were tar. Just all from a forceful effort to hold yourself off from the tar.

Well, of course, this only starts to happen after one begins to use effort to withhold oneself from the tar. You get the idea?

Now, the way this works in the field of the mind is this way. There is a thorn tree. And let's take a denizen of Arizona. The denizens of Arizona have rather uniformly done this. Cactus. And they are rushing around out in the desert avoiding cactus. And they avoid cactus and
they avoid cactus and they avoid cactus and they avoid cactus. And they sort of push against the cactus, you know. Every time they come near cactus, they sort of push themselves off from the cactus. They have some very interesting cactus out there. Some of it is ... Actually, I had it confused for the moment – the most interesting thorn bush I ever ran into or the most interesting piece of shrubbery was spare-a-momento bush, which is the "wait-a-minute bush" of the tropics, which has its thorns growing wrong way to, like fishhooks. It's a wait-a-minute bush, all right.

Well, their rivalous piece of vegetation is a particular type of cactus which has very yellow spines in a bunched group. And these spines are quite invisible in their last inch or two, so that it actually makes one feel that the cactus has leaped at him.

In other words, you can touch the cactus without being aware of the fact that you're that close to the cactus because the outer spines of these bundles of spines are invisible. And it – people all there, all claim – all the Arizonans claim that this cactus jumps at you. And I've forgotten the name they call it by, but it's a – a very annoying cactus.

I remember one time I was pulling cactus out of Mary Sue's ankle after a motorcycle ride and – with a pair of pliers and so on. And what made it most interesting is the fact that I tried to get the cactus spines out originally with my motorcycle gloves. And of course it just saturated my motorcycle gloves and I couldn't wear those and so I got cactus in me and we just had more cactus all over the place than you could well appreciate. Went straight through her boots.

Well, Arizonans with experiences of this particular character, eventually begin to avoid this cactus very carefully. At all times they avoid this cactus and they're all convinced that it leaps at you, which it doesn't. So anyway, imagine living in a country always avoiding this cactus.

Now, what does the thetan do every time he sees this cactus? He takes a picture of the cactus. He resists the cactus, which makes an energy picture of cactus. Right? So that far from avoiding cactus, he is actually duplicating the cactus in his bank obsessively. So the more he pushes back against the cactus, of course the more pictures he gets of the cactus.

Well, eventually he finds out that his bank is prickly. He doesn't like his bank. He gets a few traumatic experiences with the cactus and of course this sort of submerges and the engrams all get tangled up and that makes a chain out of these pictures of cactus. And one fine day he's being awfully pointed to people. Don't push too close on some native Arizonans because they're very cactusized. They're highly individuated and so on.

It's interesting how unfriendly a can't-have land actually is. You're walking out through the vast reaches of desert: there's no food, there's no water and that sort of thing – he's very unfriendly. And eventually the denizens of the country will become very unfriendly and everybody's having a beautiful can't-have run on him.

But there is an example of pushing against the cactus and of course every time you push against something, you get a picture of it. And you must avoid the cactus. You just must not. Well, of course, you can't see the pictures you're making of the cactus, so they don't as-is.
That's an important point, because we must avoid the cactus. We are taking pictures of the cactus and therefore we never as-is the pictures of the cactus, don't you see.

And eventually it's these pictures which cause one to feel that a closure has taken place. Actually, it is not directly true that a person avoids the cactus and then snaps into the cactus. You see, that's a simple look, but it is not a correct one. Actually, by avoiding, he takes pictures then which he doesn't as-is and these pictures not being as-ised can become quite dominant and after a while he thinks of himself as cactus. All because he tried to avoid cactus.

Now, he has already said – let's go back one step earlier. He's had – he's already had to say that "cactus can overwhelm me." He's had to make that postulate. And that is the initial postulate. And in all valence difficulties, this is the initial postulate: "Cactus can overwhelm. That can overwhelm me." And when a person has made this determinism, of course, he has started on the road of a valence closure. "That can overwhelm me." And that's the way that goes. Now, do you see how that mechanism is? It's a – it's a relatively easy mechanism.

When you're taking it apart as an auditor, what are you doing? You are trying to make somebody confront things. They then start confronting the things they haven't confronted in the bank and then the next thing you know, it turns up that they have a number of overts. Well, they are being this thing, so of course they haven't any overts against it. And therefore they're totally irresponsible for anything they've ever done to it, because they aren't doing anything to it. They are it.

And the first thing they would tell you is that they've never done anything to it and you'll get a null reading on the E-Meter, with regard to questions – regard to it. But as you go along and in general processing, the person begins to confront more and more of the pictures of his bank and we phrase it as "his responsibility rises."

Actually, it's not even as complicated as that. It's just the fact that he's now confronted enough of his bank to individuate slightly from his pictures. And the moment he does that the string of overts which he did against the objects appear. And so your Security Check begins to work. And this is why a Security Check is an excellent index as to whether or not your processing is getting anywhere. Because if a Security Check works during the third intensive and it didn't work during the first intensive – some question of it – it is only that during the intervening time you have caused somebody to confront bank.

Now, if you've caused him to confront bank, then, naturally your Security Checks will work later on things they wouldn't work on earlier. But if the pc is totally irresponsible on the third intensive on the same things that he was irresponsible for on the first intensive, then we are making no progress at all. He is stuck totally in the valences that he was stuck in at the beginning of the intensives.

So your Security Check gives us a wonderful index. If more withholds don't appear – constantly and continually during processing on things that were clean before – then the person is not getting out of any valences and he is not confronting his bank better. Processing is not working if new withholds don't turn up on Security Checks you have made null.
Give you an example: we give Sec Check Form 3 and we get all the way through it and everything is just fine and we say, "Well, that's wonderful," and we clean this all up now and – wrong adjudication: "Well, we won't have to do a Form 3 again." That's a totally wrong adjudication.

We give the pc twenty-five hours of – particularly something like Routine 3, which is straight at valences and at the end of those twenty-five hours we could go into Form 3 again. You understand, we got Form 3 all clean before these twenty-five hours were given. Now we give him twenty-five hours of Routine 3 processing and now we give another Form 3.

And if we don't get a whole bunch of new withholds, our processing during that twenty-five hours might as well have been garbage-canned. It was nonfunctional processing. Do you see why this mechanism is? The mechanism is actually a simple one. It's that an individual is not responsible for the things that have totally overwhelmed him, because it's responsible for having overwhelmed him, don't you see?

So he is *being* these things, so therefore he doesn't have any Security Check reaction to them because he is them. You're talking to a cactus, so therefore he hasn't any overt against cactus. He just *is* a cactus, that's all.

Now, as you processed him, all of his times of resisting cactus, have come up little by little or this way or that, until you have a confront going. And you have a little as-is going of some of these pictures and of course this has shifted him from being cactus to somebody who has overt against cactus. So a Security Check on the subject of cactus would not work.

There's two tests of rightness that are invariable tests and are very wonderful ones and that's new withholds on the same Security Check that was null is the best representation of case advance there is. That is better than profiles. It's better than IQ tests. It's better than anything else. It's a direct representation. Security Check was null. You processed him. It is not now null.

That one and the other mechanism is the Prehav. These are the two most important mechanisms in Scientology. If you have the right goal and terminal and you have made an assessment on the Prehav Scale, less levels will be alive on subsequent assessments – on the Prehav Scale – if the terminal is right.

If the terminal is wrong, increasing numbers of levels will be alive at each successive assessment on the Prehav Scale. Those are very interesting things. And those are two things which you should know and have a good reality on. You need to observe those things when you see them and get a good grip on them because it tells you at once "Claw off to windward, man. This boy has not got the right terminal." And it is utterly dynamite to run the wrong terminal. Complete dynamite. It just must not be done.

If you've got the wrong terminal, the first time you assess the terminal on the Prehav Scale to get a run, you had 5 levels live and you found 1 level and then you ran it. And you ran it (quote) flat (unquote). And then you assess him again on the Prehav Scale and you have 12 levels alive – *oh, oh, oh, oh, oh, oh, oh*, you have the wrong terminal on the pc. There's just no arguing with it.
And you should go back and check it all over again. And then if you still think you're right, so you run this new level that you found and then you find 15 levels are now alive — well, don't commit suicide. We need auditors. But it's almost that kind of a condition. That's really wrong.

The other one is, if you give a person a Security Check, ask him certain security questions, audit him for a while and then fail to get new withholds off the same questions, you're not advancing in processing, because you're not splitting him out of any valence.

So those are the two most important tests. So thank you very much for asking that question.

_Male voice: Right._

That answered?

_Male voice: Yes, I've got it. Thank you._

Good. All right. Any other question?

_Male voice with French accent: Yes. A preclear can have one goal and then you find one terminal. And after you've run that terminal on all the levels that will fall, you may look for a new terminal. Correct? And you may find a new terminal and run it again._

You lost someplace. This is not routine. This is wildly off. You're asking me to do a whole recapitulation of Routine 3. Now, let me see this. And I won't scold you for asking a question. I'm glad you did. Instructor, take note. Bulletin checks are in order. Because this is a very clean, clear activity. Very clean. You get one goal. The pc only has one goal. You get one terminal off of that goal. You run that until it is completely flat on all levels of the Prehav Scale and when that is completely flat and you get no more reaction on it, you check, make sure your rudiments are all in, completely and then you check the goal and check the terminal, once more, before you leave any terminal.

Now, having established for once and for all that you have actually flattened that terminal, you try to find if there are any more terminals for that goal. Now, only then, would you depart from the first terminal. Only if there were more terminals for that goal.

Now, if there were, you would assess them and run them. The same way – Assessment by Elimination – but you've actually started Routine 3 all over again.

_Male voice: Yes._

Person accidentally has the first goal is still alive – he's got another terminal for that goal. Now, once more, we do Routine 3 all over again. We just keep doing Routine 3 all over again. But, the way you phrased it there and what I heard or what I seem to hear, was off-line, in that running a number of levels, you then find a new terminal. No. No, that does not determine anything about it at all. What is determined here very cleanly and clearly is the fact that you've run that terminal utterly, absolutely flat on the case. And then go back and do Routine 3 again.
If the goal that he had before is still alive, you assess for a new terminal. But remember, you are only doing Routine 3 over and over and over. And there is no shift from Routine 3. It is the same action every time. You always do the same action. It is invariable.

Male voice: Thank you. I get more clear now. Ah – so it is likely that he may have more than one terminals for that goal. And would it be likely that he would have more than one goals?

Well, if you get that goal gone, yes, he's going to have other goals. But it's – he's never going to have more than one goal that you can find. You're never going to find more than one goal on him. You're never gonna find a pc with two goals. And you're never going to find a pc with no goals.

Male voice: Yes. And after the goal that has a ...

And if you've got the goal, you're never going to find more than one terminal. You'll never find no terminals and you'll never find two terminals. You'll always find one terminal. This is an oddity. There is only one level of the Prehav Scale, never two levels. Never no levels, unless the terminal is flat. It's always one, one, one.

There's a reason for that, is this is a two-pole universe. And the only way a thetan can get into trouble is go one pole. So you found the one-pole track. And it's one goal, which is utterly foreign to this universe, so therefore hangs; one terminal, which is utterly foreign to this universe and therefore hangs; one level of thought on this subject, foreign to this universe and therefore hangs.

But once having done this whole action of finding the goal, finding the terminal, finding the level and then running that level flat and then finding another level and running it flat and finding another level and running it flat and make sure after you have a flat level – only after a level is flat – find some pictures the person has had. Run those things as engrams. Get that two or three engrams out of the road, find a new level, run that. You keep doing this and eventually that goal will no longer produce any reaction of any kind no matter how well the rudiments are in or anything else.

Now, you can just scrub any complications, because all you do is Routine 3 again. It just so happens that that goal is still alive. Well, therefore, you'll find another terminal now that'd fit that goal. And you'll find a new level and you assess that level and you run that level and you just go through the whole action again. So it's actually – you can't say, you can't say that you run a terminal flat and then go back and find another terminal and run it flat, because if you looked at it in this way, this is very unneat. It looks complicated and it looks like there is more than one Routine 3 and it looks like he might get hung up. No, this thing is much more simple than that. Routine 3 is just Routine 3.

When you have flattened a terminal utterly on the Prehav Scale, all levels, you do Routine 3 again. It's as simple as that, you see. And of course, you take a Goals Assessment and naturally if the goal is still alive and it's – and there's another terminal to be run on that particular goal now, naturally, that goal is going to show up again. But there's no reason to be complicated about it because you might as well say, "Well, we scrubbed that terminal. Now we're going to go back and do Routine 3 all over again." And just do Routine 3.
And all you have to learn how to do is do Routine 3. And you can learn how to do that well and just do it repetitively over and over and over. And the case will go Clear. That is all you have to know. And also that there is only one goal and at any one time there is only one terminal will show up and there's only one level on the Prehav Scale. Also, there's only one engram in the chain that, actually, the pc is hung up in, that can be run at a time. He never has two engrams in restimulation. You'll only get one to react on the meter. This is the most one-one-one-one affair you ever heard of, you see. It's one goal, one terminal, one level, one engram. And it's quite remarkable.

And once you've gotten Routine 3 done with, you've said that's it, you go back – with a terminal, you see; you can't find any more live levels on the Prehav Scale – you just go back and do Routine 3 all over again. And of course, if the same goal is alive, you're going to get the same goal. But nevertheless, it's still there.

Now what goals list do you use to get the second terminal? You use his first goals list. Use the first goals list you ever saw. Therefore, the papers on a person who is being run on Routine 3 assume considerable importance, not for the record and not for my research files or something like that. No, they're of great importance to the auditor and great importance to the pc. And therefore the records of Goals Assessments and so on must be carefully preserved.

There's another reason for this. Is once a case is stalled some – because somebody has done something weird, you've got to have his auditing records available, in order to track back and find out what he was run on before. Because the cure for all this is, oddly enough, to go back and do what was un-... not done.

And you go back and find the first undone do and do it. [laughter] And it's always invariable, the same thing. If you've missed the fellow's goal entirely, you always return to the first list. Don't go on with these interminable lists, see; it – go onto the first list. Therefore, that list must be preserved.

If you've missed his terminal and after you've gotten up to five, six, seven hundred terminals and you still are getting no place, well, you'd better decide that you are driving a tricycle all over the wide plains, because that terminal is right back in the first group. But the rudiments or something or something about the case or something like this or some withholds or some suppressions, have knocked it out. And you put this all in order and then you go back to the first list of terminals.

And if you're putting somebody to rights who has been misrun and you can't find a Prehav level live, then the thing for you to do, if you get the rudiments in and you still can't find a Prehav level alive, then you had better go back and check and find out if there was any level left unflat at any time. And get the first level that was left unflat and flatten it. And all of a sudden the whole Prehav Scale will go alive again.

So you always go back and do what was left undone. And you always cover the same records. And it's one of these interesting, circular activities. And the person is Clear when you can no longer do any of them. You can't get the rudiments in because they're in. You can't get any goal because he hasn't got any stuck goals. You can't get any terminals because they don't exist. And you can't get any levels on the Prehav Scale because there aren't any. And you can't run any engrams because they're blown. And of course, at this interesting state of affairs, you
have, fortunately, another indicator, so that you don't just have somebody who is ARC broke and so isn't registering on the meter, you see. You've got another state of affairs and that state of affairs is a floating needle. The E-Meter is unreadable. The E-Meter is useless. And the E-Meter becomes a completely useless instrument.

When Routine 3 becomes completely useless and won't work, when the E-Meter is completely useless and won't work and when the pc will sit down and go through any endless number of doodle-daddles and whatamagoodjits and processes and – you just go ahead; if you want to audit it, that's all right. In other words, not even bad auditing works, why, he's Clear. And that's, that's – if you want your final test for Clear, that would be it. The final test for Clear is that you can't run Routine 3 on him anymore because the pc works but the meter doesn't work. Pc, by the way, will go on being audited, which is quite interesting. They don't do a big blow and say, "I'm too busy and I'm really Clear and I want to get things done." They will go on being audited. You make an auditing appointment – you want to audit him and so forth. They'll be audited. And it leaves a very upset auditor very often.

Well, he does manage to find an engram. He does. He manages to find one that wasn't run. And there it is and so forth. And he's got it and it reacted on the meter. The meter stopped floating. Damn it! And it stopped floating. And he actually got a reaction and it fell and so forth. So he rolls up his sleeves and he gets all set to run it and it's not there anymore.

And so he decides the pc must have escaped. And so he goes over the track carefully and he runs the Attack and Escape Process in order to get the pc back into the incident. And the incident is there; it must be there and – but it isn't there. And you can't get any reaction on the E-Meter. It's a very disappointing activity.

Heartbreaking. More auditors have been upset by trying to run Routine 3 on a Clear than any other single action. It's very upsetting. And they start blowing engrams by inspection and this is fantastic. When everybody knows that they ought to be 75 hours on the engram, you see, and they blow it by inspection.

So when you run into that sort of thing, you've got that. But don't make an error into the fact that Routine 3 is complicated. It is not. It is a very simple action. But therefore, because it is a simple action, it requires superlatively well trained auditors to follow it through. Okay? Yes.

**Male voice:** Thank you. How long would it take – time?

Hm? How long would it take to what?

**Male voice:** How long would it take uh – how long would be the maximum time allowed to run the first level off?

Aw, you can't even guess. They'd vary, vary, vary. I'll tell you how long – how long the last Clear took. Audited by a Clear. A Clear audited a person to Clear in 118 hours. That was the last Clear that was made just a week or so ago. Last week, I think, in Australia. Just checked out by HCO and the whole auditing time was 118 hours. That is a Clear auditing. So.

**Female voice:** But Ron, what about the one that was produced in fifty hours? In Mauritius.
Fifty? Oh, well, yes. I've just given you a time. I'm just giving you the time of the last Clear. There's no other complications in what I'm saying. [laughter]

Male voice: What I really meant was the first level ...

Oh no, you want to know how the first level ... Well, if I could tell you that it took 18 hours, 17 minutes and 63 seconds, I would first have to predict how many boo-boos you're gonna make, how far your rudiments are going to be out on the pc, how much trouble the pc is going to be in in life, what the pc's actual case state was, how difficult a terminal it was and how muggy a goal. Now, when we've got all those things settled in, we could estimate this. It would just take anything that you can guess. Just think of a figure. [laughter]

Male voice: Now, let's say if I knew that on the worst case if I have more than fifty hours, that would be bad auditing on my part. I would have a ...

No, no. I wouldn't want to go that far. Nope.

Female voice: It takes as long as it takes.

Will you take – will you take this as an example and as an answer? Just think of a figure. Right now. Think of a figure.

Male voice: Fifty hours.

All right. That's how long it takes. All right. Okay. Got it? I mean, it's just anybody's guess. All right.

Another male voice: What are the indications that a pc is ready for Routine 3?

What are the indications that a pc is ready for Routine 3. Will he sit in the auditing chair and answer your questions coherently?

Audience member: Any pc then. Anyone who ...

Any pc, any pc if he'll sit in the auditing chair and give you some coherent response to questions can be run on Routine 3.

Audience member: Thank you.

Any coherent response. Now that word coherent will be susceptible to numerous interpretations. And I had better define that word for you a little more closely. Intelligible answer.

You say to the pc, "How are you today?"

And he thinks for a little while and he says, "Well, I'm not so good."

That is a coherent response to your question.

You say to the pc, "How are you today?"

And he looks at you and he says, "Well, I don't know. Aunt Mamie is pretty good."

Now we're getting a questionable coherence, but nevertheless is in the zone of coherence. Now we say to the pc, "How are you today?"

And the pc says, "Cars should eat crackers." [laughter]
This is not a level of coherence. We say to the pc, "How are you today?"

And the pc says, "Uh – I'm not going to talk to you because I am mad at you."

That is a level of coherence. That is a level of coherence. He's still talking to you and it is in response to the fact that he's being addressed. That is a level of coherence. You say to the pc, "How are you today?"

And he says, "Gooba, gooba, gooba, uba-uba."

Well you probably aren't talking his language, so that isn't a level of coherence. [laughter] In other words, the thing is susceptible to numerous interpretations. But it merely means that even with a little struggle you can get the pc to concentrate on what you're doing and respond to some degree on what you want him to say. When you ask him for a goal, why, although he might occasionally wander off and comm lag and so forth, he will give you a goal. That much response is all the response you need to run Routine 3. And it doesn't matter what his sanity is or what his profile is or his graph or anything else. You could probably find many, many people – probably the preponderance of people in an insane asylum could be run on this. Okay?

Male voice: Thank you.

Right. All right. Yes.

Another male voice: Could you tell us something about the difference in what the Clears are today, whether they're Theta Clear or MEST Clear?

You are dealing with MEST Clears entirely, with a very upgraded definition of MEST Clear. A Theta Clear is a very finite definition and a very clean-cut definition. It is a person who operates exterior to a body, without need of a body. Now, you see, you're not making that type of Clear. It is an upgrade from this. Actually, a Theta Clear is cleared on all dynamics, including the fourth. All dynamics.

He is simply cleared on these dynamics. He therefore, does not have a tremendous dependency on a body and that is it. Now we have upgraded the definition of MEST Clear because it is the first stable state. We have got a state of stability for this particular state and this is a state of stability, so, just make it what it is. It is a MEST Clear, but MEST Clear before had a much lower requirement. It was a person who was not troubled by a bank particularly.

Now, today you're not doing that. Actually, a MEST Clear is inoperative on a meter. A meter merely floats. A MEST Clear totally stabilized – takes them some months to even out. They will run into things. Life itself is a sort of a confusion. And they've got the confusion of life stabilized and that sort of thing. They are, however, operating as a person and they are operating as a member of the human race and so forth; so could not be considered to be a Theta Clear.

Now, the probability is that the borderline between a MEST Clear and a Theta Clear is developed not on the button of can somebody operate exterior to his body, but on the button is he anymore controlled by the symptoms of hunger. Does he need food? Air? And these other things to survive? And it is these buttons. Those buttons rather than some esoteric button of,
could he sit on a mountaintop and regard his navel with an x-ray eye. That would establish this particular facet.

Now, you go up to the next grade. You go up to the grade of Operating Thetan and you notice that the word Clear has not been used for that grade. And there is no idea of Clear. You're talking about a different being entirely.

And that state or status would be, therefore, one who didn't have a bank that was troubling him (in other words, his reactive bank was not an unknown series of factors to him), to one who was not influenced in favor of one more than another of the dynamics and who did not experience need or necessity for food, clothing, shelter and the rest of these things. Didn't have to have a body and so forth.

Now, we go up to an entirely different aspect on the upgrade. And that is somebody who can handle mest. He is not in a state where he could take it or leave it alone. He is in the state where he could be quite aggressive toward it or he could be quite manipulative of it.

Now you get the clever states of moving the ashtray, you know. This kind of thing of – of starting the whirlwind. This is your trick – the trick level. Oddly enough, some very aberrated thetans can on some very reactive system or another of something terrifically emphasized produce poltergeist. And some magician here or there in past times has been able to start a whirlwind. And, well, for instance, you could probably – there's undoubtedly somebody here, although you possibly haven't noticed it, who could disintegrate a cloud by looking at it. And this odd trickeries – but these things are too channeled and they're too fixed and the band isn't broad.

An Operating Thetan, well, you could disperse a cloud and you could collect one and then you could move one. And then you could precipitate one. Got the idea? Then you could put it back the way it was in the first place. And then make three clouds and make three pretzels and Ballantine's Beer and hang it over the cloud.

You could do something weird. You could do something with mest. And the best index of that, the best explanatory statement that could be made is "Someone who has no consequences connected with creation." And when he's – the person is totally recovered from all consequences of creation, you could say, well, OT. That's about the only test there would be there.

And one of the tests would be, you'd have him mock up a whole bunch of things and see if he's spun in. I mean that's – that'd be the crudest level of testing we would have right at the present moment, you know. And it's a great liability having OTs around. It's a very great liability. It must be because the state has been fought tooth and toenail by practically every society that has ever been formed.

And right now the one thing to which the Roman Catholic Church owes a tremendous success line, is the fact they promised everybody to get rid of all of the spirits in their vicinity. And whether these spirits were good, bad or indifferent, they never bothered to inquire, but they promised everybody they were going to get rid of all the spirits and save their souls. Well, we don't know what that was all about. But it was apparently a lot of people were afraid of this particular state because they made a lot of smoke about it.
But of course, the people around who were in that state at that time were in such a limited state, it was something like, well, being able to dissolve a cloud today. They couldn't do very much. That, and they were possibly sufficiently irresponsible, though, that they were dangerous members of society. Who knows?

It was three states with which you're dealing – you're dealing with the fourth state. And this fourth state is Release. When you have found somebody's goal and terminal and level and when you have really nicely completed a Security Check, you will find that you have made a tremendous difference in this particular person.

And if you have at the same time – let's expand the definition a little bit – eradicated his present time problems of long duration, let me assure you you have something which is so superior to anything you had before that you certainly had better designate it as something, so you designate it as a Release. The basic definition of Release is somebody who doesn't think he's going to keep going downhill. That's all. He doesn't think he's going to get worse. He thinks he's going to get better. He knows now he's going to get better. He's got a certainty on the fact that he's on the road out. That is a Release.

It's the same state of mind that you've opened this jail door and they can look down the road and there are no soldiers with pikes and nobody in the watchtowers with Sten guns and there's no booby traps or mines on the highway and they all think there is at first and they inspect these things very carefully. If you were to suddenly go to Wormwood Scrubs or something and suddenly throw open the gates and say, "Well, all right, boys." You'd find there are tremendous numbers of them that wouldn't even go near the gate or inspect it.

You'd say, "Well, there are no guards out here. There's nobody in the watchtowers anymore and there's nothing on the road, and you can just leave. Go ahead. The gates are wide open" and turn your back. You'd come back in some hours to inspect it. You would find that some of them had not left at all and were not about to leave. They knew they had been fooled. This would be their first mental reaction. "If anybody tells you anything like that, this must be total foolery." "Uh – and it's just a new – a new technique of betrayal" – that's their big certainty. And they're still cowering back in their cells, sitting apathetic about it all and so on.

Another group you would find milling around the courtyard trying to get nerve enough up to look to see if the guards were still on both sides of the gate. They would just be trying to get up their nerve.

There'd be another group out in the courtyard satisfied that there were no guards at the gate but recognizing that the ne plus ultra would be to take the guards off the gate and then have machine guns in the towers, you see. And as soon as you got outside, you would probably get it in the back. And they're satisfied that they're free for the courtyard, but they are pretty sure that they had better not go down the road.

And then you'll find another group who are outside, dodging down the road but jumping back of bushes and jumping in and out of ditches and progressing in short bursts, you see, from cover to cover. And then way down the road someplace you'd find a group of guys walking along saying, "Wasn't that nice of somebody to open the gates?"
And these – these various states are reflected, of course, in the attitudes of pcs. And when they've gotten over the idea that – this is the principal idea they'd have to get over – is that this freedom is a new betrayal. That's the principal idea that a Release would have to get over.

If he got the – if he still had the idea that this offered freedom was just a new betrayal, you couldn't say he was a Release because he's never going to walk past the front gates or the watchtowers. So he has to be over that particular state of mind. And you could counterphrase it and say, "Well, he knows he isn't going to get worse," and so forth, but he knows he is on the road out and up. And he knows that he isn't going to get tripped down and thrown to the wolves again.

Now, he knows this, so just knowing that actually produces an enormous difference of case level. And it isn't something that collapses. It's a fairly stable case level.

So those are the four states you are operating with, right at the present moment. Of course, that first state is terribly easy to attain and one of the best ways to attain it is by Security Checks oddly enough.

But a Security Check just rendered endlessly on somebody may take quite awhile. You find his goal, you find his terminal; he gets a greater reality on himself and now he understands a lot of things that he did and you complete a good Security Check on him and he gets off all of his pretence and feeling of fraudulences about himself and odd doubts and that sort of thing. You've made an enormous difference in a person. The person now looks factual to others. He has a level of reality which is very good and so forth, so it's dignified by this term Release.

Although of course, being the lowest of the states on the road up – not the lowest of states but for the lowest of states on the road up – it of course is a far more complicated state and far more difficult to establish than the upper three states. These are very easy – much easier to establish.

Probably the easiest state in the world to establish right now is the state of Clear. Anybody could check for Clear. Anybody could check for it. If he could operate a meter, he can check a Clear. I mean, it's as easy as that because the meter's inoperative. The person isn't hanging at 2 or 3 on the apathetic underbeat with a stuck needle, you see, because the meter's still operative. You can still make that meter operate, but you got a floating needle that's drifting around and it floats and you ask the person various questions and you don't get any responses and so forth. That's a Clear test. That straighten out these states for you, Arthur?

Male voice: Thanks so much.
You bet. All right. Yes, Bonnie.

Female voice: Two questions, Ron. One ...
Only one at a time.

Female voice: Where would you read ... ?
I'm in this universe, huh? [laughter]
Female voice: All right. Where would you read a Release on the meter?

Where would you read a Release on the meter? Oh, well, that's very difficult to say. I can tell you where he wouldn't be.

Audience voice: Not at Clear.

Now, that's – no, no. No, I can tell you where he wouldn't be. And this is the only thing you've got to be careful of, in checking out a Release. And you'd better be careful of this because lots of auditors have been fooled in the last decade by this one.

He sits at the Clear read for his body and he's a dead body. He's totally irresponsible. He gets no fast needle reactions. The needle is pretty sticky. And to get any response at all, you have to advance the sensitivity, but the tone arm does locate him at his Clear read.

Of – that is the lower harmonic of Clear. And it is total apathy. It is total irresponsibility. And it's a giddy-giddy, whee, "All us people in seventh heaven" – some kind of a weird state.

And every now and then some auditor has enthusiastically offered one of these people up as Clear. And he hasn't noticed, you see – he hasn't noticed that any time he was auditing the person never has had a response on the meter. The person never has been able to go all the way through a Security Check, merely because the person hasn't any withholds. Nothing is a withhold. He has no responsibility for anything, so of course nothing is a withhold. You get the idea. Nothing. You never get a single reaction on the needle when you're asking him about anything. And to get any kind of a reading you have to have your sensitivity very well advanced and it is very far from a floating needle. And anybody who knows E-Meters could look at this particular case at once and say, "Clear? Near beer, man. That's nowhere."

Yet that has fooled people. And people have even occasionally been checked out as Clear, who were in total apathy, whose chronic somatics were in full scream, who – just a complete flub.

Now, this is – this is interesting because it means that you have to know what is a floating needle. And it is quite distinctly different from this other phenomena. The other phenomena is very distinctive.

But I was fooled one time by this other phenomena. I had a newspaper reporter who was doing some press work for an organization here. And he was one of these cases. And only when I suddenly realized the man couldn't work, couldn't think, didn't think it was possible to get any press or publicity, was totally negative along all these lines, I took another look at the situation and sure enough, he was one of these spook cases.

He sat directly on 3. He didn't respond in any particular direction to anything, but his needle was stuck – couldn't get any response to what it was. And what it turned up – the clue was – that he couldn't run Help. That was the clue. He couldn't run Help and he couldn't run Control. See, he couldn't answer a positive question. He couldn't make a decision. He just was a dead body. He was a dead-thetan case. And he had no initiative; he couldn't work. He was in horrible condition.
But nevertheless, at first glance on a meter, you see, you say, "Well, the man is reading..." This was many years ago, by the way, when we didn't know very much about this. And he was just sitting at this Clear read and apparently wasn't too stuck up and so forth. And I just happened to notice this in passing and then later on noticed his behavior on post. And it was fantastic. Complete irresponsibility. He just could not get anything done in any direction. He could not work. He could not think. He couldn't make a decision. He thought everything was impossible. And another thing he thought was everything was a fraud and everything was going to betray him and he was really betraying everybody. And, oh, it was the wildest package.

Well, I was interested in the package because that was the first one I ever saw that was a perfect dead thetan. He was a perfect dead thetan. He really thought of himself as having died a long time ago and hadn't been alive ever since.

All right. Now, there's your – there is, in essence the behavior of that.

Female voice: But how would you recognize a Release on the meter?

Well, the Release has no action on the meter, but he doesn't have that one. You see, he doesn't have that one, but neither does he have any other. A person actually could, possibly, theoretically be stuck in 7 on your dial and still be considered a Release. I mean, you cannot lay down now something like this because a person in processing from day to day if you will notice, if his case is making any progress, he's liable to be reading these days at 1 or 6 or almost anything. A Release is not necessarily not on a Clear read and a Release is not necessarily high. A Release is necessarily, however, not one of these dead-thetan cases and he, of course, is not reading with a floating needle. If he were reading with a floating needle, he would be Clear. So it's not determinate. It's not determinate. You'll ...

Female voice: How would you recognize him, then?

Hm?

Female voice: You'd recognize him by his case not worsening.

No, I'll go over this again. His characteristics are very finite and very easily established. If you call these characteristics that of Release, you will be absolutely certain not to make any mistakes. You don't want somebody who is going to be a disgrace to you. So he's got to know he's on the road out. He's got to know he's been helped. And he's got to know that he isn't being betrayed. And so if you lay down these characteristics, you will have such a person. (1) You have found his goal. (2) You have found his terminal. This will make an enormous difference with a case. And (3) has successfully gotten through a Form 3 Security Check and has it all clean for this particular level. Now, if those things have occurred, the chances of this person now being in a state of fraudulence, betrayal, upset, superchronic somatics, no road out, it's all blocked, you're gypping me, tremendous numbers of present time problems, skidding all over the place – these things are relatively well ruled out by these conditions.

Now, if you wanted to add another one to it to be absolutely sure, you would say that you have handled his problems of long duration – which is his chronic somatics have been handled. Now, that for sure would be a Release.
Now, if you've put these things together, you could, if a person had met all those characteristics, it would be the safest thing in the world, the safest thing in the world to say, well, he is a Release because he is a stable case at this point and he is not going to cave in again.

_Female voice:_ Thank you.

You betcha. All right. Now what was the other question?

_Female voice:_ How would you audit a MEST Clear to OT?

How would you audit a MEST Clear to OT? Well, that's very good. That's very fine. Now you are dealing with unknown data. You are dealing with a vast number of processes which have been turned out. And nearly all of these processes have – were covered over the years. And they are totally out of reach, but it'd be something on the order of he could do any process in Scientology.

I released some from South Africa called Ultimate Processes. Now, if a fellow could do those Ultimate Processes and they were all flat, given the fact he was Clear in the first place and he could do all those processes, why, you would find that was fine.

But of course, you're – you've taken a double jump here. You want to know how to audit a person from Clear to Operating Thetan. Is that right?

_Audience member:_ That's right.

All right. Now, Operating Thetan and Clear are not next to each other. There is Clear and then there is Theta Clear. And you would be operating him from Theta Clear to Operating Thetan or you would be operating him from Clear to Theta Clear.

Now, taking him from Theta Clear to Operating Thetan is relatively easy, because you have the old book _Creation of Human Ability_. Now, you'll find all those processes in there are applicable. You'll find the Ultimate Processes which I released last fall in South Africa. Those are all applicable. You have all of Creative Processing released in England in the 52, 53 – all of that is applicable. You'd find that we've already covered the ground. It isn't an unknown zone at all. It's a zone that has been developed.

Now, the other one – what you really ought to be asking about is – how do you take a person from _MEST_ Clear to Theta Clear. Now that is very pertinent. And how you get him over _that_ jump is under study right at this moment and it's very difficult because you are totally inoperative. You're not guided by any meter.

_Female voice:_ What about the oscilloscope?

Well, that's all right, but we haven't made the total jump on there. We merely have some clues. We kind of know where we're going. We're feeling our way. The subject is one of these research projects of some magnitude.

The first goal along this line and the first big discovery along this line occurred just forty-eight hours ago. I found out the common denominator of all cases that have bodies. And it's not very startling since you could have suspected it, but of course it'd be a violation of havingness in some fashion or another, naturally. But their attitudes in – of havingness are
incorrect, incorrect to this state, is they hunger. They can starve. And they have anxieties about procurement of food, air, heat and these other factors.

And I finally isolated this thing to my own satisfaction only about forty-eight hours ago. You clear a Clear of hunger. You see, he's already Clear. But there he is in a body and he's eating and he's breathing and he's still hanging around and he still considers himself exclusively a member of the human race. He still swats flies with great enthusiasm. Get the idea?

All right. How come all this? How come all this? Well, he is Clear on the fourth dynamic. You'll find out – you're going to have trouble, by the way, from time to time, administratively and politically in Scientology. It's entering right now because just about the first place a person who is good and Clear heads, is, of course, the fourth dynamic. And they get over this, so suffer them – suffer along with them on it. It's – it's an almost – an occupational illness of a Clear. The fourth dynamic. And they go intensely onto the fourth dynamic, you see. Up to this time they'd been on third, they'd been on second, they'd been on first and all of a sudden, bang! They find themselves on the fourth.

Well, they're cleared on the first, second and third. And that fourth dynamic – they suddenly wake up with a tremendous reality on the fourth dynamic and they say, "There is mankind! Wow!" See?

Well, now this isn't the lower harmonic of let's all go to Trafalgar Square and sit down. [laughter] This is very overt. That is the lower harmonic of the same phenomenon, you see. All things have their lower scale mockeries. This'll make you feel funny more than once in your lifetimes. All things have their lower scale mockeries.

All great dancers are now and then imitated by lousy dancers in burleycue shows, you know. I mean, it's lower scale mockeries – always occur. Just like there's a lower scale mockery of Clear. A person sits on his Clear read, is absolutely dead and completely useless, you see. A person says, "Well, that's what a Clear is, I don't want to be one." Well, I don't blame him, I don't want to be dead either, because it's so inactive. That's the only thing wrong with being dead.
