LRH: All right. Is there anything about the goal "to be an antisocial singer" that you have failed to reveal? Doesn't react.

PC: *Um.*

LRH: Is there anything about the goal "to be an antisocial singer" that you have been careful of? Now, I got a tiny slowdown there. It's hardly detectable.

PC: *Well, it's this slight little wince about it again you know, wahh.*

LRH: All right.

PC: *I withdraw from it slightly.*

LRH: Very good. I'll check that again. Is there anything about the goal "to be an antisocial singer" that you have been careful of? All right. I'm getting a slowdown instead, as an instant read on it. You got another one?

PC: *There was something I thought of. When I was in communication with you on the telex ...*

LRH: Hm-hm.

PC: *... a couple of times about this I was careful of what I said just in case you landed me with it again.*

LRH: If we learned what?

PC: *I wa – in case you landed me with it again. I was careful of what I said.*

LRH: Oh, I see.

PC: *I told you the whole truth but I was careful.*

LRH: All right. Very good. Okay. All right. Let me check that last one. Is there anything about the goal "to be an antisocial singer" that you have been careful of? All right. That is clean.

PC: *Hm-hm.*

LRH: All right. Let's check the goal again. To be an antisocial singer. Okay. To be an antisocial singer. Okay. To be an antisocial singer. Okay. To be an antisocial singer. All right. It is not reading.

PC: *Um. It doesn't feel like it.*

LRH: It makes you nervous though when I ...

PC: *Oh, you're not kidding it does. Terribly nervous!*

LRH: It's not reading. It's not in.

PC: *Hm-hm.*

LRH: All right. Now, either the goal to go to war has been listed out ...

PC: *Hm-hm.*

LRH: ... and so forth ... And your next test on a goal to go to war, if it lists to a free needle fine, if it doesn't, well, that's it. All right. To go to war. To go to war. To go to war. This thing is really ...

PC: *Hm-hm.*

LRH: I get nothing on it. That's all. All right honey, that's all I'm going to do, except the end rudiments.

PC: *Thank you.*

LRH: All right. Here we go. In this session have you told me any half-truth, untruth, said something only to impress me?

PC: *I said a few minutes ago that you landed me with it and I didn't mean to impress you, but it sounded rude again.*

LRH: All right. Very good. Didn't read anyway.

PC: *All right.*

LRH: And in this session have you tried to damage anyone?

PC: *No.*

LRH: All right. They're all clean. In this session have you deliberately tried to influence the E-Meter?

PC: *No.*

LRH: No. Good. In this session have you failed to answer any question or command I have given you?

PC: *No.*

LRH: Now, there's a fall of some kind or another and I'm not sure on what so I'm going to repeat the auditing command. In this session have you failed to answer any question or command I have given you? All right. That's clean.

PC: *Mm.*

LRH: That's clean. You had a sudden spurt of thinkingness in the middle of that.

PC: *Did I?*

LRH: Yeah. It's all right.

PC: *Okay.*

LRH: All right. In this session have you withheld anything from me? Thank you. That is clean. And are you willing to talk to me about your difficulties?

PC: *Yes.*

LRH: All right. That's clean. And now, look around here and tell me if you can have anything

PC: *Hm-hm, the picture.*

LRH: All right. Okay. That was clean. All right. Have you made any part of your goals for this session?

PC: *Yes. Thank you.*

LRH: All right. Any gains you'd care to mention?

PC: *Well, I do feel now totally happy about the earlier goal. And I'm not hiding anything from you about it at all and I feel relieved.*

LRH: All right.

PC: *Um.*

LRH: Okay.

PC: *And I wasn't sure whether you said the goal ought to be carried on being listed or not.*

LRH: All right. Anything else you'd care to say about this? Gains?

PC: *Um? Well, I wondered how I'd feel with these things here, what's its name, but they didn't bother me.*

LRH: All right. Very good. Okay.

PC: *I feel, you know, brighter and more cheerful.*

LRH: All right. Oh, I'm not asking for applause.

PC: *But I do.*

LRH: All right. Now, is there anything you would care to say or ask before I end this session?

PC: *Yes. I didn't get whether you said that that goal should go on, on to being listed on or not.*

LRH: Oh, yes. It has to go on listed. Go ahead, that's all right.

PC: *I just wasn't sure about that.*

LRH: All right, 2 – line fourteen, sixteen – it's actually down to 2 here ma'am, back and forth. You're a little above 2 right now.

PC: *Hm-hm.*

LRH: All right. Anything you care to ask or say before I end this session?

PC: *Just, thank you very much.*

LRH: All right. Okay. Here it is: End of session.

PC: *Thank you.*

LRH: All right. Session ended for you?

PC: *Yes. Thank you.*

LRH: All right. Tell me I'm no longer auditing you.

PC: *You're no longer auditing me.*

LRH: Good. Okay.

PC: *Thank you.*

LRH: Ten minute break.

PC: *Thank you.*

TV DEMO: CHECKING OUT A GOAL, PART II

An auditing demonstration given on 13 June 1962

LRH: Is it all right to audit in this room?

PC: Yes.

LRH: All right. Now, look around here.

PC: Okay.

LRH: All right. All right, and tell me if it's all right to audit in this room.

PC: Yes.

LRH: All right. I get a little disturbance on that. What is it?

PC: *Well, I wanted to get through the rudiment and didn't want to mess around with it. I thought you were going to say then no, it's not – it's not in. I was rather surprised when you gave me the question, "Have a look around here."*

LRH: All right.

PC: *I had looked around, but I hadn't actually moved my head. I had a quick twist of my eyes.*

LRH: Yes, yes, yes. All right. All right. Squeeze the cans. All right. Your havingness is all right. All right. I'll check that one more time. Look around here and tell me if it is all right to audit in this room.

PC: Yes.

LRH: I got a reaction on that. That's it.

PC: *Camera, a camera, that camera isn't working properly and it should be, and I wondered just before you asked. And I thought on that one and I'd seen it switched to the other camera so, that was all right. Well, I think it was a little disturbing that the camera wasn't working properly.*

LRH: All right, thank you. All right. Look around here and tell me if it's all right to audit in this room.

PC: Yes.

LRH: There's still a reaction.

PC: *It's warm.*

LRH: Warm. Okay, thank you. Look around here and tell me if it's all right to audit in this room.

PC: Yes.

LRH: All right. That was clean, as far as I'm concerned. All right. Now, are you willing to talk to me about your difficulties?

PC: Yes.

LRH: I got a reaction there.

PC: *Well, I just thought it might be a bit embarrassing, as the goal we're*

going to look at is a domestic second dynamic goal and I just thought it might be a bit difficult with the people downstairs. First time I thought of that. But uh ...

LRH: Okay.

PC: *It's all right.*

LRH: All right. Okay. Let me check it out on the meter here. Are you willing to talk to me about your difficulties?

PC: *Yes.*

LRH: All right. I haven't got no reaction there. That's clean though. Now, since the last time I audited you ...

PC: *Yes.*

LRH: ... have you done anything you are withholding?

PC: *No.*

LRH: I've got a *clank* here. There we are.

PC: *Uh – sexual relationships since last time, I suppose, and I was withholding it. I've had sexual relationships since last time.*

LRH: Yeah. Yeah. That's quite all right. Okay. All right. Let me check it out on the meter. Since the last time I audited you have you done anything you are withholding? All right, that's ... I'm not quite sure of this read. Let me ask it again. Since the last time I audited you have you done anything that you are withholding? I've got a reaction.

PC: *Photography.*

LRH: All right.

PC: *I've got some prints back today, some film and know you are interested, and I didn't know whether they were really good enough to show you. So I sort*

of hadn't said anything about those. I sort of thought them – thought about them.

LRH: Okay. All right. Since the last time I audited you have you done anything you are withholding? Got a reaction. Something else, it's not the same. There it is. There it is. There it is right there.

PC: *Well it seems to do with students leaving course, am ...*

LRH: Anything else on that?

PC: *Well, I suppose I've tried to explain the – um – explain the – um – policy on students leaving course, and – um – not too sure whether I've explained it completely.*

LRH: Hm.

PC: *There's a doubt there, so of course I've withheld something.*

LRH: All right. Let me check that on the meter now. Since the last time I audited you have you done anything you are withholding? It reacts.

PC: *Yes this is, yes, I've been beaten. I – before I came up here, I knew I was coming up, I went to the bathroom, washed my hands.*

LRH: Right.

PC: *As I have a theory. It's been knocked out time and time again – that if you wash your hands when – before you come up, the read is different. It isn't, you see, I'm still reading 2.*

LRH: All right. Okay. Very good. Let me check this out on the meter now. Since the last time I audited you have you done anything that you are withholding? It reacts. It's a different reaction.

PC: *Um-mm. Didn't know I was such a withholder. Um.*

LRH: There it is. There it is. There it is.

PC: *Oh, this is to do – this is – oh, we're going back a bit. This is to do with the bungalow I'm thinking of renting now.*

LRH: All right. All right.

PC: *In East Grinstead.*

LRH: Okay. All right. Since the last time I audited you have you done anything that you are withholding? All right, I don't get a reaction on that now.

PC: *Good.*

LRH: Okay? All right. Do you have a present time problem? All right. There's no reaction on that. Okay. Now, I would like to do a rapid Prepcheck ...

PC: *Hu-huh.*

LRH: ... on the middle rudiments if that's all right with you.

PC: *That's fine.*

LRH: All right, and here is the first question: On goals have you ever suggested anything? I have to ask that again.

PC: *All right.*

LRH: I'm going to do a little piece of fish and fumble here if that's all right with you.

PC: *Hu-huh.*

LRH: Because I've got a little tiny bounce which is interfering with a read or a checkout.

PC: *Good.*

LRH: It's a sporadic bounce here. First thing I'm going to do is check the middle ruds. Okay?

PC: *All right.*

LRH: In this session is there anything you have suppressed? Yes, what?

PC: *Um – well bringing up the subject of Jenny and myself.*

LRH: All right. Very good. Let me check that on the meter. In this session is there anything you have suppressed? All right. That seems to be clean. In this session is there anything you have invalidated? Got a reaction.

PC: *Well, I felt it was an invalidation when I said about washing my hands and the cans and so on.*

LRH: All right. All right. Okay. Thank you. In this session is there anything you have invalidated? Got a reaction.

PC: *Yes, when – when you said the um – rudiment was clean, the withhold rudiment, I thought – glory, I thought, I must have done much more than that and I've got away with it lightly. So I invalidated the check to that extent.*

LRH: Very good. Thank you. All right. In this session is there anything you have invalidated? It's very equivocal here. Let me check it again. In this session is there anything you have invalidated? I got a reaction. There it is. There it is – right there. Right there. There. There. There.

PC: *Well, I suppose the meter to some extent here on um – when you asked me whether I was willing to talk to you about difficulties, again I felt I got away with a rudiment – an answer very lightly.*

LRH: Okay. All right. Thank you. In this session is there anything you have invalidated? All right, it's an equivocal read. In this session is there anything you have invalidated? All right. That is still reading.

PC: *Invalidated myself when I heard that you got a – a difficult needle to read. I felt there must be something wrong with me that ...*

LRH: Oh, all right.

PC: *... it should be reading badly.*

LRH: Okay. All right. In this session is there anything you have invalidated? All right that is clean now. In this session is there anything you have failed to reveal? Yes. What?

PC: *Names.*

LRH: All right. Okay. I'll check it on the meter. In this session is there anything you have failed to reveal? All right. That is cleaner, let me see if it's totally clean. In this session is there anything you have failed to reveal? All right, that's clean. All right. In this session is there anything you have been careful of? Equivocal read.

PC: *Uh-huh.*

LRH: I'll check it again. In this session is there anything you have been careful of? It's not reading as an instant read.

PC: *Um.*

LRH: I'm still getting a – a weird runaround here, so we're now going to do this little bit of fish and fumble. Okay?

PC: *Right.*

LRH: As far as rudiments, middle ruds are concerned, that – that's clean, but let me see something else here. What are you thinking of right that minute?

PC: *What do I – I feel I hadn't, um – if you'd asked me if the meter had reacted on some of these rudiments, I*

would have told you that when you first told me I was coming up here tonight, I was quite all right. But then sitting down-stairs I gradually got a nervous feeling turned on, which is – was still present when I sat down in session. Now I don't know.

LRH: All right. Okay. Now, needle's gliding around here beautifully now.

PC: *Good.*

LRH: But I'm still getting a little bit of odds and ends. Let's think over our present circumstances here. What did you just think of right there?

PC: *Well, the situation as far as my wife and my other relationships are concerned.*

LRH: All right. Okay. Now we're getting a bing, bing, as we go on this thing All right. What are you thinking of *right* there?

PC: *Well, that the goal we're going to check out has so much to do with all this, you see.*

LRH: All right. All right. All right. We've got an action here.

PC: *It's apprehension from me – in here. It's apprehension I think, on what this will dig up, and so on.*

LRH: Uh-huh. Uh – there's a tiny little dirty needle sort of a bounce as you think about this particularity, and you say it's something about the goal.

PC: *Yes.*

LRH: Um. All right. I'm going to try to free the goal reaction on this. But I'm getting a failed to reveal type of action. Is there anything you failed to reveal about this? Is there anything you failed to reveal about this? Yes. Yes.

PC: *About what?*

LRH: Yeah, well, just about what I don't ...

PC: *Ah, yes, right. Well, it's about Jenny and I.*

LRH: All right. All right. Okay. Bing, no, there we got that same reaction. There is the little dance, bing, bing, there it is.

PC: *This is – what is it – in the officer's mess you never mention the lady's name – you see.*

LRH: I see. I see. Is that what it is? Is this something about the mention of this name?

PC: *Suppression of the name, and uh – uh – well, suppression of anything that might embarrass Jenny.*

LRH: Oh, I see. All right. All right. Good enough. Now, I'm not going to go further with this ...

PC: *All right.*

LRH: ... because I have done a little something here and it's apparently definitely associated with the goal ...

PC: *Hm-mm.*

LRH: ... something like this. So I'm not going to do anything further with it, unless I find it impossible to read through this thing

PC: *Okay.*

LRH: Okay?

PC: *Uh-huh.*

LRH: All right. Here's the first question. On goals have you ever suggested anything? Equivocal. On goals have you ever suggested anything? Probably null. On goals is there anything you have

suggested? All right. We get a reaction on goals. But uh ...

PC: *This is to do with – what I was thinking of then ...*

LRH: Yeah, go ahead.

PC: *... was my daughter's goal who – when she wanted to start a career, and so on, I was sort of suggesting things to her then.*

LRH: Hm.

PC: *That's what came up.*

LRH: All right. Good enough. Good enough. All right. I'll check it again. On goals is there anything you have suggested? No reading on that. All right. On goals is there anything you *had* suggested? That reacts. You had something suggested to you on goals?

PC: *Well, people have always suggested what I should do, but this does not – not as applicable to goals in Scientology – goals in – in life, people always had to suggest things to me.*

LRH: Good enough. On goals is there anything you've had suggested? All right. That's clean. On goals is there anything you have suppressed? Yes.

PC: *Well I think I've suppressed any doubts about – or tried to suppress anyway – doubts about this goal of mine being my goal or being the goal. I've sort of batted for the side on that.*

LRH: All right. Very good. Let me check that now. On goals is there anything you have suppressed? Reacts. Anything else?

PC: *Oh, this has to do with a student's goal that I checked out, and I wasn't too sure about it. And I think I suppressed my uncertainty on the – on the checkout.*

Something that proved all right, by the way, but to be honest I wasn't really sure.

LRH: Okay. All right. On goals is there anything you have suppressed? All right. That is clean. Thank you. On goals is there anything you have invalidated? All right, there's no read there. Thank you. Now, on goals is there anything you have failed to reveal? All right, let me check that again. On goals is there anything you have failed to reveal? I got a reaction.

PC: *Well, what I think of is, more or less – yes, failed to reveal – was that at one time this goal was checked out by an auditor and was said to be clear. Thought it was clean, we'd finished it when we were running the old type processes on it, and we did start to list again for a new goal.*

LRH: Oh, yeah.

PC: *And I don't know if I've ever really got this over to anybody.*

LRH: All right. Okay. Thank you. All right. On goals is there anything you have failed to reveal? I've got a reaction there, a slowdown and then a knock. There. There. Right there.

PC: *Oh, this is the – that's the uncertainty that I had when I – the first goals that I found when on the course here. And I'd get them to read, and then you sort of doubt, and then you'd be wheeled down to Mary Sue or somebody to check them out and they would check out. And then I think I failed to reveal at the time my surprise. I wished to be very nonchalant about it and say, well of course, and so on.*

LRH: Yes.

PC: *But I think I failed to reveal that I wasn't all that certain at the time.*

LRH: All right. Thank you. Okay. On goals is there anything you have failed to reveal? All right, that's probably clean. On goals is there anything you have failed to reveal? It's very, very hard to tell whether or not this – this did that. Let me check it one more time. On goals is there anything you have failed to reveal? That's clean. Thank you. It was your deep breath that did it. Now, on goals is there anything you have been careful of? I got a reaction.

PC: *Been very careful not to invalidate anybody's goal, or the method of finding it, or anything like that.*

LRH: Good. Thank you. On goals is there anything you have been careful of? I'm going to check that one more time. On goals is there anything you have been careful of? Can you think of another answer to that?

PC: *Well, what I was thinking was that that wasn't – that was a good answer, and I think when I'd given you one, previous one, that I'd been careful and I'd been very good, and I thought well that shouldn't be reacting. There should be something else there, and that's as far as I'd got then. Um ...*

LRH: Something right there. There. There.

PC: *Well, this is being too careful, being too careful in checking out goals and probably taking too long over it and keeping – this is, this is it – keeping in goals on a list that you are suspicious of, but – but really if you knew your job, they would be out. Being too careful in assessing.*

LRH: All right. Very good. On goals is there anything you have been careful of? I've still got a reaction here. There it is.

PC: *Well, that's all it was. I've always been careful to let everybody know what my goal was.*

LRH: All right. All right. Okay. All right, let me check it. On goals is there anything you have been careful of? All right. This is apparently flat. Okay?

PC: *Thank you.*

LRH: All right. Now, on goals have you ever told a half-truth? Yes.

PC: *Oh dear, this is sad. Um ...*

LRH: There it is. Right there.

PC: *Oh yes, this is something Mary Sue asked me one day. Yes, I checked out a Goals Assessment one day, and I did it at sensitivity 16, which I thought was right. Then I went down and Mary Sue said, "You checked this with a full-dial drop?" So I said, "Oh yes, "you see, and knowing I was lying, or half lying, lying as it was, but I – I did this at the time and I couldn't quite – couldn't quite make out why because it would be quite all right to tell Mary Sue I'd done it at 16. But I – the way she put it, it was the right thing to do, the full-dial drop, but this, at that time, was news to me, do you see? That had to be right, so to that degree there was a half-truth there.*

LRH: All right. Very good. On goals have you ever told a half-truth? I've got to ask that again. On goals have you ever turned a – told a half-truth? Something's going on here. On goals have you ever told a half-truth? Well frankly ...

PC: *Uh-huh?*

LRH: ... it's firing at half.

PC: *At half?*

LRH: And it's not firing at half-truth. So we're going to consider that null. Okay?

PC: *Okay.*

LRH: All right. Now, on goals have you ever told an untruth? There's no reaction there. Okay? Now, on goals have you ever influenced an E-Meter? Oh, there's something, something on that. On goals have you ever influenced an E-Meter? I'll ask it again, it's latent. On goals have you ever influenced an E-Meter? No, there's no reaction on that. Thank you. All right. On goals have you ever tried to damage someone? Something there.

PC: *Well, my goal is to damage someone.*

LRH: All right. All right. All right. Let me check that again. On goals have you ever tried to damage someone? All right. No read. All right. On goals have you ever failed to answer a question or command? It dances on that one.

PC: *Well, I thought of all the times when Mike was auditing me on the goal itself, and we sat out there for hours and he did a good job of it, but we didn't have the rudiments we have now, but I think some of those questions and commands must have gone unanswered.*

LRH: All right. Very good. On goals have you ever failed to answer a question or command? All right, there's a reaction there on command... There it is.

PC: *This was the session I've got that was given by Robin. I think it was that session that I sort of doped off for a while, and I'm not sure that I'd answered all the – I can't say that I answered the command then.*

LRH: Hm-hm. All right. On goals have you ever failed to answer a question or command? All right. That's clean. All right. Now, I'm going to do the middle ruds for this session.

PC: *All right.*

LRH: Okay. In this session is there anything you have suppressed? Invalidated? What have you invalidated in this session? There it is.

PC: *Well, myself again. I've done it again, I've thought about this – your difficulty in reading the needle. This isn't – is something I shouldn't have, and I'm not proud of it, and I'm invalidating myself on that.*

LRH: Okay. Very good. Let me check this on the meter now. In this session have you – is there anything you have invalidated? Yes.

PC: *Well, there is a tendency, I suppose, to try not to, as well – that was Mike when he was – Mike's auditing of me.*

LRH: All right.

PC: *And also Robin, Robin of course.*

LRH: All right.

PC: *Um-hm.*

LRH: All right. Okay. I'll check that on the meter. In this session is there anything you have invalidated? All right. Very equivocal. Let me ask it again. In this session is there anything you have invalidated? I don't get a read on that. All right. In this session is there anything you have failed to reveal? All right, that's clean.

In this session is there anything you have been careful of? All right, that is clean. Thank you.

Now, we're going to ask this goal. Now, the goal, if I remember rightly, was "To leave my wife," right?

PC: *That's right.*

LRH: Very good. Now, let's just check it just on the face of it. All right. To leave my wife. Okay. No reaction. To leave my wife. Okay. To leave my wife. Okay. To leave my wife. All right. There's the tiniest, im- almost imperceptible slow-down when we get into that, but otherwise no reaction. So let's do the middle ruds on this.

PC: *Hm, good.*

LRH: All right. On this goal, to leave my wife, is there anything you have suppressed? Yes. There. There. There.

PC: *Well, I've suppressed, um – suppressed carrying it out.*

LRH: All right. Okay. Good enough. On this goal, to leave my wife, is there anything you have suppressed? All right, that's clean. On this goal, to leave my wife, is there anything you have invalidated? All right. I'll ask that question again. On this goal, to leave my wife, is there anything you have invalidated? There's a slowdown there.

PC: *Um – I've invalidated its correctness on the grounds that it's possibly – um – too present time-ish to be of any real value on that ground. Although I've also realized it can be quite a long-term – long-track goal, but that's what I have tended to do.*

LRH: All right. Okay. Good. On this goal, to leave my wife, is there anything you have invalidated? All right, the read is quite latent. We'll ask it again, however. On this goal, to leave my wife, is there anything you have invalidated? No.

That's it. On this goal, to leave my wife, is there anything you have failed to reveal? There's a reaction.

PC: *Failed to reveal I've almost done it.*

LRH: All right. Very good. On this goal, to leave my wife, is there anything you have failed to reveal? All right; that is clean. On this goal, to leave my wife, is there anything you have been careful of? Equivocal read, can you think of anything offhand?

PC: *Well, I've been careful not to upset my wife anymore than I can possibly help.*

LRH: All right. Very good. Very good. On this goal, to leave my wife, is there anything you have been careful of? I got a reaction.

PC: *Children.*

LRH: All right. Very good. On this goal, to leave my wife, is there anything you have been careful of? That is clean. Thank you. All right. To leave my wife. All right.

I'm going to check a line. Who or what would oppose the goal to leave my wife? Who or what would oppose the goal to leave my wife? Who or what would not oppose the goal to leave my wife? Okay. Who or what would want the goal to leave my wife? I'll ask that again. Who or what would want the goal to leave my wife? Who or what would want the goal to leave my wife? Is there anything you failed to reveal about listing this goal?

PC: *Only that the – um – it was done from a short list. Found out it wasn't a short list really, I mean, I think it was*

two or three hundred goals. Um ...

LRH: There's something.

PC: *Well, there I was thinking of when Mary Sue was checking it out, that a – there was one or two embarrassing goals at the time. Since I've seen some others, it wasn't so, but I always remember this particular goal that Mary Sue read out and it rather shook me when Mary Sue read it to me, you see, with her perfect TR 0, or something.*

LRH: All right. Okay. Well, let me read that on the meter. All right. On listing this goal is there anything you have failed to reveal? All right, that's clean enough.

PC: *Um-hm.*

LRH: All right. Now, on writing the items down for this goal, is there anything you have failed to reveal? There's a little bit of a something here.

PC: *I wasn't quite sure, because I couldn't recall writing any items down ...*

LRH: All right.

PC: *...for this goal.*

LRH: All right. Thank you. Then I'll change the question.

PC: *Um-hm.*

LRH: On listing a line for this goal, is there anything you have failed to reveal? There's nothing there. All right. On the original terminals list for this goal, is there anything you have failed to reveal?

PC: *Well, that – well, that terminals ... Now, I can recall your – you listed these terminals for me in the – in your office downstairs.*

LRH: Um-mm.

PC: *That was a short list.*

LRH: Um-hm.

PC: *Um – but – um – don't think there was anything else I failed to reveal there.*

LRH: All right. Very good, very good. All right. On listing on this goal is there anything you have failed to reveal? Doesn't read. Okay. All right. Now, let's take up a little bit more about this. On listing for goals, have you suggested anything. Yes. What?

PC: *Suggested that people shouldn't do them out of session.*

LRH: All right.

PC: *Hm.*

LRH: Good. All right. On listing for goals have you suggested anything? That's clean. Thank you.

On listing is there anything you have suggested? A little halt.

PC: *Well, only a silly little thing comes up.*

LRH: What's that?

PC: *That people, when they list them, leave a margin for the checkout for the auditor to tick them off.*

LRH: Okay. All right. On listing have you suggested anything? All right, that's clean. All right.

On listing have you suppressed anything? All right, that's clean.

On listing have you invalidated anything? There's a reaction. Have you invalidated anything on listing?

PC: *I invalidated, I suppose to some extent, whether my lists – um – was long enough. That was – I did that today when I saw downstairs you'd put a notice on the board – well I did that today.*

LRH: All right. On listing have you invalidated anything? All right, that's clean.

On listing is there anything you have failed to reveal? All right. It's probably clean, but I'll check it again. On listing is there anything you have failed to reveal? All right, that's clean.

All right. On listing is there anything you have been careful of? Yes. What have you been careful of?

PC: *Careful to make my pen writing legible, which it always isn't.*

LRH: All right. Very good. All right. On listing is there anything you have been careful of? Still a reaction. Different reaction. There it is. There it is. Right there.

PC: *This is – um – outside of Scientology altogether, and it is listing items in a book which was a false postage book. Names of people, you see, and you make a long list out and all these people are supposed to have letters. This wasn't an overt against the firm or anything, it was an overt against the government, you see.*

LRH: All right.

PC: *It was a way of getting some expenses. But I remember laboriously doing this. Yes.*

LRH: Okay. All right. On listing, on listing is there anything you have failed to reveal? Yes. What?

PC: *Well, I – what I failed to reveal is right just now, that I felt quite a sense of relief when I told you that about that postage book.*

LRH: All right. Very good, very good. All right. Let me backtrack one.

PC: *All right.*

LRH: On listing is there anything you have invalidated? All right, that's good. On listing is there anything you have failed to reveal? All right, that's clean. All right. On listing is there anything you have been careful of? Now, there's a slowdown there again.

PC: *I was careful to do that list – so careful that I used different pens, and so the color – if anybody was checking this, you see, they wouldn't say this was all done on the same day with the ink. The ink was all different color. It was clever.*

LRH: All right. Very, very good. All right. On listing is there anything you have been careful of? That is clean. Thank you. I'm sorry to backtrack on this. All right, that's all right though. Very good. Now, on listing have you told any half-truths? All right, that's clean. On listing have you told any untruths? All right, that's clean. On listing have you deliberately tried to influence an E-Meter? I got a reaction of some sort, but just riding through that so I'll ask again. On listing have you deliberately tried to influence an E-Meter? No, all right, that's clean. On listing have you failed to answer a question or command? All right, that's clean. All right. Thank you. Now, on listing have you tried to damage someone? Yes. Who did you try to damage on listing? There it is. There it is.

PC: *Bobby comes to mind, but I can't get any time I did it.*

LRH: Who?

PC: *Bobby. McPherson.*

LRH: Oh, all right. Okay, well, let's check it. What are you puzzled about?

PC: *I can't say.*

LRH: All right. All right. On listing have you tried to damage someone? All right, that's clean.

PC: *All right.*

LRH: Just to clarify your own mind about it, what were you – what were you worrying about there?

PC: *Well, I couldn't get the time when I had tried to damage Bobby. She came to mind when you asked the question, which I told you basically and I couldn't – anyhow, I wanted to find out the time when I'd actually done this.*

LRH: Well, does this leave you hung up on it?

PC: *No, no, no, I'm quite happy.*

LRH: Are you sure?

PC: *Oh, no, I'm quite happy if the needle is clean on it. Relieved in fact that I haven't got to go around digging and delving.*

LRH: All right. Okay. Needle's clean.

PC: *Good.*

LRH: Just didn't want to leave you hung up.

PC: *That's okay.*

LRH: All right. On listing have you failed to answer a question or command? Question. You failed to answer a question on this?

PC: *I tried to answer that question just now.*

LRH: All right. Very good.

PC: *Thank you for listening.*

LRH: Okay. On listing have you failed to answer a question or command? That is clean. Very, very good. All right,

that being clean, we will now put in our middle ruds for the session. All right. In this session is there anything you have suppressed? In this session is there anything you have invalidated? Yes.

PC: *I just invalidated – I – while you were reading the suppressed I had the thought, well, I've got it so mocked up there's a filthy needle over there.*

LRH: There's not a filthy needle now.

PC: *No, I thought, well that's what it is. It will give the students a good chance to show how to read through one. So there was some – I was invalidating that thought.*

LRH: All right. Very good, very good. It isn't too bad. It cleans up as I go here.

PC: *Good.*

LRH: In this session is there anything you have invalidated? All right. Thank you. That's all right. In this session is there anything you have failed to reveal? Yes.

PC: *Failed to reveal the fact that just as I was coming up here, bashed into Jenny and she says, "Good luck." And I thought "Will you shut up," you know, and stir everything up.*

LRH: All right. Very good. All right. In this session is there anything you have failed to reveal? All right. There was a change of pace in the needle. Let me make sure that is clean. In this session is there anything you have failed to reveal? I got a change of pace of the needle. Is there any little other thing you failed to reveal in the session? There's something right there.

PC: *That my hands were sweating at one time.*

LRH: All right.

PC: *Or still are, for that matter.*

LRH: Okay. In this session is there anything you have failed to reveal? No read. In this session is there anything you have failed to reveal? That's all right, that's all right. That's fine. In this session is there anything you have been careful of? Yes. What have you been careful of?

PC: *Careful to do what you told me.*

LRH: All right. Okay. All right. Let me check that on the meter. In this session is there anything you have been careful of? That. More.

PC: *More? Um ...*

LRH: What else have you been careful of?

PC: *Oh yes, been careful to try and find um – the – an overt rather than the motivator, or anything like that.*

LRH: Oh, all right. All right. Thank you. In this session is there anything you have been careful of? All right, that's clean. Okay. All right, now here's this goal again.

PC: *All right.*

LRH: All right. To leave my wife. To leave my wife. To leave my wife. To leave my wife. All right. I'm going to try one more thing. Is there anyone to whom you have not revealed this goal?

PC: *My wife.*

LRH: All right. Thank you. Thank you. To leave my wife. To leave my wife. To leave my wife. I get a little slowdown. You might tell me if there's anyone else that you failed to reveal this goal to.

PC: *My brother, my children.*

LRH: All right. Okay.

PC: *Relatives.*

LRH: All right. Thank you. I'll check that on the meter. Is there anyone that you failed to reveal this goal to? Is there anyone you failed to reveal this goal to? I get action here. Who else?

PC: *Oh, my father.*

LRH: Good.

PC: *Guy named Jack Dickey.*

LRH: Good.

PC: *The – um – my employees.*

LRH: Good.

PC: *Business associates.*

LRH: Good.

PC: *Um – anybody outside Scientology circles. I'm not saying any Scientologists, but anybody outside I haven't revealed it to.*

LRH: All right. Very good. Okay. Now, is there anyone that you have failed to reveal this goal to? There's still a little slowdown there.

PC: *I thought of my children, particularly then.*

LRH: All right. Very good. Let's just hit this the easy way. What's the first time you failed to reveal this to anybody? Can you spot that? There it is.

PC: *Well, it'd be the uh ...*

LRH: There it is.

PC: *Just after Mary Sue found it. The next time I went home to see – the next time I went home I failed to reveal it to my wife then.*

LRH: All right. Very good. All right. On this goal is there anyone you

have failed to reveal it to? I've got no reaction on that now. Good. All right. To leave my wife. Slows – stops the needle. To leave my wife. Stops the needle. To leave my wife. All right. Let me try this goal, half of it. To leave. To leave. To leave. All right, that isn't reacting. It reacted just once. To leave my wife. To leave my wife. It reacted that time. To leave my wife. Reacts on to and leave and ... To leave my wife. To leave my wife. To leave my wife. It's not reacting, uh – occasionally, occasionally get a reaction on this thing. How much have you listed this now?

PC: *Well, this is several pages of the who would want to, and some on oppose.*

LRH: Any TA action?

PC: *Yes, quite a lot. Getting quite a lot of TA action on that.*

LRH: I'm going to say it a few more times here. To leave my wife. To leave my wife. To leave my wife. To leave my wife. It's not now reacting. Lot of TA action. What do you feel about listing it? How do you feel when you list?

PC: *Well, I've one stage I went through quite a dopiness, felt as if I had flu, and so on. Then I came through that.*

LRH: Yes.

PC: *And that was fine. It's when we started listing the other side that uh – the opp – the opposition to the goal.*

LRH: Um-mm.

PC: *And that felt all right. I've never had any – well some somatics did turn on – um – legs, and so on.*

LRH: You did – have not had any?

PC: *I did have some somatics, in the legs ...*

LRH: All right. Did they get worse or better?

PC: *Well, we went through them, and they went out.*

LRH: All right. Let me say this goal again. To leave my wife. All right. Who or what would not want to leave my wife? Who or what would want to leave my wife? You think that is amusing to read the goal that way, don't you?

PC: *Yes.*

LRH: That's the only charge I got on it, too. All right, all right. Who or what would want the goal "to leave my wife?" Thank you. Who or what would want – would not want the goal "to leave my wife?" All right, Who or what would oppose the goal "to leave my wife?" Thank you. Who or what would not oppose the goal "to leave my wife?" All right, I'll say it one more time. Who or what would not oppose the goal "to leave my wife?" Thank you. Interesting. I don't get any – any needle reaction on the lists lines ...

PC: *Mm.*

LRH: ... beyond your trying to suppress laughter. Now, we're going to look into this just a little bit more here just for a second, and then we're going to let you off the hook. Okay?

PC: *All right.*

LRH: Goal, goal, goal. All right, let me get in the middle rudiments. In this session is there anything you have suppressed? Invalidated? Failed to reveal? Something there? Anything you failed to reveal?

PC: *Failed to reveal that I felt you might have said a wife instead of my wife when you were reading the line.*

LRH: All right.

PC: *You might want to read a wife instead of my wife.*

LRH: Thank you. Thank you. In this session is there anything you have been careful of? Thank you, that doesn't read. All right.

Who or what would oppose the goal "to leave my wife?" Who or what would not oppose the goal "to leave my wife?" Who or what would want the goal "to leave my wife?" Who or what would not want the goal "to leave my wife?" Okay. Goal, goal, goals, goals, goals, goals, goals. Now what are you thinking of?

PC: *I was thinking of Dick sitting down here because he's checked this goal so many times. That's what I was thinking of then.*

LRH: All right. Is this an invalidation? Yeah?

PC: *What, for Dick?*

LRH: Yeah.

PC: *No, I didn't look on it as an invalidation. I thought he'd be rather interested to see this.*

LRH: All right. Goals, goals, goals. All right, thank you very much. As far as we're concerned that goal is deader than a flounder, and so are all of its lines. Okay?

PC: *All right.*

LRH: Right. All right. Here we are and we're going into the end ruds. Okay?

PC: *Fine.*

LRH: All right. In this session have you told me any half-truth? Untruth? Said something only to impress me? Or

tried to damage anyone? What's the damage?

PC: *Just thought of Dick. I didn't try to damage him, but might have done with what I said.*

LRH: All right. Thank you. In this session have you tried to damage anyone? Thank you. That is clear. In this session have you deliberately tried to influence the E-Meter? I got a slowdown there.

PC: *Oh, I just realized my hands are sort of tightened up and are hot on the cans.*

LRH: All right. In this session have you deliberately tried to influence the E-Meter? All right. Thank you, that is clean. In this session have you failed to answer any question or command? Thank you, that is clean.

In this session have you failed to reveal anything? I've got a reaction on that. Is that because I used a different rudiment?

PC: *No, well, I realized it was different, and I just thought that it didn't worry me. It seemed real.*

LRH: There's something right there. Bing-bing, bing-bing, bing-bing, bing-bing. What are you thinking about there?

PC: *Uh – well – um this should – you found this goal isn't in. It isn't the goal, and so you found it isn't the goal. Um – well, I feel it – I feel in one way it should have answered something, and in another way, well, it shouldn't. I mean nothing is – oh, I don't know, I was a bit confused about that. But that's ...*

LRH: Do you want me to say – to tell you more? I'll check this rudiment first.

PC: *Fair enough.*

LRH: All right. In this session is there anything you have failed to reveal? I got a rest ...

PC: *Yes it's a – I've failed to reveal the fact that I'm not surprised that it's no longer alive. And um – there's something that keeps hitting me here. Well, I'll leave it at that, that I – I'm not surprised. I found that I'm not surprised that it's not reacting anymore.*

LRH: Very good. I'll repeat the question. In this session is there anything you have failed to reveal? All right. There's the tiniest ghost of a slowdown. You might care – it's – most of it's gone, but there might be a little more ghost or something, little something.

PC: *I'm rather pleased it's gone. I feel I'll get my teeth into something else better.*

LRH: All right. That's okay. All right. Thank you. In this session is there anything you have failed to reveal? All right, that's flat. Okay. Now, are you willing to talk to me about your difficulties?

PC: *Sure.*

LRH: All right. I'm going to have to check that again. Are you willing to talk to me about your difficulties? All right. There's no reaction there. Thank you. Now look around here and tell me if you can have anything.

PC: *Yes.*

LRH: All right. Something kicking you. Notice anything wrong with the room?

PC: *I notice the plug out there, but it doesn't seem to be anything wrong.*

LRH: All right.

PC: *A camera missing up there.*

LRH: All right. Now, tell me if you can have anything.

PC: *Yes, the carpet.*

LRH: All right. Thank you. Look around here and tell me if you can have anything.

PC: *Yes.*

LRH: I've still got a little bang now, there's a little bang here. Tell me something.

PC: *The settee, the door knob, the window plate on the door.*

LRH: All right. Thank you, that's better. All right. Look around here and tell me if you can have anything.

PC: *Okay.*

LRH: All right, that's good enough. Squeeze the cans. All right. That's what I thought. What was I running on you the last time? Reach or Feel?

PC: *Feel was it.*

LRH: All right. Put the cans down. All right. Feel that table. All right. Feel the arm of the chair there. Thank you. Feel that side. Okay. Feel the cloth. Thank you. Feel your lapel. Thank you. Feel the top of your head. Thank you. Feel the cuffs of your coat. Thank you. All right. Pick up the cans. Squeeze the cans. That's much better, that's good enough. That was the last of it. All right. Have you made any part of your goals for this session?

PC: *Not certain if we sorted that goal out or not.*

LRH: All right.

PC: *I certainly feel quite a lot better than I did when I came in.*

LRH: Okay. Any other gains you'd care to mention?

PC: *Yes, the – uh, looking at the various aspects that come up, and although you apparently had some difficulty with them, there's nothing really serious it seemed to me. I'm rather pleased about that, and it's helped to know you're not – you haven't got a lot of overts that are still buried, and so on.*

LRH: Oh, all right.

PC: *That's quite a gain.*

LRH: All right. Good enough. Is there anything you'd care to say or ask before I end this session?

PC: *Well, you were going to tell me something, but...*

LRH: All right I will, I'll tell you something.

PC: *Uh-huh.*

LRH: If that was your goal ...

PC: *Yes.*

LRH: ... it's perfectly safe to do something else. It won't get in your road.

PC: *Thank you. Yes.*

LRH: You understand?

PC: *Yes.*

LRH: All right. You've either listed it to a null or something. I don't want to say that that would be good policy, but where a goal is equivocal ...

PC: *Um-mm.*

LRH: ... or what might or might not be, and where you did develop somatics and some flu on it, and so forth, the discussion of this goal has not shifted the tone arm.

PC: *I see. Yes.*

LRH: Clearing it up has not shifted the tone arm.

PC: *Yes.*

LRH: The lines that I've read that should be listed ...

PC: *Um-mm.*

LRH: ... have not shifted the needle.

PC: *I see, yes.*

LRH: So obviously there is no disturbance because of it, and there's no invalidations or suppressions on it. So what would you think?

PC: *It's dead.*

LRH: Uh...

PC: *Obviously cleaned up I would say.*

LRH: Well, there's obviously, there's obviously. And I always looked at this goal – that's so I won't have a withhold from you ...

PC: *Mm.*

LRH: ... as something that was awful close to PT.

PC: *Yes.*

LRH: It always made me nervous.

PC: *Mm.*

LRH: So I'm perfectly willing for you to find another goal. And what do you know? This goal goes on the list, and you find it again, why fine.

PC: *All right.*

LRH: Okay?

PC: *Yes.*

LRH: That answer the question?

PC: *Thank you very much.*

LRH: Give you all the data?

PC: *Yes.*

LRH: All right. That wasn't an evaluation, was it?

PC: *Not at all.*

LRH: All right. You didn't think of that as an evaluation, did you?

PC: *No.*

LRH: No, that's fine. All right. All right. Is it all right with you if I end this session?

PC: *Yes.*

LRH: All right. Here it is. End of session.

PC: *Thank you.*

LRH: All right. Session ended for you?

PC: *Yes, thank you.*

LRH: All right. Tell me I am no longer auditing you.

PC: *You are no longer auditing me.*

LRH: Good enough.

FUTURE TECHNOLOGY

A lecture given on 14 June 1962

Well, you will have to tell me the date.

Audience: 14th June.

Fourteenth! What planet? I've got so many calls to make these days, you know!
[laughs] 14 June, AD 12, Saint Hill Special Briefing Course.

You know, there was a great many students came in the first part of the year and that has sort of peaked the attendance here for awhile. When they arrived, they didn't know whether they'd be classified or not and when they leave, they sometimes are and they sometimes aren't. I'm going to talk to you about training a little bit more in this lecture.

Now, you think you are traveling fast now. *Heh-heh-heh!* You will think you were traveling so slow that your footprints are in front of you! Because this is the kind of a schedule that has to be met. can I give you a short rundown on same, what this is all about?

Training, as you noticed, changed recently into three sections. Now, the three sections of training were Theory, Practical and the Auditing Section.

Definition of the three sections are simply, in Theory, they have to be able to duplicate the information in bulletins and tapes, texts.

In Practical – have to do, the doingness angle of the thing.

Now, Practical actually used to be the Auditing Section. You know, used to fog around in it and that sort of thing. But the Practical now is the supervision of doingness, just as doingness.

The Auditing Section is the *fait accompli*. When you get into the Auditing Section you're not supposed to be practicing, you're supposed to be auditing. Because frankly, the only thing that is looked at in the Auditing Section will be the results that you obtain. In Practical it's how you do it and in the Auditing Section, the results.

But of course, results are now dependent on the textbook solution, which is rather unique. It's unique in any science, for any result to be obtained by the textbook solution. They teach nuclear physics today and they still tickle the tiger's tail, see. They give you formulas – endless formulas – you know. And you're supposed to be able to figure it all out – and, they do – they figure it all out, but it doesn't have anything to do with nuclear physics. They still get in there and shove bars of plutonium in and out of this and that, see. It's quite remarkable. They even run their submarines this way. The chief engineer of an atomic submarine has to know all of the Theory in the world, see. He has to be in mathematics galore, and so on. When he wants the submarine to go faster, he goes down and shoves on a rod and adjusts it to

a point where the water boils quicker. Crazy, you see. There's no textbook solution there at all.

In medicine the textbook solution is more often violated than otherwise and if you use psychiatric textbook solutions everybody'd be dead. As far as psychology is concerned, it hasn't ever pretended to have a solution for human beings – it only has solutions for animals. Oh, I didn't – I didn't mean that as a dirty crack, because, frankly, we are burying them and their future. I invite you in the next decade to the funeral of both of those activities. Of psychiatry and psychology. It'll be a very sad funeral.

But, they haven't got any textbook solutions. And right now we've moved up into the level of textbook solution.

All right, last night you saw a couple of auditing demonstrations. These were simply goal checkouts. I wanted you to see how you checked out a goal. That was the only reason I gave them. I didn't even particularly pick up goals that I wanted to check out or didn't want to check out. I thought I might learn something about it myself. How about a partly worded goal? How did it check out?

The first case that you saw had four hundred listed on each list of that particular goal. Now, if I'd tested it, you probably would have found the transfer of the goal reaction to one of the levels. Had I read the four lists off on the thing – you probably would have seen one of those lists ticking. If one of those list lines had been ticking, then of course it tended to prove out the goal. Time was going on, I didn't want to upset anything and I particularly didn't have any pat solution to it. Didn't want to say anything much more about it, because I wanted you to concentrate on just this other idea of how did you prepcheck a pc so as to prove up a goal.

Now, there was a tick on the second pc's line reads. I don't know if you saw it or not. One of the lines ticked. Well there's a high probability – is, that that goal could now be continued to be listed with profit. See, you could continue to list the goal with profit. Before I did anything more about this goal, I would read the lines off to it again and I would ascertain what was cooking here and test whether or not we could go onto a new goal, because I've already said I could always consider this goal a bit of a late one, that might list longly. And so you might profitably transfer over to another goal. But that would only be if one of those lines wasn't ticking too hard, you see.

In other words, the read that you get on a goal – I'm indebted for this term, to Charles, here. He said it very well. He said the read "transfers." That's exactly correct. That well describes it. The read transfers from the goal to one of the lines that you're listing. You see, "Who or what would not oppose going to war?" you see – *clank!* All right, well the goal, "to go to war" wouldn't read, but the line would read, if it's partially listed. Do you see that? There's more to be learned about this, there's more to be observed about this. But, there were some partially listed goals and I was simply checking them out. Giving you a Prepcheck example.

Now, if you notice, on the second pc we had a lousy dirty needle. Now, you probably wondered why I didn't finish up my fish and fumble. I'd better tell you something about that, because, there were two things that happened in that session that you might have missed. One of them is I didn't finish the fish and fumble. Every time the pc said "goal" I got a dirty nee-

dle. So I found out I was fishing and fumbling for the goal. So I got out of there. I backed the fire engine right back into the stall. And we parked it right there and went on about our business. And I thought you might possibly have missed that.

It'd been on, already. And when I started to run it down to find out if we had a missed withhold or something of the sort, why, the pc discussing it, every time he came near the subject of goal, we had a missed withhold. We were prepchecking – we were prepchecking the goal, so it was no time to fish and fumble for it because we were about to run into the line very shortly as, "On goals, is there anything you failed to reveal?" you see. And sure enough, we had it. And I finally had to ask him a slightly altered question, "Who didn't find out about the goal?" You see?

Now, the auditor had already picked up one person that had not found out about this goal – and maybe some mention of the other people – I don't know if there was mention of the other people, too. But we got a bit of a change the second that we ran through that. But on the subject of listing we got a considerable reaction. Remember?

Now, on neither of these sessions would you have seen any reason to have called this a Prepcheck. There was no Who – there was no When, All, Appear or Who. So where was the Prepcheck? Well, I didn't run into anything that needed to be prepchecked. You see? Everything cleared up on a couple of questions, see? So we're talking about a terribly short track, see. We're talking about the short track of auditing or at best this life's listing. So if we're talking about such a short track and you can just knock it out, why cheers! See? We'll do so. And the reason we call it Prepchecking is because we're always prepared to prepcheck – form up the What question, go on sailing back on the line and do a stylized job on it. But on neither case did I run into any necessity to do so. See?

These middle rudiments prepchecked out gave us an interesting reaction on the part of the first pc. The first pc was very defensive. Been talking to the pc earlier – was actually very dismayed. We invited her – we invited her, by the way, to stay over, to see the demonstration tonight. And then as a complete beast, you see, why, I suddenly realized I'd like a look at that goal and I'd like a look at the pc and see how the pc was operating. Because the pc was a bit defensive about things, you see. So I put the pc in-session. It really took her by a storm. And, when she started into that session she was really boggled. The rudiments were all out and crisscrossed, you know. But, that was all right. Got a telex from her this morning. She felt wonderful, surprised her half to death, you see. She felt wonderful and she was sawing into all the goals in the shop and had gotten another Saint Hill graduate all straightened out on his goal. So she'd instantly put it all to use at a high degree of velocity.

But before she was getting that Prepcheck, she was pretty queasy about the whole thing. And she went away feeling fine.

All right. What you saw in the Prepcheck was all textbook solution. Did you notice that? There's no variation from the textbook. There was one blunder, I don't know if you noticed it. It was the second session, it was getting late and I had not been crossing my list off and I didn't know what I'd gotten the reaction on. I have a guilty conscious every time I make a pc expose something discreditable on a TV demonstration. I don't particularly like to do that to somebody, you know? *Bang!* You know? Catch them and drive them into a corner, and so

on. He came up with a discreditable one on "careful of," you know? And he exploded with it and I looked down at my check sheet to ask the second question and I had neglected to mark it up to that point. So I had to take the safe route out. I checked the ones I knew bridged into the ones that I had gotten a reaction. See, that was pure and simple a blunder. See, I didn't remember that it was "careful of" at the moment I asked it, see.

He suddenly came up with this revelation – *bang*, you see. Well, was it on "Invalidate?" "Fail to reveal?" or "Careful of?" Which? And there I sat, see. I don't know if you might not have noticed that.

But notice that – you might not have noticed it because it was a fairly smooth recovery. I just went simply back over to the last one I knew I had covered, took the next one, checked it – checked it and finally of course had it and it was "Careful of." Meantime the pc was sitting there almost exploding with the final – with the next answer. But you notice, it didn't disturb the pc.

Now, those demonstrations you're seeing are textbook solutions. That is to say that's textbook auditing. There isn't any departure from that. The only envisaged – and I should mention this to particularly those leaving – the only envisaged change in Model Session, is to pull, "In this session ... " to the head of all end rudiments. You precede them with "In this session." You've already had the change of the withhold question in beginning rudiments and end rudiments.

But there is an additional change in Model Session and I can't tell you its absolute final form, but it runs something like this – because it's ragged. There's a raggedness to saying to somebody, "Do you have a present time problem?" He says, "Yes." Well, where are you at? See? It's an understood question. So, you could consider your rudiments question, this is the – this is the solution that I am researching right now. Consider your rudiments question this way: That the needle acknowledges for the pc so therefore you acknowledge for the pc. You an– pardon me – you answer for the pc.

Now, you see that that's going on all the time, with this anti-Q and A anyhow. You answer for the pc. You say, "Do you have a present time problem?" *Clank!*

Well, you notice that you never wait to have the pc says he does or doesn't. You notice that you say he does or doesn't, see? You say, "All right, yes, what's that? That read." You see?

After a fellow's been audited for a very short period of time he begins to expect this to happen, you see – and it is not disturbing at all. So that you've got a second question, on all rudiments questions, which is simply, "What is it?"

It's just your – your second question. That's to keep the thing from hanging in the air. And that's what I'm testing out at this particular time. So you say, "Do you have a present time problem? That read. What is it?"

And the pc says, belatedly, "Oh, well, *uh – oohh – hmmm ...* "

And you say, "Well, I'll repeat the question. What is it?"

Now, you might run into a snag that way, but that is – that is, after a considerable amount of study, the only way I can see out of this particular dilemma that is smooth. It's just recover with a "What is it?" Don't use it every time, perhaps. But certainly, if your pc does not come up with the information instantly, after you've answered for the pc. See, you've already said yes – you say, "It read." And the pc – so on. You just say, "What is it?" Don't leave the pc sitting there in a long comm lag. Got the idea? Now, there will be some more data on that, but that's the only envisaged change.

Now training has worked out this way: The auditor who comes here usually has had lots of loses. He's had loses. Let's admit it, see. First place he's been auditing up against a not totally refined technology and he's been doing this and that and he's also been doing things that were way off-line and he's lost. He's had some loses. Furthermore, he didn't have the technology which cleared everybody who walked up the walk, you see. So naturally he had some loses.

All right, then the faster we get a student into the Auditing Section to get some wins, the better off we are. Simple. We already have the solution that gives him wins. Get the rudiments in and do Havingness in the body of a session. Now, that will give him some wins – if they could read a meter, if they get the rudiments in, if they run the Havingness Process for the pc.

So this calculation has moved up to this degree: If a student has not finished his Theory, Practical and has not audited his rudiments and Havingness and all of his Prepcheck and finished up all that auditing and all of the Theory and Practical for that auditing – that's three classes, see – by the end of his sixth week, his chance of leaving here Clear is greatly diminished.

Now, I was just working this out. Based on a sixteen-week course, if he has not finished up all of that work in that auditing – finished by the end of the sixth week – why his chances of leaving here – so Clear that you rap him on the rim and he rings for hours – these are badly diminished, you see – the chances of doing that. You follow this reasoning?

Well, actually, it means for faster wins, if you look at it this way, because he's up against something that should win and if he doesn't get a win he'll be checked up on it in a hurry. So we look at the body of the course up to that point, as a *fait accompli*, and then we go on at the beginning of the seventh week to find a goal, and so forth. We might take that seventh week, on a dual capacity. We let him start finding the goal – because already he can prepcheck, see – during that week while he studies the Theory and practice of what he is doing in a Goals Assessment, like mad.

Now, we go on out to the far end of the course – the remaining many weeks of the course, up to sixteen weeks – and we polish up this auditor. In other words, we polish him up. Now, that doesn't mean that you who have not finished this by the end of the sixth week necessarily are out in the rain. But I would say, unless streams of sweat like Niagara Falls started falling from your brow, and if you have gone as much as three months now and are not yet on a Goals Assessment on anybody or on yourself and so on, your chances of leaving here Clear are quite poor. If you're only up to two months, well we might make it rather easily, still, you understand. If you're here three weeks and are still stumbling around with Model Session you

ought to have your head examined. See, you should have finished that at the end of the first week. See what I mean?

Grooming up the auditor would most easily take place, of course – making the auditor an absolute finished product – would more easily take place after he'd had wins. You see? So anyway, we had a bit of a conference this afternoon and that's what we were talking about and we're going to run it from that particular quarter.

Now, this has some influence on training outside. The Saint Hill graduate, going out of here, at this stage of the game, is – right at this moment – is the only one that knows anything about this three – three-section training system.

And I have gotten back some questionnaires, answers from Ds of T, that show they're terribly adrift. One of them wanted to know ... Many of them were very good, but some of them, *hm-mm*. One of them wanted to know what you did with the incoming students after all the old students had gotten up into higher classes, if you were using the class system. That's still got me boggled. I don't what he doesn't know, you see. That's rather marvelous – you get to asking that as a question. I don't know what he's talking about!

And, a few questions of this character demonstrate that the workability and how the system goes together, and so forth, is very much, a question in the minds of people out in Academies and that sort of thing so any assistance that any of you can give an Academy in straightening this out would be appreciated. Any way you can give them a reality on it, would be appreciated. But all training is going onto this pattern. I think you'll agree with me that it's a rather successful pattern of training.

Audience: Mm-mm, yes.

We should actually only be teaching here Class III. That's what we all actually ought to be teaching. Training is slowed down by the fact that we have to groom up the earlier classes. That's what holds one back. But naturally if we didn't have the technology, how could anybody learn it? If we didn't have it grooved and so on.

But, I've been working like mad along this particular line and I've finally got it grooved out and, your mistakes have served. Don't think that your mistakes have gone unacknowledged. The – most of what we call a textbook solution today is in there to get around the mistakes you have made or to steer you through those chasms and back alleys that you might otherwise have gone into and so forth.

For instance we used to have as a maxim, "The auditor must get an answer to every command he gives." Remember that? Yeah, but how few auditors knew this! We'd get a new auditor coming up the line and all of a sudden he'd be saying, "Do cats spit?" you know, "Do cats spit? Do cats spit?" And the pc about every third time he asked it, you know, would say, "I think so." And he thought this was all right, see?

And of course you had your end rudiments set up and the pc is way out of session and you'd be surprised how often this is the case. So much so that you know, you could take – you could take an old-time auditor and ask him in the first session in which he had failed to answer an auditing command and you'd find out you'd get a little bit of a case surge. Quite interesting. Just ask him, "What was the first time you failed to answer an auditing question or

command?" you know. And it'll rip up the line like a – like a mad buzz-saw. I remember Herbie one time when he first heard it, he just suddenly – on an ACC – and he just suddenly had remembered the first time, you know? Made an awful difference to him. He walked out of there – he was glowing.

But, so what do you have now? You have an end rudiment, something that constantly reminds the auditor of this. Constant. It's always in front of his eyes. Every time he goes down the Model Session line, he hits all the basic errors that have been constant and continuous in auditing. Of course, it so happens that these things are the *sins* of auditing and when – they're only the sins of auditing when they're out of order, auditing doesn't take place, so of course they do belong in as rudiments. But you see how the thing is packaged up? Instead of an isolated unimportant maxim that nobody has ever read, the thing sits there and is done every session.

Well, it works this way: The auditor going by this particular point is reminded every session, because he occasionally finds the thing out, you see. And he's reminded every session, you see, that he should get his auditing commands answered. You get the idea? And he's reminded about these other little points. He's reminded about the pc's overts during the session under the heading of "damage" you see? All kinds of points are interwoven into this thing. Actually it'd make an interesting crossword crazy quilt, if you figured out all the things that have finally been lined up into the textbook solution.

Actually, they're minimal. They're the minimal number. You could get far, far more expansive about this thing. But I'm certain now, that you'd be running off into relatively unimportant data. Yet – oh, you could – you could trim it up, see. You could put more in it, but you'd be running off into unimportances. You'd be running off into things that processes or listing or something like that would normally care for. We've got the minimal number – well, we've got the minimum and maximum. Beyond what we have as the textbook solution, you can be pretty confident that it can be safely ignored. See, if it isn't in the textbook solution, it can be ignored – not with – not – without vast consequences, don't you see? But those points which are the textbook solution if ignored will scuttle the lot. The ship will go down in a trail of bubbles.

Now, there's only one thing that I myself have felt questioning about, in all this. I've seen a pc get – and myself in one session got – sufficiently ARC broke that nothing in the rudiments or anything in any part of it would do anything about. That was very interesting. There was nothing would have done anything about any part of it. Why? Well, I finally worked it out and you'll be interested in this little piece of technology here, which was based on a subjective reality. Why did nothing in the whole ruddy lot affect this particular ARC break line. And you'll find out, then, that an ARC break can exist outside of this particular area. The healing of same is a bit too heroic to attempt. In other words it's too big to straighten out in a rudiments proposition.

And that is this: When a pc takes responsibility for withholding – it took me many weeks to finally curve down to what the answer of that was. And don't think about it too long, you'll get a headache! If a pc has taken responsibility – we're still on the subject of Model Session, see. If pc has taken responsibility for withholding from this auditor or from there on

out, he has dove-tailed straight into the mechanics of Routine 3GA. There is the bridge. There is the button that makes 3GA what it is. Because 3GA of course is based on the mechanics of taking full responsibility in a limited way, for one purpose.

The individual dedicates himself to never eating cats, you see, or some such goal, you see. He dedicates himself, basically, newly, primordially and before anything occurs, you know, prime postulate. He takes full responsibility for this prime postulate and here he goes.

Now, because he's taken full responsibility for the prime postulate, he of course, has set up a thing where all other things are otherness. See, so everything else is an otherness. So this is a marvelous pat, single look and a departure from all pan-determinism. And he's had it. Oh, he's had it for more reasons than that. Any other action than never eating cats... See, funny part of it is, it just doesn't even have to do with cats, you know. It doesn't even have to do with eating. Just an other action. You know, like gazing at cherry trees – is an alter-ness of the basic purpose. So, he mustn't do anything but it, because he's taken full responsibility for it. This is what he stands for – to never eat cats. Therefore doing anything else under the sun, moon and stars is a breakdown of his own determinism – which of course is very isolated determinism. And this is the way he backs out of the universe, see. And thereby runs square into it with a thud.

You see how single-minded all this gets? So therefore other occurrences are not as-ised, they are alter-ised, mass gathers around these things and that sort of thing.

Now, if a pc were to – you understand that it's a withhold in a – it's a withhold *missed* that louses up a session. Have you got a reality on that these days? Yeah, well! All right.

It's the withhold missed that louses up the session, see. Now, what if a pc took responsibility for never getting any off? If you could push a pc into a point where he would make a postulate that he would never get off his withholds, you'll get an ARC break that no rudiments could undo. And I don't even know if a process would undo it, because, of course, it ties right straight into the GPM – just like that. Nothing would go straighter to the heart of anything. It'd just key in all those basic purposes, you see? Not that they're responsibility for withholding. But they are certainly responsibility for an action of one kind or another. So when he takes responsibility for the highest button in the bank – withholding – why of course, wow! Do you see why?

Now, if you were to try to run a pc on this, "What withholdingness have you taken responsibility for?" I guarantee that you would get more somatics per square unit of pc than he ever thought existed. Because you're trying to run the GPM out from the topside down.

Now, I'm still talking about Model Session, so the final question of Model Session is under – on withholds, is under test at this time. I'm trying to find out, before we finalize any versions, whether or not you could ask anything that would undo the possibility that the pc had postulated that he wasn't going to tell you anything or talk to you in that session. It would be "Have you taken responsibility for any withholds?" Well, that doesn't do it of course. "Have you taken responsibility for not talking to me?" That might. And so forth.

Well, I've got to thrash through the woods and the saurian forests and the deep bituminous zinc pits and get this one properly nailed down and so forth. That's why you don't have a final version of Model Session, complete.

But I have found a button which is in excess of all other buttons. There couldn't be any button senior to it. 3GA is clearing people, you see. We're sitting there. The only indicated theory that explains this phenomena, locks up with this particular question. We already got a reality on what happens when these things do get collided one with another and it is quite cataclysmic. It is undone with the greatest of ease by 3GA. Maybe the rudiment process in the end rudiments for the final responsibility for the withhold question, whatever that works out, of course is: Do 3GA, you know?

I've got to work on this a little bit farther and find out if there is anything there that can be done which would wipe out any possibility of the pc doing such an idiotic thing as to deciding never to talk to the auditor again or something like that during the session. Because that would be the only thing that could keep him in a permanent ARC break. And I swear to you there'd be no process under the sun, moon or stars could budge it. Because it locks right straight down against the GPM. It's absolutely bang, bang! It is.

The reason why you get occluded childhood, probably, is the number of times you decided you weren't going to communicate. And took full responsibility for not doing so. "I'm never going to talk to you again! I hate you! You're a beast!" Yeah. That kind of thing. That locks right straight in on the GPM, bang.

All right, enough for that. I'm just forecasting technology there. There's nothing extraordinary about that; it's just another mechanism of the alter-is of the bank – responsibility for. All this alter-is exists on the total responsibility the pc has taken for a basic postulate. And if he's entered such a basic postulate into the session, as would actually make a goal, you could hang the session up, see, on top of the GPM. So that this particular session is now part of the GPM. He's run a GPM session.

Now, the possibilities of this happening if you use the textbook solution are quite, quite remote. But, it could happen.

All right, let's look a little further now. Existing technology, changes in: *Nyet*. I've just been waiting around and shifting around and working like a beaver trying to get a clearing process that applied to all cases. Everybody run with any degree of expertness, high technical accuracy, yes.

But, anyone who has been run with expertness on 3GA and some that have been run remotely from here with no more than bulletin data, have gone Clear. 3GA is not laying any eggs that are not very easily explained or straightened out by just straightening out the technology.

So you heard so often that we're there and all of that sort of thing. But I think you have also heard that, yeah, we're clearing people, but the percentage is damn lousy. I think you've heard that. Well, the reason why I wasn't concentrating in this particular line, during the past year, concentrating on old clearing techniques – one of the reasons you were getting chained

all the time – is I was trying to move over into the category of all cases Clear, see. Clearing is no good to you or anybody else unless it – you can make a full sweep, you see.

It can't be that Joan and Bill and Isabel can be cleared, but, Mr. Snodgrass and so forth, he'll never make it. You just get consistent randomness of various characters.

Well, 3GA apparently – and this is without any real reservation – I – everywhere it is – I just put "apparently" in because it's fashionable – 3GA has been taking every case apart that it was intelligently addressed to. Where the textbook solution of technology was applied to the case and the technique was 3GA, we got coming out the other end of the line some results. Now, of course, we had to know a little bit more about this and about that. But one learns that from what can an auditor do wrong. And what are they doing wrong at this particular time with this particular technology. And you keep that corrected up rather than shifting the basic technology.

Now, I gave you a talk just last Tuesday on how you do a Goals Assessment and so on. Now, that talk pointed up and summarized it. That's the first actual release of 3GA, the first bulletin on 3GA is sitting on my desk half-written at this moment – as formal release, see. The only things I was curious about and more or less were those things which were standing in people's road. I mean I was still working on these points, trying to ask these questions and get intelligent answers.

How many should a goals list consist of, you know? Do – can you completely discharge a goals list? Is there such a thing as a complete goals list? Yes, there is and about how long would it be? Well, I can't tell you how long it would be, but I can tell you how short it must not be. It must not be shorter than 850, see. Might be *longer* than that. And probably the proper question on it is – you said today – is, "Is this goals list complete?" not "Are there any more goals?" And this sort of thing, however, is ... It's obvious that if you haven't got a goal that you can get a goal. We've never failed to find a goal on somebody. But what's the easy way of finding the goal? That's been the main question.

Soon as this got broadly workable, I could understand more about the GPM and see a new method of tearing the GPM to pieces. And then I found out where the GPM went, so that's that. The GPM will go *poof!* And that's that. There is no GPM after you finish off this type of activity.

Now, how many – how many goals do you have to list out? Well, I haven't demanded anything more than 3G – of 3GA at this particular stage of the game, than that it did bring the pc, by listing, down to a free needle. Because I know by experience that if you can bring a pc down to a free needle, you could find another goal and bring him down to a free needle. We've done this lots of times, see.

And you can keep doing this and I also know now if the GPM entirely disappeared, how to get it back again. I can always get a GPM back. I know about – oh, I know lots of ways. I know lots of ways. Let a psychologist question the fellow, I mean. So his needle is clear. So his needle is gorgeously clear and so on. It's free and floating and he's only had one goal listed. How are you going to find some more GPMs to list, see? *Uhh!* Well, it's gone, you know? You can't get any tick on a goals list or something like that. Aw, I could fix that pretty easy, long as there's any GPM there, why – and so on.

I'll give you a method of doing so. This shows you how corny this could be and so forth. "Did you ever want to do anything you couldn't? Thank you, that's it." All right, just write that down as a goal and insist on auditing it for a few seconds and the GPM will be in. [laughs] And then prepcheck it and run out the suddenness of it. But you'll have a GPM to audit.

Obviously, if the fellow can still give you a spot purpose that he couldn't do, you still have a piece of lock on the GPM, you see. So you could just pull that in so that you could do enough with it so the fellow would take off and you get a registry on the meter again. That's horseplay – what I'm talking to you about – because I don't think you'll run into this particular problem. But even if you did run into it, you could solve it.

Now, on the problems of listing, these are very simple problems. The only real dangers and the only thing that a graduate of Saint Hill should be very careful about, is just kick the living teeth in of any untrained, unschooled auditor who is trying to use 3GA. Just bat their brains in mercilessly. Just tear off their thetan and send it in for a box of shredded wheat, see. Because let me tell you, that could get a pc into more trouble than you can easily dig him out of.

Now, 3GA solves 3GA. That's how you know you're there, see. You run a 3GA wrong, why, you do more 3GA to run it right. Now, it's a peculiarity of problems in this universe and the mind and a lot of other things, that a prime solution runs out errors to itself. See, that is the test of a prime solution. You make an error with this solution and then it corrects the error. So therefore it isn't a cure. That tells you it is not a cure. So 3GA is the first thing we have that isn't a cure. 3GA is not a cure. A cure does something about a prior problem. 3GA doesn't do anything about a prior problem. 3GA operates on the prime – the prime postulate. There can't be anything ahead of a prime postulate. It wouldn't even register as a goal if it weren't a prime postulate in some section of track. So it isn't solving anything. Oddly enough it solves nothing. But it puts the person into a situation where he doesn't have to be solved.

This is very tricky. But you'd find out if you were discussing this with a Catholic priest or a mathematician or something of that nature, but they would tell you that the Prime Mover Unmoved is the only thing that can resolve the Prime Mover Unmoved. That's right, you see, it's perfectly true. It's a mathematical fact, you see. The only thing that divides seven is seven, you know, that kind of thing. And you've got one of those things in 3GA.

But somebody using – it isn't so dangerous that you as an auditor cannot undo the damage done, providing the person's still alive, see. You could undo it. But you can really wind somebody up in a ball, you know? Some other – some corny auditing and auditing over the top of missed withholds and messing it up and finding the wrong goal – as they inevitably would – listing the thing.

The reason I say this is because I've never seen right goals found broadly. The number of wrong goals I've seen found in the field is terrific. That's too many. I know some of you blame yourselves occasionally for having found wrong goals or maybe something of this sort.

Well, you'll find wrong goals until you go at it in a – in a perfect textbook method and with a total Prepcheck and there's too many things can make a goal apparently stay in, don't

you see? And you get a supercharged list that you haven't exhausted any of the charge out of it is, you've got a goals list of fifteen. Well, the charge is liable to go around and round on this fifteen, you see – and things are liable to shift one way or the other. You can get a goal that reacted all right, but it's much more likely just reacting because the whole subject of goals is charged than because it's the goal.

Now, you list that thing and it's going to beef up the bank. It'll beef up the bank worse than any creative process we have ever had. It is pure agony. You run – of course you start running an alter-is, you see, and what are you going to get? You're going to get alter-is. Well, mass is alter-is. So, of course, the longer you run it, the more mass in the mind you're going to get. So, some character is going to be very insouciant and he's going to – he's going to know how to audit there. He got an E-Meter – he had it built – he got a couple of pipe wrenches and hooked them up somehow. And – he's really going to go to town. And he can – he can find somebody's goal all right because he knows what the pc's goal is already. As a matter of fact, he tells him, in fact. And what do you know! You know that goal will react after that? Marvelous. But it'll go right on reacting.

And you, if you didn't know Prepchecking could actually touch that goal and you'd find out it was in. "To be an old witch," you see, or something like this. It doesn't even have to be an insulting goal. "Oh, well, I see here you've got 'old' appearing on your goals list a lot of times, and so forth. And you often talk about witches, so therefore I can see here plainly that your goal is to be an old witch. All right, to be an old witch." Tick. "To be an old witch." Tick. "To be an old witch." Tick, you see?

A fellow who didn't know his business could actually come along afterwards and say, "What's – " to the pc, "What's your goal?" and he said, "To be an old witch." And it would go tick-tick-tick-tick. Marvelous! Look just like a goal. You prepcheck the thing, it goes *ppfff*. See? Because it's been suggested to the pc and the misowningness of it has made it seize up into the GPM, you see? Wrong ownership causes it to read. You can always make a goal read.

Now, if you take that goal and you list it, the mass in the bank is going to increase and increase and increase and the pc's going to feel worse and worse and worse and be more and more unhappy and unhappy and unhappy. That's why you must only handle a valid goal and why you mustn't let people who are not qualified monkey with this stuff.

Now, furthermore, a person who is briefly trained and so forth, may be able to put forth a fair technical show and so forth. Well, let's say he's had a PE Course and been on a co-audit, you know and – something like that – and he's going to find himself a goal. Well man, he can do it. You see, he can find himself a goal. He can find himself almost any kind of a goal he wants. And he can list it. The next thing you know the pc's eyes are sticking out about an inch and a half from underneath his lids, or sunk back an inch and a half into the skull or something like this, see. He's getting nauseated and he's dizzy and so forth. And then somebody – this fellow reads in a book and well, "The process that turned it on will turn it off." So he goes on listing it. [laughter, laughs]

So, you're dealing – you're dealing in a sphere where you have exceeded old Class I processes, of which this is totally true. You could louse somebody up with this done wrong.

You can find the goal, prove it out, he'd list it, you see, and the pc caves in. Well, why is that? Must be Scientology doesn't work.

So anyhow, there is your – there is your limit of use. The people who are not adequately trained to do this sort of thing shouldn't be using it, that's all. Some Academy might try to teach this to new HPAs or something like that, you see. Nah. No. They haven't been in the saddle long enough. That's about what it amounts to, they don't appreciate anything that goes on, they wouldn't be enough on the ball. They couldn't catch it that quick. They'd still be fumbling with the sensitivity knob which they never got checked out, you know?

So anyway, actually, we are at a position now where all we've got to do is kick up the general grade of auditing. And you speak of training – should a Saint Hill graduate train? Yes, by all means. Don't however run a four, five, six, eight-week course someplace and call it a Class II Course and have some people on it and that sort of thing. Don't do that kind of training.

Rather, get some people – I don't care if they pay you or don't pay you. Say, "Yeah, I'll bring you up to scruff. Yeah, I'll make something out of you." And run them through check-sheets and classes or anything you care to over a period of time, until they can audit, don't you see? I'm talking about oldtime auditors, bringing them up the stuff and so on. That's what I mean when I say a Saint Hill graduate should train.

As far as somebody going on a full-time course is concerned it takes today a considerable staff and a lot of administrative organization to handle this thing and you would wind up the loser if you tried to handle something like that. Oh, yeah, by all means say, "All right, I'm running a bit of a center here. You want to be an apprentice to this activity, all right. I'll require – when you are finally fully trained – I will require a thousand hours of auditing of you – of pcs of my selection and collection." I don't care what you do. But, oh, yeah, by all means train them up – apprentices – train them up, any way you want to. See, your training to a large degree would be lost if you didn't do such a thing.

As far as putting in a formal Class II type of course is concerned, saying "You come here for five weeks," and that sort – nah. *Aber nicht*. Bum show. You haven't the equipment or anything else to do so. You'll get a lot of people upset with you and so on.

Way to do it, say, "Well, if you want to hang around for the next two years and contribute a thousand pounds to the center, why, we'll make you an auditor at the other end of the line." I don't care what you tell them. But it must be on the basis of, "You've got to stick around long enough till you can do it and you abide by whether I tell you, you can do it or not. You understand?" That would be the end of that.

Now, in an Academy – would run a reread course on a grind-grind daytime basis – remember that it is not qualified to issue a classification. It can say it's a Class II Course, but it doesn't make a Class II Auditor.

This is the regulations along the line. Yes, by all means, train some people. I used to train auditors on this basis myself. I'd go downstairs to eat breakfast and so on ... We're actually back in the old swing of 42 Aberdeen Road, practically, now. Want to say goodnight to

the children, I'd have to go – I go outside where they're sitting talking to an auditor – you know, call them in – tell them good night. They – this is – this is usual and ordinary.

You shouldn't, however, mess yourself up to this extent: of let them audit pcs for you before – they don't know what they're doing. Because you will very quickly learn this lesson yourself. Actually there's no reason for my telling you this at this particular stage of the game. You'd find it out for yourself. You'd learn fast. People will be on the phone two and three o'clock in the morning, the police would be coming up from the morgue, to find out – to identify ... Be a cheerful scene.

Some of you may have seen the code of ethics of the National Academy of American Psychology cooked up by us. You might have seen that, you know. "Must be willing to accept the treatment they dish out," you know, and – did you ever see those?

Audience: Mm-mm. Yes.

Well, we're thinking of calling this a convention. A convention of ethics. The convention of ethics of international healing, you see, so that we have the World Mental Health Organization. Now, this is the only – the only horrible plot, this, in the very near future. We incorporate this thing in Switzerland, see. And it's the World Mental Health Organization. And its literature cannot be told from the World Health Organization, you see. And we have – we have credentials which we issue to people who subscribe to the convention of international healing ethics, you see. And we give them a certificate they can hang on the wall.

Well, it has various things like not curing people they can't help, you know, all these various embarrassing points. Returning people's money if they don't help them. You know, the very things that these clucks out there would never dream of approaching, you know? Guy can't give a prefrontal lobotomy by it, unless he's had one, you know? [laughter, laughs] So anyway, this is – this is this sort of thing.

Now, this doesn't go out on a common line at all; what we do is ... This is just a mock-up. This might not come to view, you see, but we're going to try to push it in that direction. And that is we appoint people around the world – inspectors for the World Mental Health Organization. And they have a card that identifies them perfectly, you see – a perfectly fine card – and they have a questionnaire. They have several types of questionnaire, one is for a doctor's office, one is for a psychiatric office, one is for a psychology department of a university. One is for a mental hospital, one is for a regular hospital. And sometime when you want a lot of laughs, you see, why you take your card down and you see – you see Doctor Cutsbin. And you simply walk in, you hand him this and it announces that you're an inspector for the World Mental Health Organization.

Now, that's a perfectly valid organization, don't you see? And we actually are the only world mental health organization there is, so this – you want to fill out this form. You want to know about his results. And you want to know about his technology and his facilities and his credentials. And you just fill out a form representing those various things. And it's in triplicate and you send one to the minister of health, of the government of the country you're in, as "*failed.*" [laughter] "Failed and forwarded to the International Headquarters in Switzerland." And the other thing – you simply send it to his superiors, whoever they are, board of trustees

of the hospital, don't you see. And the other one of course you send to Switzerland. It's very interesting. Saturday morning's work when you're walking around someplace.

Think of going into a mental hospital and presenting a card to inspect their results and their facilities and their technology, you know, and their ethics and credentials. Think of this, man. You'll be surprised. It's not just a gag, because I think the right to inspect gives the right to command. And it's your first gradient scale step over taking control. All you do is inspect. But you tell the – you're very pleasant, you see, while you're in such an interview. Very pleasant about the whole thing. He protests, "Oh, you people. I've heard about you people. You're a bunch of quacks and.... "

"Yes that's fine. 'Opinion of World Mental Health Organization – bunch of quacks and bums,' that's fine." [laughter, laughs]

Yeah, you can have a lot of fun with that. Anyway, you'd be surprised. They'd actually get all whipped up about this sort of thing. Inspect the Department of Psychology of Natal University. Of course, obviously they haven't anybody there who is qualified to teach anything about the human mind. Nobody's graduated from the Academy of Scientology in Johannesburg – they haven't got one in the place. You put it down as a serious omission. Numerous false credentials in the area. It would be a lot of fun.

Well, actually you don't have to do it at all. But very often you have PE Courses and you have people coming in asking you what they can do. So you appoint them as inspectors. [laughter] Yeah, I think – I think there'd be a lot of red faces, wouldn't there?

But I think the right to inspect is something that you can simply create by assumption. And I think it's a gradient step on the right to command. You're actually going to get people worried about this. See, they'll be worried about you.

Now, it might work out that one copy goes to the newspaper, you see – one copy goes to the minister of health of the country and the other copy goes here. We'll work out these little details later. But I can – I can hear the scream now, from the Sunday-Monday line clear around to the Sunday-Monday line, you see. Campaigns on the floor of the United Nations that we have abrogated their authority, so forth. It's all good publicity. Nobody can do anything to you at all for inspecting. [laughter]

Newspapers could become very worried that they had a hospital in the place that was not qualified, that was not staffed by qualified practitioners and that killed patients. And had been condemned by the World Mental Health Organization. "Spinbin Lawn Hospital condemned by World Mental Health Organization." [laughter] "Doctor Cutsbin declared to have inadequate training and credentials." "Quack Doctor commands hospital."

Maybe we'll have a rightist press that will be as enthusiastic someday as the leftist press. Not that we're right or left.

Actually, you know – you know politically where we stand. We're so far to the left that we sometimes look right.

If a communist ever asks you where you stand politically, the way to worry him – the way to worry him, is to come down on him with all four feet – by wanting a government. And

he'll look at you and he'll know exactly what speech to give you. He'll pull it right out of the file. It's "how you deal with an anarchist." [laughter] And he'll say, "The valuable parts of governments, governments serve a useful purpose." See, and he'll try to argue you into – not revolution, but how you have to have a government, so forth. And I don't think very many of us would buy that. But we're actually so far to the left we sometimes look to the right. We actually are not on the spectrum at all.

But where it comes to reasonableness, you can't be sensible on this planet at this particular time and belong anyplace on the spectrum of government politics.

Okay, well, having given you a few words of cheer and forecast, why we declare it closed.

Thank you.

Audience: Thank you.

LISTING

A lecture given on 14 June 1962

Okay. This is a short lecture about listing. This is lecture two, 14 June AD 12, Saint Hill Special Briefing Course.

Listing: Listing is an activity which is engaged upon after one has found a goal. I gave you a talk the other evening about how to find a goal. Well, the way you list a goal is relatively simple. If the goal is in – it stays in after being duly checked – you begin listing.

Now, you may run into some problems of listing. And the first problems you run into is: the goal has been found, the goal has been checked out, the goal is – that's fine – and the first thing you run into are the first invalidations the pc is being careful not to make with his new-found possession. So the first action of listing is a Prepcheck.

Now, you see, we – this has nothing to do with checking out goals or anything like that. Only let's emphasize lists and listing all over again. This person has had a lot of Prepchecks on this subject, but he now has a – new expansive opportunities to invalidate.

Now, this goal that he's got there is going to do peculiar things in the next few sessions. It's going to read and not read and it's going to do this and it's going to do that; because its reads are going to go over on to lists, and these reads are going to go onto items, and it's going to flick back and forth. And it'd be funny if it didn't, because you are using the most powerful method of getting rid of an aberrated prime postulate that has been devised: 3GA. So, of course, it's going to *do* something to the goal.

So the first thing we must know about listing is that when we *start* listing, we Prepcheck and make very sure that the goal is there to be listed. That's for sure – because that's the last, pure, clean opportunity we're going to have to nail it down.

Now, we make this as a specification for this particular reason: goals have often been found by other auditors and checked out by other auditors. But remember, if you are a listing auditor who did not find the goal, your responsibility for listing is tremendously great. So, you should start it with a Prepcheck.

Now, if the goal is partially listed and been partially listed, you're kind of around the bend. Now you're not so sure about this whole thing. And I know of no other way to go about it than to check the line wordings for a read. If the goal doesn't read, perhaps the line wordings will read. If a line wording reads, of course the goal is valid.

Now, this means then, that your Prepcheck – if you're taking over a case that's had a partially listed goal – your Prepcheck must include "discussion of items." You're going to ask

about goals and you're going to ask about listing, and you must also ask about items, specific items and auditing sessions for items. Why? Because you could get a line ticking merely because it was ARC broke. See?

Now, these line wordings are just as vital as the goal itself, so don't skimp them. And they're going to offer you some very tricky problems.

The usual and ordinary goal is something like "to catch catfish." All right, that's fine. That's a perfectly ordinary goal. That lists – you can form up the wording very easily because you simply add "want," "not want," "oppose," "not oppose," before the goal, and then before each one of those, "Who or what would ?"

See, the formula is very simple – nothing to this, "Who or what would want to catch catfish?" "Who or what would not want to catch catfish?" "Who or what would oppose catching catfish?" "Who or what would not oppose catching catfish?" So those are perfectly valid lines in most cases.

But you have changed the goal, haven't you? "To catch catfish" has been changed to "catching catfish." So there's one little alteration there that you should be rather careful of. Usually you will get away with it. This is quite valid and everything is fine. But if there's any question in your mind, you had better put "the goal" in front of the goal itself. "Who or what would want the goal to catch catfish?" "Who or what would not want the goal to catch catfish?" "Who or what would oppose the goal to catch catfish?" "Who or what would not oppose the goal to catch catfish?"

Now, that is not a perfect alternate, but it might be all right. Not perfect, but it might be all right. You must realize that there is no perfect wording. You've got to have, however, "want to," "not want to," "oppose" and "not oppose" as the subject and character of your lines.

But goals vary, and for that reason – and pcs' reaction to goals vary – semantics gets in the road of it. Now, any way that you can get the actual goal – as originally worded – expressed, is the best way to word it. That is the best way to word it.

Now, I can give you an alternate wording, but – of various kinds – but *no* wording would fail to have in it "want," "not want," "oppose" and "not oppose." Those are the four lines. They are not necessarily in that order while you list them, but those are certainly the proper ways. And each one is preceded by "Who or what would ?" Not "could" or "can" or anything but "would." "Who or what would ?" Always "Who or what would ?"

And now we get into interesting things. I have not seen many negative goals prove out, but negative goals can exist – not to invalidate negative goals. And it's very, very remarkable that a negative goal does not lend itself to good listing at all – wording – doesn't lend itself to good wording.

Let's take the goal "not to be detected." That's the goal, "not to be detected." Not even "to not to be," see? It's "not to be detected."

"That's my goal, 'not to be detected.' That's it!" It's not "to not to be detected." See, just "not to be detected." What the hell are you going to do with this?

Well, it depends on your meter. Your problem is to get "want," "not want," "oppose" and "not oppose" in front of that goal and "Who or what would ?" in front of each one of those in some fashion that (underscore) registers on the meter like the goal. It's got to register; got to make sense to the pc. So there's two tests there that you can immediately resort to.

Now if you word it wrong, you're going to get a cow's dinner. You're going to have three lines worded right and one line at right angles to the Federal Church, Incorporated and has nothing whatsoever to do with the case. There's going to be one line missing.

Now, that the pc can or cannot list on a line is actually no test. That's not a test, because the line "not oppose" is always something on the order of reaching into the wild blue nowhere, because it has never offered any resistance. It is the bull and the cape. See, nothing solid to push against – every time he lunges at the cape there's nothing there. So you say to the pc, "Who or what would not oppose catching catfish?" And the pc goes ... [demonstrates something] Nothing there, you know? Makes him feel bad. Dandy. It's nothing wrong with that. So he feels bad, but that's no test. So he feels bad, but if you were running that and the pc was telling you he has a *lot* of trouble with it – most pcs will tell you they have a *lot* of trouble with it. Believe me, it's a vital line, because it's one of the four flows.

Well, let's suppose you worded it up in some fashion, "Who or what would not oppose catfish?" See? You make a horrible error like that, see? Everything else was "catching catfish" or "to catch catfish." But this last one – this last one was "would not oppose catfish." Well, he's going to have – very interesting – very interesting list! No doubt, it's going to be a fine list, but that needle is never going to go free. It's going to park the case, you see? A mess.

Now, the negative goal offers you the problem of the double negative. "Who or what would not oppose not being detected?" Isn't that horrible? So the word *the goal* – by the way – by the way, don't say that that's impossible not to use the double negative, because for some reason or other a pc has already listed well on a double negative and wouldn't have it any other way – and just listed fine. But we can't count on all pcs doing this that well, so we get *the goal* interposed in there as a method of separating out the double negative. "Who or what would not oppose the goal not to be detected?"

Now, when you're doing that a question enters into it on the first line: "Who or what would want the goal not to be detected?" Doesn't work, does it?

Audience: Mm-mm. Mm.

Well, it's a mess. Now, you'd better reach into the truth of the situation, because that first line is basically concerned with an item which does have this goal. So in that particular case you can test the line, "Who or what would have the goal not to be detected?" So we drop out "want" and we'd substitute "have." But notice all the rest of them fall into line quite well, but that one changes. Do you see that?

You've got to get four flows that operate against this line – now this particular goal – four flows that operate around and with and in this goal.

Now what do those flows consist of? The goal is a prime postulate which has accumulated on to itself a number of identities by which the purpose could be executed. It has assumed these identities because there were a bunch of people that didn't want the goal and

those were stupid and incomprehensible, so one had to prove it to them that the goal was okay.

And there were a bunch of more people who violently and desperately opposed this goal and there were a bunch more people who didn't oppose it, and nevertheless, were in some peculiar way associated with it.

Now, if you can't express those flows on your four listings directly and immediately surrounding this prime postulate, of course the thing is not going to go clean. This thing is going to mess itself up one way or the other. Now, to change wording in midflight can be quite upsetting to the pc. So after you've prepchecked and fixed up the goal, and it registers and it reads and it bangs like mad, and everything is fine, and any little dabs at listing or monkeying with it or invalidation – these things are all knocked out and they're all cleaned up beautifully – you make sure of that wording. And that wording should register.

Now, after you've gone into the wording – make sure that you go into it well enough and thoroughly enough with discussion with the pc and that sort of thing – that this wording actually works out to be *the* wording for the four flows for that goal. Because after that, to change it is going to be upsetting.

Now, this doesn't say that you will never change the line – the wording of a listing, because you'll pull a bloomer sometime or another on something and you'll suddenly find out this line never has listed, you know? Nothing – no item on the line has anything to do with anything you've been doing, and something like that. That would be almost catastrophic, however.

Try desperately to hold to your original solution, having established it. So establish it with care and then hold to it unless the spot is absolutely untenable. If every time you say to the pc, "Who or what would not be a catfish?" or whatever the goal is, he says, "I – I can't answer it," see? And you get the middle rudiments in beautifully, polish it all off, and he still can't answer it – you're faced with some kind of a super emergency of this particular character. In other words, your wording was wrong in the first place and now it has moved into full view and the moon shines piteously down upon it all, and your crime lies stark upon the moor.

Well, the thing to do is be right before you start. It isn't saying you can't recover from it, but it'd be upsetting if you had to – pc now feels all confused.

Now, in listing, you probably will list against a low-sensitivity-set tone arm. In other words, you just turn the thing on barely and keep your needle more or less at set so as to get your relative tone arm read and position. Now, you get your relative action without having to madly shift the tone arm all the time to keep your needle on the dial. In other words, it can be neglected for periods while you're busy writing and the fur flying in all directions.

Now, every fifth session you're going to prepcheck the whole subject of goals, listing, auditing and so forth, newly, just as you did in a Goals Assessment. And you're going to run the middle ruds, regardless of how often you prepcheck them, every time you stop running a list – regardless of whether it needs it or not. You're going to get the middle rudiments in every time you stop listing on a list.

Now, you'll find that there's a periodic order of frequency of action for each list, which diminishes. (Boy, didn't that sound complicated? 'Tisn't. I'll say it in English.) It decreases: The length of time a list is active for one listing before you leave it to the next becomes progressively shorter. You'll get good action on the TA on a list, and then the action will slow and become less impressive. Get your middle rudiments in, go to your next list and list that, and you'll find out you've got your TA action back again, and then that will diminish. So you're always running to diminish TA action.

Now, I couldn't tell you, because we can't hazard a guess, where this prime postulate is going to sit on the pc's track. What GPM – what track, or rather what cycle GPM is this thing preceding. Well, we don't know that. So we don't know how much bank we're relieving and so forth.

But ordinarily, I'd say a half hour of listing on a list seems overly long, but you probably, you probably at the beginning, on a very mucked-up pc would only be able to list – if you're going to list all the TA action out, see, all the TA action is going to come out and so on – you'd probably find it a session – I just want to give you an example – a session per list. See, you'd list – list one for a session, list two for a session, list three for a session, list four for a session. You understand?

I'm not recommending that. Don't put that down as recommended. I'm just giving you how long that list would remain active before the TA action went out of it. It is, however, very unbalancing and impractical to do anything like this. It's impractical.

So, you just do – better do it by the count at first or by the minutes or any other way. But if you stop a pc in the middle of an automaticity, he gets a suppression. So, allow – allowing for automaticities, you more or less list an arbitrary number for each list, making perhaps fifteen minutes a list early on – something of this sort. You list maybe fifteen minutes on each list: list fifteen minutes, get your middle rudiments in; list your next list fifteen minutes, get your middle rudiments in; list your next list fifteen minutes, get your middle rudiments in; list your next list fifteen minutes and get your middle rudiments in; go back to your first list and list it. Now, of course, none of those lists were exhausted, so your TA action there is deceptively high.

Now, if a pc gets into an automaticity, for heaven's sakes don't stop him in his tracks – please. Please don't stop him in his tracks, because he'll do a suppress. So if a pc is listing rapidly and freely, let him go on listing, but that doesn't mean four sessions. You understand? Doesn't even mean one session, because none of these automaticities will run more than maybe 135, 150, 175 items. That's an awful lot. And that's an extreme automaticity. But they'll just start firing off, you know? "Waterbuck, tiger, clock, policeman," you know? And you're having a hell of a time keeping up with him.

Now, on listing it is very, very bad form to do either one of two things: to tell the pc to wait while you write the thing down and to fail to write it down. Either one of those things is a crime. You pay your money and you take your chance!

However, the pc will comm lag in the ordinary course of human existence, adequately as he runs along on a list line to give you lags, at which moment you can catch up. Of course, if you got into a 135-item automaticity that was firing off like a machine gun, you've practi-

cally had it. Now, how you handle that, I don't know. As far as a solution to the thing is concerned, it's *wrong* to stop the pc and it's *wrong* to miss the items. Well, you say, "Well, I guess I'll just have to write faster." Yeah, that's a good answer; that's a good answer.

Another thing you could do, of course, is set a tape recorder going back of you – not advised. You won't find that you have too much trouble with this, but there is some little problem comes up in connection with it.

Now, when you're so busy writing, how do you ever find time to keep your auditor's report? That's difficult, too. But actually, pcs can be encouraged to comm lag. [laughs] You say, "Well, you think there's any more on that particular list, now? 'Who or what would not want to catch catfish?'" You already knew he'd run out, see? That's not advised either, but I'm afraid I would subterfuge to it in more agonized moments of auditing.

Now, your setup on listing is that your lists must be kept of parity length. Try to keep them somewhere on the equal number of pages. Don't let one list run madly ahead of others. And you will see this tendency before you have been listing on four lists very long. You will all of a sudden look over at list three: "Who or what would not oppose catching catfish?" *Ahumpf*. It has twenty items on it and everything else has two hundred. Now you're up against the horrors of trying to catch that list up. Now, how do you do it? Well, you don't encourage any additional on any of the other lists, that's all. You list some on "Who or what would not oppose catching catfish?" You list quite a few, see? You list as many as you can possibly get listed and then you list briefly the other three lists, just almost as many as are volunteered. You just say the name of the list and the fellow gives you one item. And you say, "Fine," and you say the name of the list and he gives you one item – that's the next list – and you say the name of the next list, and he gives you one item. And then, you of course have gotten your middle rudiments in very carefully when you left this other list. Do you see? Well, get them in again very carefully, you know, and then list eighty on it. You can bring a list back to balance. But really it's quite wrong to get the list far out of balance.

Now, in the first part of listing you list more or less arbitrarily, in other words. You list arbitrarily as in terms of time. You keep an arbitrary number increasing. That is to say, you – you're listing maybe twenty per each, and so forth, because it's not important early on. It's such a mass anyhow, that it doesn't make much difference as long as they all get listed. And then as long as there's some equality in the lengths of the lists, you're not going to get lost as you go along the line.

But later on there's another factor enters into listing. As you come on down the home-stretch, you will find that you are up against the terrible thing called a free needle. Now, let me point out to you that it is an Auditor's Code break to list a line on which a free needle has appeared. Why is it a Code break? Because then you're running a process that is not producing change. See that?

So you come on down the line and you've listed six, eight – something like that – and all of a sudden the needle is floating and free. Well, don't sit there admiring it. A stage four needle can be mistaken, by the way, for a free, floating needle, but only by a very amateur amateur. Stage four is a repetitive sweep up and a stick and a fall, and so forth. Well, the free

floating needle just drifts. It's a beautiful thing to see. You never make the mistake of reading one after you've seen one once – that is a free needle.

Well, when you list down to a free needle, you're now going to upset the interesting pattern of your way, because you're only now going to list the next line that produces a needle reaction. So you list down to a free needle and then you read the next line to the pc with the forecast of "This is a test," see? And if that free needle isn't upset – that is to say, if it doesn't stick or bop or do something – you don't list that line. You skip that line. You go on to the next line after that and test it. If it remained free, you go on to the next line and you test it and if it remained free, you go on to the first one and test it; and if it remained free and you couldn't get any of the four lines to react at all, you better find a new goal because that one is dead.

But toward the end of listing you will discover that you had better list by test – you better list by test. In other words, line one all of a sudden has taken it into its head to float free and line two doesn't upset it, but line three does, so you'd better list line three to free needle. But if it doesn't go to free needle after a little while, you figure you're running on too far and too fast, you'd better go to line four. Do you see? What you're trying to achieve, there, is listing by test. You're only going to list against the needle in other words. If you don't get a needle reaction when you read the line "Who or what would want to catch catfish?" then you don't list it.

You'll find this way, at the end of the case, you catch up all the inequalities of lines. When those inequalities are all caught up... By the way, they're not numerical inequalities, they'll just be charge inequalities. Don't you see? Your lines now at the end, by doing this, might get quite uneven. They won't become double the length or anything like that, but they will become uneven just because you're listing against needle reaction.

Now, I must caution you against the sins of overlisting. The sin of overlisting is of course an Auditor's Code break. The needle is free and it isn't upset by a line and it isn't upset by further items – you're, of course, listing a flat process. It is like running a process that no longer produces change on the case and it'll *upset* the pc.

But that isn't why you mustn't overlist. You can fix up an upset; I'm sure you can keep in rudiments now, thank God. But your goal that you're operating with on this pc is not the prime postulate of his entrance into this universe. It is only the beginning of some cycle or another that you have laid your paws on through a Goals Assessment. And it might be no more ancient than a few centuries – might be that close to PT. Now look, this thing has some dim harmonic against some other goal earlier or something, because there's earlier material that can be pulled up. And you get too enthusiastic and you start yanking in earlier track, because you're pressing the pc to give you items, and the pc obligingly starts picking up the wrong GPM.

So you list *just* to free needle. You don't list *beyond* free needle on each one of the lists.

My, you know, I'll tell you this on the side, it's a great relief to be able to talk to you about what you do with a free needle. [laughter]

So anyway, it's a little merry-go-round and you keep going around: one, two, three, four; one, two, three, four; one, two, three, four – like a well-ordered engine. And it batters down the gates of Jericho like a bang so there's nothing much to handling it, providing you are listing the right lines and you kept your rudiments in when you did so.

Now, toward the end, you will find that getting the middle rudiments in every time you list one item gets to be just a little bit of a strain, and more tends to throw the pc out of session than in. So I would only get them in as I went around each time there was a beefy line listing going on or you did fifteen items or you did ten items or you did something like that. Now get the middle rudiments in. And now you've got two and that only took one or two items each, and then the third one, it took ten items. Well, get your middle rudiments in against the ten. Do you see? And you'll find out you'll make more progress. Otherwise than that, early on in listing, you run it every time you have finished a list – see, every time you've stopped listing on this.

Now, the reason a pc stops listing is because the pc has some middle rudiment out – just mark that up. That is the *only* reason a pc stops listing, whether he's listing a goal or he's listing any kind of a line proceeding from a goal – only one reason, is the middle rudiments are out.

A pc, however, can accumulate sufficient residual charge on the subject between sessions, and so on, that the middle rudiments have to be prepchecked to get it all swept in. So you could perhaps find that the fourth session after your Prepcheck – your last Prepcheck of the middle ruds – ran more arduously than the one that ran immediately after the Prepcheck session.

But listing stops, and – take it from me, it's absolutely true – it only stops when the middle rudiments are out. It does not stop because the pc is out of items. It doesn't stop for any other reason. You could probably *force* a pc with middle rudiments to list a thousand items on a single one of these lines. The fantastic imbalance which this would cause in a bank would be absolutely frightful. But you could use middle rudiments to make him list quite happily on all thousand before you touched the other three. If you did such a thing, you ought to be shot, but I'm just showing you the extent of the middle rudiments in assisting listing.

Never get the idea that the pc has run out of items. Never get the idea that this is a "Oh well, naturally, he can't think of any more," and so forth. This is not true. He hasn't thought of a single one since you started auditing him. He hasn't! He hasn't thought of a single item. Pcs *don't* think of items – they deal them off the bank. If he had no more items to deal off, he would have no GPM! So obviously, he stops listing only when the middle rudiments have gone out and he, therefore, can't get into communication. Do you see?

Now, what do you do after you have brought one goal and four lists down to a free needle on each list? That is the end of your first stage. In earlier days you would have called this a Clear and gone around and patted everybody on the back. Well, we'll still call it a Clear, why not? Because we have – we can say a stable Clear; we can say a Theta Clear; we can say other states of case, don't you see? That guy is sure Clear. You can clear up his needle almost any time by cleaning up the middle ruds on the goal or something, see, or on lines or on life or something. You can always get your free needle back. He wakes up in the morning; he

finds out that he's at 3.24 constantly. Oh, do a little Prepcheck, and you can get that out of the road, and he'll happily wake up every morning dead-on at 3. Do a fish and fumble for fifteen minutes – you could probably accomplish that, you see? Ten minutes, eight minutes.

So your listing is auditing and is done as the sole operation of auditing.

Now, you want to watch your acknowledgment in listing. This is another little tip. The fellow says, "A grizzly bear, a lion, a wolf, a – something-other, so on." Well, now, of course, the fact you're writing these things down is an acknowledgment all by itself. That's quite an acknowledgment. But you keep up a little humming song of "Mm-hm," and let me tell you, you will be a lot, lot better off than: He says, "A lion," you say, "*Thank you!*"

Well, that's the end of that, man. The guy – sits back and – what happened? You're not now going to get the next two items until you get the middle rudiments in. It's operated as an invalidation; you ended cycle. Of course, end of cycle is the end of the list. So listing is sort of on the basis of he says, "A lion, a catfish, a grizzly bear, a wolf." And the auditor each time is saying – or as often as he gets around to it – saying, "Mm-hm. Any more? All right." Saying, "Mm-hm. Got that. All right. Thank you," and so on. He's just going on.

Now, an auditor doing listing very often feels so much like a secretary obeying the boss that they lose control of the session. I've noticed this as a phenomenon. They get so willing to be inflowed on that they don't control the session and that is the first great auditing error in listing. You just keep writing and you never do anything else and the next darn thing you know the pc is out from under, all the rudiments are out – not just the middle rudiments – and, you've got hell to pay. So, when you've stopped listing you give him a good acknowledgment – not to blow him out of the chair or something like that – but, you give him a good acknowledgment and say, "Now we're going to do the middle rudiments." And you go ahead and do the middle rudiments in a very *brisk* fashion.

Now, in listing, you peculiarly must look much more like an auditor at the time you are doing rudiments and middle rudiments than you would in a Prepcheck session. You must really look like an auditor when you were doing these things because you've so little looked like an auditor before then. There you are, scribbling away and saying, "Mm-hm, mm-hm, yes, mm-hm, fine," and you write, and you write and paper and trying to catch up. And the pc sees he's got sweat streaming off your brow. He sort of slows down, and we see that we have two pages here now – we've listed two pages on everything else so that sounds good. So we say, "All right. Now we're going to do some middle rudiments." And right about that moment, you fix him with your beady eye, you know? And man you really do those middle rudiments.

Now, "In this session is there anything you have suppressed? Invalidated? Failed to reveal? Yes? What have you failed to reveal? Hmmm. All right, good. I'll check that on the meter. In this session is there anything you have failed to reveal? Good." Get that clean – clean as a wolf's tooth – finish it up. You say, "All right. Now we're going back to listing." Put in the R-factor and you read off your next line – read it off as a good auditing command. That's really the last auditing command you're going to give him till you've listed two pages. Don't you see? You're going to read it to him occasionally, going to remind him of it.

Your first one is, "Who or what would not oppose catching catfish?"

And he says, "a grizzly bear," and so forth. And he – you go ahead and you write "Mm-hm, mm-hm, mm-hm, fine, fine, fine." Your actual acknowledgment is when you've finished listing for that list. Then you give him the cheery, "Thank you" and you've got to take over control of the session again.

It's one of these awfully long auditing answers. You see, "who or what" are not singular. You consider them as a plural auditing request. And if you consider it as a plurality of auditing request, then you're not always getting in his road by saying – he's saying, "A grizzly bear, a lion, a – a – a – a wolf," and – and right about the time he said, "a grizzly bear," you see, you said, "Thank you. Now, who or what would not oppose catching catfish?" What are you doing burning up time, man? He knows what he's talking about. He hasn't lost the auditing command, see? What are you doing getting in his road?

Well, he sort of runs down and you know you got to make two pages on this sprint. See? He sort of runs down and you say, "All right. Now, who or what would want – would not oppose catching catfish?" See? "Got some more there?" See, and go on running, and he thinks about it and so forth, and he'll get some more. Now, supposing – supposing you had a goal set and you actually – yourself – and you had to get two pages out of this pc. How are you going to get the two pages out? Well, it's by throwing the middle rudiments in when he just refuses to go on. Well, he says, "That's all I can think of." Well, you see he hasn't thought of any anyhow. So you get the – you get the middle rudiments in. And also get them in when you have finished the list. You see? So that's the additional use. You *must* get them in when you have stopped listing a list of any length, you see? You *must* get them in, but you coax him into additional listing by getting them in when he stops.

He's sitting there and he's saying, "Ah, *mmmm, hrrrrr*, I just can't think of any more. I mean, it's all too dreadful."

And you've got two pages to go and you've only done one. You see? So you better roll up your sleeve and you say, "All right. Well, thank you." See? And, "Now let's get some middle rudiments in before we go on listing on this list." You get the reality factor in there, see? Never let him think you're going over to some other list. Get them in, square them up, find out what it was, and he'll come back up, *pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa*. You see? You got your two pages. You say, "All right, that's it. We hit our quota here. Thank you very much. All right. We got that now – thank you. Good. Thank you. Thank you!" He's now going to run four pages on you, don't you see?

You say, "All right. We're going to do some middle rudiments here before we go on to the next list. All right? Good! Good. All right." And go ahead and do so.

Pc takes handling on lists. And you sit there as an animated wound-up stenographer, see, you're going to have a bad time. You've got to control that session. But the liability of a listing session is, you look like you're so little in control when you're writing the thing, but of course you, in resumption of control you have to do with a little more power than you would ordinarily do so.

But it's all very delicate and it's very easy to smash these items down; it's very easy to glum it up one way or the other. Now, if you fake one item – just like listing a goals list – if you fake one, you know very well you may never null these things; you probably never will.

And supposing you say, "Because we're never going to null these things, it doesn't matter whether I understood did he say 'a wolf' or 'a wuff?'" You've entered a missed withhold into the session and it's going to blow up. So you have to ask him *right then when you missed it*, "I didn't get that. Did you say, 'a wolf?'"

"No," he said, "I said 'a wuff. '"

You say, "A wuff? What's a wuff?" See, remember. Remember – TR 2. "What's a wuff?"

"Well, a wuff's a wuff. Well, they're big, boundy things that – they're big, boundy things, you know, and they have hair all over them. And some – oh, they were on some other planet around here!"

"Oh, a kind of animal on another planet. Is that it?"

"Oh, yeah," he said. "A wuff."

"Oh-ho!" you say. "Well, good. Good." And you write it down. [laughter]

But you just let it go on the basis of "*Mm-hm*, I'm just going to fake it in," you know? And the next thing you know he's slowing down and you're slowing down, and your auditing is tiring you out, and you don't know whether you're going or coming.

Now, keep your R-factor in but also keep those missed withholds off the auditor, huh? TR 2 says that you understand. And he gives you a bunch of porridge and you don't know where to pour it. You better find out, man! He sounds quite – quite – quite raspy sometimes. He'll sound quite snarly to you sometime. "What are you – idiot? What's the matter with you? You don't know what a wuff is? You know? A wuff! You know? A wuff! A wuff! A wuff! A wuff! A wuff! A wuff!"

Well, the reason he's acting like this is because he thinks he – you have a missed withhold. That's the only reason the asperity, and as soon as you eventually get it, if you really do get it – the apparency of the missed withhold disappears and that makes it all right, see? The thing to do wrong at that time is not to get it. You want to know what a wuff is; he can tell you what a wuff is. Of course, it really doesn't matter to a hill of beans whether – factually, whether you get that it's a wuff or a wolf or a what, because you're never going back over it again, *except* if you didn't understand it. And a falsity enters into the session there which can crash the whole session, you see?

Next thing you know you don't like auditing this pc. Your hand gets so tired when you write. There'll be all kinds of things like this. It's just missed withholds; you didn't know what the hell the pc was talking about. You were missing them, then the pc gets sensitive to these things, you know? And then it enters into the tone of your voice. And next thing you know, his session is going out, and he doesn't feel like listing, and you can't keep the middle rudiments in, and God help us all.

Keep your R-factor up and for God's sakes understand what the pc is saying before you go on. Very, very important.

Now, you look over the lists quite routinely, count them up; make sure they're in parity; do good administration on the thing; make it so these things can be looked over and so on.

One of the things you do with a list or one of the things you will notice about a list, is when an actual goal is being listed out that the items will transfer over from list to list. And it almost is a test that when an item has been on all four lists, why, that's about the way it is. It's very funny, but I mean, the item will transfer.

"Officer." "An officer is something that would want to catch catfish," and then "An officer is something that would not want to catch catfish," and then "An officer is something that would oppose catching catfish," and then "An officer is something that would not oppose catching catfish." As idiotic as it may seem, he's even thinking of a game warden, you know? He would not oppose catching catfish. By this time, it's gone the full route, and all four flows are discharged off the item, and the item is fully discharged against other items and it lies null. So you find the whole list tears on through this.

Pc is trying to do this or is trying to strain at it or something like that – he will soon fall wise to the whole thing.

Well, now, that is listing. After listing is completed, find yourself a new goal. I wish I could tell you how many goals there should be on the new list for – to find the new goal. I can't at this particular time. However, I can make a very good forecast founded on very accurate information that the list would only be about half as long and that the length of time it would take to find it is briefer and the amount of items it would take to list it out are less and you get – as we already have had ample experience of in Routine 3s – you get a dwindling quantity of everything. And eventually you can't get anything and nothing will stay in and so forth, and you hit the pc on the rim and he rings for an hour.

You should, with this particular thing, wind up at the other end of the line with a – with a Theta Clear. Now, it's also my guess that on most pcs you will eventually find a type of goal that you find in the basics of Scientology. These things will register – *suddenly* register. Why didn't they register before? Is there one basic goal for all pcs? Oh, yes! But they daren't reach it and it's not real.

You want the goal that registers now – not the perfect goal – because they eventually get back earlier and earlier and earlier and earlier on the track and they will eventually run into prime, prime, prime (exclamation point) postulate, which sweeps all before it. You will see then that there's a broader generality going into this thing and its regular progress back on the track. Different areas are being tapped; different subject matter being hit.

What happens to the GPM as it is being listed? Actually, the repetition of items gets the discharge off of the basic postulate which you call a goal. And the definition of a goal is: a basic postulate for whom the individual has taken full responsibility. Therefore, as that tends to be discharged – that is to say, the items (bricks built up on that postulate) – tend to *not resist* the postulate anymore, the postulate itself runs out. And because it is the only brick that is keeping the house built, you don't get the house falling down – this is not the result of it. You don't get the house being blown away and moved over into the next county; you don't get the house being disintegrated or sold as scrap. It's just, oddly enough, the house diminishes and diminishes, and the bricks get thinner and thinner, and you eventually have a no-brick, no-basement, no-first-floor, no-roof, no-chimney edifice. The pc is now sitting there with all the

experience accumulated on the line and none of the mass, because there's no alter-is connected with it.

There's no way known to man or beast to get a prime postulate back earlier than his experience. So of course he's had it. You say, "How stable is a Clear?" A Clear is stable as you're unable to put a prime postulate ahead of the whole track again. See, that's how stable a Clear is. And of course you can't do it.

Now, that doesn't say that you couldn't get the pc sitting there gritting his teeth making a new prime postulate and going out and fighting the whole world to make that postulate stick and not have him accumulate a GPM – in another two hundred million years he'd have something to show for a GPM. He'd be in rather serious trouble, let us say, in fifteen or twenty trillion. He'd be having a rough time of it in another – another hundred trillion from now. And two hundred trillion, well, he'd be in the same condition you were when you came into Scientology.

All right. Well, that is listing and that is what is done with it and I wanted you to get all the data I had on it. Probably more data will come up, but not all the mistakes have been made yet, so I can't settle them out.

Thank you very much.

Good night!

DO'S AND DON'TS OF R3

A lecture given on 19 June 1962

Hi-ya!

All right. So, I'm going to talk to you now about the do's and don'ts of R3.

Now, Routine 3 is an ultimate in auditing and frankly should be regarded as such. No auditor who is unable to keep the rudiments in, handle middle rudiments or do Prepchecking has any business whatsoever doing an R3 process. You can try and you'll fail.

An auditor who doesn't know how to keep his rudiments in, keep his middle rudiments in and prepcheck just has no business whatsoever doing Routine 3 because he'll wind the pc up in a small ball and that will be that.

Some auditor – it's not terribly serious – some other auditor can come around and unwind the pc from this small ball, with just some more Routine 3 processes, but it means a very significant auditing failure. And don't mark it down as anything else – it will be an auditing failure.

Somebody trying to do Routine 3 who cannot basically audit with perfection will chalk up a failure. That is all there is to that. There is no arguing with that point. I'm not saying this point so we can have classifications or any other reason; I'm just saying this point because it's true.

If you want to be convinced of this sometime and you happen to be teaching a PE course, something like that, well, just take some Book Auditor out of the – out of the lot and set him down and say, "All right, find this person's goal and list it out to Clear." And oh, a few weeks later you are going to hear some screams, telephone calls in the middle of the night from the local spinbin, or something of the sort. God knows what will happen, but it won't be clearing.

Auditing successes are attained on a gradient. An auditor has to approach auditing on a gradient of successes. That is something you should sort of burn into the woodwork in an Academy. An auditor approaches auditing on a gradient of successes. If he does not have a gradient of successes, he will not approach auditing, he will go further and further from auditing. Oh, he'll keep on (quote) auditing (unquote), but the less success you have, of course, the more likely you are to get an unusual solution.

Now, not even all here have recognized, right now, that the schoolbook solution is the solution. It doesn't need one eyedropper full of anything to make it work; as a matter of fact, will only work if you simply relax and do it.

Now, it isn't the textbook solution because I tell you it is. I've been working on auditing as a framework, and the training of auditors as an activity – completely aside from processes and technology – working on the framework of auditing – for twelve years. And you're not going to dream that up in a session. Man, you're not going to. I've had too many guys I've taught how to audit and I've had the benefit of all of their mistakes. Their mistakes are absolutely fantastic. The things that a pc can get into are absolutely fantastic. The difficulties which you can confront by omitting what we now call textbook auditing parts are absolutely numberless. And the difficulties you can now get into with additives are absolutely numberless.

Once upon a time they used to string wires down along the Niagara Falls and tight-rope-walk across them. I think sometime in the 90s was the great adventure by which they used to have people walking across Niagara Falls on a tightrope. They had to balance themselves very neatly.

The wire in this case happens to be the textbook solution. There's only one other thing that I would add to the Model Session and so forth – of course, you are getting a reworked version of Model Session just in the interest of instant reads and that sort of thing – that is possibly in the end rudiments, something on the order of: "In this session have you made any decisions?" It would go in just before the withhold question. I haven't finished experimenting with it, so – but that – only thing that I have seen any reason to do anything about. And even then it would be quite unusual.

But sometimes you'll spot – could spot an ARC broken case that you wouldn't otherwise spot. And somebody has hung himself up in the auditing session who might not otherwise have been hung up.

Now, the natural impulse of the auditor is, when auditing doesn't work, to add something. For some reason or other he never subtracts; he always adds something. Now, if you see some auditor adding things, that auditor does not have a reality of the workability at the level of process he is doing. Those are also letters of firebrands on the Academy wall.

If the auditor sees fit or finds it necessary to add something to Model Session, to do something else to get a list, to do something odd or unusual in order to get Prepcheck questions, and so forth, it hasn't worked for him, see. He hasn't had any success with what he is doing, otherwise he wouldn't be doing something else. In the absence of a reality on result, then, he adds.

Now, this gets pretty wild – this gets pretty wild. Here are some of the things you have added in the last thirty-six hours on Routine 3.

Now, naturally you haven't got any reality on Routine 3 processes. You never had any wins or successes with Routine 3GA, or any wins or successes with this method of finding goals or this method of listing, so naturally you are going to add things.

Now, if you were getting good results with Prepchecking, if you got very good results with Prepchecking when you were in Prepchecking class, right this minute I'm sure you are in the frame of mind there isn't a single thing you would change about Prepchecking. That make sense to you?

And if you got good results in your rudiments and Havingness sessions – if you got good results in those – is there anything you'd change about a rudiments and Havingness session? You see? And if I were to ask any of you who got a good result on your pc – or consistently good results – in rudiments and Havingness sessions if you'd change anything about them, you'd say, "No." And we'd watch you go through a session – we could put you on the TV and watch you straight through a session on rudiments and Havingness and you'd knock it off *pocketa-pocketa-pocketa-pocketa-pocketa*, see. Fine, fine, you wouldn't change anything. There would be nothing added.

All right. If you had good results in prepchecking a pc and so forth – we'd put you on prepchecking a pc – you are not going to add one single cockeyed thing. You'd just walk right through it, *pocketa-pocketa-pocketa-pocketa-pocketa*, see.

But of course, doing Routine 3GA you are up against a *brand-new unknown*. And the night is dark, and the things you are adding are absolutely unbelievable. But why would you add these things? Well, you'd only add these things because you, yourself, didn't have a reality on its working. So you think that you have to do something else to make it work. In view of the fact that you are not up against what is to you a high level of reality, you fall into the area of alter-is.

Alter-is is the bigness of the bank. So you are up against a "don't know" and what keys in is alter-is-ness and some marvelous things happen.

Here's – listen to a few of these. Unbelievable that an auditor who just finished up Prepchecking beautifully without any additive of any kind would all of a sudden fall into this pit, or any of these.

Making up oddball goal categories to keep a pc listing rather than getting the middle rudiments in. Well, we have a few, they are the middle rudiments categories, but somebody's been making up oddball categories. You know? Just anything that came to mind, you see. The pressure of trying to get the goal. Middle rudiments wildly out, see. So the – and the pc, of course, not listing goals, so the auditor promptly moves in and gives a lot of oddball categories.

In this particular instance – the one single instance where this happened – we had a category of sacrilegious goals – I think was interesting. That arrived in another route, but it's an oddball category.

Asking the pc what his goal is or what he thinks the pc's goal is, you know. "What do you think your goal is?" I don't know, why – why not just dump a coal bucket over his head. That's what you are trying to find out. You mustn't ask the pc what he thinks it is because you are just going to restimulate the living daylights out of him. He's going to sit there, and he's go – all of a sudden go ... He was perfectly calm a moment before, you see.

You ask him something like this, an additive and he goes "Hey, what is my goal?" see. You've asked him this similar question.

"All right. Do an assessment now. Thank you. Now, tell me the last one in. Thank you." Same, be identically the same result. Pc can't do it and of course he goes *brrrrt-boom*.

After that you can hear him going around muttering, "Wonder what my goal is. What is my goal? What is my goal?" Up to that time he was perfectly comfortable to list, you see. Not now, not now, now he's got to guess. So you just get a long list of wild guesses after you've done such a trick.

Asking for only this lifetime goals. "Now, we only want goals that have occurred to you in this lifetime." I'll tell you something, if you don't get a goal that is before this lifetime you're not going to get any part of a GPM, because he's accumulated no GPM in this lifetime. The number of locks he has put on the GPM are quite slight. If you ask him only for this lifetime's goals, of course, and then you carefully made sure that he gave you nothing but this lifetime's goal, it would only accidentally get a harmonic of something he had had before. See, you've immediately almost obliterated your chances of finding the pc's goal by asking such a question.

An auditor refusing to list "To get rid of" goals or negative goals or difficulty goals. Just saying, "Well, I'm not going to list that." This is from an old Routine 3A activity of some kind or another, just followed through in the wrong time and place. There is no such provision on 3GA of any kind whatsoever – no slightest provision. The pc gives it to you, you list it. "To get rid of this headache I got at the beginning of session." Put it down, man, put it down.

You know why you put it down? He's giving it to you because it's charged up. It's part of the goals channel and if you don't write it down you won't bleed that much charge off of the bank. You're not listing goals to bleed charge, but you can't find the goal unless you have bled the charge.

Putting in oddball reality factors. One of the things in the TRs – this TR admittedly hasn't been issued at this time – but an evaluative R-factor put into the session is *verboten*. This would be a broad example: "You are such a difficult case," see, "that ..." And actually, an auditor did do just that here just in the last day and a half. "You are a patch-up case." That's not an R-factor – that's a mud ball.

Now, here's another one. Scratching goals off the list when the pc wants them off after he has put them on the list. Oh, we haven't done that for ages. You never take anything off a list. I found out that the pc would take off of lists the thing it was. But you got it onto the list by a fluke and it would be the first one the pc would take off. Well, it's the most hidden thing, it's the most withheld thing, so of course he'll look at that and he'll, "Oh, well, that really isn't a goal of mine, you see, to kiss women. That, oh, that really isn't a goal of mine." See? He'd like to hide that and he will by taking it off the list. So if you are lucky enough to get anything on a list, you for God's sakes never take it off.

All right. Now, varying the tone of voice on embarrassing-type goals. Now this has been with us from the earliest goals assessments. You must not vary your voice tone or degree of loudness for any reason whatsoever.

I'll give you an idea. [in a loud voice:] "To catch catfish. To catch catfish. To catch catfish." [in a soft voice:] "To catch squirrels. To catch squirrels." [in a loud voice:] "To run downhill. To run down ..." And you know why you mustn't do that? Because an auditor will unconsciously evaluate as to what the pc's goal is. That's the main crime.

This actually was used to keep the pc from being embarrassed auditing in a room with other pcs. He found some embarrassing goals so he said them softly. But look-a-here, the real reason that you would never vary your voice doesn't lie in that nonsensical reason, see. The real reason lies elsewhere – is it weights the goal. And you must not weight a goal. If you permit change of loudness and change of emphasis as you are nulling a goals list, then you can throw the pc's attention or belief. You can actually do an "evaluate" with it, you understand?

And it would be like this: You may have decided unconsciously, more or less, that this pc's goal was "To fly kites," you see. He always talks about kites, and so on. You've got it all figured out, there's a lot of goals like it. Auditor is perfectly all right to figure out what your pc's goal is, as long as you follow this other rule: Read them all in the same loudness and tone of voice and the same emphasis. Don't ever emphasize one goal more than another, because you'll come down the list and you'll say, "To catch catfish. To catch catfish. To catch catfish," see. And then you'll get this one that you thought was real good, see, and you'll say, "To fly a kite? To fly a kite? To fly a kite?" [in a disappointed voice:] "Oh, that's out." [laughter, laughs] That's just doing an otherness, you see, but it'll weight the goals list for the pc. He sees you are disappointed, he sees all this sort of thing. Devil with it, just do a mechanical rundown – same loudness, same pitch, same intonation.

Now, not getting middle rudiments in well. And by the way, by the way, we find out now, that because you've got good reality on them, of course, you are getting in the beginning and end rudiments very well, but you're not getting in your middle rudiments, which I think is marvelous. How possibly can you do this, you know? What are they? They're just some more rudiments, you know. They're gotten in the same way, they're the same thing. Check a session afterwards and you find the middle rudiments have been out during the session. Well, how could they be, if you've got them in, and so on. Well, true enough, the middle rudiments go out more often than the beginning and end rudiments on a Routine 3 type process. But – admittedly they do, but they couldn't be that much out, you see. If you've gotten them in four or five times in the session, something like that, how could they be out very much. And yet they have been found out.

And the next one is suggesting goals in that if the pc has done something in this life he must have had a goal to do it. You know, getting a goal surreptitiously, like, "What have you done in this lifetime?"

"Well, I was a streetcar conductor."

"Well, fine. Huh. Did you have a goal to be a streetcar conductor?"

You know why you don't evaluate for – on any goals list, and why you must shun it like mad on a Routine 3 activity? Just shun it, man, run like mad from evaluation, because the suggestion of the auditor is an alter-iveness of the goal and what is wrong with the goals channel is it is alter-ised. So you alter-is the alter-is, and when you've got that, the thing will now react till your evaluation has been picked up; and you will have the wrong goal.

You can always get a (quote) "get a goal" on the pc and look good simply by – in the middle of the session, sometime toward the end of the middle – middle of a – of a late ses-

sion, and so forth – just say, "I've noticed recently that you chew gum. Isn't it true that you have a goal to chew gum?"

And the pc says, "Well not – not really."

"You really do have a goal to chew gum, don't you?"

"Well."

"Look, you chew gum, don't you."

"Well, yes."

"Well, then you must have had a goal to chew gum at some time."

"Well, I guess I must have."

"Good."

So we put that on the list and it'll read now with a single tick and with every other indication that it is a goal. It'll read beautifully. It will check out as long as nobody prepchecks the middle ruds. And if you neglected to prepcheck the middle ruds on that goal, it will stay in much better than any other goal. As a matter of fact, it's the only goal that will stay in. Because, of course, as long as it's in, the rudiments are out.

Change one word in the wording of a goal and that goal will read at that point of word change. If you change the next to the last word in a goal and you're reading an E-Meter badly, so that the meter is actually reading across the last word in the goal, and you've changed the next to the last word in the goal, that goal will go on reading like that – right on, on, on, on, on. Every time you say it, it'll go, until of course you prepcheck the middle ruds in.

That one is particularly dangerous because I've seen it persist until the actual word that was alter-ised was picked up. You see how dangerous it is to suggest something to somebody, in any way.

You can say, "Have you had any suppressed goals?" Or "Are there any goals you have suppressed? Are there any goals you have invalidated? Have you had any goals that you have invalidated?" is a better question. "Have you had any goals you have failed to reveal?" and "Have you had any goals you've been careful of?" Of course, there's your middle rudiments. Naturally it would be coincidental: the same goals that would be out, would exactly parallel the middle rudiments. And you don't want any goals that have been suggested, so you wouldn't add that in, in any way.

Now, I'm not roasting you. I'm trying to get you to learn a lesson off of all this. And the lesson I want you to learn is actually in relationship to teaching other auditors, many of whom will do just that.

An auditor, actually, will do perfectly the textbook solution only so long as, having done the textbook solution, he has achieved a gain thereby. And if he has consistently been able to apply the textbook solution and achieve a gain, you wouldn't be able to blast him off the textbook solution with dynamite, TNT and atomic fission, see. He'd stick to it.

But where an auditor has not done a process to success, you can expect either he has not done the process, you understand, or he has – that is, he's never – he's never done a full cycle on the textbook solution even though he's trying to use it, or he has altered it in some way so that it didn't work, and so on. You will find that an alter-is-ness will very easily be introduced by the student. The student will introduce alter-is-nesses all along the line, because it's not a set reality. It's something that looks very insecure to him and something that is subject to many changes, and so on. So you actually have to ride herd on those ponies. You have to ride herd on them hard.

And frankly, it takes that much supervision. And that's basically probably why nobody could pick up a bulletin out in the field and do R3 and come up with the goal and list it out without any further coaxing of any kind whatsoever, unless he had himself been utterly sold on the idea that the earlier thing he'd been doing, Prepchecking by textbook solution, was perfect and was gaining perfect results for him, then he might tend to follow through. But I even then don't think he would. I think it takes a lot of horse wrangling.

I'm not trying to tell you that the textbook solution is the perfect solution. I'm only trying to tell you it's more perfect than one which will be evolved in one session by one auditor.

That's twelve years I've sweat over, not hot brains, but sweat over wet palms which were leaning over hot brains. The students who have been auditing pcs over a long, long period of time, and the duplication is so slight that you easily go into despair. But the duplication will be as slight as it isn't working. They are directly proportional. The less it works, the less duplication you are going to get.

Now, in that we have had things that even if duplicated would have gotten a tedious result, or a long result, or occasionally would have walked you into a box that you couldn't easily have gotten out of, don't you see, old auditors knowing this already have developed an interpolative attitude toward technology which debars their use of exact technology at the time you get up to an exact technology, you see. So that itself tends to cut it out.

The textbook solution that you're using now, I don't think you have any reality, actually, on what Prepchecking will do – maybe one or two of you have – but what Prepchecking – no, I don't even – even one or two of you – what Prepchecking will actually do on raw meat addressed straight in the direction of a neurosis.

Somebody is strictly fruit cake, you know? They go out every day in their pajamas and shoot pigeons, you know? And you prepcheck them, following the various lines and rules of Prepchecking, and use as your Have question exactly what they are doing in just this variation: They are going out every day and shooting pigeons. So, you assume that there are overts against pigeons, that there are overts against somebody who went out every day and shot pigeons, you see? You just assume the mechanics of it that they are – they have overts on whatever they have neuroses on, and you just do a lined-off of business. You haven't any idea how fast this would be. Do you know how fast this would be, if you just ran it like that? Oh, something like twelve and a half hours to a complete release of a major neurosis if you went straight at it hammer and tongs.

This person can't live because they have an absolute terror, absolute terror of traffic – complete, complete terror. They can't go uptown and they can't go shopping, and so forth. Well we boil it down, we find out – they tell us – they have a terror against traffic.

Well, it's what have they done to traffic and what have they done to somebody who had an absolute terror about traffic, you see. It's what have they done to somebody who had their exact neurosis and what have they done to the various things which compose the neurosis. And by the time you separate out all the items which might compose that particular battiness, you'll find out you've only consumed a few hours of Prepchecking. Now, they're quite interested, too, by the way – I might comment on that – they're quite interested, because you're right on a center line of fixation. How could they be otherwise than interested?

No Freudian analyst could do this in a thousand hours of analysis, for what you could do now in just a few hours of Prepchecking. I mean, you could do the job, they couldn't do the job, see.

And you haven't – certainly haven't got a full reality on how far even Prepchecking goes. But I think you do know that Prepchecking on a fellow student does work and it's swept along and it was fine, and the closer it was to a textbook solution the easier it was to do. Did you notice that fact? That the difficulties that you were having you were interjecting. Well, all difficulties are additive; one has added the difficulties.

So anyway, that you should be very aware of, both as an auditor learning a new procedure of some kind and as an Instructor working with students, and you're getting on the telephone... Somebody calls you from Lumbago, West Queensland, see, and they call you up and say, "I've got this pc in session and he just keeps screaming. What do I do?" you see? And you're fool enough to give him some directions. Well go ahead, by all means give him the directions. But he got the pc screaming by doing something unusual. He isn't going to tell you what that is because he doesn't spot it as unusual, see. And now you are going to give him some instructions and he is going to alter-is those. Well, give him the straight dope and hope, but don't be shocked if nothing ever came of it, because you are already dealing with somebody who's going to alter-is, because he got there by alter-ising. Oh yes, by all means give straight dope out over the telephone to West Lumbago, by all means, but don't be so damn hopeful about it.

And don't be so curious why it is – you will – you will start to get an incredulity in your area... You'll say, "Well, you want to know how – you want to know how – how to find a What question. Well, here's a bulletin, read it, you know. Here – here – here, read the bulletin. That's right. That answers your question all right. It's all taken care of." You come back in a half an hour and this guy has got a pc in session, and he's sitting there saying, "What?" Then, "What?" The pc says something, he says, "Thank you. What?"

Pc says something, he says, "Thank you." He isn't stupid, it's just never worked for him so he does something else, see.

Now, there is the primary barrier which you have to cross in instruction and the primary barrier of – to getting things across. That is to say you, of course, in teaching things to somebody on a set procedure, of course, are teaching something on which they have no reality

because they haven't done it. So you have to make up for that lack of reality with horse wrangling.

Just assume it's going to happen. Don't go into a decline and despair and keep your derringer oiled up to blow your brains out with. There's no point in all that. It's – just be fully prepared to be far, far more suspicious than you would ordinarily credit it ever being necessary to do.

And one of the basic things – all of a sudden this auditor suddenly starts doing a terrific job: the pcs start getting along fine, everything is along fine, and he's getting no trouble, and fine, everybody thinks, you know, you and any other Instructor around here, think he's doing fine. What magic happened? Well, he just got a reality on the process. It wasn't that his learning process got any better, see. He suddenly got a reality that what he was doing was what he *should* be doing and that by *doing* that he *achieved a reality of result*. So now he gets a reality on the procedure he is doing, so it's an acceptable procedure and it's something – after that, why, he'd say, "Well, why get off the M1?" See? But up to that he was on – he was on B 23, 42, 7, see. It wasn't M1. And he looks up all of a sudden – it's just straightaway, a hundred and twenty miles an hour, see. Now the phenomenon that takes place is that.

Now, in spreading Routine 3 you are going to run into many difficulties in teaching somebody else to do Routine 3, and they are basically composited just on what I've been giving you.

Yes, it's an involved process. Well, you say, "Why on earth – why on earth then do we do Prepchecking and these lower processes if Routine 3GA is such a splendid process?" Well, in the first – fact that the case has to be prepared, but you've got to have some security that the fellow has got a security on auditing, see.

Teach him something that will work and then make him do it till it works and then he gets this win and then after that he is willing to do the procedure which he is going to use in Routine 3GA, you see? He's at least going to do that Model Session and the middle ruds. He knows those work. Well, that's three quarters of your battle, is bringing about a reality.

Now, instruction up to this time on this planet, of course, has consisted of simply – if they didn't learn it you shot them, see. In other words, you – if a person was unwilling to learn something or they couldn't learn something, why, you just stack up the penalties about not learning it, see. You just stack them up and stack them up and stack them up. Well, their mother and father are going to throw them out in the street. They are going to be disinherited by their grandfather, you see. The school board is going to fix it up; they give them lectures about the fact they'll be digging ditches the rest of their life, you know. They'll never have an old school tie to stir their soup with, you see. And give them all kinds of terrible things and horrible fates and threats, you see, and that sort of thing.

Well, on a subject which isn't an actual subject, such as they teach on this planet, of course, that's nonsense. That is simply beating somebody's head in, and you just beat their head in and beat their head in and eventually they give up and say, "Yes, Hadrian discovered America in 1167 B.C., yes." They'll just say anything, you know.

Well, you've gotten training at the expense of judgment. You wonder why leadership amongst man gets worse and worse and why we have Nikita Kennedy and Jack Khrushchev. You wonder why these boys can't seem to make any decision that has anything to do with... I think a guy, the secretary of defense of the United States, yesterday or today, made a statement that everybody must now sign something or other to bomb only nonmilitary targets with atomic fission, see, and they were not to bomb cities. This is secretary of defense of the US trying to make a pact with Britain and trying to push it down the throats of the Joint Chiefs of Staff and other people, you see, and trying to get them to sign that they will only bomb military objectives with atomic fission.

Well, this is very, very interesting. And the British group up here told him, "Well, Britain was so small that it would be impossible to separate a military from a nonmilitary objective anyhow, so they didn't think that they had better sign the pact."

Of course, these things are bombing now at the rate of a sixty-mile radius. They are getting there up to a superbomb. Now, how do you select out of a circle a hundred and twenty miles in diameter, or something like this, the military target that's not military.

You see you have – they've invented some new protons and they're called begatrons, and a begatron, you see, avoids all nonmilitary targets [laughter] – and this is very simple. They finally got it all worked out, you see. You see, any other types, you see, they're attracted by military-type targets. So it's perfectly safe, you just throw a bomb with these mixed particles in it, you see, and it just sorts itself out and attacks the proper target, you see. And this is very simple because it's been stated by the secretary of defense, you see. That's why it's true.

How do you get stupidity like that? You get an educational line on subjects which were nonextant, see. You get nonextant subjects, you know, just dream-ups.

It's very funny, the – only the universities keep reiterating that we dream up Scientology, you see. That is their primary accusation and if you prepchecked them, they knew damn well that their subjects were all dreamed up, see.

And the medical profession, you see, says we don't know our business. [laughter] It's marvelous, you know. Why don't they wear a badge on their chest, man? And the psychiatrists say we're a bunch of quacks. [laughter] Down in South Africa, the psychologists say that we are agin the Afrikaner. [laughter] How they do confess, man. [laughter, laughs]

But the university is always yapping about the fact that we're not a science. Now, they've never even defined a science. They are just loaded with imaginative subjects. One of the most imaginative subjects you ever wanted to have anything to do with is any humanity in a university, anyone of these humanitarian subjects, or even as far as economics. If you want a walking nightmare to nowhere, why, open up an economic textbook and it says, "If the demand exceeds the greater, then the supply isn't," and all kinds of things. Other rules and laws they have worked out. Marvelous.

And if somebody doesn't pass these things, he doesn't get his old school tie to stir soup with, you know. It's pretty serious – family, disgrace, never get a job in the government, nobody'd ever pay attention, nobody'd speak to him, never be able to belong to the country club, never own more than two cars. You know, life of sheer necessity and desperation stares him

in the teeth, you see, unless he says, "The economics of huba-hubungan are all square rooted on the bugga-bugga," you know? He does, he just sits there and he says this. Some guy got A on the subject, economics, A. And you ask his advice on an investment, boy, have you had it. [laughs]

They say you never take legal advice from a modern lawyer. More business men have told me that, successful business men, legal advice, you don't take – ever take legal advice from a lawyer, and never take financial advice from an accountant or economist.

Well, what are these guys supposed to do? Well, you just – I don't know what they are supposed to do, but men who have succeeded never take advice from either one.

Pretended subjects. Well, you see you have to keep after somebody with a club and an axe on a pretended subject because he never will get a reality on its working, because it doesn't work and it doesn't go anyplace. So if he never gets a reality on it, he, of course, will never do it and you just get further variations of it, but you have to use the most fantastic duress to even keep him in a classroom going through this subject, you see?

Look at the amount of hidden and covert duress, social punishment and other things connected with education. Well, it has nothing to do with judgment, it's – you memorize the text, why, you are all set.

All right, now, we are in conflict with this because many people in Scientology have been educated this way and know the falsity of it. Now, we all of a sudden ride up alongside and we say, "You do exactly this, this, and this with no variation, goddamn it," and it looks like the same thing. But look – look, there is a difference – there is a difference, because all of a sudden the duress is removed. It's actually removed at that time when – it's the same thing – Instructors and I are always having the same type of conversation. "Well, can he do it?", you know. "She can do it. He can't do it yet," see. This is about the gist of these conversations. "Well, what part of it can't he do," is a secondary consideration, but we all want to know, "Can he, or she, do this final operation?", see.

Well of course, we know he or she can do the final operation because he or she has got a consistent, comfortable result and because they are not inventing all of a sudden. See, there's not a bunch of newnesses and alter-is-nesses coming up. It must be working for them, you see? And then they get very comfortable about it, and they look more and more comfortable about it. You've been over the jumps – some of you – on this already and you notice there is suddenly no pressure on you.

Well, it isn't that you have been grooved into something by hypnotism or something, but your reality was substituted for the duress. Well, isn't it funny that your reality could have more power to hold you on a groove than the duress. Well, of course it could, because you're getting a result and if you're getting a result, then you are able to accomplish what an auditor is doing, and that's the way to get a result. You've already had the reality of not getting a result some other way. And so you say, "Well, that's it and that's fine," and you plow through.

This has a great deal to do with Routine 3GA, or a Routine 3 process, because I'll call something to your attention; when a person's goal has not worked, the individual has done something else. And listen, that's all the trouble there is with him. He didn't follow – he didn't

do what he said he was going to do, you know? He had a goal and he – he had a goal to play a piano so he started throwing eggs. He had a goal to farm, and so forth, so he went into the city and got a job in the telephone office. That's all that happens to him and now he looks sadder and sadder, and more and more apathetic. He isn't winning in life, you see, and so forth.

It's actually very easy to make somebody's life a complete misery and disappointment. Just carefully find out what he's supposed to be doing in life, what he thinks he's supposed to be doing, carefully, and then use all of the bulldozers you possibly can to force him to do something else. And he is going to be an aberrated mutt, man.

You never quite saw as much aberration scattered around the wits of some poor kid whose parents have had great expectations. You know they do it – they do it with a smile and a kiss, you know, as they push the poniard in the back.

The child, unfortunately one day, this thetan one day picked up this body whose aunt was a successful actress. And because the aunt has the fortune of the family and everybody else, why, this kid finds that she is about to become an actress. Now, this is wild, you know. And the further they go in life – the further this person goes in life – the unhappier they get. And they might even make a third-rate actress, see, but it would be a very nutty actress.

That's all you'd have to do, you see, to produce all manner of collision and upset. That is below the level of impact, below the level of knocking people out and hypodermicizing them and electric shocking them and giving them impacts and working the love-hate cycle and betrayal and dialectic materialism and psychologosis and all other aberrated practices besides making them run through rat mazes and pick up cheeses and other human activities. Yeah, yeah, you can produce a small amount of aberration that way. But the basic method, I'll tell you right straight off the cuff, of producing a nice, big, juicy aberration, see, is this character has got a basic goal, and it goes this-a-way. And then you stand over him with a cotton-picking club for years and get all of life standing around with loaded guns making the person go that-a-way.

Not – not bunk – you know, not just say to the persons, "Your goal is wrong," and resist his goal or oppose his goal. That's not what I am talking about. No, just make him do something else. It has to be complete departure from the goal. Now, his whole life is an alter-is-ness. His whole life is based on a falsity. And some of you sometime or another will find out that ... Well, we have already had a student who had a goal – I think something on the order – of "Never to be a doctor," and so forth. Here and there you will have some student with a goal which is diametrically opposed to being an auditor.

Well, it's perfectly all right in Scientology to use a club on him, man, to push him into line because if you are doing anything like a good job, the next thing you know, why, you are doing Routine 3GA or some even more advanced routine. Naturally you've picked that up, so there is no liability to it whatsoever. You get the idea?

We are talking about the business of livingness. Let's carefully badger little Rollo until little Rollo has decided unequivocally that he is going to be a streetcar conductor. And now fix it up so he becomes a naval officer. And then wonder why it is that he drinks or wanders in and out of jail or gets this or gets that or gets the other thing and that he just keeps being on the skids all the time.

There's one for the commies. I suppose one of these days they – I doubt that they will ever use that though. They couldn't duplicate that well. They probably would duplicate it like this, that you let everybody do exactly what they want to do and that will spin them in. And if we – I guess if we convinced them of this, why, everybody would win, you see.

We probably ought to tell a psychologist, "The trouble and the real cause of aberration, you see, the real cause of aberration is letting people do exactly as they please. And if you let them do exactly as they please, you see, spin them in, ruin them, absolutely ruin them." Textbooks out, "How to do as you please," you know. [laughs]

The results of duress, force, energy, smoke and all the rest of it, of existence, are expressed from – departure from a basic goal.

Now, nobody would do any auditing if he didn't have a desire to help his fellow beings. That's a rather basic and fundamental goal, not necessarily the goal, but it is certainly part of a goal. Furthermore there is sometimes in the background – there is a feeling that one doesn't deserve to be helped and one – unless one can help a bit. There are other feelings of this character. These are quite fundamental fundamentals, and factually they override – auditing overrides these rules just as it overrides human aberration.

I can think of times when I might have had a goal, "Never to be an auditor." You walk out of session, you know, and you've had – you've had everything crossed up one way or the other. Never again. Next guy that walks in the front door of the base, the easiest and best thing to do is simply put a trap gun there. And yet when the doorbell would ring, why, you say, "Hello, come in, sit down."

But therefore, you show somebody a positive channel which does help another and does bring about a realization of those more fundamental, humane goals and they will follow that channel. They will do what will help. But they actually don't want to do it as long as they feel it won't.

Now, they feel it's going up against their various goals, like it's deriding and overthrowing their individuality and it's doing this and it's doing that.

But that, in essence, is what we are trying to do in Routine 3GA. You could therefore expect an enormous amount of alter-is-ness on any process, and particularly on something which is straight against alter-is-ness, such as 3GA. So you have to be very careful in doing it, to do it very precisely and very simply without additives.

And in teaching it, you have to make awfully, awfully sure that it doesn't get altered every time you turn around, and additives are entered into it. They will be entered into it even before they are needed.

And therefore this is climbing Mont Blanc on a Sunday afternoon, you see, on the wrong side. It – people in doing it, of course, maybe going up against innumerable factors, all of which tend to compel them to alter the way they are doing it, and so forth. And all you have to do is just hold your course steadily, then you see that it did work out.

You actually finally are sitting there one day and you – every time you say a goal it goes tick. You didn't believe it could ever happen, you know. You really didn't know up to

that point that you didn't believe it. And you say, "To catch catfish," tick. "To catch catfish," tick, what? "To catch catfish," tick. "To catch catfish," tick. Check it all out, get all the evaluations and invalidations and everything else off the thing. "To catch catfish," tick, "To catch catfish," tick. Hey look at this, you know. You feel like getting your fellow auditors over to take a look at this thing, you know, looks pretty remarkable. And yet all the time, why, you intellectually knew that that would happen, but you hadn't seen it.

Well, if you get at it in some circuitous route that you yourself didn't quite understand, the next time you do it you will try to duplicate your own route. And you can accidentally find one of these things about twenty out of a hundred without following the rules. Trouble is, the rules are securing to you the other eighty that you wouldn't find with an oddball procedure, you see. It isn't that you will never find one with an offball procedure, it's just eighty percent of the time you won't with an oddball procedure, you see, that's the difference.

Well, the do's and don'ts are: do the procedure, do it without alteration, run your session without additives or interjections, just relax and pilot it on through and at the other end you will all of a sudden say, "Hey, what do you know."

The little girl who doesn't believe that she can make a cake and doesn't believe the recipe will end up in one, seldom does make a cake. And if they do, it will be quite remarkable.

4 dozen eggs,

3 pounds of sugar,

1 cup of flour,

1 bottle of vanilla, [laughs]

2 shakers full of salt.

See, it's on the basis that you can't make a cake anyway, so how you make it isn't really necessary to know, you see.

And then you'll see some old lady with – somehow off in the Middle West on a farm or something like that. And she's apparently doing something else. And you hear something hit the bottom of a pot with a swish, swish of beating up something and something of this sort and all of a sudden there's a cake and a couple of pies on the table. They are perfect, they are absolutely delicious.

And then she is the other extreme. You say, "What's your recipe?" And she damn near goes mad trying to think of how she does it.

It will work that way with you someday. Somebody will come along and they'll say, "Well, how do you do Routine 3GA?" You see you haven't seen a bulletin on it for years. "Oh well, uh – let's see, well, it's very important – uh – to prepcheck your rudiments. That's very important to prepcheck your rudiments. That's really how you do it, and to null everything out until you get it. Yeah, now you understand. Okay? All right, thank you."

And people will sit there and look very baffled, you see. And you'll say, "What's the matter with you? What's the matter with you? Haven't I told you adequately? Haven't I told

you adequately?" And then some timid soul lifts his hand, one finger, you know, "Do you use an E-Meter?" [laughter]

Okay, take a ten-minute break.

QUESTION AND ANSWER PERIOD: GPMs, RELEASE

A lecture given on 19 June 1962

All right, this is second lecture, June what?

Audience: 19.

Nineteen, AD 12 and it's a – this is a Q and A. Gag. Questions? Yes?

Male voice: Uh – in the lecture last week on listing, you – uh – mentioned that the second goals list would be shorter than the first one.

In the lecture last week on listing, I mentioned that the second goals list would be shorter than the first one that was done.

Male voice: or words – words to that effect. Uh – I sort of thought that you took the original goals list and added to it for the – to get the second goals list.

That is not a settled fact we are talking about.

Male voice: I see.

We aren't far enough advanced on second goals to make very sweeping statements concerning whether it's longer or shorter, whether there's any virtue in using the first list, or otherwise. I personally would simply take off into the blue, run the TA action out of the listing – on doing the second goals list. That way we'd be sure would be fairly right.

And if we didn't find the goal on it, then we'd take the first one and the second one, see. But the easiest way to do it would just simply be to list some more goals and take the TA action out of it. If you find after a person has had the first one done – the first goals list – and it's come down to a goal and then that goal has been adequately listed and it's now not acting and everything is fine, you've got a sporadic or free needle on the case, you'll find now that the person does have tremendous numbers of new goals. And you'd have to take advantage of those things anyway.

So the simple way to do it is why make the thing more complicated than it is until we find some reason why we should make it more complicated. Which is you just take the TA action out of the goals list – make them list goals so you don't get any TA action anymore. They think that goals list is complete, null it, put any additional ones that they want on it, come down, find a goal, check it out. If you find a goal and it checks out and that's fine, and if you've got it, why, fine. If you haven't, you've still got the first list. Maybe work that one over.

But this is – this is to some degree a guesstimate. Okay?

Male voice: Yes.

All right. Yes, Tom?

Male voice: I'd like to know if you get tone arm action if the rudiments were out, on listing.

If you get tone arm action if the rudiments are out, on listing. I'd say that was fantas – very, very doubtful.

Male voice: Thank you.

Okay.

Male voice: Ron, what might be the liabilities of running Havingness while shifting lists – lists of items?

What would be the liabilities of running Havingness while shifting lists. If Havingness is run in a Prepcheck with the What question null, it has no liability. And in a Routine 3, Havingness run as you shift lists would only have a liability and it could have a liability, if you hadn't even vaguely exhausted the list you had just left.

Male voice: Okay.

And if you had the pc way back down the track someplace and you all of a sudden uncork a lot of havingness, wow! See. It might be very poor indeed. Might throw him.

I'd say, that this would depend on how much TA action you were leaving. As a matter of fact, I see no real reason to run much Havingness between lists unless your pc is just – seems to be going out of havingness every time you turn around. If a pc's havingness runs down ordinarily their rudiments are a bit awry. That's another little side rule that belongs there as an addendum – pc's havingness going down.

Of course, you mustn't go around worrying all the time about the fact that the pc's rudiments go out. So they go out. So you can put them in. The thing you worry about is that the pc go on listing smoothly. See, you start getting worried when the pc's listing smoothly...

There's something I'd like to comment on. Some people are doing a fish and fumble halfway through a session of listing or a session of goals or something. In other words, they take a – they see that the needle gets dirty so they start doing a fish and fumble and it's half-way through the session, something like that.

If you're going to do a fish and fumble to clean up a needle on a Routine 3, you do it at the beginning of the body of session. And if that needle occurs – the dirty needle – and it gets rather unreadable and that sort of thing, try to get it in with your middle rudiments. And if you can't get that needle cleaned up with the middle rudiments – right away, you know, nothing laborious, nothing superweighted – your best bet is to go on listing.

But if you're nulling a goals list at the time this happens and the needle gets so confoundedly dirty that you can't do anything about it and you can't read through it and so on, don't fish and fumble. Don't fish and fumble; shortsession it. Put your middle ruds in. Needle's still dirty, still messed up, you still can't read it – go right on through your end ruds; end the session; give your pc a little break; start right in at the beginning of your next session; put in

your beginning rudiments; and you'll find somewhere along the line that you're going to catch the reason why.

But I really wouldn't be too quick to take extraordinary action in nulling. Because I have seen too often a goal persist in its read.

Let's say a goal rock slammed. Goal rock slammed. Now, do you know that your next five goals are going to read for that goal? Yeah, I mean there – you shouldn't worry about this. You'll find this in doing a Prehav Assessment. You'll be coming down the line with the Prehav Assessment and you unfortunately read "killed" or something. And my golly, the next five levels are all going to rock slam just like "kill" did. In other words the pc's stuck on a rock slam read. It was a heavily charged area. So that that dirty needle coasts right on over the next few items.

So you hit a goal, "To kiss girls," and it rock slammed like mad and now you've got a dirty needle, see? And you can't do anything – you apparently... You get your middle rudiments in and so forth. Now, what's wrong with this? It was actually a rock slamming goal. Well, a rock slam persists. And a rock slam will go over your next four or five, if you just kept on going. In other words, you never got off of the goal that you were on.

Now, the best thing to do is call their attention to a room object. If you want to turn it off, if it's going to turn off, this would be your first thing to *do*. And this is a common thing to do in nulling. This is not unusual. This – we've been doing this for a long time except nobody's just called it to mind recently. You hit "To kiss girls," rock slam, you're going to see a little tiny rock slam. Looks like a dirty needle, you know, there it is, *jiggle jiggle-jiggle-jiggle-jiggle*. "To catch catfish" *jiggle-jiggle-jiggle-jiggle*, no change of the needle. "To run horses." No change of the needle. Can't read it, see you don't know whether it's in or out or something like that.

Well, if you're real good, you remember where that turned on. It was, "To kiss girls." And to assist the auditor in catching up this bug, we used to put "R/S" whenever we got a goal or an item that was rock slamming, we wrote "R/S" after the thing. That was in case – well, it was to help us track goals originally. But it also served this: That was in case you got a persistent R/S. So that the one after that and the one after that and the one after that and the one af – they all R/S. Well, what's R/S? Well, you know where to start in again to pick the thing up; go to the next one after the R/S. Don't read the R/S again because that's just going to give you R/S. Take the one after the one you've marked "R/S."

But what do you do? What is – what was the old solution for this? And that was to say something like this: "Floor. Floor. Floor. Floor." Use a null word. Preferably a room object. "Floor. Floor. Floor. Floor. Floor. Floor." The rock slam turns off and you go to the next one after the one you marked "R/S." It was quite a little drill and I see now that you're having to fish and fumble in the middle of a session. I'm sure all you are running into the persistency of a tiny rock slam. And it's not really a dirty needle. It's the fact that you've got a goal that read with a rock slam – tiny rock slam. And of course it's persisting right on through.

If you went on ten or twenty levels, it would also turn off. It would also turn off. It's a symptom, by the way, of an insufficient number of goals. If you're getting this thing stuck up

like this and you're getting this rock slam that goes like this and it turns on and won't turn off, you haven't got enough goals on the list. It would be the first thing you would think of.

But when you see one of these little tiny dirty needle rock slams, you know, this is *g-b-z-z-z*, something like that and it turned on with something and you saw it turn on, write "R/S" after the thing. And if the next one that you read, see, it was, "To kiss girls" *b-z-z-z-z*, see, mark it "R/S." And then, "To catch catfish," and man, that R/S is still on, don't be so im-perceptive as to realize that this isn't just a persistency of read on something you have just read.

Now start saying, you know – it's just, "To kiss girls" *b-z-z-z-z*. You write "R/S." "To catch catfish," and it's still going all the way through and at the end – *b-z-z-z-z*. See, it's just consistent and continual. It'll just go right on going *b-z-z-z-z*. You say to yourself, "To hell with it," and you say, "Floor. Floor. Floor. Floor. Floor. Floor. Floor. Floor." And all of a sudden the pc says, "Floor? What floor?" You know, "Floor? Oh, floor! Heh-heh! Yeah, well, thank you," you know. "Floor, yes." And your rock slam will turn off.

Now, don't read that R/S goal again, go, "To catch catfish" and you'll get your proper read on, "To catch catfish" which is one of the easiest ways to put this little phenomenon back on the rails that you know of. That's the proper way to handle that sort of thing.

What was your question originally, Jim?

Male voice: The liabilities of running Havingness when shifting lists.

Yes. Well, your liabilities of running Havingness on shifting lists comes under the heading of having the pc back on the track, well in-session and calling his attention out into the room environment and getting him kind of madly out of it all and so forth.

However, if your needle is persistently dirty and that sort of thing, you've probably got down havingness going and so forth and it wouldn't be any liability to it anyway because the pc probably isn't in-session anyway.

Now, that's a form of Havingness. This is how I got off onto it. "Floor. Floor. Floor. Floor. Floor. Floor. Floor. Floor." Thought I'd call it to your attention, because on marking folders this has been called to mind in the last day or so.

Male voice: Thank you.

Okay, you bet.

Okay, what other question is there that I can diverge on like that? Yes, Quentin?

Male voice: You mentioned in the previous lecture, a possible new rudiment, "In this session have you made any decisions?" How would uh – that cover any decisions made prior to the session?

Well, "Since the last time I audited you" is a characteristic, of course, of the beginning rudiments.

Male voice: Uh-huh.

And, if decision went into the end rudiments, it'd probably go into your Prepcheck of the mid rudiments list.

Male voice: I get it.

And, you'd catch that every few days anyway. And I wouldn't try to strain at it too hard. But there still, as you say, there might be some virtue. But you couldn't use it in the end rudiments. You want to know if he made any decision in the session. They do. They make decisions. Not to go into that goal channel again. Not to hold the cans this way. All little odd-ball things.

Actually, they all constitute a type of withhold. But if it went into the end ruds, it'd probably go into the Prepcheck list, so that every fifth session you'd be picking up those interims anyhow. Okay?

Male voice: Uh-huh.

Right. Any other question? Oh, I don't think you're that well informed. Yes, Jack?

Male voice: Uh – this fifth session, is that based on the fact of a two hour ...

This, this ... ?

Male voice: This uh – Prepchecking every fifth session. Is that based on the fact of a two-hour session?

That is based on a two-hour session. Prepchecking every fifth session is based on a two-hour session – based on what you were doing. Then this would be considerably different in an HGC.

Male voice: Yeah.

But it still – it would mean a Prepcheck about every second day. Yes. Okay?

Male voice: Thank you.

Right. Yes, Tom?

Male voice: Uh – as far as uh – completing the goals list, can we expect any uh – help as far as the tone arm's concerned ?

In completing the goals list can we expect any help as far as the tone arm is concerned. Anything more?

Male voice: Well, I was looking at also, the other thing that stuck me – would there be any good between that and the rudiments being out? Because any time, as I mention, the rudiments go out, how would one determine which was which, if we did get help from the tone arm motion of slowing down like flattening out?

Go over that last again, now. If we did get ... ?

Male voice: The first thing I was interested in, what help could we get from tone arm motion as to telling us when the list was complete? Would it help us any?

What help could you get from tone arm motion telling you the list is complete? Well, in the first place by the time you get up to R3, you should have a good security as to whether your rudiments are in or out.

Male voice: Yes.

You should be able to know that rather easily.

Male voice: Yes.

If your rudiments are in and you're getting tone arm motion, then of course the list of goals is not complete.

Male voice: Yeah.

If the rudiments are out and you're getting no tone arm motion, of course you would just expect to get the rudiments in. But in any event, a checkout of a goal is a little bit late to find out whether or not you've got the goals list complete, so you probably should be very careful in prepchecking at the end of your goals listing. And that'll make sure that your stuff was in and all was well and so on.

Ask if there are any more goals and the fellow ponders for a while and gets a quarter of a TA division change. You know your rudiments are in. So you know there's more goals. You ask him for more goals and the needle flies around – that's the best way to read it. And you say, "Well, is this list complete?" and the needle flies around. You say, "Is this list..." and the needle flies around. You say, "goals" and the needle flies around. You say most anything because, frankly, it's not very critical – it's an open and shut proposition if you're going to get any help from a TA action.

An incomplete goals list is terribly incomplete. And with just one more goal on it, it's complete. See, it's not necessarily quantity of goals that makes it incomplete, but it's whether the goal is on it and therefore that channel is sufficiently discharged.

All of the rules of Routine 3GA are based, now, on making it very easy to find a goal. And all activities of earlier Routine 3s, unless restated for 3GA, should just be forgotten. Just forget those earlier activities – just skip them because 3GA goals listing is not in an effort to get the goal on the list, but to permit the auditor to find it, you see. And there are other little changes of this particular type.

You'll get TA action if the goal isn't on the list and your rudiments are in. You'll get TA action. And with one more goal on the list you will cease to get TA action. It's not a quantitative additive, see. Yes?

Male voice: If you have run one goal, once all lines have gone null on – on the thing, the goal is gone, the lines are gone, the needle's sitting on Clear read and free, uh, you – would you expect it to stay free for any length of time ...

Uh-uh.

Male voice:... or does pieces of the GPM fly back in or ... ?

Well, I wouldn't expect it to stay free at all.

Male voice: Uh-huh.

You're saying now, if you've listed a goal and TA's come down to the clear read and the needle has gone free, would you expect it to remain free? *No*. The answer, definitely not by the mere fact of breaking the Auditor's Code and overlisting. You may – got a free needle, so you list the next list, see. You read the question of the next list, "Who or what would want to catch catfish?" and you don't get any interruption of free needle and if you ask for one more item on it, it's a – it's a break of the Auditor's Code.

Now, by asking for one more item on it – this is what I'm getting around to here – for asking for one more item on it or two more or a half an hour's worth, you all of a sudden are going to get yourself a pretty wild needle. It is going to get wilder than scat. It's probably going to have more read on it than you've seen for many a day.

What exactly is happening? The pc is being obliging and is hauling chunks of the GPM on. And you could overlist a free needle and overlist it and overlist it, until you had the whole thing stuck up like a circus poster after a wind storm, see. It'd just be a mess because you pulled in the GPM.

So because you can pull in the GPM early on, so easily, you shouldn't have any difficulty whatsoever in cancelling out that free read with a new goals list. Now, that means of course that the pc, just living in their environment, going to be able to key that in like crazy, because they got a bunch of new goals. But actually they aren't new goals, they're earlier goals.

Now if you see the GPM as a series of cycles – you ever read *History of Man*? All right. Now, *History of Man* talks about cycles on the whole track. This would be a pc in a new environment dedicated to a new activity, going through a whole bunch of new nonsense and experience and so forth, would be a complete cycle. Then he changes. He changes his activity. And he goes over here and he becomes something else in another area and dedicated to other things. Well, that stays relatively keyed out. But that first area could have grouped and become – that first cycle could have grouped and become a piece – a piece of the track GPM. It's actually a cycle GPM, see.

All right, and then he's got this next GPM up here. Now, what you've actually found when you found the first goal, is something that is relatively new. You have found the basic postulate on usually some track piece of a cycle. Just a cycle, see. You found the earliest basic purpose of the cycle. Now you, of course, have got all the cycles earlier than that yet to clean up. So if you overlist, just in an effort to be cooperative and so on, the pc will start coasting backtrack. You see, he starts to make something out of it. And the second he does that he starts pulling in earlier track, see? All right.

Male voice: I didn't communicate one thing, Ron. I wasn't talking about overlisting, I was talking of blowing the one package. The first package is gone.

Well, I'm talking to you about how you can get the second package in.

Male voice: Oh, I got it, I see. I get it. Oh, I'm sorry.

See? Now, you can get your second package in, in livingness, by overlisting and so you sure get it back in that. And there's probably nothing more delicate or easier to cancel out than the first package's free needle. That's the only point I'm trying to make with you. And I was just trying to show you how it is cancelled out. You can cancel it out numerous ways. Fellow has a perfectly free needle, he's had a free needle for days, he feels wonderful, he's up on Cloud Nine, he sails around without even a rudder, he gets up in the [laughter] – he gets up one morning, he gets up one morning and sees a glass of water alongside of the bed. You put him on the meter and he reads 6. What was it? Well, God knows. It just happened to be an earlier piece of track. It might have been the time she poisoned all the boys or something like this. But it's – it'll just go out, just like that.

That's what happened on your first Clears. See? And some of them stayed quite remarkably stable. Went along for quite a while. And some of them folded up by the next day, see. And that was just all because there was earlier track. You'll eventually get back to some rock goal, some goal around the rock someplace, the first time he decided to be or something like that and it'll be something way early, native state transition sort of goal. And after that you could hit him over the head with a club, shoot him with a shotgun – free needle. Free needle. You couldn't get anything but a free needle. And it's just going to take them ages to get into a state where they could gum it up now.

You see, the reason you get a – you know, you all get a very weird view of what livingness can do to a human being in Prepchecking. Well, you find out this little girl, this little girl actually made an improper remark at a dinner party. And it's ruined her whole life! And life begins to look to you from a Prepcheck viewpoint, you know, like man, you've just got to walk through with your breath held, you know? And that's life, you know? And if you just hold your breath just right, then you're not going to get aberrated much, you see. And it looks from a Prepcheck viewpoint as though aberration is much easier to acquire than dandruff, you know? [laughter]

So you – and then when you start blowing off pieces of the GPM, you recognize that all of this stuff – which you were getting in Prepchecking – depended, of course, for all of its force and power on the GPM. And with the GPM gone, of course it doesn't have any force and power. And a person's viewpoint becomes just as exaggerated in the opposite direction. And you could measure how long somebody's free needle would stay free by their somewhat exaggerated ideas of what wasn't aberrative. See, you could make a little test. This is all on the same line.

You could say to a person that you're prepchecking, "What would aberrate somebody?"

"Well, making an improper remark to a hostess at a dinner party. You could become very, very aberrated through having been acquainted with an aunt who took sleeping tablets. Having a mother who loved you too much, yeah, these'd all be sources of aberration. You see, this'd drive a person crazy."

And if their free needle's going to stay stable, their answers are much more likely to be in this classification: "All right, what makes a person aberrated?"

"Well, that's hard to say. It's his own Goddamn foolishness, that's – that's – that's – that's one of them."

"Well, all right, thank you. Thank you. What would make them aberrated?" You say to him – foolishness?

"Oh, I don't know. Let's see, you could find somebody who was trying to get out of this universe and then you could torture them for a long time while saying to yourself all the time that you were not responsible for doing so – no, that wouldn't make somebody aberrated." [laughs]

You get the idea? Well, similarly, the key-in is as delicate as this. See? The glass of water keys them in on that first goal, you know. Oh, that brings in the whole GPM, everything is going to hell. And later on they're in an automobile accident and they were standing in the middle of the street – if this would happen, which it probably wouldn't, you see. But they're standing in the middle of the street and got hit by an automobile or something like that and you put them on the meter and they've still got a free needle.

Relative stability would be length of duration by which they could retain a free needle. You want to know relative state of Clear would be relative time that the needle stayed free. That's just answering and over-answering your question, but there it is. Okay? All right.

Any other questions? Yes?

Female voice: Yes. I have something about this – the length of these cycles. Could one – like a sort of a Prepcheck to find out how long ago it goes back?

All right. You want to know about the lengths of cycles ...

Female voice: Yes.

... and how about a Prepcheck to find out how long ago one goes back?

Female voice: Yeah. If that overlaps with other track.

Well, you can read all this off on a meter. You could actually ask people how long they've been here and how long ago it goes and you can use old electropsychometric auditing techniques that are given in that first earliest, earliest, earliest book on the E-Meter and check out pieces of track and find out how many years it responds to, although what's known as "year" we haven't a clue. But the reactive mind seems to know all about it.

And the – you could check all this up and get your responses off the meter. You could do this. And you could plot out the length of each cycle. And the funny part of it is, is you will get most of them. You would probably get it very well plotted.

What you want to do is take *History of Man* and about five yards of adding machine paper and write figures on it one way or the other. You'll finally come up with a track map. You get a track plot and then you would – you would have it fairly straight.

The oddity is, is you could do this without the GPM being gone. That's what is odd. I mean, you could do this over the head of the GPM, which is quite remarkable. Don't expect your pc to have much reality on it and don't expect a lot of other things, but you actually could do that and find out how long the cycles were and everything else.

Now on the other hand, there's another way to go about it, is you clear them with 3GA, you see. And you get them so Clear that you tick them on the shoulder and they ring for hours, see, and then you just ask them. See? The information is very available.

Female voice: That would collide with the free needle then? On that particular goal ?

Yeah. Well, if that – if that section of track has no further bunchings, groupings or masses which have been accumulated by alter-is, it'll read free needle.

Female voice: All right. Thank you.

All right. But if you're going to investigate track with an E-Meter, then you do it before you fully clear somebody. Because you're not going to do it afterwards. You have to have very aberrated banks before you can really get data. Unless you ask somebody.

Okay, any other – any other questions? Yes.

Male voice: How many packages would one have to run or would there be a fixed number of packages to be run, before the person really goes Clear?

How many packages will the person have to run to get Clear? All right, term "package" is Routine 3D. Hope you realize that. And it has no existence in 3GA, so let's – not scolding you – but let's – let's omit that. A package, we mean by a package, we mean the opposition goal and the terminal and all that sort of thing. We're not finding them today.

Now, how many cycle GPMs would you have to run out? I don't know. It's a very finite number. But I wouldn't know. You couldn't even, I don't think, guess from pc to pc. It's going to vary. Look at the life you've been leading, see. All right, now compare the life you've been leading to the life that somebody else has been leading. Now, have you ever run into a case which was basically just all free track? You know, you tell them to go back down the time track, you ask them to look at the picture and they tell you all about it? You ever run into such a case? All right, did you ever run into a case of, ask them to – what they're looking at and they tell you it's all black as night and it's never been any other way, except for this little rocket that's going from left to right. See – you get the idea?

All right, there are two factors. One is *severity* of immersion into the GPM and the other is lightness of experience. These are each two different factors. You could have somebody with light experience who's thoroughly immersed into it and totally jet-black. Now, they'd clear up awful easy. It's a fact; you could have.

Then you've got somebody else with tremendous amounts of experience, lots of – lots of cycle GPMs and so forth, only for the last cycle, he's rather new on the cycle and he doesn't int – he doesn't tend to be smeared up in anything. It's all just free track and three dimensional color pictures and so forth and you say...

All right. Now, this is a fooler. Because this bird is cruising along and you say, "Oh, what an easy case. There's nothing to this case, see." *Crash!* See, and we're back into the lineup and *crash!* Here we go again and there's horrible somatics and everything goes black and the person is totally *appalled* because everything has gone black. Now they know they're getting *worse* and everything ...

And then we find out that it takes three times as long to clear the free track person than did this black five that could never move an inch on the time track, see. These are the oddities you run into. I wouldn't know of any way of estimating it, for this reason: Nobody shows the total aberration of which they are track-capable, see. Nobody shows this much aberration. They never show as much aberration as can be keyed in, man. Impossible! And it's going to vary from person to person, case to case, so on one person you do twenty packages – I use your phrase – another person, why, you do fifty.

Also, this factor enters into it: The thoroughness with which the auditor is working. Some auditor is being a little bit sloppy and he goes three cycles. And he just gets three GPMs of a cycle-type out of the road and off the main GPM very easily, see. Beautiful job of it. Beautiful job. And then he says it's so easy, now, that the fourth goal he finds, he finds very sloppily while the pc is being very insouciant and he's being cross-eyed. And he didn't check it out. He didn't add it up. And it's the wrong goal. It's a really wrong goal. So he lists it. So the case goes *zzuupp!* Thud! Crash! Black mass, where is it? You know, what wall?

The remedy for that sort of thing is to find the right goal. But you see, auditing would also tend to produce a variable picture. When we have four or five thousand cases in the racks, why, we can add up a statistical average. But I think the statistical average will be filled with so many variables that it'll be worthless. Some people live 'ard. And some people just haven't had a chance to. [laughs]

Okay? Answer your question? All right. Yes?

Male voice: Ron, what is the definition of Release and what test can you make to ascertain whether a person is a Release?

Oh, the whole subject of Release is a very easily covered subject – is, is the person better by reason of auditing and does he know it? That's a Release. In the first place, unless he's been released from some chronic difficulty that he considers – then he won't consider that he has been improved, because his attention is sort of thoroughly pinned down onto the chronic difficulty that until he has gotten out of that he won't admit to having gotten any better even though you may have cured him of a dozen other things.

So, a Release, purely and simply, is a person who has obtained results in processing and has a reality on the fact that he has attained those results. That, severely, is the definition of a Release. Now, when you try to subject this thing to a test – which can be duplicated in HCO offices for some sort of an award or something like that – you run into a difficulty. Because you don't want this sort of thing whereby you walk in – somebody walks in and says "Well, I feel much better by reason of my processing."

"All right, you're a Release, thank you."

The guy – it isn't necessarily true. They might just be hitting a manic at session end. I've never seen anybody so *deliriously well*, now, as a psychoanalyst I audited one time and she stayed "*wonderfully, wonderfully well*" for three days. Then she really fell on her coco. Coconut milk splattered in all directions, practically. She just sailed into the middle of a manic point, you see. Dramatizing like crazy. So, that doesn't give you anything.

So something of the idea of a stability of gain enters into this when you talk about testing. And it isn't something that an auditor would release – issue; he wouldn't issue an idea of having released the pc at the end of session, you see, or even perhaps at the end of an intensive. He'd let it cook for a little while. But he'd have to figure some way to ask just these two questions so that he wouldn't get an offhanded or unreal response, is: "Have you had a distinct gain from processing?" and "Do you have a reality that you have had that gain?" see. "Do you know Scientology has made you better and are you better?" That – that is it.

You see, it's one of these things that's overly simple. It's so simple that it's almost impossible to – well, you can't issue a perfect test for it. You'd have to put the person on the E-Meter and find out if they were telling you the truth and you'd have to do a lot of other things to have the perfect test. But that is a Release and that has been a Release just absolutely for years and years and years. But it gets fancied up. And what you see is a release form that has to be filled in to tell whether or not the person is released. Well, actually it's just trying to be secure in getting an answer to those two questions, whatever the form is.

And you'll find that a person who has not had any improvement because of auditing and who has no reality on that fact, basically, well, could be in propitiation, you know, and could be in some other state of mind. But you'll find that that person – they're never – not really very safe to have around. They've been audited for quite a while and they haven't had any gains and so forth and, "What is all this?" They – these are the people that give you trouble and so forth.

Why is that? Well that's because, of course we know now, they have withholds and missed withholds and things of this character. You know, a missed withhold can throw somebody down into propitiation.

Now the earliest statement of release is about 1952 and it's simply: The person knows he won't get worse. So you could add that as one of your requirements for Release and to get the full historic picture. He knows he won't keep on getting worse now. And you can achieve a Release rather easily on some people – just, you can break up a neurosis with ARC Straightwire. If you get somebody that's real bad off and it's what wall and what bank and you run a little bit of ARC Straightwire on him and all of a sudden it clears up and they've got some hope and they know they're pointed in some right direction.

Well, if you were then assured that that improvement would be stable, see, through waiting a week or two, why, you'd have a Release. Do you get the idea? All right. If you've – if a person has improved, by the way, by auditing – just to lay it on – if a person has improved by auditing, you've got one other factor here. You know that their missed withholds and that sort of thing are fairly clean and that you won't wake up some morning with a poniard sticking out of your abdomen. Looking down and finding poniard hilts in your abdomen, I don't know, you've probably done it yourself, but it's uncomfortable. Not that one feels that one is going to be struck at every time by other people, I'm just giving you whether their...

You'll find somebody who has not been to this exact definition a Release and they go along, just fine, for three or four months and pat you on the back and that sort of thing and then give a story to the newspapers and you wonder what the hell's going on here. There's no stability.

You see the value of a state called Release, then? You see, there is a value in having a state called Release, the difficulty of testing that state, because of the simplicity of its definition. Now, I think that's the best way to answer you on the subject of Release. Okay? All right. Of course, that's quite a question, what exactly is a Release.

Male voice: Troubled me for years.

Huh?

Male voice: Troubled me for years.

All right. Well, that is exactly what it is.

Male voice: Hmm.

Here's the weirdity. There's very few Scientologists realize they are Releases. [laughter] They're bird-dogged on to Clear, you know. If they could answer that question positively and affirmatively, they're a Release.

By the way, this is very appropriate. We're just now getting a – we've got a release button, it's the "S" and double triangle, with an "R," a red "R" on it in the middle of the enamel. Very pretty little button. It's exactly the same size as the old "S" and double triangle.

Male voice: Can we all have one? [laughter]

If you pass the test. [laughter] Oh yes, and – but many are called and few are chosen. And in your particular case, because you brought up the subject, we'll give you one when you devise the perfect test! [laughter, laugh]

Male voice: Okay. That's...

Because – well, frankly, right at the moment, we don't have one that I consider adequate. We just have guesstimates. Okay? "Many are called, few are chosen, the lightning often strikes...." Okay, you bet.

Yes?

Female voice: I have one more question. Uh – if someone gets good 3-D pictures on goals listing, that would be free track, wouldn't it? Would that be a possible indication for a goal or not a goal?

My – the whole subject goes back to the first lecture, Louise, is you're not interested, as the auditor, in whether they got pictures, haven't got pictures, where they're getting their goals from or anything else. You can read no indications from this because they're going to hit free track or they're going to hit black areas or they're going to hit free track and the second that you start to list it they'll hit black areas. When you finish the listing of it they'll be hitting free track. You don't – you're walking with a variation here, of considerable magnitude. And you should never, never, never, on listing goals, inquire if the pc has any pictures.

Female voice: Uh-huh.

Never. Never mention it to the pc. Because it's of no value of any kind in listing goals.

Female voice: Yeah.

Good enough.

Female voice: Thank you.

I didn't mean to scold you. That's a good point to keep in mind.

Female voice: If it – if it is mentioned, without asking?

Hm?

Female voice: If it is mentioned, during listing, without asking for it, I just wondered what...

So it's mentioned!

Female voice: Yeah.

TR 4. TR 4. Understand it. Acknowledge it. And return the pc to listing.

Female voice: Yes.

But God almighty, don't ever say, "You mean the last few goals you have listed you've had a stuck picture? Hm! That is very puzzling. What is the stuck picture?" Now you could go on like this, you could say, "Well, what is the largest object in the picture?" Overboard would go your pc and that would be the end of goals listing.

By the way, we had somebody, last year, who found a pc's goal by sticking the pc in a picture and then asking him for goals out of the picture. We didn't find a goal on the pc either. Because there weren't that many goals in that picture. I think the goal was, "Not to be be-headed" or something like that. [laughs, laughter] That was a good thing to bring up, Louise. All right. Okay. Yes?

Male voice: Uh, in your E-Meter book you mentioned about an OT meter. Is that still going to be used ?

In your E-Meter book you mentioned about an OT meter, is that going to be used or not? All right. Well, I haven't had any need of it. We would be researching it madly if we had much need of it. We started into researching on it. We found out body read is so enormous on that type of reaction. We did a little other research on it. We tried to get a very sensitive needle meter that the medicos have – I guess they've tried to duplicate our E-Meter, which has been around long enough – and it wouldn't read either.

And we've gone into this, but frankly, we haven't, since the advent of the Mark IV – see, that was not – the Mark IV hadn't appeared at that time or had been proven out – we haven't found any real reason to have an OT meter, yet. If we do, we have gotten a leg up on its research and so on, but I won't say that there is no reason for one. But right now we don't need one, so there is no priority on it. Okay?

Male voice: Yeah.

All right. Okay, any other questions? Yes?

Male voice: Could you briefly summarize the data you're got now about chronic tone arm readings, at say 4.5, 3.5, 2.5, 1.5? You told us a number of things about chronic tone arm reads over the years, like 4.5 equals actually stuck in a crowd, is a chronic reading there.

Yes.

Male voice: Could you give us your – the current ...

The significance of chronic tone arm read.

Male voice: Yeah. Especially 2.5 and 3.5.

Yeah, well they're the same as they were. The same as they were. Your person who reads below 2 is lower in responsibility and... the same as they've always been. 2.5 is inevitably something about a machine, a robot or something like that. Your 4.5 is a crowd, it's just as it's always been. I don't know what 7 is. But it's something. And in general, chronic reads on people grabbed off the street do fall into these categories. But you must realize that you no more than start to get the rudiments in and you start upsetting this. And when you prepcheck the pc you upset it farther. You're keying out things now. Now, you've changed the pc's position on the track and numerous other things with R3GA and your tone arm sweeps, as they move back and forth across the dial, actually denote nothing of any significance except that you have motion on whatever you are doing, because it's all relative motion. See, it ceases to be fixed motion as soon as you start disturbing the case and it then and there becomes relative motion.

You're starting to push around the reactive bank. Your modern processes do not leave this chronic state of affairs chronic. They're very briefly there. So that the meaningfulness of a tone arm, once it has started to move on a pc by reason of Prepchecking and R3GA is practically zero. It has no meaning as such except the fellow isn't Clear. Masses are passing through, don't you see. It doesn't even mean if he has a high TA that he has a withhold now. See? There's no significance actually attaches to the exact meaning of a tone arm read, once you have started the fellow in the modern processing. But all of those reads, which have been announced previously, are all factual and apply very definitely to the man in the street. If he's sitting at 4.5, you can adjudicate some oddball facts about him with regard to crowds. If he's sitting at 2.5, you can make some kind of an odd estimate on what the fellow might be doing in life.

You could tell fortunes with it that would upset people god-awfully. The – this guy walks in, sits down, PE Course, you know. I'm not saying you should do this, but he comes in, sits down, you put the cans in his hands and you find out he's reading at 1.5. Well, you could start off with a long song and dance, "Now let's see, now you've often, often had difficulty with your family, isn't that correct? *Hm-hm*, yes, *hm-hm*, as a matter of fact you've left home quite a few times. Yes, *hm*, you ever been married? Yes, well, you've left your wife a few times and you haven't been doing too well in business. And, you haven't been this and you haven't been that ..."

He'd agree, "Oh my God," he'd say, "Yes."

"You very often are very careless of yourself, you stand out in the rain very often without coming inside."

And he'd say, "Oh, yes, yes. How – how did you know that? How did you know that?"

See, you could go on and on. Some bird is sitting at 2.5, see, and he comes in there and you say, "Well, you constantly tinker with machines. You are very interested in computers. You probably have wondered about giving people orders at a distance through some communication equipment and having those orders exactly, promptly, immediately and never defied – obeyed, you see. Never defied under any circumstance."

"Yes. Yes. How did you know that?"

You see, of course you've got a robot read. And you just read the character ...

"You run your home on a highly systematic basis and are very, very impatient of your wife's irregularities. Isn't that true?" [laughter]

You could go on, you know, you could make an astrologist look like a punk with this thing. [laughter] And, you've got other reads and so forth. This boy comes in, he's reading at 2.

"Well, you've had a great deal of trouble with women, haven't you? You've had a lot of trouble with your mother, isn't that correct? Yes, and the last time you were in love, it didn't go well, isn't that right? You have a tendency to be rather didactic with regard to women and give them orders and – to do this and to do that, with women, but secretly, down underneath it all, you are really afraid of them, aren't you? Isn't that the case?" [laughter]

"Oh, yes, yes, yes, how did you ever know that?" you see.

Some girl walks in, she's reading at 3. "Now, you've been death on men, haven't you?" [laughter] "You've always had trouble with men, isn't that correct?"

Oh, my, you could go on and on. Or, "You've often thought of getting married and/or of staying married – which are you, married or unmarried? Now, you've often thought of – of staying married, but have changed your mind."

Oh, man, you could really read it out well. "You actually don't prefer housework. You think the woman's place is not in the home. Is that correct?" Yeah, you could really do that.

Have – he reads at 4.5, "You – haven't you often thought of yourself as a priest or heading a large congregation or a large organization of some kind or another? Have, you had – often had thoughts of doing revolutionary type work. You have envisioned yourself as out there talking to the multitude, isn't that correct? You don't like armies or navies and you don't like crowds. You hate to go downtown at the rush hour. Isn't that right?" And so on.

"Oh, yes, yes, how did you know?" you see. 4.5.

You'll get the positive-negative aspect. You'll get the plus and minus aspect the way one of these reads. And if anybody wanted to do a complete job of this, he would actually have a fortunetelling scheme that would make anything since Chaldea look pale. But its validity, for an auditor, once it has been disturbed, becomes zero. You audit a guy for a while and – well, it's true, if he settled down on a new read and stayed there several weeks, yes, he'll have the characteristics of the new read. But you see auditing doesn't really do that with somebody. It moves it all over the place.

Answer your question?

Male voice: It does, thank you.

All right, didn't mean to answer it at such length, but it's an amusing subject to me. Some of the things you can do – the longer we look into this, why the more swami the swamis look.

Someday – I used to be very good at telling fortunes and that sort of thing. Simple expedient, reading other people's pictures. It was very embarrassing to people. They come in and you tell them all about what – where they've been that day. I never realized at the time that you could also shift their bank. And I've never worked it out since, so that you moved the somatic strip and looked at the pictures. You see, you get the idea? You can – you could look at the pictures where they've been that day, you'd say, "Well, where have you been today? Let me see, I can tell you where you have been today." You see, you're reading their pictures. And you give them just a description of the picture you see, you see. And, "Oh, yes, yes" and it sounds very wonderful. "You must be very prescient" and so forth. Of course they're carrying it right in front of their face.

Well, as the years have gone on – I hadn't thought, actually, until just this moment, the fact that all you have to do is move the somatic strip through various portions of the person's past, you see, in order to read all of their past life, you know. And then really all you'd have to do is move in future track. Well, we don't know anything about the validity of future track, but you could at least move in the track on them that they would like to have or were afraid of having as a future and either one of them would be other – equally satisfactory in a fortunetelling, wouldn't it?

You know, it's funny how tricky man has been about all of these tricks without ever being able to do anything for man, isn't it? You realize all fortunetelling is basically based on making the person agree to a postulate. You create the future for them by creating a postulate. So the next time the ancient witch gazes into her boiling cauldron and says, "I see you meeting with a dark-haired young man," you say, "I don't like dark-haired young men. Make it a blond." Something like that, you see. Or she says a blond, say, "I don't like blonds. I like dark-haired young men," you see. Get her to change it around, till you get an acceptable future! [laughter, laughs]

Okay, well, we're overtime and overdue. That's it.

Thank you very much.

Good night.

TV DEMO: NEW MODEL SESSION

An auditing demonstration given on 20 June 1962

LRH: Little closer up. There we are, thank you. How are you tonight?

PC: *Well, I'm surviving.*

LRH: All right. Okay, here we go. Tonight you are going to – I'm going to run you on a new Model Session with its thing, and find a Havingness Process if yours isn't working, and just that and nothing else.

PC: *Good.*

LRH: Okay?

PC: *Yes.*

LRH: All right. Okay, pick up the cans. All right with you if I begin this session now?

PC: *Yes.*

LRH: All right. Here it is. Start of session. Has the session started for you?

PC: *Yes, it has.*

LRH: All right, very good. What goals would you like to set for this session?

PC: *Well, I'd like to get my havingness up. I think it's been a little shot lately. And feel more confident as an auditor, do a real good job as a result of this session with Dorothy tomorrow.*

LRH: Good. I didn't quite understand the last part of that. What was it now?

PC: *Well, I'm about to start nulling Dorothy's goal list, Dorothy Broaded.*

LRH: Oh, I see.

PC: *And I'd like to feel that I'm in real good shape to do that.*

LRH: All right, all right, very good. You are on auditing now.

PC: *Yes.*

LRH: Yeah, all right. Okay. Any other goals?

PC: *No, I think that's enough.*

LRH: All right, very good. Any goals you'd like to set for life or livingness?

PC: *Yes, I would like to be a top-notch auditor.*

LRH: All right.

PC: *And in general to communicate freely and effectively with people.*

LRH: All right.

PC: *To get off the effect-point that I've been on since I've been plunged into practical which seems a little beyond me at times.*

LRH: Okay, all right. Well, let's see where you are sitting on this meter here, hm? Ah, your tone arm is sitting here at about 3.25, not too bad. And – all right, no other goals for life or livingness?

PC: *Well, yes, I want to go home feeling that I've accomplished something here.*

LRH: All right.

PC: *That I'm better able to cope with my life and to influence others when I get back.*

LRH: All right.

PC: *I think that's it.*

LRH: Okay, very good. All right. Tell me if it's all right to audit in this room.

PC: *Yes, it seems a little strange, but it's all right.*

LRH: All right, okay, that's clean. Are you willing to talk to me about your difficulties?

PC: *Yes. I rather hate to admit I have any.*

LRH: All right, all right, good, that's clean. Now, in the last day have you done anything you are withholding? Let me check that. In the last day have you done anything you are withholding? I've got a reaction here.

PC: *Well, I flunked TR 4 twice today and I'd rather not admit that.*

LRH: All right, okay. All right, I'll check that on the meter. All right. During the last day have you done anything you are withholding? All right, that's clean, thank you. Do you have a present time problem? I don't get any reaction on that.

PC: *Okay.*

LRH: All right. All right, what we're going to do here is check over some of these Havingness Processes and see where you stand on them. All

right?

PC: *Good.*

LRH: Regardless of whether you have one or not. Now we're going to test the first one, and the first thing I want you to do is give the cans a squeeze. Oh my, yes, that Havingness Process – that's pretty low. I mean I only got about that much. All right, very good. Here's the first one. Look around here and find something you could have.

PC: *That sofa.*

LRH: Thank you. Look around here and find something you could have.

PC: *The fireplace.*

LRH: Thank you. Look around here and find something you could have.

PC: *That door.*

LRH: Thank you. Look around here and find something you could have.

PC: *That picture.*

LRH: Okay. All right, squeeze the cans. Well, that's working. Is that the Havingness Process that's been working on you?

PC: *No, it's been, "Touch that object," which has been, I thought, very good.*

LRH: All right, but this one is working.

PC: *Okay, I'm not contesting that.*

LRH: All right, good enough. Look around here and find something you could have.

PC: *The rug.*

LRH: Thank you. Look around here and find something you could have.

PC: *That wall.*

LRH: Thank you. Look around here and find something you could have.

PC: *That secretary.*

LRH: Thank you. Look around here and find something you could have.

PC: *The telephone.*

LRH: Good. Look around here and find something you could have.

PC: *That goosenecked lamp.*

LRH: Thank you. Look around here and find something you could have.

PC: *The ashtray.*

LRH: Good. Look around here and find something you could have.

PC: *The drapery.*

LRH: Good. Look around here and find something you could have.

PC: *The ceiling. I always liked ceilings.*

LRH: All right. Look around here and find something you could have.

PC: *The fixture.*

LRH: Good. Look around here and find something you could have.

PC: *That green cover to the couch.*

LRH: Good. Look around here and find something you could have.

PC: *The armchair.*

LRH: Good. Look around here and find something you could have.

PC: *The cover on that door.*

LRH: Good. Look around here and find something you could have.

PC: *The cover to this table.*

LRH: Good. Now we're going to make another havingness test now. Squeeze the cans. All right, that's very interesting, but that does not sustain its gain.

PC: *Okay.*

LRH: All right. So we're going to test the next one. All right?

PC: *All right.*

LRH: And that is, "Point out something in this room you could confront," and "Point out something in this room you'd rather not confront." Here is the first command. Point out something in this room you could confront.

PC: *That bag on the sofa.*

LRH: Very good. Point out something in this room you would rather not confront.

PC: *I think the grate to the fireplace.*

LRH: Okay. Point out something in this room you could confront.

PC: *This sign with your name on it.*

LRH: Okay. Point out something in this room you would rather not confront.

PC: *Um, perhaps the telephone. There is something a little sinister about a phone.*

LRH: All right, thank you. Now let's make another can test here. Squeeze the cans. All right, that's apparently loosening the needle. You said your – the process you had been running was "Point out something."

PC: *No, "Touch that object."*

LRH: "Touch that object," all right. Well, let's push this one a little bit further.

PC: *All right.*

LRH: All right. Point out something in this room you could confront.

PC: *That glass door to the secretary.*

LRH: Thank you. Point out something in this room you would rather not confront.

PC: *Well, the apparatus up there.*

LRH: Thank you. Point out something in this room you could confront.

PC: *The upper part of that wall.*

LRH: Okay. Point out something in this room you'd rather not confront.

PC: *The television screen behind me.*

LRH: All right. Point out something in this room you could confront.

PC: *The cord to this meter.*

LRH: Good. Point out something in this room you'd rather not confront.

PC: *Mm – the valve to the radiator.*

LRH: All right, thank you. Now let's test this again. Squeeze the cans. All right, that – put your cans up on the table. Just put your hands there. Now lay your cans definitely in your hands. All right, good, now squeeze the cans. All right. How were you squeezing them before?

PC: *Well, I don't believe I had them held quite as loose as they are now.*

LRH: All right, let's check that again. Squeeze the cans. All right, well, we apparently are now getting an adequate ... You can put them back in your lap.

PC: *All right.*

LRH: All right. Well, we're going to run this a few more commands. Okay?

PC: *Okay.*

LRH: Point out something in this room you could confront.

PC: *That door.*

LRH: Thank you. Point out something in this room you'd rather not confront.

PC: *The right side of the mantel.*

LRH: Good. Point out something in this room you could confront.

PC: *The corner of the rug.*

LRH: Okay. Point out something in this room you'd rather not confront.

PC: *The arm to that sofa.*

LRH: All right, now let's check this can squeeze test again. Put your hands back up on the table. All right. Squeeze the cans. All right, that – that is increasing it. We're getting an increase.

PC: *Okay.*

LRH: I'll check it again just to be sure. All right, put them back now. Point out something in this room you could confront.

PC: *The picture.*

LRH: All right. Point out something in this room you'd rather not confront.

PC: *The hook on the door.*

LRH: Good. Point out something in this room you could confront.

PC: *The ceiling.*

LRH: Good. Point out something in this room you'd rather not confront.

PC: *One of the boards of the floor.*

LRH: Okay, thank you. Let's test this again. Put your hands back up on the table. All right, now squeeze the cans. All right. Do it again, squeeze the cans. Well, we're going to mark that as conditional. Okay?

PC: *All right.*

LRH: We're just going to put "conditional" down, because actually it's apparently – you can put them back in your lap – it's apparently loosening it and tightening it very slightly, but it's not making any wild swings. All right. We don't test IV of course; no point in testing V. All right here – here's a good one, here's a good one. All right, it's, "Look around here and point out an effect you could prevent."

PC: *All right.*

LRH: All right, here's the first command. Look around here and point out an effect you could prevent.

PC: *Well, I could prevent my purse from falling on the floor.*

LRH: All right. Look around here and point out an effect you could prevent.

PC: *I could prevent that picture from having an effect on me.*

LRH: Good. Look around here and point out an effect you could prevent.

PC: *That chair.*

LRH: All right. Now put your hands back up on the table there. All right. Squeeze the cans. All right, I get no, no real increase with that, so we're going to leave that alone at the moment. All right, now here is

ordinary, old, "Point out something." Okay? So here we go, and you can throw the cans around all you wish. All right. Point out something.

PC: *The handle to the door.*

LRH: Thank you. Point out something.

PC: *The molding on the wall over there.*

LRH: Thank you. Point out something.

PC: *Well, this part of the curtain that has the bouquet on it.*

LRH: Thank you. Point out something.

PC: *Telephone receiver.*

LRH: Thank you. Point out something.

PC: *The base of that lamp.*

LRH: Thank you. Point out something.

PC: *The cover to this table.*

LRH: All right, thank you. Put your cans back on the table again with your knuckles down. That's right, all right, now squeeze the cans. There we've got one I think. I think we've got one, heh, heh. And it also gave us tone arm motion.

PC: *Hmm.*

LRH: All right, very good. Put your cans back in your lap and we'll run this a little bit longer. Okay?

PC: *Yes.*

LRH: All right. Point out something.

PC: *That ashtray.*

LRH: Thank you. Point out something

PC: *The rug.*

LRH: Thank you. Point out something.

PC: *The sofa.*

LRH: Thank you. Point out something

PC: *The ceiling.*

LRH: Thank you. Point out something.

PC: *The fixture.*

LRH: Thank you. Point out something.

PC: *The frame to that picture.*

LRH: Thank you. Point out something.

PC: *The ship model on the mantel.*

LRH: Thank you. Point out something.

PC: *That wall.*

LRH: Thank you. Point out something.

PC: *Uh, that wall.*

LRH: Thank you. Point out something.

PC: *The shelf up there.*

LRH: Thank you. All right, now, let's take a can squeeze test again here. All right, squeeze the cans. Put them back up on the table again. Socket 'em down in your hands there. That's right, that's right. All right, just hold them comfortably. All right, squeeze the cans. All right, that is causing us an open – it went better, and now it is swinging less. Squeeze the cans again. We get a variation of swing here, but we haven't any marked increase. That was closer to the truth than we have had, because we did get a little tone arm motion with it. All right, put the cans back in your lap. We'll go on to the next one. All right, we are now going to test, "Where is the (room object)?" Okay?

PC: *All right.*

LRH: All right, here's the first command. Where is the table?

PC: *Here.*

LRH: Thank you. Where is the bed?

PC: *There.*

LRH: Thank you. Where is the chair?

PC: *There.*

LRH: Thank you. Where is the curtain?

PC: *There.*

LRH: Thank you. Where is the telephone?

PC: *There.*

LRH: Thank you. All right, put your hands back up on the table again. All right, all right, now squeeze the cans. All right, once more squeeze the cans. All right, that – that's not too bad, that's not too bad. We're going to go on. Pretty high read. Going to leave that. We're going to go on now. All right?

PC: *Yes.*

LRH: All right. Here we go, you can put your hands – cans back in your lap. Squeeze them from there now, yeah, all right, you're getting the hang of it. All right, this one is, "Look around here and find an object you are not in," okay?

PC: *All right.*

LRH: All right. Here we go, here's the first command. Look around here and find an object you are not in.

PC: *I'm not in the – in that cupboard of the secretary.*

LRH: Thank you. Look around here and find an object you are not in.

PC: *I'm not in that telephone.*

LRH: Okay. Look around here and find an object you are not in.

PC: *In that E-Meter, thank God.*

LRH: All right. Look around here and find an object you are not in.

PC: *In that chair.*

LRH: Okay. Look around here and find an object you are not in.

PC: *In that sofa.*

LRH: Okay. All right, put your hands back up on the table. All right, squeeze the cans. All right, that's a fairly decent squeeze. Let's – let's try it again. All right, it could be better, it could be better. You got a cognition out of that though, didn't you? Huh? What was it?

PC: *Well, I guess it's that the situation isn't quite as desperate as I thought this afternoon. In other words, I seem to be coming to life again here.*

LRH: All right. For your information, actually all of these are doing a little bit of something. None of them are really mucking it up.

PC: *Hmmm.*

LRH: But I suspect at this time, I suspect at this time that we could get a little distance by doing some mid ruds on the subject of havingness. Put your hands in your lap.

PC: *All right.*

LRH: We are going to do a little bit of a mid rud Prepcheck just on the subject of havingness here. Huh?

PC: *Okay.*

LRH: And we're going to say, "On havingness," all right?

PC: *Yes.*

LRH: All right, so here we go. On havingness have you ever suggested anything? I'll repeat the question. On havingness have you ever suggested anything? There's a tiny halt there.

PC: *Well, what I was getting really was that my preclear suggested to me what her Havingness Process was. I did a little flip on that. When she came to me, said her Havingness Process was TR 10, so she suggested that to me.*

LRH: All right, thank you, thank you. All right, on havingness is there anything you have suggested? That seems to be clean.

PC: *Okay.*

LRH: All right. Good enough.

PC: *Um-hmm.*

LRH: All right. On havingness is there anything you have suppressed? Yes, what? What is it?

PC: *Well, at one time I thought it was possible to clear people on Havingness. Then I more or less suppressed that when you came out with some other modus operandi, you know.*

LRH: All right, okay. All right, let me check that now. On havingness is there anything you have suppressed? I still got a little hang-up here. What is it?

PC: *Well, I have perhaps a wistful feeling that I'd like to have everybody's havingness up to the nth degree at all times. It's a kind of a goal of mine. You know, I feel that if everybody's havingness was up that everything else would fall into place.*

LRH: All right, very good. All right, let me check that on the meter. On havingness is there anything you have suppressed? All right, I'm going to have to read that again. On havingness is there anything you have suppressed? Yes, I've got a reaction. What was it? There it is.

PC: *Well, actually it antedates any Scientology. I mean it goes back to childhood and it seemed that at a time when I was giving a Punch and Judy show. You know, I mean that sort of havingness.*

LRH: Hmmm.

PC: *And I more or less suppressed that, my interest in operating puppets and marionettes, that type of havingness.*

LRH: Um-hmmm.

PC: *So I kind of jumped back into that period.*

LRH: All right, thank you. Let me check that on the meter now. On havingness is there anything you have suppressed? I'm having a rough time reading this now. It's probably not clear. All right. When was this suppression when you were a child here?

PC: *Well, I was wondering then if it was a half-truth because I blur with it a time that I gave a puppet show for my son and his friends.*

LRH: Um-hmmm.

PC: *I mean those – the two seem to be a little locked together here, the two incidents.*

LRH: Um-hmmm.

PC: *Which is the one? I was a little dis-*

turbed as to which was the one that really concerned havingness.

LRH: Hmmm.

PC: *Because I wanted to give those children havingness very much. You see, my son was three years old and I had this party for him, and I put on this show, and I guess it re-stimulated me on my old desire perhaps to have – to be kind of a puppeteer, you know.*

LRH: Hmmm.

PC: *So that's the one that seems to be predominant at the moment and that was in 1930 – the spring of 1930 would be May 22nd, 1930, his third birthday.*

LRH: All right. Let's – let me try to get some little test question here. What about suppressing a puppet? That doesn't make any sense, does it? What about suppressing children?

PC: *That would make more sense probably.*

LRH: Was there a suppression of children in that early incident there?

PC: *Well, perhaps the sense that I should run a little 8-C on them so that they wouldn't get out of hand, you know, that they would uh ...*

LRH: Well frankly, there isn't any overt there. You say in that first one that you suppressed the desire to.

PC: *Yes, there's no overt really.*

LRH: Just suppression on the thing. All right, very good. All right, let me check the question. On havingness is there anything you have suppressed? Yes, it's still alive, and as a matter of fact as we go into this,

this is getting terribly alive.

PC: *Well, but it would go backtrack quite a bit you know, probably.*

LRH: Yeah, yeah.

PC: *That has me a little concerned. I'm not too anxious to go backtrack.*

LRH: Does that worry you?

PC: *Well, it's just – how it could be handled in a very short time perhaps.*

LRH: Who is handling it?

PC: *You are.*

LRH: All right.

PC: *I'll let you handle it.*

LRH: Good, thank you, thank you. All right, now let's – let's take a look at this. We got a suppression and we got puppets, and we've been getting a sort of a slammy sort of a needle out of this thing. Now I'm trying to make up some kind of an overt that has to do with children or puppets. What can we find here? Children, puppets, havingness, trying to give children havingness, trying to prevent children from giving you havingness?

PC: *Well, actually I got a little off the chain. The last few days I've been preoccupied with a facsimile of a shipwreck, you know, where I have been responsible for the shipwreck and the ship went down with all hands, and so forth. So perhaps I was trying to lead you astray with it. I mean, perhaps my bank was bound to lead you astray on that thing – it could be because there seems to be an awful lot of havingness bound up with that ship.*

LRH: Yeah, yeah, all right, all right, I'm not ...

PC: *It's in a former life.*

LRH: I'm going to check this out now, and let's see, let's see if we haven't freed this up. All right?

PC: *All right.*

LRH: On havingness is there anything you have suppressed? I don't get a reaction on it.

PC: *Okay.*

LRH: All right. Do you want me to check it to make sure?

PC: *I don't care.*

LRH: All right. On havingness is there anything you have suppressed? Oh, oh, I got a reaction.

PC: *I always worry if the auditor checks it again; I think, oh, now it won't stay clear.*

LRH: Is that what that is?

PC: *There's a little of that usually on a recheck.*

LRH: Oh, well, all right.

PC: *Even with you.*

LRH: Yeah, all right, all right. This rock slammy needle here, I don't get it back right away. I'm actually not trying to clean it up particularly. On havingness is there anything you have suppressed? Now that isn't reacting. That really isn't reacting. Let me get the next one.

PC: *All right.*

LRH: On havingness is there anything you have invalidated? Yes, yes, yes, yes, oh that's hot. What was it?

PC: *Well, I have invalidated my own ability to select the right Havingness Process for a preclear.*

LRH: All right, thank you. All right, let me check that on the meter. On havingness is there anything you have suppressed? [sneezes] Excuse me, clean, that's clean. I beg your pardon for sneezing.

PC: *Okay.*

LRH: All right, on havingness is there anything you have invalidated? I asked you the wrong question a moment before. Thank you. On havingness is there anything you have invalidated? I don't get a reaction on that now. I get – this needle roughs up on the subject "on havingness."

PC: *Okay.*

LRH: All right, here's the next one. On havingness is there anything you have failed to reveal? All right, no instant read there. On havingness is there anything you have been careful of? Yes, I got a reaction there.

PC: *Well, I've been too careful of possessions in this lifetime.*

LRH: Oh, all right.

PC: *I think of them as havingness.*

LRH: All right, very good. Let me check that on the meter. On havingness is there anything you have been careful of? That's clean, that's clean. All right, anything you'd care to say before we drop off what we've been doing here?

PC: *No, it's been interesting and I feel that it's been a little revitalizing for me.*

LRH: Mm-hmm.

PC: *This experience, you know, of your giving me a little auditing.*

LRH: Mm, hmm.

PC: *Very interesting.*

LRH: All right. Well, thank you. I've gotten a little TA reaction here all of a sudden. Let me see something here. On havingness have you told me any half-truth? Yes, I got a reaction.

PC: *Well, there is the – perhaps a half-truth about that former life and the ship.*

LRH: Mm-hmm.

PC: *Because there have been times when I've kind of flipped to being the lighthouse keeper rather than the captain of the ship. I'm not completely sure of my identity in that incident.*

LRH: All right, thank you. Let me check that on the meter. On havingness have you told me a half-truth? Yes. What was it?

PC: *Well, I was thinking I probably exaggerated this puppeteer thing – making it sound, you know, as if that was my one ambition as a child to be a puppeteer.*

LRH: All right, thank you. On havingness have you told me a half-truth? That is clean, thank you. On havingness have you told me an untruth? That is clean, thank you. On havingness have you said something only to impress me? No reaction. On havingness have you tried to damage anyone? That reads. What was it?

PC: *Well, perhaps myself a little bit*

because I did say, you know, that I had trouble, or that I didn't – or that I invalidated myself when it came to finding processes, Havingness Processes for preclears – times I've done that.

LRH: All right, thank you. Okay, I'm going to check that now. On havingness have you tried to damage anyone? I get a little reaction. What was it?

PC: *Well, I was just wondering whether you are confining that to this session, you know, or you meant in general. I think that's what occurred to me.*

LRH: All right. I'm just using an end rud, see, as a...

PC: *Yes, but I mean my attention began to flick to something that wasn't in the session and I ...*

LRH: All right. What was it?

PC: *Well, I just thought of the time that an auditor had run the Havingness without much intention on it when I was a pc.*

LRH: All right, good. Let me check that on the meter. On havingness have you tried to damage anyone? I got a faint reaction on that.

PC: *Well, then I was thinking maybe I wasn't being quite fair to the auditor. I got a little bit trapped in that, you know.*

LRH: Oh all right, all right.

PC: *One of these foolish go-arounds on something.*

LRH: All right. Let me check that on the meter. On havingness have you tried to damage anyone? No reac-

tion on that, thank you. Now, want to ask you one more, is: on havingness have you ever failed to answer a question or command? That's clean. Thank you very much. Well, we will call that an end to this brief little Prepcheck here, and then, let's see – not of the session.

PC: *Oh, I see.*

LRH: This is just this little mid ruds thing I didn't go into it very deep because there wasn't anything to go into. But what I want to do now is carry on here. One of my favorite Havingness Processes is not on this old list, so I'm going to use that now. We're going to return to testing Havingness Processes. All right?

PC: *Okay.*

LRH: All right. Put your cans back up on the table, your knuckles down. Thank you. Squeeze the cans. Thank you, all right. Do that again, squeeze the cans. Thank you. All right, now stand those cans up right where they are and let go of them. All right, and I want you to feel the tablecloth. Would you do that please. Thank you. Feel the arm of your chair. Thank you. Feel your shoulder. Thank you. Feel the other shoulder. Thank you. Feel your right hand. Thank you. Feel your left hand. Thank you. Feel your face. All right. Pick up the cans now. All right, put them in a similar position on the table with your knuckles down. Thank you. All right, squeeze the cans. Let's do that again, squeeze the cans. All right, thank you. All right, we're going to run another one. All right. Stand the cans back up on the table.

All right, here's the first command. Touch the tablecloth. All right. Touch the sign. Thank you. All right, touch the arm of the chair. Thank you. All right, touch the other arm of the chair. Thank you. Touch the base of this lamp. Thank you. All right, touch the sign. Thank you. All right, pick up the cans. Okay. All right, put your knuckles on the table and your cans up there, grasp them rather firmly. That's fine now, all right, squeeze the cans. Good heavens. Squeeze the cans. There we are, all right, squeeze the cans. All right, we're going to get off of that one right now. All right, put the cans back in your lap.

All right, we're going to run a new one, which is, "Look around here ..."
We – we've got two that we had a pretty good effect on. All right, here we go. Look around here and find something you wouldn't mind being in.

PC: *I wouldn't mind being in the space under the bed.*

LRH: Thank you. Look around here and find something you wouldn't mind being in.

PC: *The space under the table.*

LRH: All right. Look around here and find something you wouldn't mind being in.

PC: *The space under this chair.*

LRH: All right. Look around here and find something you wouldn't mind being in.

PC: *In the chair I'm sitting in.*

LRH: All right, very good. Look around

here and find something you wouldn't mind being in.

PC: *I wouldn't mind being in that lower compartment of the cupboard if I were sure I could get out again.*

LRH: All right, very good, all right. Put those cans up – no, put your knuckles up on the table again. All right, squeeze the cans. Dear me. Hey now. We seem to have found something here. All right, put them back in your lap and we will carry on with this test. Okay?

PC: *All right.*

LRH: All right, that seems to be working like a bomb. Look around here and find something you wouldn't mind being in.

PC: *The fireplace.*

LRH: Thank you. Look around here and find something you wouldn't mind being in.

PC: *That corner between the curtain and the molding.*

LRH: All right. Look around here and find something you wouldn't mind being in.

PC: *Well, actually in the E-Meter.*

LRH: All right. Look around here and find something you wouldn't mind being in.

PC: *That bag.*

LRH: Thank you. Look around here and find something you wouldn't mind being in.

PC: *That ashtray.*

LRH: All right, put your knuckles back up on the table. All right, that's good. All right, squeeze the cans.

- That actually has widened the sweep. Squeeze them again. It's widened the sweep. Let's carry on with our check. Okay, you can put them back in your lap. Look around here and find something you wouldn't mind being in.
- PC:** *Well, the light to that light fixture. I mean the shade to the light fixture that is nearest to this body.*
- LRH:** Okay. Look around here and find something you wouldn't mind being in.
- PC:** *The space between that shelf and the bed.*
- LRH:** Good. Look around here and find something you wouldn't mind being in.
- PC:** *The drawer to that secretary.*
- LRH:** Okay. Look around here and find something you wouldn't mind being in.
- PC:** *That electric light bulb.*
- LRH:** All right. Look around here and find something you wouldn't mind being in.
- PC:** *That telephone receiver.*
- LRH:** Okay. Look around here and find something you wouldn't mind being in.
- PC:** *The ashtray.*
- LRH:** Okay. Look around here and find something you wouldn't mind being in.
- PC:** *Your pocket.*
- LRH:** Okay. Look around here and find something you wouldn't mind being in.
- PC:** *The grate.*
- LRH:** Good. Look around here and find something you wouldn't mind being in.
- PC:** *That chair.*
- LRH:** Good. Look around here and find something you wouldn't mind being in.
- PC:** *That sofa, curled up in the corner.*
- LRH:** Good. Look around here and find something you wouldn't mind being in.
- PC:** *The space under the table.*
- LRH:** Good. Look around here and find something you wouldn't mind being in.
- PC:** *This E-Meter can.*
- LRH:** All right, okay. Put your hands up on the table again like that, and let's see how we are faring here. Squeeze the cans. All right. There's not much doubt about the thing that that has widened the thing, and there's also not much doubt about it that it's not flat because it's kicking the needle. You are getting a little tiny tone arm motion here. I'm going to carry on with it if it's all right with you.
- PC:** *All right.*
- LRH:** All right, put your hands – cans back in your lap. Look around here and find something you wouldn't mind being in.
- PC:** *That bag.*
- LRH:** Good. Look around here and find something you wouldn't mind being in.
- PC:** *Your watch.*

LRH: Good. Look around here and find something you wouldn't mind being in.

PC: *That space between your tie and your shirt.*

LRH: Good. Look around here and find something you wouldn't mind being in.

PC: *That corner of the room.*

LRH: Good. Look around here and find something you wouldn't mind being in.

PC: *The space – that triangular space underneath the sign.*

LRH: Good. Look around here and find something you wouldn't mind being in.

PC: *The space under that grate.*

LRH: Good. Look around here and find something you wouldn't mind being in.

PC: *That space between the bed and the chair.*

LRH: Good. Look around here and find something you wouldn't mind being in.

PC: *This chair.*

LRH: Good. Look around here and find something you wouldn't mind being in.

PC: *Your chair.*

LRH: Good. Now we're going to make another test of this, all right? All right, put your hands up on the table like that, as before. All right, good, squeeze the cans. All right, now let's see exactly how you are holding those cans. Get them good and snug down there in your hands.

That's a girl, that's a girl. All right, squeeze the cans. Wow, squeeze them again. We get a variable squeeze here is what we're getting. Squeeze them again. All right, it's less than it was before so that was the last command. Okay? We got the little jolts out of the needle. You can put those back in your lap. All right, here we go, let's go on to the next one here. What did you say the Havingness Process you have been running was?

PC: *"Touch that object."*

LRH: All right. All right, we're going to run now, "Notice that indicated object."

PC: *All right.*

LRH: "What aren't you putting into it?"
You know that one?

All right, here we go. Notice that table.

PC: *All right.*

LRH: What aren't you putting into it?

PC: *Effort.*

LRH: Thank you. Notice that sign.

PC: *Yes.*

LRH: What aren't you putting into it?

PC: *Interest.*

LRH: Thank you. Notice this E-Meter.
What aren't you putting into it?

PC: *Milk.*

LRH: Okay. Notice that ashtray.

PC: *Yes.*

LRH: What aren't you putting into it?

PC: *Cigarette stubs.*

LRH: Thank you. All right, put those cans back up on the table, knuckle down

- now. Give them a squeeze. All right, let's do it again. All right, that's doing us no good at all. Put them back in your lap. All right, now we're going to run, "Look around here and find something you can agree with." Okay?
- PC:** *All right.*
- LRH:** All right. Look around here and find something you can agree with.
- PC:** *The cover to that sofa.*
- LRH:** Thank you. Look around here and find something you could agree with.
- PC:** *The ceiling.*
- LRH:** Good. Look around here and find something you could agree with.
- PC:** *That picture.*
- LRH:** Good. Look around here and find something you could agree with.
- PC:** *That mantel.*
- LRH:** Good. Look around here and find something you could agree with.
- PC:** *Your coat.*
- LRH:** Good. Look around here and find something you could agree with.
- PC:** *You.*
- LRH:** All right, very good. Well, let's squeeze the cans again in the same way. Put them up on the table. All right, get it up, now, hold them loosely. All right, now, squeeze the cans. All right, well, that's opening it up from where it was anyway. Do it again, squeeze the cans. That's opening it up from where it was a moment ago, so put them back in your lap and let's try it a little bit more. Look around here and find something you can agree with.
- PC:** *The bulletin.*
- LRH:** Thank you. Look around here and find something you can agree with.
- PC:** *That secretary.*
- LRH:** Good. Look around here and find something you can agree with.
- PC:** *This expanse of floor.*
- LRH:** Good, all right. Once more put those knuckles up on the table. All right, and squeeze the cans. That is opening up the meter. That looks very promising. Put them back and let's try her some more. Look around here and find something you can agree with.
- PC:** *Your watch.*
- LRH:** Good. Look around here and find something you can agree with.
- PC:** *Your hair.*
- LRH:** Thank you. Look around here and find something you can agree with.
- PC:** *That wall.*
- LRH:** Good. Look around here and find something you can agree with.
- PC:** *That door.*
- LRH:** Good. Look around here and find something you can agree with.
- PC:** *The rug.*
- LRH:** Good. Look around here and find something you can agree with.
- PC:** *That picture.*
- LRH:** Good. Look around here and find something you can agree with.
- PC:** *The mantel.*
- LRH:** Good. Look around here and find

something you can agree with.

PC: *The facing to the mantel.*

LRH: All right, one more time let's test this. Put your hands up on the table there. All right, now, just relax your hands there. All right, good, squeeze the cans. Well, that is very interesting. Squeeze the cans again. Quite a variability of squeeze here.

PC: *It seems to be easier to snug it down in my right hand than my left hand. The crevices don't seem to match.*

LRH: All right. All right, just hold them relaxedly now. Good enough, all right, squeeze the cans. All right, that actually isn't opening it up any further. All right, you are getting a lot of havingness here though because none of these are destructive. The only one that was destructive is that, "What aren't you putting into it?" started to tighten everything up. You can put those back in your lap. All right. We're going to try the next one. That's, "Look around here and find something you could have." "Look around here and find something you could withhold." Okay?

PC: *All right.*

LRH: All right. Look around here and find something you could have.

PC: *The back of that sofa.*

LRH: Thank you. Look around here and find something you could withhold.

PC: *That door.*

LRH: Good. Look around here and find something you could have.

PC: *The mantel.*

LRH: Good. Look around here and find something you could withhold.

PC: *That sign.*

LRH: Good. Look around here and find something you could have.

PC: *The back to the meter.*

LRH: Good. Look around here and find something you could withhold.

PC: *Telephone receiver.*

LRH: Good. All right, once more up on the table there and let's take a good look at this thing. All right, squeeze the cans. All right, squeeze the cans. All right, we're off of that one. Okay, that's the end of that. Okay, now there's another one here that we've had lately, and I'm going to check that out on you, which is "reach." Hmm?

PC: *All right.*

LRH: Put those back in your lap. All right and here's the first command. Look around here and find something you could reach.

PC: *I could reach that ceiling.*

LRH: All right. Look around here and find something you could reach.

PC: *The rug.*

LRH: Good. Look around here and find something you could reach.

PC: *The bag.*

LRH: Good. Look around here and find something you could reach.

PC: *That door.*

LRH: Good. Look around here and find something you could reach.

PC: *That corner shelf.*

LRH: Good. Look around here and find something you could reach.

PC: *The hearth.*

LRH: Good. Look around here and find something you could reach.

PC: *That baseboard by the door.*

LRH: Good. Look around here and find something you could reach.

PC: *That drapery.*

LRH: Good. Look around here and find something you could reach.

PC: *The cord to the meter.*

LRH: Good. Look around here and find something you could reach.

PC: *The lamp.*

LRH: Good. Look around here and find something you could reach.

PC: *Your pen.*

LRH: Good. Look around here and find something you could reach.

PC: *Your bracelet.*

LRH: Good. Look around here and find something you could reach.

PC: *The ashtray.*

LRH: Good. Look around here and find something you could reach.

PC: *The cover to the table.*

LRH: Good. Look around here and find something you could reach.

PC: *That corner of the floor.*

LRH: Good. Look around here and find something you could reach.

PC: *That recessed portion of the wall.*

LRH: Very good. All right, put your knuckles up on the table there and

let's try this now. All right, squeeze the cans. All right, wow, that increased it. We got a nicely increased fall here. Once more, squeeze the cans. All right.

PC: *I bumped it there.*

LRH: Yes, all right, squeeze the cans. All right, that's good. Now we're going to check this further. All right, put those in your lap. Here's the next command. Look around here and find something you could reach.

PC: *The top of the secretary.*

LRH: Good. Look around here and find something you could reach.

PC: *That menacing looking apparatus over there.*

LRH: Good, all right. Look around here and find something you could reach.

PC: *The cushion to the sofa.*

LRH: Good. Look around here and find something you could reach.

PC: *That sharp edge of the baseboard near the fireplace.*

LRH: Good. Look around here and find something you could reach.

PC: *The green cover on the bed.*

LRH: Good. Look around here and find something you could reach.

PC: *That pipe that goes up to the corner of the wall.*

LRH: Good. Look around here and find something you could reach.

PC: *The meter.*

LRH: Good. Look around here and find something you could reach.

PC: *Your coat.*

LRH: Good, all right. Now we're going to make another test of this. All right, put your hands on the table there, backs of your hands down and let's get them – just hold them fairly relaxedly. All right, now squeeze the cans. All right, once more, squeeze the cans. Let's try her once more, squeeze the cans. Well, well that's quite interesting, that Havingness Process is as good as any of the others. It does not particularly tighten up the thing, but there is certainly a limit to the scope it opens up. So we're going to try a couple of more, huh?

PC: *All right.*

LRH: All right. We've already found one, by the way, don't think you are getting any lose. The old Pre-session III here gives you a bit of a spread on the thing, it just doesn't continue to spread. I'm just trying to find a little bit better here.

PC: *All right.*

LRH: Perfectionism.

PC: *Okay.*

LRH: All right. Now we're going – you can put those in your lap – and we're going to run here – here we go Pre-session XVI, and of course that's, "Point out something around here that is like something else." Okay?

PC: *All right.*

LRH: All right. Point out something around here that is like something else.

PC: *That wall is like that wall.*

LRH: Thank you. Point out something around here that is like something else.

PC: *That corner of the hearth is like that corner of the hearth.*

LRH: Thank you. Point out something around here that is like something else.

PC: *That door, that door.*

LRH: Thank you. Point out something around here that is like something else.

PC: *That corner of the secretary and that corner of the secretary.*

LRH: Thank you. All right, put your hands on the table there and, all right, squeeze the cans. All right, let's check it once more, squeeze the cans. That is not bad, you know. Put them in your lap. That is not bad. I'm going to have to test this just a little bit further here to make sure. Okay?

PC: *All right.*

LRH: All right. Point out something around here that is like something else.

PC: *That arm of the sofa and this arm of the sofa.*

LRH: Thank you. Point out something around here that is like something else.

PC: *This can and that can.*

LRH: Thank you. Point out something around here that is like something else.

PC: *Your coat, my coat.*

LRH: Thank you. Point out something around here that is like something

- else.
- PC:** *Well, I don't know the exact names of these devices, but the upper device and the lower device.*
- LRH:** Thank you. All right, point out something around here that is like something else.
- PC:** *That glass door and the other glass door.*
- LRH:** Okay, good. Point out something around here that is like something else.
- PC:** *The top shelf and the next-to-the-bottom shelf.*
- LRH:** Thank you. Point out something around here that is like something else.
- PC:** *That wall and that wall.*
- LRH:** Thank you. Point out something around here that is like something else.
- PC:** *That – the one shade to the fixture, and then the other shade to the fixture.*
- LRH:** All right. Point out something around here that is like something else.
- PC:** *This button and this button.*
- LRH:** Thank you. Point out something around here that is like something else.
- PC:** *The meter cord and the – this other black cord.*
- LRH:** All right. Point out something around here that is like something else.
- PC:** *The base to the telephone and the base to the lamp.*
- LRH:** Okay. Point out something around here that is like something else.
- PC:** *That chair leg and that chair leg.*
- LRH:** All right, very good. Now let's test these things again. Put your hands on the table, there, and hold those cans quite loosely, quite loosely there. All right, now, squeeze the cans. All right, let's do it again, squeeze the cans. All right and that is not for you. Put those back in your lap. We get a tighten-up after a little while that that runs. Now let's see what else we can find here in shopping around. All right, here's Pre-session XVII. And the first – this, of course, is "Where isn't that – indicated object."
- PC:** *Okay.*
- LRH:** Okay. Here's the first command of that. By the way, is there any feelingness, any feeling on your part that you're getting loses here?
- PC:** *Oh no.*
- LRH:** Or anything like that? It's all right?
- PC:** *All right.*
- LRH:** Any feeling like your – you want to make me look good or anything like that?
- PC:** *No.*
- LRH:** All right, very good, all right. Here we go. Where isn't that table?
- PC:** *Well, it isn't in the fireplace.*
- LRH:** Thank you. Where isn't that sign?
- PC:** *On the mantel.*
- LRH:** Good. Where isn't that ceiling?
- PC:** *On the floor.*
- LRH:** Good. Where isn't that fireplace?

PC: *Against the window.*

LRH: Thank you. All right. Now let's put your hands back up on the table and once more give the cans a squeeze. Hey. Squeeze them again. It looks very promising. Put them down. You are actually not – an auditor might very well be fooled trying to find a Havingness Process on you because in the first few commands you always contrive to get a loosening on the thing. I'm looking for one that wobbles the tone arm around and well, of course, I'm looking for one with a can squeeze.

PC: *Okay.*

LRH: But I'm keeping my eye on this other because it's rather static. And we'll find something here. All right, where isn't that E-Meter?

PC: *Under the bed.*

LRH: Good. Where isn't that microphone?

PC: *Under the table.*

LRH: Good. Where isn't that ashtray?

PC: *In my lap.*

LRH: Good. Where isn't that sign?

PC: *In the fireplace.*

LRH: All right. Now put your hands back up on the table there again. Good. Squeeze the cans. All right, once more let's squeeze the cans. All right, all right, now let's – now give them a squeeze. It's not for you, tightens up again. You run a cycle – you run a very interesting cycle. Put them back in your lap. You get a loosening and a tightening, and it's almost always the same cycle – you are hanging right around here

on this same thing. All right, I'm going to check the middle ruds now. In this session is there anything you have suppressed? In this session is there anything you have suppressed? Now, that is clean. In this session is there anything you have invalidated? All right, that's clean. In this session is there anything you have failed to reveal? Yes, what? What is it?

PC: *Well, occasionally a little concern that people are watching me downstairs, you know. I forget about it and I feel I'm in-session, and then occasionally I think, well, they're interested in what's going on.*

LRH: Very good. All right, let me check that on the meter. In this session is there anything you have failed to reveal? Probably read. In this session is there anything you have failed to reveal? Highly equivocal. Can you think of anything offhand?

PC: *No.*

LRH: Have to be considered as something or other there. All right, we're going to leave that. In this session is there anything you have been careful of? Yeah, what's that?

PC: *Well, I think I'm a little concerned about my can squeeze and I realize I was perhaps a little tense to begin with and I wasn't squeezing it in quite as spontaneous a way as I like.*

LRH: Okay, very good. All right, let me check that on the meter. In this session is there anything you have been careful of? All right, I've still got a reaction. What is it?

PC: *Well, the main thing is perhaps*

careful to do the right thing, you know, and make it worthwhile for the people downstairs, you know.

LRH: Yeah, all right.

PC: *Some kind of an exhibit A, or something like that.*

LRH: All right, okay, very good. In this session is there anything you have been careful of? I've still got a reaction. What is it?

PC: *Well, I think I have mmh – I have – I am careful about my auditing at present, I'm a little too careful about it, and that just came up there, you know. In other words I'm not – I don't have the confidence I should have, the ease of which you've spoken once we have mastered our tools.*

LRH: Hmm.

PC: *And so that's kind of come into this a little bit, a little anxiety about, being careful, you know.*

LRH: All right, very good. Let me check that on the meter. In this session is there anything you have been careful of? And that's not reading now. Okay? So here we go. We're going to use the first one we found here which is Pre-session II, which is conditional action but all right for the moment, which is simply Pre-session III, and that's, "Point out something you could confront," and, "Point out something you'd rather not." And I think you are right in the middle of some kind of a havingness shift. You're – you're doing Routine 3?

PC: *Yes.*

LRH: Yeah. I think your havingness is

probably going to shift around on you while you're shifting. None of these things are bad for you. The "Point out somethings" don't do anything for you particularly, they are not particularly good, they are not particularly bad, but when they are combined with "confront," why, it becomes more workable. Okay?

PC: *All right.*

LRH: All right. Now we have accomplished our purpose as far as I am concerned, and I would like to do the end rudiments now. Okay?

PC: *All right.*

LRH: All right, here we go. In this session have you told me any half-truth? That read. What was it?

PC: *Well, perhaps what I said about confidence. It wasn't, you know, the whole story, there is more to that than just lack of confidence in my auditing. I mean there is some lack of know-how ...*

LRH: Hmmm.

PC: *... back of the lack of confidence, so in that way it would be half-truth.*

LRH: All right, all right, thank you. Check that on the meter. In this session have you told me any half-truth? There's still a reaction on it. What was it?

PC: *Well, I think maybe I was a little bit glib about some of the things that I could confront, you know. I mean I felt that in a way I could confront them, but I would perhaps rather not on that command.*

LRH: Hmm, all right, very good, very

good. Let me check that on the meter. In this session have you told me any half-truth? Still got a reaction. What was it?

PC: *Well, there's a half-truth when I said I couldn't find Havingness Processes on my pcs. I mean sometimes I can and perhaps I weighted it in the other direction.*

LRH: All right, thank you. I'll check that on the meter. In this session have you told me any half-truth? All right, there's still a tiny reaction on this.

PC: *Well, in regard to this shipwreck incident, I'm not entirely sure just what happened.*

LRH: All right, all right.

PC: *There's a little half-truth for me too on that.*

LRH: All right, thank you. Let me check it on the meter. In this session have you told me any half-truth? That's an equivocal read. I couldn't tell. In this session have you told me any half-truth? I got a reaction on it. It's much less now. Let me see if I can't steer you into this a little easier here. Right there, what are you thinking about?

PC: *Well, I was thinking that I didn't – I wasn't really anxious to be an exhibit A. The way I put it, it sounded as if I wanted to be on display. I don't know, that's the thing I thought of then. My main point was that I wanted to make it easy for you to give your demonstration to the students, you know, and do my part on it.*

LRH: All right, okay, very good. All

right, let me check that on the meter again. In this session have you told me any half-truth? That is clean. Thank you. In this session have you told me any untruth? All right, that's an equivocal read. In this session have you told me any untruth? That's probably reading. What was it?

PC: *Well, I was thinking of goals there. I'm a little bit foggy as to just what goals I gave you. It's possible there was a partial, not a willful distortion, but it may have been that at the moment, you know I thought it was a goal, and now perhaps I don't think so. I just had that feeling.*

LRH: All right, all right. Let me check that on the meter. In this session have you told me any untruth? All right, that reads. What was it?

PC: *Well, of course, I do get concerned about the idea of my telling you an untruth. And this always comes up in a session and I get restimulated on my mother when she used to say, "Now dear, are you sure you've told me the whole truth?"*

LRH: Mmm-hmm, all right.

PC: *That creeps into it at this point.*

LRH: All right, okay. Let me check that on the meter. In this session have you told me any untruth? Now it's pretty hard to read through that. In this session have you told me any untruth? We are going to pass that by. All right. In this session is there anything you have failed to reveal? Yes. What was that?

PC: *Well, right then my left hand was quivering. I have had that of late, a*

little restimulation of the left hand quivers and I didn't mention that to you.

LRH: All right, very good, very good. In this session – check that on the meter – in this session is there anything you have failed to reveal? All right, there's perhaps a tiny acceleration there. Something else, what might that be?

PC: *Well, I have been quite upset over my inability to perform on the course, especially since this practical has been added.*

LRH: All right, okay. In this session is there anything you have failed to reveal? All right, there's a tiny reaction there. What's that you're thinking of right there. What was it?

PC: *Well, that I'm – it just goes along with that, that I'm kind of engulfed by stupidity at times, of late.*

LRH: Hmmmm.

PC: *On the course, and I haven't mentioned that to you.*

LRH: All right. Let me check that on the meter now. In this session is there anything you have failed to reveal? The meter is a little bit rough to read right here. In this session is there anything you have failed to reveal? That reads. What was it?

PC: *Well, I was a little concerned that Tom was taken off as my auditor, you know.*

LRH: Mm-hm.

PC: *I feel that if my ruds are out, I – I share the responsibility of that, you know.*

LRH: Oh! All right.

PC: *I have felt a little down today because he was taken off auditing. He was cancelled as an auditor.*

LRH: All right, okay. Let me check that on the meter. In this session is there anything you have failed to reveal? Yes, that reacts. What is it? What are you thinking of right there?

PC: *Well, I don't feel I did as good a job auditing Dorothy today as I should have, and in a way it was almost as if, if Tom didn't deserve to audit, I didn't either, you know. A little bit of that feeling.*

LRH: Oh, all right, all right. Now did that answer the question of something you failed to reveal?

PC: *Something I failed to reveal during this session to you. Yes.*

LRH: All right, good. Did it pass through you mind in this session?

PC: *Yes.*

LRH: All right. I'm just being careful.

PC: *All right.*

LRH: I don't want to be cancelled, you know.

PC: *Okay.*

LRH: All right, all right. In this session is there anything you have failed to reveal? All right. There's still a tick left on that. It's freed up there.

PC: *Well, that I do have this kind of a lump in midriff you know, that feels like apprehension, but I know darn well it's my GPM. I failed to reveal that to you.*

LRH: All right, very good. Let me check that on the meter. In this session is there anything you have failed to

reveal? All right, there's still a reaction on that only it's a different one. What's that right there?

PC: *Well, I was just thinking I did a very poor job of going through TR 4 outside with Vi before the evening TV started.*

LRH: All right. Okay. Let me check that again. In this session is there anything you have failed to reveal? All right. We're going to pass that by, okay?

In this session is there anything you have been careful of? Equivocal read. In this session is there anything you have been careful of? Yes. What is that?

PC: *Well, I suppose careful not to dump my whole case in your lap.*

LRH: Oh, oh. Is that the withhold reading I'm getting here?

PC: *I imagine so.*

LRH: All right, very good, thank you, thank you, all right. In this session is there anything you have been careful of? All right, that is not reacting now. All right.

In this session have you said something only to impress me? Equivocal. In this session have you said something only to impress me? Doesn't read.

In this session have you tried to damage anyone? Check that. In this session have you tried to damage anyone? Have to check it again. In this session have you tried to damage anyone? Got a reaction.

PC: *Well, I suppose by admitting that I was so stupid at present, I damaged*

myself.

LRH: All right, very good, all right. In this session have you tried to damage anyone? All right, that may have read or may not have read. What was it that you thought of?

PC: *Well, I – more or less I felt I was trying not to damage Tom, you know, because in a way I felt I had damaged him a little. So I was trying not to in this session.*

LRH: All right, very good. Let me check that on the meter. In this session have you tried to damage anyone? I don't get a read on that. Okay? In this session have you deliberately tried to influence the E-Meter? Yes, what's that?

PC: *Well, I tried to squeeze the cans as I was supposed to.*

LRH: All right.

PC: *A little anxiety about the effect on the meter there by my can squeeze.*

LRH: Good enough. In this session have you deliberately tried to influence the E-Meter? All right, that is clean.

In this session have you failed to answer any question or command I have given you? I'll have to ask that again. In this session have you failed to answer any question or command I have given you? Can't read the meter here. It – I'm getting a – I'm getting a constant agitation on the needle here. All right. In this session have I missed a withhold on you? Got a reaction. What was it?

PC: *Well, it's just that I don't feel as secure as I should about auditing I have less confidence in my audit-*

ing. It was false confidence before I came here, you know, and I have to hit bottom. I apparently have to scrape the bottom and realize what a dub I really am before I can begin to be an auditor.

LRH: All right, thank you. In this session have I missed a withhold on you? Yes. What was it?

PC: *Well, just in general, I don't have the mastery of my tools that I should have.*

LRH: All right, very good. Now listen carefully to this question. In this session have I missed a withhold on you?

PC: *No, I don't think so, I mean I have told you these things before.*

LRH: Yeah. Well, have I missed a withhold on you?

PC: *Well, yes, you haven't found out what my goal is.*

LRH: All right, very good, all right. All right. Now, let me ask this and check it on the meter. All right? In this session have I missed a withhold on you? I don't get a reaction. I get an agitated needle on this thing, but that's all – in general. All right, let me see if I've got this clean now. In this session have you failed to answer any question or command that I have given you? All right. In this session have you decided anything. What's that? I've got a read.

PC: *Well, I've decided that you have a vitalizing effect on a preclear. You know, that I feel more alive and more vital and more here. I've been quite dispersed of late and so I did*

decide that, that you could help me to collect myself.

LRH: All right, very good. We'll check that on the meter. In this session have you decided anything? Yeah, there's still another one. What was it?

PC: *Well, to make more of an effort to get my practical work done.*

LRH: All right, very good. Let me check it on the meter. In this session have you decided anything? All right, I don't think that's reading now. Is there anything you care to mention about it?

PC: *No.*

LRH: All right. I'm going to call it out one more time just for the devil of it. In this session have you decided anything. Yes, there's a reaction on it.

PC: *Well, I've reaffirmed my determination to get Clear. There are times when that submerges a little bit, you know, and doesn't seem so possible.*

LRH: All right.

PC: *Now I feel that it is possible and you are kind of steering me toward it now.*

LRH: All right, very good. In this session have you decided anything. All right, equivocal read. In this session have you decided anything. There's a read on the end of that, tiny, but there. What was it?

PC: *Well, it's more or less to keep going and not – not turn aside from my goal, because I have – as I say, I've felt just a little bit overwhelmed of*

late.

LRH: All right.

PC: *So I'm going to keep going.*

LRH: Very good, all right. In this session have you decided anything. Yes, still a read on it.

PC: *Well, it feels more like being on the point of deciding something, not having actually decided something.*

LRH: All right, all right, all right.

PC: *I mean in addition to what I've told you.*

LRH: All right, very good. Let me check this now very carefully. In this session have you decided anything? I haven't got a read there. Thank you. All right. All right. In this session – in this session have you thought or done anything I have failed to find out about? No read. Okay? All right. In this session – in this session have you thought or done anything I have failed to find out about? No read. Okay?

PC: *Um-hm.*

LRH: In this session have you been critical of me? I'll have to check that again. In this session have you been critical of me? I got a little read on that.

PC: *Well, I would say it was quite the reverse.*

LRH: All right, all right.

PC: *As the session has gone along I have felt much more at home with you, you know. Much more relaxed.*

LRH: All right. Got a question: Does the question shock you?

PC: *Yes, I think it did a little bit.*

LRH: All right.

PC: *It was – you sprang a surprise there.*

LRH: Yes, you've never heard it in the end ruds before.

PC: *No.*

LRH: I beg your pardon.

PC: *Okay.*

LRH: All right. In this session have you been critical of me? All right, it reads, it reads.

PC: *In a favorable sense. Criticism can be favorable you know.*

LRH: Oh, all right. All right. I'll check it one more time. In this session have you been critical of me? I got a flick. What's the ...

PC: *Well, there was once in the middle rudiments where you did repeat something after you'd cleared it, you know, and then you pointed it out yourself. But I did notice that you went back to the "suppress" after you'd gone on to the "invalidate" middle rud.*

LRH: Yes, yes, that's right.

PC: *So I wasn't really critical, but I'd noticed you'd made that mistake.*

LRH: All right.

PC: *And really it warmed the cockles of my heart to think that Ron could make a mistake like that.*

LRH: All right, good enough, good enough. All right, in this session have you been critical of me? All right, that is apparently clean. Okay?

PC: *Yes.*

LRH: All right. In this session was the room all right? You got a tiny slowdown there.

PC: *It seemed a little formidable to start with.*

LRH: Um-hm.

PC: *You know, the sense that we aren't exactly alone.*

LRH: Yes, that's right. All right. Let me check that on the meter now. In this session was the room all right? I get a – still get a read on that. What was it?

PC: *Well, the room seems a little portentous, you know, as if some – something big is about to occur, which may well be the case because I do feel that there has been a case change since I've been in the room.*

LRH: I didn't quite get the front part of that, what ...

PC: *I said there seemed to be something portentous about the room, you know ...*

LRH: Oh yeah, oh all right.

PC: *... and that there – in other words, there seemed to have been something portentous, and something was portentous since I have had certainly the beginning of a case change in this room.*

LRH: All right, very good, very good. Let me check that on the meter now. In this session was the room all right? All right, I get a – get a bit of a reaction on there. What was wrong with the room? There it is. There it is.

PC: *Well, it didn't seem to be a warmly inviting room when I came into it,*

you know. Reg led me in kind of on tiptoe and warned me that sounds would sound, you know.

LRH: All right.

PC: *So I felt just a little tippy-toe about it.*

LRH: All right, okay, all right. In this session was the room all right? All right, that's clean. Thank you very much. All right. Now, have you made any part of your goals for this session?

PC: *Well, I'm sure I have, although I've – oh yes, the havingness goal, I've certainly made that.*

LRH: All right.

PC: *And yes I think I will do a better job of auditing Dorothy because some of my assurance has come back. There is more hope there.*

LRH: All right. All right, okay. Now, have you made any other gains in this session you'd care to mention?

PC: *Yes a – a renewed awareness that it is possible for me to get Clear.*

LRH: All right.

PC: *Kind of a rekindled hope, you know and ...*

LRH: All right.

PC: *... and then this revitalized feeling I spoke to you about.*

LRH: Okay.

PC: *... which is going on.*

LRH: All right, all right. Any other gains you'd care to mention?

PC: *Yes, I feel more at home with you.*

LRH: All right, thank you. All right. Now is there anything you'd care to ask

or say before I end this session?

PC: *No, except, well, I was a little curious about my tone arm. Did it finally respond to some ...*

LRH: It was responding between 2.9 and 2. ... 3.25 and very slight fluctuations and so forth. I take it from this that you are either in the process of having a goals list nulled?

PC: *Yes.*

LRH: Isn't that right?

PC: *Well, right now – we have been nulling, but we are adding to the list right now.*

LRH: Yes, well, you're in that process.

PC: *Yes. It's rather an uncomfortable state.*

LRH: Yes. I took it – I took it that this was probably a, frozen arm, slightly frozen on exactly what you were going through on your goals list. And actually you're being checked on havingness halfway through a very powerful process which is R3.

PC: *Yes.*

LRH: So I took – took no real attention to it. Just wondered if we could upset it and get some motion in it with this. We did, we did – we got a little motion in it here and there. All right?

PC: *All right.*

LRH: Well, is it all right with you if I end this session now?

PC: *Yes.*

LRH: All right, here it is. End of session.

PC: *Okay.*

LRH: Session ended for you?

PC: *Yes.*

LRH: All right. Tell me I'm no longer auditing you.

PC: *You are no longer auditing me.*

LRH: All right.

PC: *Thank you very much.*

LRH: You're welcome.

MODEL SESSION REVISED

A lecture given on 21 June 1962

Thank you.

First lecture, June 21st, isn't it? Saint Hill Special Briefing Course.

Okay. Tonight's lecture is on the subject of Model Session, revised. It's revised and amplified in Saint Hill lecture 21 June 62, the one which you're about to hear. [laughs] Oh, you didn't get that as a gag – boy, you're really slow. Look, come up to present time. Come up to present time.

Now, if you have any confusion, if you have any confusion about this Model Session, it's actually HCOB 23 June, is the date on it. Actually, it's HCOB 21 June, but it's marked 23 June. Why? Well, because 21 June is today's Thursday bulletin. But this didn't go out as the Thursday bulletin. You see? It's HCOB 23 June, as a special designation. And that is "Model Session Revised." You're going to live with this one for a while. And you're up against throwing everything away that you knew, you see, because Ron has changed his mind again.

You most – you hear Ron has changed his mind again most prevalently on people that didn't know there was any stable data in Scientology, you know? If you hear somebody say that sometime, ask them for, "What's Axiom 3?"

You know, "Axiom? What axiom? Axioms? We're talking about Scientology." You know? They actually don't know their basics.

The fundamentals we're working with remain relatively unchanged. But the further we reach into the never-never land of aberration and life and the mind and this universe and God and beans and catfish and kings and coal heavers and other odds and ends which you find about – not only in your reactive bank but in the actual universe – the smoother we can make it.

And this Model Session actually will make auditing far, far, far, far, far, *far* – the last far has an underscore under it – smoother than you have seen it going before.

Now, Model Session made auditing much smoother. And the earliest Model Sessions had separate processes. In other words, you did a rudiment and then you did a process to straighten out the rudiment. And all to date did this. But this Model Session is remarkable in this one aspect: It – that is, the only extra process which you need is the pc's Havingness Process. And because that has to be found and tested on the meter, it of course can't be a canned process.

The rudiments, whether the beginning, middle or end rudiments, used in this Model Session are themselves repetitive processes. You ask as long as there is an instant read on the

needle. And the moment you get a clear reaction to your question, that is flat and you go on to the next one. You don't ask the question one more time. You only ask the question twice or more if it had an instant read. You ask it merely once if it didn't react.

Now, I refer you to HCOB of the 25th of May for what we mean by an instant read. And the – let's not let this one get by us again. Eleven-tenths of the auditors in Australia, I just learned, were trying to clear prior reads off the meter. So that would have been a horrible mess, man!

The one that makes the pc feel good, the one – you know, that's the only test as to what's right – the one that makes the pc feel good is the instant read, just like it's described in 25 May 62, see? If you clean off that end instant reaction... Let's say the sentence ends with the word "cat," and you want the instant reaction which begins with the enunciation of a "t" on the end of "cat," see? If you have an instant reaction which begins with "c," *heh-heh*, that question is null.

You say, "Well, what about it if the pc thought of it before you got to the end of it?"

What do you mean auditing a pc that much out of session? That is just all there is to that. I mean, it's just ...

You say, "In this session have you invalid – ?" Read. You say, "Well obviously, the pc knew what I was going to say, so the pc knowing what I was going to say, of course you can invalid – you get a read – that's so – figure-figure-figure-figure-figure, screw the head on a little tighter! You know, get the azimuths out ..."

Oh, man, that is *wrong!* It's only one – the only read is when you have stopped speaking and you get a reaction. And if you think maybe the pc didn't understand it, you read it again, grooved. But that would be an equivocal read – that would be it was reading almost on the end, but you were not sure. Was it on the end or latent? You were just a little bit asleep at the moment the thing clicked. That's an equivocal read; meaning which, you don't know whether it was which or which. Was it plus or minus? Did it react or didn't it react? That's an equivocal read and you must establish the actual read.

Sometimes the pc is so busy figure-figuring reactively – got some circuit going, you know, making coffee or something – and you got this circuit going and it isn't true that the pc knowing the question will react to the question. If you think this can happen, then you think you are auditing the analytical mind. Then you would also think that the pc knew the answer when you ask him for a withhold and therefore you'll never search for the withhold. Because you think you're auditing a knowing being. And you're not auditing a knowing being.

So therefore, a prior read which would read on, "In this session have you inva – ?" Read, see. You say, "Well, the pc knew what he was going to say, you know, and so therefore, of course, the pc anticipated the question! Ha-ha. Ha-ha-ha. All right. Oh, I'll just find out what he invalidated this session."

About a half an hour later of tugging and pc out of session and everything all messed up like fire drill, you eventually conclude that there wasn't – there wasn't anything on it. No, the pc was just making coffee in the reactive bank at that moment, don't you see? What you said had nothing to do with any reaction on the meter, see? Something else was going on. It

does, too. Pcs' hearts beat. Pc with very low havingness, eyeballs click to the right – the meter will fall if the pc's havingness is in a horrible shape.

Some pc all of a sudden – you'll see some pc, some pc whose havingness is lousy and so forth – they'll be sitting up this way in the chair, see, they'll be sitting up this way holding the cans and all of a sudden the meter will be reading at 4, see. And they'll decide, well, they're not comfortable that way so they're going to sit this way now, see, and the meter will read at 3. You say, "What the hell went on here?"

Well, nothing went on here except the pc is such a mass that the fact that the pc moved the body put the mental masses in a different place, so you got a different read. That's right, see? You got enough black masses which are pasted down against the pc's face, he can wiggle his nose and he'd get a read on the meter, see?

Somebody's showing you that they can make an E-Meter read, why, laugh at them, man. Because, yeah, you can make an E-Meter read any day of the – you like – they'll go – and so on. But you have to have the GPM right down on you, man. And your havingness just has to be so that it's like strung wire. The pc's nerves, you know, you strike on him and he goes high C. You could play him in a symphony orchestra if you could get him under your chin. [laughter] Havingness can run down to a point where a physical reaction causes an action on the meter. That will come up here in a moment; I'll discuss that a little bit further.

But the point I'm making is, is you want an instant read. And it's the one which finishes up with the auditor's major thought. And it is right on the end, and it is no place else. It isn't prior to the end, it isn't after the end. It is right on. "Invalidated." All right, "-ated" read. See? The read starts with the last "-ted." The read that started with the "inva-" is invalid.

Don't compromise with that. Don't think you all of a sudden have observed something that I haven't seen. Of course, there – you could be using some type of meter – you could use a meter with a built-in lag that is reacting to the next-to-the-last question you asked. But that isn't true of a Mark IV.

Now, there's no compromising with this. The most amazing precision occurs on that – most amazing precision. The pc doesn't get it telepathically into the reactive bank before you say it. Nothing else is happening here. You say, "In this session, is there anything you have invalidated?" Read, see? There's no lag between the "-ed" and the read. You see, it happened simultaneously. And here's what's weird about it, is it always reads *exactly* in that fashion. If it reads late, it isn't a read. If it reads "invalida-," it isn't a read, don't you see?

You know, some of you, sometime or another, are going to find somebody around who hasn't had the benefit of your training; they're going to come rushing up to you and they're going to say, "But the pc always has present time problems." And you say, "Well, let's see." And you put the pc on the meter and you say, "Do you have a present time problem?" And you're going to find that the needle starts falling at the exact "e" end of "time" and that the pc has a difficulty with time. He'll say, "I never can get him into session."

Well, the more you louse up the principle I've just been talking to you about, the more prior reads you start monkeying with, the more latent reads you start monkeying with, the more out of session your pc's going to go. So an improper use of the meter and reading

against this Model Session can dirty up the needle and drive the pc further out of session than not using it at all.

Do you understand? This is one of these things that has to be used properly. If used properly, it's marvelous. It's something like gunpowder. You stuff it into the right end of the musket and point it in the right direction and it is marvelous. But you use it to light your pipe with and it blows your silly head off. And that's very true of this Model Session. Therefore, it has to be used properly.

Now, it is of enormous benefit to have a repetitive command Model Session. That's very enormous as a benefit. It can't be exaggerated because it isn't changing a process on a pc all the time; you just keep asking the same question that you ask over and over and over and you'll get the same – you get the thing cleared up that you ask for. You're not then clearing up some variation of what you ask for. Do you see? "Are you willing to talk to me about your difficulties?" Well, you'll finally clear that up, see, because you're just asking him this. But the process is, "What difficulty aren't you willing to talk to me about?" And that's a process, bang, bang, bang, bang, you see? But, of course, you ask the whole thing through each time.

Now, it has this beauty, is there's no variation in what you do. I mean, if you don't get a read you go right on from the point you didn't get a read. And if you do get a read you finish the sentence. If you ask him the question and get his answer and check it on the meter and you ask the question, and you know, go on and on. I'll give you some little examples of this.

This has another virtue: It is terribly easy to do once you find out that it works. It's very easy to do. It is so easy to do that nearly everybody starting in to do it has to do something else, because they know that anything that works this well couldn't be done this easily. It has to be done hard.

Now, if you think – if you think that the moisture has to come exuding from your brow and splattering on the glass of the E-Meter for you to look like you are auditing, go back on the track and pick up the old strong-man act that you used to do, you know? Where you took these ten-thousand-pound dumbbells, you know, and strained and your muscles quivered, you know, and you lifted it up over your head and the whole audience could sit there and say, "God, that's hard to do! What an expert he must be! Look how difficult this thing is!" See? And they keep talking that way until some little girl comes by and picks up the ten-thousand-pound dumbbell and puts it under her arm and clears up the stage and walks off. You see?

Yeah, everybody has to some slight degree a desire to demonstrate that they are an expert because what they are doing is difficult. Everybody has that desire to some tiny degree.

The real experts are the ones who fool you. I imagine if you were ever down and saw Sterling Moss in his heyday and you got a close-up of that boy driving a car you would have had the impression: Anybody can drive this car! Just anybody could drive that car. Anybody could drive that well. Anybody could drive a race, see. Gravel shooting out from underneath the tires, you know, and everything going on, but you just say man, that's just driving a car, you know? An old lady driving down Main Street, you know? Nothing to it.

And the fellow that came in last in that race, his knuckles – the bones of his knuckles have burst through the skin, you see? He has sunk his teeth – upper teeth into his lower teeth,

you see? His eyes are bugged out three-eighths of an inch. You say, "Man, he's really driving." He came in last, too.

Well, the funny part of it is, is the mark of an expert is ease – always. Now, remember that because you're going to fool students; you're going to fool people. They see you give an auditing session and it looks very, very easy. So they're going to go through this nonsense – all of you – some of you are going through this nonsense, all of you will go through this nonsense or have gone through it – and that is to say when you first sat down in a co-audit or to audit or took the book, there was nothing to it at all. You simply sat down and you said a few things to the pc, the pc answered these things and bong, and you got a good result. It's fantastic, you know?

And you go in to co-audit, you'll see a lot of birds sitting in co-audit, you know, and they'll be saying, "From where you could communicate to a head? Thank you. From where could you communicate to a head? Thank you. From where could you communicate to a head? Thank you." See, there's nothing to it, you know, just bang! bang! bang! They actually – there's no difficulty, they're just sitting there and doing it.

And do you know they have to go all the way around the dial to get back to that point?
[laughter]

The second you throw them a little more complication – see, they were all right. There was an Instructor standing there. Didn't know anything was to be worried about but of course, they aren't having any trouble either. Well, there isn't anything to be worried about. And they will go all the way around the dial before they come back to that ease.

So it looks very funny to see somebody sitting there. You really can't tell whether he's – it's beginner's luck or he's an expert. You see?

But in actual fact, you, time after time, will in futures be giving a demonstration of auditing or something like that. You'll be sitting down, some other people will be around watching you audit, you see. And you'll be doing a flawless performance of auditing and so forth and they'll all be fixed with the total impression that they could do that. They'll all be absolutely convinced that they could do that with the greatest of ease.

And sure enough, they'll take something like a script Model Session, they will ask the thing and they will get along fine and then the horrible unknownness of it all, you see, starts closing down on them. And are they doing right? Are they doing wrong? Which way are they going? And which way is up and backwards? And they just become all thumbs. You know?

People do this with golf. They do this with golf. They walk out on the links and they take a club, any old club, there's the ball and they haul back – 275 yard drive. You know? Knocks the whole top out of a tree at the far end of the runway, you know. And they say, "Well, there's nothing much about this game!" And spend the next twenty years trying to make half that distance. [laughter, laughs]

So the simplicity of this is a fooler. You enter into it with the idea that there must be something else to do. But you also enter into it with all the alter-ises wide open. And the expert has had the alter-ises impulses flattened. See, he has the – he no longer has an impulse that he's got to do something else or he's got to meet an emergency or he's got to be brilliant at

this particular point or he's got to be this or he's got to be that. These are flattened with the expert.

Your amateur goes along fine right up to the moment when the pc says something, "yeowll."

"Did he say yes? Did he say no? What do I do now? Should I? Shouldn't I? Let me see, maybe I'd just better avoid the whole thing. I'll go on to the next question." So on, so on and so on. Not quite right. You get the idea? He doesn't know.

So the next time he comes by this thing, he alters. And he alters badly. The pc said something different at this level so there might be something wrong with it. So this time he makes absolutely sure. "Are you willing to talk to me about your difficulties?" So he's got the word "difficulties" and he knows the difficulties and the pc told him – has told him several times that difficulties are something he shouldn't really be talking about because it – that is a charged subject and that it's really all right to audit, you see, be audited by the auditor but difficulties is a separate and different subject. See? He knows this. So he says, "Well, let's put another one in here; let's – is it all right if I audit you?" That was an old one, see. So he says, "Well, we'd better go back to that one because the pc has so much difficulty with difficulties." And he gradually shifts things this way and shifts things that way and the next thing you know he doesn't have the benefit of the workout and he's having an awful time.

He discovers various things as he goes along, you see. He discovers things. And as he discovers these things he normally does something else. He actually has – a person who is new at it is nervous at discussing somebody's problems with them anyway and they're liable to find ways and means not to do so and they go into all sorts of variations. It – they never give it a chance.

Now, similarly, you get Q and A going about the same way. You say to the pc, "Do you have a present time problem?"

And the pc says, "Yes."

And you say, "What is the problem?"

And the pc says, "Pretty – it's a pretty difficult problem. Nobody's ever been able to do anything about it. As a matter of fact, more auditors have broken their hearts over this problem than anybody else," you see?

The guy thinks, "Well, gee, you know, maybe this is something unusual here." So he says, "Well, you can talk to me about it," and leans back away from the meter and goes into a long and involved conversation with the pc. And if he's very, very new he'd probably listen to the earnestness and worry in the pc's voice and the tenseness in the pc and wasn't reading his meter right anyhow. Actually he didn't have a read on "Do you have a present time problem?" See. He just followed the red herring, not the path.

Or the pc with this tremendous buildup finally tells him what this problem is. That, "I'm in love with you." See, something like this, you know. God! The ruddy amateur – the grizzled veteran says, "Thank you. I'll check this on the meter," you know. [laughter] The amateur has gone all these years, you see, and nobody's ever said this before, and feels guilty.

Does this. Does that. Takes it up, discusses it at great length. All of a sudden says, "Well, when did you first notice these symptoms?" Q and A, here we go.

But it's just these little points, the particularly disarming points, the points that disarm the auditor, the points that hit him personally, the points which are calculated to upset him or worry him. On these points he'll go adrift, become unusual, do something else, flub, fail to handle the thing And if he gets into a habit of doing this sort of thing and if he never does conquer this impulse, why, he winds up with nobody ever getting better. So he says, "Well, Model Session can't be any good." How would he know? He's never used it.

Now, this session is built with great care, with a tremendous amount of data back of it. Now, I'm not trying to give it altitude, but I am talking now about the amount of data which is wrapped up in this. Actually, the first Model Session – the first discussion of Model Session was, I think, about 1958.

We said, "Well, you know, auditors say certain things, see, and it might be a good thing if we patterned those things and made it easier and made it sound more constant." And that was all there was to Model Session.

Then the next reason for a Model Session was if you used the same session every time it tended to run old sessions out. That's a worthwhile reason. So that was why Model Session continued on.

And then here at Saint Hill it became the earmark of a professional-looking auditor. Just no – no more importance than that, don't you see?

Ah, but it has moved up into far greater spheres than these earlier reasons. Yes, it is nice for all auditors to be in agreement on what they say in an auditing session. The R-factor on auditing comes up enormously if you use Model Session. And now, if you have every question of the Model Session is the beginning of a repetitive process which can be run as long as it is necessary to clean the needle, then there's every reason in the world to have a Model Session.

Now, this session just used exactly as it's supposed to be used without departure going on down the line will get you some very interesting results just by the use of it. You put this person into session and you take him out of session. You know, no body of the session at all. If you did that, let us say, every day for three days running, this person would be going around talking about "my auditor." See, if you did a nice, smooth job of that fact.

Furthermore, it has this unusual power, particularly gripped up with Prechecking or Havingness. But a pc's needle tends to smooth out if – on just repeated, expert use of this Model Session. Using nothing more than this. Your expectancy is that a new pc that you have might have a rather weird looking needle. You know? It might read five times before the end of the major thought and seven times afterwards. You know? You'd think the electrodes were better connected to the mantel clock than they were to a pc. You're not quite sure what's going on, but it sure has nothing much to do with what you're doing.

You're looking at the out-of-controlness of the pc. See, the pc actually isn't in-session. The pc is running on a kind of auto. They actually are not powerful enough to generate their own reactive bank. The reactive bank is just running on automatic, you see? And what you

say doesn't have very much to do with it. By the time you've audited him for about three days what you say has a lot to do with it. And you will notice that a pc sort of – a new pc quite often looks like somebody who is keeping himself three or four feet out of the water, and then he will go down to head level and swim comfortably after a while.

Well, it's actually their concern; they never work out what's going to happen. And the main concern of people is they don't – they don't know what's coming off. They don't know what's going to be demanded of them. By the time an auditor's demanded exactly the same thing of them for three days running they all of a sudden heave a horrible sigh of relief and get comfortable – just that factor alone, see? If all of these lines were gobbledygook that is what it – would happen.

Supposing you had a patter that was something like this: "How are you today? That's clear." See? "Have you been enjoying yourself this week? All right. Thank you. That's clear. Are you fond of clothes? Thank you, that's clear." Didn't do anything else than this, see. "Do you like fudge?" And then your end of session – your end of session rudiments were, "Have you been comfortable in the chair?" See? "Have you thought about anything? And do you feel like yourself? End of session."

Now, by some tiny little stretch, one or another portion of these might have been slightly evanescently therapeutic but I think you'd find all of those things rather wide. And yet if you did that to somebody for three days running and you used the same patter and did it exactly the same way, at the end of the third day they would trust you more than on the first day. Their trust would be higher because they'd know what to expect. They'd say, "Now, the next question he's going to ask me about fudge," you see? They know what's coming. Well, there – your R-factor's high, you see? Their expectancy. They're never startled, always that sort of thing. And they would feel more friendly towards you. And their case would be just as lousy as ever, but as far as you, the auditor, was concerned, they'd feel more friendly and you would be much more real to them. And if you were standing in a group of people and that pc came in the room you would look more solid than the other people in the room. Quite interesting. You would look more solid. There's your expectancy – just establishment of expectancy. Now, don't downgrade that as a factor in Model Session, see?

Well, this comes to this point, then, that the whole effect of Model Session, for various reasons, increases the reality of the session and increases the pc's ARC with the auditor. So therefore, don't make this mistake: don't expect any question, any one question in Model Session to suddenly straighten out everything that's wrong with the pc. See, anything more than you would expect one button to straighten out the whole case. You understand? Get them clear, get them clear, but the first time you run it you've got a dirty *bzzzz*, the needle is going *bzzzz* every few minutes - *bzzzzz*. And for to – unfortunately, every now and then, the *bzzzz* occurs instantly with where you ought to get the instant read, you see? He's zigging while you're zagging.

Now listen to me. This you actually have never heard very well. That *bzzzzzt* doesn't mean you can leave a question hot on an instant read if the instant read *bzz-bzzzed*, but it means this: that you shouldn't get so confoundedly optimistic about cleaning up the *bzzzzt* off a needle with any single rudiments question, by asking for missed withholdings or doing any-

thing else. You take the *bzzzzzzts* off and the ticks and the tocks and the clicks and the clacks with auditing, not with a part of auditing. In other words, straighten out and smooth out the pc mentally so that you don't get all these zigs and zags on a needle and *brrrt-brrrt-brrrt*. That takes auditing.

You will find that every time you run this Model Session the needle at the end of the session will be a tiny little bit cleaner. By the time you've run three or four sessions the needle will look pretty smooth.

Now, you'll get pulled out of the datum I've just given you by the fact that now and then you will have some fantastic luck. You know, every hundred thousand visitors at Las Vegas walk in and put a dollar in one of the slot machines, you see, and hit the jackpot. The machines are rigged so it's every one hundred thousand visitors, you see. And the thing feeds you back several hundred dollars in a jackpot. And it's very delightful because the silver dollars roll all over the floor, you know, and get into the spittoons and everything. And marvelous – you know, wasting money like crazy.

Well, you're going to hit this, see, you're going to go halfway down through a Model Session one day – discount the fact that you've been working on it, you see, for a week or two – and you go halfway down through a Model Session one day and you said, "Is there something you have failed to reveal?" You know? You're in the middle rudiments or something and "In this session, is there anything you've failed to reveal?"

And the person says, "*Uhhh, ohhh, uahh*, maybe I'd better tell you – I've been hiding it from you every session but the truth of the matter is, is I wear boys' underwear under my dress." And all of a sudden the needle's going this way, see? Up to this time this was needle motion. All of a sudden ...

Well, this sticks you as an auditor. Whenever that win happens you tend to get stuck in that win. Now, you just realize that you have been already stuck in that win a time or two, haven't you? You all of a sudden saw something like this happen, see. And so after that you keep going, "Let's see now, how can we find this lady's wearing boys' underwear?" See? "How can we – how can we ..." For a little while you kind of have the impression that every time you see a stiff needle that the – the person is wearing boys' underwear. [laughter] You actually get stuck in the win. And you go on and on and on this way and you'll start doing your Model Session a little differently. You know, you'll just be watching it very closely, see – trying to cover the thing, you know, clear up the whole case on any one of these questions. See, any one of these questions and this can happen. Next time you get somebody with a stiff needle, you know – oh, man! You just sweat over these things, you know? Which one is going to free it?

Oh, it isn't which one is going to free it. You didn't remember something about the boys' underwear case. There was something you didn't remember about that case and that was that you'd been auditing the person for a week. And what you did was walk it right up to the point where all of a sudden you apparently pulled it all on one button. But you didn't. You didn't. You had been preparing the case. What you got was a sort of an instantaneous improvement of the case.

Psychoanalysts just blow their brains out all over the world with this one. They – they'll have forty, fifty patients and on one of them, one day, they say, "Did you ever have sexual relations with your little brother?" or something like this. And the person will look kind of haunted and, "Yes." See? And right away they're clean, they pass their Rorschach, their Wassermann – they pass everything and they're just in marvelous condition thereafter. You'll find this poor psychoanalyst for the last twenty years has been hunting in every patient to find incest in their childhood.

Freud got hung with what he got hung with because he had a piece of luck. See? He had a piece of luck and here and there and so he just assigned that to all cases.

Well, it's quite a few things that a case is composed of. For us to be at 3GA, to have Routine 3GA and to have Routine 3GA rather fantastically bringing arms down and needles going clear is the confoundedest magic that anybody ever imagined could happen – just a hundred percent clearing. You haven't realized it yet because you haven't walked into too many cases, you haven't – but it's going to creep up on you.

One of your reactions is, when you first do this is, "Well, why the hell didn't I start 3GAing this pc when I first got my hands on him? Find the goal the first day, you see, and then write all the lists the second day and I would have had a Clear." And you kind of – then – so you try that. And you come a gorgeous cropper, you see. Can't keep the pc under control enough to keep him listing and can't do this and can't do that and they aren't able to blow anything and they're not in-session and all of these other factors are deleted from it, you see. So our concentration is on 3GA. See? It's on the doingness, the thing: find the goal and then list the goal and that is what makes a Clear. That is an inaccurate statement. It is good auditing with the technology of 3GA which makes a Clear.

The funny part of it is if you delete the good auditing you won't get a Clear and if you delete the 3GA you won't get a Clear. Oddly enough, you won't get a pc up to 3GA unless you've got something – you won't get all cases up to 3GA unless you've got CCHs and Prep-checking either. See? So it's all a piece. It isn't 3GA that is making Clears. It's CCHs, Prep-checking and terrifically good, accurate, smooth auditing.

Well, this Model Session, then, is a piece of clearing, to that degree. And all this does is tend to keep the session predictable and present time clean enough to be audited in. And that's what this does. It keeps the session predictable and present time clean enough to be audited in. And you get an undistracted pc if you go at it in this particular wise.

Now, I'm not trying to give you a sales talk on this Model Session. I'm merely trying to say, "Give it a chance." This Model Session will be released in this bulletin the 23rd of June. Probably be in your hands late tomorrow afternoon. You don't, therefore, have to copy off what I am about to say. So I'm just going to read it off so it will also be on this tape:

It's "Start of session." Of course, these – many of these things are the same as any old – other Model Session. "Start of session." "Is it all right to – with you if I begin this session now? Start of session. Has this session started for you?" If pc says, "No," say again, "Start of session. Now, is this session started for you?" Pc says, "No," say, "We will cover it in the rudiments."

Beginning rudiments: Goals. "What goals would you like to set for this session?" You notice there's no read on this so "for this session" can follow it. "Are there any goals you would like to set for life or livingness?" Same thing, isn't it?

Environment: "Tell me if it is all right to audit in this room." That got shorter, didn't it? Now, if you were to ask the pc repetitively, "What is wrong with this room?" I don't know that you'd ever get this rudiment in. If you have the pc's Havingness you run his Havingness if you get a reaction on the needle. Now, there's two things you can do at this point. One is simply observe the instant read. "Tell me if it's all right to audit in this room." *Clank!* All right. If that instant read was present you must run Havingness. Do you understand that? This one has to be cleared, too. You must run Havingness. Now, how long do you run Havingness?

If you don't have the pc's Havingness, you use old TR 10, see. How long do you run it? Well, you just better check this again a few times. "I'll check it on the meter. Tell me if it's all right to audit in this room. That is clear." See? "Thank you." We go on to the next one. You see how that rudiment's handled? Well, actually, there's one in the beginning ruds and one in the end rudiments that are handled the same way. But these are the only two things where you use any process other than the exact question.

Auditor: "Are you willing to talk to me about your difficulties?" And "What difficulty aren't you willing to talk to me about?" You find that will clear it up slicker than scat. See, actually it's a repetitive question. "What difficulty aren't you willing to talk to me about?" Of course the trick is he's telling you. See? "What difficulty aren't you willing to talk to me about? What difficulty aren't you willing to talk to me about?" If you ran that as a repetitive question you'd find out that you'd get – you'd get an auditor improvement.

Lay off this idea here – and you'll notice it isn't present – "Is it all right if I audit you?" because that violates a prime principle of auditing. It puts the pc's attention on the auditor. So somebody who thinks that one has to be used will find himself having to straighten up something; if he'd kept his cotton-picking mouth shut he'd never have had to straighten it up. That is asking for trouble.

Have you ever noticed that your attention goes very suddenly and sharply on auditors who drop ashtrays? Well, that's just like dropping an ashtray, that particular question, so it's been dropped as a question instead of an ashtray.

All right. "Since the last time I audited you, have you done anything you are withholding?" And "What was it?"

PTP: "Do you have a present time problem?" "What is the problem?"

Let me go back one moment and say about this, "Are you willing to talk to me about your difficulties?" We mustn't lose sight of this old one. The definition of in-session is: willing to talk to the auditor and interested in own case. So this is, of course, a very trick package. You're asking him, "Are you willing to talk to the auditor and are you interested in your own case?" We're asking him in the same sentence. Actually, that is a masterpiece of condensed statement. All right. And of course, every time you say your – yeah, "What difficulty aren't you willing to talk to me about?" of course you're asking him to look at his own case and talk to the auditor about it. So actually, you put him in-session, put him in-session, put him in-

session, put him – and all of a sudden you ask and it reads and you're all set. You haven't got any read on it anymore and there you go. It's in.

Don't worry about your identity as an auditor. You realize – you realize it isn't really the pc that is difficult, ever. And from the pc's point of view it really isn't the auditor. See, it's his conceptions of the auditor.

Now, you want to throw all these into full bloom, just ask a pc, "Is it all right if I audit you?" Now, he's got to think over all the reasons why it isn't all right and he's thinking about you as a personality and he's thinking about all the O/Ws, so you've got marvelous opportunities to miss withholds. Instead of that, carry it over on this other line and it's fine.

All right, let's carry on with this. "Do you have a present time problem?" "What is the problem?" Now, you know, "What is your problem? What is your problem? What is your problem? What is your problem?" is an old process to run out problems. You know a pc will always give you a different answer. You know, that's an old one. So, you say, "Do you have a present time problem? That reads. What is the problem?" The pc tells you. You say, "I'll check it on the meter. Do you have a present time problem? That's clear. Thank you." And you're away into what else you're doing.

But you could keep this up this way: "Do you have a present time problem? That reads. What is the problem? Thank you." Pc tells you what it is. "I'll check that on the meter. Do you have a present time problem? That reads. What is the problem? Thank you. I'll check that on the meter. That reads. What is the problem?" You know, you could keep that up for half an hour? No pc under the sun would be able to get a read every time, though, for a half an hour, I'm sure. [laughter]

You just ask it until you run into this. "Do you have a present time problem? That's clean. Thank you." See? No last half, see? And the rule is in all of this: when there's – when it reads clean there's no last half of the question.

Now, of course, your middle rudiments is: "In this session is there anything you have suppressed, invalidated, failed to reveal or been careful of?" And "What was it?" But now, that's a package question. The auditor who is lucky slides over this, this rapidly, see. He says, "In this session ..." It's just like you've asked four different questions, but you can get rid of it rapidly. So this apparently violates the instant read proposition. But, actually, this – these are the questions you're asking "In this session, is there anything you have suppressed? In this session is there anything you have invalidated? In this session is there anything you have failed to reveal? In this session is there anything you've been careful of?" That's actually four rudiments.

Now, the second you have trouble with this, it breaks down into four rudiments. See? If it's all clean you're just lucky, get off of it and get out of there, see? Not any one of those endings read. If one of those endings read, the repeated question is the single rudiment question.

I'll give you an idea. "In this session is there anything you have suppressed, invalidated? That read. What was it? Thank you. I'll check that on the meter. In this session is there anything you have invalidated? That's clean."

"In this session is there anything you have failed to reveal or been careful of? That reads. What was it? In this session ..." and he tells you. And "In this session is there anything you have been careful of?"

But to keep the pc from ever getting confused I handle this this way. And you've heard me handle it this way. If he gets one read I give them the next ones in singles. See? I don't care which you do, but I find out there's you – there's a possibility, I feel, that he could get confused.

So, all right, let's give you an example: "In this session is there anything you have suppressed, invalidated? That reads. What was it?"

Pc says, "Oh, so-and-so and so on."

And you say, "Thank you. I'll check that on the meter. Is there anything you have invalidated? That's clean. Thank you."

"In this session is there anything you have failed to reveal? That's clean. Thank you."

"In this session is there anything you have been careful of? That reads. What was it? Thank you. I'll check that on the meter. In this session is there anything you have been careful of? That's clean. Thank you."

In other words, ride him singles. You get into less trouble that way.

All right. Now we get – of course there's body of session. Body of session is where the middle rudiments are used. And you start a process, if you're going to run a process, you start it the same way you always have, is: "Now, I would like to run this process on you (name it). What would you say to that?" See? It's the same wording. And then you get into your middle rudiments.

And then you've got end rudiments. Now, your end rudiments have had one or two additions here – with the half-truth: "In this session have you told me any half-truth, untruth or said something only to impress me or tried to damage anyone?" And the response to any one of those that reads is, "What was it?" And the same rules apply as apply to model sess – middle rudiments in the Model Session.

Now, the E-Meter: "In this session have you deliberately tried to influence the E-Meter?" And we get a departure here. See, there was a departure on difficulties. You have a different end question, "What difficulty aren't you willing to talk to me about?" See, not "What was it?" And we get another departure here in order to get it as a process. You find out that, stretch your wits as you can, "In this session have you deliberately tried to influence the E-Meter? What was it?" That doesn't go, you see?

"How did you try to influence the E-Meter?" is the question we get answered. That follows the same rule, of course. "In this session have you deliberately tried to influence the E-Meter? That reads. How did you try to influence the E-Meter? Thank you. I will check that on the meter. In this session have you deliberately tried to influence the E-Meter? That's clean." Then we go on to the next rudiment.

And your question or command, "In this session have you failed to answer any question or command I have given you? What question or command did you fail to answer?"

Now, that could require a little stirring around in your skull. Because you got a read on question and command, you'd better sort this thing out and drop the one you didn't get a reaction on. Now, I will confess to this: that particular rudiment is not as happy as I would like to see a rudiment. But "In this session have you failed to answer any question or command I have given you?" We will find out that it will read question or command as an end line.

Give me your pencil. You know, you have just seen something change.

It's, "In this session have you failed to answer any question or command? What question or command did you fail to answer?" Now, please drop the question or command out. Did you fail to answer any question – or command? You'll get a clang or a clang. Well, ask the one that clanged. Okay? So it becomes, "What question did you fail to answer? What command did you fail to answer?" Another package rudiment. Okay?

All right. "In this session have you decided anything? What was it?" (Give me your pencil.) "In this session is there anything you have decided? What was it?"

Withhold: "In this session have you thought or done anything I've failed to find out about? What was it?"

"In this session have you been critical of me?" Now, we can't work that one around to the stylized wording of having it all end right on the end or it would read this way: "In this session, of me have you been critical?" And somebody would say we were "mein kampfing." They will want to put "of me yet."

"In this session have you been critical of me? What have you done?"

Now, that is the – that is the neatest package that keeps in the auditor's mind from here on, this one thing: that when the pc thinks a critical, it is normally followed with a "What have you done?"

He, of course, will say, "Well, I thought something." Well, that's doing something. We don't jog him up this way. But if this wasn't clearing you could keep asking a pc, "What have you done? What have you done? What have you done?" and he would come up with something eventually. So this one is bound to clear sooner or later. Right?

All right. "In this session was the room all right?" And of course, if the question reacts, why, you run Havingness.

Also, at this stage of the game, it might be very wise for you to get a can squeeze test. And if you had too little can squeeze showing on the needle at sensitivity 0, to run Havingness anyway. You never go wrong running Havingness.

By the way, the first rudiments – the first end rudiments ever used, I used at 42 Aberdeen Road – oh, no, Bay Head, New Jersey – to bring a pc back to the land of the living, having been way down the track someplace. And he took it as a process. See, I just kept calling his attention to the environment. And I'd been doing that on people rather consistently and that's the original action of havingness. That is where that – where all havingness came from. That's the first genus of havingness. And you find it's wise to end up the session by calling the pc's attention to the environment anyhow. See? So even if it didn't react, run some Havingness. Who cares? You can't make a mistake on that one.

You can always tell beginning auditors, "Well, there's one rudiment on which you cannot make an error and that's the end rudiment on, 'Was it all right to audit in this room?' Because whether it reacts or not you do – can do something about it or not." It's impossible, you see, to make a mistake on.

All right. "Have you made any part of your goals for this session?" And "Have you made any other gains in this session that you would care to mention?"

And end of session: "Is there anything you would care to ask or say?" And notice that is interchanged because "ask" is actually – belongs in English construction before the exclamation point of "say." And I'll bet some of you have had trouble with that. Well, that's because they're out of order. All right, they're in proper order now. "Is there anything you'd care to ask or say before I end this session? Is it all right with you if I end this session now? Here it is: End of session. Has this session ended for you?" And so forth. "You'll be getting more auditing." [laughter]

Now, we go into this just a little bit further here and we still have the end of process... If you're running processes noncyclical, is the same as it's always been: "If it's all right with you I will give this command two more times and then end this process." And gives the command two more times. "Is there anything you would care to say before I end this process?"

That, by the way, doesn't even apply to a hav – that doesn't apply to a Havingness command being run in rudiments. That you simply end. The less time spent on it, the better off you're going to be. Because all these rudiments and everything in Model Session is run to a clean needle. So you're going to clean the needle and then ask two more times. Oh no, you're not, not if you're wise.

All right. Now, I'm going to just give you a very brief and rapid list of the most flagrant errors that can be made in using this Model Session. And the first and foremost is not being expert on a meter. You don't know how to audit a meter and you're just making wise with a meter and you can't read it for some reason or other. And of course, everything else falls down, crash.

And the next error is, of course, fumbling with script and not knowing it. You see? Not knowing Model Session.

Three is asking a question a second time when it was clear the first time. *Huh-huh*. You say, "Well, is it all – are you willing to talk to me about your difficulties? That's clean. I will check it on the meter. Are you willing to talk to me about your difficulties?" Do you know that you will inevitably, I think almost always, get a read? Because you are alter-ising the clearness of the needle. And it will read your alter-isingness. If you don't believe that sometimes, ask the question twice in a row; ask a clear question a second time and then watch it and then ask – say to the pc, "Recall my asking it the second time. Thank you." And then ask it the third time and it's clean again. In other words, you can put an instant read on a meter by reading a clear question twice. It's quite spooky. You see, it now isn't responding to the bank; it's responding in a protest.

All right. Four is not asking the question a second time when it read on the meter. Of course that – that is just – you got an instant read, see – not ask the question a second time – you got an instant read, now don't check it. Now, that's murder.

You say, "Are you willing to talk to me about your difficulties? That read. What difficulty aren't you willing to talk to me about?"

And the pc says, "Well, I have a horrible hankering for butter cakes that turns on at 4:32 in the afternoon."

And you say, "Thank you," and go on to the next rudiment. You've missed a withhold right there, because he's probably got another one. And you'll find as a pc grooves in on this he will expect you to ask it a second time and you'll get the added disadvantage of the fact that it now adds up to a flub.

All right. Five: Not saying you could – you – this is another error: not saying you could not tell what the read was when you couldn't. You couldn't tell what the read was and you didn't say so. See? It was going *bzzzz, bzzzz, bzzzz, bzzzz* and you asked, "Are you willing to talk to me about your difficulties?" And then just as you said "dif-" it says, *bzzz, umph, bizzz, and biz, biz, brrrrp*. Now, if you ask the question a second time the pc may be under the impression he doesn't know what's going on and you've hung him with an unknownness. And you have to tell him what you're doing. You say, "I was unable to read that; I will have to ask it again." I've been saying, the read was equivocal – this mystifies the pc. You've got to tell him when you couldn't tell. Now, don't try to sit there and appear so wise and sage.

Never pretend on a meter reading. Just never pretend, man. If it was clear and you thought it shouldn't have been so you ask it again, you'll foul up every time. And never pretend that it wasn't, you know – never pretend that the person got a read when he didn't. This drives a pc up the bank, you know? Up the wall.

All right. And the next one is, number six, is failing to get in the R-factor by telling the pc what you're going to do at each new step. That's very important, telling the pc what you're going to do at each new step. Now, you don't necessarily say, "We're going to have to – we're going to start the beginning rudiments," and so forth. But man, from there on you'd better tell him you're going to start the middle rudiments. And you'd better tell him you're going to start the end rudiments. And when you sit down before you start the session, why, it's an awfully good thing to say, "We're going to have an auditing session." Very good. And when you start to get the body of session you tell the pc, "Well, we're going to prepcheck today." You don't clear these things on the meter. It has nothing really anything to do – it's just the R-factor. It wipes out his mystery about it all. And you can practically drive a pc round the bend by never letting him in on what's going on.

You simply sit down and you're going to run a Havingness session. He expects to have his goal found. *Baaaah!* Rudiments all fly out with a crash.

Part of keeping the rudiments in is keep the environment predictable.

And number seven: doing what the pc suggests. Oh, my God, that is horrible.

And number eight: adding unusual questions or remarks or making suddenly irrelevant statements. Always upsets a pc when you make sudden remarks or statements that have nothing much to do with anything. Yanks him out of session and so forth.

All right. Patter is what I have given you already on this tape – the way you handle these questions and so forth.

This does not take very much doingness. It isn't very difficult to get used to this thing. It is very easy to use it. Most of your trouble will be trying to do too much of it. Trying to make it too much something or other, trying to do something else with it. By that I simply mean adding four or five rudiments at the wrong places, questioning the pc's answers or any other of the bum ones which I just gave you. Okay?

Thank you.

Take a ten-minute break.

QUESTION AND ANSWER PERIOD: TR 4, MODEL SESSION

A lecture given on 21 June 1962

Okay. This is the second hour of the Saint Hill Special Briefing Course, 21 June 62.

What question would you like to ask me about Model Session? Meryl?

Female voice: I wonder about something on one of those questions – what was it? What question have you failed to answer?

Yeah?

Female voice: I thought that you should never ask a pc a question that didn't give him the possibility of just saying "no." Like, "Have you failed to answer a question?" Remember, like in old Sec Checking, you know, you never just say, "Well, what did you steal?" You say, "Have you ever stolen anything?" So he always has gotten "no" for an answer – a choice. Do you see what I mean? Rather than the question simply implying that he must have done it.

Well, that's your second question.

Female voice: Well, then, how exactly does the first one go? Unlike this "failed to answer a question or a command."

"In this session ...," what is it?

Second female voice: "In this session, have you failed to answer any question or command I have given you?"

Female voice: That is the ...

"In this session, have you failed to answer any question or command?" is the way it goes.

Female voice: Well, that is still just the way it is then?

Yes. So...

Second female voice: Yes and then if you get a read, then use the second one.

Yeah. Your second question is not asked unless the answer is "Yes."

Female voice: I see. Yeah, I get that.

Now, the trick is here is your pc – I should comment on this – is your – the auditor always thinks that the – he builds up a facade here that the meter answers for the pc on the yes and no. And you'll find out in normal auditing that your pc will – after they've been audited

on a meter for a while, they begin to wait for the meter to answer anyhow. So – they do, to find out whether it's clean or not clean, which is perfectly reasonable. And that question which you just asked me is not answered unless the question was "Yes."

Female voice: I see. Mm-hm.

Okay?

Female voice: All right, fine. Thank you.

You bet. Yes, Ian?

Male voice: on "Failed to suggest," Ron, if you left out the middle rudiment, is there an optional one you can use?

That's a prep.

Male voice: You can't use it in the middle ruds?

That's a Prepcheck. If your pc is busy and consistently and continually desiring to suggest something, you've got a point now which is an interesting point of decision. See? It was one of these optional questions. If this is always hot on a pc, your pc is always about two-thirds out of session, this could be used, don't mistake this. If it were to be used it would be the first one. You'd say, "In this session is there anything you have failed to suggest, suppressed?" See? "Invalidated, failed to reveal or been careful of?" But you'd find out that this rudiment would tend to drop out even in one or two sessions. Because it is so symptomatic of somebody being way out of session, it is not something that puts a person well into session, it's simply a symptom. The rest of the rudiments are not symptoms. They're ill in their own right.

Male voice: I have that but I was thinking ...

You always use it on a prepcheck.

Male voice: I was thinking chiefly in terms of auditing people like the mob we have here, professional auditors.

Yeah. Yes, yes. It is a bit trickier to put a professional auditor into session than it is raw meat off the street, see. It is trickier. There is no doubt about this. But I wouldn't Q-and-A with this fact. I'd just go ahead and put them into session. For instance, Kay Minor, last night – where is Kay? Oh, there she is. She'd evidently been run lately with the rudiments out. See? So she was sitting there a little bit – about half out of session, see, and toward the end of it she started to go into session. See? I think she would agree to this. And I don't know if she felt like that or not. But if I audit her again, she would be taking it much easier. See, audit her again with all the rudiments in. And then if I'd audit her again with all of the rudiments in, the test would have been made, is: Yes, I dare go into session with this auditor. Get the idea?

Now a professional auditor is to that degree harder to put into session because he knows what is being done right or wrong. It isn't that he is a tougher pc. He is not. Don't ever make that mistake. He's just tougher to get into session.

Why is he tougher to get into session?

Because he has a higher criteria. His critical sense on the idea of auditing – not critical as a derogatory thing – but he has more information to be critical about.

The funny part of it is, is the raw meat is just as critical, but never says so. You make mistakes and because Model Session is geared exactly the way it's geared, you'll get the mind reacting reversewise.

So you can expect that a professional auditor is harder for an auditor to put into session, perhaps in the first one or two or three sessions.

Now, if a professional auditor is almost impossible to get into session, then he's being handled with all the rudiments out. In other words, nobody is actually getting the rudiments in.

So, you've got some student now in HPA. He's the third week and he thinks, actually, that you read the thing off the tone arm. If you don't get a tone arm shift when you ask a rudiment, why, then it's clean. Well of course, a professional auditor can be audited out of session, to session-outness, out-of-sessionness, you see, much more rapidly than anybody else. Because he knows this is so dead wrong and he knows he's liable to be gotten into trouble. So his wariness goes up. See?

Does that answer any part of your question?

Male voice: It answers all of it.

All right. Thank you. Okay. Any other question? Yes, Peter?

Male voice: Ron, I had a question that really was last night's question ...

All right.

Male voice: ... on the cognition ...

Comm lag permitted.

Male voice: Thank you.

All right.

Male voice: On the cognition that you picked up. You said to Kay, "You cognited on something then," and I didn't know how you picked that up. You were running a Havingness Process and you said, "How is it going?" or something. "But you had a cognition on that, didn't you?" And I didn't know how you realized that.

Just tone of voice. Put it down to an irrelevant remark. Frankly, not good auditing. Irrelevant remark. But it's not bad, merely because it was absolutely germane to an acknowledgment. But it's skirting along the thin edge, man. See? It's – if you can't handle those things with a clash-bang – it's just an effort to get the pc acknowledged – an appreciation of something

Once in a while you'll hear me say, "That was very interesting," or "That was amusing." The pc's laughing about something, I'll say, "That's very funny." Understand? That's just part and parcel of the skill of *thorough* acknowledgment. See? Unnecessary – unnecessary. It isn't vital. Probably shouldn't even do it. Pc's laughing like hell so you sit there like old stone

face. [laughter] See? Actually you could sit there like old stone face and get away with it and sometimes get away with it more often than by laughing like hell. You all of a sudden find they were really crying. [laughter] So, frankly, Peter, it's a tightrope walk. But any remark of that character is simply in the interest of further acknowledgment of the pc – has no other value. That particular case the pc said, "Well, I'm not in that, you know, thank God!" and so forth. And I just say, "That was a cognition, wasn't it?" See?

These things have a tendency to boomerang on you. Well, let's ask the pc. Did the pc mind that?

Female voice: No, I enjoyed it.

Yeah. See? But you're walking on a thin edge.

I'll tell you what the irrel... what irrelevant remark really is, is the pc is sailing along on an even keel, no particular action is going on and you all of a sudden say, "Wow, that needle just fell half a dial."

And the pc says, "What needle?", you know, "What – what – what – what happened? Why? Well, why did it fall half a dial? What happened to me?" See? All right, that's an irrelevant remark. It's a sudden remark and that should be eschewed madly.

But if you can appreciate what the pc is doing sometimes, so the pc feels quite well acknowledged – and it's just a trick under the heading of TR 2 – little TR 2 trick. That's all. You're commenting on something – it takes me by surprise to that degree because every once in a while somebody finds a trick I do and calls it to my attention. I've been doing it for years and never recognized it as a trick, but that is one of them.

The pc starts crying and they keep on crying for a while and so forth, you go on with a hard-boiled tone of voice and they are not acknowledged and they will cry harder. Mmmmm. They say, "And my father and my mother both died in the blitz," you know? And you say, "Yes," and they go *oouuh*, thud, you know, *bmmm, bmmm*. They get stuck in whatever they're in, you know? And the pc's saying, "Well, my father and my mother, they died in the blitz." And you say, "Rough go." You don't say, "Okay," you say, "Rough go," you know. Pc feels acknowledged and smooths out of it. The course of existence is not suddenly shifted by the auditor.

The pc has to have a certain feeling that the auditor is with him. If you want to make a pc go back down track, use the pronoun "we." Where are we now? Pc will lead you if you use "we." It's quite amusing.

These are little points of trickery. Not necessarily splendid auditing. You can sometimes make mistakes with them, so forth. But put it under the heading of a TR 2 and you'll know exactly what that is.

People have trouble with TR 4. The basic reason they have trouble with TR 4 is they don't understand what the pc is saying and then they don't acknowledge it adequately and so forth. And everybody wants a new TR 4, TR 4. Well, actually, it isn't TR 4, it's TR 2, it's TR 2 that is sour. And you've got to understand what the pc was saying. Well, this could include what the pc is doing, and unless your voice records some comprehension of the mood or ac-

tion of the pc... Pc says, "And they had forty skeletons strung up in the sky." And you would overdo it if you said, "My God!" See? Just overdo that like crazy. But if you say, "Yes," you do it the wrong way, too. Would be quite in order to say, "Mm-hm!" or "No kidding! All right, thank you."

I very often will pull such a gag with the pc. It isn't a gag because I don't put a sufficient – I don't put myself in such a vice that I fail to respond to what the pc is doing, see? I'm perfectly willing to be an effect of the pc to the degree of acknowledgment. I'm not an effect of the pc beyond the point of acknowledgment. The pc couldn't make me change the course of an auditing session with bulldozers, caterpillar tractors, winches, wrecking cars or anything else. But on point of acknowledgment, yes. The pc knows then he's having an effect on you and he'll stop trying. Turneth away mightieth thises and thats.

But you can – you can make a mistake on something like this, you can make a mistake. It's not easily handled, I wouldn't kid you to that degree. Pc says, "Well, they were all dead, they were all dead. Yup, that was about the saddest day I ever had; it was pretty gruesome."

And you say, "Yes, I bet it was," something like that, and you intend simply an agreement.

And the pc takes it, because he's all geared up for a derogatory, he takes it for a derogatory. He says, "Somebody's making fun of me." See? The tiniest inflection offbeat.

The safe course is to say, "Yes." Just a simple acknowledgment.

But if you're very good you can start playing around with that type of acknowledgment and you'll find out the pc thinks you're very *simpatico*. Well, actually, it's under the heading of understanding but it isn't something that you do – frankly, this kind of thing isn't something that you do as a practice. It is simply you know so well what you are doing – you know what you're doing with the pc, you know your tools, you know what is happening and that sort of thing, and in this framework you're terrifically comfortable and so you can add on top of it now that you – you're also free to be appreciative or interesting. There's nothing forced about it, see? You see, nothing would happen. Dynamite wouldn't disturb your use of your tools or where you're sending the pc, see? So on top of that, of course, you can be human. Pc then tends to overlook the fact that you're a dedicated monster down underneath the surface, you know? Get off of that process? God, no, man.

Pc says, "Oh, boo-hoo-hoo, this process is driving me mad and my head is just splitting. You ask me just one more command ..." This sort of thing never happens to me, by the way. "But you ask me just one more command," you know, "and I'm just going to go up in smoke!" You know? Something like that.

I just ask one more command, you know? The probability is, is I wouldn't even acknowledge it at all. I'm a past master at just letting entheta fall on the floor with a dull plop. Pc says, "What the hell is the matter with you? Why are you going into this? Good God, how many mistakes can an auditor make!"

I'd just give them the next auditing command. I don't even – don't even give it the TR 4, see? It would just pass through the wall two feet to the right of my head, see. And they let up a new scream and – about something or other – and do the command.

But if a pc is in there working, I acknowledge him well. And if he's not, I just throw away TR 4.

There probably is some more to know about TR 4. But I rather tend to think it would be when you were absolutely expert in handling a session, knew completely that your control of the session would never be moved, knew implicitly that – exactly where you were going and your control of the pc was perfect. If all of these things happen I think you'd tend to relax in session and enter into that type of response. But if you relax to the point of entering chit-chat into the session, you destroy the thing completely. So it is actually relegated only to TR 2. It's just a little more on TR 2.

Hey now, that's quite a commi... that's a cognition, you know. Pc says, "Good God!" you know, and "You know catfish are very often twenty feet long. I got et by one once and that means that catfish are never necessarily small!" And, hey, you know?

You say, "Well that's – guess you're finding it out, huh? Good-oh." No further than that.

"I'd like to catch one of those someday. Heh-heh." Irrelevant remark, see? [laughter]

Tiny borderline between these two things, a tiny borderline. You keep all such remarks in the line of ack and now and then you'll be sorry you opened your cotton-picking mouth. But most of the time the pc will feel he is talking to somebody, providing you know your business well enough so that that is never contrived. You see, you feel like saying, "Ah, well, heck," you know? "All right," you know? Puddle has just accumulated, you know, beneath the E-Meter so you have to turn on the bilge pumps, you know. "Ah, come off it," you know? "All right. All right, you'll be okay," you know? That sort of thing.

The funny part of it is the pc's grief charge is acknowledged. See, you've acknowledged a doingness on the part of the pc. And if you said just, "Yes, okay, thank you," oddly enough, most of the time you would be all right, too, you see? But if you say, "Yes. Thank you. Mm-hm. All right," the pc tends to go out of session.

So the pc does something, you don't remark on the fact the pc has had a cognition because you are interested in the pc cognition. You're interested in the pc's attitude and you acknowledge the fact. Get the trick? TR 2 only. Okay?

Male voice: Mm.

You bet. Didn't make to – mean to make such a long and drawn drag-out of it. But you called to mind something I do that I myself had never analyzed. Thank you.

Any other question? Yes, Ian?

Male voice: Ron, if the preclear comes in and sits down you – and there he is in session – you've got to prize this case off your lap – whereabouts would you take up Model Session to start? You're not going to throw him out of session by saying, "Is it all right if I start this session?" He thinks it's started.

All right. You start the session in a quiet tone of voice. That's the only – that's the only surrender you make on Model Session.

Male voice: All right.

Don't Tone 40 it.

Male voice: No. Otherwise you go through the beginning ...

You go through everything just straight on because there isn't anything now... Pc comes in and he's got to do an awful lot of goals and he's got all this goals and he's talking about his goals and he's going into this and that and so forth. All right.

Experience demonstrates that he wakes up somewhere along the line later and goes much slower if you haven't properly started the session. So what you – the only compromise you make is just to look at the pc, and he's saying, "And these goals so-and-so and so-and-so and I've got this list and I was up half the night writing this list and here it is," you see, and so forth. And you say, "All right, okay. Start of session." So on.

You might add this reality to it. This would be a trick I might use in the R-factor, "All right. Good enough. We're going to take – we're taking it up. Well, let's get into it. Let's get going right now, now then. All right, you've got it; let's get going right now. All right. Start of session." And rip off the beginning rudiments and go right on into it and you won't blow the pc out of session.

Your question is well put. It's never actually been asked. You would handle that factor in the R-factor and by softening up the way you started the session. All right.

Yes, Jim?

Male voice: I found it necessary a couple of times to handle the withhold prior to the appropriate moment for asking the question about withholds ...

Mm-hm.

Male voice: ... in beginning rudiments.

Mm-hm.

Male voice: Otherwise the pc is kind of sitting on something waiting for the appropriate question to come up. Is it all right to do that?

Frankly, the pc will give you a withhold under "difficulties." Havingness won't function too well under it. But in actual fact, by experience, if you take them in that order, you'll find out that you'll have a gain by doing so.

Male voice: Mm-mm.

Now, grabbing the withhold out of order of the Model Session, see – grabbing the withhold out of order was something we were doing. However, there's very little advantage in doing so; very little advantage in doing so. Particularly on a pc that's been audited two or three times at least, you see? He knows this is going to come up. Now he's liable to originate the withhold.

Male voice: Mm-hm.

That's right. Then you merely handle it with TR 4.

Male voice: Mm-hm.

But you don't give it any credence with the meter. You got it?

Male voice: Yes.

So any time a pc interjects and tells you something, for God's sakes give it the treatment, see?

Male voice: Right, but not necessarily check the rudiment question.

But don't now, because he gave it to you, check it.

Male voice: Quite. Okay.

See, always be perfectly happy about the thing. Also, you realize, to the degree that you don't use two-way comm in a Model Session you will tend to succeed better. Two-way comm during Model Session tends to slow down the progress of the session. Two-way comm in the body of the session, for sure. But two-way comm in the beginning rudiments, middle rudiments, end rudiments areas tends, more than anything else, to slow things down. But it's not forbidden.

Male voice: Mmm.

Now, you could handle it something on this order: Your R-factor at the beginning – the pc is all jumped-up. Now, instead of saying, "Well, the session is going to handle this," you say, "Well, what's gotten into you?" See? No meter.

Male voice: Mm-hm.

See? Get him talking to you at least. And he says, "Oh, well, hell, I've got so many withholds you wouldn't be able to count the things," and that sort of thing, and so forth. "And I've had an awful rough time of it and I haven't had any breakfast, dinner, lunch or supper and it's terrible and, the weather is bad and besides, I've got a headache," and that sort of thing.

You let him run on, very short. And then let him have the business, you know, with a terrific ack. See? Acknowledge it. Acknowledge it. Now start the session. Now get these points together in order. And some order will establish itself in his confusion.

So there is an area where this could come about. It could come about before session, just in an ordinary friendly discussion. But there must be no meter connected with it. If the pc volunteers a withhold or tries to straighten out something with you – he says, "Now wait a minute before we get on with this, I was out with your girl last night, you know, and I – really this is weighing on my mind so that I know I couldn't go into session." And so on.

You say, well, give him a cheery aye-aye or give him anything you want to say. You see? But no meter treatment.

Male voice: Right.

See, you don't ever dignify an out-of-orderness, see, by checking it or anything of this sort. That's actually Q and A with the pc.

Now what he's done, actually, is get the session started in his direction.

Male voice: Mm.

Now any of you, sooner or later, are going to run into a pc who is going to prevent the session and can keep control of the session with conversation. Therefore, you must actually learn to turn the spigot off with a good ack. You know, there's an awful lot of auditing time wasted under that heading. Pc's talking and talking and talking and talking and you never can get your session in edgewise. Well, blow him out of the water with a Tone 40 and get the session turned on and the orderliness of the session, the inevitability of where you're going, all of a sudden puts the pc under control.

Now, if the pc is able to introduce on you, Jim, an irrelevant step, he to that degree has taken the session out from underneath your control. Okay?

Male voice: Right.

And they will try to do it.

Male voice: Mm.

Okay. Anything else on that?

Male voice: Yes. Not on that exactly ...

All right.

Male voice: ... on Model Session.

Right.

Male voice: It seems to me now we've eliminated any necessity to vary a question when the meter reads and the preclear says "no," ...

That's right.

Male voice: ... by getting in first. I wanted you to confirm this.

You do not ever vary any of these questions. Forget varying the question – it came from old Sec Checking – you don't have to do it anymore anyhow. The only question that is varied is a What question – and that sometimes has to be tested in its variation till you get it to read. But on a rudiments question, no, you do not vary it.

And what's the rest of that you said?

You've eliminated any possibility or any need of varying the question ...

Male voice: By getting in, "That reads, there is a reaction on this in this session."

Oh, well, when you get a read and the pc says, "No," and the meter says "Yes," you acknowledge the meter and to hell with the pc. See? At that particular time, don't ever worry about this making the pc wrong. Because hell, he's wrong anyhow. See? The pc [auditor] said, "Do you have a present time problem?" *Clang!* You see? And the pc says, "No." And you say, "What is the problem?" You see? But you say, "That reads. What is the problem?" And the pc says, "Well, you're – you're right, I do have a problem." See?

Now, your rightness, all of a sudden, shows up and his wrongness doesn't necessarily show up, and he gets rid of it and he hands the thing to you. But never have any qualms whatsoever about crossing the pc's "No." Pc says "No" – you say, "Yes." Not snidely. He says... "Do you have a – do you have a present time problem?" And the pc says, "No." And you say, "Ha-ha-ha-ha-ha, ha-ha-he-he-he-heh." I wouldn't advise that particular approach. But you just tell him, bang, right now. Just tell him, bang, right now, "That reads."

As a matter of fact, I don't contradict – I know that there's a trick in this. Thank you for asking this question. There's a trick in this. Your "That reads," doesn't contradict his "No." And the best way to handle this is never pay any attention whatsoever to the pc's "Yes" or "No" in rudiments. Don't ever answer it. Don't ever pay any attention to it. Only answer the meter. And you'll never make a feeling in the pc of countering what he has just said. That's a little bit of a – magic involved in it. He sees – he says – "Do you have a present time problem?" He says, "No," and you say, "That reads." He often will interpret it, if you've said to him in contradistinction to what he said, "That reads," he will argue this as a disputation. If you weren't paying any attention to it at all, whether he said yes or no – "Do you have a present time problem?" He says, "No," and you say, "That reads," you're just saying it reads here. You're not saying he was right, he was wrong.

Male voice: Mmmm.

In other words that statement he made fell on the floor. You can't depend on that, as you learned in Sec Checking and that sort of thing and in Prepchecking, you could never depend on the pc's yes or no anyhow. The meter's always right. The pc is not necessarily always wrong. See? You don't run on that basis. But where there is a difference between the pc and the meter, you pay attention to the meter. So on the yes or no point of Model Session, never even listen to the pc.

The pc also will very often louse you up on your second question, by the way. You say, "Do you have a present time problem?"

He said, "I beat my wife last night and she won't speak to me today."

You say, "Thank you. I will check that on the meter." Omit your second question. See? Just skip it. You will find out that this looks a little bit ragged at first but you'll eventually get into it. The pc who is really comfortable in the session will eventually settle down and wait for you to ask him the question. He'll let you run it. It's the eager pc that is jumping that one all the time. But nevertheless, just drop it out of the lineup.

Well, thank you for asking that question, Jim.

It's just answer always – talk to the meter after that first question. "That reads." "That's clean." That – just say that to the meter. You never even heard his "Yes" or "No." Don't pay any attention to it at all. Then you'll never be in a dispute on the thing

"Oh, did you say no? I'm sorry. I didn't hear you. I just – looking at the meter here which read. What was the problem? What is the problem, rather – What is the problem?"

But he says, "But I said no. I said no!"

"When did you say no? Oh, yeah? You said no. All right, thank you. Thank you. Very good. What was the problem?"

"Well, you're making the problem."

"All right. Very good. Very good. Thank you. We will check that on the meter. Do you have a present time problem? That reads."

"All right." And he'll tell you, you see, whatever it was.

He – you're just making him confront to that degree.

Thanks for asking that question, Jim.

Male voice: Thank you.

All right. Anything else? Yes?

Male voice: Ron, how do you handle it when a pc, in the middle of a session, asks you a question?

Asks you a question? All depends on what's the question about. I usually answer a pc's questions.

Male voice: Uh-huh. Well, say it's about some auditing acknowledging.

What?

Male voice: Say it's about some auditing.

Well, give me an example.

Male voice: Well, such as, "How do you run CCHs on an unconscious person?"

Female voice: [inaudible comment] [laughter]

Man, if a pc asked me *that*, [laughter] I would say, "Thank you very much." I would say, "Thank you, very good. Thank you very much. Thank you for asking me. We're now going into end rudiments." [laughter] Get end rudiments in and I'd give him a tenth of a second break and get beginning rudiments in and get him in session, man. It's – it'd be a terrible symptom of out-of-sessionness because he's not interested in his own case, you see.

Male voice: Well, you – you – you don't think this would suddenly come up as a result of him uh ...

It would only come up if he was out of session.

Male voice: Would it?

See, he's not interested in his own case.

You got – you got what in-sessionness is? It's interested in own case and willing to talk to the auditor. Well, when a pc has totally lost track of what you're trying to do – I'm not making fun of your question, see – when he's totally lost track of what he's trying to do, when he hasn't a clue where you're going anyhow, his rudiments are wildly out, he'll start asking you irrelevant questions and chitchat and things of this particular character. First chitchat that

a pc ever gives me, I start sliding the rudiments in with a coal shovel. I want to know what the hell happened. By the way, it doesn't happen to me. I don't get this trouble. Why?

Well, I don't get this trouble because I pick up an out-of-sessionness long before the pc does. Long time before the pc does. He didn't find out about it for an hour. He wouldn't. And get it corrected. And therefore, you never get an irrelevance to the session.

An irrelevance to the session – You say, how to handle this thing? Well how to handle it as a question? Well, by all means, acknowledgment, acknowledge it. It's an origin on the part of the pc. He has said something. He's made some noises in the air. Yeah, yeah, handle it by all means.

But so as not to ARC break him up, and then realize that a question that far from any basis of anything you are doing, my God, at least your middle rudiments are out. Something is out here, man. The banana peels have been scattered all over this walk. That would be it. And so what you would *do* about it is *get the pc in-session*.

Male voice: Mm-hm.

As far as answering a pc's questions are concerned, I thought you were going to ask me some question of the type that pcs *do* ask when they are in session. Pc's sitting there steaming away and the steam's coming out of both ears and he feels this mass coming in on him and so forth. And he's saying, *Whoow!*, you know, he's very interested in all this and he's – "What's the tone arm saying?" You know? "What's the tone arm reading?"

And I say, "4.25. Thank you."

And the pc says, "4.25 – God, it sure feels like it in here!" [laughter]

He says – he says, "What are we going to do now?" He says, "What are we going to do now?" You know? He says, "I'd like to find my goal today. What – what are we going to do now?"

And you're going to say, "Well, it's twenty minutes from session end. We're going to have to run end rudiments. We'll try to find your goal next session." Whatever it is. "But I'm not going to make a botch of it. Anything you'd care to say?" You know?

The pc says, "Oh, well. All right." The pc says, "My God," he says, "What are you doing?"

And it suddenly dawns on you that you put in no R-factor on this whatsoever. You were supposed to be running 3GA today and you're prepchecking. And you just say what you're doing. You say, "I'm prepchecking. I'm sorry I didn't tell you." Cover it up that way.

Never be – never think that by admitting you were wrong, you lose control of a session. That's another trick. You don't. Do you know you only lose control of sessions by demanding to be right? When you didn't understand – the pc said – you say, "Point out something." And the pc does this, you know, and you say, "Well, I didn't see what you pointed at." See? You don't say, "What did you point at?" like, "What's all this clumsy motion you're making with your hand?" That knocks him out of session.

And you say, "I." Get the Chinese into it, see, the Japanese, "Blind, insignificant me, failed to perceive what wonderful, radiant you did." [laughter] The pc relaxes himself straight into session. There are many methods of control, as women could tell you.

But pc asks you a question – basically answer it if it has anything to do with his case or this session. Answer it. If it doesn't, why, give him a cheery aye-aye and then try to size up whether or not this pc is in-session or out of session or what's going on here, see? At least get your middle rudiments in. Do something. Size it up. Use it as a word of warning.

Male voice: Mmm.

See, that is a word of warning. He isn't in-session if he asks you something like that. Okay?

Male voice: Yes. Well, a question that follows on, somewhat, is that the havingness is up at the beginning of middle rudiments and the beginning of end rudiments but goes down when the rudiments are finished. In other words, you don't get the swing of the needle. What does this mean?

How would you know?

Male voice: How would I know?

Yeah.

Male voice: Uh, finishing Havingness, running end rudiments, having time at the end of the session and run some more Havingness. And when you start, the swing is down.

What are you doing? Finishing off the body of the session with Havingness?

Male voice: Well, you might get through your end rudiments ...

Another male voice: It's a Havingness session.

Male voice: ... so fast you've got another five minutes up your sleeve.

Another male voice: It's a Havingness session.

Male voice: It's a Havingness session.

Oh, it's a Havingness session.

Male voice: Yes.

And you think you have observed here that the havingness was well up and went down?

Male voice: Yes.

By the time you hit the havingness at the end?

Male voice: That's right.

Nothing peculiar about this.

Male voice: Mmmm.

Havingness slides all over the place. I don't think you've noticed this consistently. You have noticed it on one pc and that pc is being inquired into. And actually – oh, I really shouldn't answer this question – it'll make you gun shy of asking them. I don't want to do that. The answer to the question, unfortunately, is a symptom of very rough auditing. It's a symptom of unconfidence.

I already made this test years ago. ARC break and havingness are interchangeable. In the presence of an ARC break, havingness goes down. When an ARC break is cleared up, havingness goes up. Those two things operate hand-in-glove. When havingness goes up, ARC breaks disappear. When havingness goes down, ARC breaks appear. You sometimes get an ARC break just because havingness is down.

Now, if there's anything rough at all about auditing, you'll get a dwindlingness of havingness. You see? If you're failing to get a rudiment in expertly, if you're not old smoothie himself, you see, in snapping these things off the line, you can expect the havingness to drop.

I'll give you an example. You say, "Did you – in – in – in – did – in – yeah. Did, er – did – did – this – this session – is there anything – any que – is there any – que – in this session, a question or command – uh, let's see, now – no, no, I got this – I got that wrong now. Wait a minute. Is there a question or command I haven't a... no, no, that's not – right."

You could pull something like that on a pc, give him a can squeeze test, see – here's your test, see; you've been auditing him smoothly, see – give him a can squeeze test and he gets a full dial drop at sensitivity 0 here. Then say your next rudiment in that garbled fashion. Quite sincerely garbled, you see – no gag about it. And – or do this, "In this session is there any question or command you have failed to answer – answer with me?"

And the pc says, "I don't think so – I don't think so."

And you say, "Question, man, question, what question, what question – question. I said question, question, what – what question? What question didn't you answer in this session? That's what I want to know."

And the pc said, "Well, I don't know of any. I don't – I don't know – I don't think of any – right at the moment."

And you say, "Good. Thank you very much. Squeeze the cans." [demonstrates something, laughter]

Now, it doesn't have to be this flagrant. It just has to be that the pc's confidence in the auditor – actually, confidence in the auditor is proportional to the smoothness of the auditing from the pc's point of view, you see? And little bits, almost microscopic to somebody else, are rough spots on the road and you'll get a havingness drop.

Now, you find this out that if you smooth up on a pc the end rudiments – smooth up your approach with this pc on the end rudiments, see. Smooth it up so – oh man, is it glassy. You come down to the body – into the body of the session, you open up with your end rudiments, you go through to the end, you test it again. Your havingness, if anything, will have increased. See? That's what – confident, flawless handling. See?

I've also been interested in this. Don't think it's necessarily you, you understand. Because a pc, early on in his auditing, tends to be more critical of the auditor than later. And if you take a pc who is having any kind of a rough time, casewise, and if you ask that pc every five minutes if you have made a mistake, the pc will have – find one that you have made. You're doing a flawless job of auditing, if we could theoretically put it that way, and ask the pc what mistake you have made in the last five minutes, and the pc will find one that you have made. It'll be a mistake such as, "You turned your head on your side when you asked – on its side, slightly, when you asked me the question." See, there'll be these little, microscopic things.

But these are all symptomatic of a very nervous pc who is not well grooved in, who is having a hard time anyhow and who has been roughly handled in life and has possibly not been too easily handled in earlier auditing.

So, as your pc is well audited, this factor drops out. Let's keep your auditor constant, see; your auditor is always the same. And the pc havingness after the fifth session with that auditor will stay up, whereas in the first session would have gone down. Auditor's equal factor, see. You got your pc's change.

Now, similarly, your auditor is auditing better and better and handling things more and more expertly as the session goes along, you're going to get the reverse – you're going to get the same effect happening. As your auditor gets better, your havingness stays up. See? If you can give – if you give a rough session, if your handling of the sessionness is rough, you can always expect havingness to drop.

I'm sorry to have to give you that answer.

Male voice: No, that's all right. I like to hear it.

All right. Okay. That's the answer to it. All right. Yes, Esther?

Female voice: I'd like to know more about the importance of the tone of voice of an auditor when noticing something about the E-Meter like, let's say, all of a sudden you get a free needle – the auditor never saw a free needle, "My! Free needle!" Or, let's say, "Well, in this session have you tried to damage anyone?" The needle is null. "Fine! It's null!" Well, what effect can that have on ...

All right. You're asking me if tone of voice ...

Female voice: How important is it?

... how important is tone of voice? It actually isn't tone of voice, honey. It is irrelevant remark, which is already at the end of the bulletin there in Model Session. It's irrelevant remarks. Now, you can make a remark without saying anything.

Female voice: Yes.

And it's still a remark.

Female voice: Just by the expression.

Yeah. All right. You say, "Do you have a present time problem?" You say – you say to the pc, "Do you have a present time problem?" The auditor wouldn't do this, but he said, "Do you have a present time problem?" ...

Female voice: Yeah.

"It's clean!" [laughter, laughs]

Female voice: I had that experience quite a few years ago. I had a free needle for a day and a half and the auditor was saying, "God, I never saw anything like it!"

Yeah. He did? All right. Now, that is a remark.

Female voice: Yes!

And it's a whole series of remarks. They are understood. They express themselves in the tone of voice ...

Female voice: ... startled.

... and so on, and they are all bad. That's – that's very sour. That's a very sour thing to do. It is making a remark with a vocal expression.

"Have you ever been raped?"

And the pc says, "No."

And the auditor says, [demonstrates some facial expression] "It's clean," you know. And well, he's made a remark, hasn't he? All right. And then anything like that is a remark – an irrelevant remarks.

Now, this is as bad. You're running – you're running the pc and you say, "Look around here and find something – *Hey!* That – that – that needle just dropped a whole dial!"

And the guy says, "Huh? What? Who? Where? What does this have to do with anything? Which way did they go? Who – who was – who was that?"

See? And it enters a whole chain of stuff. This all comes under the head of the auditor putting the pc's attention on the auditor. And of course, the pc goes out of session because the attention comes off the pc's bank onto the auditor.

Female voice: And the E-Meter.

Therefore goes out – and similarly, E-Meter. And therefore the pc goes out of session with a crash. And you can knock a pc out of session with any of these irrelevant remarks.

Oddly enough, if you're too different even in voice tone you can do the same thing. You can say, "Well, I'm not going to make any irrelevant remark." All right. [in a monotonous, robotic tone of voice:] "Do you have a present time problem? That is clean."

And the pc says, "What's this?", see. [laughter]

And once more you've achieved yanking the pc's attention out of session.

Now, there's something more serious about this. A sudden yankingness of attention off of a bank and onto the auditor – the auditing environment or the meter – a sudden yank in this

particular line – causes those things which the pc has sort of been holding out from him with a thin, frail straw – see, he's got a straw punched into this mass out here and you all of a sudden scream behind his back, and he goes, "*Beeeeeyaaaaah*, what the hell!" You know? And this – he lets go of this straw and the mass will hit him right square in the puss. And after – you'll find it's an awful hard time digging the pc out underneath all of this mess now.

And you say, "Well, how did he get so caved in?" Well, it's something like being mystified. You're in the mines, you see. And the mine domes are all held up with pillars, you know. And you go down there with a bazooka or a sledge hammer or something of this sort and you knock all these pillars down. You see? And you say, "What are all those miners doing buried under all of that coal?"

See, it's just as idiotic to be amazed about that as it is to say, "*Good God! What the w – well, look at this meter! Wha – oh dear! Huh?*" You know?

And the pc says, "Where am I?" you know?

And you say, "Well, what's my pc doing buried under all that coal? You know, the needle stick now and – and I – what am I going to do?" And it's a hell of a thing to dig a pc out from underneath. It's one of the most serious things an auditor can do is a sudden shift of a pc's attention.

One of the ways you can do this is get him awfully absorbed in question one and then before he gets a chance to answer it ask him question two. You say, "Well, did you ever have a mother?"

[mumbles:] "*Mother, wonder if I ever had a mother. Mother – mmmothermmmother-mmmothermmmmmm ...*"

And you suddenly say, "Well, any parents at all?" [laughter]

And what he's put his attention on down here is "Mother" all of a sudden goes on him, *snap!* Because he's holding it out with his attention, you might say, and his attention goes off of it suddenly and it's got spring to it and it'll – it'll give him the sensation of being hit.

Okay. Well, thank you for mentioning that, Esther. It's all under the heading of irrelevant question. It's irrelevant question, irrelevant remark, irrelevant action. It has nothing to do with anything, and it's all very damaging. The only place it's allowable at all is when you're trying to acknowledge the pc. Then you can make a little bit of a remark. And you can answer the pc's question when they appertain to the session. Always answer him, don't leave him in mystery.

I neither inform him when he doesn't want to be informed or withhold information from him when he wants it – about a meter. I never obtrude a meter on a pc. Never obtrude a meter on a pc unless the pc has already got the meter in the middle of the field. Pc says, "Is my needle dirty?"

And I say, "Yeah."

He'd say, "Oh," and go on back into session, see.

He says, "Have you been auditing an awful lot of pcs lately?"

And I say, "Mm-hm. Thank you. Yes." And just let that one go by, see? It didn't have anything to do with the session. It's none of his business.

Pc says, "Are you doing this because you hate me?"

I pick up the missed withhold. Get in the mid ruds – something.

Question will come up, sooner or later ... That answered your question, didn't it, Esther?

Female voice: Yes.

Yes. Question will come up, sooner or later, do you ever use the middle rudiments while using the beginning or end rudiments? The question will come up sooner or later.

I can imagine a situation where this should be – where this could happen. I could imagine. But I couldn't imagine an auditor who had a pc well under control having to do it.

Using a consistent, skillful auditing approach, getting the pc day after day, session after session, well into session – carrying it along and so forth – you'll find out, gets away from having to take any unusual steps at all. Actually getting all of the rudiments in, getting something done in the body of the session and getting the pc, you know, out of session at the end with the rudiments, you'll find out that that, skillfully done, answers in very short order – just a very few sessions and any need for anything tricky – it'll smooth out the pc's needle, give the pc better confidence. It'll cut back the pc's incidence to tantrums and so on. Actually not because you've done anything but be consistent. Not because you've only done that which is necessary to do. Only because you've been predictable. Just those factors alone will keep the pc from blowing up.

With what a relief some pc who's had a very Q-and-Aing auditor, all of a sudden finds out that the pc will go on in spite of being blasted out of the chair – I mean, the auditor will still go on.

Let me give you this. This pc has on many occasions gotten ARC broken and had an auditor quit – had the auditor just quit, see. Wow! Then the fel... auditor left him and he's stuck in it and so forth. Well, that's all what it would be. But it has an additional effect beside from a bank effect – he's kind of afraid the next auditor will do it, see?

So you're now – now he's got an auditor and, he goes, *blaaaaaow!*, you know, and he splatters all over the ceiling and he knocks everything off the table and he screams and so forth. And the auditor asks the next auditing question. So he screams a little bit and the auditor says, "I'll repeat it. I'll repeat the auditing question," and does so. So he answers it. And all of a sudden sits back with a tremendous sigh of relief and goes right on, just walking along beautifully.

What's happened there? His confidence has come up. His reality's come up. And he finds out he can trust the auditor to audit him. That's all that's really happened. He realizes he's going to get some auditing.

And the funny part of it is, you can sometimes be quite rough. You can say, "Sit down there! Sit down in the chair! Now pick up these cans! I'll repeat the auditing question."

And the guy says, "Wow, you know! That's terrific. That's real good. You know? You – that's great."

And if you did the reverse and did the kind thing, why, he'd just be – he'd just go all to pieces. See? He'd get worse and worse. The more you tried to do something about it, the worse he'd get.

I'm not saying be tough with such a person. I'm just talking about predictability and predictability alone will hold somebody in-session regardless of whether you're doing anything with the mind or not. It's a factor which you mustn't neglect.

And therefore, the more irrelevant actions you take or the more unusual things you do, such as getting in the middle ruds while you're doing the beginning ruds, the more unusual things that you're doing, such as getting in the end ruds while you're getting in the middle ruds, see, anything that you're doing that's the least bit off-base runs you at the risk of seeming unpredictable. And it actually works up to more of a curse than it does a cure.

What you should concentrate on is predictability of saying the exact auditing question, doing the exact textbook response, see. Going on that way just absolutely exactly and give that a chance to work. And you'll find out in two or three sessions one of the roughest pcs you ever had is sit – sit in the pc's chair, you know, and he just begins to smile like the Cheshire cat, you know? Needle gets smooth. Case starts to move. He starts to blow things that he never blew before. And the only thing, perhaps, that you introduced into the whole thing – you understand getting rudiments in outside of this doesn't really introduce anything at all except getting the pc into session, the auditor real, the session predictable, things smooth, taking off anything that happened in the session.

But it's all predictability. And get it under the heading of predictability. And as soon as you understand it from a standpoint of predictability, then you'll see that it itself has a virtue and it itself does something. Now the person has confidence in you so then he dares go into session, so he dares blow something. Otherwise they're sitting, you know, like a gopher on top of his mound, you know? Watch, you know? And they don't go into session so they don't blow anything.

Predictability alone permits them to go into session.

Now, when you add to that the tremendous strength and power of the buttons you are using in beginning, middle and end rudiments, how can you miss? But the first factor you must strive for is predictability of use – that you must strive for. When you've got that, then you'll find out the better you can make that, the less unusual you have to be and the more you will do for the pc.

A very skittery pc and a very nervous pc is best handled with a simple predictability. The more nervous they are, the more predictable you should be. The more dispersed they are, the more steady you should be. And you'll find out that'll work just like absolute magic. That has nothing whatsoever to do with the buttons you are using.

By the time you have audited a pc three or four sessions, no matter what you are running, if this person isn't swearing by you and if this person isn't deeply in-session every time they go into session and so forth, then your handling of this must be unpredictable to that pc.

And you are actually not doing anything odd. What you're doing will be unpredictable. You'll be doing something off the rails here and there.

One thing I wish to apologize to you about is those who just learned the first Model Session, I wish to apologize for having to give them another Model Session to learn instantly. But there is this one point, there is this one point I would like to make. I wouldn't do it for worlds, see, I just wouldn't do it for worlds unless it made it that much better.

Now, we're winding up to go for broke here on clearing and there's the course and direction that we're steering. I don't want to get well into this and then have to change horses. You see? So I'm trying to change horses here so we can hold it stable from here on.

Everything I'm trying to do is in the direction of a greater stability and we're just now achieving the results, broadly, by auditors who are well trained. And I don't think there's a person that we can't clear. If we can get our hands on him, we can clear him.

All right. But it all depends on the consistency of application of what we are doing. We know all the rules. It depends on whether or not all those rules will be applied.

And along with this goes predictability. And you'll find out that I am less and less violating this particular factor. I've only violated it up to the point where I find out we have a very nice workability and there you'll see it stopped.

You haven't heard a thing about Prepchecking for a long time. I did find we had a hole the other day. We find – didn't have our Havingness Processes, all of them, on one sheet of paper. I was quite amazed that we didn't have them all down and so I've got to fill that in, and here and there you'll find one that is filled in or needs filling in. But basically I'm trying to – trying to create and hold a standard here.

And don't be too dismayed when you find something isn't quite as standard as you thought it was, because I'm always willing to learn, I'm always willing to improve something. But I'm also very careful of improving things that are working. It's only where we need improvement that we keep putting them in.

So I hope you'll be very successful with this new Model Session. I hope it will answer everything up the way you think it ought to go. Use it though, just as it's written to make a predictability come along with it.

If you have tremendous difficulty, consistently and broadly, with any one of its lines or any one of its wordings, I guarantee you, I will change that. But that would be the only reason I would. Okay?

Thank you very much.

Good night.

E-METER QUALITY

A lecture given on 26 June 1962

How are you tonight?

Audience: Fine, thank you.

Good. Good.

Male voices: How are you? How are you?

Oh, a little bit quivery, but I'll be all right. Okay. This is what?

Audience: The 26th of June.

The twenty what?

Audience: 26th.

Twenty-sixth.

Audience: Hm-hm.

The devil it is.

Audience: Uh-huh. Sure it is. Yep.

What planet?

Audience: Earth.

Oh, all right. I got it, then. [laughter] That's coming up to present planet.

This is the first lecture, Saint Hill Special Briefing Course, 26 June AD 12. Now, there are many things I could lecture you about this particular week and probably will. But I think it's most important to give you some sort of a rundown... Did you get a bulletin today on... This – today's bulletin?

Yes. HCOB June 25th, 1962. The whole crux of auditing today stems around the sensitivity of an E-Meter. The expertness of its handling, the sensitivity of the E-Meter. First thing I'd like to call your attention to that – is that if the operator can't read one, why have an E-Meter? And if the E-Meter is no good, why have an operator? This is very much to the point.

Now, we have HCOB June 28, 1962, oddly enough on this 26th, because that's the Thursday bulletin going out and it has to do with how to smooth out needles.

Now, an E-Meter needle can become rough. That doesn't mean it continuously goes *bzz-bzz-bzz*, little patterns, while the pc is on it. That means it goes tick and sweep and tick-

tick and *bzz-bzz-bzz* and then tick and then sweep and then *bzz* and then tick and then – you know. It is *active*.

Now, the varying degrees of activity, of course, are a gradient scale that run from a clean needle, which is to say it acts when you speak – the auditor, see? The needle reacts when the auditor speaks. Now, that is a clean needle. The rest of the time it is doing exactly nothing.

And that gradient runs up through one that goes occasionally tick and tock. Auditor didn't say a thing and the needle ticked.

Now, a clean needle almost always reads only on an instant read. You don't get prior reads with a clean needle – very seldom. It clicks right where it's supposed to click: right at the last vowel or consonant in the statement said in the major thought. HCOB 25 May: A clean needle reads right. And then as the gradient scale of dirtiness is entered into and spiraled down, one of these needles that goes tick and tock without the auditor saying anything at all ... It's twitchy, you know; you get prior reads on the thing. The guy is sort of segmentalized mentally.

You say, "Have you ever been PDHed by a cat?" And it goes "Have you – " *Blam!* see, "ever been – " *tick! tick! tick!* "PDHed – " *bzz! bzz! bzz! bzz!* "by a cat?" *Klok, klok, klok, klok, klok, klok, klok, klok, see?*

You know, you can prove to anybody the cat PDHed him, you know? You can say to the fellow, "Did you ever know a cat?"

Fellow says, "Yeah, I had a cat once. Name was John Brown."

And you say, "Uh-huh, all right. This cat ever inflict pain-drug-hypnosis on you and give you an interspacial implantation?"

And the fellow will say "No."

You say, "I'll prove it to you." "Has the cat, John Brown, ever inflicted pain, drugging and hypnotism upon you?" It'll go click, click, *ploonk-thlunk-thu-thud, bzoo-boo-boo-boom, fah!* In fact, it'll read every place but the exact instant read. That'll be blank. Most auditors – most auditors in the old days didn't bother with that missingness, so all sorts of wild tales could go around, including John Browns, the cat.

Now, you check this over and you say, "Pain." It goes *clank*. You say, "What about pain?"

"Well," the guy will say, "I don't like it!"

"All right. Thank you. Thank you. Pain." Doesn't read. "Drugs" – *clang, clang, clang, clang!* You say, "Well now, what about drugs?"

"Oh, I don't like them!"

"Did you ever give anybody drugs?"

"Oh, yes. Well, I'd – I mean – yeah. Well, now that you a – make me admit it, yes."

"All right. What about drugs?" Doesn't read. You say, "Hypnotism" – *ping, ping, ping, ping, ping, ping, ping, ping, ping!*

You say, "You ever been hypnotized?"

"No."

"Did you ever hypnotize anybody?"

"Well, I tried to." *Ping, ping, ping, ping, ping, ping.*

You say, "All right. What about hypnotism?" Doesn't read.

Needle can be smoothed out to a point – just by taking these segments of it, you see – can be smoothed out to a point where you can finally ask him if the cat has ever inflicted pain-drug-hypnosis on him and, of course, it doesn't read.

Of course, the cat never did inflict pain-drug-hypnosis on him. But he had a reaction to pain and a reaction to drugs and a reaction to hypnotism and he'd have a reaction to John Brown the cat if he'd ever kicked John Brown the cat, see?

So you could make an awful liar out of a meter. But remember, the only needle that you could make a liar out of is one that goes sort of hunt-and-punchy anyhow. It's pretty hard to make a liar out of a clean needle. It only falls on an instant read. You say, "You ever been PDHed by a cat?" No reaction. The guy isn't edgy, you see?

All right. The somewhat dirtier needle, you say, "Have you ever been PDHed?" *Clank*, you know? "You – been – PDH –" *clank*. "Cat" – no read. Latent read on something like "ulp." See, the pc thought, "ulp" or something

Now, that's a not extraordinarily dirty needle or a messy needle or a mucked-up needle, but it sure isn't a clean one.

Now, we go down into the nether regions a little bit further and we get a needle that goes little tiny rock slam, tick, tick, tick. Now, this kind of a needle reacts often enough with enough different reactions that when you say something to the preclear, the reactions on the needle – the reactions that are there on the needle when you ask the question – are so numerous that one of its actions coincides with your instant read. And you get equivocal questions all the time. You don't know whether the thing said yes or no. Because it's so active, it's got so many different things happening all the time that quite often when you say, "Do you have a present time problem?", why, the instant read might or might not be there, but you can't read it because the needle is already so twitchy and scrubby, you see. And you say, "Well, I'll have to ask the question again," or something like that and hope that the moment you finish the sentence "Do you have a present time problem?" happens to be unused space. Get the idea? Sort of like trying to get in transatlantic telephone calls or something like that. Sometimes you can connect and sometimes you can't. All right.

Now, that's – isn't the most extreme needle. The most extreme needle is in constant and continuous motion. And I don't care whether the motion is tiny or large. But you would never be able to get an instant read on one. Never. Because it is just in motion.

You don't know whether it's reading on the auditor, the pc or the bank or the electric light circuit. You haven't a clue what it's reading on, but it's just going *bzz, btz, tick, tick, tick, tick, bzzzzz, brrm-tick-tick, boom, srr, dit, dit, brb, brb*. Where's there any blank space on this needle to squeeze an end of sentence into, see? There isn't.

That needle is an impossible needle. Fortunately smooths out on more elementary Havingness and is the only thing that'll smooth it out because of course you can't find out what's wrong. You can't find out what's wrong with the pc because, of course, you can't read him on the meter. You could say, "Do you have a present time problem?" Well, what – what would this be all about? Yeah, maybe he has. Maybe he hasn't. Maybe it's on the meter. Maybe it isn't. But of course the meter isn't doing anything that has anything to do much with the session but is just in constant motion. Moves all the time, all the time, all the time. Always moving. I've seen these, by the way, on various types of people.

Now, it isn't necessarily true that the cleanliness or dirtylessness or dirtyliness, I guess it is – the cleanliness and the dirtyliness, yes. Finally figured that out.

English is an interesting language. You know, English gets in our road all the time. You know, there isn't any word that combines "he or she?" And every once in a while, in trying to put auditing commands or wordings or something together, you run into this lack of a... You've got a neuter pronoun, a masculine pronoun and a feminine pronoun, see and there is no pronoun which is both masculine and feminine. Because you can't say "it" and mean "he or she." Somebody would be offended.

They've worked it out in the farm country; it's *'um*, or *'em*, depending on what farm country you're in, you know? "I see *'um*," you know?

The difficulties of transmitting thoughts, of course, are from the major thought to the symbol, the recorded symbol, into a relay in somebody's mind, into the thought again. That is what is happening. You are actually not recording "he," "she," "it," "been," "does" or anything else directly on the reactive bank. It is not arriving in symbols; it's a symbolized form. That is why you can get a goal out of a pc that was originally expressed in Phoenician and you can find it in English, which you yourself ought to think is rather peculiar when it comes right down to that. That's why you can audit a pc who speaks a different language.

But of course, on a meter, which is registering thought, a constant agitation and a no-registry of thought and a bunch of other things of this character give us an impossible needle.

The dirtiest needle would be that one which was registering the least thought and generating the most thought. It's autogenerated reactive thought. And that is the "doitiest" needle there is – constantly generated thought but it's autogenerated. In other words, you're watching a circuit go zip and zap, see?

All right. This circuit gets to going boomity-boomity-boomity-boomity-boom and it's flipping from one part of the bank to the other part of the bank and taking shortcuts through the middle of the bank and around the edges of the bank and wrapping itself around other demon circuits and curtains and occlusions and all that sort of thing.

That's what you see happening on the dial here. That needle is just going *bzz, brp, bzz, bzzzz, brrp, blp, thr, click, boo, frmp, thud, tick, krk, tzz, zzzzzz*. Well, how are you going to get a thought in edgewise?

You know, most people have a hard time getting a word in edgewise with somebody who talks too much. Well, it's the auditor trying to get a thought in edgewise into a reactive bank that is *bzzzz* too much. It's doing its own think-thunk, see? It draws its reactions and restimulations from itself continuously.

The auditor has no impingement on this bank. The bank itself is running at a high rate of autogeneration. Probably a bird lighting on the window ledge would have more effect on this bank than the auditor screaming at the pc, see? It's a problem in communication. It's also a problem in electronics.

But that is basically the dirtiest needle there is. It's in constant motion, but along with that you get the fact that that person's mind is autogenerating restimulations. Its restimulations are quite often not from the exterior environment at all. There aren't even associative restimulators in the exterior environment. This person is totally introverted and he is just autogenerating restimulation.

You see, he thinks of a cat and then a circuit thinks of another cat and another circuit, then, regenerated, thinks of a tiger and another circuit, regenerated then, thinks of tank cars (for some reason or other – circuits are not quite sane, you see) which makes another circuit think of milk.

Now you've had it. Cats give him a mushy taste in his mouth. But there isn't any cat in the environment. Nobody said "cat." He didn't read "cat." Nobody mentioned them. There weren't any cats around. Where did the cat come from?

Well, that's just an autogenerating circuit of some kind or another which pushes up an image at random. He's had sufficient restimulation in the past to last him all the rest of the trillennia. See, he had the warehouses full.

Now, of course, if you went out extensionally enough, you would find out that that morning when he got up, he was thinking about ice cream. And that is how it all has been happening ever since.

Well, how was he thinking about ice cream? Well, he dreamed a dream about ice cream. And having dreamed a dream about ice cream, that's enough. Why did he dream the dream about ice cream? Well, he was short on B1. There is nothing around here to restimulate ice cream except something on the extreme track. Well, this guy is all the way on the back-track. You get the idea? See and the restimulators are on the back-track and the physical universe doesn't exist.

So you get the needle going *bzz, bzz, bzz, bzz, tick-tick, tick-tick, bzzzzzz, tick-tick-tick-tick*, you know?

Now, oddly enough there is a worse situation than that. Now, you say, "That's impossible!" No, no, there's a worse one than that. It's called a stage four needle. It is the same restimulation going on all the time. This doesn't even change its mind. And the needle goes up,

up, up, up, up, up, up and it sticks and frees itself and falls. And then it goes up, up, up, up, up, up, up, up and sticks and frees itself and falls and goes up, up, up, up, up, up and sticks and frees itself and falls.

And you know, you can't get a reaction on that as an auditor. You can't get a reaction out of the pc by even kicking him in the shins. It's been tried. Guy with a stage four needle. He's stuck in one totally insulated channel. He doesn't even get cross-restimulations, don't you see? Nothing is going on, really, except this one thought is probably going through all the time.

You ever see that newspaper electric sign up on Times Square? There it runs around and round and round? Well, just imagine that thing has one line on it: "You are a good boy," see? And it goes round and round the building, you see? "You are a good boy." "You are a good boy." "You are a good boy."

Well, that is actually nuttier than somebody thinking two or three thoughts, don't you see? "You are a good boy." "You are a good boy." And he as a pc or as a person, actually, is way back below "hide," reading this sign. And you'll get it on the meter; the sign is on the meter. And it goes up, *bz*, up, up, up, up, up, stick, fall, up, up, up, up, up, stick, fall. Nothing varies it.

Now, there's such a thing as a reverse stage four, God help us, which is down, down, down, down, down, down, stick, *swoooooop*. Down, down, down, down, down, down, down, down, stick, *swoooooop*. And it just goes on like that, on like that, on like that, on like that.

That's all that's happening. We didn't know the "reverse four" existed except we found one. It had been branded a free needle.

Somebody asks you sometime, "What is the pattern of a free needle?" Shoot him for me, will you? Yeah, because the regularity of this swoop down and the rapidity of recovery, which was going on and on and on and on and on, why, everybody thought the person must be – have a free needle. A free needle is nothing if not free. And it has no pattern. It just floats. And it doesn't go up and then go down. And it doesn't go down and then go up – a reverse stage four.

Well now, those are fixed situations. That's a fixed thought. Now the fellow is – can't even be in a confusion, see? "You are a good boy. You are a good boy. You are a good boy. The *Herald Tribune* now brings you the news: You are a good boy. You are a good boy." One thought, see? And that thing will play out – I don't know how many trillennia that'll play out before it wears out, but I think it's been a long time.

All right. Now, there's another condition. (These are chronic case conditions – what I'm giving you.) There's a condition of a needle that doesn't move and doesn't react. You can fortunately – that has been gotten around by your meter. So we don't much have to comment on the case because you can jack the sensitivity up to 16. You can get some reaction out of this boy.

But theoretically there could be a case that couldn't be sensitized into a read. I have not seen one. I have seen one that on the old Mathison was a totally motionless, non-reading needle, but not the Mark IV.

Now, that's a theoretical thing and that would be – that would be the same low scale of reaction where he'd just be stuck in a ridge; he wouldn't even have "You are a good boy. You are a good boy." It would just be the "Y" of "you" as it comes around the corner of the building is just stuck there forever. He doesn't want the rest of it to come around. He's got it stopped. He's afraid of what it might read. It's just all shut down.

Now, these are conditions that you will run into – just a general sort of a basketload summary of conditions of – meter conditions that you'll run into. I've not said anything complicated like the sensitivity knob can be adjusted and you can do this and you can do that and you can do the other thing to recover these things. But anything that – that's all I want to drive home to you – anything that isn't a clean needle isn't all right.

Now, this is a big point I'm trying to make with you here. I've talked to you sort of randomly about this and you all knew this right up until this point, but the lightning is about to strike, so brace yourself. This you might not have noticed or coordinated with all this. The only reason you are running CCHs, Prepchecking, Havingness, any of these things, putting rudiments in – the only reason you are doing this is to get a clean needle. And if you've got a clean needle, what are you doing it for?

Now, you see, from this point on you can never come around and say, "Well, you said to," see, to me. You got this? I see no lightning struck with you. Is this a new thought? Is this kind of a new thought?

Well, the only reason – that I'm – that's with exclamation points – the *only* reason that you are running rudiments, Havingness, Prepchecking or anything as a preparatory step is the relative dirtiness of a needle. You're all – that's all you're trying to do is clean that needle up.

And when the needle is clean, whatcha doing? What are you doing now? You're doing exactly nothing. There's absolutely no point in it. I don't care how fast this needle is traveling in sweeps back and forth and how much trouble you're having adjusting the tone arm trying to keep the needle somewhere on the dial; that has nothing to do with its dirtiness, you see?

When it clicks is when it instant reads. That's the only time it clicks. That's a clean needle. See? You say, "Do you have a present time problem?" – click. Yeah. He's got a present time problem, see? It didn't click on "present" and it didn't click afterwards. And you could actually sit there for a minute and nothing would happen with the needle; just nothing would happen. It would just – well, it could be falling and rising because of the breathing of the pc or something like that. It could be going over here and hitting the pin and you'd have to adjust it one way or the other at sensitivity 16.

But there are no sudden little jerks or burrs or reverse courses. It doesn't rise and then turn around and go the opposite direction with a – with a sudden hitch and that sort of thing. It's just there. It reads when you say so. That's a clean needle.

And man, if you got a clean needle on the pc and you keep the pc in Model Session, you keep your middle rudiments in, you can do 3GA like [snaps fingers] that, man. There's just nothing to it.

There isn't any reason to continue doing anything with a pc beyond the point of clean needle preparatory to a Goals Assessment. In fact, you're taking your life in your hands doing so. Because you might drop the E-Meter on his head, or something happen and you wouldn't get another good chance at a – at a Goals Assessment, you see?

You're cleaning up the needle. Now, let's go into what is the best operation to clean up a needle. Well, in fish and fumble, I have cleaned up some needles quite markedly at one time or another and hit the middles of circuits and done a lot of other things. But by and large, the best method, the very best method I know of for getting a clean needle on a pc is to put the pc into a state of confidence. Confidence equals predictability as per an earlier lecture. Predictability – confidence. The pc can predict what's going on, the pc will become confident.

Therefore, you do a very predictable session. And you pull some of this and some of that and something else. It doesn't matter whether you're prepchecking or a rudiments and havingness or something like that. But that isn't important. What you are doing in the session isn't important compared to being predictable. You must be very predictable.

First session pc didn't know what was going to happen. Second session he's got some kind of an idea. He knows you're not going to bust down in the middle of it. Third session pc has got it taped. His nervousness vanishes. His rudiments have been put in three times. He's had some Havingness, some Prepchecking or something else run. It's all predictable as far as he's concerned. You're a predictable auditor. And from that point on, with one slight reservation which I will go into in a moment, your pc's needle should just get cleaner and cleaner and cleaner.

Now, it is a mistake in most cases to try to sort out the *bzzzts* and the ticks and the tocks and the prior reads and so forth. And it is definitely a mistake on a case which is going *bzzzzzt* all the time – a total unreadable needle; a complete, utter bottom rung of a dirty needle; total agitation continuously.

You, of course, have no choice about such a case. This case cannot get the rudiments – have the rudiments put in. What are you going to do? What are you going to pick out of this garbage can and straighten up? It's all garbage. The only thing you're going to get out of the garbage can is garbage. And it's an awfully deep garbage can.

Unfortunately, this person needs most 3GA. And this case cannot possibly have 3GA run on it. What is wrong with the case is the case has changed his purpose line or the case's purpose line – basic purpose – has been too often shifted, which of course gives us all sorts of conflicts. Everything is alter-is and conflicts and that sort of thing.

There isn't much you can do with that case, short of CCHs. But the CCHs would have to be very gently run and you wouldn't be able to run the CCHs in Model Session because of course you can't get the rudiments in.

So you handle that case very gently, very easily and *terribly, terribly, terribly, terribly* predictably. You don't do anything odd or peculiar. The rule *is, the worse off the case is, the less random you get.*

That is the colossal blunder made by the alleged psychiatrists on this particular – what planet did you say this was?

Female voice: Earth.

The Kruegers and other people who have no credentials to practice in the field of the human mind – they shouldn't. They really – people should realize they have no credentials to practice. We've never given them a certificate, have we? Well, therefore the man is practicing without credentials.

And you know what forfeits their credentials? Because the crazier the patient, the crazier the treatment. All they do is Q-and-A with the patient. The only possible chance that those patients have of getting well is total predictability.

Now, they all know this and their manuals are full of this: that people who are not treated get out of the insane asylum *weeks* ahead of people who are treated. And they all know this. So they go on treating them.

If somebody ever dumped on your head a hundred thousand loonies – somebody might, you know – and said, "Here, well, heal them up *u-huh-huh*. The state's tired of spending eighty thousand pounds per minute per psychiatrist on these people." About the only thing you could do is find the quietest abandoned army camp you could possibly find and get the quietest possible attendants you could possibly find and spread these people out so they can't annoy each other. And just let them have the predictability that the next couple of minutes will be quiet. Just work on that as a predictability. Not even telling them so, you see?

And then you should have some motionless figures around that they can look at and that will be there tomorrow. And then just don't change anything – change nothing. And, you know, an awful lot of them would go sane?

You, by the way, permit no mail to enter this area. You keep the phone lines beautifully cut. The worst-off ones will worry about their families for the first month or so, you see and then they forget them. It's about time they did.

And you would probably produce the highest ratio of "deinsanitizing" that anybody had ever produced on this planet. Just practice restraint, boys and girls; just don't *do* anything, see, beyond that. Just let them be. Let them exist. Let them sit around and look at a rock. If I had no boulders in the vicinity, I'd import some and put them on pedestals. You walk down this street, you find an awful lot of seats sitting around a boulder. The boulder is on a pedestal. You'd find an awful lot of these people sitting there looking at them.

But what's wonderful about it: it's going to be there tomorrow. That's what they finally start marveling about. And you have entered some predictability into the situation.

Food, rest, predictability, is actually the only treatment anybody has any business giving the thoroughly insane. They have no business giving them any other treatment.

You actually have no business auditing these people. In the first place, their auditing environment is liable to be too unpredictable and they'll make it unpredictable enough, man. Remember, they're a total bundle of alter-is, so their whole impulse is toward change, toward randomness. They're alter-is from the word go.

All right. You're going to do something about it, why, let the – let the confusion blow off, see? Give them a stable datum of some kind, let the confusion blow off and they'll be all right from there on.

Because let me assure you of something: The number of those needles on the actually insane that you're going to get to read are so slight, they're going to be very few. Most of the insane – I haven't had very many insane on a meter, but their needles are in constant motion, those that I have had on a meter.

Now, that doesn't mean that an index of insanity is a constantly moving or totally stuck needle; that is not true either. Because you as an auditor, by sticking your foot in your mouth often and repeatedly in Model Session, can set a pc – and this comes the rest of this horrible lecture – you can take almost anybody and put ticks and tocks and *burrs* and *bzzzts* on their needle.

All you've got to do is don't get the rudiments clean. Let that be your motto and the needle will depart further and further and further from a clean needle and become more and more and more a dirty needle. And the way you would do that is be unpredictable in a session. Forget to put the goals in, you know, and forget to do this and do that, and don't clean up a rudiment and all of a sudden change your mind in the body of a session and decide to prep-check when you were going to run Havingness. But no more than start to do that than start to go into fish and fumble, you see?

Yeah, just keep that up. Keep that up. Just audit left-footedly routinely, continuously and you could take a very clean needle and in very short order, in a week or two, you'd have the thing going *bzzzt-um-a-dit-duh-whum-oom*. The guy would sort of feel like he was nuts, too.

An auditor auditing badly can dirty a needle up. This doesn't say that he is driving somebody insane. The needle does not give an index of sanity or insanity, because this is the other side of that horrible picture: you could probably, in your hundred thousand insane people, find quite a few of them with perfectly clean needles. And you could set them down and get a list of goals, find their goal and list them on out to Clear. Because remember, insanity is a specialized condition. It is merely the sensation of having to reach and not being able to.

You can always turn on the sensation of insanity on somebody by saying, "Get the idea that you must reach but you can't reach and you must withdraw but you can't withdraw." If you can get him to get the first pair and then get him to get the second pair, too, for a second he'll feel like he's stark, staring mad.

Insanity is more a sensation than anything else. But as close as you can get to this sensation is get a total unpredictability. Now, you can almost produce the same thing. It doesn't work well. Aw, I don't know; get in the army sometime – get in the army. That'd be a good approximation of it. You go out and the notice board says, "All troops will *report*" see, "All

troops will *report* at eight o'clock." And this is crossed out and it's "six o'clock," and then somebody blows a bugle and it's five-thirty and you were supposed to have been on the move an hour ago and somebody stops you and says, "What are you doing here? You're not supposed to leave until noon."

You keep this up long enough and you get yourself some interesting states of mind. The thing that the guys probably do is say, "Oh, to hell with it. It doesn't matter," and so forth and "We're apathetic," and all that kind of thing.

But they're approaching the same thing. And after somebody had been subjected to that treatment for a while – let's say their needle was clean – well, their needle would tend to get dirty. Get the difference?

Now, the same guy – you set him down on the beach and you tell him, "All right. Now you keep watch out to sea. We don't expect anything to come. We don't expect anything to happen, but you just keep a watch out there," and go away and forget him for about three weeks and let no sergeants near him or any evil things like that and come back and put him on the meter and he'd be reading a clean needle, see?

He could predict, you see? He knows he's going to be sitting on the beach tomorrow, too. He has a certain amount of Havingness, which is your other *clue* to all this.

Now, running Havingness tends to key out circuits. And you notice I always use this word *tends* to. I don't say that it *will* key out circuits *always* because that's not necessarily true, because sometimes circuits in the process of keying out go through the pc. All kinds of interesting things occur on mental masses.

But Havingness tends to key out circuits and predictability tends to key out circuits and smooth out needles, and so forth. So let us take the gross values: predictability on the part of the auditor and havingness on the environment. All right. If you combined those two things, an auditor would be running a smooth, easy, gentle string of CCHs. He runs these various drills and he makes nothing complicated about it and he's very easy about the thing and he's very pleasant about it all and everything goes along fine. And what do you know? Some circuits start keying out and the guy's predictability comes up and here we go. And you notice all of a sudden that you're getting yourself a cleaner needle.

Now, if you're *not* getting a cleaner needle on this character doing the CCHs only, either you are not being predictable or this person needs to confide in you.

So you've got the other side of the coin which is Prepchecking. Frankly, Prepchecking is a very high-scale mate for the CCHs. If you were being more factual, you'd run the rudiments and Havingness session along with the CCHs. You know, you get in the rudiments and do the Havingness and then you would do CCHs, see? And it'd be my recommendation that if you were bucked in to somebody who was really, really a *rough* needle and things were pretty grim (just rough needle is good enough; you don't have to say how bad the case is and so forth) and this needle was awful hard to straighten out, stop getting so extraordinary. Don't be a psychiatrist. If you're not having any *luck* straightening out a very dirty, rough, mean needle and you've audited the pc for a while – I'm talking about four or five sessions now of whatever you're doing on the pc – and it's not getting better, it's getting worse, well, you're just up

too high – too high a level of randomness for the pc. That's – let's not say what's wrong with his mind, just beyond this point of the havingness and the predictability is above this pc's ceiling.

All right. Let's say – I'll give you a good example of this – you're running CCHs and Prepchecking on somebody and the needle was getting rougher. Be pretty hard to imagine how this was happening, but let's say you've run into something like this, see? I'd drop the CCHs back to a Model Session and Havingness. And I would make sure that in the CCHs I cut out *any* complicated action of any kind.

Don't wind books around your head and bang the pc in the chest with them four times and that sort of thing. No. Just pick up the book and turn it around and hand it to the pc until he can do it, see? In other words, the dirtier the needle, the simpler you get.

There is your direction of change.

Now, when should you make up your mind that you *should* change into a simpler thing? After about three sessions. Now, if you're doing a good, interesting session – you're doing a nice session that's very predictable and that sort of thing – the weapons in your hands are sufficiently good that they should start smoothing the needle out; doing CCHs the way you're doing them, doing Prepchecking. And you should start getting the things pretty smooth. This should start looking easy to you and the needle starts to look better and that sort of thing. You find out that you'll get this chain up and that chain up, because – now I'm not kidding you – the getting the chains released and that sort of thing assists this condition. Providing you do get the whole chain, see. I mean, you do a good, thorough job of it.

An hour of thorough auditing, you know, is worth a thousand hours of clumsy auditing any day of the week.

So, anyway, your concentration is in the direction of a clean needle. And if this is not appearing, the thing to do is to get *simpler*, to get more *basic*, not more *heroic*.

Now, if a needle is getting dirtier as you audit the pc, suspect the following – at once suspect the following, in this order: suspect the *meter*. It isn't getting the rudiments in. The rudiments are out and the meter is not reading them. Suspect the meter. There's something wrong with the meter. We're assuming, of course, that you know how to audit and read a meter and that you are doing a standard job of Model Session. And you're doing the best job you know how and those rudiments, as far as you can see, are cleaner than clean.

Well, don't be so baffled. First suspect is the meter. You may have a disconnection in your leads – E-Meter lead. Your battery may be down or the meter might actually have a mechanical fault in it. Suspect the meter and check it out from one end to the other. Make sure that meter is okay.

Now, supposing that you were stuck. We've assumed you're trained, you know how to do this and you're going to clean up your middle ruds and Model Session rudiments and so forth. And this needle is getting dirtier. And you're sitting out there in West Keokuk – now that's worse than being in Keokuk; that's being in West Keokuk – and you're a long way from another meter.

There is something you can do. You will notice this is occurring: Whenever you ask a rudiment and you get a clean needle, the pc had an answer for you. And it will run up as many missed withholds as you have rudiments. This is the liability, by the way, of a bad meter, a bunged-up meter or something of the sort, see? Sounds grim, doesn't it? I see some of your hair standing on end.

Now, listen. I'll go over this test. This is a very important point of this lecture – very important point. Your meter is not doing well – I'm going to get you a meter standardizer and I'll get a little thing built that you can get for a few pounds and it'll tell you whether your meter is smoking the proper petrol and so forth. You know, like these motor analyzers. I already designed it. The letter went out today – I mean, with everything. We're going to get one of these things shortly.

But in spite of that, not even one of those may be available, you see? I mean you may really be – you may be in the south part of West Keokuk. [laughter]

And you make this test. And you say to the pc, "Do you have a present time problem?" You see your meter is clean. Now you say to the pc, "Is there anything you wanted to say about that?"

And the pc says, "Yes. So-and-so and so-and-so and so-and-so and so-and-so."

Well, running a rudiment that way, that's the type of response you get. Well, let's start in at the beginning of the thing, you see? "Look around here and tell me if it's all right to audit in this room," see – that type of rudiment. Clean, see? You say to the pc, "Is there anything you want – you thought of to tell me about this?"

Pc says, "Yes, I can't stand green wallpaper."

You say, "All right. Thank you." Go on to your next rudiment. "Are you willing to talk to me about your difficulties?" That's clean. Or he says something and you check it again, "Are you willing to talk to me about your difficulties?" and it's clean. Now you've cleaned it up, see? When you got it clean, say to your pc, "Was there something you thought of after that last question there that you wanted to tell me?"

And the pc says (this one, too, see), "Well, yes. As a matter of fact, it so-and-so and so-and-so and such-and-such and such-and-such and – uh – I – uh – ha-ha – have grave reservations in disgusting [discussing] reincarnation with you because you look so reincarnated to me."

Then you say to the person, "Since the last time I audited you, have you done anything you are withholding?" You get a read. You clean it, usual way. And then you ask him again, "Since the last time I audited you, have you done anything you are withholding?" See, your meter's clean. And you say, "Well, is there anything you thought of then to say to me?"

And the pc says, "Yes and yes and yes and I did this and I did that and so forth and I thought of saying this to you, too."

You say, "Well, thank you very much." And then, "Do you have a present time problem?" And it falls and you get the problem and all that sort of thing or it doesn't fall – doesn't

matter – take it up to clean needle and say, "Well now, did you think of anything else you wanted to tell me?"

And the pc says, "And so-and-so and so-and-so and so-and-so."

Well, listen: Don't think that you just got a gabby pc. Your meter isn't registering on that pc as far south as you've got to go to get the rudiments in.

You follow it? In other words, your meter doesn't go as far south as you've got to go to get the rudiments in. *So even though the meter you're using is clean, you're auditing a pc with the rudiments out.* And that is the *only* thing that'll dirty up a needle.

Prepchecking without cleaning up the What questions, you understand? Stacking up the missed withholds in all directions here.

Of course, you're auditing with the rudiments out. And you're auditing with a whole, big stack of missed withholds. So it merely means that your meter isn't reaching as deeply as the pc can *reach into his own reactive bank.*

In other words, you can audit with an insensitive meter. You're almost taking your life in your hands. But you can take the curse of it off, if you find this sort of thing is occurring and you're in the south part of West Keokuk – on the other side of the railroad track – you can add this additional caper, this little additional action. Because when you do add that addition – the only reason you add it is because when you *do* add it you find out consistently that the pc has always had *another* missed withhold, has always had *another* problem. They were not registering on your meter. That means your meter is being insufficiently sensitive for that pc.

There's a limit to which a meter can go. It may even be that you can find a pc that just doesn't register on meters worth a nickel. And it may be that when pcs get very close to Clear they're not banging enough read on the meter to get the rudiment in when it's out.

Some interesting things could happen here, don't you see? Completely aside from the fact that you've dropped the meter and it's gone down the steps striking every fifth one with great regularity. See, some other oddities happen here. So we won't bother with the oddity. We'll merely say the meter isn't reaching as deep as the pc is reaching.

Now, it isn't necessarily true that every pc has a withhold just because he wanted to say something else. You put him on a drill like this, he's liable to start dreaming up things to say to you just to be accommodating.

The answer is, is how comfortable is this pc after a session is over? Is this pc really relaxed at the end of a session? Does this pc really feel fine as silk at the end of a session?

Well, here's the 18-inch gun on the thing. A pc after a session where the rudiments are unobservably but actually out, feels as roughed up as a violin being used for a canoe paddle. And a pc who has finished a session where the rudiments were *well, well, well, well*, thoroughly in, feels like a cat that's just been fed fish. He feels sleek. He feels smooth. Big difference.

If your pc doesn't feel very smooth at the end of a session, there's only one reason why. The What questions, the rudiments, are not clean. If those things are clean all the way down, the pc feels wonderful.

Now, there's a certain point of tolerance. But it's not very great.

Now, if your meter – here's another point – if your meter is never detecting and your meter never, never, never detects anything reactive on the pc, it isn't sensitive enough.

The pc never has to think and you never have to say, "There, there, there. What's that? What's that? What's that?" you see? "That, that."

"Oh," he says. "*Oh, oh, oh, oh, oh yeah, ha-ha. Oh, yeah, hmm.*"

But if your meter is clearing every time on this basis – "Do you have a present time problem?"

"Oh, yes. I – actually I meant to go for a ride last night with two boys and I didn't and now I don't know whether I should have or not."

And you say, "Thank you. I'll check that out on the meter. Do you have a present time problem?"

And it reads and the pc says, "I'm – uh – rather uncomfortable in this chair."

And you say, "Thank you. Do you have a present time problem? That's clean," and so forth.

You know, you never had to steer the pc's attention. He knew all about these problems. Quite interesting. Pcs often do know all about these problems, but if they knew about those analytically, what are you using the E-Meter for? This pc actually isn't reading the deeper problem.

Actually, if you said then to the pc – it cleaned, see and you ran this other drill I was giving you for when you – when you think your meter is running far, far too shallow. You say, "Is there anything else you thought of to say to me?" you see, something like that.

And he, "No. I just had a feeling like it isn't quite all right. I don't quite know what it is. Oh, well, yes. I just realized I – uh – *h-aah* – I'm thirsty."

And you say, "All right. Well, thank you."

The meter didn't go as shallow, you see it went too shallow. It didn't go down as far as the pc goes. It's something like finding the bottom out in the middle of the ocean with a short piece of string, you see? And you never get anywhere near the bottom.

Now, this condition can exist when your meter is out of whack, when it's insufficiently sensitive, battery is down, something like that and possibly could exist on some pc as he's moving forward toward Clear. You may hit bottom as far as the meter is concerned, but that isn't bottom. See? And you may have to introduce this other drill, which is clean it up *thoroughly* on the meter and then ask the *pc* if there's anything else. Got that? It's just as a standard drill. Doesn't matter whether you're prepchecking or anything else.

Oddly enough, you're still going to get the readings adequate for goals. They're still adequate for goals; you can read goals that way and so forth.

But there is the story of meters. A meter out of whack early on in auditing or a pc who finally suddenly gets Clear enough to know more about his reactive bank than the meter does and you won't get registries on the reactive bank, but the pc will know all about it. See?

Go ahead and use your meter. But you have to append the additional magic phrase. Got the idea?

And this other one – I want you to learn this real well and get a good subjective reality on it: Run a pc with the rudiments only partially in, you know, and the pc winds up rough; run a session with the rudiments very thoroughly in, the pc winds up very smooth.

The other datum is, if you've got a dirty needle on a pc, use the most predictable things you know how to do. And do those things very gently without any vast changes of pace or anything like that. Get predictable with this pc and you'll see that needle start straightening out.

Why is the needle dirty? The needle is dirty because the circuits are pulled in. Why are the circuits pulled in? Because the pc is way back on the track and very low in havingness. How do you get the circuits off the pc? You pull the pc out of the circuits and up toward present time by running extroversion-type processes and by raising the pc's havingness to key these circuits out and so forth.

The worse you audit the pc, the less his havingness is going to be, the more the key – you're going to get circuits keyed in, so therefore the dirtier needle you're going to get. Those are the mechanics of the thing and the only reason you're cleaning up a needle is so you can do 3GA.

You got it?

Audience: Yes, thanks. Hm-hm.

All right. Thank you.

Audience: Thank you.

PREPCHECKING AND THE TIME TRACK

A lecture given on 26 June 1962

Okay. The problems of auditing. Well, this is the second lecture, Saint Hill Special Briefing Course, 26 June 62. I'm going to talk to you about Prepchecking.

Prepchecking is a very easy activity. There is nothing very difficult about it except trying to understand it. You sometimes can try to understand it so hard that it becomes quite difficult. Prepchecking is based on one of the simplest fundamentals of Dianetics; which is that every type of incident which had relationship to one another tended to form up in a consecutive chain on the time track.

You should understand the time track as consecutive occurrences in time. You live, you live, you live, you live, you live. Those are all different items in time.

All right. Let's put it this way. You make a picture, you make a picture, you make a picture, you make a picture, you make a picture. Those are all separate items in time. But pictures classify themselves after construction, into chains. You've got a chain for most anything. You've got a breakfast chain of all the breakfasts you didn't like. And you have a lunch chain of all the lunches you didn't like, particularly those. And you have a supper chain for all the suppers you didn't like. You see. Now, you have an eating chain of all the eating you didn't like, you see. But inside this chain you have these subdivisional chains of the breakfast chain, the lunch chain and the supper chain. Get the idea?

Now, when you get so general that you have livingness you didn't like... See, these are – these are pictures you didn't want and therefore suppress and submerge and get the hell out of the road and try to do something with, you know.

It's something like the artist in the studio, he's got this potentially beautiful model. She's standing over there on the platform and he takes all of this clay, you see, and he slings it together and he makes something that looks like a combination between a giraffe and a custard pie, you know. And he says, "To hell with that thing," so he says, "I'll work on that later," or something. But that's very unsatisfactory, so he tries to push it out of the road. Well, suppose this was made up of stuff that he didn't know how to squash it after he had made it. Supposing he'd just forgot that. Well, he's got an unwanted picture there. He's got an unwanted statue. So let's say he hangs some curtains across the thing or puts it back in the corner, you know and pushes it out of sight and hangs some curtains over it and says, "Well, we don't have to pay any attention to that."

And he takes – and he says, "Well, let's have another go at it," you see? "Let's have a much better go at it," and he gets all this clay and stuff and he makes himself up a new statue of this model, you see. And it is mostly feet. And he says, "Well, *heh-heh, ha-ha, ha-ha, ha-ha.*" Not knowing how to unmock this thing, you see, we'll get some more black material and we'll drape the thing and we'll shove it over in the corner.

Well, this can continue and is a perfectly successful activity up to this point – when he runs out of studio. He got no place to stow these things. So he probably tries to push them all together into various classified piles, classified into "things we don't look at." Now, actually if they're hanging up, they are a violation of purpose. That's not in *Dianetics: Modern Science of Mental Health*, but that's how a picture gets there. That's how a picture persists. The alter-is is a violation of purpose.

A guy intended to hang somebody and got hanged. Violated his purpose. But that really is a fairly close activity and won't trouble him as much as going out to shoot the mayor and electing him. Now, that will trouble him. And he'll have this beautiful picture of this election. You'll run into it in the bank, you know? And you can't find anything wrong with it, you know. So he elected a mayor. Eventually, you dig around for a while and you discover well, hell, he wanted to kill the mayor, not elect him and he wound up electing him when he intended to kill him. You run out that basic purpose with regard to the mayor and the picture will fold up. The pictures are held in place by violation of purpose.

Now, the place they hang up in is the mind and they get into classifications of chains. And every chain has a basic and a basic-basic. Now, every chain has a basic. Well, that means that there are tremendous numbers of basics. You probably have a basic on the subject of bad food for every lifetime you ever lived. But there is only one basic-basic and that is the first time on the track you decided food was bad, see. And that's hung up because you weren't eating and intended not to and then did. And you'll get a basic-basic.

Frankly, there is no basic picture on a chain. There is no basic *picture* on a chain. There is a basic *purpose* on a chain which the chain *violates*. And that is what hangs the chain up.

That is even more esoteric than you need to do adequate Prepchecking. You need that to do 3GA but the mechanics are still true otherwise. The only thing you need to know to do Prepchecking is the fact that there is such a thing as a time track and that a time track has classified chains on it. And by chain is meant a consecutive series of incidents: He ate breakfast and didn't like it; he ate breakfast and didn't like it, see? Well, that runs from this lifetime, the first breakfast he ate and didn't like, up to the last time he ate breakfast and didn't like it which is probably this morning. See, he got a nice chain there. Well, now basic for this lifetime – actually when you say basic, you needn't add for this lifetime because you mean that. You mean somewhere near this lifetime, you see. Could happen in the last two or three lives. Sometimes these chains overlap a lifetime. You'll find yourself occasionally prepchecking back past this lifetime. Perfectly all right.

And basic, then, is the first time this happened on this particular chain. This chain is not united particularly with other chains and will free by finding that one basic. You can get

rid of this whole concatenation of not liking breakfast by finding the first incident where he didn't like breakfast in these finite periods like the last life or two, you see. Now, there is a chain and they are pictures. And the only thing which holds them all in place is the basic. You needn't particularly play around in Prepchecking with the purpose because you're going to get yourself into 3GA a long time before you're ready to be in 3GA. You start running back to find the purpose back of not liking breakfast. *Oh-ho*. The violated purpose.

"What is the violated purpose of not liking breakfast?" Well, it's a *woooooo*, and then he's back a thousand years *woooooo*, and it's back ten thousand years *woooooo*, and then he's back a hundred thousand years *zzzzz*, and then he's back a trillion and he's two trillion and fifteen trillion *yawhoooo*. There it is. Oh, yes, yes. You finally get it back down to the bottom and find out that's not his goal. What's happened during all this period of time? All you've done is beef up the bank all the way.

So you don't bother much with these basic purposes and that sort of thing as a relationship to chains even though that's how they exist and how they persist. The only thing you're interested in is the first time. The first time. Well, that is a very, very reserved statement, (quote) the first time (unquote), see. Honest, he's been having – a first time he didn't like breakfast here for trillennia, see? Every GPM has a not liking breakfast chain in it or something like that, you see. Back we go – back, back, back. But for our – for our purposes and for the edification of the general public and the pcs and so forth that you start auditing early on, you say well, that is the first incident. That's what we mean by basic. That is the basic incident.

That doesn't mean the first incident ahead of all such chains. That just means the one ahead of the chain that is close up here to present time and fairly accessible. So that's what you're after in Prepchecking. Because the mechanics exist that if you pull the basic, the rest of the chain will go, *bzzzzzt*. You can discharge a chain by pulling the basic on that chain.

The basic on the chain generally hangs around childhood, oh, maybe a few years ahead of this life. It's fairly recent. You can expect it quite normally to occur two, three, four, something like that. Sometimes you startle yourself by finding a basic in the prenatal area in spite of the fact that the medicos at first objected seriously to prenatal engrams and their objection to them has not eradicated them. I thought you might like to know that. They still run into them. They now, by the way, heal people by healing their prenatal proclivities, you see. Johns Hopkins University has issued many learned papers about prenatal influence now and not any one of them has got the story straight yet.

As far as past lives are concerned, you rather inevitably run into past lives. You start Prepchecking and everything is going along fine. This person's never heard of past life, never heard of living before and all of a sudden you find him in 1868 with the basic of the chain of hating wool. You know, what's he done to wool? Something like that. He's an Australian sheep farmer, you see. And he has – he's out there and he's sheep farming and so forth. And you all of a sudden find out the reason he is sheep farming has something to do with his having killed a man in England with a woolen scarf. That happened in 1868 and he finally gets it straightened out that he started sheep farming in 1870. And this doesn't seem to be quite right

to him, but he eventually straightens it out and all of a sudden he has no wool allergy. See wool doesn't do anything to him.

I didn't mean to step on any Australian toes here with regard to that sort of thing. Just for the benefit of it, as far as Australia is concerned, Australia is – shouldn't feel sad about it because that's what happened to everybody on this planet, you know.

Anyway, you've got a situation there, don't you see. And the basic on the chain doesn't pull in this lifetime. And the pc will go back and he'll go back and sometimes they go back two or three thousand years. Seldom much more than that. It would be quite unusual if they did, but you'd let them if they did. And they all of a sudden pull this basic. And it's some overt. They did something. And you pull that thing and *bzzzzzzt*. The rest of it will go.

Actually no charge can remain in a chain after the basic has been pulled out of unknownness and put into known category. The electronics of the situation is you're not going to get a *read* on a chain if it is no longer charged. And what charges it up is what keeps it in place. And that is the basic on the chain is an unknown zone or sphere. There's something unknown about the first incident and it remains charged up until that becomes known at which moment the electronics of the chain convert and the chain is desensitized and remains so thereafter.

And it is quite tricky. The pulling a chain is a permanent activity. Chains don't charge up again as long as you have the basic on the chain. Therefore in Prepchecking, you always test the What question for charge. You test the What question. Don't test the Zero Question because a person's reliability and responsibility increases. He's going find new times when he used wool for strangulation purposes, you see? Or something. He's going to find brand-new times and so forth, but it'll be on the Zero.

"Have you ever killed a man?" See, something like this. And no, he never killed any man. You've got this What question, see? Finally you find that he has an impulse to strangle people, particularly on sheep farms. For some reason or other this doesn't make any sense, you see. And you follow this on down and you pull the basic on the chain. Well, now that particular activity is going to desensitize. That'll never charge up again. But he's going to get more responsible and realize that by his reckless driving at some time or another or his failure to repair a car or something like this, his extensional responsibility is all of a sudden going to make him realize that he's killed somebody else. At this time the Zero is flat. You raise his responsibility and the Zero unflattens. But the What question flattened, remains flat. There is the curious difference.

Now, the anatomy of the mind then, is that chains consisting of similar incidents plot from a basic which can be reached up to present time. And Prepchecking is simply an effort to reach one of these chains and trace it back down to its earliest basic that can be found. That is to say – I beg your pardon – to the earliest incident that can be found, which is its basic for this finite fairly recent chain. And get the unknownness off of that incident at which moment the rest of the chain should go *bzzzzzzt*. You find out there's no real necessity to come back up a chain again once you have gone down it and blown the basic.

You test the What question and the What question is now flat. It is completely null and doesn't register anymore. It's gone. And the whole magic of it consists of finding the basic.

Well, therefore, the system called Prepchecking consists of a method of locating chains of sufficient charge to aberrate the conduct of the individual. And then provides a withhold system – it's called originally – a little system which knocks out the basic and removes the charge from the basic on the chain so the chain will fold up. So whatever else we say about Prepchecking and whatever else rote activity we get into about Prepchecking and however involved we get with Prepchecking, please don't lose sight of what you're trying to do.

You-uns is just trying to find a chain of antisocial activities on the part of this pc that are considered somewhat less than optimum; and you're trying to run that chain on down to its basic; and you're trying to knock that basic out and so get that chain to fold up. Now, whatever you are trying to do, you are trying to do that. And you will discover you have some remarkable successes doing things like this.

You find this person just cannot stand their mother-in-law and you say this is normal and natural. Nobody likes his mother-in-law, you say. Now when we investigate this thing a little bit further we find out that his mother-in-law does all the washing and bakes him pies and cakes that he particularly likes and is always giving him money and is very pleasant to him and is quite proud of him. But he doesn't like his mother-in-law. And this starts to get senseless. This starts to get stupid. It's ruining his whole life. That's all it's doing.

Well, all right. We prepcheck this thing – not because we pick upon it as a particular wrongness – we just happened to collide with it and run into it while looking for overts on the part of the pc. There we all of a sudden find the similarities and so forth that he has associated up with and the overts and the missed withholds connected with this mother-in-law and we find they all lie in a chain. It is not the mother-in-law chain, see. It is the – a female chain or an elderly female chain or it is some other characterized chain. But it is – it's better called, "Doing something to older women," chain. You locate that, pull the basic on the thing, *bzzzzt*, comes up to present time and he goes home and he kisses his mother-in-law and says how nice she is. She hasn't changed. He has.

Now, this could get more serious. He could get so upset about his mother-in-law and that sort of thing, he's perpetually sick. And you sometimes won't be able to figure out just why the pc became so mysteriously well. The pc had constant and continual earaches. Constant and continual earaches. Well, there's no sense in going in and trying to audit his ear or find a wrongness. You just do a more or less standard job of Prepchecking. All of a sudden you find out he hates his mother-in-law. You run this out, overts against elderly women, see. And you find out when he was a little boy, why, he pegged a rock at some elderly woman and hurt her in some fashion or another. And this all associates out and magically turns out that this woman was not his mother-in-law and somehow or another. And his crimes were so-and-so and such-and-such. And they all fold up and he doesn't have an earache and he likes his mother-in-law. Very mysterious.

How did all this occur? Well, it could only occur because of misassociation. He's reactively making identifications: A=A=A=A. Prepchecking is all out of *Dianetics: Modern Science of Mental Health* man, I mean this is – this is wild that something like – like Banquo's ghost coming to life, you know. It's right out of the old book. Except this is how you run it

with an E-Meter and you don't bother much with the engrams. The engrams all rip up anyhow and you don't pay any attention to engrams anymore, but you can get the whole chain, don't you see? Chains are described in *Dianetics: Modern Science of Mental Health*. Basics are described. Basic-basic is described. Also by the way, 3GA is also piloted out in *Dianetics: Modern Science of Mental Health*. The basic purpose of the individual. That's what you're finding when you're finding goals.

So anyhow, not to show you how right I was – just to show you that you're – just to show you that you're dealing with fundamentals. You aren't dealing with a whole series of chains. You're dealing with a peeled-off series of fundamentals. This is very streamlined auditing, man. When you get down to Prepchecking, why, you find yourself looking at all the parts that you saw in *Dianetics: Modern Science of Mental Health*, except you don't bother to run anybody through engrams or put them into engrams or explore still pictures or get too nosy about what the pc is looking at or anything because you can actually just run on down and pull the bottom of the chain and the chain goes *bzzzzzt*.

Now, there's been a reformation in Prepchecking. Originally we prepchecked on the basis of take the last incident in order to settle the individual on the chain or reveal the chain. We ran the withhold system on the last incident – the nearest to present time. And you see, that was the one we found.

All right. We have what's called a Zero Question. All right. That Zero Question is some highly generalized question that is liable to get the pc where he lives. It is arbitrary. If it operates on the pc, good, we use it. If it doesn't operate on the pc, we discard it. And lists of these questions exist in what we used to call Sec Check forms. They are found in HCO Policy Letters. The best of them are Form 3 called the Joburg and Form 6A as far as Scientologists are concerned. There are many of them, however. They exist. Though, there's been a lot of them put out in Info Letters, people have been real busy making up Prepchecks. They've done a real good job of this sort of thing.

So you've got lots of Zero material. I suppose at some time or another we'll be so rich that somebody has been a bus driver and we just look up in the – *der* master textbook on *der* subject of Prepcheck Forms. And it will say "Bus Driver, Type B." You see. And "How many fares haven't you turned over to *der* company?" You know? In other words it could be quite stylized. You could even bring it out for dynamics. Do a Dynamic Assessment on somebody and then you'd get a Dynamic Prepcheck and all of that.

But there's a danger in being *too* fundamental in Prepchecking. There's a *danger*. You start doing – you start doing assessments and you're going to run into the GPM and the GPM is nothing to handle with a Prepcheck, let me assure you. So you want a shallow draft sort of look. That isn't to say you don't want shallow incidents like I ... "Well, the reason I hate little girls is because that – I was at a party one time and I took my index finger and I touched the little girl on the shoulder and that's my overt act." The hell it is. He's done worse than that. He can do – he can come up with better than that to show for a whole lifetime for heaven's sakes, you see?

But comparatively speaking, we are not going to do 3GA and then a Prepcheck, don't you see. We're going to take something that's relatively light, you see. And we get it out of these forms.

"Have you ever stolen anything?" Well, on the whole track, look at you, man. Look at you on the whole track. Aw. Think if you – if you try and clear this question up for the whole track. Oh, wow! You know, "Where'd you put that planet, man?" You know. But we ask this question as a Prepcheck and we find out that he's been stealing pennies out of his mother's purse and he's been stealing lollipops and he's been stealing copybooks off of his teacher and he's been – he's been purloining this and that for quite a while. And it's finally wound up into the fact that he'd better not reach certain items in this lifetime.

So we ask him the Zero Question, "Have you ever stolen anything?" Of course, we don't know that he's stolen something or not stolen something. This is minor. This is just a test question. Zero Question equals test question. And it reacts on the meter. It goes bang!

Well, we say, "That reads. Now, what have you done?" And he says, "Ah, well, stealing things. I ..." He says, "I – I – I stole an icebox once."

And you say, "Good. Thank you. I'll check that on the meter. Have you ever stolen anything?" *Clang!* Well, you've had it, see? You gave him one chance, you see. You gave him one chance to clean it. And if it didn't clean, you got your paws on a chain. Chains never consist of two incidents.

Sometimes there are isolated, single incidents that clean up just, boom! Well, you don't want to monkey around with those and beat the pc to death, but they clean up just on utterance. Pc says yap-yap. They're gone. That's it. They don't read. But you say, "Have you ever stolen anything?" a second time, he goes clang! Oh, well, come off of it, man, there's a chain here.

Now, what is it a chain of? Well, probably it might be four chains. It might be six chains. Now, he says he stole an icebox. And this is the way you prepcheck now. You take that incident and you don't run, "When did it happen? Appear?" and so on. You don't – you don't do that with that incident. He just tells you that incident. You try to clean it on the meter. It didn't clean and now you put your What question around that except you dabble and dab and monkey and fumble and fool around trying to get this What question to operate like that *clang!* you got there on that "Have you ever stolen anything?"

"Have you ever stolen anything" fell about two E-Meter divisions with a very fast *chop*. Well, you want a What question that falls two divisions with a very fast *chop*, see? So you're just going to have to be inventive at this time and this is the weakest part of a Prepcheck system. This is where the auditor can make most of his mistakes.

You say, "What about...?" All What questions begin with "What." "What about?", they say. Isn't even very grammatical and it isn't very sensible, but you find out it works fine. And nearly all Zero Questions begin with "Have" or have "have" as their third word. Like, "In prison have you ever ...?" See? It's a modified have. So your What question: What about? All right. Now you've got to find out what about what? Well frankly, you're like a fisherman who is blindfolded standing on a stream. He does not know even, really, if the stream exists using

tackle to catch fishes that he does not know the type or identity of, you see? So this is a sort of a – of an interesting activity. He's got to form a What question all on his little lonesome. So with great genius our new HPA student says, "What about stealing iceboxes?" See. That's genius. This is just brilliant, you see, because he only stole one icebox. He's stolen lots of things but only one icebox.

So now let me show you how the guy's made it tough for himself. This thing is at the *top* end of the *theft* chain. See? It's supported *all* the way back to the age of *two* when he used to steal safety pins off his nurse, you know. It's supported all the way back there by *all* that charge and *all* those incidents. My God! He's stolen iceboxes and opera hats and he's stolen women, he's stolen all kinds of things, you see. And this auditor says, "What about stealing iceboxes?"

"Oh, *th-blah-blah-blah, this-that, uh-aw-yeah-blah.*"

And the auditor says, "Are there any earlier times?"

The fellow says, "No, there aren't any earlier times." So he checks it on the meter. "Any earlier times you've stolen any iceboxes? Well, there are no earlier times... All right. When was that that you stole ...?"

Oh, no. This isn't going to – this isn't going to give. This isn't gon- ... He can sit there now and grind on it for the next couple of hours. I'd say he could probably spend four or five sessions on it.

"When did you steal the icebox?" See. "Is that all there is to it? What might have appeared there? Who should have found out about it?" And the What question – it sort of dies a hard death. After several sessions it sort of dies a hard death. Both auditor and pc finally get tired of this icebox. [laughter] It was sort of cold and clammy to begin with and didn't get any more entertaining as we went along.

Well that is what could be classified as asking, formulating, the wrong What question. We want to know something that will give a chain. So this is what we do. We – of course, in a test question, you say, "What about stealing iceboxes?" but we're wasting our time, you see. We want to know about, "What about stealing furniture?" see. "What about stealing appliances? What about stealing equipment? What about stealing heavy things? What about stealing massive items? What about stealing property that didn't belong to you?" That doesn't read. "What about stealing white objects?" Sheer genius. Didn't work either. [laughter] Finally the auditor remembers what the pc told him – that is he stole the icebox and hid it in a barn. So, "What about stealing and hiding things?" Clang! "Oh, that was good, huh-huh." We got the same clang. And we say, "Have you ever stolen anything?" Clang! "What about stealing and hiding things?" Clang! Hey, hey, that's all right. All right, now.

"All right, now – what a – what about, stealing and hiding things, huh?" Oh, the auditor, he's got it easy now. In this new type of Prepchecking, he has it very easy. He wants the pc to get windy. That's all. He just wants the pc to go on and tell him all about it. That's good, yeah, well yeah, all right, fine. The pc just tells him all about it. He doesn't ask for anything earlier; he doesn't steer the pc in any way; the pc tells him all about this question. Actually, the pc may give him three or four overts. He doesn't challenge the pc, he doesn't stop the pc.

Because listen, if he stops the pc he's got a missed withhold right there in the session that's going to go all – fly to pieces.

See, he did, he sort of shut the pc up while he found the What question and that sort of thing. And it was a little bit lengthy and he did it and that's fine. But now that he's found it, now he wants to know about stealing and hiding things. And the pc's – well, the pc's been sitting there kind of ready to tell him, you know, about the Ford car and the house and the battleship and the bass drum and the giraffe and all these things that he's stolen and hidden, you see? And the guy goes on and on and on and on.

And only when the pc runs down, the auditor – this is the time the auditor should encourage – he should understand the encouraging acknowledgment. Girls know this better than men. Girls are experts at this sort of thing. I know a girl, stone-deaf she got through her whole life, married eight millionaires and all she knew how to do was give an encouraging acknowledgment! [laughter, laughs] It's the invitational, "Hm-mm." You know? "Right. Right. Right. Right. All right. Hm-mm, hm-mm, good, good. All right, all right, yeah." Of course, the girl adds the "Gee whiz!" to it, you know, a little bit, but you don't have to add that.

Pc runs down – doesn't matter whether he gave you one, four, six, eight – doesn't matter what he gave you, take it. You've got this What question, you've written it down. That's the main thing. It's got to be on your board. It's got to – registered along with the "Have." And after that you let the pc answer that What question in full. And now start pushing for earlier. And you don't even have to read the meter, man. See? You're not reading the meter during all this time. Give your eyes a rest.

You know he's not going to tell you the earliest. Because if he could reach the earliest all by himself, it wouldn't be a chain. So he can always answer the question, "Is there an earlier incident?" And you shove him back to the earliest incident you *can find*. That is, he's always going to tell you "the earliest," "It is the earli-est." The pc's always using "earli-est," and the auditor is always using "earli-er." See, auditor never says "the earli-est," "Tell me the earli-est incident." "Tell me the earli-er incident," you know, because he'll hang the track up.

And he gets the pc back to the earliest one that the pc can be coaxed back to without a meter and without anything. See? He gets him back there. And he gets that *earlier* incident – pc says it's the earli-est, it's not. That incident is the barrier.

That incident that the pc can reach without much assistance is the barrier to earlier memory. There is always a barrier incident. It's a barrier to earlier memories. It's not particularly a technical term, I just want you to get the idea that there's a fence built about a third of the way up one of these chains. And the pc can get back there dead-easy. That's to the age of eleven. He can get back there awful easy. But somehow or another, at that point it all folds up and that one's pretty foggy.

So it is at this point that the auditor now brings out his withhold system. Now, he wants to know when that *early* – the pc says "earliest" – he wants to know when that "earliest" incident, when it was, wants to know is that all there is to it, he wants to know what might have appeared there and he wants to know who should have found out about it and didn't, so on. The When-All-Appear-Who system. And he works that over, one time, two times.

And when he's got that far – I'm just giving you this in the rough, not by the rote procedure of the HCOB June 24th, 1962 – he wants to know if there's any earlier incident. Well hell, of course there is. See? He used the withhold system to blast the track open so the pc could remember earlier, see. And he runs the pc on down and the next thing you know they've got their hands on an incident about stealing and hiding things from his little sister and driving his little sister berserk and plenty of overts. And finally we find out that he'd steal and hide things – it's usually got a – the basic on this thing has usually got a hell of a curve in it, somehow or another, you know. And he finds out that he stole and hid things from his little sister so that she would get beaten for losing her toys.

And he sort of sits there stunned for a little while and he says, "I do that? No, I couldn't have done that. Yes, well, I guess I did do that." And, having arrived down at that level, then we get the withhold system being operated again, very strenuously and we get that thing gone over two or three times, he develops new material out of it and he gets his own overts out of the thing, he gets disentangled and so forth. And then we test this What question. Does it still bang on the meter?

"What about stealing and hiding things? Bingo! See, still reads. All right, so we go back into our song and dance again and we get an earlier incident. And we find out Little Sister be damned, you see. As far as stealing things is concerned he used to steal bottles of milk at the age of eighteen months. And we actually have plowed memory back to that point.

The beauty of this is the withhold system, the When-All-Appear-Who system, has the power of opening up track. And it will open up more damn track, if you'll pardon my French, than any psychoanalyst ever hoped to see. And it's nothing to get somebody to remember at the age of eighteen months, see. Well, stealing and hiding things, he used to drive everybody nuts. He'd crawl across the floor and open up the icebox and he'd steal his own milk bottles out of the icebox. And he'd go around and he'd hide them all over the house. And there was nothing but sour milk being poured all over the house. And this turns out to be an overt against himself in some fashion, an overt against his mother, an overt against everybody in sight, don't you see. And it finally – we picked up the icebox, he finally tried to do this all over again, you see, because he'd just got through stealing an icebox, see? But now we find out what he was stealing out of the icebox, you see and that happened at the age of eighteen months.

And there'll be some wild and extraordinary curve on this one, too, somehow or another. There'll be some kind of a starvation terror. Has to do with his ulcers or something like this. We get that thing all worked out, we work that out again and then we test this question, "What about stealing and hiding things?" And we find out it is dreadfully flat now. There is nothing left in it. It hasn't got a click to its name at a very high sensitivity and so we get the middle rudiments in, zing-zing-zing! "In this session is there anything you have suppressed, invalidated, failed to reveal or been careful of?" Boom. We get those in and then we read the What question again. And maybe there's a little tick on it, on the What question. And the pc says, "Well, I – uh – one thing I – I – I didn't tell you, I – I didn't tell you," he says, "Uh – I actually, uh – steal sour milk. Heh-heh," you know or something like that.

Just ask the What question – flat. That's the end. That's all. That's all there is. That's even a chain.

So, we go back to the Zero Question now. And we look down the throat of the Zero Question and we say, "Have you ever stolen anything?"

Now, if the Zero Question reacts we do exactly as we did before: we get an overt and we go on and we do everything for him. And we'll find this time we're on an entirely different chain.

We keep that cycle up until there's nothing left of that Zero Question. And then we go to the next Zero on the list, regardless of what it is. "Have you ever raped anybody? Have you ever eaten waterbuck?" you know? Doesn't matter what the Zero Question is. And we work it the same way.

Now, we're not necessarily looking for fantastic amounts of crime. We're not looking for quality. And we certainly are not looking for sordidity. You can very often find pcs who have read a book by Freud and – or comic books or anything – and they've read these things and they've got an idea that if they recall certain types of incidents, which they make up and say enough about it and fill in enough words, somehow or another something marvelous will happen to them. And you never fail to find somebody who's been psychoanalyzed, trying to apply the formula of psychoana – analysis, you see, to clean up a chain or something like this. And man, in that particular case, when you find this, man, you better tackle those middle – the middle rudiments with those beginning of the end rudiments. You know, the half-truth, un-truth? Otherwise you're mucked up all the time. So just add the half-truth thing to your middle rudiments and spit out that four-way one.

And they'll try to give you all sorts of very sordid, down-to-earth modern literature-type chains that haven't got a single thing to do with their overt. Now, it is so much so that you can assume that if you were to tear into a case without an arbitrary standard, such as a list of Zero Questions, that the case will present to you the least aberrated chain. The case will inevitably give you the least aberrated chain, which is best known to them. And if released, will produce the least possible change in their case. This you're sure of. Because that chain is safe. And the pc is always for security. Good roads, good weather and security and no bank turned over and we will be all set. See, what he'll give you – he'll give you something that he has already made up his mind is aberrative.

Now, if he's made up his mind about it, he knows about it. And therefore, so help me Pete, it probably has very little to do with his case. And there's where you get sucked in on Prepchecking and sent over the falls. If you sit there and the pc, "All right, now what have you – what..." If you approached it – if you approached this: "Well, what do you think is wrong with your case? What overt have you done in life that have affected you or influenced your life most singularly?"

"Oh," the pc would say, "I – I – I think it's all the – all the terrible things I have done on the second dynamic."

Now, you could approach it just like that, see. You know, "What do you think is wrong with your life?"

"What I think is wrong with my life is this series of overts."

Just – you could take your meter right at that moment and say, "Have you ever palmed this off on any other auditor?" "Has anybody ever tried to clear this up in Sec Checking" "Has anybody. ..." – "Have you ever persuaded anybody to audit this with repetitive processes?" see, here we go, man. This is Brahms, "a la preclear." It has absolutely nothing to do with the pc's case.

Therefore, I very earnestly recommend to you, lists of arbitrary questions. "Have you ever stolen anything?" "Have you ever raped anybody?" "Have you ever shot anybody?" "Have you ever fiddled the company's books?" I don't care what it is. You go right on down the line and you just take what falls. And you could actually prepcheck the rudiments. Use those as Zero Questions. "Are you willing to talk to me about your difficulties?" *Blang!* "What difficulty aren't you willing to talk to me about?" Set that up as a Prepcheck and you'll get someplace there, too. You can also set up any type of activity, such as finding goals or auditing. Well, as far as that's concerned, you know the fellow's driving buses. As long as he doesn't tell you what's wrong with him is because he drives a bus, you're always at perfect liberty to pick up driving buses, see? "Have you ever – have you ever sinned in buses?" see.

The trouble with you is your sales resistance is low. That's the main trouble with you where the pc is concerned. The pc gives you the most interesting story you ever heard in your life as what is wrong with the pc. "I've just told auditor after auditor about this and they've handled it, but they've ARC broke me so much that I really have never been able to really handle this adequately, but if I ever really got this handled adequately, then I know then, that everything would be ..." oh, let's play it on Nero's violin. It sounds so much better. He *knows* about it, therefore it isn't what's wrong with him. See, it is the *unknownness* that makes it wrong.

So of course, if you can open up some chain that the pc has never gone "ulp" on, why man, you're going to tear up track in all directions and the pc's going to say, "*ooh!*" Pc's got ulcers, he knows what caused his ulcers. It was being rammed in the stomach with a pogo stick at the age of six. You could say to him, "How many people have you told this to, pc?"

"Oh, just most every ..."

It – you always get taken in on the idea that you're the first one, you know, that he's ever told this to. You've got a virgin complex or something. [laughter, laughs] He's told doctors and his mother and his sisters and his brothers and his last three auditors, all about this pogo stick, see. Well, look at the evidence. Look, he's told about it often enough to have run it out long since. Well, you can't say that, well, it's just held in place by something else. You can't say that. If he got that close to it, that it was the pogo stick, if he just got that close to it, he wouldn't have ulcers. Because it's almost impossible to maintain an aberration.

How people keep their Goals Problem Mass balanced is the – is the glory of all time. You know? There's supposed to be certain rocks in the world that hang up on the tops of mountains at very delicate balances, you see. And man, that's nothing compared to the GPMs.

Well, similarly, an aberration has a hell of a time being maintained. You hit the thing and it'll slip. So, let me tell you, that if it is as advertised, it ain't. [laughter] So you don't pay

any attention to it. That means you – that doesn't mean that you never pay any attention to what the pc is telling you. But as far as – oh, yes, always pay attention to what the pc's telling you – but you get him telling you about things that you want him to talk about, not that he wants to talk about, you see. And you – the balance and the delicacy of auditing is getting the person to talk to you about things that he doesn't know he should have talked to you about, preventing him from rambling on about things that won't increase the stature of any session and he doesn't find out about it. He doesn't realize how thoroughly he's being steered. Now, that's the delicacy of auditing.

Some people can jump in onto the seat of the fire truck and open the sirens wide open, you know, go dashing around the corner and so forth. And the pc almost inevitably knows he's being taken for a ride, you see? Now, the adroit auditor, who's very straightforward and doing his stuff very well, actually does have the pc going down the road and driving. The pc knows he's driving. They're going down the road at a hell of a rate of speed. And the pc thinks it's all his own idea. And the pc starts to go up the wrong road, starts to turn to the left, you see and the auditor has him turn to the right and the pc never notices. He just goes right on with the story, he just goes right on down the line and he's – that's it, that's the way it is.

Naturally, he'll tend to bounce off of things that are aberrative. He doesn't like to confront them. They are not as-ised, so therefore he hasn't confronted them, so the probability is, is he doesn't want to confront them. Well, you don't get any place by forcing him to confront something. You've got to let him discover he is confronting something. There he is standing there and he says, "Well, here's all these damn statues I made. Hey! Hey!" He says, "Hey! Hey! There's three statues here and they're actually of a beautiful model and so a-ha! Look at that! Heh, look, I put some black flat covers over them. Hah! That's pretty clever of me to find them again."

Man, you've been heading him down corridors and beating him over the head with a baseball bat every time he tried to dive out the window and you've finally moved him into this room, you know. And even had to put horse blinkers on him, you know, so he could only stare in one direction. And he found them. That's quite ideal, this session. Pc's very pleased with it all. Very often the pc suddenly looks at you after he's discovered them and realizes, "Hey! How'd you know these were there? These are – this is pretty clever of you," see? Well actually, you always look clever when you use a standard Prepcheck, Model Session, steer the pc into the chain, that sort of thing. You always look clever to the pc. Sooner or later he begins to realize that you know where you're going.

Well, you know where you're going because you're traveling on a series of fundamentals. You're only trying to pull up the basic on a chain of incidents which were wrong conducts on the pc's part. And he knows they're wrong conducts and therefore he's got these things buried. And you don't want to make the pc guilty or something like that, but you really hit pay dirt on one of these things. You can't – you can't have it good all the time. But you sometimes ... My God, there'll be an incident within the last year and the pc, "I stole a car last June! You know, I ... What the hell? I – I didn't remember it till just this minute. I'd never thought about it! Wow! Gee. Hey." He's found something. There was something lived there that he – been haunting him for some time, because it wasn't the car he stole in June. The top

of the chain is closed off. How hot do you suppose that chain is, huh? Boy, that chain's as hot as skyrockets. The top of the chain is gone. Most people know the tops of the chains.

"Aw," they say, "Yes, I have this peculiar, peculiar penchant, I – I borrow money from my friends and don't pay it back," and so on. "I – I know that's what's wrong with me. I know I do that."

You've said, "Have you ever borrowed any money and not paid it back?" Some Zero, you see. "Oh yeah, I – well, I – I do that, yeah, I know I do that."

And you say, "All right, well ..."

He says, "I just – I just borrowed – borrowed some money just the other day" and so forth, "and I didn't intend to pay it back. Yeah, I know all about that."

See, they know the last one. You ask them again, "All right, have you ever borrowed any money and not paid it back?" and it goes, clang! And you say, "Well, any earlier times this happened?"

"Well, yeah. Yeah, you know, there are – there are quite a few." And he starts reeling them off and so forth. "And the first time I ever did it was when I was twenty-five."

Maybe so, man. That's the earliest time, that's the earliest we can get him back to, so we run that particular crime and incident. And what do you know, it might blow the chain, too, but, probably it'll not. And we finally get the thing back. We've opened up track he didn't know a thing about. And that's when you're really getting someplace.

Now, a Prepcheck that is terribly successful usually runs as a short story of this particular character: The guy's been doing something he knows is wrong. He can't account for it. He's got a lot of motivators, people do things to him on this particular subject. This worries him. And you run back down the chain of doingness of these things – it's always what has the pc done, you see, it's not what has been done to the pc. You never buy anything that's been done to the pc. Nothing has ever happened to the pc in Prepchecking we don't care if the car flew around and cut his head off, nothing happened to the pc. You understand that this as unreasonable as that sounds, that's how it has to operate. You let a pc give you a lot of motivators, his needle will dirty up. It's a bum thing to let the pc give you motivators. He's pulling in circuitry.

And, you start charging down the line here. This pc – and he didn't know what it was doing and so forth. And he's opening up track. And then we all of a sudden get to – we get to something that he's always thought of as a motivator. This is quite common. He's always thought of this as the motivator, you see. He's thought about this fellow who threw his tricycle downstairs. And that was a pretty terrible thing, to throw his tricycle downstairs. He remembers this. He remembers this. It's always stood out in his mind, you see, throwing that tricycle downstairs.

And there's something goes just before this which gives a *volte-vis* and a reverse that would make O. Henry green with envy. It's got a short story twist on it at the beginning of the chain. It'll be something on the order of: it turns out that it wasn't his tricycle being thrown downstairs, it's his young friend's tricycle being thrown downstairs – after he threw the young

friend downstairs, you see? And it sort of turns out that it wasn't the young friend who threw the tricycle downstairs – it all got kind of mixed up, actually. But it was he who threw the tricycle downstairs so it landed on *top* of the young friend! And he thinks this is all fine, but it's still kind of active on the needle. And then we find out that he's convinced his mother and his young friend's mother that his young friend had done it!

And this will all be sort of obscured at the bottom of the chain. And he gets this all straight and all of a sudden the thing goes *zzzpp*.

You'll find out that it's characteristic of a very thoroughly aberrated chain, that the incidents are all in juxtaposition. The later ones are always earlier and the earlier ones are always later and it's all mixed up and it's one of the symptoms of the thing – the pc starts to straighten out and keeps saying, "Oh, well wait a minute! Wait a minute. Wait a – wait, wait, wait, wait, that was – that was the year before! That was – that was the year before." Well, this is – you know the track's straightening out and you're winning all the way, see. He never realized it was the year before, right up to that moment. He thought it was the year after.

See, he thought he went to the university and then joined the ambulance squad. But as a matter of fact he joined the ambulance squad and then went to the university. How he could lose this much detail from his life is quite a mystery, but they manage it on these chains. So that the time factor is all scrambled on these chains.

So when you say earlier and earlier, you sometimes get an answer from the pc which apparently is – oh very innocently – earlier in the pc's mind, but actually is much later. And it suddenly transpires that this was at the age of eight and he had already been down to the age of five. And all of a sudden he gets it back to eight and he finds the earlier incident of five.

Mixes in time is a good indicator. If you're on something hot, time will be mixed up on it.

As far as the earli-est is concerned, let the pc use that because the earli-est probably happened two hundred trillion years ago. And the earli-er only gets down to what you call basic.

You're normally dealing in these things with locks – Dianetics: *Modern Science of Mental Health* – you're dealing with locks. You're not interested in moments of pain and unconsciousness, you're interested in locks. And you're interested in only overts: Things that the pc has done to others; damage the pc himself has created or herself has created. A resurgence of responsibility happens as a result of these things. A lot of interesting things occur.

Of course, you realize that Prepchecking – Prepchecking is a method of straightening out the life of an individual, making him feel less harassed and haggard and a lot of things like that. But Prepchecking is not something that can be gone on with forever. You cannot forever prepcheck a pc. You will never clear a pc with Prepchecking. In fact, somewhere up in the hundreds of hours you would start to run into an increase of bank by reason of Prepchecking because you're off the pc's goal.

You see, a hundred hours of this – they'd go a long way, man. That'd go a long way – a hundred hours of Prepchecking. And you start taking it over – you're demanding things of it

which it won't do, which is to clear somebody and it won't clear anybody. But it'll straighten up somebody's life. It'll make them feel much happier and a lot of things will occur, highly beneficial. You'll get a smoother needle; you'll get practice in auditing and sessions. They suddenly realize that things can happen. They can talk to the auditor better and circuits key out and things. You get a lot smoother, but don't expect it to go the lot. Don't expect it to go the whole road because it won't.

It will do more than any psychotherapy system which has ever been developed on this planet for straightening out sanity. It will do more by a factor of maybe a thousand to one. It is fabulous from this point of view. If you were to walk into the field of psychoanalysis with a Prepcheck system and just to do Prepchecking in the field of psychoanalysis, my God! The people – their eyes – eyeballs would fall out and roll around the floor, you know? Because it would be for the first time that anybody dealing with memory had produced a lessening of insanity or neurosis on the part of the individual. In fact, there hasn't been any psychotherapy dealing with this lifetime and dealing with the various quirks and aberrations of human beings as they are recognized to exist or thought to exist by modern science, before Prepchecking. There was none.

So it's a – it's a kind of a first all by itself. Of course, the earliest forerunner of this was a very spotty sporadic, "If you did it, boy, was it wonderful. And if you didn't do it, wasn't it horrible?" You've – it was the Straightwire taught at 42 Aberdeen Road at Elizabeth, New Jersey. And you just remembered somebody who had the similar illness and spotted when it was and sometimes – most of the time it would blow and the guy would lose his unsimilarity with that individual and he'd break up the identification with the person. And it was quite remarkable when it worked. But you had to be awfully clever and it didn't work all the time. Well, this'll work all the time.

Now, what is it – what is it good for? Why is anybody teaching it to you in the first place and that sort of thing? No. It's a very good thing to know because you can straighten out an awful lot of things with human beings. Because it won't clear somebody don't underevaluate it, see. It'll sure make things smooth. And if you don't know how to prepcheck, you'll be stopped with a lot of cases. You'll just be stopped in your tracks because the needle will be so dirty. And you can smooth it out just so far with consistency, with Havingness, that sort of thing. It goes just so far and then it sort of hangs up. And the individual's got a lot of withholds and a lot of things from you and you can't quite get rid of them. And they give you the *same overts every session* and you know, recurring – recurring overts. They give them to you session after session after session – same overts.

And you'll wish to God you had something like Prepchecking to straighten out that pc and grab him up the last few rungs of the ladder to where you can run 3GA on him. That is actually the purpose of Prepchecking. But, of course, it has much wider horizons and applications than that.

And if you were to be a very clever auditor and did nothing but prepcheck people they would be – and did a very good job of Prepchecking – they'd fall around your neck and think you were solid magic. And if you are a good Prepchecker, of course, you are solid magic.

Thank you very much.

Rudiments

A lecture given on 28 June 1962

Thank you.

Well, is there anybody present who has their rudiments in?

Different voices from the audience: Yes.

Yeah? Yeah?

You look so sad about it! Okay. This is the what?

Audience: 28th.

Twenty-eight of June AD 12. I have absolutely nothing to talk to you about. You are all doing horribly. Saint Hill Special Briefing Course lecture number one.

You know what you're doing? You know if a – an E-Meter – this is a general talk about rudiments – much as I hate to mention it. If an E-Meter got any more sensitive, you wouldn't be able to control it. You're right up there at about zenith on the sensitivity of a meter of that type in a Mark IV. So, you haven't a prayer of doing anything about the – sensitizing the E-Meter to read more sensitively on the person because the electronics of the E-Meter have to be sensitized and the lightness of the needle have to be sensitized and that sort of thing, in order to get a more sensitive read.

So you can't go more sensitive on an E-Meter than sensitivity 16 on a Mark IV. The thing is going to fly around so much you won't even be able to keep it in the middle of the dial. You agree with that? It's already a little bit rough to keep it in the middle of the dial on sensitivity 16, because of course, as you deal with rather aberrated people the needle is fairly stiff. But as you move it on up the line to people who are not quite that aberrated, you still have to have the increased sensitivity to get the read. You won't know that the read grows less, the less aberrated the person is and the needle grows looser. Oh, isn't that horrible. The needle grows looser and the read grows less. So, I think to a very marked degree it's up to your TR 1.

Now, let me tell you exactly what happens on an E-Meter and why you have difficulty with rudiments, when you have difficulty with rudiments. Let us consider here an E-Meter on a totally ARC broken pc. It won't read. You see, that is a known condition. It won't read. But have you considered the gradient of this? And that is, the more ARC broken the pc is, the less the meter reads. Now, it should go by some other kind of a gradient, see? It should be that the more – the more the ARC break, why the greater the response of the needle. And this does not happen to be true. Actually the greater the out-rudiment, the less the needle response is. And that's the little hill you're walking up. And that's pretty grim.

All right. Now, let's apply this to a session. And we find that you very often find your second, third and fourth or your third and fourth of the beginning rudiments out. See? They're out when the needle – when the meter and the session are checked. When the session is checked, your rudiments are checked of the session by an Instructor or something like that, it's most commonly the later rudiments that are out rather than the earlier rudiments, right? Well, now why is this? It's because when you don't get a rudiment in, the later rudiments don't read well.

Now, sitting right up at the top of this is the room. An auditor can make a number of blunders and one of them is not checking what he's trying to put right. And that is a general blunder that gets you in more trouble than probably any other single action. You're trying to put right, "What about stealing ladies' boudoir tables?" See. So, you get the middle rudiments in and then you omit reading off and checking "What about stealing ladies' boudoir tables?"

If you have made this mistake two or three times and caught yourself at it, let me assure you, you will never make the mistake again. Because, after you've gotten the middle rudiments in on a What question, the What question very often is still hot. And, all you've got to do is leave a hot What question sitting there and your meter from then on is not as operative as it was before. Do you follow that? By the omission here of this What question, on checking it up and straightening it out, your meter becomes less operative. Now, that's quite, could be quite obvious you see when you apply it to a Prepcheck.

The pc says, "*Hm*, I can get away with this. *Hm*, out of session. *Hmm*, missed withhold. *Hmm*, ha-ha," see? "I didn't tell him at all about those ladies' boudoir tables I stole in Siam – ha-ha-ha-ha-ha." See? He might have told you up to the time when you didn't discover them and then you gratuitously inform him that the What question is clean. He says "What goes on here?" You see? Well, actually failure to check what you're straightening out before you do something else is the secret of inoperative meters in a session.

Now, you essay to get the havingness rudiment in right at the beginning, see? You essay to get this in. And how many of you run the Havingness like this – how many of you run it like this? "Is it all right – look around here and tell me if it is all right to audit in this room. That reads." Can squeeze test. "Put some beingness in that object, put some beingness in that object, put some beingness in that object." Can squeeze test. "Are you willing to talk to me about your difficulties?"

Ohhhhhhhh. You went in one door and you never left by that door. You never went back and said, "Look around here and tell me if it is all right to audit in this room," and read it on the meter. See, the omission of that step now starts throwing your remaining rudiments in the beginning rudiments out. Very simple.

Do you know that can squeeze is absolutely no guarantee of any kind that the pc is willing to be audited in that room? Did you – do you know about that? Well, that's a fact. Indicates exactly nothing, except his havingness is up, which was not the question, see. The question is, "Look around here and tell me if it is all right to audit in this room." You see how that omission there then starts the snowball of error.

Now, we say, "Are you willing to talk to me about your difficulties?" And the pc has an answer but you don't ask for it. *Ohh*, so you say, "That's clean," and you go on to your next

rudiment. Oh, it's almost, why bother? See? This session is a dog's breakfast by this time. And sincerity of the auditor and the strain upon his face is absolutely no index of the degree the rudiment is in. A rudiment is in if it's in.

Now, you would be amazed how many answers the pc has, you'd be amazed how many answers the pc has he never gets a chance to give you. And every time he doesn't give you an answer, whether it is vital or not, you have a missed withhold. How many missed withholds make a session? That can get pretty grim.

Now, he only starts doing this, by the way, and the meter stops recording this after you've already flubbed. One flub on meter – metering the rudiments – begetteth a nonreadable meter. The more you flubbeth, the less you will getteth. See the dwindling spiral till finally the meter is totally inoperative and then it's all missed withholds from there on. You have nothing else but missed withholds.

Now, that's your – that's your difficulty with the meter. It isn't the sensitivity of the meter. It isn't that – so long as you are regarding a Mark IV – it isn't any other oddball action that you're taking. It's just that you failed to get a rudiment in and then the next rudiment is harder to read, doesn't read as much and then the next rudiment doesn't read at all, see? See, you didn't get one in at all, so the next one of course, you don't get all of that one in. And then you're going to get less of the next one in and you're going to get much less of the next one in. Then you get down to nulling goals or something, see, and you've got a – you've got an un-reading E-Meter.

So, you get your session all wound up in a ball. And you get, frankly get into a situation there where you've got the *non compos mentis* thing – it – I don't know – You'd do better if you just read the sparkle in the pc's eye as you said the goal, you see. You've driven him out of session.

Now, there might be several methods by which you could get rudiments in. The one which you are using at the present moment is simply to ask the pc the question, find a response, take whatever the pc says and then test the question on the meter. And if you find a response, take whatever the pc says and you test the question on the meter and if it is clean, you then leave it. That is the system which you are using at the moment.

Now, that system is perfectly adequate so long as you never miss. The frailty of the system is, missing. The pc's a little ARC broken, you haven't got anything going anyhow and you ask him a question, a rudiments question and then you don't get a response and you say the needle is clean and from there on you've had it. See? Now, that's the frailty of that system.

Now, here's another system, here's another system. Your patter would go this way: "Are you willing to talk to me about your difficulties? That reads. What difficulty aren't you willing to talk to me about?" Pc says, "So-and-so and so-and-so." And you say, "Thank you. Are you willing to talk to me about your difficulties? Do you agree that that is clean?" Now, that gets you off the hook slightly, see, and probably is a much smoother approach.

Now, here's an entirely different system which is the same system that used to be used on Sec Checking and it goes like this: "Are you willing to talk to me about your difficulties?" You see, your meter is – you're not watching your meter. See? "Are you willing to talk to me

about your difficulties? Thank you." Whatever he says. Until he says, "No." And then you look at the meter and you say, "I will check that on the meter. Are you willing to talk to me about your difficulties? That reads. What is it? That. That. That." He tells you. You say, "Thank you. Thank you. I will check that on the meter. There is *another* read here."

Listen, by the way, if I ever catch any of you or practical passing, "That still reads" as a statement, I'll have your thetan, because that's a wipeout of the statement of the pc and puts him on a stack of missed withholds. You mustn't ever say, "That still reads. That still reads. That still reads. That still reads." That's says *flunk, flunk, flunk, flunk*. See? What you should be saying is, "There's another read here" or some such statement, see? *Another* read and you notice it quite honestly. You've cleaned up the reads you got but now you have another read. So it's much more honest. And it makes the pc feel like at least he's gotten rid of part of it. Otherwise if you keep on saying, "It still reads. It still reads. It still reads," the pc feels like he hasn't said a word to you. And he blows up eventually.

All right. Now, your missed withhold problem doesn't arise there with this system for this excellent reason, is you've got the pc talking to the auditor about his case. So, therefore by asking the question without recourse to a meter and asking him the question without recourse to a meter and asking him the question without recourse to a meter until he says, "No," you now have him sufficiently in-session with you, you have him sufficiently in-session with you and of course the meter reads. You get the trickery of it? You'll always get a more fundamental read if you do that. And then you – but you'll have to steer because the one you find that time will be totally unknown to the pc. You've plumbed the bank, so you'll have to steer it.

You'll say, "There. There. That. That. That, what are you looking at there?" and he tells you.

"Oh, yes," he says and gives you the thing.

And you say, "Good."

See, there's another system.

That system has disadvantages particularly to an auditor who can't leave the middle rudiments alone. Some auditors have middle-rudimentosis. They null five goals and get in the middle rudiments and they null five more goals and get in the middle rudiments and they null five more goals and get the E-Meter over their head.

You know when you get in the middle rudiments? You only get in the middle rudiments when everything is null. You're getting no reads of any kind whatsoever on any goals. You know in reading goals you usually get a tick on the first one. See? It's when those first ticks are missing that you get in the middle ruds and then you go back to when they started to miss.

It's the first consecutive "X" is what you go back to. It's the rule of the first consecutive "X." In other words you get in your middle ruds when you don't get a read anymore. That's all. That's simple, isn't it? You're not going to go over several goals without getting a read. Let me assure you this is impossible unless the middle rudiments are out. You understand what I mean, don't you?

All right. Prepchecking, of course, it's preordained when you get the middle rudiments in on Prepchecking. You get the mid ruds on Prepchecking every time you flatten a What question. You get in the middle ruds and test the What question. That's when you use them on Prepchecking.

But in nulling of goals they are usually overused. The poor pc suddenly says, "You know, I've always wanted that goal," as the pc – as the auditor starts to read it. "Oh" the auditor says, "He's talking. God almighty. What are we going to do. It's terrible. Terrible. Send for the marines." And gets the middle withhold – the middle withholds in. [laughter] Your situation – your situation, of course, is ludicrous. There isn't any sense to it at all. You're getting reads on the meter, what more do you want?

Now, that a pc closes his eyes is not a good enough reason to get in middle rudiments. That a pc says something about his goal – now, listen – pc says something about the goals you're nulling, he says, "Oh, oh, I invalidated that one." Now, look there, that isn't a good enough reason to get in the middle.... Because look, he's interested in his own case, he's interested in his goal and he's talking to the auditor. You want to cure this situation? You can cure it. Just get your middle rudiments in every time he does it and you've cured it. It'll get grim in short order. So the pc *talks* about his goals. So he says something about his goals. So where's your TR 4! Don't park it under the chair, use it!

Now, your TR 4 is the only thing you greet that with and you keep right on going, man. You just keep right on going. Your TR 4 is *all* you use at this point. If you fail to use TR 4, you might find it necessary to put your middle rudiments in. You understand? See? You might find it necessary to use your middle ruds if you fail to acknowledge what the pc says. Because you're stacking up his missed withholds, you see, by the barrel load. He says, "Gosh," he says, "You know, I hope that one stays in, you know."

And you say, "To catch catfish. To catch – to catch catfish. To catch catfish."

And he says, "Uh – is that one still in?"

You say, "To run rum runners. To run rum runners. To run rum runners."

The pc says, "Where is this guy, where is he?" Don't be so afraid of a pc's comm. When a pc doesn't comm, that's the time to get worried. Not when a pc's talking, man, don't get worried about that. Don't ever worry about a pc talking to you about his own case, because that's the definition of in-session. That the pc is trying to hold his rudiments in, is not a good enough reason for you to put them in. Why Q-and-A?

He says, "Oh, oh, I think I suppressed that one."

You say, "Good. Thank you." And go on and read it. He's interested. What state do you want him in? Frozen disanimation?

No, that is not when you get in the middle ruds. You get in the middle rudiments after a What question and before testing it again, you prepcheck the middle ruds but in order to get a goals listing or anything else going, you do lots of use of the middle ruds here and there. But amongst them – amongst them is not introducing them extraneously to keep the pc from talking. And don't introduce them any oftener than is necessary. And in a goals nulling you actu-

ally only do it when you're getting blank-blank-blank, blank-blank-blank, blank-blank-blank, blank-blank-blank. Hold it. You look this over a minute and you haven't got a quiver on that meter. Your read disappeared. So you, you went blank-blank-blank. That's out. Blank-blank-blank. That's out. Blank-blank-blank. That's out. Blank-blank-blank. That's out. Hey wait a minute, this meter isn't talking. Now – now, let's just get in the middle rudiments. Get them good and clean. And then go back to the first consecutive "X." And that's, "To catch catfish. To catch catfish. To catch catfish. That's in." Ha-ha. You notice after you get the middle ruds in that this thing will now start reading again.

It's very strange to read a goal three times without one of them ticking, you understand? It's a missingness of ticks that tell you when to get in the middle ruds on that.

Now, in listing you get in the middle rudiments when the guy simply says, "I can't think of another blessed thing." Now, I can give you the mechanical law that every time you change from one list to the next list you put in the middle rudiments and so forth. But it isn't any law. That is just an effort to give somebody something to do when he can't think. Truth of the matter is you put in the middle rudiments in listing only when your pc says, "That's it, there isn't another single one, not from here to Halifax and back again is there another one."

And you know damn well, this list, this particular list you're working on has lagged 110 behind the other 3 lists and man, you've got to get that list up there. So you just put in your middle ruds and you'll find he will go right on listing it up to 110. In other words you can boost listing with this thing. And the index then is the same as otherwise. Your pc isn't giving you any so you put in the middle ruds. Similarly with goals, pc says, "Well, that's it. We listed 65 goals and I have no other goals and I never thought of another goal and never in my life have I ever had another goal." And so forth. You put in the middle ruds and he gives you another 65. You see?

That's the use of the middle ruds. They're boosters. You use them to boost the E-Meter when it stops reading in nulling. You use them to boost the listing of goals or items. And to test the flatness of a What question in Prepchecking and that's the total extent of their use. You can overuse these things like crazy you know? So, a pc talks. I only – actually I – there is one other comment I would make. When the pc starts to snore I usually would think it was time I got the middle rudiments in. But of course – of course I might not put in the middle ruds. I might just kick him and go on nulling. Say, "Hey! Reveille!"

"Oh! What's that? What's that? Oh!"

"Okay. Sit back. Relax, but not quite so far." [laughs] And "To catch catfish. To catch catfish. To catch catfish," you know. Going to sleep isn't a good enough reason. Thinking about something else isn't a good enough reason. It's only when the meter stops reading.

You realize that a guy can be practically snoring and not even knowing what goals you're reading and your meter will still read. On that right goal, too. See? I've made test after test out of this thing and it has been phenomenal. The ones that are supposed to be in are in. You can check out somebody's goal with him practically asleep. See, you're dealing with the reactive bank, not the analytical mind anyway.

So, you can use middle ruds to drive the pc out of session. And of course, they will get harder and harder to get in, because it's a no-auditing situation. No auditing is occurring while middle ruds are being put in. So, therefore the system which I have just given you – the system which I have just given you of calling it off without looking at the meter and calling it off without looking at the meter, asking the question, "In this session have you suppressed anything?" You know, no meter, see. "In this session have you suppressed anything? Thank you. In this session have you suppressed anything? Thank you. In this session have you suppressed anything? Thank you. In this session have you suppressed anything?"

He says, "No."

You say, "All right. I'll check that on the meter." And you say, "In this session have you suppressed anything? That reads. What is it? That. That."

Be sure this time you have really walked him into the reactive bank. See? He isn't going to know. It was really why it went out. See? In other words you put him in-session before you do this. See, and it makes the meter read. That's the one you wanted anyhow.

But the other way to, you're not liable to get it unless he's very thoroughly in-session already and of course, why are you putting the middle ruds in is to get him in-session. And then you take up the next one, "In this session have you – in this session is there anything you invalidated? Thank you. In this session is there anything you've invalidated? Thank you. In this session is there anything you invalidated? Thank you."

And he says "No." Finally, "No." See? Now, this has a liability that he sometimes says "No," and then says "except." So you shouldn't be too quick on your uptake on that "No" you see. You know, get a really "No" before you go charging on.

This session – this action also has another liability to it. And that is, is he hasn't given you half the answers and you find yourself pinned to the meter running this against the meter – running this against the meter. Well, I'd only run two of them against the meter before I laid the meter aside and went back to my first system. Don't get yourself caught, in other words.

"In this session is there anything you've suppressed? Ah well, that reads. What was it? That. That. That. That. That." And he finally comes up with it. "I'll check that on the meter now. In this session is there anything you've suppressed? That. That. That. That. In this session is there anything you've suppressed? That. That. That."

Oh, to hell with it, man. Come on down to this level. See? Check it. Be happy to check it a couple of times. Check it even three times. Perfectly all right. But don't let yourself get pulled into the fourth, fifth and sixth. In other words, if these things are still hot, why, he's got some other answers. See? And just take it off the meter.

You probably won't get into that mess very often because it usually cleans on one or two. But you could get some kind of an endless mess going here. I foresee it. "In this session is there anything you have suppressed? Yeah, that read. Yes, what's that? That. That. That. That. All right. I'll check that on the meter. In this session is there anything you've suppressed? That. That. That. That. Thank you. I'll check that on the meter." See? "I'll check that on the meter. I'll check that on the meter." What are you doing, a Prepcheck in the middle of a session or something wild going on here? So, I'd tend to come off of it and just put the meter

aside and say, "In this session is there anything you've suppressed? Thank you. In this session is there anything you have suppressed? Thank you."

And he finally says, "No, there isn't anything else."

And you say, "Good, I'll check that on the meter." And check it that time. It'll probably clean. Got the idea?

Otherwise you will run into latent thinks and again run into some missed withholds. You'll see how that is. Right after you've said, "That's clean," he'll think of several. Of course, you pull this reactive one and you can expect that if you pull one or two reactive ones, some others are going to fly into the air. You might even find it sensible only to check once before you go back to the repetitive treatment. That would depend on your experience and that's more than I know about it just now.

But in this system you for sure get the pc into session. I'm not particularly recommending this system to you. I'm not particularly recommending it, because it has a horrible liability when combined with senseless unneeded ruds. Now, if you want to blow a pc out of the water good and quick, use this system on the middle rudiments while finding a pc's goal or listing or something else, because of course it amounts to no auditing. Amounts to no auditing at all. So, maybe you could combine the two systems. "In this session is there anything you have suppressed, invalidated, failed to reveal or been careful of? What was that? That. That. That. That. That. All right. Thank you very much. To catch catfish. To catch catfish. To catch catfish. To catch catfish." See?

So, this system – this system I would believe you would find very valid in the beginning rudiments, rather invalid but usable on the middle rudiments and awfully time consuming on the end rudiments. I believe it's most favorably situated to the beginning rudiments and there is where I myself would use it. And I'd be sure everything was grooved.

But I wish to forward to your attention the fact that there is a problem there. I'm giving you these different systems and so forth of getting the rudiments in just because you might find them much more useful than the one which you are using. Now, it would be up to me to say well, that *is* the system but I'm not in a position to say there is an exclamatory is-ness in the handling of this. You want to get them in and perhaps an auditor's – this is the variance you see – an auditor's TR 1 is pretty shaky on this pc, not particularly shaky in general, but on this pc, the pc just never seems to get anything the auditor says. Well, let's groove it. You get the idea? You say, "All right. Are you willing to talk to me about your difficulties? What difficulty aren't you willing to talk to me about? Are you willing to talk to me about your difficulties? What difficulty aren't you willing to talk to me about?"

And he gets that and he gets that and he gets that and then he asks for his meter read and *bang!* He can make this pc read that way. See? He gets around these other difficulties.

Now, when you look at this you'll see that you have a very large number of pcs in terms of – types of pcs I should say – pcs are different one way or the other. But all pcs agree on certain fundamentals. And that is that auditing must take place. Auditing is scarce and it must take place and it must be effective.

Now, you use this type of system on middle rudiments, you're liable to have a pc biting your head off. "In this session is there anything you've suppressed? Thank you. In this session is there anything you've suppressed? Thank you. In this session is there anything you've suppressed? Thank you. All right. I'll check that on the meter."

God, you know, this is in the middle of goals nulling, you know, and he's coming right on down the line you know, he's going to get it and he sees the clock going tock-tock-tock-tock and session time running out so that one flattened all right. Nothing happened then. And then you say, "In this session is there anything you have invalidated?"

"No!" *Boom!* What happened, you know. Honest, the explosion will occur that fast. See, you're trying the man's temper. Or you got this girl, she was – know exactly where she was going, you see – knew exactly where she was going. They were going to get down and get them all at least nulled once you see, this session, and all of a sudden she's sitting there looking at the auditor and the auditor's saying, "In this session is there anything you have suppressed? Thank you." And she notices the auditor isn't looking at the meter. Maybe she was not aware of having her rudiments out. And maybe the auditor has injected a missed withhold into the situation all on his own.

He was doing the middle rudiments because the pc had dropped one can down to his side and it was sort of trembling as it hit the chair. See? And instead of saying, "God damn it, pick up that can and put it face up on the table where it – so I can read this meter," the auditor goes into middle rudiments, see? That's not doing what is happening, see? Doesn't give the pc a direct order but tries to use the middle ruds to get around giving the pc a direct order about something, don't you see?

The – the pc keeps scratching his nose with the can. You know? Try to read a goal while he's doing that. Well, it'd be no good whatsoever getting in the middle rudiments because not one of them is, "In this session, have you scratched your nose with a can?" I mean it is not one of the middle rudiments. You just say to him in no uncertain terms, "Put your hands in your lap and stop fiddling with that can and we will get done a lot quicker here."

And he'll be all for that. "Oh, oh, yeah, oh, oh, yeah." [laughter, laughs] Very cheery.

In other words, there is a point where rudiments waste session time. You exceed this point and you don't *gain* from the rudiments but start *losing*. In other words, up to a certain point getting the rudiments in make your meter read *better* and then beyond that point, makes your meter read *worse*. And that has a lot to do with how much auditing time is being consumed which is the weakness of this repetitive command system.

So this repetitive command system would be absolutely wonderful and I recommend it *thoroughly* for getting in the rudiments on somebody who is very nervy and who is only receiving anyhow a rudiments havingness session. And I'd run it – beginning ruds, middle ruds, end ruds – I'd run them all the same way, see? Crowd it to it. Because what is it? You're trying to get his needle smoothed out and get his rudiments in and get some Havingness run.

All right. Prepchecking, Prepchecking, I'd run beginning rudiments, I'd grind them out man. I'd grind them out but good. You know, repetitive question you know and so forth. Get those beginning rudiments really in on Prepchecking. Take your middle rudiments and give

those a lick and a promise after the What question, but make sure they're in. See? But just the packaged read. End rudiments, just knock them off, packaged read. See? Not give a lot of stress and strain to them. Well, you can do that with a Prepcheck session because you're releasing withholds all the time and the session is interesting to the pc.

Now, do you realize that a Routine 3 is a different sort of auditing? Routine 3 is actually not as interesting to the pc. Did you really realize that? Basically it's not as interesting to the pc as Prepchecking. It's not getting into something he remembers vividly. It's going somewhere else. It's not as interesting.

Oh yes, it's very interesting to him writing his goals. He's happy to write down his goals. He's very interested in that. But beyond that point it is merely anxious. You see there's a difference. Pc with his list being nulled all the way down, he's much less interested than anxious. You know the last half of that list of that – of that nulling. You know? Man, he, he, "What's the goal going to be?" you know. "What's the goal going to be? Or is it all going to go null? Or wha – wha – wha – what's going to happen?" You see.

He actually realizes, basically, that his whole life is hung on this thing by the proverbial thread. He reactively knows he's going for broke right here. He knows that this is an important action. And he responds to the importance of the action, not the interest of the action. It's terribly important, oh yes, yes. You muff this one for him, the next few trillennia he's right in the same mud he's in, but worse. You get this one – he's free as a bird. And down below consciousness he really knows this. See? So frankly, frankly he's not as interested as he is anxious. See? There's a point where interest boils over and he's usually in that state.

Now, a pc therefore has to be pretty smoothed down before you start Goals Assessment and start the rest of this sort of thing. And if you have to use an extraordinary method of getting in or keeping in the rudiments, I would say he wasn't ready for Routine 3 because he's going to get far too anxious. He's going to explode far too heavily. He's going to be all a quiver here because one, he's doing something which is very nervy anyhow and the other side of the thing, he doesn't have any confidence in his auditor.

While he's being anxious – it's something like – something like the fellow's ride – finds himself riding on a train and suddenly sees the engineer and fireman walking back down the aisle, while they're going through the mountains and the train is accelerating, you know? What are they doing here? You know. He gets nervy. He wants to know that auditor is sitting there in the driver's seat, man. He wants to know that this is going and he wants to know it's going as fast as possible and he knows damn well it's liable to go wrong and it's too good to be true anyhow.

See, he doesn't express it to you and he really doesn't understand it analytically himself. But he's been sitting in this cage. This cage has been pushed around from head to head, more or less randomly for some time. And it has various inhibitions and so forth. And he has long since realized that nobody could get out of this cage, you see? He's long since realized this. And he's habituated himself to it. And he's reconciled himself to it. And he believes in God and all that.

And then he's got himself perfectly schooled and then by God the padlock begins to rattle. Oh my God! That padlock hasn't rattled – that padlock, that damn padlock hasn't rattled

for the last eighty trillion years! He thought it rattled once about eighty trillion years ago, but that's the last time. Is somebody really going to open that thing up? You know. And what you're looking at there is a sort of an incipient prison break the guy can't quite believe in. [laughter, laughs] And even though he doesn't understand this analytically, it's there or its impulse.

So, frankly, in a Routine 3 session especially, you can drive your rudiments out, out, out, out, out, by not doing the job. If you can imagine the fellow on the outside of this cage. The fellow doesn't hear the lock rattling now. No padlock rattling. And he listens, you know. He finally peeks through the keyhole and sees the bird is now polishing up the bars on the other side of the building which has nothing to do with letting him out. And frankly he is liable to become hysterical. He frankly does. He's liable to become hysterical. Sees the auditor there, polishing up stonework and so forth, doesn't have anything to do with him. See? Auditor's saying, well, so on.

You could imagine what would happen. You get the guy up threequarters of the way to getting the goal and then start to take your E-Meter apart. [laughter] That's cruelty. See? Sheer cruelty, sadism. And actually you can run middle ruds and Q-and-A and do a lot of indefinite things and so forth. All of a sudden the guy is just saying, "I knew it couldn't be true, I knew it couldn't be true. But still it's really got to be true," and he responds accordingly. Then all of a sudden rudiments, hell. The mechanics of the mind simmer down to a jail break that is going to go wrong. And he starts to control the session and try to do all sorts of wild things, don't you see?

So the auditor on a Routine 3 session has got to sit there and drive pocketa-pocketa-pocketa-pocketa-pocketa-pocketa. The more time he wastes, why, the worse off it is, see? Now, he has to balance this sensibly within himself. This he has to balance within himself as an auditor. At what point does he start to drive rudiments out by trying to get them in? At what point does he do this? And therefore it is not even vaguely recommended that this repetitive syste Too time consuming. Takes twenty to twenty-five minutes to get through the beginning rudiments. *Ooooo!* That's a long time. And the pc will begin to respond to this as being a long time. And he won't like it.

Now, theoretically the pc has been audited up to a point where he can stay in-session anyhow before he's doing R3 and therefore if you went into too much weighting of the rudiments, gave him far too much importance you see, why he starts to drive them out himself. You'll see this. The first time you put in the middle rudiments they go in easy. The next time you put in the middle rudiments they go in harder. The next time you put in the middle rudiments, God, he's got a dozen answers, see? You'll see this. You're just putting in the middle ruds too often.

It's the amount of progress made which is the total measure of Routine 3. Actually it's in Prepchecking Routine 2-type – well, not Routine 2 but Class II-type processes – it's the amount of stuff dug up that he didn't remember, that is the index. And all that's kind of cute and interesting and he actually, a lot of time, doesn't even connect it to feeling better or something like that. But not this other, see? He's willing to play the game on Class II but when you get into these Routine 3 processes you're in a different operating mental climate. So therefore,

you could find a present time problem. Oh, just imagine you get this guy – you get this guy and he's been listing and he's been listing on his goal and he's listed up to the line and three days ago he had a free needle and he hasn't had one since. And there's a whole bunch of stuff that is coming up and things are going *boom*, life is getting rather interesting. But he all of a sudden realizes now that this stuff is actually going to come off of him.

And you take him right at that time and then start him into the next session and find a present time problem and in that present time problem start to run, "What part of that problem could you be responsible for?" Your pc's going to blow up. That problem is going to get worse and worse, it's going to go deeper and deeper in and the rudiments going to go further and further out and there hardly will be anything you can do about it. In other words what you're running into is the pc's goal is being alter-ised. And the whole session becomes a GPM all on its lonesome, see. You understand? GPM, he depend upon goal. When goal, she alter-ised, you get a mass. Well, the session isn't a mess, it's a mass. There's where it goes.

Now, these are the things, just speaking sensibly about this whole thing, it's a lovely thing to be able to lay down rote, you see – and to a large degree we can. I can – and get this thing squared away and so on. That's lovely. But there is a point, there is a point when you can get in the road of your own feet on this sort of thing. And you never want to falsify the fact that it is clean when it is not, and so forth. But you can handle it in such a way that whereas it might be out, the pc isn't told that it is in, see?

Let's suppose that the pc always has latent answers to it after you said it's clean. Now, I'll give you another phrase that you can use with great usefulness. You see, it was clean, you see, you noticed it was clean. "We have the significant withholds off of that" see. Or "That is clean of important answers." You get the type of phraseology, you see. Now, it could go this far. "At least we have the reactive answers off of it" see? Now, understand me there is no pattern for saying it is clean and it reads and so forth. Now, somebody can come along and tell you that this is the way you should call it. But let me tell you that the statement, "It is clean" is an awfully broad statement and it might not apply to your pc and it might be driving him out of session. Savvy?

So, you should say there, at that point, that you indicate to the preclear that you have not had a needle response. Now, that is technically exact. That is what you do. "Are you willing – are you willing to talk to me about your difficulties? What difficulty aren't you willing to talk to me about?" So forth. "Now, are you willing to talk to me about your difficulty?" Now, we say – if we say, "That's clean" he can still think of three or four things you see, that he's really not willing to talk to you about.

Now, if I were heading along on Routine 3 or something I'd be far more prone to say, "Well, we got the worst of that off, let's go on to the next one."

The thing was clean as a wolf's tooth and I wouldn't say anything about it at all if I didn't have any read on it. But I absolutely would *not* count on the fact that if it [didn't] read, the pc hadn't thought of anything. Pc thought of something – it wasn't significant – but he thought of it and then the fact you tell him he hasn't thought of anything – you see? That's the phraseology which becomes dangerous.

So, the exact proper phrasing of that must answer this exact definition, that the thing has not read although he may still be thinking of something, you haven't got anything reactive enough to stop the session at this point to take it up. See, you'd – you'd only say that when it was clean as a wolf's tooth. See, you'd clean it up – you'd get all the reads you could off of this thing you see? Then you say to him, "Well, that's good enough for the minute."

"Oh, do I have another one on there?"

"Oh, you've probably thought of some more things but there isn't anything registering on here that will hold up the session."

"Well, I thought you were a dog last night, wouldn't that hold up the session?"

"Apparently not, here's the next rudiment." [laughs]

And the guy will say, "Oh! I can still think of things and if they don't register on the meter then I necess- haven't necessarily thought about the things reactively so therefore they wouldn't impede the session because I'm not obsessed with them." And you'll have somebody coming in with a big theory. You'll have this all worked out.

"There's certain types of responses," somebody will say to you, "which are important and certain types which are not. Now, I sit here thinking all the time, you're a dog, you're a dog, you're a dog, you're a dog and you've never considered that an important response." If it – if it has rudiments in mind I don't mind saying to the – something, "You're quite right, has no bearing on the session."

Evaluation. Meter has never picked it up. Well, I don't want the meter to pick it up, for God's sakes. Every session we're going to clear off three thousand "you're a dog"s. This doesn't give you carte blanche to evaluate for the pc, but if you're going to make an evaluative statement the rule is – make an accurate one. [laughter] When you say, "That's clean" and it compares to "You haven't thought about anything either" that won't go down, see? But you can make it go down. You say, "That's clean enough to go on now." You see?

There's a lot of things which you can do with this and you'll find out this is normally true. You can make a session hang up, you can make a session hang up by letting the pc think of a lot of answers to a rudiments question which have not registered on the meter. One of the reasons they haven't registered on the meter is that they're not reactive. See, he's just thinking, "Mmmmmmm-mmmmmmm-mmmmmmm, the auditor mmmmmmm-mmmmmmm, I don't know maybe I shouldn't tell him about Gertrude, shouldn't tell him about Gertrude, I don't know whether I'm willing to talk about Gertrude or not."

The auditor says – has just said, "Are you willing to talk to me about your difficulties?" you see?

And he says, "Oh, I don't know, I should – oh, I don't know...."

The auditor says, "That's clean."

He says, "That's clean? Hell I was just thinking about Gertrude and she's filthy." [laughter] "Doesn't sound clean to me." He'll get real upset about the meter.

But if you say to him, he's saying, "Well, Gertrude, Gertrude, I don't want to tell him about Gertrude, he's asking me what do I want to tell him about Gertrude, I don't want to tell him about Gertrude."

And you say, "Well, we've got the reactive responses off of it anyway."

"Oh, what I'm thinking here doesn't have any reactive responses, so what."

Let it go. You've created a different atmosphere. If you're going to say something evaluative, why be sure it's correct. And as far as telling people if the rudiment is clean or the rudiment is not clean and the rudiment is still reading or something like that, if you're going to, don't tell them in such a way as to hang them with a missed withhold. And that's the basic rule on that. And if you're trying to get the rudiments in on somebody and get up his confidence for the first time do it the long way around and if your pc's at the other end of the line and trying to come down the line with his goal and Clear and so forth, you make it brief. And those are the basic laws that have – influence rudiments.

And the other thing is simply that if you get one out and then you don't do – you see, you get one rudiment out, the next successive rudiments are going to have a less responsive meter. And then you run from there into trouble. So, be thorough and be fast and be accurate and – but basically what are you trying to do? With the rudiments and Havingness sessions you're trying to clean up the needle, you're trying to continue the cleaning up of the needle, bring about more confidence in auditing with the Prepcheck activities and you're trying to bring a nice clean needle that doesn't have ticks and tocks on it up to Routine 3, get the fellow's goal in the least possible length of time and then list it out on four lists to a free needle and find the next goal and here we go. That is exactly what we're trying to do.

And you, of course, could be so formalized in trying to approach this situation that you keep driving madly to Canada to arrive in Mexico. And you keep saying, "Well, we just never get to the point of clearing this fellow, you see, because we actually haven't finished the Prepcheck formula rote x-y-z-k," you see. And you look at the fellow's needle, it's clean. Well, if this fellow becomes aware of this you know his needle starts to dirty up on irrelevant auditing thereafter. He gets to certain zones where he deteriorates as a case, merely because he knows where you're going. That's only if he knows where you're going.

These things will all be – got to be kept in mind by an auditor. An auditor is trying to clear somebody, his aim and goal. My aim and goal is trying to train people so they can clear people and get the people cleared at the same time. In this particular unit that takes a little bit of doing but we are doing it and we are succeeding and you may not have looked around lately but clearing is probably swinging in under the 250-hour mark now for the whole ruddy lot. And that's getting down there within finite ranges.

And we have put the dynamite to several cases that were historic with Routine 3GA and those cases to begin with had such dirty needles that the Phoenix laundry would have rejected them. So, we're not anyways unconfident of what we're doing. It is just the ease with which we get it done.

I give you as much rote and formula as I can't pound sense into your 'eads. That's the truth of the matter. You have rote and formula which get you beyond and past points that re-

quire very good judgment. Now, up to a certain degree I use rote and formula. I use things like Model Session and rudiments and meters and standardized types of sessions and this sort of thing and don't vary from these. But actually that isn't just a rote for the sake of rote, that's something that's been built over the years.

But you can get some parts of your parts mixed up in slowing the pc down and after that, why, you're in trouble. Then you wish this car only had two wheels because it could only blow out twice. You see? Whereas it's got four wheels and you get four blowouts before you get to the end. You get the idea?

This is no invitation to depart from standardized sessions, but it is an invitation to understand what you're doing and to be sensible about the use of your tools and to recognize what this thing called an E-Meter is and how your rudiments behave under it. There is no constancy of read to an E-Meter. Your E-Meter reads to the degree that your TR 1 is good and your pc is not ARC broke with you.

Fortunately we have a meter that has quite a bit of tolerance on that. But it can't go all the way, it won't give commands and it won't restrain an ARC break by simply leaping off and giving a confidential, pastor-like talk to the pc. It won't do any of these things so you just have to realize what your tools are. Okay? All right.

Thank you.

QUESTION AND ANSWER PERIOD: CCHs, NULLING GOALS

A lecture given on 28 June 1962

Okay. This is the second lecture, 28 June AD 12. Saint Hill Special Briefing Course.

Questions. *Qué* questions do you 'ave? Yes, Ian.

Male voice: Ron, if the – if a person is ready for 3GA when you've got a nice, clean, free needle – smooth needle, you can read instantly and directly, and if rudiments and havingness of the CCHs will do that, if you're auditing outside, not from the point of view of us training here, but if you're auditing someone outside, would you need to bother about the Prepchecking stage?

There is this possibility, Ian. Would you – would you need to do this outside if a person had a nice, free, clean needle? There's this possibility: that a person is at your mockery level, see? Reading at 2 for a girl, 3 for a man. Needle appears to be not really free but, you know, it's not jerky or anything. You've got the unfortunate fact in such a case of just nowhere. See, you – you've got just a big beautiful nowhere as far as this case is concerned. And this case is going to rise up into trouble. This case is described in *E-Meter Essentials*.

Now, if the case were not of that type, you would at least – you would at least have to run, some Model Sessions and Havingness sessions to give him some kind of an idea of what auditing was, you see? They would – they would need to have a little bit of certainty grooved here, because this factor of anxiety is going to rise in this case. And remember if auditing was a total unknown to this person, this person wouldn't have a clue.

It would be best policy on any case to run a rudiments-Havingness session on the case. Find his Havingness Process. Run a Prepcheck-type session even if it were only grooved in the direction of goals, don't you see? Give him some idea of that. And then get firing on his goals list, yes.

Does that answer your question?

Male voice: Yes.

Good. A certain sensibility is offered in this. But remember there can be this other case, this one that's described in *E-Meter Essentials*. The dead thetan case. And, boy, that one would blow up in your face. That one would really explode. You would have more trouble than you could shake a stick at if you started to do a 3GA on this case because the case is, of course, not even vaguely anywhere. They're merely calm. Okay? All right.

Yes, Jean?

Female voice: CCHs. Can you tell us something more about the method we had on CCHs?

CCHs. Can I tell you more about the what?

Female voice: The method we had on CCHs.

The method?

Female voice: The new method of not taking up physical originations but just asking the pc, "How are you doing?"

That's not a new method. Somebody invented a method. The CCHs are a fruitful source of invention. [laughter] And they are what they are. And those of you that watched me do the demonstration that night when I was running the CCHs on Suzie, remember you didn't hear very much about calling off what she was supposed to notice, you just heard a lot of – of "How are you feeling? How's it going?" and so forth, "How are you doing?" You know, this kind of comment. And then somebody came along, apparently – I don't know who it was around here, and I didn't find out about it till a couple of days ago – and they started asking – a person's eye would twitch and they would say, "Did you notice that eye twitch?" and so forth. And they were using this as a method and it got to be quite a method.

But actually, let's look at it compared with the Auditor's Code. Of course, it's an evaluation. We have noticed the eye twitch and we're forcing the person to notice an eye twitch. And the whole trick is, is let's get the guy to look; and we'll find that if he looks he will exteriorize from that particular somatic. That's what we're trying to do.

And this is a very deft, very, very delicate action that the auditor undertakes. And you start using mechanical sledgehammer type actions on it and it'll fold up. All of a sudden the pc doesn't get better. The pc does a physical origination, he starts going this way, you know, and you just ask him, "What's happening?" But that's as far as you can go with evaluation. You just say, "What's happening?"

And he says, "What's happening? Oh! Yeah, yeah, thanks, ha!" And he maybe doesn't even say anything more. He sort of notices that something is going on. Because they will walk along somnolently without noticing anything is going on unless you stay in two-way communication with them. They put it all on automatic, see? And they start walking into a wound-up doll proposition, see? And they just go through motions and they never look at anything and they just go through this and they hope they will finish up at the end of two hours without dying or something. And they just fall rapidly out of session.

So the CCHs call for a physical origin – origination on the part of the pc because the CCHs are physical processes less than mental processes. See? And you count on the fact that he has originated something. Well, he does something, he makes a physical motion, he makes an error. He does this, he does that.

Now at this point, if you can bring him up to the point of observing as a live being not an automaton – see, you just get him to observe – why, he gradually will get better and better and better and better and better. It's quite – it's quite mysterious how rapidly he will improve.

But if you step over the borderline, see, an inch, and tell him he's got to observe – he won't. Then he feels bludgeoned. Then he feels banged around. And he just feels like he's picked on. Feels like he's being criticized for having an eye twitch and all that sort of thing. So it's a terribly delicate line and it's a very difficult one for an auditor to hew, actually. Sometimes the auditor finds that he has gone too far.

The old drill that best describes it is "Fishing a Cognition." And you just try to fish a cognition out of this fellow. And if you don't succeed, *violà*, you have not succeeded. And if you do succeed, *merveilleux*, we have succeeded. You just pays your money and takes your chance. And it's just on the basis of "Give me that hand. Thank you. Give me that hand. Thank you."

And the pc suddenly holds it back. And you just say, "What's the matter? What's going on?"

"Oh, I had a pain in the end of my hand."

And you say, "Good. Well, all right. All right now?"

"Oh, yeah, yeah. It's much better now." See.

And "Give me that hand. Thank you. Give me that hand. Thank you. Give me that hand. Thank you."

And he all of a sudden says, "B-z-z-z-z-z!"

And you say, "What's going on?"

"Ah," he says, "it stings."

And you say, "All right. Good. All right. Give me that hand. Thank you."

And then all of a sudden, why, he's giving you – he's giving you three, four of them and it's nice as purr and there's nothing going on of any kind whatsoever. Get the hell out of there, man. That's your – that's flat for all intents and purposes. That's actually everything that's going on.

Now an auditor, in his anxiety to make somebody well, often pushes somebody's teeth down his throat. And it all stems from just that fact; the auditor gets anxious to have a beneficial effect upon the pc and is liable to get impatient, see, and is liable to start pressing. And as soon as an auditor starts this he drives the pc out of session; he adds a note of anxiety to it all, a note of urgency, a note of impatience. And the pc is – attention has shifted over to the auditor.

Now, it's just those considerations which establish what you say. Actually it isn't any wording, see, it's just those considerations. You can say enough so as not to yank the pc's attention off onto the auditor, evaluate for the pc and tell the pc what is going on, you can do that. But basically, you want to keep the pc vaguely aware of an ARC condition with the auditor and also noticing what is happening. You can easily overstep that boundary. So there is no actual series of words which give this, because it'll vary from pc to pc.

I imagine some upstage character from Oxford would be terribly upset every time you said, "How you doing? How's it going?" and that sort of thing. You'd have to say, "I hope it's – I hope it's quite all right there, old chap."

That answer your question?

Female voice: Yes, it does. Thank you.

All right. What other question do we have? Yes?

Female voice: In the sessions as we have them here, Ron, if two things go on with goals listing, you see sometimes on the meter ...

Now, let me hear that again now. In the session?

Female voice: If two things go on in one room here, say in goals nulling...

Yes.

Female voice: ...so you see sometimes an odd read on the meter you're working on because it's sort of listening in. What can one do then instead of middle rudiments, to ask whether you are at the goals you are reading the pc and not the other one?[laughter]

She's talking about a pc hearing somebody else's goals and the meter responding to it.

Female voice: Maybe!

Well, I would say that your rudiments – your beginning rudiments, not your middle rudiments but your beginning rudiments – never went in.

Female voice: Uh-huh.

What are you doing having your pc respond to somebody else's voice?

Female voice: Yes.

Hey, you mustn't have your pc responding to somebody else's voice: That answers that.

Female voice: Uh-huh.

Now, of course, this demands of you much higher caliber in-sessionness than you would have out in the middle of the Sahara Desert in a soundproof room, see?

Female voice: Yeah?

Yeah. It demands much more in-sessionness.

Female voice: Uh-huh.

Now, if your pc's meter is going off reading on somebody else's goals, then your pc is not in-session to you.

Female voice: Reading odd, you see, it is sort of like picking up a word or something. It's sort of – of an oddity.

That's just what I mean. You're right with me. I'm answering the exact question you're asking. And that is to say, if your pc reads on a word mentioned by somebody else anywhere

in the vicinity and isn't reading exclusively on his auditor's voice, then that pc is not in-session to that auditor.

Female voice: Uh-huh.

That pc is in some sort of an auto-session. Or is in-session to this other person that has been auditing him three months ago, you see? Or something – something is wrong here.

Female voice: Yeah. What is it – what does one do then?

One gets the pc in-session. I'd wind that session up, *b-z-z-z-t*. And I'd give the pc a moment's break and I would start the next session and find out that four rudiments were well out.

Female voice: Ah.

Understand?

Female voice: Yes.

That is a very extreme condition that you're mentioning there. That is almost too extreme to be ...

Female voice: It's only sometimes happening Then it comes back again. But there's sometimes a moment when one is not quite sure.

Ah, pc isn't in-session. He's not interested in his own case. He's not willing to talk to his auditor. So, of course, he wants auditing so he picks it up from somebody else's goals list. [laughter]

I will comment on this, I will comment on this. Your in-sessionness at this particular moment here at this course is poor – is quite poor. I picked up pc after pc I've looked at in the last month or so and so forth, I have found them all floating on a sort of an auto-out-of-sessionness. And it used to show up in Sec Checking and Prepchecking. You ask them for a good, big overt, you know, well, they noticed a pin in their mother's boudoir or something.

And we actually did have this as an overt which an auditor managed a chain on. This – this one: they had thought of stealing a paper clip from a Central Organization, and this was the depth of sin and crime that the pc was willing to go into with that auditor. It wouldn't be safe to go any deeper than this. This one was particularly humorous because we have often used this as the ne plus ultra of a light auditing, acceptable overt, don't you see? That would be the screamer to end them all, you see. And actually somebody did come up with this; thought – their pc thought of stealing a paper clip from a Central Organization.

Now, that is all symptomatic of out-of-sessionness. That is all symptomatic of no-confidence. That is symptomatic of rough or wobbly Model Session. You see? Going past rudiments when they are still out, leaving them, you see. For instance, one of you the other day had the very, very bad luck of having the pc on the TV the other day when I stepped in here and there was just rudiment after rudiment after rudiment were giving quarter-of-a-dial drops and half-a-dial drops. In other words, the rudiments in that session were so wildly out that how could anybody have ever called it a session or never noticed it. So I thought it was

so bad that I got ahold of the student's E-Meter and checked his E-Meter. His E-Meter was all right.

But I had another pc in the last demonstration I gave you, Kay, and I noticed that she was pretty wildly out of session, and so forth, and finally had the auditor's meter checked and the meter was inoperative. I thought that was pretty interesting.

But this – you just have to learn to be so smooth and so predictable and have your pc under such control in a session that the pc just never would think of doing anything else than listening to and responding to what you were saying on your meter. Got it?

Female voice: Yes. Thank you very much.

You bet you. All right. Okay. Any other questions? Yes? All right.

Male voice: Ron, as a person hears Clear on 3GA, does the needle if it's – sorry, does the tone arm if it's down say at 2 and he's a male, will the needle free up and be a free needle and then go to 3 or will it gradually go towards the 3 and then go to free needle?

The latter.

Male voice: The latter.

Yes. Always the latter. Needles don't go free off Clear read.

Male voice: Thank you.

You bet. Next question. ...No questions? Goodness, gracious me. You know all about it, huh? Well, all right. Yes?

Male voice: On the CCHs, to get back to them, if you notice quite body – quite a lot of body action on a pc and you say, "What was that?" and they continually say, "Oh, nothing..."

You notice an awful lot of body action in the CCHs on a pc and they keep saying, "Oh, nothing..."

Male voice: Uh-huh.

Go on.

Male voice: Then you just acknowledge, "Okay, fine," and go right on with it.

That's right. That's right. And then the next time you've got him in a Prepcheck session you get off *suppression*. You can remedy that sort of thing. The person is, by the way, giving you a social response, giving you a social response. And the person, by the way, would be rather convinced that you perhaps were being critical of them so they're making nothing out of it, and so on. And I myself would have varied the auditing question I kept asking there, until the pc didn't give me the, "Oh, nothing." You see? I wouldn't challenge the "Oh, nothing," I would just ask a different question next time.

Male voice: Uh-huh.

I would say, "How are you doing?" Now, let him answer, "Oh, nothing," to that. You see, he can't. Got it?

Male voice: Thank you very much.

You bet. All right. Yes?

Female voice: I've got a question following that on asking the pc, "How are you doing?" In view of the fact that it activates circuits and what have you, what about if he just sort of starts, going into a compulsive outflow there? That's a bit of a dangerous thing to ask that type of case – "How are you doing?" I mean, it just doesn't stop from then.

Well, I suppose you could walk into this. Let's see, you asked a case, "How are you doing?" and the case goes into a compulsive outflow that you find is very difficult. In the first place, the compulsive outflow isn't dangerous, particularly, until it goes on long enough to run their havingness out the bottom.

There's ways and means of handling that sort of thing And they come under TR 4. Now, he goes into an action of this character, well you want to – you want to return the pc back into session. Because only a part of that response was an answer to your question. He went into a compulsive outflow. All right, you say, "How are you doing?" And he says, "Well, pretty terrible just now. I have been ..." Well, now, "pretty terrible just now," that answered your question, didn't it?

Female voice: Uh-huh.

Now, if you weren't in there with your acknowledgment, you, to some degree, drop the ball, see? Now, you've got TR 4 to contend with because he's now originating so, your trick is to understand what he's saying, acknowledge it and return him to session. And there are several methods by which this can be done. But one of the smoothest is he says, when he's busy – he's going on and on and originating, he's going yap-yap-yap-yap-yap, and "My father and mother always beat me and that's why I hate to have you touching my arm this way," and so on. An awfully good method of handling this is, "When did that occur to you in this session?"

And he says, "Well, it was a little bit earlier," and so forth.

And you say, "Well, all right. Now here's the next command." You've got to be slippy this way.

The essence of CCHs, of course, is communication, control and havingness. And you're perfectly right in saying, yes, there's some danger in an obsessive outflow on the part of the pc because it'll run down his havingness. And therefore that violates part of the CCHs. But also you're violating the control if you don't handle that obsessive outflow, see.

Now, a pc properly acknowledged has found out that he has reached you. See? If you acknowledged him properly then he's found out now that he has reached you and he'll stop talking. That's how the cycle ends.

So if you were to pick up his hand and put it on your shoulder as he was talking, he would shut up. Get the magic? He'd reached you.

I won't say the ways of handling this are unlimited, but there are several. And they depend, more or less, on the situation in which you are involved. There was one old lady, I remember, who was going on and on; and she was just talking to the blue, she'd just stopped talking to anybody, you know? And the auditor finally got around and got his face in front of her so that she actually couldn't look any

other way than look at him, and gave her a Tone 40, "Good!" and she was so surprised she almost dropped the mock-up. And well, what do you know, you know? It startled her considerably, not because of the suddenness of it but she thought that was a pretty nice fellow after that. See? You're actually not trying to reach the pc, you're trying to convince the pc the pc has reached you. And if you can do that, why, any pc will shut up. As a matter of fact, you could probably stop a war if you could convince the other side that they had reached you already. Because what are they trying to do, you see? It wouldn't be a retreat proposition because that would show they hadn't reached you and you were still worrying about their reaching you. But if you notice all war propaganda is on the basis: you haven't reached us and you're not going to; but we're going to reach you and smash you, see? And war is something that grows up this way.

So your ARC break can get going on the pc by showing the pc that the pc can't reach you. And the pc will start getting berserk after a while if you keep retreating on this, and so on. If you just remain silent and courteous the pc talks and talks and talks and you remain silent and smile faintly, you see and talk – and he can't see you – and the pc talks and talks and talks and talks and talks. You sort of withdraw a little bit, sufferingly, inside yourself and the pc will talk and talk and talk and talk and talk. You get what's happening?

All right. So your action is to consider an answer to your auditing question requires an acknowledgment and if the pc goes any further than that, that the pc is originating. Then if the pc is originating he has an anxiety about reaching you. So all you've got to do is cure that anxiety right there in a couple of well-chosen words or gestures and there you are.

Now, in view of the fact that you're reaching a pc with great surety every time, while running the CCHs, you're liable to get a reverse flow on the line. Auditing kids, of course, as you probably know, is very amusing. They turn around and run "Give me that hand," on you after a little while, you know? They kind of keep it balanced up. They're friendly that way. They – if you run 8-C on them they'll pretty soon run 8-C on you. And so forth.

Well, pcs will sometimes try to do that verbally. And try to do it some other way. That answer it?

Female voice: Yes, thank you.

You betcha. All right. Yes, Peter?

Male voice: On that, that reminded me of the question I wanted to ask before. And that is the use of CCH/Havingness that you used on the television. We haven't had any particular rundown on the use of that. Asking the preclear, "Touch me. Touch me..."

Uh-huh.

Male voice: ... with the CCHs.

It's very simple. The CCH/Havingness Process is simply repetitively, "Touch my – blank." And then don't introduce any parts that he'd be diffident about touching. And it's, "Touch my right shoulder. Touch my left shoulder. Touch the top of my head. Touch my stomach. Touch my right elbow. Touch my left elbow. Touch my right knee. Touch my left knee." See? "Touch my right shoulder. Touch my left shoulder. Touch the top of my head."

And you'll find out the pc would go on and on this way. It's quite interesting. What's particularly amusing about that is once in a while an auditor had love turn on on the part of the pc. You know? Love. Love raises its – its embarrassing skull, and so on. And that is a reach-can't reach; weird situation. Well, this process has the liability of turning on that phenomenon. And you have to run it out. So you have to run that Havingness Process long enough to run out the misemotional connotations which the pc generates. Quite amusing. That's the only thing wrong with it.

And as far as when you run it is concerned, it would be early on in auditing and once a session. It would have these limitations. It's something that goes a long way because you're going to have to run it quite a little bit to get it flat. Okay?

Male voice: Yes. I was wondering about its uses and to replace – instead of doing a model session rudiments, on the CCH session whether one could use that as sort of a havingness-auditor ...

Well, that's what it's for.

Male voice: Thank you.

That's what it's for. I don't know. Some auditors have pcs go out of session running the CCHs. And, let me tell you something, that is a mark of rough auditing. That – that's a mark of not much comprehend. You could do the CCHs in Model Session, but, that's all very well except for this one little thing: it violates the basis of the CCHs. They are a physical process and you're busily introducing a mental process on top of a physical process and it's sort of, "What's this all about?" see?

The facts of the case are that an auditor ought to be so smooth, so lacking in Prussianism, so uninhibited on his comm line that he runs a nice, easy, comfortable set of CCHs. And you're not going to find anybody going out of session. A nice, easy, comfortable CCH run wouldn't need any rudiments. Because the guy's with you all the way, you're not overrunning everything, you're running it up just to a point of three-no-change, it's no great strain on him, you're checking up on him, you're – you're – you're showing him concern, you're acknowledging them well when they speak to you and all that sort of thing. It sort of runs off and it's sort of like – sort of like waltzing with a pretty girl, you know, it's – it doesn't tire you.

But I imagine that trying to fox-trot with an elephant, I imagine could be fairly exhausting and would require innumerable rudiments. You get the idea.

The thing – that, however, is not a mental Havingness Process and belongs with the CCHs. A little of it'd go a long way. But it's blood brother with the CCHs and it would – your thought is very good there – it would supplant all this anxiety about MS [Model Session] while doing the CCHs.

Yes?

Female voice: Ron, what you were saying, you know, about the CCH process being, "Touch the auditor." Is it not all right to touch the surrounding environment? I mean, if you have a male auditor and a female, and you want to CCH process ...

Right.

Female voice: ... can you just not touch the things around you?

No.

Female voice: Touch his own body.

No, that is strictly an auditor rudiment.

Female voice: I see.

It is a havingness of the auditor. It puts in the auditor and so forth. If you'll notice, the CCHs touch an awful lot of surrounding environment. See? CCH 2, you've got a lot of "Touch the walls," and that sort of thing, don't you see? No, this is – this is just a peculiar oddball method of getting the pc to find the auditor. And to run any other Havingness in the thing is probably risky because it very well may not be the pc's Havingness Process. The pc is not going to get a tightened up needle while doing 8-C because there's a lot more to 8-C than touching the walls. But if you were just to get a random touching of walls and pat-pat-pat, imagine your embarrassment when you were getting the pc's Havingness Process to find out that that tightened the needle, which it easily could do. Don't you see? You follow that?

Female voice: Uh-huh.

So this is mainly an ARC Havingness. And you find this pc is finding his auditor a little bit roughish and – and he's getting standoffish and he's doing thises and thats and so forth, and he starts snarling a little bit. You run some of this CCH/Havingness and this really just smooths right out. Of course the pc's liable to smack you hard occasionally, but, I'm sure your shoulders could stand that. Okay? All right.

Female voice: Thank you.

You bet.

Yes, Jim?

Male voice: Nulling goals.

Right. This – you're interested in this tonight?

Male voice: Rather. Sensitivity setting.

Yes?

Male voice: I'm wondering if we're absolutely bound to null at the sensitivity for a full dial drop or can we null at a sensitivity setting which is more convenient, which might be a higher setting than that?

No. You're – you're wasting time. Nulling goals. Here's exactly how you null goals. It's its own formula. One dial drop, sensitivity set for one dial drop. Null the whole list; null it down to a point where you've got 30 or 40 left in. Take those 30 or 40 that are still alive, copy them on a separate sheet of paper, crank your sensitivity up to 16 and fire down that list at sensitivity 16; you're going to find your goal every time – providing the rudiments are in and the meter is reading for the pc and the auditor, see? Providing these things.

Any other sensitivity setting or settings would be a waste of time because it'd be a compromise between these two things. And you don't want a compromise. In the first place,

when you go down this goals list the first time, you're only going to find the goals that are going to stay in are going to be knocking hard when you first go by them.

Male voice: Uh-huh.

And after you've nulled the thing a couple of times, that knock is going to recede. And that's about the time you've got 30 or 40 left. And now, the eventual goal is only going to read at sensitivity 16, so you've actually shorted or scanted or shorthanded the nulling process. So you didn't have to knock the pc's brains out by erasing every goal, don't you see, as you went on down the line. In other words, you could do a light job of it this way. As long as your rudiments are in that is quite good. As long as you're getting ticks quite routinely on goals and so forth and your rudiments are in, that's fine.

Now. What gets in the road of this, Jim, and I think this is what you're talking about, is when this is not done from scratch in this particular way. You see, that has to be a package all by itself. You have to take the pc from scratch. So he wrote up a lot of goals himself and you finished off the list and you got the tone arm action out of the list. Then you went tearing down the list at one dial drop. And then you waited until you had 30 or 40 left and you copied those over and went to sensitivity 16 and then nulled those out at sensitivity 16. Then checked out – and then checked out against every one left on that list. All right, that's all stylized.

Well, we're continually running into people who have had old goals lists, who have had extended lists, who have had a goals list nulled out totally because it was not complete and had to be done again. All right, now we're running into random situations, see? That first one is the textbook solution and then when taken from scratch you'll find out it's terrifically workable.

But as soon as we move on and we've the person's goal list nulled out, now what do we do? See? When it all went null? Now, how do we patch up this situation? How do we – how do we add some to it?

We've got people who have had a goals list, already before they came here, has been already nulled out. And then we've added to that goals list, you see, and then have nulled everything out on that goals list so that now we had to extend a goals list and we are now doing a new extensional line and that all nulled out. You get the idea? This thing is winding up in a ball here somehow or another.

And even there, even there, that is not going to help you. By the time you have had to add to a goals list – let's say you had something like seven or eight hundred and you had to add to that list – well, the reads are going. You've got it faded down now. It is no longer fitting within the framework of the textbook solution. All right, you have only one sensitivity setting that you can use in that case: 16. Somebody has missed the boat so, therefore, now we are dedicated to sensitivity 16, God help us all. Now, it all has to be done at sensitivity 16. There isn't any other choice. There's no intermediate goals setting for nulling that has any value at all. And that's for that reason.

Your first list, "a virgin" is sufficiently charged that it reads beautifully at a one dial drop. And you're going to get every goal that is significant is going to be reading there bright

and shining, ready to be taken down to the last nub, you see? Once that situation has been overrun, spoiled, flubbed, now you're up against it.

It interests me why you were asking the question.

Male voice: Thank you. Because, Neal (if he doesn't mind my mentioning this) his needle is tight. Okay. And a higher sensitivity setting has been necessary for me not to need a magnifying glass to read accurately.

Well, he's not a stylized case here.

Male voice: No, he's not.

No. His goals list was nulled down in Joburg and it's been renulled and nulled and renulled and so forth. No, that's cranked all the way up to sensitivity 16, man. Rough as it is.

Male voice: Uh-huh.

That's the place to ride that one down. You'll have to ride the whole thing down at that to really get an accurate picture.

Male voice: Well, I've been doing that, hoping that was all right.

Yeah, well, you couldn't do anything else. Once the thing – once you have spoiled that basic picture, once the glory of that is departed into the sunset, you have the upper sensitivity and that's all you've got left. Okay?

Male voice: Thank you.

Right.

Male voice: How necessary is it to acknowledge after every goal? Instead of just the once after three.

Why?

Male voice: Well, it slows things down a bit.

Oh, it's rather microscopic in its slowdown. The original method of doing them was to acknowledge after three. And this acknowledging after each one is apparently – people have been doing it here recently. I don't know that it's mandatory.

Male voice: Uh-huh.

I'm afraid that I would much rather tear down a list. "To catch catfish. To catch catfish. To catch catfish. Thank you." I'm afraid I would. But then, I develop a considerable – I get up – I get up to planing speed on nulling goals and other people don't like this speed. They don't think a needle will travel that fast. They don't think the reactive mind (which has no time in it at all) can travel that fast. The reactive mind, of course, is at instant infinity, exclamation point! The reactive mind will respond to a needle as fast as you can read and the faster you can read, it will respond to the needle that much faster. But, frankly, getting a thank you in between doesn't add all that providing your thank you is right on the ball. Because, of course, your *thank* you starts the second you have stopped talking.

Male voice: Uh-huh.

See? "To catch catfish. Thank you. To catch catfish. Thank you." And you just use it for a filler. See, you put no pause in between, you just put a thank you. And if you could imagine the sentence, "To catch catfish, thank you – to catch catfish, thank you – to catch catfish, thank you," all with no spaces between the letters, see, there's no spaces left in the line and it's just all letters, you know, like Russian is written or Chinese or something like that, why, you'll get the same effect.

Male voice: Ron, if one did it that way, you wouldn't be able to glance at the pc on the intermediate thank you – on the say, the first or second thank you.

Why?

Male voice: Well, it's – because you're saying thank you the microsecond after the instant read should have occurred. You'd get the "you" in by the time you ...

Female voice: You've got two eyes.

Male voice: I can't believe this.

Oh, I don't know. You guys can go on looking at pcs and having a ball, but I null goals myself. The speed with which you can null goals is – has a lot to do with this. And if you didn't find it very nice to get in the thank you or something like that, I should say offhand it was not necessary.

I've always nulled goals, "To catch catfish. Thank you." No. "To catch catfish. To catch catfish. To catch catfish. Thank you." And looked at the pc and gave him a thank you to see if he was still in the chair. And let it roar.

I don't know how many goals I can null a minute. But it is a lot. And I look at these pathetic attempts to null a hundred and fifty goals in a two-hour session and so on, and I say, "Oh, let's all go to sleep. Let's let our arms and legs fall off." Because, frankly – because frankly, it's just wasting time. You're paying time to the reactive bank. What's the reactive bank, man? What is the reactive bank? Well, it is a timeless activity. It responds to minor and major thoughts. And why make it respond to any minor thoughts when you're trying to get it to respond to major thoughts? You know? And I don't think courtesy was ever heard of in the reactive mind. I know I've been in one for quite some time and I never found anything very polite about it. When it bit, it bit.

I'm not trying to break down any particular drill that you are being taught in this particular way. But you also are entitled to know that I don't have any particular patience with – with anything that gets in the road of auditing. And when I do auditing I do the essentials and I don't do more than the essentials. And I get the job done. And you could really make it fly.

Speed, man, it's speed. It isn't courtesy. It isn't whether or not the auditor bites his fingernails. It's how many goals you get read per unit of time.

It's how many goals you get written per unit of time. How many goals you get read per unit of time and how many items you list per unit of time that totally regulates the length of time it takes to clear a human being. Nothing else regulates it.

Now, we start getting in the vagaries as, "Is the pc in-session?" trying to keep the pc from going out of session. All right, to a certain degree we can tolerate that. We had better

pay attention to that to a certain degree. Because the meter will go null on a pc who is out of session. And if you don't get in your beginning rudiments you're liable to be going straight into it with roaring present time problems and everything else and your meter not operative and you've got a hundred and fifty, two hundred, three hundred goals you've nulled in that session and – oh hell, you didn't null them in the session, the pc nulled them before he came in, and that means the goal was in that bunch. Well, lord help us, man, you have now gotten yourself into *beaucoup* trouble.

So you want to make sure the pc is in a state of mind whereby he will read on the meter. Now, don't stretch that state of mind and push him so he won't read out of the meter while trying to make him read on the meter. You understand?

All right. Well, similarly, a pc who is being hit with machine gun fire is much less likely to have rudiments go out. My pcs don't have time to have rudiments, you know? They don't have time to have rudiments go out. They just don't have time, that's all. Keep them busy.

Male voice: ... while you're nulling I've been asking Jack for some good recommended reading material ...

You're out of session. That's why your list is slop. How do you like that!

Jack, wake up. Find that man's goal. Stop this nonsense. He has no interest in his session. Hah! Isn't that right?

Male voice: Every time I do something the middle rudiments go out.

Uh-huh. I just looked at it. The middle rudiments were put in, I think, fifteen to twenty times in one session. And I didn't think they had to be put in once.

Now here's what I talked to you about in the first lecture. I'm sorry to be rough on rats here. You understand? But, here's the way it is. Using middle rudiments to drive the pc out of session. Now, the pc says he is not interested in what's going on. Every time he says something the middle rudiments go out. See? You got that?

Male voice: Uh-huh.

Well, don't do that. Your middle rudiments are out when the meter's no longer reading. And that goal, then, is probably on the list. But I noticed that the list is 2.75 to 2.3 of tone arm action in 20 minutes, which also might speak of an incomplete list. Or it might speak of the fact that the middle rudiments – the middle rudiments, being rudiments, are knocking the pc in and out of session and you're getting rudiments action. I don't know which you're getting. You're getting tone arm action on rudiments?

Male voice: Occasionally. Not always. Usually it just goes straight through. Just say the questions, say the whole thing and that's it.

Well, 2.75 to 2.3 tone arm action says that the list is incomplete. That's too much. Furthermore, there are a few too many strikes on the list. A few too many. You know, it's nulling a little bit hard, and it could be listed a bit further, and you just lay off the middle ruds.

Male voice: Okay.

And pc starts to snore, kick him; and keep on going. He looks out the window, if you complain about his disinterest in session, say, "Get interested in this session," you know? Say, "Whose goals are these?" Got it, Jack?

Male voice: Yes, Ron. Thank you.

All right. Well, that is the – that is an example. Because I just looked at the folder in there. There was too much TA action and I said, "Well, there's a possibility the list is not complete." And then the other one thing I saw, too many middle ruds.

When your meter is no longer registering tick, tick, tick, you know, "To catch catfish. To catch catfish. To catch catfish," your meter hasn't read; not at all. I don't care whether it was at a one dial drop or sixteen, see, it hasn't read, not at all. Your ears should go up, flop! And then, "To eat gumdrops. To eat gumdrops. To eat gumdrops," not one single tick on that goal. *Ooooh!* This is probable that something weird has occurred. Don't make up your mind yet, however. "To run downhill. To run downhill. To run downhill." Not a single tick – except some random ones that you don't know quite where they are. You haul back at that point and get your middle rudiments in. And you'll find out if you do that that they only go out once in a blue moon – once every couple of sessions – something like this.

If you're suspicious of middle rudiments, put in your beginning rudiments and run right over into your middle rudiments. Put in your beginning rudiments, *ta-ta-ta-ta-ta-tat*, and put in your middle rudiments, *ta-ta-ta-t-atat*, and then just leave them alone.

You actually can use middle rudiments to keep the pc from talking and make the pc disinterested in his session. That – he's just given us the perfect example.

Male voice: Did the same with me today, myself, I noticed it.

All right. Of course you would. It's happened to you as a pc. That make sense to you?

Male voice: Yes.

Yeah, have you ever felt all of a sudden like you were being punished for talking?

Male voice: What do you mean all of a sudden? [laughter] Don't blame Jack for this.

No.

Male voice: I was punishing myself.

Yeah.

Male voice: But certainly, that's true.

But there was a feeling of punishment. Pc will normally get that frame of mind, and after that you can't keep anything in.

No sir, just because a pc talks is not any reason to get middle rudiments in. And that is definite. See? And if a pc never says anything about any of his goals I start to worry about him. You know, pc's sitting there looking out the window; well, that's all right as long as the meter's reading. The meter stops reading, I get worried. One of the symptoms is the pc doesn't ever say anything, never does anything, so forth. You can't find a goal on a pc in that – in the

frame of mind that the pc feels he is punished because his rudiments are out, he's ARC broken, the meter isn't reading well. Make sense?

Male voice: Yes.

All right. Okay. Right. I wasn't being hard on you, Jack. He thinks I was. All right. I was being hard on you, Jack. [laughter] All right. Yes, Dale?

Male voice: On listing goals, what are the current tests of the completeness of the list?

No TA action on listing.

Male voice: Well, how little is none?

There's a certain amount of drift. If you want to know how little there is – if you want to know how little there is ...

Male voice: Uh-huh.

... supposing you were to sit there and say, "Do fish swim? Do fish swim? Do fish swim? Do fish swim?" to the pc. Or supposing the pc were simply – this – you understand this pc isn't Clear – was to sit there with his hands on the cans and have nothing happen.

Male voice: Uh-huh.

How much would the meter drift?

Male voice: Uh-huh.

That is how little.

Male voice: Okay.

All right?

Male voice: That answers my ...

It's damn little. It's in the course of an hour it drifts from 2.75 up to 3.1. But that's just normal drift.

Male voice: Uh-huh.

See? Tone arm motion, lots of motion, is defined as .75 divisions of the TA every 20 minutes, within 20 minutes. A little motion is .25. No motion at all is what you're asking to be defined.

Male voice: Uh-huh.

Well, no motion at all is defined as the normal drift, if nothing were happening.

Male voice: All right. Thank you.

All right. Yes?

Male voice: Question on Prepchecking, Ron.

Right.

Male voice: In the new rundown, when you run the When, All, Appear, Who system, you run it several times.

Now, what's this now?

Male voice: When you're running the ...

When you're running the ...

Male voice: When you run the withhold system on the ...

When you run the withhold system on the ...

Male voice: ... on the earliest incident ...

... of the ...

Male voice: ... of the pc ...

... earliest incident the ...

Male voice: ... and the pc ...

... the pc has now found ...

Male voice: That's right.

Yes?

Male voice: When you run the When, All, Who ...

Yeah.

Male voice: ... When, All, Appear, Who, will he manifest something to indicate to you that everything in that incident has been cleared? Or do you run it several times?

You want to know how long to run this.

Male voice: That's right.

You want to know how long to run the withhold system on the earliest incident the pc has found. There are two questions to this. You want to – if it doesn't release and look like a toy balloon being punctured – you can tell when the basic goes because the rest of chain will go and the pc will usually manifest it emotionally. They say *he-he*, or they cognite or say, "Oh, well, yeah, hey, I never knew that!" See, there's a cognition goes along with it, there's a release of affect of some kind that goes along with it. They, "You know, I always thought that that tricycle was mine! Ha-ha-ha! 'Tisn't! I stole it!" You get that kind of thing. And it goes up the line and you find out that that's the end. There isn't any point in proceeding beyond that. As long as the What question nulls with it.

Now, you're talking about obnosis by the auditor. How long do you run this thing? Well, if it doesn't produce such an action, there is an earlier incident. So you don't run it very much. You run it just enough to open up the track to an earlier incident. See? You run it on the earliest until you can find an earlier. How many times is that? Well, on some pcs that will be three or four times. But on most pcs it'll only be once or twice. And then you're asking for the earliest, again. He's asking, you know, earlier incident. Oh, he says, he's really got the earliest now; it's at the age of forty.

You'll find some pcs go down this line sort of like a tent peg, you know, being driven into hard ground with a sledgehammer. You know, thud! thud! thud! you see? And other pcs,

you didn't notice there was a crack in the ground and they went to the center of the earth. *Swish!* Where'd he go?

It depends to a large degree on how closely associated it is with the GPM. And if you're trying to pull something, right off the side of the GPM, you can expect it to go down awful hard. And the cognitions to be awfully tiny. And the number of times you use the withhold system to be numerous. But if it's a nice piece of free track, it goes boom! There's the earliest withhold system, once, twice. His tricycle all the time! *Z-u-u-u-p*. That's the end of stealing cars, see? And four minutes by the clock, see. The other's an hour and a half by the clock. You get the difference?

Male voice: Yes. Sure do.

So it's actually – varies. But it always winds up in a cognition. If it doesn't wind up in some kind of a cognition, the line never blows. Okay?

Male voice: One other – two other questions. If you say, "Is that all of that?" and he says, "Yeah, that's the lot," do you press for more?

No. That would be a double questioning and that would be a Q and A.

Male voice: I see.

He – you have asked him a question, he has answered it, you've got to give him a cheery aye-aye.

Male voice: Uh-huh.

Very often he'll give you these things out of sequence, see. He'll give them to you all out of sequence. He's already asked the question, at which time you're quite at liberty to omit the one he has just answered. You say, "Well, when was that?" And he said, "Well, when George and I went down to the – (so on) and I didn't tell you about this, but there were three Fords there and they all had false bottoms," and so forth. Well, then you ask him, "What didn't appear?" because he just answered All.

This is a fluid system. It's very fluid in its application. You always ask them, When? And sometimes you don't get a chance to ask them, All? And sometimes they gratuitously tell you Who didn't find out about it. And you don't ask them right after they told you because that's an invalidation. And they – you say, "Well, what didn't appear?" "Well, Uncle George didn't appear and if he'd found out about it he would have killed me; fortunately he didn't." Your next question is When? See?

Male voice: Uh-huh.

It's a fluid system. And it depends to a large degree on the cognition in it.

Now, I will tell you this about Prepchecking. Once in a while an auditor gets unlucky. He just shouldn't have gotten up that morning at all. [laughter] And he asks this perfectly innocent question off of a form and finds out that he's going down through the middle of a coal mine that the pc observes nothing in. He has just unfortunately hit *bing-gong-bang-thud*, into the middle of the GPM. He's not about to clear any What question that he has anything to do with. See? It'll just slug, slug. How far south is this thing going to go?

Well, actually, he can carry it back. He can carry it back. He can get the thing to release. He just shouldn't have ever asked that question. He just knows that. It's too rough.

And once in a while when you're in private practice, you'll skip one. You'll wish you hadn't, but you'll skip one and say, "Well, there wasn't any reason to have really flattened it because it was impossible to have flattened it." You'll say to yourself, "Well, I'll come back to it later after we've cleared him," or something of this sort. And your pc then, after that, will get sort of nattery. And you can expect the pc now to develop into sort of a nattery pc and the needle will get a little dirtier.

Well, when you do this trick – because everybody will do it sooner or later – I've done it – just remember that's what you did, and go back and grind it out. Grind it out.

But occasionally it's just lowering one down through the dark maw of the coal mine. The pc sees nothing, he cognites on nothing, he can remember nothing about it, the needle is still firing, there must be something there, he is terribly occluded, you have to run the withhold system five times on making a telephone call to find out if he could commit an overt. You know, I mean, it's just gruesome, see. Grind, grind, grind, grind. Because, of course, these – some of these chains have – are free and they're on parts of free track, you see? And some of these chains are right down the GPM line, *du-du-du-du*.

If there was any way of forecasting a chain being in the middle of the GPM line, you'd never ask the question in the first place. But, of course, you have to ask the question to find out that it is. And then you've had it! That's the liability of Prepchecking You should recognize that.

In answer to your question, it's a variable number of times. It depends on how arduous it is for the pc to get back earlier and blow the chain and that's it. Okay?

Male voice: Yes.

All right.

Male voice: There was one other question.

All right.

Male voice: If the What question is still reacting, can that be one of two things, either you haven't got the basic or the incident you were working on is not yet cleaned up?

You could have a tiny, tiny, little forerunner to the incident which you are trying to clear up that the pc hasn't seen yet. It's always – the answer's always a former incident.

Male voice: It's always ...

It's always an earlier incident. But that earlier incident can be five minutes ahead of the earliest one you've found, see? So we don't say how much earlier this thing is. See, it could be a thousand years or five minutes. But if it doesn't blow you haven't got the earliest.

Now, there's one little exception to this rule: Is sometimes the pc thinks there's an earlier incident because he's been told so, when there isn't.

Male voice: Uh-huh.

And you saw such a case on a demonstration. Pc was convinced there was an incident at four – at age four. There was no incident there. Simply checked it out on the meter and told the pc so. After that, why, the incident at the age of six blew and we didn't have any more trouble with that one. Okay? Answer the question?

Male voice: Yes.

All right. Well, that's it. We've crucified enough for tonight. Don't anybody commit suicide over this. Because, let me tell you, you can't put E-Meter cans in the hands of a corpse. Therefore, suicide isn't indicated. You understand. As long – as long as the person can still handle cans and still talk and we still have E-Meters, the situation can be saved. That's something for you to remember in years to come.

Thank you.

Repetitive Rudiments and Repetitive Prepchecking, Part I

A lecture given on 10 July 1962

[part missing]

Thank you.

Okay. This is Saint Hill Special Briefing Course, lecture of what?

Audience: Ten July.

Ten July, AD 12. Very good.

[part missing]

Well, I'm going to cover repetitive auditing tonight and give the first lecture on this subject as such, because there has been a considerable improvement which, if you dig the opacity from your optic nerves and can read a needle, why, all will be gorgeous.

Now, the contest is not so much to develop a technology that I can do or that a handful of auditors can do. It's to develop a technology which gives routinely good results in the hands of auditors and getting around those things which the auditor is having trouble with, with the simplest possible solution.

Now, we are right back to basics today in auditing. Right back to basics. You can find the ghosts and forefathers and ancestors of practically everything we're doing in *Dianetics: The Modern Science of Mental Health*, oddly enough. As a matter of fact, we still use today some of the principles from *The Original Thesis*, and they are nowhere else stated than in *The Original Thesis*. The auditor plus the pc – greater than the reactive bank. The auditor versus the pc is less than the reactive bank. So you get no auditing done. Those formulas that are in the back of *The Original Thesis* still form the foundation of auditing. And right along with this, we're back suddenly to a type of activity which all auditors are familiar with. Auditors have always been able to do repetitive processes. They haven't really never had any trouble with them.

The main thing they had to find out and one thing they never could learn very well was when was a repetitive process flat? I remember giving a lecture, I think, in the 17th ACC and there were something on the order of about thirty-five students on that course, and I had just given a lecture concerning comm lags and the three ways you could tell if a process was flat, you see. And I had just given those and so on, the day before. And I came in the following day and this was the burning question, you see, in that whole unit is how did we tell if these processes were flat? And I asked them student after student, front row, second row,

third row, fourth row, and there wasn't anybody who could give me any of the answers. That was sad. A certain amount of knuckleheadedness has gone forward ever since that time on the subject of when is a process flat.

Well, now that has been solved in this method of using repetitive processes or questions. These are actually not repetitive processes. They're repetitive questions. And they are flat at a very precise point. And this is the one you will have the hardest trouble with is, of course, when are they flat. There's two troubles one has with that. One is not reading the meter and the other is not believing it. And either one of them bring about a very upset pc.

So anyway, this process design or type has been adjusted to Model Session, June 23, 1962, changed in the HCOB July 4, 1962.

Now, this Model Session is a brand-new designed Model Session. It looks like the same Model Session but it is not the same Model Session. It is the repetitive Model Session. And it is designed with the change of July 4th, which deletes the Havingness from the beginning rudiments but leaves it in at the end rudiments. It gives you your beginning rudiments and all but the Havingness in the end rudiment as an auditing question. And they are just handled as such, in repetitive treatment.

You have here a number of processes, in other words. You have as many processes, if you are going to do them all repetitively. You've got the beginning processes and the beginning rudiments are the beginning processes. And you've got the middle rudiments and they are the middle processes. And then you have the random rudiment which is a random process and then you have the end rudiments which are end processes. It's quite interesting.

You'd think slugging this many processes at a pc in one session would be catastrophic. And if it is not done properly, I assure you it *is* catastrophic. All you have to do is overrun the process one question. It's just as little as that. Overrun it one question, there is a loud splash, and pc is in the soup. Just one question too many and you've had it. Now one question too few and you've had it. It has a tolerance of zero. There is no allowance for error on when it is flat. And most of your difficulties between now and the year two thousand will stem from what I have just outlined as possible errors.

Now when you're teaching this to people, when you're teaching this to people and somebody comes in and they say they are running Routine 3GA or whatever the routine is called, and the pc somehow or another isn't nulling well on the list and the meter isn't reading right and they say to you, "Please think up some unusual solution – some fabulously unusual solution." Let's see. You could dream up the fact that we do a yogi exercise every fourth command or something like that. That'd probably help the pc. I'm afraid your answer is something of this nature. They are ending their Model Session processes and the rudiments one question or more too early or they are carrying them on one question or more too long. Either one brings about catastrophe.

Now, if you end them too early the pc still has answers. And every answer that he has or would give you, now becomes a missed withhold. Which – I think that's marvelous, you know. We've just set up – you see, there's two things you could do about missed withholds: Is you could forget all about O/W – bury the whole thing – never have anything more to do with ever asking anybody for an overt, you see; or do it exactly right. Those are the Aristotelian

elements involved. The black and white. We're into oddly enough some black and white things. There are no shades of gray in any of this, you see. And this Aristotelian – you either don't ever breathe at a pc that you ever want to know anything from the pc of any kind whatsoever or you do it perfectly. Any shade of gray is chaos. Disaster will strew the auditing room. This hyperbole is actually not hyperbolic but an understatement of fact.

Marriages, business careers, life itself could go by the boards if you don't believe that. I mean this is really wild. You either never ask the pc anything about what he ever did, to minimize the situation, or you do it perfectly.

Now, in view of the fact that you can't do the first one for this reason: any time you see the pc you're liable to miss a withhold. The mechanism is still there. Whether it's advertised, written up or not, it is still there, and explains all the vagaries and upsets that you've had in auditing. It's still present. Wouldn't care if we abolished it; we held a big conclave and decided to eradicate it and so forth. I don't think it would do a bit of good.

In addition to that, there happens to be the case who thinks you should know everything they're thinking. This is one case in twelve – as frequent as that. And you should know everything they're thinking. And if you don't know everything they're thinking, of course, you will ask them questions. So any time you ask this pc any kind of a question like, "How are you?", you've missed a withhold. You say, "How do you do?", you've missed a withhold. They're furious with you. I don't exaggerate. That is the truth of the matter. There are people around who think you should know what they're thinking. And they think something is wrong with you if you don't. And the way they got into that state of mind, of course, was pretended knowingness on other people's parts and too much indulgence and this and that. Actually, overts against questions get a person into this state. But just did a bulletin on it. It's coming out Thursday, HCOB July 12, I guess it is.

Now the – if this type of person exists, and that type of person does, and if lots of people get into this state, and they do, and if man keeps being active while being secretive, which he will, it is inevitable that you miss a withhold. The person is sitting in the room; you walk in the room; you walk out of the room; you've missed a withhold. No conversation. Furious with you. You'll see it happen every once in a while. It becomes utterly inexplicable. You didn't do anything to the person. You didn't say anything to the person. Nothing. And they're mad at you. Well, you can't do number one then. So the only answer is to do number two perfectly. You can't do it, "fairly well." It's unfortunate that we have entered into a level of auditing sometime since where you couldn't do it fairly well. It's impossible to do auditing fairly well. Auditing must be done perfectly.

Now, you're very rich at this time whether you know it or not in having Repetitive Rudiments and Repetitive Prepchecking because it is rather easy to do these things perfectly. There's no variation. You don't have to vary questions. You don't have to dream up something in passage. There aren't exceptions to the rule. These things all go on down the line. Now the only difficulty you will enter into is in a very, very severe case you will find that the Model Session withhold question has to be changed for that very severe case. You have to specifically state, "to another," or something like this in the question. You'll find that the person always answers it with a motivator. And he'll spin himself in.

You'll say, "Since the last time I audited you, have you done anything you are withholding?" If you know your pc and this pc falls into the one in twelve you'd better change that question. Like, "Done anything to another?" Or even "done anything bad to another." Because the pc will answer it this way, "Have you done anything you are withholding?", you see. And the pc will say, "Yes. I sympathized with myself for having such a lousy auditor." [laughter]

And man, they will keep going this way, and you can just see the pc scrunching up in the chair. And you let this be answered that way on and on and on and on. And the next thing you know the pc just spun himself in. It won't ever clear. That is the test. If you just sit there and you keep asking this question, "Since the last time I audited you, have you done anything you are withholding?"

And the pc says, "Yes. I discussed with Gracie Ann what an ugly face you have." See. And so on and so on and so on. Your end rudiments are going out faster than you're putting in the beginning rudiments, don't you see?

And you could just go on like this endlessly. You can just go on and on and on and on like this, and this question doesn't clear. The needle gets sticky and then it gets dirty and you can't tell whether it's clear or not. So you have that vagary. And I would dare say sometime up in the near future I'll probably watch you operating along this line and will probably dream up an absolutely perfect question for that very one that's totally embracive. But just now I've been so busy I haven't done it. So you just have to put up with that.

Now, auditing is a pretty open and shut proposition now. And oddly enough, it is as successful as it is predictable by the pc. Now, auditors get spoiled by a success. A howling, singular success greeting an unusual solution can practically ruin an auditor. I know. I myself have sometimes smoked around for a month or so trying to recover from some fabulous victory. That's right. It was an unusual solution and I couldn't figure out why it worked or how it worked or exactly where it fitted into the jigsaw puzzle and so forth. Well, you saw more unusual solutions from two or three years ago and back than you have seen since. And you have seen many more unusual solutions from 1955 back to 1950 than there were from 1955 onward. You get the idea?

In other words the more we know about the mind, the less unusual solution we need. That is something to remember. See, the better your tools, the less the unusual solutions you need.

That is something to remember. It's also a way to measure up somebody, let us say, an HPA/HCA student. That person is smoking along one way or the other and one day they get up very bright and they hit it rich, you see. And they hit some button on the pc, dream up this unu... they're worrying about the pc, you see. Well, if they're worrying about the pc with the modern weapons which they're using, then you can really realize that they're not using the modern weapon. They're doing something odd or peculiar already. So they lie awake half the night trying to figure out what button it was, and they remember their Axioms or something of the sort, and they put it all together one way or the other, and they put their finger – because pcs – auditors are all so intuitive and they can put their finger exactly on the button that needs to be pushed, you see. The pc breaks down and cries and says, "Oh God, how did you

know this?", you know, and feels wonderful and the warts all disappear off his face. [laughter] Just like that, *zzzp*. The auditor goes *guuulp*.

You have to beat him after that. You have to beat him several times with losses before he starts to realize that he'd better audit along a standard line. The way he gets beaten is he does the same thing to the next case. Well, the more unusual was the solution, the less cases it's going to work on. So he might have to audit another hundred cases before he would get one to respond to this button.

So after that he gets nothing but losses, losses, losses, losses, losses. It works, unfortunately, sometimes. Sometimes they get so many losses they just stop auditing. And they never really trace it back to the singular victory which departed from a standard procedure or action.

Now, the closer we approach in toward clearing – producing Releases easily and clearing – the closer we approach in toward this, the less unusual solutions appear or are required in the handling of cases. Naturally, if you have the answers that release and clear people, well, you aren't going to get it hunt and punch selectively, you see. You're not going to audit one one way and another the other way, don't you see? In order to release everybody and clear everybody, you've got to have how everybody's mind works. That's it. All right. Let me point out to you we're clearing people. We're releasing people rather easily and we're clearing them. So you see, we're getting in an – into an invariable type of procedure.

Now, the procedure which we're using, which did these tricks, gets modified to the degree that it is successful in the hands of all auditors – not a few, see. So we have two things monitoring: the result and the ease of the result. Those are the two things that monitor our technology.

Now, I watch people auditing. And on the Saint Hill Course we're watching – as they come in brand new – the better auditors in the world. There's no doubt about that. I mean just as they walk in the front door they're the better auditors of the world. Instructors faint, you know. They just hold their heads, say, "Oh, my God! Don't tell me they really audited like this in Port Darwin. Oh, my God!" I have to cheer them up. I say, "Oh, my God! You should have seen what they were doing a few months ago in London. I mean, don't be so downhearted about this because it's been worse. It's been worse." "No, we doubt it."

All right. So our technology at the moment, because of observation and cooperation here, is monitored against what these auditors can do. Well, that makes a mighty rough hill to climb perhaps in this technology for somebody who is already having a very hard time of it. But I try to make a bit of an allowance for that. And when I find something that you can do standing on your head, I know it can be done elsewhere with sweat. If it doesn't get done elsewhere with sweat, if it gets done not at all, well, it will require further study.

Now I feel, however, that we're at a very happy state of the game. The problems were these. And you should know the problems about this before you start sailing off on unusual solutions or something or not grasping the solution which we're using. You should know what the problems were. I'll try to outline those to you rather rapidly. I won't tell you I'll tell you all of the problems, because some of the problems were you personally. But... I thought that'd wake you up.

Now, the problems are these. You got a GPM. A pc is built like a universe. First mention of this is *Advanced Procedures and Axioms*. Time postulate. What begun this 'ere thing called the MEST universe. It were a prime postulate. And it then accumulated thereunto, mass. That's the way the universe was built. Built on a prime postulate. And that's the way any mass connected with the pc was built: on the pc's own prime postulate.

A pc's reactive bank does not exist native to the corporeal self he is packing around as an identification card. They have other reasons for having bodies. I know. Sensations, storage, and that sort of thing. Food absorbers – for polite drinking. There are various – various reasons to have bodies, you know.

Oh, you'd be surprised – wearing a doll body, somebody offers you a drink, and you can't follow a very mannerly procedure. I know. I got to be a drunk one time on a planet a long time ago. It was very embarrassing. And supposing you're sitting there with some human beings and somebody hands you a drink, you know. There you are in a doll body. Well, if you poured it down your gullet, for God's sakes, your condensers would short the capacitors now – and I do mean short out! Your crew chief would be collecting you and wanting to know what happened. He might add "Sir," but it'd be in sort of a surly fashion.

So the hostess offers you this drink, you know. You know what you have to do as a doll? Pour some on the tablecloth. That's right. So it'll evaporate. It's the only way you can get drunk. Oh, hadn't you remembered that? Goodness, you're foggy these days. Not remembering something like that. It's impolite. Ruined linen. Man dramatizes it. He takes these sniffers – these balloons – brandy balloons. And he, you know... [makes sniffing noises, laughter] That's – that's how a doll gets drunk, you know.

Now, a human being is merely determined by having a human body. And the difference between a doll and a human body is just a difference of corporeal self. And you know a doll packs around the same kind of bank as a human being. Thetan's got a bank. It's always the same kind of bank. This bank is constant and is all built the same way. It was built on a prime postulate. And oddly enough, so was the universe built the same way. Only we call that prime postulate the basic purpose of the individual in *Dianetics: The Modern Science of Mental Health*, or his goal.

There can be a lot of these. There can be a lot of sections of the master – you might say the whole track GPM. The individual is dragging this stuff around.

It is the *alteration* on the prime postulate occurring in the course of putting it into effect. In other words, the individual says he wants to catch catfish and that's his prime postulate. That's his basic purpose. Of course, you might say there's a prime prime postulate and a prime postulate. The guy in the beginning of any cycle on the track or any life usually makes a prime postulate. I remember my prime postulate when I picked up this body. No, not this body. The one just before that. And that was, "I'll show them they can't put me out of the game," you know. No effect to amount to anything on this lifetime, monitored by a cycle prime postulate, don't you see. But that's a new prime prime postulate erected on a cycle prime postulate. And then you've got the prime prime postulate for the whole track. You're not going to get to that in one fair gulp. That's a few goals back, you see.

And the story of it all is alter-is. The individual's going to catch catfish, and by God, he finds himself studying law. Accumulates mass. He'll study law and try to go fishing. It's the shift of attention; the shift of direction. And it inhibits his ability to as-is so he accumulates mass. Also, change of attention is change and energy is change, if you want to get more scientific about it. There's a lot to be understood about how mass evolves out of alteration.

Alter-is-ness. Alter-is a postulate and you get mass. Well, you got the idea. Lightning bolt goes from A to B. *Boom!* Nothing left of the lightning bolt. It all went over to B. All right. Let's have a lightning bolt determined to go from A to B and then let's put some huge capacitors and some impedances and put three vias on the line and let it flow. Something is going to happen to mass. Something is going to occur here. Let it flow through just – just this much. Just let it flow through air and you'll get ozone being created. In other words, there's a – change is going to take place.

Change occurs the moment that you make something do otherwise than go from A to B. Something goes from A to B smoothly with no impedance of any kind if you can imagine that, and you get, of course, no change as far as that's concerned. Oh, you doubt that. Well, there's this little point. You see, if it goes from point A to point B with no change, then of course it can't – not travel across any distance, can it? You follow that? So point A has to be point B. And under those circumstances you get a no-change situation.

Now, by introducing the arbitrary of space, you have introduced a via. It can't get from A to B without traveling through some space. You get one of the first things that happens to build a universe. That, by the way, looks so ordinary to you, but in actual fact is so peculiar that a universe will result from it – that A and B are different points. That's really a brain-cracker – distance. Now as we inspect all these various things, we see that alteration or shift of attention is what causes hang-up – motionlessness in time – you already have time. Now we get a shift of attention, we'll get a motionlessness in time. We get all kinds of variations. We get accumulation of mass. We get dissipation of masses. We get all kinds of weird things going on here. Interchanges of masses. Dislocation of points in space. We get all kinds of things. And because we're getting all these changes, we get an individual, who after a while, obsessively changes.

There are two things wrong with the human personality – if you can call them wrong – two basic errors. These are not the most basic errors. One is too great a constancy, and the other is too much inconstancy. Those are two crimes, you see. Two is-nesses.

An exaggerated constancy is described in that *thrilling* poem, "The boy stood on the burning deck, The flames were about to kill him, And there came a thrilling rescue in the last three feet of film." That, of course, is an alteration of the poem. It almost murders you just to read the poem, you see. The temptation to alter-is it is so great, because its constancy is so fantastically stupid. He stands on the burning deck and burns up, see. This is supposed to be a great thing. We're supposed to teach the kids, you know. If you're standing in the road and you are supposed to be waiting for your father, and the car is coming, it is very evil if you move. Don't move.

Doesn't sound educational, does it? Well, that is what you might call too great a constancy.

And the other is too great a variation. You never can find the kid. Unlocatable. As soon as you call up Jimmy's house to find him, why, he's gone over to Mary's house, and you call Mary's house, and he's back at Jimmy's house, and you keep this up for hours.

Auditors do these two things. Auditors do these two things: They resist change even when it is sensible; and they will obsessively introduce change when it is not required. Constancy without understanding, without reason, is simply a characteristic of MEST. One should understand why one is being constant before one starts being constant. I recommend it thoroughly.

And one should also understand what he is undertaking before he introduces alteration. This is also appalling. Now auditing, oddly enough, following the science of mind and life, does not necessarily bring about – and is not bound and determined to bring about its own track and its own mass because it's short track and it is singularly deprived of duress. Auditing today is not something to worry about unless it is done in such a knuckleheaded fashion that nobody would believe it. Then you could worry about auditing because it'll put the individual beyond the reach of help, which is the only actual overt.

Well, you could audit an individual so badly and so constantly and so consistently that nobody could ever tie him down again to get audited. That would be a crime, see, caused by bad auditing. Because it would make auditing bring about an inaccessibility of the case, you see.

And you could audit somebody on the wrong goal knuckleheadedly enough, long enough and hard enough and knuckleheadedly enough, and viciously enough, and ARC breaky enough probably to kill him, see. Probably knock the body off before you got through. It would take some doing. An auditor would have to be singularly stupid to do this, but you must not, just because we are all tender little flowers that are likely to be shocked, we must not exclude that fact because it might alarm somebody.

I am a great believer in people doing what they're doing, knowing what they're doing I'll think that's a good thing, you know. I don't like to see troops told that they are going to go to heaven if they get killed on the battlefield fighting the Unguts or something, you see. I used to look at the whirling dervishes telling the Mohammedan troops and that sort of thing that this thing was going to happen, you know. Hang more dervishes. It made me feel spinny for a while, but I ran it out.

Anyhow ... Cheer up, it's not that bad. [laughter] Now I don't like to see you walking in against the pcs these days without realizing that you could use Routine 3GA in a completely knuckleheaded fashion; insist on – insist on the pc handling the wrong goal; insist on very ARC breaky and duressful sessions and so forth, and obtain a – well, probably, possibly even a knock-off on the part of the pc, see. I don't like to see you blind to that fact because it could happen. It would have to be pretty – pretty wild, but it could happen. Ordinarily the pc becomes very sick and very dizzy and you realize something is going wrong, and if you know your business, then you'll find the pc's right goal. It now becomes a little bit harder to find, but it can still be done, you see.

Now, in Prepchecking – in Prepchecking we had a problem. First, there's this problem of alteration. There's a problem of too great a constancy. You know there are people still run-

ning engrams because the stuff I figured out later, that was no good; that, the early stuff, that was good, you know. I know this. There are people in the United States – there's some guys in the United States sitting in the back areas. They're still running engrams like mad. They probably never will get beyond this point in psychology classes in universities where they're using Dianetics. Because that was good, but any improvement on it, well, that was too much. And Hubbard shouldn't have started thinking about thetans or anything like that. That was a nasty thing for him to do in this materialistic society. That's what you might call too great a constancy.

The guy sacrifices his future in the – in the idea that constancy is that great a virtue. Well, it isn't that great a virtue. Constancy must always be accompanied by understanding. Similarly, change should be accompanied by understanding. If you fully understand the tools which exist at this moment, you will see minimal reasons to change them, and you'll get your maximal change from the auditors who know the least about these things or do them least well.

But that doesn't say when you're auditing a little kid who can hardly speak English, that – you see, this is too great a constancy – he's seven years old and you're – he can't speak English very good, you know. He's only been speaking it since – for the last five years, and you say, "In this session is there anything you have suppressed?"

And he says, "Suppressed?" He says, "What's that? What's that suppressed? What? What's suppressed? Suppressed? What's that?"

And you say, "*Suppressed*. I'll repeat the auditing question. In this session is there anything you have suppressed?" And you know, you're not going to get anyplace. You have to give it to him. He'll finally understand what you're talking about. "Hid" or "squashed" or "put out of sight." You know, you'll say, "fail to reveal," he didn't get that. He didn't dig that. And you'll finally say, "hid from me." *Hu-hu*. Yeah, he digs that, see. You get the idea.

But this is – this is too great an alteration. Talking to somebody who understands all this and so forth. Pc says to us, "Well, every time we have a session you keep talking to me about difficulties, and I really don't like to have difficulties discussed because – and so forth, because it upsets me every time you mention difficulties, and difficulties are pretty bad, and nobody can ever get over their difficulties, see?" So you omit it from the Model Session. Never ask that. That's too great a change, man.

Or every time you say the criticism end rudiment, why, the pc says, "Every time I – every time I hear that I – I get the idea that you're – you're just sitting there looking at me and thinking that I just sit here and criticize and criticize and criticize you all the time, and do nothing else but criticize you. I never criticize you. I never think any critical thoughts to myself at all. I never think any critical thoughts in the whole session. Yet you just keep asking this question and asking this question and so forth, and I ..."

So you say, "Well, have you done anything in the session?" I'm afraid that's too great a change. Or let us say you can't clear the mid rudiment, "In this session, is there anything you have failed to reveal?" and you can't clear this mid rudiment. It just doesn't ever clear. So you say, "Are you concentrated on anything during this session that you aren't letting me in on in some fashion." And then develop seven or eight more middle rudiments. And then develop a

hot button: "In this session are you refusing to win?" I can hear it now. [laughter] This becomes the place where they raise kangaroos. It's up there in Southwest, New South, North Wales – place they raise kangaroos. I can hear it now. Right above one of those little lakes. Canberra. That's it. Canberra. Yeah, yeah. I can hear it now: "In this session are you refusing to win?" You know? Something like that. Gets to be very fashionable. Finally, we send out an expedition, make the archaeological discovery that that's why the civilization of Canberra disappeared, you see – because they squirreled all the time.

You get the idea? There's moderation in all things, even in constancy. And there's certainly moderation in alter-ness.

If you think you need four or five different new middle ruds to get your pc kicked along the line, you're going to be in more trouble than you're going to be in because this is one of the problems.

One of the problems is that an inconstancy of approach by the auditor causes more trouble than an unusual solution heals. Yes, these little buttons are wonderful; injected in the right place and all that sort of thing. But they inject an inconstancy and a failure to predict in the session, which overreaches the good they do. In other words, they actually might improve the pc's case and lower the pc's confidence; because he couldn't predict what the auditor's going to say next, see. And he gets down along the line and this auditor's always coming up with something different, you know, and the pc's always coming out of session with his attention on the auditor. You see, that can be an evil. And it finally results in violating the definition of in-sessionness.

You get a constancy that works so that your middle rudiments consist of suppressed, invalidated, failed to reveal and been careful of. That takes an awful lot of edge off the case. Yes, we know there's more we could get off the case. Mary Sue and I were fooling around one night and I think we racked up I don't know, eight or twelve or fifteen, something like that, different new things that could be put into the end rudiments.

End rudiments would be about twenty questions long. You know, you start the session ten minutes before session time in order to get the end rudiments done by session end, you know. There's all kinds of them: "Is there anything in this session you've been responsible for?" The hottest of them, "Is there anything in this session that has shifted your attention?" or "Has there been a shift of attention in this session?" that sort of thing. Oh, that's a very hot button, but listen, there's about twenty of them.

And we were cleaning up a session which hadn't been noteworthy for its meanness or something of the sort, and she kept asking these questions. We were just – the session had just passed by, and she got a fall on every one of these. Little tiny things. Didn't amount to a hill of beans, you see. But nevertheless each one of them was slightly charged.

What you're trying to do with Model Session – and this is another problem – is you're trying to make the pc auditable and continue to be auditable. That's all you're doing with Model Session and its processes. Just trying to make the pc auditable and continue to be auditable. And oddly enough, if you run it, it's got therapeutic value. The repetitions are perfectly done with Havingness or something like that in the body of the session.

This is tremendously valuable, therapeutically. But honest, you could run it for a thousand sessions just as itself, and it wouldn't clear anybody. The virtue of Model Session then, is not its processing value, it's its predictable value. Pc knows what's going to happen, and additionally it takes the edge off the things most likely to distract the pc. Your Model Session doesn't try to heal all the pc's mari... Imagine your embarrassment. You're going to use the Model Session – the PTP question, "Do you have a present time problem?"

And the pc says, "Oh, I'm having terrible difficulty with my husband."

So you say, "All right now. Isn't that marvelous? We've finally gotten her to realize that she is – and so on."

And we take off at this point – see, we're not even in the session – and we take off at this point, and we use this. Just as a repetitive question. No – we could, too. We do nothing but run this with one aim in view: to cure all of her marital difficulties. We're going to have all of their marital difficulties cured on the whole track.

Five or six sessions later, the pc's starting to look rather odd by this time. And we somehow or other never seem to get past this rudiment. We never bother just to clean the rudiment, you see. We're trying to audit the case with that rudiment. And imagine our embarrassment – either we or somebody – we finally get tired of it – we finally find the pc's goal: "To kill my husband." [laughter] You're never going to run a R3GA with a rudiments process, I assure you.

Hidden in this case – here's another difficulty – hidden in any case is this basic purpose, a prime postulate. And earlier than that other prime postulates. These vary. And it would be very nice to say the basic prime postulate for all human beings every place is "to be." And all you have to do is list, "to be," and that will be marvelous and we'll just get the four way flow on "to be," and we just do that on any pc and we never have to do a Goals Assessment. And I wish that were true because you're knuckleheaded when it comes to Goals Assessments. But it doesn't happen to be true.

No, they have goals of various kinds. "To kill my husband." "To catch catfish." "To fall in love with golden haired goddesses." "To be a crapehanger." "To sit." [laughter] Now, remember that any alteration of that goal is going to add mass, and it's actually a fantastic thing that we have processes such as these Model Session and Prepchecking today, which actually can do something with the case over the head of this without getting us into too much trouble. Remember that's the way it is. It doesn't get us into too much trouble. That's the way to look at Model Session and rudiments and processes and Prepchecking and so forth. It's just fine. It doesn't get us into too much trouble.

As far as improving the case is concerned, all we're trying to do with the case is smooth out the needle. That's basically all we're trying to do with the case so the case will sit there quietly and can have an assessment run. Now, that's the brutal truth of the matter.

Now, that people feel better is incredibly a fact, but it should be regarded as somewhat incredible by an auditor. How can the guy feel better when he has a goal, "to sit," and his job tells him he has to run all day. [laughter] See, that is your senior aberration, and is so over-

whelmingly senior to any other button or aberration on the case that to be able to do anything for the case at all is absolutely miraculous.

But you can walk up to somebody, and put your finger on his forehead, have him look at your finger with his eyes shut, you know, and so forth, and cure his headache by spotting your finger around here, there; or that you can run "From where could you communicate to a leg," and "To what leg could you communicate," or something. That you could do anything for this guy at all – that you could take somebody who's lying in a sickbed with upper leukosis or something and run out what the nurse said yesterday or something and have the hemorrhaging cease. This is absolutely fantastic when you sound the well of human aberration and know that the prime postulate is going to interfere with anything you try to do. That you can get away with this is fantastic. Now, this is unusual enough without flying into the face of the gods.

Now, if you're trying to solve a case without recourse to the case's goal, I sympathize with you. I've had lots of experience. I can tell you that it can't be done. That case will not solve all the way. That case's recoveries will be quite often very spectacular, neighbors thrilled to pieces, everybody very happy. Little Izzekranz can see again, you know. Marvelous. Roscoe's right arm is not now shorter than the left. Yeah. This is gorgeous. It's fine. You'll find these pcs in due course of time, not necessarily getting that trouble back, but you'll find out they haven't found out they changed really. Very unsatisfactory over the whole thing. You're not going to change a pc short of his goal.

The way to change a pc is to clear him. That's one of the basic problems you're up against. The basic problem of clearing a pc is cleaning up his needle. The basic problem of cleaning up the needle is to have a sufficiently powerful process which is sufficiently constant in its application, that the pc gets very confident in being audited. Do you see how those problems add up?

Now, strangely enough, a pc is not going to let anything help him against which he has fantastic overts. He gets in a games condition with it, and you as the auditor or the subject you're using – he gets overts against you or overts against the subject, your missed withholds and it makes him misemotional or something like this, and he can't be helped as easily. In fact it is not only much harder but sometimes impossible to accomplish help in the face of those things so it requires a certain amount of preparatory action so as to keep the pc in-session.

Now, you were asking me one night whether or not you would do these things – you would set up a case like this after you left Saint Hill. Well, you're going to run into the same problems. You see, some case with a nice free needle, and you say, "Oh, well, that's fairly – all right. I mean – well, I'll just sail into this case. Aw, I'll just get the case's goal and ..." And you'll be killed by your own good luck. So help me Pete, you found the pc's goal. So help me Pete, it was dead easy. Nulled it out, the needle went free, the pc felt marvelous. It's an absolute miracle. It didn't take anything like the number of hours that you thought. You think this is the most marvelous thing that ever happened to you, see. Oh, it's marvelous, see. Great. Great. Great.

And you get your next pc. And you say, "Well, I've got a fairly free needle ... There's no dirty needle there or anything. I'll just go to work here." And then we hit the anxiety peak

as we come up on the last quarter of the run in finding his goal, and suddenly discover belatedly that we have never had the pc under control ever. And the pc's anxiety throws him totally out of control. There isn't any way we can hold him in-session. He just blows, *bloom!* So we keep climbing uphill against this sort of thing, and we waste five times the number of hours on this pc that we would have had to spend in setting the pc up in the first place. And we become citizens, see. We can be spoiled by good luck. Don't think for a moment that you can't have good luck like this. Just please for my sake feel a little bit leery of it.

Little Johnny's schoolteacher understands you're a Scientologist, and she's heard something about this and she wants this and that. And we say, all right. Well, make yourself out a list of goals, and we'll find a goal. And she does and you run down the list once and you find a goal sitting there. And that's the only thing it takes and it checks out perfectly. And you list it, and you list twenty-five items for each line and the needle goes free.

She tells you the next goal and the four items to free that and she becomes OT, you see. Look, I just hope it never happens to you. Yes, then every pc after that is going to look horrible. It's just disastrous in all directions. Life becomes gruesome.

Now, the other thing, the other main problem that stares us in the face with all this, is the fact that the E-Meter itself can be run into a hole with the pc. You can neglect reads on an E-Meter and make the E-Meter unworkable. An E-Meter does not ARC break from full reading to no read, one-two. That is not black and white. It's all shades of gray. An E-Meter fades out and becomes less and less readable the more you neglect. A very inexpert auditor, not seeing the tiny reads that occur on the meter in answer to rudiments questions, can very easily and very shortly get into – get the pc into a *barely* readable meter, which only reads on the greatest of greats, that just misses withholds from there on out. That is the problem.

That's ending the rudiments process too soon. We ask the question one more time. The needle was rising as we asked the question, and there was a microscopic, infinitesimal slow in the rise. It'd take Hawkeye himself to have seen it. And the auditor lets it slide. Actually, he lets the next one slide. And he lets the next rudiment slide. By the time he gets into his third or fourth session doing this sort of thing, his meter isn't working. The guy could have been found standing over the policeman with a smoking gun in his hand, and the meter on the question, "Did you kill that cop?" would not even wiggle on that auditor.

In other words, you can sort of educate the meter out of reading. You see how you can do it? It's done on a gradient. Now, we know it can be done with a sharp and incredibly harsh ARC break from read well to no read at all. But this other one has not been suspected until recently. You can get a meter which gradually drifts out of read. The next thing you know you're ending all of your rudiments questions too early. All of them. The rudiments are never in. The whole list goes null on you every time you turn around in nulling the list. About every three questions, the list – every question goes null. Every read of every question on a goals assessment is null. There's – that needle is no longer ticking at all. That is the consequence of this earlier neglect. Now, you might have not – not have been the auditor who neglected it, but you must to some degree have aided and abetted it in the rudiments.

Now, the other problem is being too careful because you aggravate the pc every time you try to clean a clean rudiment. Just clean the clean rudiment. Now, I did some more tests

on "Do you agree that that is clean?" and taking the read off of that. I found out that doesn't work because you're cleaning a clean rudiment. And it will ARC break a pc more often than it will salvage the case. If it was clean once, it was clean, man. You can say, "Do you agree that that is clean?" so as not to evaluate for him, or "Do you agree that that is null?"

Now, you've got an end of process type of solution. "Is there anything you care to ask or say before I leave this rudiment?" If your pc always adds something afterwards you could frankly get into the habit of asking him if he wanted to say anything, see. But it doesn't come under the heading of part of Model Session. What you must remember is what you forgot in the CCHs. Two-way comm still exists in a session.

Model Session run strictly, right on the button, word for word, still is not a muzzled session. Oddly enough, it would run today as a muzzled session. But a good auditor should have enough sense to maintain two-way comm with his pc. Too many auditors withdraw out of the session and just let the Model Session carry it. That's too great a constancy, you see. Never asks the pc how he is; never sounds cheerful about the thing. You know? Never does anything to let – you know, keep the pc thinking we're all alive after all. So you drop that out and you're also in trouble.

Now, we're also wealthy to the degree that repetitive rudiments use exactly the same pattern as Repetitive Prepchecking, and we need only one skill to cover both. And that is one of the problems – is teaching a number of technologies, a number of processes, a number of procedures. No, I would rather teach one procedure superlatively well than ten indifferently. So your two things the auditor was having the most trouble with – rudiments and Prepchecking or Sec Checking as it was called earlier – have been solved today. And we've brought this up to a constancy. Well, nobody is trying to change things just for the sake of changing things, but one is certainly – I'm trying, and I think I have succeeded in bringing it up within shooting distance for any auditor so that he gets results.

It's a great joy to see the pc sitting there chatting with you, talking to you interestedly about their own case, brightly, very happy to be sitting in the auditing chair.

You use this type of procedure and you use it well, why, the pc just sits there and they talk happily to you and describe everything and they're real sent, and things are blowing Things will blow, blow, blow, blow, because they're cheerful.

And sometimes when you've been grinding away on a pc who never spoke to you cheerfully but just answered the auditing command, you all of a sudden shift to repetitive rudiments and Repetitive Prepchecking and have the pc sitting there cheerful, happy, glad to be audited, glad to talk to you – you will see that there's a considerable advance just in the technology itself.

If your pc isn't doing that with you, and you use repetitive rudiments or Repetitive Prepchecking, well, you're probably doing something unusual.

Thank you very much.

REPETITIVE RUDIMENTS AND REPETITIVE PREPCHECKING, PART II

A lecture given on 10 July 1962

Okay, and this is lecture two, Saint Hill Special Briefing Course. What did you say the date was?

Audience: The 10th.

The 10th?

Male voice: Yeah.

How did it get to be the 10th? Terrible.

All right, we're still covering the subject of repetitive rudiments and Repetitive Prepchecking. And we're now going to go ahead and extend this into Repetitive Prepchecking.

Repetitive process is simply a process that is run over and over with the same question of the pc. The pc answers the thing and the auditor gives him an acknowledgment, gives him TR 4 on his origins and it is run until it is flat.

And when we say repetitive these days and apply it to rudiments and applying it to Prepchecking, we are talking about a very precise flatness. There are no more – there – in this use of it, you do not say – oh, this is really corny, I mean, to add this – "I will ask you this question two more times and then end this process." Now, you don't ever say that, see. The procedure is very precise.

There's two ways of handling these things: one is repetitive, the other is fast. See, you can include these as technical terms: repetitive rudiments, fast rudiments.

Now, there are no, and you would never run any, beginning rudiments as a fast check. Beginning rudiments would always be repetitive.

Early on when you are doing basic types of sessioning, particularly in training, you do your middle rudiments repetitive and your end rudiments repetitive. At that moment your end rudiments become single questions, each one, and it takes forever to get them in.

And that is not how they are written in Model Session. It is almost identical, except that you take the packaged question and subdivide it so that your un... your half-truth, you ask

a whole question repetitively about a half-truth, and then a whole question is only about an untruth and so forth. You break that down so it becomes a *fabulous* number of rudiments.

But that's all right. That's all good training and that's all fine and it's kind of a Prep-check in disguise. But that would simply be a training mechanism.

It would be more usual to run your middle rudiments repetitive than end rudiments. End rudiments thereafter, would normally be handled as fast rudiments. And normally mid rudiments, particularly as a case advanced, would be handled as fast rudiments.

The random rudiment – asking for a missed withhold randomly, any part of a session – would usually be handled as a fast rudiment. In the first place the pc hasn't – you haven't missed that many withholds on the pc during that session. The pc starts to look a little bit tense so you ask him the random thing and you ask him the random rudiment. You're just asking for a missed withhold, that's all. And check it on the meter, guide his attention into it and he tells you this and he's fairly cheerful.

Sometimes you have to wrestle around for this one. I mean, be accustomed to getting that question answered. Never ask for a withhold unless you get the question answered: That's a maxim. And never ask for a missed withhold unless you are fully prepared to sit there all night to get it answered. So a little bit of random rudiment goes a very long way.

Now, the repetitive aspect is very precise in its delivery. At one time we were sec checking this way. Everybody could do it very easily. And we found that it was very well handled normally. And it was known as the "Impasse system," – its earliest action, sometime around the first of the year. And it was quite successful. And I got Prepchecking – developed Prepchecking after that, asking for chains, and developed the withhold system and so on.

And if you are very expert and your pc is well, well in-session and you dig chains and basics and a lot of other "if's," prepchecking by the withhold system is undoubtedly very fast and it's very good and very able, and percentagewise it is unteachable. There are not too many auditors can use it successfully. They get all fouled up. Their feet get all tangled up in the E-Meter and it gets pretty grim.

Quite in addition to this, used as itself on an ARC breaky or poorly reading pc on the meter, is not as successful as the Repetitive Prepcheck.

In other words if you are very good and your TR 1 is excellent and your pc is well in-session, prepchecking with the withhold system can be pretty marvelous, pretty rapid, and you can do some things with it which look absolutely miraculous. But in the general course of human events, your pc is happier, you will get more done – the average auditor will get more done with Repetitive Prepchecking than he will get done with Prepchecking with the withhold system. So, Repetitive Prepchecking becomes very valuable. The pc goes better into session with Repetitive Prepchecking than they do on Prepchecking with the withhold system.

We are not doing, and I do not advocate your doing or learning, Prepchecking by the withhold system. I don't advocate that now. If you were fortunate enough to have learned it, and to have learned how to do it, you will occasionally find yourself facing some pc that you are trying to straighten out – straighten out a needle on, or something of this sort, and you take Repetitive Prepchecking combined with a fish and fumble, or either one of them, and you

can chase that needle down and clean it up, scat. And it's a good skill. If you haven't learned it, don't bother. Okay?

The Repetitive Prepcheck follows exactly the same pattern as a repetitive rudiment. And this is a wild virtue because the individual is then not having to learn two skills; he only has to learn one skill to perform two functions. They are both identical. There is nothing – no difference at all between the way these two things are used, except of course, the repetitive rudiment stems from the rudiment question of the session as given in Model Session and no other way, except of course, as you might have to modify it for a very motivatorish case or as you have to modify it, perhaps for a child – something of that sort.

You don't use more rudiments than you'll find in the modified Model Session. Don't use more rudiments than that. If you find yourself having to run more rudiments than that you still have the solution. The ARC breaky pc, of course, comes to pieces on O/W. And see, you've still got a process sitting there.

The process O/W – general O/W, is added, by the way, to Prepchecking, Model Session, and can go prior to any Prepcheck, Havingness or Routine 3 session. It isn't not – doesn't matter what type of session you are in – the rule is the same.

We've never before had a specific allowance for one fact: that occasionally a pc comes to a session – not comes into session – but comes *to* a session so misemotional, so ARC broke, so wrapped up in a PTP of great magnitude that they hardly even hear you say, "Start of session." They are just involved. And this new Model Session allows for you to put in general O/W ahead of any other rudiment, because the pc can't pay any attention at all to the rest of it and you are just going to get soup and mush. You – just going to find yourself terribly messed up, because the pc's attention is so fixated that any change of the pc's attention on exactly what the pc's attention is on is going to lend to ARC breaks, apathy and upset on the part of the pc and is actually a cruelty.

The other one is a seriously ill pc or a pc who feels too ill to be audited. Now, those two pcs we have never specifically taken care of. They are unusual circumstances, but the general O/W at the beginning of session – just after you say, "Start of session," is "What have you done? What have you withheld?" Or the motivatorish one which will be out with the 12th July bulletin, 62. The motivatorish question is "What have you done to another? What have you withheld from another?" You have to get around this tendency, "What have you done?" "Well, I've punished myself terribly by sitting down in this auditing session and having to look at you," you see? I mean, the pc will rapidly plow himself in on this.

That, right there at the start of a session, is *not* run against the meter. It's *not* run against the tone arm. You should understand that it isn't run against the *meter*; it's run against the *pc*.

Now, when it first came out, that was when I first released it, I showed you how you could run it against the meter. But I found out on a little more experimentation that it really wasn't necessary to run it against the meter. You are going to find out if you missed a withhold on the pc in the next two questions anyhow. See? So you needn't even bother to check it if you don't want to, you just, "What have you done?" you see, "What have you withheld? What have you done? What have you withheld?" Oh, his tone arm is moving madly, you

know. Well, maybe you've got some kind of a situation where you've never seen the pc's tone arm move before, *ho-ho*. You know? Great. It's true, too!

Some pcs with a superautomatic bank – you know these pcs are rare, but when you meet them, you've had it. The superautomatic bank: Did you ever hear about this? Well, it is just like somebody shuffling through a Niagara Falls of lantern slides – if you can just imagine it. They are all over the time track. Everything is grouped, everything is in motion, everything is automatic. You say, "Did you ever drink any coffee?" And they get rapidly five hundred pictures of drinking coffee. See? You say, "What did you say to the fellow?" And just on the mention of "fellow," you get *brrrrrrrrr* of "fellows." See?

It's almost impossible to hold this pc on the time track anyplace. The pc is not very frequent. But I have seen a pc with an automatic bank fail to respond to any processing known to man or beast because you couldn't control him enough in session – except O/W. Now, I've seen them – I've seen them run on anything else – no tone arm action, no answers, can't spot it on the time track, always in trouble. The mere fact that you have asked them a question practically slaughters them – upsets them.

The pc generally starts in and says, "Well, I've been audited an awful lot of times, been audited in an HGC, and several, several auditors and I've had no less than twenty-nine Saint Hill graduates" – this is very peculiar you see, because there aren't twenty-nine of them in Canada – "and all of this and so on, and never had any results, and all of this sort of thing, and it's all very terrible and I wish I had some reality on the situation, because I always have this kidney backache," or "I always have this – this knife through my chest," or "I always have this bad foot. See? And it doesn't do any good. There's just no reason to audit me and I don't ever get any results from auditing"

You hear something like that, ask the pc what happens when you ask a question or ask the pc what they are looking at, and you are liable to find you are auditing an automatic bank. Quite interesting because the case, of course, is in so many engrams so often they never have an opportunity to suffer from just one. Yet they will respond to O/W. You can ask them "What have you done? What have you withheld?" or the motivatorish version of it, see. "What have you done to another? What have you withheld from another?" And actually get a wild lot of tone arm action.

So the only thing you would do with tone arm action – the only thing you would do – if you did see tone arm action while you were running O/W because the pc was sick at his stomach that day, and you hadn't seen that much tone arm action on this pc, and you were prepchecking this pc, *ho-ho-hoo*. Well good, just move it into the body of the session.

In other words, you run the thing until the pc feels much better and you can get in your first rudiment. Then get in your second rudiment, get in your third rudiment, go into the body of the session and resume O/W. Get the idea?

So if you were getting tone arm action on a pc with O/W and you hadn't seen it before, no matter what you were prepchecking on, why, that would be about the only time you ever paid much attention to the tone arm action of O/W. Don't you see? That would be a time to pay attention to the tone arm action of O/W.

But you don't run the tone arm action out of it because you can't. And you don't run the ticks out of it because you can't. Would you please look at the breadth of the question? Have you even said, "In this lifetime is there anything you've ...?" No! Well, let's just jump at the whole track! "Now, have you done anything in two-hundred trillion years?" See? "Well, that's not flat yet." [laughs] So just forget about – forget about that, except where the pc's concerned.

Now, we used to have an ARC break-type process that we ran without the meter. Do you remember that? You know we ran it – we spotted the fact the pc didn't feel good with our eyes, you see – we didn't pay any attention to the meter. And we ran something on the pc till they felt better and they looked better to us, and then we went ahead with the session. Do you remember that? That was because the meter was unoperative on ARC breaks, so you could never quite take that chance.

Well, O/W comes under the same category. The pc says – sits down. He says, "Oh, I'm not going to be audited by you. I don't want to be audited by you because the last time you audited me you put both of your feet in my lap and kept kicking me throughout the whole session." And the thing to do at that particular time is not say, "You're lying." That is not the right thing for an auditor to say. It's just – not that there's anything wrong with it – it's just that it isn't done and Ron frowns on it. Now, the thing ... And the pc will do worse than frown.

The thing – the thing to do at that particular time is realize that if you asked the pc, "Are you willing to talk to me about your difficulties?", you are going to get a howling, screaming, "No, goddamn it and I never will." Don't you see? We are now going to just stack up a whole bunch of new overts.

See? If we run, "What have you done to *me*? What have you withheld from *me*?" – we are running a terminal and maybe we're allergic on the pc's terminal track. See, maybe it – maybe we are the wrong terminal to be used as a terminal on the track, you see. Sometimes you know, you can audit the wrong terminal and beef up the pc's bank in about five commands. But as the auditor, if your attention isn't being yanked off onto the – I mean pc's attention isn't yanked off onto you all the time you could audit him for hundreds of hours without messing him up, see. So you can say to this pc, "What have you done? What have you withheld?" That's all.

Now, if the pc seems to be withholding things and having a very hard time, you could ask the random rudiment in the middle of that particular process. It's an opportunity to use the random rudiment. It's called random ... You see, mid ruds are used only in the body of the session. This random rudiment which pulls the missed withhold can be used during any rudiment or at the end of any rudiment or any time.

So you could run O/W and you'd find this pc would eventually settle down. The pc would find you as an auditor and so forth. The pc's finally sitting there, looks pretty well all right, looks better, sounds calmer, doesn't look even apathetic. We say, "Well, the pc looks vaguely like they could be audited." So then we go into the first rudiment which is, "Are you willing to talk to me about your difficulties?" And the pc says, "I guess so." You see? That's a way of handling that situation.

Supposing the pc blew and you went and got the pc and tried to get the pc back into session. That's in the middle of the session isn't it? What are you going to do then? Oh, I don't know – I don't think if you let a pc blow you deserve a solution. Let's go on to something else. [laughs, laughter]

No, you could use that. By introducing the random rudiment or getting the random rudiment flat you would also accomplish the same ends. And probably you couldn't use O/W on such a case without using the random rudiment also. Now, how would you do that? Well, you'd use the random rudiment every once in a while. Just check a rudiment while running O/W, in other words.

Now, the random rudiment is always checked against the meter, but O/W is the exception to the line. You don't run the O/W questions to a flat meter. You don't because you can't. And it is not safe to leave that without adding the random – without being very, very – I won't say that you always have to use the random rudiment by reason of running O/W, but I would say you would be safer if you did, rather than to wait till just the question after the difficulty question. That might be one question too many, particularly if the pc was misemotional. At the beginning of session you are liable to spin the pc in again. Do you follow this?

So you can use the random rudiment anyplace. Let your conscience be your guide. Of course, the more rudiments you use, and the more you use middle rudiments unnecessarily, why, the more time you are going to waste in a session. That's your main penalty. And the less auditing the pc will feel he is getting.

Now, just how does this – how does a real rudiment sound? How does a real rudiment, repetitive, sound? What is it?

Well, the auditor ignores his meter and he says to the pc, "Are you willing to talk to me about your difficulties?" – not watching the meter.

And the pc, let us say, says, "No."

And you say, "What difficulty aren't you willing to talk to me about?" And get it answered. And then you say to the pc – no meter, see – "Are you willing to talk to me about your difficulties?"

And the pc says, "No."

And you say, "What difficulty aren't you willing to talk to me about?" And the pc answers it – you still don't have a meter, see.

"What – are you willing to talk to me about your difficulties?"

And the pc says, "Yes."

You say, "Good. I will check that on the meter." And for the first time, bring the meter into it.

And then looking at the meter, you say, "Are you willing to talk to me about your difficulties?" Now, if it was clear you say to the pc, "Do you agree that that is null?" or "Do you agree that that is clean?" And you – if you've got a null read – didn't react to your question – you leave it whether the pc says anything else or not or whether the "agree" has a fall on it or

not, because the rule is: is once you get a clean read, you never ask it another time. You shut up right now.

If you've gotten a clean read on, "Are you willing to talk to me about your difficulties," the only way you can ask it again – and the only reason you would ask it again – is because you couldn't read the meter, and to keep in the reality factor you say so. Rather than use clear technical words, rather than to use words which might be slightly engramic or something, use something that is offbeat like, "That was an equivocal read." The pc learns pretty soon that when you say "equivocal," you probably mean that it wasn't quite understandable to you and that you are going to say it again. That's the least the pc will get out of it and you haven't introduced the idea "the meter isn't reading," or "that was wrong," or "I couldn't tell," you know.

You old Dianeticists would know the folly of saying to a pc when he's half-anaten, "I couldn't tell that time." That is lovely, you know, you just get that piece of the time track in the session – just get lost right there, you see. So use something like, "that was an equivocal read," see. Use something besides... That is not a – there is no standardization on that particular wording because you are going to run into trouble on any standardization. Because sometimes you weren't able to see it, or something of that sort. And your R-factor to be put in very solidly, simply should be that. You can even say, "It hit the pin. I'm sorry." And ask it again. Get the idea? It's what breaks through to the pc without interrupting the whole session and throwing it all in a cocked hat.

The truth of the matter is, the R-factor is, is *you missed it*. You couldn't tell. You missed what it said. And that's fairly easy to do.

Don't feel too upset because it has very, very little to do with the auditor. Given a trained auditor, all variations and numbers of equivocal reads depend on the pc he is auditing. Audit one pc and my gosh, every fifth – every fifth read on the meter is equivocal. See, you've got a dirty needle that's going tickety-tick, tickety-tick, tickety-tick, tickety-tick, tickety-tick tickety-tick – and it never ceases. Boy, how you can read – how you can get a read through that is pretty fantastic, and yet you have to do it.

So, rather than make a liar out of yourself and ... Never pretend on a meter read, because somewhere down deep the pc knows. See? Never pretend. Say what it is. Don't ever try to make yourself look good at the expense of the meter or something like that. Boy, that's dynamite!

So, about every so often on a pc, and sometimes on the same pc, you'll get patches of clean and patches of dirty and you'll just spend a couple of sessions when all the reads are – about every third or fourth read is equivocal. And then you're into the same trouble when the pc is coming up toward ... You got the needle all loosened up with prepchecking gorgeously. And at sensitivity 16, if a breath of air passes through the room, why, the needle kicks over against one pin and comes back hard enough to hit the other pin and bounce. You see? And it does it so rapidly – and by the way, I probably should mention this: You ride the thing with your thumb. You ride the tone arm with your thumb. See, you should always be able to ride a tone arm with your thumb. See? You don't keep reaching over here adjusting it. You see me do it on the TV because the meter is left-handed, see, for me. See, I have to work the meter

with my right hand which I ordinarily wouldn't do at all. But that's just so you can see it on TV – it has nothing with the proper way of setup. And took a little doing for me to get used to that too, when I first started to run that.

But, it's very funny, in order to do this, this is the way you'd – see – you'd have – it can't even be done. This is the equivalent position of the meter. See, really – you can't do it, so I have to adjust it with this finger. And it's very hard to do. So you don't – you never have seen how I do this, but when I'm auditing the pc, I put my thumb over here on the tone arm and throw – this is with too loose a needle, see – and I throw the thing as I start to say the sentence. If I've got too loose a needle, throw it so it will hit the pin and bounce back and idle as I say the last word. It takes nice timing, but you know you can actually train yourself to do this to such an extent that your needle is never under the impulse of being thrown at the time you are saying the last word.

If you are absolutely perfect, the needle will be sitting right straight up in the middle of the dial completely motionless and unaffected at just – at the instant you finish the last word, and you'll get [snaps fingers] any action that is on it. You never find yourself trying to read on a fast rise. I always distrust fast rises. Particularly, do you know a goal – an actually reading goal – doesn't have enough impulse to read down against a fast rise. Did you know that? It won't tick against the fast rise. It will show up as a tiny slow, if you can detect it at all.

You'll see some goals – they'll go tick, tick, and then by that time the pc is now suddenly getting a fast rise, you see, because they've got a very floaty needle or something like that, and you will have said the goal the third time as it gave that fast rise. And you won't get any read, and then it will drift over toward the middle again and you'll say the goal the next time and you will get the tick, the tick, and then the fast rise and it won't read. That's about the only time. An impulse against a speeding needle is always to be distrusted. Don't get too trusting about that.

That needle was flying around. Remember that needle has weight and the little tiny missed withhold that is going to shoot your session full of holes does not have enough energy to overcome all that inertia. So the needle that is really flying around on the dial – ah, you'd better call equivocal reads more often than you do, until you really get used to it, any time that needle was going too darn fast.

Oh, never go in for this: never wait for the needle to sit down before you start reading it. Don't make that mistake because you will find yourself spending one and two and three minutes dead silent as the auditor in the session, waiting for the needle to be still enough to ask the question. But of course, now that you have started to ask the question the pc is not yet in the condition where the pc is not disturbed by the sound of your voice, so of course the needle then starts moving and is off the dial by the time you have said the last word. Then you have to wait two or three minutes, don't you see, in order for the needle to quiet down. And that's not what we're – that isn't the way you ought to be doing it.

No, the way to – the way to handle one of these things is: If your sentence finishes against a fast flying needle that is flying very, very fast and so forth, and the pc's reads are usually against that direction, see. It's up, and the pc's needle – there's a slight fall you've been getting lately. And you didn't detect a slow. See, that will read as a slow. Don't take a chance.

Just say, "That was equivocal," and say it again. See? Don't be in all that hurry. But when you announce that it is or infer that it is by saying, "Do you agree that that is clean?" – you be awful sure that it is clean, you understand?

Say "equivocal" all you want to, you understand, but be sure. Because this other factor enters in. This other horrible factor enters in: Miss a little tick here and a little tick there and the pc will cease to read on the meter at all. They've gotten away with it this time, and they've gotten away with it that time and the next thing you know they know the meter isn't functioning on them; and the meter will read less and less and less and less and all of a sudden the meter doesn't read for you as the pc – as the pc's auditor.

Interesting, isn't it? And then you have to trace way back in your auditing and you have to take the Zero Questions that you hoped were clear; and then you have to study down the line; and you really scrunch up your eyes; and you really watch the meter; and finally you'll see that one of those questions goes *pft*, you know. And you say, "Did it or didn't it?" And you say – ask it again and you watch it very closely. "No, it was a null that time."

Oh, you've had it. See, you've compounded the felony. Of course, it will be unreadable the next time because the needle has already ceased to read, to all intents and purposes, because the pc – you just missed too much on the pc, don't you see? The needle isn't reading now to amount to anything, and you did get one little tiny twitch, and just that extra question to make sure will be enough to cause it to be another missed withhold. See?

So that one has – that track back has to be done with the greatest of care. And you get back to something and get it to twitch, and then call the twitch and get it answered. And you gradually will build the case back to a good, solid reading needle. That's how to build them back when they've faded out on you.

All right. So, with all that explanation – you check whatever question it was that you were asking the pc, "Are you willing to talk to me about your difficulties?" You've gotten no reaction, so you say to the pc, "Do you agree that that is clean?"

And the pc says, "No. Yes. The sky is green. The moon is made of green cheese."

From there on it's a TR 4 situation. You got it? That's just a TR 4 situation. You don't do anything else, in spite of the liabilities of missing withholds. Once you have declared something clean don't reverse your tracks, because this upsets the pc more than the tiny missed withholds. See?

You'll get all upset about this thing. See, I mean the pc – "Oh, what the hell? God almighty, we got the thing clean. We had a present time problem and now here we've got another present time problem," and so on, so you never check it twice. Once you have issued the papal bull – once the proclamation is posted in the village square it is never pulled down, till next session, or the next time you run mid ruds or something. See? You've pronounced it.

Now, the pc says, "No, that was not clean. In actual fact there are several difficulties I'm perfectly unwilling to talk to you about and they have to do with cats, fishhooks and catfish and various things of that character." You just TR 4 him, TR 4 him, TR 4 him. "Thank you. Thank you. Thank you. Thanks. Good. Well, all right." And we get on with the next rudiment. You got it?

All right. So what's your exact action here? The exact action is without the meter, you say, "Question." The pc answers it yes or no. You ask him for the more information if he hasn't given you the information. Ordinarily a pc will generally get so that he is making a session out of it. That's neither really bad or good in the rudiments. He won't give you the yes or no anymore because he finds out it won't do him any good, you'll just ask the additional question, so he answers the additional question at the time you ask him the rudiment. Quite common, let it go by. It's not perfect, but then neither are rudiments.

So the setup in this particular case is: You ask the pc the question and you – the pc answers it – has an answer for it, has an answer for it. You always ask the same question. You never vary the question. You never ask another question. You can engage in two-way comm at any time with the pc of course. But you don't go and pester him; you don't Q-and-A on this; you don't question his answer – nothing like this. You take whatever he tells you. You even take what he tells you if he gave you a motivator when you asked him for an overt, you know, unless it flagrantly is not an answer to the auditing question. Flagrantly – it has to be pretty flagrantly not an answer to the auditing question. "Since the last time I audited you have you done anything that you are withholding?" "I am mad at you." Well, when you finally get it amplified, the pc has answered the question, only he's shorthanded it. So you didn't buy that? Cut your throat man, you are going to have an ARC break. Now he is going to be mad at you. You get the idea?

You say, "Since the last time I audited you, have you done anything that you are withholding?" And the pc says, "Well, I've become unwilling to talk to you about my difficulties." Of course an auditor at that time practically goes up the pole. He doesn't know whether to go back and ask the first rudiment question which is apparently clean. He doesn't know. But the truth of the matter is, an auditor is only puzzled when he feels he has to do something every time the pc says something. That is the only auditor that ever really makes a mistake.

The guy who can sit there and fiddle while Rome burns, and fiddle cheerfully with all his TRs 0, 1, 2, 3 and 4 right on the front burner – that's the auditor. But the guy who has to go and call the fire department every few minutes – he's a lousy auditor. See?

So you say, "Since the last time I audited you have you done anything you are withholding?" "Yes, I've become unwilling to talk to you about my difficulties." And my God, you just went over the rudiment and that was clean. Well, don't be so concerned; don't be so involved. The pc, in actual fact, is simply telling you that there was a point during the wee small hours of the morning, when he became unwilling to talk to you about his difficulties. And he decided this, see. And he doesn't also tell you that at breakfast he decided he could, see. And you ask him the first rudiments question, "Are you willing to talk to me about your difficulties?" And he says, "yes." And of course this is clean and perfectly factual. And then you ask him if he was withholding something. He tells you – if he amplified it, he'd say, "Well, in the wee small hours of the morning, yak-yak-yak-yak, why then – so on, I became unwilling to talk to you."

Buy it, see. Don't be too critical of the pc's answer. The only time you want the pc to say more is when you honestly didn't understand what he said. When you can't make sense out of something, you are a fool to go on. Why leave yourself in a mystery-sandwich session?

The beginning and end of the session are totally clustered around the mystery in the middle of the pc's comment.

Why did the pc say, "Roses are piccadillied never." What reminded him of what that caused him to say which? You put yourself on a missed withhold with regard to the pc. He doesn't know that you didn't know. See, always fill that missed withhold in, for this reason: The most serious button that you can disturb on a case, of course, is the knowingness button. You throw the pc into a situation that has to do with know or not-know, and of course you are going to get into an involved situation. So, that's the only time when you ask a pc to say something else or amplify it.

The funny part of it is, let's say that you've had a horrible time in the last few days and you've become totally knuckleheaded and half-deaf, so that *every* time the pc says something you have to tell the pc to speak up and you didn't understand it. You didn't hear it, you didn't understand it, you didn't dig it. Do you know that the only way to really mess up the session is to fail to do that – when you didn't understand it, not to say so. Then you can mess up a session. Next thing you know you find yourself furiously angry with the pc.

Why are you angry at the pc? Well, he's missed a hell of a lot of withholds on you, hasn't he? You didn't understand a thing he was saying. On his Havingness Process, you didn't know whether he was pointing at the ceiling or the rose garden. See?

Now, therefore with those amplifications and that sort of thing, you simply ask the rudiments question and you get the pc's answer *until* the pc has no further answer. It's the pc who decides he has no further answer – nobody else. He's got to say, "No, I ain't got no more answer."

Now, as long as the pc was willing to sit there and answer the auditing question, you have no recourse to the meter. He just goes on and on and on. I don't care if it's the whole session. But remember, there must be answers to the auditing question.

You can't say, "Are you willing to talk to me about your difficulties?"

And he says, "I want a drink of water." That's not an answer to the auditing question.

You, in that particular case say, "I will re – well, thank you. You want a drink of water, all right, well, we'll take care of that in due course. Thank you very much. Now, I'll repeat the question – 'Are you willing to talk to me about your difficulties?'"

He said, "But I really do want a drink of water."

You say, "Good. Thank you." Just treat it as a brand-new origin. You aren't going to get in an argument. I don't care if the pc originates the word "peanuts" thirty times every half hour, see – once a minute. Always give him an ack on it. It'll wear out before I do. I don't get upset because he is repeating himself.

Now, you'll sometimes get a repetitive rudiment sung back at you. Now, we can talk about your, "Are you willing to talk to me about your difficulties?" An auditor become quite upset by this. "Are you willing to talk to me about your difficulties?"

"No, I am not willing to talk to you about dogs – the trouble I have with dogs."

"All right. Thank you very much. Are you willing to talk to me about your difficulties?"

"No, I'm not willing to talk to you about my trouble with dogs."

"Thank you very much. Are you willing to talk to me about your difficulties?"

"No, I am not willing to talk to you about my trouble with dogs."

Well, you can go on like that forever, can't you? The very funny part of it is, you can always go on like that much longer than the pc can.

I usually start increasing my acknowledgments – the only thing I ever do to meet a situation like that. Of course, there is a limit on increasing your acknowledgments because if you gave the pc a tone one-thousand, "Okay," you know, he'd disappear. [laughs]

Sometimes I assume – I assume that I haven't understood it when I haven't. I'll make the pc tell me. See? I figure out, well, yeah, he – I haven't got it, you know. I just – and I won't have. It suddenly dawns on me that I'm not digging what the pc is saying. See. He's talking about firedogs. I get this little additional datum, you know. "I'm not sure that I dug you. I'm not sure that I understood what you were saying."

And he says, "Dogs, dogs. I'm not willing to talk to you about dogs. I have trouble with dogs. Every time I light a fire in the fireplace the dogs fall over." "Oh," you say, "Oh, oh yes." Funny thing, his repetition will cease at that moment.

The onus of understanding is on the auditor, and also the onus of making it understandable is on the auditor. That's where your TR 4 goes to pieces. You get into more trouble with TR 4 because you confuse Qing and Aing in making something understandable. You could actually make a pc sit for a half an hour and explain this thing to you that you couldn't dig and you would have a better session than by, in any way, pretending that you understood it when you didn't.

This happened last year sometime. Somebody was running old 3D and the pc – the pc all of a sudden ran into a spacecraft and was talking about oogly-boogly rotor bug drives, you see, and how mescus these things were. And his auditor was a girl, and fashionably all these rocket jockeys that now have girl bodies, you know, aren't supposed to understand anything about this in this lifetime. They keep pretending this all the time till you finally get them back on the track. Anyway, the auditor sat there just so long in a big stupidity about the thing and finally said to the pc, "I don't know what you are talking about with this oogly-boogly-bug-rug oogger-drive, or whatever it is."

And the pc who had been only moderately in-session, sat up, got very alert and explained a spaceship – this particular Mark 61 space vessel or something of this sort – in complete detail to his auditor with sufficient explanation so that the auditor actually did understand it! And the auditor came out of session saying, "And I would have bought one if I had had the money." [laughter] One of the most pleased pcs you'd ever want to meet.

Anyway, that isn't a Q and A. That is not a Q and A. But to keep it from being a Q and A you've got to preface such a thing with the actual fact that you didn't dig it.

You never say to the pc that he didn't express himself well or that he is daring to talk about something you care not what of. So don't put the onus on the pc. Say to – say yourself the actual truth of the matter – you didn't dig it, see. "I didn't understand what you said. I don't grasp what you are talking about. Dogs, dogs. What – what kind of dog? I don't understand what you are talking about." And the pc elucidates and goes off the machine at that point. Why? Because a complete comprehension takes place and with a comprehension you get an as-issness.

Your pc gets hung up all the time because you never give him the comprehension necessary to an as-issness. You can practically blow the bank up like it's full of atom bombs if you give him enough comprehension.

You can overdo this, but oddly enough I never have. I never really have been able to overdo this. I only been sorry in sessions when I haven't – when I haven't really understood what that was all about.

Now, we get down to that drill. We have a variation when we check it and it does read. We say, "Are you willing to talk to me about your difficulties? Are you willing to talk to me about your difficulties?" And finally the pc says, "Yes, I'm willing to talk to you about my difficulties." And you say, "Oh, good. I will check that on the meter." This is the first time you've paid any attention to the meter and by golly, you get a read. Well, you stay with the pc on that read because factually the pc won't know what it is. He'll go darn near bats if you just leave him completely unguided. So every time it goes with the same tick as you got the first time, you have to recognize that the tick you got is the tick that will clear it and not a different one.

So you say to him, "That. That. That one. What were you looking at right that minute?"

"Oh-oh-oh-oh-oh, well – that's oh-who-oh – that was last night, midnight – I'd forgotten all about that, but I suddenly woke up and said, 'I'll never say another word to that auditor about my sex life,' you know, and went back to sleep again."

And you say, "Thank you."

Well now, that didn't clear, did it? So the whole cockeyed action has to be done again without a meter. Don't now stick on a meter. That is a serious mistake. Don't keep checking it and getting a read and clearing it and checking it and getting a read and clearing it. Why? Because that hidden one you just pulled – the pc actually is leveling with you – 99 44/100 percent of the time he's pure. He's leveling with you. He's telling you all the answers he knows. And when you release one that he didn't know you are going to get a whole bunch of locks. So why stick with it? See, it's just good technical sense. Why stick with it, because now he's going to give you all the locks.

So you just put the meter aside and you say, "Are you willing to talk to me about your difficulties?" And he answers it.

And, "Are you willing to talk to me about your difficulties?" and he answers it.

And, "Are you willing to talk to me about your difficulties?"

And he says, "Yes."

And you say, "Good. I will check that on the meter." And you do so. And that time it reads.

So you say, "That. What were you looking at right – right then? Yeah, that. That. That." You get that located, he gives it to you. You don't even bother to find out if that was it or not. You go off the meter. "Are you willing to talk to me about your difficulties? Are you willing to talk to me about your difficulties? Are you willing to talk to me about your difficulties?"

Finally, "Yes."

"Good. Thank you. I will check that on the meter. Are you willing to talk to me about your difficulties? Do you agree that that is clean?"

Now, whatever else happens after that point, you never do anything more about it. Do you understand? It's all TR 4 from there on. But you don't ask him two consecutive times against a read, see – ever.

Now, that's the exact procedure. Now, you go at it just like a one, two, three. Always do it just exactly that way. That is a repetitive rudiment. And you'll find out that has been worked out within an inch of its life and it just worked like a dream.

The few little difficulties you get into will only be gotten into early on in auditing the pc. The pc will very soon come uptone as far as you're concerned, to a point where they audit very well by this. They never tell you any lies. You very seldom – less and less do you find your end rudiments out and more and more do actual overts by the pc read.

Now, you do that every time just exactly that way. And you clean up your rudiments that way. That's a repetitive check.

Now, oddly enough, that is the *whole* drill also of Prepchecking. You do *exactly* the same thing. There is not one *tiniest* variation in Prepchecking. You just treat every Prepcheck Zero as a rudiments question and depend on the automaticity of cycling to pick up your basic on the chain. It's going to take longer, but it's going to be more thorough, and your pc's going to stay cheerily, cheerily, cheerily, cheerily, cheerily in-session. The pc will be very happy with you – very cheerful.

You do this right – and with any given pc you never make a mistake on a meter read – and very soon you are going to have a pc going into session and being so cheerful and chatty and happy to be audited that you won't believe it.

And you start making little tiny mistakes or you pick up a pc on which little mistakes have been made and not play that pc back into a readable condition again, and your pc is going to be nattery and upset and miserable because you're all missed withholds, missed withholds, missed withholds – are all over the place.

There's a difference between night and day in the results you can get with exactly the same procedure. Do the procedure carelessly – horrible. Do the procedure very nicely, very neatly, very expertly, and the results are fabulous.

Prepcheck Zeros: Don't ever do anything extreme, extraordinary, unusual – nothing. You've just got a Prepcheck Zero is: "Have you ever stolen anything?" And that's all there is to it. And you ask the pc if he's ever stolen anything and, "Have you ever stolen anything? You ever stolen anything? You ever stolen anything? You ever stolen anything?" – as long as he'll answer the question.

And you finally hear, "No, nothing else," or "That's all."

Then you say, "Thank you very much. I will check that on the meter." Look very fixedly at the meter at sensitivity 16. Say, "Have you ever stolen anything?" And it goes *clank* and you say, "That reads." Well, don't think the pc is holding out on you. You've actually found one that he's buried himself down into and he hasn't got that one. See?

So, you've got now, "That. That. That. That. That. That."

He says, "Oh, ho-ho-ho-ho-ha-ha-ha-ha. I forgot about that thing – Bank of England." See?

And you say, "Thank you very much." – Off the meter now – "Have you ever stolen anything? Have you ever stolen anything?"

And he finally says, "No, that's all."

And you say, "Good. Thank you. I will check that on the meter. Have you ever stolen anything?" Clank! And just expect that cycle to go on and on and on, you see. But only clear it once and then go back off the meter again.

Finally, it's clean. Get out of there. Drive away from that while you are still alive. You ask, "Have you ever stolen anything?", after you've got a clean read on the meter and hell hath no ARC breaks like the ones you've just started to set up.

Because, you know why that ARC break is so rough? A thetan is closest to nothing. You've set up a nothingness withhold. That's very upsetting to a thetan. You've given him a withholding of nothingness, and of course he can't spot the nothing. See? And of course he's closest to a nothing and he thinks he himself has been missed. And he goes buggy when you try to clean a read that is not there. He's – you already – he's already told you all, you see. And you say, "Have you ever stolen anything?" One more question, see. He doesn't know what's happened to him. He thinks you are asking for him. And of course, he can't spot the nothingness that he is now withholding. He is withholding just one word, "nothing," see. You didn't buy "nothing," so now "nothing" is unacknowledged. So therefore he is unacknowledged, so it upsets him far more than missing an actual read. See the mechanism?

Now, that is all you do. Believe me that is all you do. And anything more you do than that – beyond getting your question answered, beyond understanding what the pc said, engaging in what little two-way comm passes by – anything you do beyond that, you get into trouble. And that applies to both rudiments and Prepchecking. The only difference now between a rudiment and a Prepcheck repetitive question is just that they are – one is in Model Session and the other is in forms or you've written up a flock of Zeros you want to knock out on the pc.

Now, Prepchecking comes into its own and the less – the least you goof around – the less you goof around in handling rudiments questions and trying to audit the whole case with rudiments, the happier you're going to be. And the smarter you are about Prepchecking and the more inventive you are about Prepchecking, the better off you are going to be.

An auditor should be able to take a plain form or an auditor should be able to write up a form based on the mechanics of auditing, based on the mechanics of the mind, based on his own intuition. So they are flat. All right, so they are flat. So what. So they didn't have any response to them at all. All right, good – he at least knows they didn't have any response to them. Or they might be hotter than a pistol.

No, you save your inventiveness and your intuition for the perspicuity of your Prepcheck Zeros. And you can be as inventive as you please. But once you've written down a Zero to ask the pc, then ask that Zero. Don't go varying it around. You don't vary it any. You just ask that Zero and get it cleaned with the repetitive rudiment form, you see. Same – same thing.

You suddenly woke up in the middle of the night and realized that this pc is craving – this constant constant craving – for ham sandwiches smothered in chocolate milk sodas and so forth, has a great deal to do with somebody who has been with that food fixation. Because you can't get anything on food and must be a person in some way or another. And lightning strikes and you realize that the pc must have had some member of their family who liked that sort of thing. You see?

So you just ask the pc this question, "Who do you know that likes strange foods?" You see? "Have you ever known anybody that likes strange foods?" You know? Well now, don't go getting goofy. If that's the question you dreamed up to ask the pc, that is the question you ask. You got it? And that is the question you flatten. No matter what you now go and find out, you've now made up material for a new Zero. See? Don't go wishy-washing around with the question you're asking until it is flat. When you've got that flat, now if you want to invent another question, why, great – invent another question, you see. But don't halfway flatten something and then vary the question – not with this system, because this system is too powerful.

Now, what you should know about this system is it has a liability. Now, the liability is that it pulls the pc deeply into session. It builds up a fantastically high ARC between the auditor and the pc. And your sudden goofs or perhaps a tendency to speak your mind on automatic three-quarters of the way through the session, or something like this. Whereas they never might have hurt pcs before – of course, you never had a pc in-session so they didn't bite. This time they'll bite. And you see the pc's ears fly off, man.

You say, "What the hell, what's so important about ARC breaks these days? By golly, I've done these things before and the pc's never ARC broken. Well, what's happening now? Good heavens." Well, it's just the pc's in-session. The pc was never in-session before. So the auditor's command value over the pc is fantastic – very high. So the disparity of the ARC break – just fantastic!

Now, let's say the auditor is sitting there not giving a damn what happens to the pc and somehow or another the session is carrying – the Model Session and the system – is carrying

the pc deeper into session and all of a sudden the auditor expresses his actual opinion of the pc. *Oh-ho-ho!* It's a betrayal that was never suffered between the Union and the South. The Civil War is going to result. Your meter just stops reading. Everything goes to hell.

Well now, this whole activity was invented for just one reason: is auditors were having trouble getting pcs to read on meters. You cannot improve this type of meter any further than this sensitivity or it will become unreadable. It just gets unreadable. It is adequate to find a goal. It is adequate to find this and that, but the pc has to be in-session. No electronic device is going to operate in the absence of a command value in TR 1 to activate the pc's bank.

Now, if the pc's bank is activated, any electronic instrument of high sensitivity is going to react. But in the absence of a high-level TR 1, in an absence of an in-sessionness on the part of the person being asked, you get no internal reactive bank reaction.

Well, that would be usual. People walk up and down the streets and they hear all sorts of things and people say all kinds of things to them socially and that sort of thing. And they are not affected by these things particularly. They wouldn't read on a meter either.

And you meet an old friend and he says, "Well how're ya, you old horse?", you know. Your meter wouldn't operate, see. You don't have now an engram about horses. So the common social aspect is that commonly and socially a meter is inoperative.

A person has to have some tiny degree of in-sessionness before a meter operates at all. That would be the most sensitive meter in the world. It isn't more sensitive meters, it's the degree the bank reacts, see. So there's got to be some tiny amount of in-sessionness. That the meter reacts to the degree that it does is fabulous. Even a – even a Keeler meter – these eighteenthousand-dollar monstrosities that they make up around Chicago – those confounded things, they'll even react on people in the hands of a police detective.

You think about ARC and you really don't – aren't immediately led inextricably into a course of thought which arrives at a police detective. I think you'll agree these are not associative thoughts. And even then you get some kind of operation on the meter, mostly because – at – but it's usually at that level of response that you find a detective, which is terror or something of this sort, you see. The guy is terrified. If he's really afraid of the detective you really get a reaction. You get how the thing operates? So it operates at that tone level. You would really get a pounding reaction if a fellow had just committed the crime and blood was all over the floor, you see, and the guy is trying to hide it, see. You get this terrific... And, of course, it even reads so that a detective can read it. And that's fantastic, you see.

I mean this guy is sitting there in the police station and shuffling guys through, and if he gets a single person to answer it somebody goes to jail. Look at the level of overt. What do you think that's going to do with this cop's ARC with the people he's asking, you see. Every win is an overt. Oh, my God. See, so we're not going to get very much action here.

So let's go a little bit further with this thing. Let's say the fellow was just afraid of police and has engrams on the subject. You'd get the same reaction on the meter.

A lie detector does not detect lies. Therefore – and actually they are quite dangerous in the hands of justice. Very dangerous in the hands of justice because in the first place you are not going to... There are many fine men in police work and that sort of thing, but very often

their work is undone by the terrific injustices of the fellows on the other side of them, don't you see? And cops are always swearing they could clean up all the crime in the city, you see, if the judge would only let them.

New York City – the way the bulls in New York City used to put it, they'll bring anybody in you want. Well, whether the magistrates will keep the fellows there or let them go because of influence is another thing.

But anyway, you get meters even operating at that level. But they would not operate at tiny levels of sensitivity in the presence of ARC. Your pc knows he's not – you're not – he doesn't – doesn't matter what overt he gets off, you are not going to turn him in, see. There is no liability connected with this thing so you're reading, actually, at a very high level of ARC. You are not reading in the same zone or area of the lie detector. And these impulses are very slight, man.

So you have to make up for ARC, what the situation lacks in terror and brutality. See, you are either going to – the pc is either scared to death of you and the meter reads because of high-degree terror, you see. Or you are either in good ARC with him, he wants to talk to you and therefore you have an influence on him and the meter reads. You get the idea? It's one thing or the other. So the meter – the better ARC you have with the pc, why, the better your meter reads.

Now, you start missing reads and you run into missed withhold phenomena. So, if you run into the missed withhold phenomena consistently and continually then it fades out and you cease to get the pc operating on the meter. Do you follow that?

All right. This repetitive system is so that you will get the pc *in-session* before you meter him. And just by the trick of, "He talks to you about his own case," gets him in-session so the meter reads. So you prepare a meter read before you read the meter. Then you prepare a meter read before you read the meter. So you prepare a meter read before the meter. You got the idea? And that's why repetitive rudiments and Repetitive Prepchecking will work where nothing else does. Do you follow that? That's – and you will find that will hold up.

If you want to re... fix up a pc who has gotten so he won't read on the meter, you better backtrack against questions that have been left unflat on the pc at sometime or another. Develop those questions, get everything out – you know, get repetitive answers from the pc in this same system, get all that stuff off. Then ask him on the meter. Pull the hidden one. Get some more stuff off he wants to give. Pull the hidden one. All of a sudden your meter is reading again beautifully.

So, if a pc's meter stopped reading while you were doing Goals Assessment you would assume that he'd been badly prepchecked, not that your mid rudiments were out. Oh, your mid rudiments, you see, can be put back in and they're a patch-up and you'd better use them. Yes. But, to totally not read any place – goal after goal after goal after goal – not for one tick to occur. It's never happened to me. And it means there is bad Prepchecking somewhere. Go back. You have to develop the guy back onto it. You also must have missed a few little rudiments reads, or something. You've got to get the pc operating again. And don't just keep bulling on with the Goals Assessment; take him back, check over Prepchecking, figure it all out, get him straightened out, get him functioning again on the meter. Get him in-session with you

as the auditor and now you will be able to continue on and get his goal. You see how it's done?

But that's how this whole thing is designed. That's how it will operate. And it will operate to the degree that you don't do something unusual at the middle of thing that breaks the ARC up before you find – before you've found the thing.

You build a confidence, you'll get the reads, everything will straighten out. Do you see how that system is designed?

Okay. Well, thank you very much. I kept you overtime. Thank you for being patient.

METER READING

A lecture given on 12 July 1962

Thank you.

Okay. This is what?

Audience: The twelfth.

Twelve-twelve, huh?

Audience: It's not twelve-twelve – twelve-seven – yeah – twelve-twelve.

Twelve July, AD 12. All right.

First lecture Saint Hill Special Briefing Course having to do with meters. Meters, their importance.

With all due respect to meters, I feel I should apologize for coming a little bit late to this lecture – three, four, five minutes. But you should realize that this particular planet has a great many lures. There are all kinds of things. There's drink, you know, there's beautiful women. There are all of these various things and they lure you away and distract your attention from what you should be doing. And recently – I'd had a Lincoln for ages and – since about 54, and I traded – I sold it and got a fantastic price for it. And then I traded the – an old Humber we had out here for it, you see, and I got me a Jaguar and – a 60, 61 Jag – and came out all straight on this. And I regret to have to report to you that the Jaguar is leading me astray. [laughter, laughs] I went out to take a fifteen-minute run to get some fresh air and came back three hours later. So you see, sometimes it's drink, sometimes it's women – in this particular case it's a Jaguar. You'll pardon my weaknesses. Blame it on the planet.

Well, I was actually celebrating. I felt I should go out and get some fresh air and look at the countryside and celebrate, because you don't know it yet – but we've cracked it! We've cracked it.

In scientific research one follows certain laws. Take far too long to enumerate them. You'll find some of them I've used in Dianetics and Scientology are actually developed for the first time and has made it possible to crack some problems that have been cracking people. And, nevertheless, somebody comes along and tells you we don't follow the laws of research as used, well, I'm afraid that they are adventurous in the extreme because any law of research this planet has we follow and better – to an enormous extent. See, they just don't even vaguely have the rigor of research that has been followed in Scientology. Because we're not interested in anything but effectiveness and we've been cracking away – not at the idea that everybody was crazy – we've been going in a somewhat different plane and on a different road up. When

you can get a research problem down to where you have one variable and there's only one thing you have to remedy to straighten things out, why, *voilà!* You're there, you see.

All right. Clearing people, fixing up needles and states of mind in order to sit quiet enough and find somebody's goal – we've got that sort of thing. We've even got CCHs. They go tremendously far south. We've got all kinds of stuff here, you see. And I take a look at you and realize you've been audited in the last twenty-four hours and I can't figure how that possibly could have happened. Don't you see?

So there might be fifteen, twenty, thirty things wrong, you know. Might be a lot of things wrong, so during the last couple of months, having observed that auditors were not actually able to get a uniform result one way or the other, I started taking every variable out of technology that I could take out of it. And I just started stripping it down and testing what we were doing and stripping it down and testing that, and we finally got the Model Session the way you're running it right this minute. Without a single additional process, if something is wrong with the Model Session questions, you just use the question. That's quite a trick. Took all of the difficulties out of Sec Checking. You see, Sec Checking was followed by Prepchecking, was followed by Repetitive Prepchecking. Now the difficulties of Prepchecking by the Withhold System and all of the old Sec Checking difficulties are resolved – to all intents and purposes – right now with what you're using and calling Repetitive Prepchecking, you see.

Of course, tremendous background work has gone into all this which includes first a meter and then refining a meter and then refining a meter and then re – then abandoning them because no, it didn't work, and then refining a meter and refining a meter and refining a meter and we finally got the Mark IV. All of these things...

But still as – a pc could walk out of a session and look wobbly. See? Got everything streamlined down. Auditors are men and women of good heart. Nobody is questioning that. There must be something wrong here someplace or another.

And now I know that the variables are out of it as far as the human mind is concerned. There are no variables. You do your Model Session without any additives, your beginning rudiments and your middle rudiments and end rudiments, and you do the Prepchecking with Zero Questions which are applicable to the case and will straighten the case out. And you move through into listing goals and finding goals, and then listing the goal that is found – you're going to have a Clear on your hands. I mean, you can't help it. But, the pc could still walk out of session looking wobbly.

So I set you up last night. I said I'm going to watch three auditors, not necessarily all Class III-type auditors, very far from the worst auditors present and I'm going to look at these auditors, and I'm going to let you look at these auditors, and we're going to see what they're doing here. And I found out what they were doing. I never would have dreamed it – never would have dreamed it. We found the one variable – *the meter read*. The meter read. Now all three of these people have been reading meters for an awful long time. These three people should know a great deal about meters.

And it works out this way: All you've got to do to muck a session up is clean one read that is clean. That's all you've got to do to muck a session – to just throw it into a cocked hat.

Louse it up, but good. Just clean one thing that's clean. You can check something that's clean, but don't go clean something that's clean. Pc will go into a cocked hat every time.

And the other one is: Don't *miss* cleaning something that reacts.

Those are the two crimes of meter reading. Cleaning something that is clean – and failing to note something that reacts.

There's little to choose between which is the most serious. Frankly, there's little to choose. They're equally serious.

Why is this serious? Well, basically a pc has a certain knowingness. He may be occluded – he may be all buttoned in the cotton batting and black wool – he may be packed as tight as sardines ready for shipment. He may be all of these things, and yet permeating this hard core is an instinct, an intuitiveness. See, he basically knows. You can't kid a pc and that's a very important datum. You actually cannot fool a pc.

And any auditor that's going forward on the course that the pc can be fooled is being very foolish himself. He's being quite misguided. A pc knows when a question is hot, even if he doesn't know the answer. And he knows when one is cool. See, he knows there's nothing there or he knows there's something there. He has a something-nothingness sensitivity. He can sense if there's something there. He can sense if there's nothing there. It requires help before he can tell *what* is there – or before he has a high certainty that there is nothing there. Don't you see? I mean, you're now transmitting from an intuitive feelingness to an analytical knowingness. And this intuitive feelingness is not articulate. He can't tell you. You look at the fellow and you say, "Do you have a present time problem?" and so forth; and now you're asking him to express it analytically and give you what the problem is and all of that sort of thing. Well, he's not going to be able to do that very well.

But let's take the reverse. He doesn't have a present time problem – we tell him he's got one. Now, it's not aberration that objects. It's just this intuitive feelingness. He knows he hasn't got a present time problem right here and now. He knows he isn't worrying about anything.

Now let's take the reverse. Let's take the reverse. The pc has a present time problem and you tell him he doesn't have one. Either statement, if contrary to the fact – fact merely being established by this intuitive feelingness of the pc – will cause a disagreement between you and him.

Now, what you're basically doing is invalidating the knowingness of a thetan. Oh, a thetan will put up with a lot of invalidation of this knowingness. He has put up with a lot of it and so on. He can be overwhelmed by that invalidation. All these things are true, but he doesn't have to like it. That is the final test. He just doesn't have to like it. He can walk down the cloister every day and pray before Moloch or whatever they have in the monastery these days. Very hard for me, you know, to keep up with these various transient religions. And this situation – he can say, "Well, God is great," or "Moloch is great," or something of the sort. All right.

He's used this as a pitch on others. He's used this as a control mechanism on others. Used it to overwhelm others. So inevitably, because of the overt he gets overwhelmed. Did

you ever notice how unhappy they are when they are doing this? Well, what's this unhappiness? Why aren't they really relaxed about the thing?

This feeling of internal peace that you hear about every once in a while, I've investigated occasionally and found it was mostly a light in an implant which was moving across the thetan at regular intervals or something like that. He was nervous as a cat about it. Terribly nervous for fear his internal peace was going to be distorted or destroyed. But we're not off on any anti-something-or-other pitch except just truth is truth.

This fellow hasn't got a present time problem; you tell him he has one. Well now, you're auditing actually at a higher level of knowingness and awareness than human beings ever achieve. You've got his awareness and his knowingness all keyed-up here, and this intuitive feelingness of what is right and wrong is particularly present in an auditing session – far more so than out on the street or in the cloister. You've heightened this. Now you say to this heightened perception, which hasn't got a present time problem, "You've got a present time problem." Well, he's got a long way to fall.

Perhaps snails don't mind being stepped on because they haven't very far to squash. Do you see? But I think even a snail would mind falling off the top of the Empire State Building. See, the auditing session gives him a long way to fall. See, and you talk about ARC break – I call your attention back to anatomy about downcurves. It's the steepness of the curve per unit of time. The artificial tone of the pc or the tone which he is able to attain in a session is quite ordinarily much greater than he attains in life, you see? Now you give him one of these speeded downgrades – one of these downcurves – and you let him fall twenty tones in a 20th of a millisecond, see? Well, it comes to him as a severe shock and you get an ARC break.

All right. He's got a present time problem. He's sitting there worrying about Aunt Phylbia. He's just worried stiff about Aunt Phylbia and all of a sudden the auditor says to him, "You haven't got any problem with Aunt Phylbia. There is no problem there." Well, he's had this treatment often and he's found out that that didn't work either. You can't go around and not-is all the problems and wind up with everybody happy. So he knows that doesn't work and he knows that's wrong. But basically what he knows is he's out of agreement with the auditor. That's the first thing he knows. He's out of agreement with the auditor.

So let us say *hopefully* before the session got wheeling, he had a session. He had it mocked up he was going to have a session at least. He probably had a session at start of session, he'd maybe have a session through the first rudiment, don't you see. And, maybe the first rudiment even builds it up into more of a session, you see. Well, this guy could be likened on to somebody who is doing a high, steep fighter-plane climb, don't you see. He's going up. His awareness of his own mind, of his reactive bank, feelings – all these things are heightened.

And you get him nice and heightened and then you say, "Well, you don't have a present time problem with Aunt Phylbia." And he's hauled down because he thinks he is in good agreement or rapport with the auditor. And when he finds out he is not and the degree of the finding out "not" is a horrible shock to him. And he doesn't fall the ordinary one-millionth of a tone that George falls as he is standing behind the bank window and he said, "I've got a cold" and the bank customer says, "You haven't got much of a cold. You should have seen

Aunt Isabel's," see. He maybe does a little fall – about onemillionth of a tone, see. This pc does about twenty tones. Steep, steep. You've got an ARC break downcurve.

Well, all of this – all of this is the discovery of disagreement. This comes under the heading of that. He discovers that the auditor's in disagreement with him. He's in disagreement with the auditor and he thought he was in agreement with the auditor. And the degree that he thought he was in agreement to the auditor, crystallizes the degree that he suddenly realizes he is out of agreement with the auditor. All things are relative. And if you've got an agreement that's built as high as the Empire State Building, the first scrap of disagreement will appear as high as the Empire State Building.

Now, that should explain to you why a pc carries on so, when ARC broken out of a session. They aren't like that in life. They aren't like that at all.

You ought to see this fellow. In life, why, somebody walks into the store and says, "Hi, you old horse thief," you know. "You look like hell today." Doesn't change his mood any. He says, "Hello, Bob." You know, nothing to it.

In a session the auditor suddenly says, "You're a horse thief." Doesn't go, man. If the session ARC, you see, was as high as the Empire State Building, why, this disagreement erects a duplicate structure of ARC break, see.

It's pretty wild, and it's just all out of importance. The importance of it to the pc is fantastically great! It's as though he has suddenly been hanged for murder. And listening to a pc who had just been thoroughly ARC broken, you would be sure he was being unjustly accused of having too many bodies on his hands and being dragged off to the local galley – gallows, you see. You'd be absolutely sure that this was what was happening. If you listened to his tone, if you listened to the emotion involved with the thing, if you could measure out how bad he feels about it and so on. These things in the work-a-day world of hanging horse thieves would be tantamount to being betrayed by his whole family, turned in by his most trusted servant, you see and hanged for a crime, barbarously, that he did not commit. You'd think this was the circumstances.

Let's say that we were auditing in Japanese and you didn't speak Japanese, but the auditor who was auditing was auditing in Japanese – and you were to hear this ARC break come out – and you'd think, why – my God, that auditor must have broken out a knife or a samurai sword or something and taken several passes at the pc's head. But even that wouldn't have caused that much upset if you just listen to the emotional content of all this – he must have at least cut off one of his hands. There's something going on here, you know. You'd think.

You hear it in English – you understand it better, you see. You understand that it's all evolved out of the fact that the pc was told he had a present time problem reading on the meter and there hasn't been a present time... He – as a matter of fact he is sort of happy all afternoon. It's been the first afternoon, let us say, that he hasn't had pressing present time problems for a long time, you see. Let's just steepen the thing up, you see. And this auditor has simply said to him – nothing more than this: "Do you have a present time problem? That reads. What is it?" That's all the auditor has said. The auditor's not done another blooming thing. You've

had it from that point on – if that meter really didn't read. There was no read on the meter at that point whatsoever.

The pc, at a heightened level of his awareness of his own condition, instinctively realizes that he doesn't have one. So you're foisting off an untruth. Well, here he is swimming in the direction of truth for the first time in the last couple of hundred trillennia, and he knows the cage has suddenly been unlocked and here he goes, and all of a sudden here's this fantastic falsity which has entered into his environment and he reacts accordingly.

Cleaning a read that is clean or failing to clean a read that is reacting – produce almost equal magnitude.

The first is the most mysterious because the pc can't find out what's wrong because the withhold is nothing. See, he can't find out what's wrong. Actually, it's just withholding nothingness. What is wrong is nothing. That's what is wrong. A nothingness is wrong. It isn't nothing is wrong. The language hardly even handles the sense of it.

All right. So what do we get here as the greatest order of error? I want to give this to you the way that you will find it very easy to hand it on to anybody you're instructing or anything like that. It's very simple. A very simple statement can be made, which is as follows: You can have one lousy TR 4 in a session, can't you? – without busting it all up. Pc said, "I'm sleepy," and the auditor said, "Mm-mm." The pc said, "No. I said I was sleepy!" "Oh, oh," the auditor says, "Oh, oh." Wakes up himself, you know. "Oh, oh, okay. Yeah, fine."

That doesn't downcurve the pc particularly. You can get away with it. Oh, it's not good – but you can get away with it. You don't bust your session up one side and down the other side.

You can drop a TR 1 – even occasionally a 0 or a 2 and a 3, and still get away with it. You can forget to check a question and it won't cause the whole session to cave in. In other words, you can do at least one of any of these things.

See, you can forget a rudiment without absolutely smashing up the chinawork for blocks around. Pc's liable to say, "Hey, you forgot a rudiment." No, a pc doesn't act as though he had just been disemboweled.

No, the one that you can't do – see, you can do one of anything else – but you can't do *one* clean a clean read. And you can't do *one* neglect of a read.

Now, I'm sure that as you start going along the line flawlessly in auditing with meter reads, you will soon recognize the validity of what I'm telling you.

The one thing you can't do and still have a session come out right is a flubbed meter read. Whether it was clean and you cleaned it – or it was reacting and you didn't clean it. You have one flubbed meter read and you're going to watch everything go to hell in a balloon in that session.

Now, when you're used to missing them you get an entirely erroneous idea of what a session looks like and how a pc behaves. You get an entirely erroneous idea.

Auditing isn't the same thing at all. It's a sort of a half-out-of-session: "I don't mind ARC breaks; it doesn't matter to me what he does; I can somehow or another carry it along

anyhow on my own hook; and after the session even if he does flub, I can probably audit it out myself."

One has answers for these things, see. But there's not much ARC involved with it and there certainly isn't very much heightened awareness of the bank and ease of blowing and that sort of thing. The things that are supposed to be in the session aren't there.

Yeah, you go along and you get so you actually can become hardened into something called auditing that misses reads and cleans things that are clean and there are protests go along on this line and "Auditing is basically a sort of a protest," isn't it? I mean it's a "Good pc'ing is not letting the auditor get too close to you so that he can louse you up." I mean, isn't that by definition? [laughter, laughs] So naturally you really don't see fast auditing.

Now, auditing is as fast – in almost direct proportion – as a pc is in-session. Because the more he is in-session, the more easily he can blow things. And the less he's in-session, the less easily he blows things. So the length of time it takes to audit anything is bounded on all sides by the degree that the pc is in-session.

Let's clean up five Prepcheck questions. Pc's beautifully in-session; meter's reading gorgeously; the auditor has flubbed nothing; the auditor flubs nothing; everything goes along swimmingly and gorgeously, five Prepcheck Zeros. You begin to wonder what you're going to do with the rest of your time in session. See, they're all beautifully cleaned up and your session's only thirty-five minutes deep. And yet a lot of material came up on this. See? Guy feels a lot better. What are you going to do with the rest of the session?

All right. Pc not much in-session. Five Zero Prepcheck questions – five Zeros. Week – week. At the end of the week you kind of have to scant them because you can't do all that, you see. That would be the difference. Don't you see? There's how the old factor of "five to one" came about. It may be altitude to some degree. It may be the presence to some degree. It may be this and it may be that, but it's certainly – it's my meter reading that gave you the five to one. I don't miss on these things. I don't know why, but it just never occurred to me to. So, of course then it never occurred to me that you ever might.

No. Last night, Wednesday – Black Wednesday – it became very obvious. It became exceedingly obvious that there were, in the best session we saw – the best session we saw, there were read misses. See? Uncertainty – which was so great that it was actually transmitting: uncertainty. Worst one we saw there was actually miscalls, many of them. And you saw a pc moving on out of session.

Now, what is most interesting is that a pc is there to get audited and may – you may not have realized what a persistent cuss a thetan is. You may think of a thetan as somebody who can be overwhelmed and who can be crushed and who can be this and who can be that. To a limited degree that is true – to a limited degree it is true. He can get in such a position that he cannot outflow or communicate to the degree that he might. But do you know, he never stops trying. That is the fantastic thing about a thetan. He never really stops trying! He's got some idea that he is going to wipe out the civilization of the continent of South America and by this time he's deleted down to being one of these crazy-looking dogs they have in Mexico. But do you know that little dog sits around and every once in a while he'll – wipe out

the civilization of South America, you know? South American comes by and the little dog does what he can. [laughter] He really never stops trying.

What is fantastic in child – this is particularly notable in child handling – you think this little kid is "little," so forth. Well, it's utterly fantastic. As long as that kid feels that he is going to get anything borne in upon him from some quarter or another, he'll keep revenging himself on that quarter. This is what you call a bad child.

I've worked this out so often and observed it so often that I'm absolutely flabbergasted at the complete accuracy of it. Nursemaid shows up. She's going to push one of the children's head in, you see. Honest, from that time on she really never has a – he really never has a calm moment. It goes from actual insolence on the part of the child and outright disobedience – to spreading rumors and scandal and covert disobedience – to apparent obedience that always seems to spill the shoe polish all over the nursemaid's bedspread. And it just goes on downhill, to being terribly ill and impossible to care for and keeping everybody up day and night, see.

But this little kid is still trying. See? You can follow this impulse, "Get even with the nurse," you see? – right on down through a full cycle.

And although the manifestations of trying are enormously different and are hardly distinguishable as a gradient scale sometimes, you can carefully trace them all down and get all to the base of it and you'll find out, good God, this kid is still trying.

This person is coughing at the dinner table. If you trace this thing down meticulously as though you would trace down a tiny cough – because, you see, this cough the person is coughing, at best you could only trace down one tiny little portion of this cough. Don't you see. But if you want to know when it turned on and they started using it in this lifetime, it will be the end product of getting even with Father. See? Father: the harsh disciplinarian, the this, the that, the other thing. And the little kid sat at the table, and got down to a point where the only action that could be taken was spasms and fits of coughing at the dinner table, because coughing was very annoying to Father. This is your pc's cough, see.

Because of the GPM and the stronger forces that are at work, these facts tend to be obscured because it's quite difficult to run them down and doesn't pay too much cash award to run them down. Because after you've got rid of this source of the cough then you pick it up in some other lifetime. They were annoying somebody else then, the cough turns back on. And then, like a fellow I backed out of his head one time, I – he finally found out *he* was coughing and the body wasn't coughing at all. That's right. He was coughing – standing there ten, fifteen feet back of his head coughing like mad. Always, ever since he started coughing, he'd always blamed his body for coughing. But the point is, he was trying to make some point good. He was trying to reach in some direction and a thetan just never stops trying, that's all. You set him up a target to reach at and he'll try. It's fabulous.

Now, when you conduct a perfect session and then suddenly set up a wild, random wrongness somewhere in the session, you catch the pc off-balance and the pc goes to – into action reactively. He actually is powerless to stop himself from going into action. He'll say things, he will be cross about things because you had the reactive bank all stretched out, and let's say it was made out of rubber bands, you know. And it was all stretched out and it was all

fine and he was busy spotting, you know, various points of it, and this is the anatomy of it, and he's got a chance to straighten out this thing, and he's doing fine. And then all of a sudden somebody lets go of all the other end of the rubber bands. He finds himself in this mess. And he gets overwhelmed at that point and he starts dramatizing whatever's handy. And actually he's just got thousands – hundreds of thousands, perhaps millions of these instances of unfinished cycles of "still trying," and they will go into action. They'll go against the auditor.

The final denouement – he'll say he didn't get any result. That would be one method of getting back at the auditor for doing this. He didn't get any result. It's actually worse than this: he gets negative results. He can actually dream up a negative result. He can get very subtle and very involved about this. What you do is convince the auditor – he can get down to this point – you can convince the auditor the auditor has gotten results and then you fix it up so somebody else knows now you haven't. But this somehow or another gets back to the auditor and we get a terrific confusion going here of one kind or another.

These are all dramatized things. These are all efforts to get back at, to fill in the breach – the dramatization of all of these things.

A pc is in control of the bank. Suddenly, the auditor's force and power with which this bank is being held up for inspection – see, it's auditor plus pc is greater than the bank – auditor makes one mistake on the meter, we have deleted the auditor from the session. The bank caves in on the pc and the pc dramatizes. It's very elementary.

It's always good news when you have only one error to locate. You can't always locate what's wrong. You can go on fumbling around. Supposing twelve things were wrong. See? Oh man, you could hunt and punch for those for a long time. No, the only thing that's wrong in Scientology today is meter reading – that's all. There isn't anything else wrong.

Look, if you guys in just a few days can learn to do repetitive rudiments and Repetitive Prechecking and more or less master a new Model Session and do all that sort of thing, and – we well know that your TRs – and we've isolated what Q and A is – we know all that can be straightened out. Well, these things, then, pose no difficulty. They're actually a no-difficulty status. No difficulty involved in any of that.

Well, where is the difficulty? Where is it? Where is it that drives the auditor to use an unusual solution to patch up something that's happened wrong? See. He's got to have eighteen new middle rudiments to put the pc right. Well, how come he needs eighteen new middle rudiments to put the pc right, see? Well, the pc must have been driven wrong somewhere.

Well, I know by careful inspection you don't need any more beginning rudiments than you got. You can delete the Havingness. As a matter of fact, too often it throws the pc's attention out of session. Pc is feeling bad, you can build his havingness up with O/W. That's havingness. Sure keeps the pc's attention on his bank. You don't want a pc extroverted at the beginning of session. How would you like to sit there and for half an hour persuade the pc – you'd never do this – but, persuade the pc to examine some locks or pictures. You know, persuade him that he should be interested in what's going on in his head. Think of that. Think of that. Can you imagine yourself as the auditor sitting there saying to this person, "Well, actually you're – you should look at those pictures. You say you have a pain in your chin. Well,

you should look in front of your face, there." And the pc said, "Oh, no. I'd much rather look at these walls."

Well, you could go on like that for quite a while. Once in a while you will find this kind of a condition. But running Havingness at the beginning of session tends in the direction of setting up that condition. Pc's all prepared to be interested in his bank and himself and his reactive mind and you say, "Be interested in the wall," don't you see? So to that degree, to that degree – it is not a serious error, not for a long ways. But there is something in favor of dropping it even though the pc's havingness might be down. See, on the average, on the average – down havingness will wreak less havoc than taking the pc's attention off of what his attention is on.

Now, if the pc feels bad, it's because of the overt-motivator sequence. That's right. That's the only reason the pc feels bad anyhow. It's the only reason he got a GPM – is basically, he's got this all in the woof and warp of the bank already. So, here he is. He feels bad and that sort of thing, and you run O/W, his attention will get on his bank and he'll get interested and he'll go into session.

Your problem with a pc, of course, falls under the headings of every problem an auditor has ever had with a pc. Communication, control – keeping the pc's attention on what you're doing, getting your auditing questions answered: all of these things. Oddly enough, to a marked degree, you have mastered these things. And sometimes have had them deteriorate and you have been overpersuaded into unusual solutions and actions and doing something else and Q-and-Aing and getting very anxious about the pc. You get thrown. Do you see? Why? Well, the pc apparently is out of session. This is one of the most baffling manifestations. You've carefully put the pc in-session by the best way you could and you'll find the pc is out of session somehow.

What drives the pc out of session although you're trying to put him in-session? Well, let's take Havingness out of the beginning rudiments, which we have done – just to prevent any possibility of this ever doing this. So we get good shooting all along that line. Let's patch this up any way we can by any mechanism we can. And it's all patched up – you don't have to do anything unusual about it. But we find this pc is out of session. He was terribly interested in his ulcers a minute ago and he's not interested in his ulcers at all now. Well, what happened? You missed a meter read. That's the answer to it.

It must sound peculiar to you. I tell you all you've got to do is run two or three Havingness Prepcheck or just – pardon me, Rudiments Havingness, you know, Model Session Havingness sessions – Havingness in the body of the session, which is gorgeous. Just run two or three of those and your pc's needle smoothes out. And yet there are auditors here who have run eight, ten or twenty of them and have had a rougher needle at the end of the time than they did at the beginning. See? I don't know if that was true or not, but the observation I have made could have been contingent upon several errors. And it could have been this error and that error and another error and some other error. And these various errors, all combined, could bring about the situation where the guy's needle gets dirty. See? We could be hunting for the needle in the haystack, in other words.

In every auditor we could be looking very carefully around to what *is* this auditor doing wrong? Is it TR 0, 1, 2, 3, 4? Is it his Model Session? Is it his – the way he snaps gum in the middle of the session? What is it? What is it? We could – it's this, it's that, it's the other thing. No, we don't have to look around like that.

The auditor is driven into looking bad by the fact he isn't getting results. And he starts looking bad. He starts getting anxious. He sees that his orderly and disciplined approach is apparently producing no good result, so he'll start doing other things to reach the pc, to produce an effect of some kind or another. His Axiom 10 is being thrown out the window and he starts breaking down his own discipline. He is – he hasn't anything to grab onto. His reality is poor.

All right, the Instructor comes along and tries to patch up this auditor. And he stands back and he gives him a terrific analysis of the thing. He watches him and he says, "Well, your TR 4 is quite weak. Your TR 0 could be improved, and you do always seem to make an awful clatter there writing up your auditor's report, so we can improve that. And you really haven't got this drill down exactly right as to when you ask on the meter and when you ask the pc – you haven't got that drill quite right. We'll straighten out that."

And we straighten out all these things meticulously and the Instructor works, you know, and his perspiration soaks into the grass – kills vast areas of grass off. And this auditor is finally all straightened out now and everything is fine and so forth. The auditor goes back into session and the pc ARC breaks and it all goes to hell. And the auditor, in his anxiety to help the pc and Axiom 10 and so forth, he starts doing unusual things and adds twelve more beginning rudiments and changes the wording of all the end rudiments and finally decides he'd better finish the session with, "Give me that hand," you see – a Prepcheck session. It seems to work for him, you see?

The Instructor gets a lose and it's reported to me, you see. And you say, "Well, it's just something or other isn't working and we're not quite sure what it is." And I decide once and for all what was doing it. That's what's doing it. Very hidden. Very mysterious.

The auditor in the first place wasn't actually getting the pc all this upset with his TR 4 or something like that. That wasn't really what was upsetting the pc. The auditor was missing meter reads. The auditor was insistently saying, "Well, it says right here," (as you saw last night on TV), "It says right here you have a present time problem so you – you've got a present time problem. That's all there is to it, see. You – what do you mean you haven't got a problem? Goddamnit, there it is!" [laughs]

This sort of an approach... And so the pc got all frayed around the edges and the session went to pieces and the auditor lost his drill. And so the Auditing Supervisor gave him a GAE and the Instructor looked it over and he says, "Well, this could look lots better," and straightened him all up and he goes back into session again and he does the same cotton-picking error. See? He just cleans up a clean read, you know.

Everything was going swimmingly in the session. They'd gotten down to, "Have you ever raped anybody?" You see? And there was a rape, you know. The guy had a rape on the thing. And the auditor says, "All right. I'll check that on the meter." It's clean as a whistle, see? "Have you ever raped anybody?" Nothing. And the auditor says, "All right, what's that?"

And the pc says, "What nothingness am I supposed to regurgitate here?" His reality breaks on the situation. First of all, he credits the thing, and so forth and so on and so on.

By this time he's got an ARC break and there is a read on the question "rape." It'd clean up instantly if the auditor simply had presence of mind enough to say, "Is there an ARC break here? Here, that. That."

"Oh well – huh, yeah."

And then asked the rape question again and he'd find it again would be clean. But if the auditor were particularly abstruse and obtuse, the second time he asked the rape question and got no read, he would see a read.

We don't know sometimes – they read a phantom needle. Maybe they're reading them – a needle they got mocked up because they themselves have got a rape on the case, see. We don't know what this is, but they will see a read here. And then they go and thrust it down the pc's throat and the whole situation goes to pieces. And the auditor walks out of that session and says, "Well, standard drills don't work." See?

The wrongness is the imaginary read – the erroneous reading of the needle. See? And out of this – this having the one thing you can't do wrong – we get a pursuance of a tremendous number of things going wrong. And then, of course, anybody can sit around and see these things going wrong. After all, the auditor picking up his E-Meter and hitting the pc over his head with it – that anybody could observe that that was going wrong in a session. So, you see? So they say, "Well, this auditor has an antagonistic attitude toward pcs, you see. And we'll give him some auditing and we'll do a 6A and we'll clean up all this antagonism he has toward pcs."

We send him back into session and this time he just stands there and kicks the pc's shins one after the other – in rotation – one, two. We don't see what has preceded this. What's preceded this is an erroneous meter read.

Now, that's the one thing that is difficult to supervise. You don't have a Supervisor stand in back of everybody all the time seeing how they did. And at this particular stage of the game you haven't got enough coaches or Supervisors who can read a needle accurately every time to tip you off. You understand? So your situation – your situation there, it just goes unobserved – whole thing goes unobserved.

Now, we can find lots of reasons the session went wrong: The auditor came a little bit late to session; the pc was annoyed with the way the meter was set up, *clang-crash-bing-pow*, you know and the cans dropping on the floor; there's noise in the same room – there's another session going on so we can attribute it to that. The pc feels a little bit fluttery and upset and the auditor forgets the first part of his Model Session and says, "All right. In this session have you been critical of me – I mean start of session!" You see, something like that – he makes some minor boob. Well, we say that would obviously wreck a session. And we have been built into a belief that a session could be wrecked by things which actually wouldn't wreck a session. They could be patched up. They could be straightened up. No, a session is wrecked by the invisible thing. This was a hidden thing.

The auditor was sitting right there and he said, "Do you have a present time problem?" And he said, "That reads. What is it?"

And the pc said – pc tries, see? "... I don't know ... I guess it's with my own pc. Yes, I'm having trouble with my own pc. Yes. That's it."

All right. And the auditor said, "All right. Thank you. Do you have a present time problem?"

"No. No. That's all. That's all."

"All right. Thank you. I'll check that out on the meter. Do you have a present time problem?" See?

There's no more read than a rabbit on this meter, see. Nothing. And he says, "That reads," he says, "What is it?"

And the pc says, "Do I have a present time problem. Well, now I have got one. It's the problem of having a present time problem."

See? Here he goes. It's the missed withhold of nothingness. And the pc goes right down the spout. So you say, "Well, do you have a present time problem?" It falls off the pin because it's falling on ARC break, see? You get an ARC break fall.

And the auditor says, "Well, that's clear. You agree that's clean?"

Pc now knows he has an ARC break and he feels very nervous, feels very upset one way or the other. Isn't responding well. So the pc says, "Oh, yeah, yeah. I agree it's clean. Yeah."

"All right. Now, let's get into this Prepcheck. All right. In this lifetime, have you ever been mad to a pc? That's clean."

"That's clean? *Me?* ...All right, if he says so."

"Have you ever taken any money and never given any auditing in return? That's clean."

"It is?" [laughter] "Golly, you know, maybe I cleaned that off in that other session ... I must have – somewhere ..."

Got no meter reads practically for the next – rest of the session until another ARC break occurs, somewhere here. Now the meter starts reading all cross-eyed and crazy, see? Finish up the session. Everything's a dog's breakfast. The pc feels bad and the auditor doesn't know what's wrong. And everybody is attributing it to something else.

But nobody was standing there pointing out the fact that the very first time he tried to clean something that was clean, and maybe he committed the felony of doing it again, he set up a situation of a missed withhold – the roughest missed withhold there is – the withhold of zero. The nothingness. There it went. There went his session. And he never does spot this as a missed withhold and the pc doesn't spot it as a missed withhold or call it such and of course it never cleans up. So you've got 3 May HCOB in full bloom. Right in the session and your meter stops reading, eventually. It goes on down on a gradient and stops reading.

Now, if this happens session after session after session, you get an automatic sessioning on the part of the pc. You get a pc trained to self-audit while faced with an auditor. The pc never waits for the meter read one way or the other. He unloads to you his withholds. See, he gives you this, he gives you that. He said, "Well, I've been very careful since the last session – so on and so on. Yes, I have a present time problem with so-and-so and so-and – I also had another problem with so-and-so and so-and-so and I had another problem with so-and-so and so-and-so and I got another problem with so-and-so and so-and-so. And that's about all the problems which I have, and so forth, and those are my problems. Okay. There aren't any more."

The auditor will say, "I'll check that on the meter. Do you have a present time problem?" Gets no read and says, "That's clean." And goes on from there.

But the pc, if you'll notice, oddly enough, is beating the gun on practically every question – hardly waits for them to be asked. Here's your gopher sitting on top of the thing right up there in PT. He's keeping his own rudiments in – keeping his own rudiments in. You're nulling on a list – he keeps his own rudiments in.

Perfectly all right for a pc to say, "Hey, I just invalidated that item." The auditor should do nothing like auditors sometimes – when a pc volunteers something, why, they do the mid ruds on nulling. Man, that's a way to shut your pc up in a hurry. But you'll find out the pc who's really been mauled around with bad meter reading who keeps them in obsessively, he'll say, "Just a minute. I want to get this Invalidation off and that Careful off, and I got that and that's all straightened out now. Okay. Carry on." And the pc actually is running the session.

And that automatic attitude, self-auditing attitude, while in session, is borne directly and *only* from bad meter calls. Self-auditing of that particular type, right there in session, occurs only when the meter has been called upwards and backwards. Nobody is trying to say that self-auditing is no good and doesn't work and that sort of thing. There isn't anybody ... There isn't a soul here who hasn't done some self-auditing, even if on such a mild basis as: burns his finger and there's nobody around and he stands there and touches the side of the cook stove a few times until the finger burn goes out. Auditors are always doing that sort of thing. We're talking about the thing where the guy can't have an auditor. Well, he can't have an auditor because he can't trust meter reads anymore.

Now, you find a pc that has the word "difficulty" charged and the word "problem" charged – as minor thoughts these are terrifically charged – then use bad TR 1 on him so the whole thought doesn't register and you only get the minor-thought charge. Then try to clean the word "difficulty" while asking, "Are you willing to talk to me about your difficulties?" which doesn't clean the word "difficulty." Do you find – do you see what I'm talking about? And you'll see a session fall right straight into the wastebasket, because there are no answers.

You see, "Are you willing to talk to me about your difficulties?" is not going to clean up the read on the word "difficulty." You understand, I'm saying this guy has a charged thing called "difficulty." He's got a button called "difficulty." So where you – wherever you have a sentence, if you – in the absence of good TR 1 – wherever you have a sentence where the word "difficulty" occurs, even in life, why, there's an instant read at the end of "difficulty."

All right. Now, we try to clean up this rudiment with the poor TR 1, because the word "difficulty" is reacting. You're going to be in a mess in no time at all. Do you see what I mean? Because you're trying to clean something that isn't there. Well, it isn't that subtle. It's not that subtle. You don't have to worry too much about the TR 1 and the end words.

Those catastrophes will happen to you, too. You should know they exist so you can straighten them out. No, the catastrophes all occur unwittingly. The auditor doesn't think anything is happening because he's not aware of having made a mistake and the pc just goes into a total fog. The ARC breaks bloom in all directions. The pc ceases to read on the meter or starts reading backwards. Every time the auditor says anything to him, he has an ARC break, so he reads. Something wild is going on from one end to the other, and of course, we get no auditing done. Worse than that, we get negative auditing done. If you keep this up on meter reading, you'll drop graphs.

If you want to know – really drop a graph, get an intermittent fault in the E-Meter. You know, you part one of the wires so for every ten minutes, it's out for ten minutes. Do it for twenty-five hours and look at the graph, before and after, of the pc. It'll drop.

In other words, the technique and routines and drills of auditing are not great enough or powerful enough to overcome the liability of missed reads or cleaning clean reads.

And in a session, the number of reads that you can miss is exactly none. This is something that has to be done perfectly.

It's a tolerance of zero. There is no tolerance of any kind whatsoever. You just never miss a read.

That doesn't say you can't say occasionally that one is equivocal or something of this sort. You can, and read it again. No. It's – don't – don't misread. One misread will throw a session into a cocked hat. You can ruin a whole session with one misread. What do you think happens in a session where you miss five? Interesting question, isn't it? It's a question of, sort of "My God. How are you still alive?" Even as auditors, "How are you still alive? How hasn't some pc shot you?" It's pretty wild, you see?

Now, definition of a dangerous auditor is: an auditor who might miss one read in a session.

You see what you're shooting for? Now that you know what you're shooting for, make your form look good. Do your drills right and so forth. Don't let down on that.

But what you're shooting for in absolute perfection, is meter reading. Unless you can get that down to a point where you miss *none, ever*, you will be a dangerous auditor.

Thank you.

METER TRAINING

A lecture given on 12 July 1962

Thank you.

This is the second lecture, 12 July, 12, Saint Hill Special Briefing Course – and it has to do with E-Meter training: E-Meter training.

If people can't read an E-Meter, what's the matter with them? Obviously, it's bank. Obviously, it's lots of things.

Well, I'll tell you what the answer isn't. It's to audit everybody until they're Clear and then let them audit. This is very often proposed to me as a solution. Somebody calculated it, that it'd take twenty-nine thousand years for the auditors now trained on the east coast of the United States to finish up New York City – something like twenty-nine thousand years. And they're not that durable! That was my own comment on the thing, you know? You see, that's not and never has been a solution.

Another solution that's been proposed to me is that I audit everybody. [laughter] That's not a solution either.

No, the solution we're working on is a perfectly valid solution. Now we've got it narrowed down to – its most random factor at the present moment is the variability of meter reading – one auditor to the next. Auditors make mistakes reading meters.

Now, it isn't their banks, except indirectly, because the thing can be countered educationally. It can be countered very easily educationally. And you could say, "Well, the fellow's bank ..." so on, and so on, and so on, and so on, et cetera and et cetera. Oh, that's perfectly true – perfectly true – but it can be countered educationally more easily than by processing. That's quite interesting. And it's a fact *tremendously* in our favor.

First thing that's wrong with auditor meter reading is the auditor can't see. Now, that's a – that's not all of it, that's not all of it – but the auditor has a difficulty in seeing. And Scientologists, quite understandably (and I could compliment them for it) don't like to wear glasses. Fine, fine. But I'm afraid that the order of magnitude of the crime of wearing glasses doesn't even vaguely compare with the crime of not reading a meter. So that's first and foremost.

So this is – actually, this is a lecture of what we're going to do about this, you see? This is a lecture of what we're going to do about this.

When a person is going to be an auditor – not the pc off the street, the raw-meat pc – and we're auditing them, when we first audit this person, we should make out a Case Assessment Form. This more or less falls under the heading of Academy auditing – course auditing. Make out a Case Assessment Form. It's the old one; same one you would do if you were go-

ing to do a Problems Intensive, but you don't do the final two sections that you would do for the Problems Intensive. And in the process of doing this you'll find most paper matchbooks have some fantastically small printing in them. You look around on almost any paper of matches and you'll find some very tiny printing of one kind or another. Says all the advertising or something like that on it, and then it also says that it was printed and made in Racine, Birmingham, or something. See? Or a railway timetable – that also has some fantastically small print. Not supposed to be read by anybody because they'd never take the trains if they could read it, you know?

Reg suggested the other day the stock market report in the newspaper is awfully good. That's an eye strainer to end them all. It's anything, you see, that's about four-point type. Tiny, tiny, tiny type. There isn't anything that small on the E-Meter. There's no type that small. So you can't turn around and have them read something on the E-Meter. Maybe we ought to put over in the corner of the E-Meter some type that small. You see? Then everybody would find out what it was, and the test would be invalid. Or we take an insurance contract and take the small print section of it. That would be a good source of it. But you understand I'm talking about tiny printing. And it's very legible but very tiny.

And you hold it the distance away from the pc's face – the distance that he would ordinarily be seeing a meter if he were sitting back in his chair – and ask him if he can read it and have him tell you what it is. And if it's obvious that this pc can read this, we mark the top of the Case Assessment Form that his eyesight is good. Now, we don't care how it is good – whether it's good with glasses or without glasses, you understand? But if with glasses is the only way he can read this, then we will put the additional remark "Eyesight is good with glasses." And we'd just do this as a subtle tip-off that we're liable to have meter-reading trouble with this character if it isn't good. And if he can't read that tiny print the distance that meter would ordinarily be away from his eye, we put "eyesight poor," anything else we care to put, such as "requires adjustment" or "should have glasses" – anything we want to say. But that, we for sure add. And this will call to people's attention, such as a D of T or a Course Supervisor or something like that, that he has someone in his midst who, the second they start auditing, is going to be a liability. See?

So, let's get rid of the bad eyesight at one fell swoop. We don't care whether we have to get a magnifying glass – and one day Reg got me a crane-neck magnifying glass that went over the face of one of these meters and I've still got it upstairs; I'll bring it down – sure magnifies a needle. I was using it for microscopic reads to check up on old goals and things like that.

Glasses, anything you would care to do. But a magnifying glass, I should point out, is no universal answer, because everything might be blurry at the range of two and a half feet, which is about this range.

We can do something about it, and in the process of making this fellow an auditor, this is already called to somebody's attention because it's sitting on his Case Assessment Form, right at the top under his name, preferably written diagonally. And if you've got a red ball-point, put it in there. If his eyesight is bad, well, for heaven's sakes, underscore it a couple of times. Because you're setting up sessions to be very rough, ARC breaky; auditor is going to

go into unusual solutions; auditor is going to depart from the standard drills. All of these kind of things are going to happen, because in anxiety to make the pc better, why, he's going to do anything. And he will really never suspect that it's his own meter reading. He might suspect it, but he'd probably never confess it to anybody. See? So let's get that one out in the clear when we're running courses and that sort of thing.

And let's take a practical section and we're first teaching people about E-Meters. Let's pull out a timetable or the small print of an insurance contract or a book of matches and let's just hand it to the guy – holding it about two and a half feet away from him – and say, "Read that." This is an additional provision, don't you see? "Read that."

And the fellow says, "Uh – mm-mm ..." It's an ad for Bispicks, see? And he says, "Yeah. I can read that: 'Bispicks.'"

And you say, "No. The small print right there at the bottom."

"Oh," he says, "you mean the staple?"

Then the first step that Practical Section Instructor should take is to make that student take steps to provide himself with some glasses that are trained at two and a half feet, so that he can read a meter. You see? That would be his first step. He can make him go through set-up drills, and so forth, whilst the "occultist" [laughs] is making them up. You don't need any fancy glasses. They should ride on the nose. Girls tend to go in for things with diamonds scattered out along the rims and that sort of thing, but they're not really necessary.

Now, we think that's good enough. You think we've taken care of it then. No! Ladies and gentlemen, in Scientology we have not at that stage taken care of very much except maybe the next few days, because eyesight changes in Scientology like nothing else does. And it's quite upsetting to some pcs because their glass prescription is always shifting around one way or the other. All right. If we know we've got to do it, we can cope with it, can't we? But nevertheless that makes it a little bit hard to do.

So, any time Practical Section gets somebody back for a GAE, they pull out the insurance contract, the matchbox, and with the person's glasses sitting on the end of his nose, say, "Read that," holding it away at two and a half feet. See? So that's a good safety margin, because people's eyesight changes.

Now, this will get worse if everybody is reading meters darn well. Then processes bite harder and you're going to get faster eyesight changes. [laughter] But we can still cope with it. All right. That's fine. We just want them being able to keep seeing it out there.

Now, the trick is that you actually cannot trust the person to read a meter at that distance who can't read that print at that distance, because the amount of shake of the needle that is a read at sensitivity 16, that he'd have to follow down in many cases, is as much as print is blurring at that distance. In other words, if everything blurs to him, then the needle could move just under the blur and because the needle is moving, it just looks like it's blurring. See, it isn't a blur; it's moving. But he is so used to seeing things in a blur at that distance that it looks to him like a blur and therefore is not moving. You get the error that sorts out of this? See? Well, it's quite important to keep an eye on this as we're training people along and processing them up the line.

This is just for the greater good of the greater number of students. Don't you see? This fellow can always read this, and so forth. Well, that's fine. We'll still always do the drill. The person came back for some more meter work or something like that – he came back for some more this or that into the Practical Section, having been found wrong in auditing – let's assume that the first thing that was wrong that he did was not what the Auditing Supervisor said. Let's assume automatically that he couldn't see a moving needle. See? Let's just assume that. We don't care what the Auditing Supervisor said; we'll assume that. We'll take up also what the Auditing Supervisor said in the Practical Section, but we will just always add to it to this degree. We'll assume there might be something wrong with meter reading that we haven't caught yet. Got that?

Now, this merely takes care of the idea of focus. So far I've merely spoken about focus and being able to see a certain distance, and I have not talked about many other factors involved.

We have now hit the most elementary and the most obvious level of straightening up meter reading when we're straightening up people's eyesight with glass prescriptions or magnifying glasses or something like that. See, that's the most elementary level, but quite necessary. And the next level doesn't necessarily invalidate this at all.

Let us go into a much wider theory now, which is the width of present time. How wide is present time? Is present time a thousandth of a second wide? Is it zero wide? Is it two seconds wide? Or is it ten minutes wide? Now, you would be reading the future like mad and could win your fortune at Monte Carlo any time if present time was ten minutes wide. You might even be able to win some horse races. You know, get the bet down and – just before the window slams shut. And you still might be able to get your bet in under in time to get the horse in, see? But that would be bordering on what most people would call the ability to foretell the future.

I mention the word ten minutes because it's not impossible, because I myself have a ten minute band on TV and movies and that sort of thing. I never bothered to investigate it, but I have a subawareness of what is going to happen any time within the next ten minutes on the film. Now, this is very annoying. Spoils all the plots and so forth. Now, I first thought it was simply writer training, and I've since begun to watch some soap opera that no writer was ever near, you see, what passes for TV plays these days. Well, it happens just the same, you know? Suddenly find myself thinking about somebody being hanged, you know, then suddenly realize that this character who just walked in is about to be hanged and realize – then I realize how he is going to be hanged. You see, it's spreading down now from the ten-minute mark as the zero, and we're marking off one minute at a time. We come down somewhere within four or five seconds – that is the period in which I am actually watching the film. I'm aware of this.

So you see, by drawing that out I can conceive of a present time ten minutes wide. See, there's nothing more – nothing esoteric about this. I'm not trying to tell you that it's some wonderful ability. As a matter of fact, I very often would like to lose it.

A person who is cleared gets into the fantastic state of being able to tell at every intersection some fifty to a hundred feet before they get to the intersection, if anything is coming

down the intersection and from which side and about how fast. See, it's almost as if they have a radar vision that looks around the corner, and it looks to them as though they have developed a perception which is lineal, present-time perception. And they think they're looking around corners. No, they are not looking around corners. They have a wider present time and haven't accustomed themselves to it yet, and they are looking at a fringe of knowingness which is many seconds up the line. They're looking at something like a fifteen- to twenty-second fringe of knowingness. See, they know what's going to happen in fifteen or twenty seconds, but it comes through to them as an impression. So they think they are looking around the corner at the truck which is coming down the street. But they try to do that, and that doesn't work. And this is quite baffling to them. It's reading the future is what it is. But it isn't *reading* the future. It's not even *being* in the future. It's just that PT is that wide. That's the thing.

Now, somebody who is really sharp as an athlete ... oh, I don't know, I suppose Sam Snead has a present time from the drive of the tee to the landing of the ball. I suppose that all takes place in now. And if you asked him very closely, he would get the sensation as he hit the ball of knowing exactly where it was going to land or just before he hit the ball he knows where it's going to land. And everybody says, "This is skill that is doing this," you see? Well, it is not skill that is doing this. Actually, he knows where the ball is going to land, that's all. It's – he doesn't even have to go through the idea of following at a line of flight to find out where it's going to land. See? The ball is lying there and he is hitting the ball in the same band of PT.

Of course, the poor sods go out there and try to whip this guy Snead, you see, and nothing happens, you know? He feels a little stretchier one day and goes out and breaks the course record, you see? And then he feels a little stretchier the next day so he breaks the record he made, you see? This guy is terrific. But it looks very easy to him. And so it would look easy to you if you had control of both ends of the flight of a golf ball.

You see, people believe they can do this. Have you ever seen anybody stand on a golf green, and as the ball is rolling across the green, they go [demonstrates something] – and try to push it into the hole. See? "Missed," you know? Do you see people do that? You ever seen people follow the course of a bowling ball, something like that, and twist it back straight, and so forth, get down finally? Do you ever see people try this? Well, why do they *try* to do that if they know they can do that? It isn't the projection of the control they just did with their hands. They're aware of the fact that the event is not predicted and they're trying to predict and control the event. And their stretches and strains around in the thing is in despair of not having done so. Because it's always despair. It isn't really just ...

Well, if you were going to knock a ball into the – into the cup on the green, you certainly wouldn't go on – *oooahhh* – grunting and straining and doing all sorts of things. You'd just go *ptt*, and it'd go right in the cup, bang! You sort of brush a beam at it, you know? Well, how about at the moment you hit it it's already in the cup? Well, that's controlling both ends of the span of PT and this is your great athlete.

Great athletes, by the way, are always – always exterior. And you show them the Axioms of Scientology – "Oh, that's what I've been doing! Oh, yes! Good! Yeah, fine! Oh. Oh,

that's what that's all about! Mm-hm. Well, of course, anybody'd know that. Yeah. That's right." And they go right on down the list of the Axioms – *brrrrrrrr!* Quite remarkable. But what I'm calling your attention to is, their PT is wide.

Now, frankly, they don't think of their PT as containing motion. They think of it as containing control. Motion doesn't happen randomly in their PT. When they're doing something, they're controlling all the motion in that PT because they are in that PT and they have the width of that PT in which to decide. It's almost as if at the end of two seconds they could undecide what they decided at the beginning of two seconds. So therefore, they have terrific judgment. They don't have to test-decide anything, because they know which decision is right because they saw it happen. You get how silly and involved this can finally become? All right.

Those people are capable of perceiving motion. They can also perceive stillness as a total is-ness.

And then we get down to the guy who has a present time one one-thousandth of a second wide. And he is in nothing but anxiety – continuous anxiety. He's always regretting what he just decided because it's already too late. He's always in trouble. But it's an anxiety he feels. That would be a crazy man's present time, see? It's all wrong all the time. There's no telling what will happen. He doesn't even know if the bed will continue to sit on the floor, don't you see, because he can't perceive the bed sitting on the floor. See, there's no test line.

Actually, as you look at those TV sets up there, you recognize that those TV sets are continuing to be there. Don't you get that idea?

Audience: Mm-hm.

They're continuing to be there. You look at me; you know I'm continuing to sit here in the chair. How do you get the idea of continuance? You don't get the idea of continuance by comparing the fact that I was here and therefore I will be here. That isn't what you figure out at all. No. All at one glance you see me across a span of time, so you know I'm continuing.

Now, how about the fellow who can only see me across a span of one one-thousandth of a second? He'd be mighty anxious. He'd be mighty anxious. "Is he going to exist or isn't he going to exist? Is he going to sit down there?" And he'd wind up telling you, "you can't tell what I'm going to do next." He'd tell you, "You make me nervous. I don't know what you're going to do next." Well, how come he's so uncertain about it? Well, that's because you're not there while you are being there in the same PT, you see? It's a little bit hard to talk about because language isn't nicely matched up to this phenomena. It's unexamined phenomena. All right.

The less PT a person has, the more difficulty they have with the perception of motion and stillnesses. The more present time they have, the easier it is to perceive motion and stillness. Elementary.

Therefore, just to give you an odd example of this, an individual could be run on "Look around here and tell me what you're absolutely sure will be here in one second." Of course, all of you look around and you say, "Well, everything in the room will be here in one second," see? But then we start grading that up: Five seconds. Twenty seconds. Half a minute.

A minute. Five minutes. Ten minutes. And all of a sudden, about this, we're hitting – we're hitting such an – a wider fringe, the span is too great, and we have to look for a specific object and figure out a continuance for that object. But nevertheless this drill, phrased in any way that it could be put together – such as "How long are you absolutely sure that door will be there?" and take your answer – you would drill the person's perception into a broadening of present time.

There happens to be a process. (I don't say that these processes are the answer because they are not. I'm just giving you data.) you say, "Look around this room and find something that's having an effect on an effect," or "Look around this room and find something that's having an effect on something else."

The latter one, particularly, when tested, will be found occasionally to turn on for a pc, for fifteen or twenty minutes or maybe the next hour or two, a fantastically widened PT. You can sometimes get the same phenomena that a Clear gets of knowing about the cars coming, knowing whether lights are going to turn, when they're going to turn. His prediction goes way up.

"Look around here and find an effect that's having an effect on something," or "Look around here and find something that's having an effect on something else" – your commonest wording.

So these processes do exist which widen PT. They're specifically addressed to it. Nothing much to do with somebody's goals. Nothing much to do with anything else. But if you look it over, you'll find out that they're not so much processes as they are drills. They're practices. They're just practices.

So, widening of PT any way that you possibly could do it would improve a person's recognition of motion and stillness of a needle, or of course, change of rate of motion. Now, some auditors can – have no real difficulty in telling whether a needle was in motion or a needle was still, but do definitely have difficulty in establishing a change of rate of motion. The sudden tiny acceleration – the very slight acceleration which occurs in the middle of a fast rise: At what moment did that rise faster than the rest of the rise? Or, an accelerated fall: At what moment did that fall fall faster than that fall?

Now, we're not talking about good or bad meter reading. We're talking about the absolute minimum meter reading and that is meter reading. See? It's not a freak to be able to tell an accelerated fall or an accelerated rise. You *have* to be able to because they are reads. So even that skill – being wider than merely still and in motion – has to be under the hand of the auditor. He has to be able to tell that it's rising faster than it was rising. See, the – for one division it rose a tiny bit faster than it did in the three divisions before and the three divisions afterwards. That's the accelerated rise. You've got to be able to detect that because it's a read. He also has to be able to tell that it *didn't* do that, because that is a clean. And now we're getting down to very, very narrow limits of needle perception.

Now, the first is purely the problem of eyesight: Can the fellow see lines and circles and so forth at a distance of two and a half feet on very tiny print? That's purely eyesight. Now we're getting into – with this next echelon – the relative ability amongst people to perceive motion when it exists, lack of motion when it exists and change of rate of motion when

it exists. A slowed rise, a speeded rise, a slowed fall, a speeded fall – he's got to be able to tell those. And all of this depends on the width of present time.

Now, what perception can a person have? What can he do with his perception? How can a person improve his perception? Well, as a matter of fact, there's a fellow named Bates in the United States that developed a whole system and wrote a book about it. So much so that I think he got to be known as "perfect-sight-without-glasses Bates." Now he wrote this book, *Perfect Sight Without Glasses*. Terrific number of drills contained in this thing. Well, they've departed beyond this particular book and they have all kinds of drills whereby a person follows with his right eye one line and the left eye another line and that sort of thing. And they have machines you look into and it exercises the eyes and the fellow perceives, and that sort of thing. Very often this will alter the characteristics of a person's sight. I'm not saying this is any panacea. I'm not recommending this in any way, shape or form. I myself have tried some of these things and they've gotten no place. But I have seen sight improved by this – in other words, perception improved by this.

But we're out and beyond perception. We're into consecutive awareness when we're reading meters. There are three moments that we have to perceive in order to find out if a needle is still. Of course, at first glance you say to yourself, "Well, yuueearree [there's] only one moment that you have to perceive to find out if a needle is still, and that is simply look at it, and in that moment it isn't moving, so therefore, the needle is still." That's not good enough because you have nothing to compare it with. You have to have the moment before, the moment it is still, and the moment afterwards to make sure that it is still still. How wide are these moments? These moments may only be a thousandth of a second wide. So a still needle is read by "it wasn't moving, it isn't moving, it won't move; therefore it isn't moving and therefore it is still."

Now, a moving needle requires at least two observations and it is therefore easier to read than a still needle. A moving needle is always easier to read than a still needle. If you don't believe this, go out in the forest sometimes and try to find a deer that is standing behind a thicket watching you. Just try and find him. And, by George, you may be out there looking at him and in his direction for a half an hour and you'll never discover that he's there, because he's still. And you don't discover he's there until he takes off. You pitch a bully-beef can in that direction of that thicket thoughtlessly and he takes off. And you all of a sudden are aware of the fact that a deer has been standing there watching you – probably all the time you've been there. Startles you half to death. Well, how is it that you didn't perceive him when he was still but do perceive him when he was moving? "Oh, well," you say, "the relative thing, and it attracts the eye, and motion attracts the thing; and then there's more things to perceive, such as noise and ..." you can figure it out and you can figure yourself half to death!

The thing is only, basically, that motion requires only two observations and stillness requires three. The motion takes part of the responsibility of directing attention, don't you see? Whereas stillness takes no responsibility for directing attention. You see, the motion almost pulls the eyeball along with it. Do you ever get that idea?

All right. Now, let's be a little less esoteric than that. But a motion is detected simply by observing that something was in place A and then observing that it was in place B. And

you observe these two consecutive actions, you know it moved. That is all you have to know about it: that it was in place A and now it's in place B and therefore has moved.

Now, how narrow together can place A and B be before you detect that motion is occurring? You can gulp over that one. That's one of these questions almost: "How long is a piece of string?" But on an E-Meter we can answer it. It's something on the order of a tenth of the width of the tip of the needle, to the right or to the left, is a motion. Now, that's pretty darn microscopic. In view of the fact that the needle is sloped out and gets wider rapidly as it comes down, that tenth could be interpreted in all different and wide and peculiar ways, but I'm talking about the tip – the top tip. A tenth.

Now, most Mark IVs jiggle before you put in the cans. They all jitter. They all do. That's nothing because the stabilizing factor is contained in getting the circuit completed. That stabilizes them at once. This is nothing to worry about. Only start worrying about your Mark IV when you've got the can jack plugged in and the pc on the cans and it's jiggling. Now you can get worried because there is something wrong with your meter. Usually it's a grain of dust or something has gotten into the tone arm swing, but we've put a new tone arm carbon-brush arrangement in there, and they don't do too much of this now.

But most people are not aware of this. This meter is jiggling right this minute. You see this meter jiggle?

Audience: Yes. Hm-hm.

Hm.

Male voice: Big jiggle.

Well, the read that you're supposed to read is about one tenth of that jiggle. You having a hard time reading the jiggle?

Male voice: Oh, I can see the jiggle, but one tenth of it – uh-uh.

Yeah, one tenth of it. Ha-ha. That gets rather small, doesn't it? Well, to be absolutely safe, that's what you should be able to do.

Female voice: Hm.

I've seen a goal that read no more than that jiggle, and was the right goal, read every time. Yet nobody could locate it. I thought they were all nuts. It was obvious the goal was reading. [laughs] Nobody else could see it move.

Width of present time could then be broadened to a point of where you could perceive motion or stillness by various drills of perception.

Now, your next level, let's take up, is brevity of perception. What section of the present time you are in do you require to perceive an inaction or an action? And as soon as we have said that, we actually open the door to the solution to this problem. Broadening your present time is most easily done by clearing you. And any other processing leveled in that direction of broadening your present time is frankly a waste of time, because it's all going to come out right when you're Clear.

But the proposition that you must be Clear before you can audit anybody is totally unworkable and never will work. There are several reasons for this, having to do with practicality. And one of the reasons you perhaps are not too aware of, and that is to say, cleared raw meat with no reality on what has happened is enormously inferior to somebody that has the data and goes Clear. They get a subjective reality on what it's like trying to wrestle with the problems of it. They understand this. Their comprehension and understanding of the problems and so forth, are infinitely greater. They're left with a capability of understanding people, even though Clear. Whereas you clear raw meat and you're liable to find somebody now very impatient with people – wonders why he's associating with them or something of the sort. Gets all involved. I've had some interesting letters on this subject, by the way.

It's easy to follow some person's worries when they're jammed in their heads and aren't thinking very straight. That's easy to follow, if you can follow it, when they start figure-figuring. It's dead easy, you know? A guy is dead in his head, and the pattern of his thought is now going to repeat itself. You're going to have a way to figure this out. You may not get it the first pattern, but you'll get it the second pattern. You'll figure out finally what he means.

Well, this isn't true – you get a Clear who is doing a figure-figure and you've really got something on your hands. Trying to understand a Clear when he's figure-figuring is one of the more difficult things that you will be called upon to do here and there. Because you will inevitably make, sooner or later, a raw-meat Clear, and then he's going to ask you the damndest questions. You've had answers to these things all along. And, of course, he's much smarter at asking questions now. It's rather interesting. They've asked me all kinds of – I've been asked very, very complicated questions on the subject of why people behave as they do. Or how you – how I could possibly stand to associate with people or... You know, all kinds of oddball questions.

It just shows you that the poor guy has suddenly been launched into the stratosphere and is being expected to fly without having found out that he's in an airplane. He has no comparative data, don't you see? He'll be fine. I mean, he'll do well in life and that sort of thing – not that I'm trying to run down the state. But as far as the idea of the mind and people and this universe, there is no substitute for a guy being as spun-in as you are [laughter] and then going Clear, because you go Clear on it with all the data.

And listen, if you can understand what's going on now, you'll understand it real well; you'll get it nicely sorted out. There's a lot of virtue to be said for this. So, completely aside from any other understanding here, you get much more comprehending people this way. That's why clearing everybody without training any auditors is not a solution.

Now, when we look at the problem of time, we see that you have to have a little more time to conceive a stillness than you do – have to have a motion, because we've got to see three things, three moments of time in a stillness, and only two moments of time in a motion. And people, by the way, are more intolerant therefore and thereby of stillnesses. Whatever other value this philosophic observation has, they're much more intolerant, because it takes more time to see one; takes more time to observe one. They always think of stillnesses as absorbing tremendous quantity of time. They get very, very tired.

They see an oak tree out there motionless in the pasture and for a little while they'll "ooh" and "ah" over this marvelous oak tree. But they may go out and sit in the pasture themselves and look at this oak tree and then just suddenly be overwhelmed by the terrible standing-thereness of it, foreverness of it, see? *Th-uth-zz-zz*, you know? Whereas they look at something traveling rather rapidly, like a colt, and the idea never comes to their mind. Has nothing to do with the gra- the development of the colt. Has the idea that the colt is in motion, so therefore he – his continuance does not have to be as great as something that is standing still. See? Three moments as opposed to two moments.

So the period of time required to observe can be shortened until a person can observe in the tiniest, narrowest present time – three moments of time or two moments of time. Let's say this poor sod's present time – let's really cut it down, see – is a millionth of a second, see? Well, we're out beyond the realm of being able to observe anything at all. See? So he's had it. We're not training him as an auditor. He's leaning on a tree in some cemetery feeling sad for himself, you know? He isn't even picking up a body, this one isn't.

No, let's take a tenth of a second as somebody's PT. Oh, well, let's be better. Let's take a twentieth of a second – twentieth of a second. Now, that takes us down to almost anybody. See? And now let's be able to carve a twentieth of a second up into three pieces. And of course, we get three periods, see, of each one – what is it? – a sixtieth of a second in duration. So we then have to be able to observe an instant in time which is no longer than a sixtieth of a second. And we can observe three instants in time in the guy's PT. Therefore, he sees that the needle is still. He observes it's there, it was there, it is there, it will be there, all at one fell swoop and recognize that he has no motion involved with it.

So, you might then say the moment of tolerance of observation is a sixtieth of a second. You must be able to perceive an is-ness only a sixtieth of a second long. You see, this is not trying to expand somebody's PT before he's Clear, you see; this is cutting it down to where a below-average PT can perceive it. And now let's educate him by practice and drill into actually perceiving what he can already perceive. He can perceive a sixtieth of a second.

I don't know if you ever looked at the shutter of a camera that is set for a sixtieth of a second, but it's very perceivable. You take a shutter of a camera and set it for a twentieth of a second or something like that, why, you can almost see images in the room through the thing. You look through the back of the thing, and it goes click and it's – oh, it's dead slow. The diaphragm opens and closes again and it's – it's terrific, see?

All right. You set that camera for a five-hundredth of a second and you have to ask yourself for a moment: Did it open and close? You're more told by the fact that it clicked aurally, see, than the fact that you perceived the light. Nevertheless, you hold a camera at a five-hundredth of a second up to a light and most people will be able to perceive, at least – even if it were wide open as a lens – they'd perceive something about the size of a sixpence or something like this. They perceive a smaller diameter than the diameter of the lens. Actually, it's in direct ratio: The amount of PT that they can observe easily, see, is reflected in the narrowing diameter that they could perceive of that diaphragm. We won't bother to get into this too technically like that, but some people will see it as a pinpoint. See? And other people will see it at a five-hundredth of a second; they will see the whole lens. It just varies from person to per-

son. I only make these remarks and add this into the setup because it gives you an index of actually indexing people's present time, which you might find of some use sometime or another – choosing pilots or something like that.

Now, if we take a sixtieth of a second as a tolerance point – let's be twice as good and let's make it about a hundred and twenty-fifth of a second. Let's be able to perceive an is-ness in a hundred and twenty-fifth of a second. And you'll find out without broadening PT that most people will be able to be drilled into this.

Now, it goes something like this: They can perceive an is-ness in a second. You show them the lantern slide of a chair for one second on a screen and nearly everybody present, except somebody who is stone blind, will say to you, "That was a chair," but won't be able to give you much of the detail of the chair in that one second. But we keep showing them the chair and we keep showing them the chair and showing them the chair, and finally – it isn't that they stack up a number of observations; we could show them different observations of the chair – and they eventually would see the chair better. And they would see it better to the extent of telling you how the seat was finished – whether it was in cloth or embroidery or leatherette or something of this sort. They'd tell you how many rungs it had, how many verticals in the back of the thing and if there was anything else in the picture. And they eventually perceive everything that is there. In other words, they wrap themselves around the is-ness of the thing.

All right. We take another picture – let us say a table – and we show this to them for a half of a second, and a half a second, and a half a second – we show them the same picture half a second, or different views in a half a second – and they finally are able to pick up all of that. In other words, they can see in that half a second. We take another slide, entirely unrelated to it, and you'll now find out these people who have learned to see in a half a second – if they have drilled adequately on it – will get all of the detail necessary, or that's in the thing, in that half-a-second look, see?

All right. So we slow it up now to a quarter of a second. And we show them a picture at a quarter of a second. If before they were drilled at one second you had shown them the picture at a quarter of a second, to a lot of people it would have looked like a blank. But now we're working on a gradient scale. We've shown a second, we've shown a half a second; now we've got it down to a quarter of a second, so we show them the views of something or other at a quarter of a second till they can see at a quarter of a second without questioning.

And having done that, we move down to an eighth of a second and we repeat the same drill in an eighth of a second. You've got a magic lantern, is what you've got, or a projection machine of some kind or another, which has a photo diaphragm which can be adjusted from one second – well, it's got to have a time device on it so it can be left open – but it's adjusted from one second to a hundred and twenty-fifth of a second. We get everybody that's involved in the drill accustomed to seeing things at an eighth of a second there and at the eighth-of-a-second flash – they can get everything out of an eighth-of-a-second flash that they would get out of it.

Now we move down, of course, to a fifteenth of a second – that being a handy halving used by a camera – and at a fifteenth of a second ... That, by the way, is the speed of a

Brownie box camera. Have you ever looked into a Brownie box camera and seen the lens travel across in a fifteenth of a second? You'll be able to perceive everything that is perceivable in the picture in that fifteenth of a second.

Now let's take it at a thirtieth of a second. And let's perceive everything at a thirtieth of a second. And now we're up to a sixtieth of a second, and that's the first admissible point for absolute reliable reading. A sixtieth of a second. We get everybody in so they can see it and then we move them on up to a seventy-fifth, or some such thing, and then speed it up until we eventually get them to a hundred and twenty-fifth of a second.

In other words, if there's anything on the picture at all, the person's eye and viewingness and alertness on the thing can be trained up to see at a hundred and twenty-fifth of a second if it is there or if it isn't there.

What I'm giving you actually, is naval recognition training, World War II. There were a lot of these ideas kicking around California and other places and the navy and the army got up into certain problems they couldn't immediately solve, so they picked up educators here and there and they finally developed things like this recognition training.

I went a little bit further with it. We had outfits of one kind or another. You can teach kids the alphabet. You can teach people when they – that can't read, and you can teach them to read very rapidly. You can teach little kids to – arithmetic with great speed, as well as to recognize what kind of an airplane it is, given the briefest glimpse of it – all of these things. That was the intention with which the stuff was used.

They've brought it up into reading now. Now it's in reading, and they have – they issue you books in the United States now that have timed slides on the side of them. You set this thing and you've got to be able to see a single word or see a group of words and they give you different shutter speeds with which you can perceive these, and it's speed reading. And as an attesting to it, actually a United States senator was able to read – he had trained himself up to read, I think it was *Oliver Twist*, in fifteen minutes or something like that – at least he was standing there – but because he's a United States senator I don't believe that. You wouldn't either. Anyway, the fellow had actually condensed his recognition line.

That's the use that's being put to today. So they're still using this principle. That came off of aircraft recognition.

I never used it myself. I trained men on it and that sort of thing. I had an entirely different attitude toward aircraft recognition. I was in South Pacific at the beginning of the war. The extant philosophy at the beginning of the war was "If it flies you shoot it down because there are none of ours up there anyplace," and you sort of got into that habit. I got into a nasty habit with regard to aircraft: is – it flies, shoot it, you know? And in fact it's a good sport. He's shooting at you, shoot at him. What's the difference?

And I was never under the delusion that the Army Air Forces were on our side. I never was. I never made that mistake. [laughs] We used to talk it over occasionally, and we always came to the same opinion – that we were not fighting the same war. Anyway, they had an IFF, Identification Friend and Foe radar, and your radar screen would hit the aircraft and if it was equipped with IFF or if the IFF was working, it flashed back a signal and it told you that it

was a friend. You just shot at everything else. So I never used this system. But I did train a lot of people up in it and used it in various ways, and have myself been trained on this system itself and I know it's quite remarkable.

The first time I ever saw – I think it was a Japanese bomber – slide of a Japanese bomber at a hundred and twenty-fifth of a second, let me tell you, I didn't even think there was a blackboard there that the thing was shining on. Hundred and twenty-fifth of a second, you know? And I sort of saw it wink. I wasn't even prepared, you know, to greet this thing at all. I didn't even know what was going to happen, you know? And blink! And I was in there with a bunch of advanced students. The Instructor says to the students, "What was it?" And they say, "A Mitsubishi *yump-shomph-womph-womph* something or other bomber" you know? I just looked out the window. I didn't see any. [laughter, laughs] And I finally dug what they were up to. And I saw a group of sailors pass from a second of scratching their heads to find out whether it was an airplane or a fly or what it was that had been flashed on the screen during that second, to being able to hit it on the button in a seventy-fifth of a second with the greatest of ease.

Just that training gives you a method by which you can bring a person to observe stillness or motion in the tolerable instant of time. Now, we're not now talking about rigging up anything very fancy. This isn't a very fancy rig. This is any old projection machine fitted with a camera shutter that will take speeds of time of one second and down to a hundred and twenty-fifth, so it's not even a good camera shutter. Most of them will take you down to a five-hundredth and a lot of them to a thousandth, you see? You don't need it that fancy. But it has to be a fairly big shutter, and it has to be installed in such a way that it doesn't interrupt putting in slides. If you were just to take some pictures – pictures of pretty girls, (anything), or pictures of handsome and strong men (anything) – and just flick these on with some distinguishing feature, or if you were just to take numbers written on a piece of paper, see, that went into the slide just so it projected clearly on the screen, and you did this same drill of just shortening the length of time necessary to perceive it ...

Of course, it's best to have a large assortment of drills that goes in one after the other, because people very quickly will learn rotation, and they fool you in various ways, so that you throw in these slides variably, you see? Anything that they could recognize. It wouldn't matter what it was. A series of numbers. Anything, see? Blondes and brunettes. It doesn't matter what it was, as long as it was there to be recognized and you could tell whether or not the fellow had seen it. You could gradually work up his ability to perceive in briefer and briefer intervals of time until, of course, he could perceive in the three intervals, one sixtieth of a second each, necessary to tell him if that meter was acceptably still. Now, you'd have it. That would give you perfect meter reading.

Now, this is an interesting approach – an approach through a lot of training methods, visual training aids and that sort of thing, which were developed a long time ago but which were very successful. It gives you more than this. You could get into a situation here where you fit this thing up with an E-Meter element, and you actually see a still needle, and you actually see a moving needle. And seeing a moving needle for one hundred and twenty-fifth of a second would be asking the person to perceive moments of time consisting of a three hundred and seventy-fifth of a second. To perceive that it was still, it'd have to be a three

hundred and seventy-fifth of a second that the person could perceive an instant; and to see that it was moving, he'd have to be able to perceive a two hundred and fiftieth of a second instant. That's far beyond the tolerance absolutely necessary for a person to read an E-Meter. But if you're going to train people, train them good, you know?

And anybody could make this kind of a rig and experiment around with it until he found out how to shorten people's necessary period of observation.

The psychologist, who has made many mistakes – and by the way, apologized to us the other day. The big chief in South Africa apologized abjectly to me for daring to use my name in vain, and our solicitor turned the letter back and said that it would have to be publicly published, and so on. He was saying some dirty words concerning me. He was inferring I was a psychologist, I think.

Anyway, a psychologist has observed this interesting error, that the eye has a shutter speed of about a twentieth or a twenty-fifth of a second. This is a stupid lie. The eye has no shutter speed. You gaze into some girl's eyes, and if you're not terrifically stricken along other emotional lines, you maybe perceive that there is no Compur shutter installed back of the iris. I know it seems sacrilegious to gaze into some girl's eyes just to understand whether or not there's a Compur shutter back there, but nevertheless, you have to do some things for science. [laughter]

But the point is, is there is no interval. But there's a thetan back of the eyeball, see, back of the channel line, who has a width of PT and who tends to fixate on what he considers an observable moment. And then he – if it takes place shorter than that, it isn't observable. Well, he very rapidly – because you're narrowing time – can follow it easily. See, he can train himself down into narrower glimpses and it appears very comfortable to him finally because he's actually looking at segments of his own PT. And he finds his own PT fairly comfortable – relatively speaking – and so therefore he can comfortably observe briefer moments than that.

I mention this thing about the eye being a twentieth or twenty-fifth of a second, or something like that, because somebody will bring it up and tell you how it is sooner or later and doesn't happen to be factual. There is no shutter.

What the eye perceives as motion and what it perceives as stillness is almost as variable as there are people. This is not any constant.

To teach people never to miss a read consists solely and entirely of being able, for those people, to establish what is still, without any question in their mind, and what is moving, without any question in their minds, and what is moving faster or moving slower than it was. That's all they have to establish and be satisfied with in their mind and read a meter.

Meanwhile, you have none of these training aids, none of them. They are things of the future. So you are the children, the forgotten children of yesteryear, who grew up in the dark ages when we didn't have these things and somehow learned anyway.

But I call your attention to the fact that this can be taught, can be acquired and you can acquire it directly on a meter. Just by watching a meter, observing what is moving and what is still, you will eventually come to read it anyhow.

And remember this: that one read, wrong, to clean a clean or to ignore a reacting, moving needle in a session, are intolerable at the level of one per session. You can't even have one per session. It's zero per session.

So that is the direction I want to see you go and that is the direction I know you can go.

And we got the hump – we got the hump crossed and that is very good news. Now all you've got to do is read that needle.

Thank you very much.

Good night.

E-METER READS AND ARC BREAKS

A lecture given on 17 July 1962

Thank you.

Well, I just gave all the instructors infraction sheets so you should be very cheerful. They get on this stuck flow, you know? And they keep giving them out and giving them out, you know? And they get to a point where they, if you don't give them a few, why, they'll snap terminals, you know? [laughter]

Well, good to see you. A few of you look like you'll survive. No great percentage.

And this is what? This is the 17th?

Audience: 17th.

17th July, AD 12, first lecture, Saint Hill Special Briefing Course.

Okay. Well, nothing much to talk to you about tonight. You're all straightened out on everything and got it all taped. And I'm glad to see that. I'm glad to see that. As soon as you get some glasses and some magnifying glasses [laughter, laughs] – there's some possibility – there's some possibility – that your focal distance can coincide with the point of the needle; so don't despair. Don't despair.

Mary Sue had a speed flash system going. They teach them how to read in the United States these days with a flash system. You throw a shutter and it gives you a hundredth of a second – two words at a hundredth of a second. And you're supposed to be able to read those in that hundredth of a second, and so forth. And everybody flunked it.

So, we're making some progress. We're making some progress. At least we know now people can't see. [laughs] That's development.

All right. Let's look at something very banal; something you know all about. You can relax your mind. Let's look at the subject of E-Meter reading and ARC breaks, relationship between.

Model Session, June 23rd, AD 12, as amended (amended by the Havingness being dropped out of the beginning rud), gives us a weapon which exposes all else. As soon as we use that Model Session and repetitive rudiments – repetitive beginning rudiments – and repetitive Prepchecking, we've actually stripped the technology down to a very easy and very positive performance. It's very easy to do these things. They're not involved, you're not worrying about having to form What questions, you're not worrying about this and that. Actually,

there are plenty of forms around to give you Zero questions for this pc and that. And you yourself, dreaming up what might be wrong with the pc, can also dream up lists of Zero questions for some particular pc, which you should be able to do.

And the culmination of all that is the eradication of technical variables. And there's nothing there in the Model Session or its procedure or anything connected with what you are doing verbally, and so forth, with the pc, that is open to very much question. Oh, you can argue around as to whether or not you get in the end – the middle ruds by repetitive check or by fast check before you check the Zero. And you can contend that if the middle ruds were clean, then you shouldn't have to recheck the Zero – which you should do. You should recheck the Zero always.

A lot of questions can come up, but frankly none of these things are capable or susceptible to ARC breaks – capable of ARC breaking a pc or susceptible to creating ARC breaks. It's smoothed out to such a point that a performance done – oh, relatively indifferently – would leave a pc improving, gaining, coming on up the line.

And it exposes – the simplicity of this existing technology – also the simplicity of Routine 3GA; there's nothing complicated about 3GA – exposes just one thing, and that's meter reading. You take all of these constants and you find out that you do them – do them fairly well.

You see, you don't have to do those perfectly to get a result. You should be able to do them perfectly. You should be able to put on a good show. But you shouldn't be able to do – have to do them perfectly, you see, in order to obtain a result. I mean, the technology is very powerful. That particular approach to auditing is very powerful!

And it leaves to view only one potential error: TR 4 in one form or another.

There's a TR 4 phenomenon connected with the meter. And the meter, if poorly read, or only once in a while read wrong, operates to throw TR 4 out in the session.

See, the pc has a present time problem, and the auditor looks straight at the needle and says – after he's said "Do you have a present time problem? Do you have a present time problem? Do you have a present time problem?" and it got to that point where the pc says, "No, that's it!" and then he looks at the meter and he says, "Do you have a present time problem?" and the thing falls off the pin, and the auditor says, "That's – do you agree that's clean?" See? Misses the read – out goes TR 4. See? That's out the window. Bang, gone. Why?

Well, the pc has an answer which the meter hasn't acknowledged. According – as far as he can see – and remember, he's looking at the back of the meter. And as far as he can see the meter has not acknowledged it. He then can start to get mad at the meter. But usually he isn't sufficiently clear thinking or directive enough to get mad at the meter. He doesn't quite know what he's getting mad at. And so he usually assigns the cause of his upset to something else. This assignment to something else all the time is, of course, why what a meter does in a session, if misread, has been obscured for so long.

Of course, the meter did a perfectly good TR 4, but the auditor interpretation or failure to read the meter does a bad TR 4 and you get the same thing as though the pc had originated and the auditor didn't get it. So, therefore, you've hung the pc with a missed withhold.

Similarly, the pc sits there. "Do you have a present time problem?" the auditor says. "Do you have a present time problem? Do you have a present time problem? Do you have a present time problem?"

Finally the pc says, "No, that's it. Uh, that's it."

And the auditor looks at the meter and he says, "I'll check that on the meter," and says, "Do you have a present time problem?"

And, honest, it's falling at an even rate, you know, that is – no disturbance of any kind whatsoever. And it just keeps on falling at this even rate. There is absolutely no change to the needle whatsoever. And the auditor says, "What's that? What's that? What was the problem? What is the problem?"

And the pc says, "Well, there isn't any problem."

And the auditor says, "I've got a read here." See?

Pc says, "What could it be?" And then he says, "Well, I haven't got a problem!"

And by this time the needle is reading an ARC break characteristic. So he just says, "Do you have a present time problem?" Bang! the meter goes. You see? Every time. Bang! You see? "Do you have a present time problem?" Bang! "Do you have a present time problem?" Bang! See, he cleaned a clean and the only way he's going to get this off now is to ask if he's missed a withhold – the random rudiment.

Sometimes the pc doesn't interpret it just like that. If you were to say, "Has my asking this question upset you?" and he answers it and says, "Yes. Yes, it sure has," the read would then come off, and it'd be clean again, you see?

Now, what's this all about? What's this all about? Basically only one thing is occurring. And it's an old law which has been pretty well obscured, however, through the years and has not come up much with importance. The importance has never really been assigned to this. It's been cruising around inside of Scientology technology for ages and ages and ages. And that is, you mustn't acknowledge a lie.

Actually, you get yourself in trouble every time you acknowledge a lie. You accept a lie as the truth; that makes you a fool.

Guy rushes up to you and he says, "The whole of central downtown has just burned down, and it's all up in smoke, and 1,655,000 people have been killed!"

And you say, "Oh, good heavens! Good heavens. Good heavens. How terrible! How awful!" or faint away or something like that, not stopping to realize that there aren't 1,655,000 people in the town – or in the whole state for that matter.

And he says, "Ho-ho-ho-ho-ho-ho! Good joke! Good joke! You're a fool. Ha-ha!"

Now, what's this all about? Very simple. Prime postulate. Let's start learning to interpret things from Routine 3GA – that makes your Clears. And there's not much question about that. In fact, there's no question about it.

The only time we've seen them held up is when the exact original specifications of Routine 3GA were not rigorously, slavishly and fantastically closely followed.

For some reason or other when I sat down to write the four lines out for Routine 3GA, I scribbled them out as the potential, and I thought this will probably have to be varied for pc after pc. And you know, the only pcs that have gone Clear are those who have exactly been run on those exact lines – the first four I wrote. You get any variation on it: your needle will stick, tone arm goes up, everything goes to hell. That's sort of an oddity. It's an oddity. In the first place, the goal was probably originally framed in Amharic or Lingua Spacia or something like that, you know? And to hit the semantics of it right dead on the button and have that the only one that leads to a free needle is quite remarkable.

I'll give you the datum, although this isn't – not a lecture about it.

It's "Want – who or what would want (exact statement of goal)?" "Who or what would – ." (These are not in sequence.) "Who or what would not want (exact statement of goal)?" "Who or what would oppose" – what is it, the participial form? – "(the i-n-g form of the goal)?" and "Who or what would not oppose (the i-n-g form of the goal)?"

And it just has to be that. It isn't anything else. You can't say "the goal" so-and-so: "Who or what would want to 'the goal' (something or other, something or other)?" That's the way it's working out. I mean, it's fantastic!

And this makes it look very silly. What – let's get the goal "not to eat pie." "Who or what would not want not to eat pie?" is the wording of the line. There is no other wording. "Who or what would not want not to eat pie?" makes sense to the pc beautifully. And "Who or what would oppose not eating pie?" See? Them's the words! Them's the magic words.

And let's take this silly shift of pronouns. "To kill myself," let's say, is the goal, see? "Who or what would want to kill myself?"

Auditor sits there and reads to the pc, "All right. Any more items here? Who or what would want to kill myself?" It's fantastic. I mean, you can't say "to kill yourself." You can't change the goal that much.

So you can apparently horse it around all you want to, to agree with the English professors, and miss clearing. That's apparently the magic code on this sort of thing

And it's doubly upsetting because you miss all the right items. And they become missed withholds then. So the tone arm goes up and sticks, and everything goes up and messes up and so forth. And the session is hell to run; and can't hold the pc in-session. You drive home in your Mercedes and feel like going off the curve.

But it's just nothing – nothing but the slavish following in of those lines. Well, I expect someday there'll be an – we'll find exception to it.

It isn't true just because I sat down and wrote those four lines as the first lines – has nothing to do with it. But nothing else has ever brought a free needle. We're up to about nine now. And they all go free on those wordings, and on any other wording they don't go free.

All right. I just interject that.

3GA is a demonstration of the similarity of construction between a reactive bank and a universe. And you've got the common denominator of the construction of something. The universe is formed by a prime postulate, which then alter-ised, makes matter, energy, space and time. Maybe someday you can amuse yourself by speculating what that prime postulate might be. If enough of you hit it, why, the earth will start getting spongy, but don't let that scare you. Go ahead and run it out. If you get that tough and that strong, you could always mock up another one, couldn't you?

Anyway, the pc has a basic purpose or a goal. And this is indistinguishable from prime postulate. See, he has them – he makes them at different stages of the track as he goes along, but he hasn't made too many. And therefore, you get your prime postulate as being the basic building block of a reactive bank. It's the goal, it's the basic purpose and so forth.

So that if you have a section of the reactive bank of the last trillion years, or something like this, or some strata of the reactive bank – actually, it doesn't go exactly plotted against time; it goes kind of differently. It goes fundamentally. How basic is the basic purpose, see? And that's sort of liable the first time to skim off what looks like the basic part of the – the whole time track. In actual fact, the basic purpose has occurred before earlier track, and that's all sort of condensed in and it's become part of this cycle. So your basic purpose isn't something you can plot back on the E-Meter and find and blow. You see? I won't go into any ramifications of that particularly.

But there's this postulate, see?

Now, the prime prime postulate would be the basic-basic of the goal or purpose on which everything else would be stacked. You're not going to get it the first crack out of the box. So don't worry about it. You just take what you can get on a goals list.

Now, the keynote of the formation of mass and spaces and everything else connected with the bank – that is, the reactive bank – the keynote of it is alter-is. And then the alter-is suppresses down into a not-is. Now, you see, the postulate is an is, and then you get an alter-is, and then you get a not-is, then you get the formation of matter, energy, space and time contained in the bank.

Now, that is the most succinct, brief, correct, workable, demonstrable statement of the structure of the reactive bank and man. And also, in the field of the physical sciences, it is the most direct and correct statement of the formation of the universe. It's demonstrable.

In other words, the human mind merges simultaneously with the universe. See, you've got the parallels of their construction and evolution. In other words, the field of the mind is now on a parallel – the field of the mind is now on a parallel – with your scientific sciences. Because, of course, there is the field of the mind and then there is the universe – not as everyone tends to believe: first there is the universe and then some fleas come along and light on it and develop their mental aberrations. It does not go this way. It goes quite the reverse.

You have thetans and they develop reactive banks, and then you get as a result of this the formation of universes – the old, old technical data from way back, one's own universe and the environmental universe and all that sort of thing

Now, that's quite important. That's important data. For any being to actually discover this data or start using it is fantastic. See, because it's totally in violation of mass, it's in violation of energy, it's in violation of space, in violation of time, so on. You're not supposed to do that! Slaves of the world succumb! You know?

You're not supposed to fly in the teeth of this kind of thing. You find out information like that, how would people like the pope and so forth make their coffee and cakes, see? I mean, be pretty grim. Do a lot – a lot of unemployment result, you know? Think of chain manufacturers: bankrupt them. Look at political contracts for the constructions of jails and prisons: up in smoke, no percentage for the politicians. Ruinous! Terribly revolutionary doctrines here, see?

Now, you want to know what starts the downward spiral on this sort of thing and how it gets denser and denser and denser – is the acceptance of an alter-is-ness as the fact! Now, that is actually and basically what a thetan knows, way down deep, that he must not do, and what every thetan that ever got himself in trouble has done. He knows he must not accept an alter-is-ness of the fact as the fact.

He gets nery when he starts to suspect this. And if he accepts too many of them, he goes into an overwhelm. He's overwhelmed by lies. And, therefore, people who buy – oh, I don't know; let's take the worship of the god Muggy-wug, or something like that. He's made out of mud and sticks in the middle of the Venusian jungles or something. And this god Muggy-mug and – if everybody – if everybody protests this god enough and protests the lie enough, and if the priesthood of Muggy-muggy is sufficiently brutal and overwhelmish, and if they can collect to themselves enough overt acts – you see, it's very, very important. They've got to collect motivators, see? Get other people to commit overt acts against the god Muggy-muggy, see? And everybody commits more and more overt acts against Muggy-muggy and after a while, of course, gets totally overwhelmed by the god Muggy-muggy, you see?

And after that you don't get a sane course of evolution from that point of acceptance of the god Muggy-muggy, see? You get zealotism, fanaticism, atheism. Everything that happens from that point tends to be chaotic. See, because they have fought an untruth – see, they've fought an alter-is of the facts. Muggy-muggy did not make the Venusian mud, see? But that's the prime declaration of the religion of Muggy-muggy.

"Oh, Muggy-muggy! Thou, who hast madeth the mudeth!" See?

These birds used to get out in the morning and storm around and wake everybody up long before they were supposed to get wakened. Developed fast days – nobody was supposed to eat, you see? Games conditions, games conditions and so forth. And before you ate dinner, why, you were supposed to go out and heap some mud on your plate in respect to Muggy-muggy, you see?

These things thetans didn't like to do! So, of course, they would get protesting against Muggy-muggy, and then this untruth would overwhelm them.

I use that quite deliberately, because it has been religion which has been – the strongest arguments and the strongest mechanisms which have brought about an alter-is-ness of the mind and form have been religious mechanisms. You might even say it's a religious universe.

And they get protested against most strongly and thetans get overwhelmed by them the most easily, and so on.

This just isn't my bigotry talking one way or the other. I listed it out the other day – it burned holes in the paper! – and then found out that I felt the same way about it afterwards! Very interesting.

The facts here are creation, assignment of. And you notice Muggy-muggy created mud, and some and some – or you've got somebody who is the – like Kali, the goddess of destruction, or something like that. But they have something to do with a cycle of action, the great popular gods, see? And it's all an alter-is. Kali had nothing to do with creating anything and neither did Muggy-muggy.

See, that's the alter-is, is the assignment of who created it. So that, naturally, is the biggest alter-is that you could make, is the alter-is of source.

So therefore, that's what – the most powerful overwhelms succeed the most powerful protests. And, of course, they're in the field of the seventh and eighth dynamic.

And well, it's not for nothing that every year there were a hundred thousand Christians killed in Alexandria during the early days of Christianity. That sounds impossible, see, but yet the rosters and records do contain that fact. In any single year, there were more Christians killed in Alexandria by Christians than there were in all of the Roman purges. It's interesting, see?

They protested harder amongst themselves than they ever really protested against anything else. And that's because they're wrapped up in a lie! See, they're wrapped up in an alter-is-ness of the fact of creation.

And it's hard to talk to you about this, because even as I speak, some people hearing this are still so enthralled in their overwhelm and protest along this particular religious lines on the seventh and eighth dynamic that they say, "Oh, God! Listen to what terrible blasphemy! And that couldn't be true," you know? It starts off all the alter-is on an automaticity in their head.

And they say, "Well, he's just anti-this and anti-that."

I'm not anti anything, except like any other right-minded thetan, I'm kind of anti-alter-is.

This is your most fruitful source, then, of lies and commotion – would be anything that had to do with creation. And you introduce an erroneous assignment of creativeness, or actually, less strongly, any part of the cycle of action; introduce – misassign, see, who created it, say something else created it, and you'll get randomness all out of proportion to everything

Walk into a – here's a – here's a kick for you sometime – go into an art museum and look at Rembrandt and point out to your companions in a loud voice – particularly during an exhibition, a white tie exhibition or something like that – point out to your companions in a very loud voice the wonderful work done by Picasso. And, man, you'll have a riot on your hands. There's other people standing around. They will come over and they will correct you and they will argue with you and they will look at you with terrible contempt. They'll become

very misemotional about the whole thing. The guards and that sort of thing are liable to come up and start trying to eject you or – all kinds of unlikely things will occur, you know?

You look at *The Cavalier*, or something like that, and you say, "Now, that actually is a very excellent example of Picasso's brown period." And go on and hold forth in great dissertation.

Or go over to the Royal Festival Hall or some such area, the music hall, and start talking outside when you hear – oh, there's something by Mussorgsky, you see? And you say, "Now, that's by Stephen Foster." You'll get upset!

Alter-is-ness of the source of creation is the most fruitful source of upset and commotion because, of course, it itself is the father of all chaos. If there's any chaos in the universe, or any lack of order, it will be found by reason of a misassignment of who created it.

We're liable to get so little upset on the subject of founders of countries and that sort of thing: "Well," we say, "George Washington, the founder of his country." See? Well, nobody will much argue with you. You don't get in much of a stink. I bet you could sit around for hours in the States in various popular and public places and say, "George Washington founded," you know, "his country." You could go on and do this and do this and do this, and nobody would ever do anything. They never say anything. It was generally accepted to be a fact and it more or less is a fact, you see? And you're going to get no commotion, that's all.

Well, if you said, "Marco Polo founded the United States of America," people would simply think you were insane. But if you came almost on the truth, see, and said, "Alexander Hamilton founded the United States of America and was its first president," you know, everybody's brains would go kind of creak, creak. You see, it's not – you know? He was at least alive at the same time, so it's a recognizable alteration.

The truth of the matter is that probably anything wrong with the United States right now, it's George Washington. Now, you'll get an argument about that because it's so much accepted to be truthful otherwise, see? The guy tore up the minutes and records of the constitutional convention! They were never published. He made sure they were burned. Nobody has been able to interpret the cockeyed Constitution since. And they keep changing it and changing it, you know, and trying to amend it and wondering what people meant by it, and so forth. And nobody can find out because they threw it all away, see? That's a fact, do you know? There were no – you know there were no minutes of the constitutional convention ever published! And I don't think it was until way into the nineteenth century, sometime or another, that somebody released a book on his demise, which gave something – I think he'd been the secretary of the convention and he gave some of the data.

And you got an operating machine now called a Constitution, which nobody is supervising. And it's starting to alter-is, and itself was an alter-is, and it's kind of going out of hand and nobody can quite make any sense out of it. And the citizens have less and less liberty, but they can't – don't quite know what to do about it. You see?

Back in 1905 somebody changed the Constitution, said the poll tax could not any longer be charged. That's what it used to say. Well, they wiped that out, so now they can charge income tax. Everybody is fined for making a living. And all kinds of wild things pro-

ceed, you see, from this point. Well, of course, there were no records to say why they had this. You know? There were no – none of the arguments as to why this existed or was put in by the constitutional convention, you see, no arguments were available to anybody to refute this proposed amendment to the Constitution about 1905. See, here's missing data of some kind or another.

And here's George! Well, what did George stand for? What did he mean? What did he want? Everybody was perfectly happy at the time of the revolution, they were perfectly interested in him. They thought he was a nice guy, everything was fine, everybody believed him. The only reason the revolution got anyplace at all was because of George – a terrific figure of a man. And this guy had the country in his grip. Actually, he had to protest many times against becoming king of the United States, see? Everybody wanted to make him king! He said, "No. No. No."

We don't know what his basic purpose was, see? We don't know what the basic purpose agreed upon by all the founders of the United States was. We read the propaganda which issues from their writings.

To give you some kind of an idea, the United – this is not quite political – but the United States Naval Academy issues the letters of John Paul Jones. And this is the most flagrant example I know of. Their booklet on the letters of John Paul Jones is what they want every midshipman to become! And, frankly, they make a bunch of clowns out of them, because they've excerpted all these letters. The true letters of John Paul Jones, without anything cut out of them, show you a very lively sort of a bird who was all over the ship all the time and believed in all kinds of things and was very enterprising and fantastically energetic, and who had many opinions, and who believed naval officers should have opinions and all kinds of things, you see, that have now been carefully cut out of the letters before they're published for the budding, young naval officer.

In return, we get the stark patriotic statement, you see? We don't get that you ought to teach midshipmen to dance. See? That's all missing.

There's an alteration here. See, there's an alteration to the goal or the basics or the fundamental. Now, he was the founder of the American navy. I won't say anything particularly against the American navy, there's no reason to. It exists.

But if I see one more ensign become admiral, fattened on the letters of John Paul Jones excerpted, I'm afraid I'll be impolite to him. I have been known to have been impolite to him already because he isn't true! See? He isn't real! There's something missing.

No reason to analyze what's missing, but basically the fundamentals of his education have been alter-ised. The things which he ought to know and understand aren't there!

And that alone would break him down into a sort of an apathy. He would sort of smell the missingness in there, see? He would see there's something he didn't quite understand or wrap his wits around. And therefore he would never really spring full-armed into a sailor of war, you see? There'd be something restraining his going-forthness. He'd tend to solidify right in his tracks. You could expect him, then, to be rather defensive, rather unimaginative, perhaps a little frightened and very, very careful of what he did.

Where's the bold sea dog that you normally think of as a ruler of a navy, you see? Well, he's not to be found. He's got a fantastic alter-is on his educational line.

Everybody thinks, well, you should teach these boys to do this and to do that, and you should teach them some more of this and you should teach them some more of that and some more of this, and alter-is it and alter-is it and alter-is it. And when we get all through, we'll have it all alter-ised, and it'll all be wonderful. You'll find it'll just get more solid, more apathetic, and more quit.

Basic purpose alter-ised creates mass. But similarly, it creates a degeneration of tone – inevitably creates a degeneration of tone.

Now, some of you think, once in a while, that I have alter-ised in Scientology and Dianetics far too much. Well, if you think that hard, you don't recognize that we're running independent of the sequence of time. We're running a backwards track. In other words, we're cutting into the most fundamental fundamental that we can cut into regardless of the continuous forward progress of time, you see? And we're swimming against the time stream, in actual fact.

All right, we suddenly come up with this, and on isolation of importances, discover that we're back in 51, 52, you see? Basic purpose, you know? Basic postulate. What's the prime postulate of the universe? Book One, Book One – actually December 1949, not even 50, is basic purpose in Book One, see?

Isolation of important materials and shedding off the unimportant materials and occasionally going down cul-de-sacs, occasionally getting into blind turns, you know, and say, "What are we doing here?"

A wonderful example is 3D Criss Cross. I had received a cheerful despatch saying, "After we've trained all of our students here to do 3D Criss Cross, is it all right for them...?" Boy, they had an air letter going out of here so fast, its edges were charring. "Don't do 3D Criss Cross, man!"

Why? Well, it actually came just before I found out about prime postulate, you see? So you do a 3D Criss Cross line or anything like a Prehav line – see, that's the ridge that I ran into just before I found prime postulate, see? I thought you could go on and list. Enough interesting things happened about listing to demonstrate that listing was quite a process. But it also demonstrated that it makes a hell of a lot of difference what you list, and you mustn't list anything at random and you must never list a wrong goal, because it just adds more alter-is to the bank. So 3D Criss Cross was actually alter-ising the pc's goal unless, oh, God, a million to one chance that you would have his line – you should have his goal in one of the lines. Ten million to one.

All right. So, we've been in little cul-de-sacs and that sort of thing. But note I pull out of them in an awful hurry and cut to a more fundamental fundamental.

And you're in the happy state right now of being on a plateau of this particular character that is just the data of late spring and early summer 1962, see? And it makes a package all by itself, and you'll get this special checksheet that contains the bulk of it. And I've just issued a policy letter for staff training around in Central Organizations which, with a few more items

added, is just the last few weeks of development is all that contains. And that's their staff training checksheet and nothing else, see?

And you, unfortunately, picking up a GAE, possibly think to yourself that you are being victimized by being put on this special checksheet. And it probably hasn't been pointed out to you that you all have to pass this checksheet anyhow. And naturally if you get a GAE, there's time for you to study on the checksheet. So you're not really being assigned the checksheet because you got a GAE. You've all been assigned the checksheet whether you're going on auditing or not.

That's modernization, but it's a plateau. You've hit it suddenly, and I haven't put up very many electric light bulbs and that sort of thing around, or fired off many rockets. But I'm at a point where, what am I going to write for bulletins, see? Interesting state for me to be in!

So I'm refining bulletins and reissuing the bulletins. And today did you a policy letter, 17 July, on the exact Prepcheck for listing goals or lines. Exact Prepcheck with – a nice Prepcheck. It's all for – it's all the slotted lines. And you put the pc's name at the top of it, and then you just run the Prepcheck down. You make out a form every time you do a Prepcheck, see, just line after line, slot after slot. And get each one of those nulled and turn it over and get the rest of those things nulled, and you've done a Listing Prepcheck.

And yesterday did your Goals Prepcheck – how do you check out a goal? It just does it on this form, and so forth. Oh, I suppose we'll go along a little while and find out that there's some other button we ought to add to the thing and reissue the Prepcheck. That's about where you stand, now, because you stand at the pinnacle of success. See? It is happening.

And I'm not making any allowance at this particular time, of whether you find it easy to learn how to do this or not. I'm making no allowance for this, whatsoever. I'm just saying, "Well, you can learn it!" I'm not just throwing it off, but because I don't know any other road around it! See? I know no way to proof the technology up so that you will never longer have to run an E-Meter. See, I don't know how to do this.

I'll tell you how far away we are on research. I am actually researching some sort of a technology that if you kicked off from Earth, or it billiardballed under atomic fission, or something like that, you wouldn't have to make an E-Meter in order to clear somebody, see? That's the echelon of research I have just entered into. And then improvement research, improving the thing, or this very high-flown "What the hell do you do about that?" Oh, I don't know. I might crack it and I might not.

All Scientologists have a slight anxiety of, "What if I kick the bucket? How much of the information would I pack along with me," see? They all have this. So, what I'm really trying to do is make out the information package you take along with you. [laughter]

But there's about where we stand. Now, as far as alter-is is concerned, we've done this incredible thing of while going forward on the time track we've run the fundamentals back. All right, now we're at a fundamental that runs out everything we've put on the time track. You see, anything developed in Scientology or in Dianetics is now run-outable by the exact technology which you have. It runs itself out rather easily. It can be put together, in other words. All right, so much for that.

Unless you follow some such operating pattern as this, you then can't backtrack this terribly complicated thing called structure – matter, energy, space, time, whether a reactive mind or a universe – you can't backtrack this terrific complexity to a sufficient simplicity to be able to do something about it, you see? Well, that's what we've done. We've brought it back now and we find out – great surprise, surprised me, too, you see? What's wrong with it? The pc's goal. That isn't what's right with the pc, that's what's wrong with him, see?

George Washington is not what is right with the United States, it's what is wrong with the United States! See?

That's pretty weird. It's a complete whizzer. We've had a whizzer run on us, you see?

This guy goes on being loyal, being loyal, being loyal, being loyal. And he goes on being a lot of other things. And he doesn't know what he's doing wrong; he's doing something wrong. And he's caving in and falling on his head and unable to do his job and betraying everybody. And eventually we sort out his goal and we find out it's "to be loyal," you see? That was probably the goal of Benedict Arnold.

If the individual is no longer able to adequately do something, it's probably his goal – if he isn't happy about doing this thing, you see? You got a goal "to harpoon whales." Well, you'll always be thinking about harpooning whale and always missing or unable to find a boat or find whales or something. It'll be the one thing that kind of makes you sigh and that you retreat from. See, a lot of things haywire about this.

It's very dangerous to tell you this because it's slightly invalidative of your goal, you see? But nevertheless, I have to tell you; it's the truth of the thing.

Now, let us consider the goal a finite truth. Now, it isn't completely true that the goal is everything that is wrong with the person. What is really wrong is the alter-is-ness of that goal. If the person never alter-ised the goal, he would probably be all right, you see? Now, you can say what's wrong with him is his goal, but it's a little bit too short a statement. No, what's wrong with him is the alter-is of his goal, the alteration of his goal, the departures from his goal line, his inabilities to commit this goal to action. See? That is what gives him his bank.

But you strip the goal out from underneath all this and the bank disappears and you find out he didn't need the goal in the first place which is all quite interesting.

Well, consider that goal, then, a finite truth. (You probably don't think so, but this is still a lecture on ARC breaks and TR 4.) It's a finite truth. It was truth to this pc; it was actually self-postulated truth. And it never got acknowledged. But all around him lies got acknowledged and this baffled him.

And if you listen to a thetan for a while, you'll find out, really, all he's protesting is the fact that lies get acknowledged but truth doesn't. See, if you listen to him for a while, that's really all he's talking about. Whatever else he's saying or however he's putting it – whether in the Demosthenian oratory and logic, or no matter how colorfully or how dully or how whin-ishly or how meanly or how grandly he is putting it – that's what he is saying! He is saying truth never gets acknowledged and lies always get acknowledged.

Some woman comes in and she says, "And I lost my husband. And there I was, a good homebody, and I was sitting there doing everything I was supposed to do, you see, and so forth. And he left me for this little flirt that would never cook and would never do anything, you see?" And you'll hear her going on and on along this particular line in some shade of gray of this argument. She, the wife, you see, was not acknowledged – and she was a true wife – but this flibbertigibbet that he ran off with, you see, well, he bestowed his whole fortune on her, and she was nothing but a cockeyed lie. See?

And you just look over these various things and you can generally trace through an argument these threads: the protest of the acknowledgment of lies and the failure to acknowledge truth. And that is the basis of a thetan's misemotion. These are the principles – above his goal, in back of his goal, and around – on which all thetans operate. There are no exceptions to this. They all operate on these same buttons. You press A chord major and you get A chord major.

And therefore, when you say to a thetan in a session, "I am not acknowledging or taking up the truth," he gets upset! And that's cleaning a clean read. And when you say to a thetan that he's got something he hasn't got, he gets upset – or, that when he hasn't got something he's got, he gets upset – because you're doing an alter-is of the facts.

He's got a present time problem, you read the meter and tell him he doesn't have one. He's upset! It's a violation of the true state of affairs. See, you're acknowledging a lie, here, and not hitting the true state of affairs. So the thetan doesn't have a present time problem and you tell him he's got one. Once more, you're acknowledging a lie and failing to acknowledge a truth. And he gets upset! And there's nothing makes a thetan get more upset than that. It's alter-is-ness. And there you get into all kinds of wild messes with a thetan.

Now, do you see how prime postulate has a connection here and how it is definitely and intimately involved with reading the wrong meter read. See? You just hit right to the middle of his "thetanesque" soul with a dagger of betrayal. See?

He's got a present time problem, you tell him he hasn't got one. You didn't acknowledge him, did you? All right. He hasn't got a present time problem, you tell him he's got one. Everything goes to hell from there on. He gets very upset because, "thetanesquely," he now wants to convince you of the truth of the situation. He's trying to impress you with the truth of the situation from that time. He then becomes the living crusader of Truth – capital T; sword in one hand, torch in the other, you know?

You haven't got a pc from this point on. You have a crusader for Truths. And how do you get into that state? Well, it's very simple – you just miss a meter read. You clean a clean or wrong-call a reaction. You get a reaction and say there's no reaction; you get a clean and say there's a reaction. All you got to do is twist these two points and you no longer have a pc. You've thrown him right into his most turbulent areas of action. He is now demanding that you do not acknowledge untruths. He is now crusading on the basis that "we mustn't have more alter-is than we already got because it's put us in the position we are in."

You've stepped all over his Scientological corns, if he's an auditor, perhaps, but you don't have to have a trained Scientologist to have this mechanism. You go out and you get yourself some raw meat, and the fellow sits down and says, "I've got ulcers."

All right. Let's say, for fun, that he hasn't got ulcers. Let's say, for fun, what really is the trouble with him is every day he drinks unfermented – insufficiently fermented wine and it upsets his stomach and gives him indigestion, see? And he knows this. He doesn't even have to know it up on the surface of his mind, you see? He's got it all set. And he sits down and he says, "I've got ulcers."

And you say, "All right. Good. Fine. Thank you very much. You got ulcers. All right. Hm-hm. Well, very good. Now, the best thing for us to do for you is to give you some Pepto-Bismol or barium meal and so forth, and we'll treat these ulcers. And if they don't get better, we'll operate on them."

He'll be mad as hell at you! And you won't quite be able to figure out – "Hey! What's going on here?" See?

Guy comes in, he has one ten-thousandth of an inch of tissue left before perforation, see, of the ulcer. See, he's just on the verge, you know – he can still walk around – and he's got ulcers to all intents and purposes, man. And he comes down and he sits down and he says, "I haven't got ulcers."

And you say, "I agree with you perfectly. You haven't got ulcers."

And, boy, he will be mad at you!

That's why you mustn't treat illnesses: because they're all lies.

Guy comes in, says, "I have a sore throat. I have a sore throat. I have a sore throat." You run something on him and the ridge moves. Yes, his throat is sore. That is a statement of truth.

But he says, "I have a cold." If he means by that, he is being attacked by virus or germs or something of the sort, and this is not the case, you can get yourself all involved in an ARC breaky situation by making him gargle.

Very interesting. No wonder the medical profession has to have law to support them! Do you see? This is under the heading of acknowledging the lie and ignoring the truth.

A guy comes in and says he hasn't got ulcers, you say, "I'll audit you." Fine. Make sure you do so if you say so.

He comes in and he says, "I haven't got ulcers. Actually, it is just some pains that I get from drinking too much ketchup."

And you say, "Good. I will audit you."

You enter into the field of what is laughingly called diagnosis, you're in trouble. But oddly enough, as close as you can diagnose is guessing what he has done, and running it out as an overt.

And, of course, it mustn't be forced on him that he has done it if he hasn't, because now you're really in trouble. You dream up a Zero question, "How about blowing up railway depots?" (he's never been near one in his life) and then insist that he find the overt. Oh, man, that session is going to go round and round and round. You're going to be in trouble all the way.

All right. Now, during the war he was a light-bomber-force bombardier and he was a specialist in blowing up railroad stations. In fact, he'd go out practically every night and blow up another railroad station, see? And you say, "Have you ever blown up a railroad station? That's null. We will go on to the next question."

Well, everything kind of goes whirry and wheely in his skull. The cogs start to mismatch. And boy, he gets mad, he gets upset, he gets misemotional, because of the same mechanism. He has blown up railroads. It isn't that you've failed to discover something about him. It's just that it isn't true, see?

You've said, "All right, you haven't blown up railroad stations," when he has. Or you've said, "All right, you've blown up railroad stations," when he hasn't. Either way, you're acknowledging a lie and failing to acknowledge the truth. And you're on the direct line of a thetan's favorite protest through the ages.

And this – out of this you get an ARC break. And that's what an ARC break is. It is an abandonment of truth and an acceptance of lies. And after that you got trouble.

So when you misread a meter, you've hung the pc with one or the other.

That's why you got to be able to read a meter every time and never miss. Because every time you miss you've entered into the session the thetan's favorite boogeyman: the acknowledgment of lies and the ignoring of truth. And you have just entered this into the session and after that he blows his stack and ... He doesn't really know why his eyeballs keep going out a foot in his face and snapping back into the sockets, you see? But he knows he's upset, and it's the most fundamental upset there can be since out of that upset comes the whole construction and, reversely, the whole destruction, not only of universes but of his own reactive bank. And you've hit right on the primary principle of construction of the reactive bank and of the universe. And you've hit right on why it is that way. And he doesn't like it being that way. And you have made the session agree with all of the slave tricks that have ever been pulled on him.

So therefore he has to protest against you. And up to that moment you were his friend that was going to get him out of all this. And now you've pulled the trick that got him into all this. You see, you've acknowledged the untruth and you have failed to acknowledge the truth. And that was the trick that got him into all this in the first place. So he doesn't want to be in there again, so he tries to get out of that session. Sometimes very loudly.

So that's why meter reading has to be 100 percent. And that's why there is no substitute for good meter reading. And that's why, in procedure, you can occasionally flub, misread a question, do something like that – your TR 0 will go out, or something like that – you don't upset the session to any great degree at all. But, brother, you just miss that one read – it reacted, and you said it was clean. You have taken a bayonet and slashed clear back to the beginning of time with this pc and restimulated every protest he's had – every protest he's had for two hundred trillion years. So you're getting violence, of course.

You can learn how to read a meter perfectly. Don't worry about it. It is doable.

All I wanted to show you is the mechanism of what happens when you misread a meter and how that compares with 3GA and how your session and sessioning, now, is totally

lined up with the actual principle of the mind. You are doing now what the mind is doing. You've got it exactly paralleled. And so therefore you can spot any error that you commit and the error is merely in that field.

But the pc protest now is the most fundamental protest that a thetan can make in a session, because you are doing exactly in a session the parallel of what the mind has been doing, and therefore you are at extreme truth. This whole session, you're running extreme truth. And that pc can feel it. He knows you're running extreme truth. And then, carelessly, you introduce the needle that didn't react and you say it did; you introduce the needle that reacted and you said it didn't. And into that extreme truth you introduce this untruth, and after that you've got hell to pay.

That's why pcs ARC break, and that's the direction that you have to take to repair sessions – you have to repair these introductions of untruth. Okay?

Thank you.

ANATOMY OF ARC BREAKS

A lecture given on
17 July 1962

Thank you.

All right. This is lecture two, July 17 AD 12, Saint Hill Special Briefing Course and this – easiest thing to do is to give you a lecture, but I might give you a question period. Which do you want?

Audience: Lecture.

You want a lecture?

Audience: Yes.

All right. I'll go on and give you a lecture on the subject of ARC breaks and their anatomy. The training of metering is probably the hardest hump to cross in the absence of proper educational aids. During World War II an enormous number of visual aids were developed and the whole principle of visual aids sort of moved into view.

And at one time or another in Scientology, we've had visual aids of one kind or another, but the biggest need at the present moment is a visual aid which parades out meter reads. And we're lucky here at Saint Hill having a TV closed circuit television. And this assists to a remarkable degree and of course, tomorrow night three luckless students whose names are not yet known will benefit us with some sessions.

I wouldn't guarantee that they – that we won't get a repeat of one or two of last, you know. I saw they were – I just looked over and saw they were feeling comfortable.

Now, because one television camera is posed on the meter which the auditor is using and another one on the session and because you have a picture of the thing going on, you have it pretty well taped. You can sit there and you can watch it and so forth.

But of course, that's for a limited period of time. And although – to give you very sharp examples of how auditing is done, this is invaluable.

We nevertheless need an extension of that particular type of training. We're working right now on stereo equipment whereby one side of the tape is used to duplicate a meter read and the other side of the tape gives you the vocal. And then you hook the meter, you see, onto the meter-read-stereo line and then you hook a speaker onto the verbal side and, of course, you get coordinated meter reading. Estimate was given me the last night that we'll probably have this in a couple of weeks, which is very, very rapid.

This device of course, is exportable. By using the same stereo tape recorder and by copying the tapes on stereo recorders, we can actually put these tapes all over the world. In other words, we can put proper sessioning all over the world. Our sessioning now is very standardized in that it's a very smooth workout of repetitive commands and that sort of thing. And no great changes are expected in that, so the tapes will be valuable.

But the idea is that you'd have a number of auditors sitting there each one – this is the *ne plus ultra*. I'll expand the idea a little bit for you.

Of course, you could have one stereo tape recorder and one meter and one auditor being trained. But last night we were going into it a little bit further here, the auditor could push a button and get some help and the guy who was monitoring all the co-audit sessions could throw a switch and read the meter on the session that was going forward and so forth.

But a similar circuit to this probably will eventually be worked out whereby several meters can be plugged into a switchboard and will all read and where you either have a microphone to each of these auditors sitting there holding one of these meters or you just have a central microphone in the room, whatever is simplest.

And this thing of course, makes all the meters read, so you're not butchering up some pc. The problem is you got some pc who is sitting there and you're asking him questions; you're not clearing it up and all that sort of thing and the pc knows it's sort of a test and so on.

Nevertheless, a little bit of strain goes on the thing and I imagine before now you've probably had to clean up some of these practice sessions when you're actually in the auditing section. I imagine you've picked a few of those things up.

And that's rather hard. Particularly since TR 1 tends to be very poor at that particular stage because the auditor really doesn't want to know the answer. He's asking the guinea pig pc, you see, who is not a pc at all, various questions in order to get a meter read, not to get the answer from the pc. So this, of course, throws TR 1 and its basic fundamental completely out. It's – TR 1 is the desire to get a response from the pc. And you want a meter response from the pc, but you really don't want to know. You get the idea? So this really crosses up the wires on the poor pc.

Nevertheless, I imagine this system of instruction will continue on to the end of time. Here and there you will still have nothing but that system of instruction, you see.

You're going to teach fifteen auditors who are in lower south Pasadena and you're going to train these guys up to a point where they can read a meter. And you haven't got any stereo and you have no tapes and you have no switchboard and that sort of thing, so how are you going to do it? Well, you're going to do it by butchering up pcs, see. It's more important that you learn than it is that some pcs get somewhat upset, because you can always straighten it out if the sessioning is good. But if an auditor, you see, doesn't ever learn how to do it, you'll never straighten out anything!

So what takes priority? What takes priority is the auditor learning how to read a meter. And if you ever get too softheaded and you find yourself completely without equipment and too softhearted, you see, about the whole thing and decide this is too hard to do and decide to fake it up by lifting fingers on cans and doing other things of this particular character, my

advice to you is, don't, because the very pc who is sitting there serving as a guinea pig depends utterly, in nearly all cases, on auditors in his vicinity learning how to read a meter for his own solution of case and his eventual clearing. See. So it's sort of give a little, take a little and get a little back. And get an awful lot back, you see.

But, I'll give you that as meter training. That is the most fundamental action then of meter training – is for this exact combination to exist. The auditor sitting there holding a meter. The (quote) "pc" sitting there holding the cans. The coach standing there back of the auditor correcting the auditor on the reads. The auditor asking questions – we don't care what he is using. It is perfectly all right to use somebody else's goals list. Don't read the pc's own goals list to him, by the way. That's *verboten*. You can always take somebody else's goals list. You'll get reads on it. They won't rerun out either. Very virtue – they don't flatten.

I actually would – you'd need practice in asking rudiments questions or something like that. Well, that's a horse of another hue. You probably should use the right rudiments questions because they'll be the most likely to get cleaned up in the long run.

But the person who's doing the auditing is asking a question and getting a meter read and then calling it and getting an answer or not from the coach. In fact, he probably better not get an answer from the coach. It better be understood that nothing is to be answered. That makes it all missed withholds, but then it's understood and the reality of the situation is far better.

And then you've got this coach standing back of the auditor looking at the meter and correcting whether or not the auditor read them right.

All right. Let me show you the – at *once* the basic difficulty is we have no guarantee that the coach knows how to read an E-Meter. No guarantee whatsoever. So we just enter this fantastic piece of randomness that, for the purposes of the drill, the coach is right. That's fantastic randomness to enter into the situation, see.

The immediate result of this is going to be in the initial stages of the drill, a fantastic confusion. And it'll get so confused that out of desperation everybody sooner or later is going to learn how to read the meter. [laughter]

Now, as I say, that is the most fundamental and the crudest form of meter training. And yet I dare say in the year 2000 or 2050, why, there'll be somebody in upper Lower Slobovia having to train some auditors and that is exactly the way he will do it. It's inevitable because he hasn't got the rest of the equipment, don't you see.

Now, out of this, believe it or not, comes learning. You eventually learn it, but the confusion that results – you see the needle fall off the pin, and the coach says – you say, "That reads." And the coach says, "That's null."

The coach is forcing you to agree to a falsehood. So don't agree to it. Just let him say so. Nobody asked you to agree to it. He simply called it. Isn't that right?

I used to get by in being audited – I could be audited by everybody or anybody for the simple reason that I'd always answer the auditing question. I only came a cropper when I was given four auditing questions and not told which one to answer. That fouled me up a little bit,

but up to that time the stable datum I got by on, is somebody asked me to do something I did exactly what they asked me to do. You would be surprised how mild an approach that is to pc'ing. Just always do exactly what you're told and you don't get into any trouble, of course, because there's no alter-is in the situation.

The auditor says, "Do you have a present time problem?"

And you say, "Yes."

The auditor sits there alertly waiting for you to say something else. And of course, you don't say anything else because he hasn't asked you anything else.

And finally the auditor says, "Well, what was the problem?" And you tell him, see.

The auditor says, "Take your right hand now and put it on the back of your right hand." Go ahead and try to do it. The auditor will wake up after a while that you can't and cancel the auditing command, you see.

You can only get into trouble by saying, "I can't do that. What are you doing tearing me to ribbons, see, by asking me to do things that are impossible? And why don't you go back to the Academy and learn how to audit," see.

And you can get in trouble that way because you're protesting the alter-is. But don't worry about that. As pcs, you'll always protest the same way, so nobody's asking you to be a certain type of pc. I'm just giving you an example of the thing.

So in these drills you will get a certain amount of alter-isness and confusion. And I wouldn't be a bit surprised but what somebody – could get away more or less with reading the meter, wouldn't pass into a stage of not knowing whether the meter was actually on his lap or not, much less what it was reading, you see.

Falls off the pin, the coach says, "That's null." And the thing is absolutely motionless. It hasn't moved for a minute or more. And the question is asked and the coach says, "That's a read," see. Well, you get beyond your confusion by not getting into fights about it.

Now that is very crude – a very crude drill and so on, but as I say, it'll be used for a long time.

Now, as we improve on this drill with a stereo tape and other mechanisms, we of course, can play back play a tape and make maybe four or eight meters, something like that, in people's hands, read. And maybe, so we don't get any room lag, a microphone speaker around the neck of every auditor, so he hears the tape. And he hears the auditor say, "Do you have a present time problem?" Sees the read, you see. Then you have the coach who is working off a mimeographed sheet, because the correctness of every read on that tape has been established. And it's marked by rudiments. The first question, "Do you have a present time problem?" is followed by a reaction and it says what it is on the tape.

Now, these tapes are not perfect meter tapes. That is their main virtue. Some of them are early. Some of them are late. Some of them are on the button. And some of them are called reads when they are actually null. You know. There's a confusion involved with it. You see?

And so it says, "Do you have a present time problem?" and then right under it in a long string, "Right-right-wrong-right-wrong-wrong-right." See, that's all the coach calls. See, there are just that many reads and they are – that many were right and that many were wrong in that sequence and order. So it becomes very simple coaching.

That's just one use of the situation.

Now, your next action would be something like this. We put a whole bunch of auditors, about eight auditors in the room, with meters on pcs and we have them all onto a switchboard and that is – goes to one stereo recorder and in turn we take a section of each one's session.

We got a microphone hanging on the chest of each one and the cans pass from the pc to the switchboard back to the auditor's meter. And then they bypass off that onto the Instructor's meter, amplified and onto a stereo recorder. So at the end of the goldfish-bowling, all he has to do is start the tape again.

Have some people coach this or inspect it or look it over. They will see how many reads they are missing. They'll see – they'll see everybody's auditing. They won't see all of their own auditing, but they'll see some of their auditing, don't you see. Take some of each session that was going on in the room and then play it back to all auditors.

See how many types of arrangements that can be made on this. Well, you could make an endless number of tapes in that particular line, so that's what we're – particularly what we're trying to develop.

Now, the difficulties of teaching an auditor to read a meter are enormously rewarded by the fact that you have productive sessions. And I assure you that there is no benefit in being audited by an auditor who cannot read a meter. That's pretty ghastly because it leaves one out of session. One's statements are not being accepted. One's reads are not being accepted, see. One's no reads are not being accepted. And the net result is the pc is sitting there trying to keep his own rudiments in because, of course, the meter and the auditor have cancelled themselves out by incorrect reads here and there.

We can't have an *occasional* correct read, see. Actually, we can't even afford an *occasional* error. Well, a lot of sessions running along, early on in student auditing have an occasional correct read. And then they graduate up to only an occasional error. And then they would graduate on up to no errors. Actually, that *tolerance* can be attained. I don't have ARC breaky pcs. My pcs don't ARC break. Once in a blue moon I've chopped one or gotten mad at one, snarled, something like that along the line – even as thou. And of course, have gotten an ARC breaky pc. But then turned right around and pulled them right straight out of it so they were all smiles.

But my expectancy of auditing is a no-ARC-break session. In fact I would be quite amazed to have an ARC breaky session. It would startle me no end. And that's with very rough pcs, you see, easy ones, rough ones and so forth. I have no expectancy of an ARC breaky session.

I expect to get everything that the pc tells me. I expect to find out everything I'm supposed to find out about the pc. That's the expectancy. Now, I'm not talking about what a good auditor I am. I'm just talking to you about what my personal experience in sessions is.

So you are fighting with a problem I don't have. So give me that, because it's taken me a long time to understand what you were doing, see. Any trouble you were having was relatively incomprehensible. I have – haven't got a reality on it as an auditor, but I do have a reality on it as a pc. And of course, as a pc I never knew what was going wrong on the other side of the meter because I wasn't reading the meter while I was being a pc, so that datum was barred to me, too.

I would occasionally think that I was kind of in rough emotional condition or I must be tired or I must have too many present time problems or something like this. The pc actually never assigns the right reason for his ARC break. That you can count on. The reason for the ARC break is almost never accurate. Even if it's on the same subject like, "You missed a withhold on me" the pc will give you the wrong missed withhold, see.

The ordinary action is and what you can ordinarily expect, is that the *pc* is upset and that there is some truth in what the pc is *saying*, but that what the pc is calling the actual *cause* is *not* the actual cause, that the actual cause occurred *earlier* than the pc is telling you. That is routine. You could expect that just as much as you can expect darkness when the sun goes down.

Even if he told you exactly what was wrong in the session, that you had missed a read, it will not be the read that he says you missed. It will be an earlier read whether by five minutes or ten minutes or something like that.

If he – if he calls you on the third rudiment which is now the "PTP," see – if he calls you on that one, there's probably one in the first rudiment, you see.

He says you missed the read on the PTP. You probably didn't miss the read on the PTP – you probably did, but the one that is upsetting him is the one on the auditor. See, you missed an earlier one than he says. That is invariable. There will always be that much *alter-is* in a pc's protest. It's always earlier than he says.

But because the pc is in a state of *alter-is* anyhow – you touch a pc's bank, he's in a state of *alter-is*. You can count on that. Absolutely count on it. Touch a pc's bank, he's in a state of *alter-is*. That's one of these other – another invariable *maxim* or *figure* lines.

You run – you run ARC Straightwire and the worst pc will never answer the auditing command at *all*. Will say he did, but he doesn't. Therefore, you must never run a, "Yes" response-type process without also asking, "What was it?" Otherwise, you never spot this *alter-is*. I'm now talking about the – well, this was given in the 3rd ACC. *Alter-is*. Pc *always* does something *else*. Or does something entirely different. You say, "Recall a time you were in communication with someone." And the pc will actually sometimes think that he has done this when in actual fact he has recalled a time he was speaking not to anyone at all.

Now, that is a very *innocent* pc error, see. That's a very mild one. In the pcs that are the worst that you will have to do with – your very neurotic institutional type – you know, I mean in that band, they never even answer it as a *communication*.

You say, "Recall a time when you were in communication with someone," you see. And they won't even go so alter-is as to recall a time they spat, see.

They will alter-is *completely* over on to something else. They will mock up a dog. Not even that they ever communicated with dogs. These things are totally disconnected and disassociated.

You say to them, "Put your shoe on the window seat" and they will throw their hat out through the area over the door.

And here's the oddity. They think they're doing what you said. To look at them and to listen to them, they think you're doing what they said. But, if *you let them get away* with this you have stepped on this button of acknowledging a lie and will at that moment, by the missed command doingness, set up that alter-is in the session. So you've acknowledged a lie.

Now, Mr. Pc, let's say this is institutional stuff and you say, "Now put your shoe on the mantle" and the pc takes his hat and throws it in through the port over the door. And if you say, "Thank you very much. That's fine," you have ended the session right there because that pc becomes unauditible.

Because the degree that they alter-is monitors the degree that they protest alter-is. These things are a *constant*. They are of the same order of magnitude. If a pc alter-ises, he *screams* like mad if any alter-is occurs. That is if you acknowledge the alter-is. See, he screams as hard as he alter-ises. Got the idea?

So the worse off a pc is, is measured by the degree that the pc alter-ises in his thinking. That is a direct index of bad off. But of course, it's bad off on certain subjects because one person will alter-is on one subject and one will alter-is on another. And it's only those pcs that alter-is on all subjects that are – fall into the neurotic and – oh, pardon me, pardon me, fall into the psychotic band.

But, the worse they do it, the less they can tolerate it. So you mustn't say cheerfully, "Oh, thank you" and "That's fine" when the guy throws his hat out the door. You told him to put his shoe on the window. Now, of course, telling him to do something before you have some control of him, tell him to do some independent action that you aren't exactly monitoring before you have any control of him at all, is just asking for it.

You should be walking into this by gradients. But about the only way to solve that situation is just skip what he did with the hat, take his hand, lay it on his shoe, take his shoe off, move him over to the window and put the – put the shoe via his hand on the window ledge and then say, "Thank you very very much." And do you know, he's liable to scream at how terrible you are and what a bum you are, but auditing will continue.

So you mustn't acknowledge the improperly done auditing command because you are okaying alter-is. And that renders you very suspect. And yet the pc acts as though he wants you to and acts as though the only thing that will please the pc is the same alter-is. This is what he wants you to do. That's why you never do what the pc tells you. It's fatal.

The pc acquires this alter-is. Oh, God. Talk about logic, man. They can back it up with ENIACs and Einsteins. Every reason under the sun why you ought to do exactly what they said just now.

Truth of the matter is just before they started giving you orders they alter-ised something. They flipped a command on you, they didn't do what you said, they – something went wrong in the session. Something went haywire. And then they started giving you orders because they're trying to keep their own session in. You see what happens?

They start giving you orders when they have ceased to accept you as an auditor. It's not actually something that you ought to pay any more than diagnostic attention to.

You say this pc has some missed withholds. What's a missed withhold? Well, it's an unintentional withhold perhaps. The pc tried to tell you something and thought you didn't get it. See, that's the commonest one. The most fundamental, however, is the meter read missed withhold.

Earlier than all of these difficulties existed, you read something wrong. And you told the pc he didn't have a present time problem when he did have. You told the pc that he did have a present time problem when he didn't.

So you get – you've acknowledged something wrong in the session that is one of the deep fundamentals of the session, such as rudiments. You've acknowledged something wrong. You've done something reversewise and after that you can expect alteration, alteration. And alteration will exist up to the point where the pc started to give you orders.

Now, how come the pc's giving you orders? Well, the pc's giving you orders because the pc has ceased to have an auditor.

The gradual breakdown of a session passes through that as its low point on the totem pole. Pc suddenly tells me, "Would you like to – you should really let me go to the bathroom and smoke a cigarette and that sort of thing." If I – got to that point – I don't get to this point in session, but if I got to that point in a session – I would not say, "How am I going to acknowledge or handle this situation?" see. I wouldn't waste any time on that. I would say, "*What* was wrongly or not acknowledged, when, earlier in the session?" That'd be my first mechanism, see. Just bang. What is it? See, back there.

It would be something like this: "When did you first feel I didn't hear you?" With enough confidence in my meter to know that I didn't miss a meter read, I'd fall back on the other. I'd have to think that the pc said apples or peaches and then thought I didn't get this, see.

Pc has got an inadvertent withhold, now there's no communication existing. But it would be earlier. I wouldn't take up the idea of the pc giving me orders. I'd trace this thing right back in the session to the first time the pc had gotten an inadvertent or actual withhold or didn't do the auditing command, which of course amounts then to a withhold. See. What – what happened? When? What happened back in the – early in the session? Let's put that area right. Let's not start to cope with the building falling down. Let's not worry about that because we got something wrong earlier.

Now, the reason some people wind up not understanding that a missed withhold is the cause of all ARC breaks is they don't look early *enough* and, therefore, don't *cure* it with a missed withhold.

See, this pc says, "Well, you better let me have a cigarette now and give me a break, because in actual fact I'm pretty tired and so forth."

If your response is to find out what withhold you just missed you probably won't get it, because your pc has gone to that length, time has stretched out after the withhold and it's minutes, tens of minutes, earlier. When you've had a blow, the blow has actually begun an hour to an hour and a half before the blow occurred and it'd be a missed withhold of some kind or another.

And you've tried to acknowledge something that you shouldn't have acknowledged or you've shoved off on the pc something – like you've got a present time problem when he didn't have or something like that. Some fundamental alteration has taken place where you were acknowledging an untruth and ignoring a truth.

And that situation has existed much earlier. And when that situation first started to exist, you got the beginning of the deterioration of the session. And to trace it back, you've got to trace it back earlier in the session. Therefore, a very good way to handle this kind of a situation is to end the session and begin one.

See, that's short sessioning. That, of course, gets you back to your beginning rudiments – is where you probably missed it.

Now, regardless of the complications of what you do about it, let's handle instead the fundamentals of exactly what occurs.

ARC – this is about September 1950, California lectures and I think it's contained in *Notes on the Lectures* and an axiom about 1952 contains the data that ARC is the equivalent of understanding. And the component parts of understanding are A, R and C. I won't bother to go into the dissertation by which this is evolved, but you frankly can mathematically evolve this fact. And it's quite fascinating. Affinity, reality and communication are interdependent upon one another. And the sum of affinity, reality and communication or the absence of affinity, reality and communication add up to understanding or misunderstanding.

Low on the Tone Scale the ARC is, of course, nothing but a misunderstanding, see. You don't have any reality on Russia. Russia doesn't have any reality on you. Of course, you don't understand Russia. Russia doesn't understand you. Of course, there's no communication between you and Russia. See, it's as simple as that. Therefore, everything is misemotional from that point thereon.

Now, when a pc gets going, you're liable to attribute the lack of comprehension in the session to anything except the mechanics. You're not interested in what's comprehensible or not comprehensible or sensible or not sensible. You just got to make sure that you understand what the pc said.

When you fail to understand what the pc said, ARC breaks down, because understanding has broken down. And that is the anatomy of TR 4. TR 4 says that you *comprehend* what

the pc said. You *understand* what the pc said and you *acknowledge* what the pc said and you return the pc to session. And every time I turn around somebody's trying to give me the word that we need a new TR 4. I don't see what they need a new TR 4 for, they haven't used the one they got. Perfectly brand-new. I mean, why use a new one? They – you see that *understand* is the *clue*. That is the *key* to this.

Now, in-sessioning is, of course, interested in own case and willing to talk to the auditor, of course, about one's own case. But interested in own case and willing to talk to the auditor. So if understanding drops out, willing to talk to the auditor drops out and then interest in own case tends to drop out because one feels one doesn't understand as much about one's own case as one just understood.

Now, the greater the understanding the easier it is to blow things. In other words, you can start – if your understanding on something is high it goes out *zip-zip-zip-zip-zip*. And if your understanding on it is low you stand there and gaze at it stupidly. There it is. What are you going to do about it? Nothing. *Huh, da. See?*

Yet all of a sudden you say, "I know what that's all about." *Zip-zip-zip*. And that's – that's it. You've done an as-is.

So, as-is-ness depends on understandingness.

Alteration inevitably pursues lack of comprehension. Alteration pursues failure to understand. You get an alter-is when you don't get an understand. You see?

And not-is accompanies the notion of incomprehensibility. You can't understand it. It's not possible to understand it. Therefore, let's just shove it out of sight. That's what any non-sentient society or very unalert society does with its insane. Nobody can understand the insane, so you've got to put them out of sight.

And the degree that they don't understand the insane or think they don't understand the insane so they hide them. They squash them out of existence and they actually try to kill them one way or the other. In this civilization today – very modern, very kind, very genteel and so forth – they sterilize them, they cut their brains out, they make idiots out of them, they subject them to tortures the like of which wouldn't have been tolerated from the *barre noir* in the middle of the Dark Ages, you see.

Fantastic. You mean in this enlightened time all this is going on? Well, of course, they've alter-ised – they failed to understand the insane, then they alter-ised it. And now they've got it into place where they've even got psychiatrists in charge of them. You see how far you can get.

And this is total alter-is. And they don't look at what's insane about the person, they give them classified labels. They label them. And the label actually, has nothing to do with the insanity. The label has to do with the insane asylum the person is in.

Oh, you think I'm kidding you as usual. But that happens to be the truth. If a patient is moved from an area that has sex criminals, you know, he ceases to be a sex criminal and becomes a schizophrenic if he goes to a hospital that specializes in schizophrenics. Patients are now classified after the hospital they attend. See how nutty you can get. But, of course, what

is comprehensible about this situation? Well, that people don't comprehend it. Don't you see? That itself is an understanding. All they had to do is say I don't understand it and they come off immediately off the high horse of pretending to understand the alter-is and of course that is the deepest lie of all.

So you get this kind of a situation of pretended understandingness, followed by fantastic cruelty and downscale activities going in that particular cycle. So if you sit there complaining – I'm not putting you in the same category at all – but you will actually in some little vignette run this cycle.

You sit there and you pretend to understand the pc when you don't and you pretend to understand him when you don't and you pretend to understand him when you don't and the next confounded thing you'll be mad at the pc here. And you go out of session spitting your teeth out about this pc – the stupid jerk and yip-yap and snarl – and you're snarling about the pc.

When you find yourself snarling about a pc, all you have to do is recall the first time you didn't understand what the pc was doing.

Now, that is not as successful as treating the mechanics. You see, understanding is in the realm of knowingness and not-knowingness. That's a very very high echelon pair of postulates. That's right after Native State. And we're really in the esoteric wonder world. So those buttons don't operate very smoothly on people. To some degree they operate, but you'll find they occasionally lay an egg, too. They're too esoteric, see. They're *way* off, you see. That's really running the pc over his head. No, but a severed communication line is very comprehensible. That's very comprehensible.

So the missed withhold, the intention to put a communication line through or the intention not to put a communication line through, each one treated in reverse to the way it ought to be treated, is the way the pc understands this. This is where understanding comes in with the pc, see.

He sees that. He sees that and he reacts to that right now. Therefore, we talk about missed withholds, missed withholds. Actually we're talking about understanding and ARC on a very high echelon.

But you can handle the mechanics of the missed withhold – bang, bang. Everybody understands that. Because it's the cure, because it's a sufficiently low-level concept that the pc understands it and you understand and his mind responds to it and everything is dandy and it all works out when we say, "Missed withhold."

Now, what actually could be a missed withhold? We have the communication intended and not received. See, that is truth unacknowledged – recalling you to the first lecture.

Pc intends to communicate and it is never received. We express that as the inadvertent withhold. But that's unacknowledged truth, the very thing he has protested about since the beginning of the universe, see. And it sits on prime postulate and his own goal line and everything else. So he screams like a banshee when you run into this one.

He says, "It's *hot* in here."

And the auditor says, "*Sh-nyaa.*" Or the auditor says nothing.

You will then find the pc saying, "It's *hot* in here."

And if the auditor says nothing, watch the pc start to sweat. The pc will start to manifest it physiologically if he cannot put it across verbally. He's going to make this stick. Thetans are fantastic to this degree. They're always going to make it stick if they possibly can. And you're not now in a session. You've got somebody who's trying to set up a brand-new universe all based on the postulate that it's hot in here. And the session becomes a ball of universe based on this, "It's hot in here" because it's an unacknowledged truth. You got that side of it? See, that's just 50 percent of it.

Now, the other 50 percent is he tells you, "No, I have never had anything to do with women."

And you, you knucklehead, say, "*Good. Fine. Thank you very much. Here is the next (rudiment or question or Zero).*"

Now what have you done?

Understand it in terms of communication. He's put through a whopping big lie. This has no truth in it whatsoever. And you have said, "*Wonderful! Fine! Thank you! Oh, give me some more lies!*"

In either case, your session will blow up. That's how you blow up a session, see.

Now, there you can see it visibly on the communication line. As far as the reality of it is concerned, do you see that the reality also fits in there? The reality of it is the pc thinks it is hot in there. It doesn't even have to be hot for the pc to have a reality that it's hot. This is actually the only thing he's trying to put across – that he thinks it is hot in there. His commentary. You see?

And all you acknowledge is the fact that he thinks it is hot in there and everything is fine. As long as that truth is acknowledged, you don't leave him on a withhold of truth.

Then everything goes along fine because the R stays up. And then, of course, perforce, the A stays up.

Now, he put you through, "I have never had anything to do with women in my whole life." Now, he has actually posed a very low R. It's a lousy lie. He can't think much of you if he thinks he – you know, if he's postulated the A of, "You're a nut" and he doesn't like you. You see that? Because he said already, "I can't trust you with the truth," – not as a consequence to your having missed something else. This would be an entirely independent operation, see.

He says, "Well, I can't trust you with the truth" is what he's saying. He's saying you're not trustworthy. What is your A there? Your affinity's very poor.

So now you say, "*Oh, fine! Thank you! Oh, good! Yeah! Three cheers, you know. Oh, fine!*"

And he says, "Well, if this is the kind of session we're going to have around here, we're going to have A of that character where I don't trust the auditor. We're going to have R

which is a cracking big lie like this and therefore this wasn't a C at all because there was no truth in it to be comprehended."

And the funny part of it is, is you can reverse the whole triangle – flip – by making sure that you didn't buy that lie. Making sure what you bought.

Your Zero Question of, "Have you ever had anything to do with women?"

And your pc says to you, "Ah, no, I've never had anything to do with women in my *whole* life."

And the auditor says, "All right. I'll check that on the meter. Have you ever had anything to do with women? That reads."

And the pc says, "*Ho-oh-ha-ya. Ha-ha-ha-ha.* I did have a little bit to do with women. When I was two, three, four, five, six, seven, eight, nine, ten, eleven and twelve, there were incidents. And when I was thirteen, fourteen, fifteen, sixteen, seventeen, eighteen, nineteen and twenty, there were incidents. And then we really got busy."

And you get these all stretched out, why, you've bought nothing from him but the truth, man. The ARC is out of sight.

You *cannot* create an ARC break by establishing *truth*. You can *only* create an ARC break by *refusing* truth and by accepting lies. And of course, the whole thing sums up under the heading of refusing truth. You refuse truth, you have an ARC break. You fail to establish truth as an auditor, you'll have an ARC break. You cease to handle truth, you'll have an ARC break. You cease to have as your primary stock in trade the ingredient known as truth and you, of course, have no more control in the session. Because you don't have a pc who is in-session.

You sit there and handle anything but truth and you're in the soup. And a lot of you go on the basis and get into trouble, because you think it'd be terribly unkind to prick this guy's bubble.

You say, "Well, I don't know. I mean he says he's never had anything to do with women in his life. Well, it'd be awfully embarrassing ..."

I feel this on TV sometimes. I'm rather unwilling to expose all of the pc's overts, be responsible for... I'm perfectly willing for the pc's overts to be exposed to me, but I am actually not willing to possibly damage the pc by exposing his overts elsewhere, don't you see. So, on TV I feel a little bit queasy like this. So I know how you feel sometimes.

And this girl says, "Oh, I'm a virgin."

And you say, "Well, that's nice. That's sweet." And you let it go by. And she's cutting your throat. And she's not in-session. What's going to happen? And you have this ... See?

You're running something like old Formula – what was it – Thirty-three? "What question shouldn't I ask you?"

And it's very very often you'll get this from a girl, "Oh, you shouldn't ask if I'm a virgin."

"All right. Are you a virgin?" – see, it was just the old pattern response.

And she says, "Well, yes, I – I – I am a virgin."

And you say, "All right. Good. Fine. Thank you." Because you think it would be unseemly or something to inquire further into this thing. You should ask yourself why the hell she mentioned it in the first place. How come she brought it up? See.

So you got – that's what you got a meter for. And later on in this session, why, she's blowing her top and way out of session. You can't get the rudiments in and that sort of thing. Well, you departed from truth. You didn't follow it down and get at truth. That was all. There was a moment of untruth in the session. It is very unkind to leave one of those things in a session – to be so diffident that you don't want to establish truth because it might embarrass somebody or hurt somebody's feelings. That's never a good enough reason to ruin a human being.

They don't suffer from having their feelings hurt, let me tell you. They only suffer from being permitted to depart from truth. That is all. And this E-Meter is not a lie detector. It's a truth verifier.

The reason it's unpopular in the world is because the police started calling such machines lie detectors. Actually, comparing this to a police lie detector is something like saying the 1886 Mercedes-Benz is as good as the modern Jaguar, you see. Because the sensitivity of the instruments is not even of the same order of magnitude. And that doesn't matter that the police lie detector costs \$18,000. That has nothing to do with it. This is a truth verifier.

An auditor is an establisher of truth. And if he can establish the truth of the situation and then acknowledge what he has established as the truth of the situation by accepting it and so forth and that he does not avoid the truthful statements of a pc and does not accept the untruthful statements of the pc, of course, never after that does he have any ARC breaks. It requires something fundamental in the auditor. It requires that the auditor is not shy of establishing the truth of a situation.

A pc will actually protest very loudly sometimes when you're trying to establish the truth of a situation. But you notice they're also blushing at the same time. It's a – it's a confusion. If you're – if you get very clever and experienced, you will always know when you are establishing the falsity, you see, of the situation that has been uttered by the pc and that you're establishing the actual truth of it. The pc has attempted to establish falsity and you are attempting to establish truth. And it's a pretty weird look on the pc when you're doing this.

I don't care how loud the pc sounds. He ordinarily won't, after a very short time, sound loud at all. The *only* way you ever come out the other end as a friend of the pc and he's a friend of yours, is if you've established the truth of the situation regardless of embarrassment and regardless of anything else.

Those considerations are entered into the track to make you more reactive bank – that we must have social lies. Very often playwrights come along and they tell you, "Well, if anybody told the truth for twenty-four hours without any difference whatsoever, he would lose all of his friends."

And it's one of the old-time favorite themes in this universe, because they're trying to establish the validity of a lie. That will establish mass and get everybody in trouble and it's quite a – quite a black operation. Whereas it's not true at all. If you were to sit out from the human race's social lies for twenty-four hours and do nothing but tell the truth for twenty-four hours and insist on nothing but the truth for twenty-four hours, he would wind up top dog. He would not be in a mess at all. Do you see that a lie has been entered on to the track here that you could not tell the truth for twenty-four hours? Yeah, you'd wind up wonderful.

In the first place, if you really insisted on the truth, you would wind up at the end of that twenty-four hours having some friends, where you only thought you had before. But it requires a very strong man to enter into the first part of that. Because it's repercussive.

I've told the truth to somebody and had them scream enough to take the roof off. By the time you've told them again four or five times, they eventually listened. Then it didn't seem so much.

It is stepping back from the establishment of truth that pitches one heels – one's heel over the edge of any grave he may fall into. That is the way down.

Now, wherever an individual sits into an auditing session with social mores and kindnesses in full play, he can wind up with the most confounded mess of junk you ever, as a session, you ever heard of.

Pc wildly out of session and so forth. It would actually be unkind to ask this girl if she had ever stolen anything. So we will say, "Have you ever stolen anything?" And then we will just ignore that read on the meter because it isn't necessary to go into it.

Actually, an auditor's mind doesn't really operate like this. He's just blind. He needs glasses or something. I'm just warning you that the wrong direction – just giving you this word of warning – a wrong direction is in the direction of buying lies or letting lies go by in a session. You're always in trouble.

And what we call this, "Letting the lie go by" is the missed withhold. Remember, there can also be the inadvertent missed withhold of letting the truth go by, see. So, if you let a truth go by without acknowledging it and let a lie go by without challenging it, in either way you're in trouble. Because you just restimulated the guy's whole track.

And of course, the ARC sinks, the corners of the triangle start to explode with small firecrackers and debris scatters around the scenery and there it is.

You want ARC to drop out of the session, why, just follow this same basis. That is why your metering has to be 100 percent. And why, incidentally, in passing along, your TR 4 has got to be pretty good. But your TR 4 will be pretty good if you just remember to understand.

All right. Let's all agree you're a complete knucklehead when pcs start muttering. Let's just, you know, take that as a basis: The pcs are rather incomprehensible and nuts on this line and that you are particularly knuckleheaded where what they're saying is concerned. You've got a perfectly safe basis. There's nothing wrong with the statement at all that prohibits auditing.

Well, you could accomplish auditing with that statement. But if you pride yourself that you always understand everything the pc says and never have to inquire into what the pc is saying and that it would look awfully stupid of you to have to inquire again about what the pc is saying, you've laid the basis to the damnedest messes you ever saw. They won't be sessions.

I'm perfectly prepared to be stupid as far as a pc is concerned. Perfectly prepared to be stupid because that's the isness of the situation I'm handling is stupidity, aren't I?

So the pc says – he says – he says, "*Yagayaga-plitzou.*" And ha-ha, I don't depend on my altitude for appearing bright. Why should you? No point in it.

You say, "What did you say?"

And the pc says, "*Wiggle-wiggle plitzboom.*"

Well, don't show any misemotion. Say, "Well, I'm just particularly stupid today. I didn't get it. You'll have to say it in English. You'll have to drive it across this wagon one way or the other so I can see what it is."

And he says, "Oh, skip it."

And I say, "No, that one we're not going to skip. I'm just particularly stupid. What is this '*wiggle-wiggle plitzboom?*' What is it? I mean what are you saying?"

And he says, "Well, you wouldn't understand."

And I say, "Well, that's what I'm trying to tell you. That's what I'm trying to tell you. I don't understand what you're saying," and so forth. I'm perfectly willing to sit there for half an hour and go over this thing.

And he finally says, "Well, I mean that the chair leg has come down on the tip of my foot."

And you say, "Well, all right. Thank you very much. Slide it out. All right. Now, here we go."

And you find out your session doesn't come to grief. The way to make a session come to grief is the pc says, "*Wiggle-wiggle plitzboom,*" and you say, "Good. Fine. Thank you very much," and go on. You've had it. You've entered pretense into the session and it didn't live there.

No, as long as an auditor considers himself an establisher of truth and as long as he refuses to do anything less than establish truth, he's all right.

From then on, why, he can't have any real difficulties, because a pc will forgive an awful lot of fumbling if, during the fumbling, an auditor has only one intention: is to establish the exact, "What is it." See, if that intention is totally clear, the pc can forgive a lot of fumbling.

Don't ever try to look brighter than you are. And never be dumb enough to do otherwise than pursue truth and you'll have it. In essence, you'll build a whole universe out of bad auditing sessions simply because you've continued to alter-is the basic truth of the pc and the basic truth of the universe. And it'll all just mess up like fire drill.

And of course, the meter is simply nothing more or less than establish a truth. And you ought to be lucky you have it. Think of the lies you lived in before you had it.

So if it'll do that, why, you at least have the responsibility of reading it right all the time. And then you're true with the meter. Okay?

Thank you very much.

THE E-METER

A lecture given on 19 July 1962

How are you tonight?

Audience: Fine.

Better?

Audience: Yes.

All right. Well, this is what?

Audience: 19th. July the 19th.

Nineteen July AD 12. All right. So be it. Let's have tomorrow be the 20th. First lecture, Saint Hill Briefing Course. The results of last night's TV demonstration, in one session that was given, gave me unlimited hope. It gave me a great deal of hope, because it shows that auditing can be done. That was pretty doggone good. But it was slowed down slightly by the failure of some of you students to recognize that it was an excellent session. And you left me flabbergasted. I don't want any withholds from you, but that's a fact. How couldn't you see that auditing presence and the fact the boy was reading the E-Meter pretty doggone well? How couldn't you see that? How couldn't you look at the pc and tell whether the pc was in session or not, see? Your ability to look and see what a good session is has got to be improved. See? Going to raise your criteria. If you haven't got one we'll audit one in. [laughs] But that's definitely a very, very hopeful sign. Very good auditor presence. Pc put into session with a slash and that was it. You got to learn to see that.

Tonight we're going to talk about the E-Meter. The E-Meter is an instrument mentioned in a lecture by L. Ron Hubbard in October of 1950. And I said if I had one, that would be very nice. And for about a year and a half or two years I had been trying to find out how to get an auditor to observe a pc, and I hadn't been successful at all. And I myself – I myself saw that one had a much greater need for direct and positive observation. And I've audited pcs with my fingers on their pulse and done other things trying to find out what was going on and if there was any detectable reaction. And out in California on, I think it was about the twentieth of October or something like that, I described such an instrument in a lecture and said it would be very, very, very useful. And a fellow by the name of Mathison went home and he put one together on a breadboard and I got it in very early 51. That is, I probably got it a little bit before that, but I got down to experimenting with it.

Now, these comments are very germane. The genus of the E-Meter is not, as one would like to say for the benefit of licensing and patenting and the law and public credence and all that sort of thing – just forget all those things – the genus of the E-Meter was exactly just that and it was no more than that. It was actually not born out of the Wheatstone bridge.

That Mathison knew the existence of the Wheatstone bridge didn't cause him to build one. The first Mathison really isn't built that way. And – this was just developed just like that, to detect an electronic impulse in a human being

Now, up to that time they didn't even have the theory of a meter straight. You must realize this. Man has had these things around but they didn't even know what they were measuring. And you yourself will run into arguments about this, so you should – you need a little of the background music. They think it measures sweat. In other words, you don't have instant reads, you have instant sweats, and instant non-sweats. And the reason for that is the early galvanometer is so thoroughly insensitive that they wouldn't know whether they were measuring sweat or what. But they think it is sweat.

We had an engineer here the other day that our TV circuit was designed and built by – Reg's engineer. And Reg had him going in circles on an E-Meter, and he was saying kind of "Well," and so on. Because, you see, he knew about galvanometers, and they think these things are – they measure the amount of sweat in the palm. Sort of on the basis that if somebody gets nervous his palms get sweaty. That's how far back the animal psychologist is in it, see? And Reg talked to him for a while and of course there was a meter up there. Of course, unobserved, why, he could take hold of the thing and fool with it a little bit and so on. And pretty soon he was rather diffidently shocked about it. He was coming to the conclusion that it must measure something about an electrical or mental impulse. See? He'd come toward that conclusion. Now, possibly there's more to the story than that but that will serve our needs at the moment. That it was an electrical read, not an electrical measure of a physical read, that it was all electrical, that – something like this. Something was dawning on him that it might be in that direction, that it really was reading thought and so on. Spooked him quite a bit. Now, this is a very knowledgeable man, you see? He knows his stuff pretty well.

And engineers in Scientology and electronics men in Scientology have not always recognized, have not always recognized completely, that this is a wild departure from standard thought on the subject; we're doing something else. The meter is designed to do something else than the old psychogalvanometer or any part of an old lie detector or anything else.

Now, if they'd known how those things work maybe they would have developed one that did work. But, as a matter of fact, they don't work. And if you get somebody who is accustomed merely to the old psychogalvanometer, or something, to fool around with a circuit or something and build an E-Meter – and he doesn't know anything about Scientology or anything like that – one of the first things he does is protect the movement. It's necessary, you know. Meter comes first and subject comes second. And they build a lag into the movement of the thing. And to this day you can see homemade E-Meters around that have built-in comm lags in them. And it's about a half a second to a second built-in comm lag. It's pretty grim. The instant read, then, occurs a half a second to a second late.

Well, this was true of all earlier meters, so, of course, nobody did any observation on it because the electronic circuit was not a direct circuit. And the Keeler galvanometer, I think, has this same fault, and I think they read prior reads.

Now, I don't know. I haven't been through their course up near Chicago. Because I get mixed up. I don't know whether that's the alcoholic cure is Keeler, see, or whether that's

Keeley. See? There's somebody down in the southwest that cures alcohol and their name is Keeler or Keeley, see? And this other outfit near Chicago is named Keeler or Keeley, so I can't even write to them. I'm liable to, you know, insult them or something so it's put me pretty badly out of communication. Otherwise, I'd go up and take their three-and-a-half-day course on the operation... [laughter] I probably would, too, and see what they teach is which. And I might know a little bit more about the background music.

I only know what I have found from police operators who have had that course. And the police operator uses a lie detector in combination with a blood pressure meter and a breath meter. And it's a muscular-strap arrangement that goes around the chest and if the guy goes "uh-ha-uh-ha-uh-ha-uh-ha-uh-ha," it registers, and if a guy's blood goes pound, pound, pound, pound, it registers. And these three needles – one from a galvanometer, one from the blood pressure, and one from the breath – are all joined together on an endless tape which has three needles, and you can make notations on the side of this tape as to what this was a reaction on. So the fellow writes down "bodies under bridges" – give you an actual case – "bodies under bridges," you see, and then asks the question, "Bodies under bridges?" and sees if there's any disturbance of these three needles on that area of the tape that says, "Bodies under bridges." Now, this is just about as crude as you can get because none of these reads are instant reads. The galvanometer's motion is protected so the actual read is always too late to be considered, of course. It's prior reads that they consider, so any restimulative word causes the police lie detector operator to immediately say, "He's guilty. Take him out and hang him."

But over the years they've become wise to this. They've gotten a coordination of cases and people have turned up often enough, after they'd burned the guy in the chair, and things like this, and confessed to the actual murder, that they've got a coordination of data, and their vital statistics demonstrate to them that it's 9.5 percent to 15 percent wrong. And their data also says that a certain percentage, which is not announced but is probably the same percentage – they would condense this data, don't you see? They'd say 9.5 percent to 15 percent of the people who are put on this lie detector machine cannot be detected by the machine. See? So they expect the machine to be that much in error, always. They do not distinguish, physiological or any other way, prior to the reading of the machine, whether the fellow will read on the machine or not, and they don't take any particular characteristic of the machine as saying whether he will read on the machine or not.

Now, the early Mathison that – no matter what Mathison did afterwards, give the man credit, see? Mostly what Mathison didn't do is he wouldn't listen. He kept building things that had long tubes and that you glued onto elephant's toenails and – I don't know, my God! He finally got up to a fourhundred-dollar lie detector that has two dials and five or six adjustments, all of which throw inconstants into the read, and about that time an auditor couldn't read any part of any of this, you see? But to this day he still carries "Tone Scale" on his tone arm. See? I told him about the Tone Scale so he drew an arbitrary Tone Scale over this, and this became known as the tone arm. He built these things for a while for chiropractors and so on. Possibly even today he builds some of them. But he wouldn't groove the machine in to practical auditing.

So the first year that I had this machine, it was refined two or three times, and the first two or three times it was refined on request. And the very first Mathison would not read on a

large percentage of the cases. I don't know what the percentage was because I didn't have enough people on it, but it – recognizably more than 10 percent. The people would come in off the bottom of the dial – see, you couldn't wind it down enough to catch some people – and you couldn't turn it up enough to catch some other people. The sensitivity knob in those days couldn't be advanced enough to separate the read of a low-tone pc. And if a fellow was sitting there in a lot of mass, you just couldn't get him on the machine. You just couldn't ever get your needle on the dial. So I got him to expand this and got him to make this more flexible so it'd take more people, and so on, and we expanded the thing, and made him adjust the sensitivity of the thing and so on. By the end of 1952 we had a pretty good meter – pretty functional.

And unfortunately Purcell grabbed the first of these things which would be a good museum piece, and it had probably been thrown on a junk heap someplace up in some junk-heap state. "Kanzarkansas," I think the name of the state is. I keep forgetting these things that have alter-ised the track so badly. I think the name of the town was Mud Bayou, Kanzarkansas. Yeah, I think so. Where the presidents don't come from.

Anyhow, I'd still – I'd like to have – I'd like to have those, because there was the original meter, the original Mathison, was not unlike the face layout of this meter; not unlike it at all. And it had a dial and it had a tone arm and it had a sensitivity knob and it had a jack and you plugged in the cans, and so forth.

Well, the thing wouldn't read mental thoughts when we first got ahold of this thing. Let's go back to that first machine and our trials and tribulations with it, and I think it will remind you of some of your own trials and tribulations with this machine.

It wouldn't read. Oh, you could jump on the electrodes. I think they eventually – they had an egg – no a tea strainer – the tea strainer electrode eventually evolved along this line. But the original ones had just a little bar and you were supposed to put a plastic bag over the pc's hand, one hand, so that he couldn't knock the cans together. And this was Mathison's first concern. He was always worried about knocking the cans together because he was afraid his meter would short out, of course. And that was a mains meter, and that – that plugged into the mains, and all kinds of valves in the back of the thing glowed and so on. And the production line of these things had the frailty of very often having the chassis grounded to the pc, and now and then you'd pick up the electrodes on a Mathison and get 110 volts right straight off the mains. And, once in a while, an auditor whose Mathison had been operating just fine would reach over to start to move the machine while it was switched on and get 110 volts off the back of the case. They were jolty. They sort of made things respected – made themselves respected in this fashion.

And the thing – the thing had tiny little bars for its electrodes and when it was first delivered up to the house, Mary Sue – she wasn't around when that thing first arrived, but she was around shortly afterwards when we were doing things hot and heavy with the thing. But a fellow named Jim Elliot was there at that time and Jim and I sat up most of the night. I finally got disgusted with the whole thing because we couldn't make it read, couldn't make it do anything.

And one of them was a projection meter. There were two, and one of them was a great big projection meter, sort of a magic lantern with an element built across a huge magic-lantern lens with a reverse Tone Scale on this thing so it projected right into – when it hit a screen. It was an interesting and a very, very good projection meter. I've never seen as good a projection meter. If it had the guts of a Mark IV to that needle across the lens, that would be the finest projection meter anybody would wish for. But he fooled around with the projection meter, and I was fooling around with the other meter, and after a half a dozen shocks and no mental reads and a few things like that I was getting awful disgusted with this thing.

And I don't know whether it was Jim or whether it was me, but somebody thought of soup cans. By increasing the amount of electrode area we might be able to increase the mental read. And so we went out in the kitchen – and I think V8 vegetable juice or something like that; and we got awful tired of that stuff after a while, you know. Because, you know, American Can Company won't sell you just plain tin cans. You've got to go out and... If they do sell you tin cans, they cost as much as a can of soup anyhow, and you can't get them. For some reason or other these big can companies won't sell you cans. Sears and Roebuck at one time had home-canning outfits, and I hoped to be able to get spare cans from them, but we've never been able to run down just plain cans! We've always been going to the grocery store and buying a couple of new brands of vegetable juice or orange juice or something of the sort that were the right size, bringing them home, drinking the stuff down and washing them all out and hooking them onto the meter. Some day somebody is going to permanently paint cans, you know, and they won't have paper on them, and we'll be sunk. [laughter] They don't realize – they don't realize what scientific advance is hanging on this whim. Hey! We'd be out of business at once.

And it must have been two, three, four o'clock in the morning when we finally hooked up these cans, and so help me Pete, we could get a reaction that was understandably and visibly and undoubtedly a mental reaction. And at that point I knew we had something.

We went on and fooled with that thing for quite a long time. Did various things with it. I put different types of people on it; studied their reactions. And to this day I go back to that work every time I turn around.

You know, you get a constant, agitated rock slam on psychotics. You possibly didn't know that, but you'll be horrified someday. You'll be down in the local spinbin; they've just laid out the red carpet for you and that sort of thing; and the psychiatrist is standing there with his staff drawn up on dress parade, surrendering the place to you, you know, handing you the electrodes of his electric-shock machine or something like that. And you'll go in there and you'll put some – with great confidence you'll put some psycho on your meter, thinking you are going to do something. And you're not going to do anything – not with a meter, man.

Fortunately, it coincides with this: when a person's needle is in constant, agitated rock slam – a manic-depressive, schizophrenic, these people – constant agitated rock... Oh, it's just horrible! Just all over the place. *Nnzzrrrr!* As soon as you pull it down far enough on sensitivity, why, you're below his read because the guy is just pounded in, in concrete, don't you see? Fortunately, no E-Meter process will work on these people and you'd use CCHs anyway. See, that's just fortunate because it means that we really don't have to develop a psychotic-

detecting E-Meter. But you will be horrified when you first see a real full-blown psycho on an E-Meter. The needle will either be stuck like the sword in the hand of a statue, or it'll be so agitated that you can't read any part of it.

Now, if it isn't that way – if it isn't that way and you can talk to the person, the person is auditable on an E-Meter. It's a fortunate coincidence.

It's just a coincidence that if you can read a psychotic on the E-Meter he'll run a Prep-check process. See? If he'd speak to you or answer the auditing question. But if it's too agitated for you to read it on the meter – we're not talking about the little dirty needles that you guys get occasionally. This is violent, man.

Your little dirty needle cleans up when somebody finds out that the TR 4 was mishandled in the beginning of your first auditing session, or something wild has been going on, and various oddball things. You know you can get a dirty needle from people objecting to the electric current they feel in their hands, even on a Mark IV? If they've got an awful lot of overts on the electrical line. I cleaned up a dirty needle one time with just running up those overts. You know, "shocking people" and things like that? Cleaned it up very nicely.

It's just a happy thought, it's a very happy thought, that if you can read the person – you can get a reaction on the person – why, you can audit them with a think process, you know? They can audit with a conversational process – you know, repetitive process of some kind or another. You get your rudiments in, everything. No matter how batty they look, or what their reputation is.

I found out also that psychiatric assignment or classification had nothing whatsoever to do with sanity, through an E-Meter. Hasn't any bearing on sanity. As I told you before, I finally found out what this was (not afterwards but before I had the answer to this), and it was the institution they're in that determines the type of psychosis they have, which I think is interesting.

So the meter, to that degree, will detect whether or not a person is auditable. I learned that very early on.

Now, I went on from there and developed this – the second model of it and a more sensitive third model and did an awful lot of work with this thing

The result of that work is still extant in *The History of Man*. Mary Sue and I worked on that, I guess, for the better part of a year. And my God, you talk about chasing each other and everybody else, and so forth, all over the time track picking up this and that. If you want to see a sixteen-dial drop on one of these things, why, just take the Grim Weeper or something like that in *The History of Man*, and you'll see a sixteen-dial drop. They're sixteen-dialdrop incidents. They go on and on and on and on and on and the needle is falling fast all that time. It's not a slow fall. And you just keep trying to free it off the pin. And your effort to keep freeing it off the pin will be something like five down ... See? Your tone arm is reading something like this. Sixteen dials. And those incidents still exist in everybody's bank.

Now, the meter, then, landed us in a complete cul-de-sac. As you know, if you stay in this lifetime with a Prepcheck you can make somebody look pretty good. But what we ran into, unwittingly, because of the meter, was the whole, open span of the backtrack. Now, the

E-Meter didn't pilot this out. I'd found backtrack earlier than that, to such a degree that the board of the first Foundation was resigning all over the place if we – if I dared go on and re-research past lives. It was the damndest thing I ever heard of. Anyhow ... And it was the first time they found out I could get mad. And they said afterwards that was what really shocked them, you know? That sort of thing. They had to pull themselves out of the plaster from the wall back of them. And that really shattered them. That was probably the beginning of the end of the first Foundation, right there. But I thought, "There can't be people around to tell you what to research and what not to research, man. That would be the end of all."

But it wasn't until we had the E-Meter that we went back and found out how significant all this was and how fantastic all this was and the number of engrams that actually exist on the whole track of the pc. And the number is infinity. Whew! And don't kid yourself, that was an awful research blow. And that was pounded right into view by the E-Meter. Because it meant that Dianetics was wrong. As far as I could see, Dianetics was wrong.

Now, what I had been doing previous to that was taking this lifetime's engrams, taking these engrams, taking something like conception and birth, something like that, and on a case that could run an engram you could clean that case up and make them look awful good. Oddly enough, we've come right back to it again in Prechecking. As long as you keep somebody around this lifetime, you can make them look awful good by just running this lifetime.

But this was an end of track, as far as I could see at that time. I didn't care why this was, or if there was any saving graces about it. It became absolutely positive and obvious that to make a Clear Clear – exclamation point Clear – by first-book definition, which is to run out every incident and every engram on the track, that this was impossible. You just didn't have enough time to do it, that's all. There are too many. And that was where the first E-Meter landed us. And that was an interesting research datum. You can do it to this day. If you want to fool around for a year or so with an E-Meter, you can plot up whole track on people in the most general incidents and so on. It's pretty hair-raising. But you will soon come to the conclusion that if we had to do it engram by engram, or even chains of engrams, if we did it on a whole-track basis, we're in for four or five lifetimes of engram running. And that was the first thing we learned from an E-Meter.

So Suzie and I went down to the library, and we started hauling books out and looking for words. And we finally found *scio* and we find *-ology*. And there was the founding of that word. Now, that word had been used to some degree before. There had been some thought of this. Actually the earliest studies on these didn't have any name to them until a little bit along the line and then I called it anything you could think of. But we found that this word *Scientology*, you see – and it could have been any other word that had also been used – was the best-fitted word for exactly what we were – wanted.

Scio means knowing in the fullest sense of the word. It is one of these ultimate or exclamation-point words. Translated across it becomes *scien*. And we went down and we made sure that that was the right word and that was what we were trying to do and that was what I was heading for and so forth. And she was very good about it. She was lugging the books and I was turning the pages. You know, proper division of labor. And we said, "Well, that's what we've got to do."

Now, one of the reasons this was so is because we had to move out – I had to move out of the field of studying the mind into studying knowingness. Simultaneously during this work, I wrote the first axioms of Dianetics (doing the first E-Meter work) and the first axioms of knowledge. And that was a wonderful weapon in itself. I assembled the means by which this was done. And the mind is only a vessel of knowledge. If you want to know the conclusion I came to, it was just that: it's just a vessel of knowledge. So what are you studying the earthenware for, see? That's what that amounts to. So it required a brand-new approach. And it was. It was a completely reversed approach to what we had been doing before.

Exteriorization, other things, started coming up. We went on down to Phoenix and I kept on studying this and that and well, we had fifteen-dozen ways of trying to study and view this idea of looking at a thetan and so on.

And one day Evans Farber – one night – he showed up on the front porch out in the desert there, and he wouldn't go away; he had to see me. And I'd had a hard day and I was there watching Mr. Farber decide he wasn't going to go away. And I was feeling mean about it, as a matter of fact. I was just feeling darn mean. And by golly, he went out on the front lawn and he lay down and he wouldn't go anyplace. Well, Evans had had many wild ideas at one time or another and he'd occupied hours in trying to relay these things. And I was very tired, I'd been lecturing all day, and I just was bound and determined I wasn't going to see him! That was all! Just mean. And I finally said – conscience got the better of me – said, "What the hell. He's lying out there on the front lawn, exposing himself to the Arizona night."

So I went on out the front porch and I said, "All right, Evans, what have you got?" Well, actually, Suzie was pretty cross at both of us the next morning because we'd been making so much noise the rest of the night, and so forth, she couldn't sleep. But it was the "Try not to be three feet back of your head." That works to this day.

He'd taken two lines out of a bulletin and combined the two things, and he'd looked this over, and then he had decided that it would be a reverse vector. So he had put the magic words – not "be three feet back of your head" but "try not to be three feet back of your head." And he found out he was getting the largest proportion of people he addressed these words to – they would fly out of their heads like they were shot from guns. He was having a ball. So he blew me about halfway across Arizona, and I blew him out of his head. Nobody had said it to him yet. [laughter] We went around patching things up.

The things I've been through. What I have done for you, my God! [laughs]

Anyway, old Evans was very elated with all this and he finally went off home. And that was practically the end of the E-Meter. Because you can't register a thetan out of his head.

I came over to England. We fooled around a bit more with E-Meters, we were still using E-Meters on detection, we were still working with E-Meters to some degree, but it wasn't making any real advance, don't you see, because I wasn't depending on them. And I tried to develop a thetan detector. I took one of these magic eye things that had just been designed – it's a little bar; it's not the round magic eye but it's the little bar magic eye – and by amplification was trying to test exteriorization. I was up at 30 Marlborough Place up here in London for a long time. And we were trying to test exteriorization. How do you test an exteriorized

thetan? See? And the difficulty with the meter was, if a being in his head or out came within a circle of about ten to fifteen feet from this antenna it started registering. Now, you could blow somebody out of his head and make him sit on the table or around the antenna and you'd get the read, providing the auditor then didn't approach the antenna; or if he was within ten feet of the antenna didn't wiggle his head. You get the idea? It was very unparticular on what thetan it registered. [laughter]

Now, the gimmickry on that was really – not really worth preserving. I've even forgotten exactly how it was amplified and so forth, but it was mostly because it was such common electronics that any good electronics man could reapproximate this thing. It just super-super-superamplified and then you read the thing on an expanding beam of light in a tube. You got the guy – or you could put it on just ordinary E-Meter providing the meter was far enough away from the antenna.

We made several mains E-Meters. We had trouble making E-Meters. E-Meters were around for a long time. We used them more or less. There was no real improvement in E-Meters and about 1955, 56, something like that, I think we stopped using them entirely. Didn't have anything to do with E-Meters for quite a while. And then all of a sudden we moved in toward the first Clearing ACC over in the States. And I did assessments on a lot of people with the E-Meter. But, basically, it was on this basis that E-Meters revived.

There were several chaps around the Washington organization and to give any one of them full credit along this line would be a mistake. Well, Dale had been around talking about this sort of thing, and Pinkham, and there'd been a lot of this sort of thing over a period of time and they'd done various things with circuits and meters and so on. And I wasn't paying much attention. I'd listen, but I wasn't paying it any real attention because I didn't have an immediate or real use for this machine.

Till all of a sudden one or another of these designed the first transistor meter, which is the direct grandfather of the Mark IV. About 1957 that thing was released and the immediate result of offering this E-Meter, you know, in an auditing session and taking the amount of material that it could give you and so forth – the immediate and direct result of this was leading directly up to clearing. And we made a whole bunch of first dynamic Clears (something on the – I've forgotten the percentage; it was fifteen out of sixty, or fifteen out of seventy or something like that; it was some fabulous percentage) on Help – a 5-way bracket on Help. And there was only one bug to the process. There was a big bug on the process. It was, I had to do the assessment. That's a horrible fact.

We were assessing on machines and factories and all kinds of circuitry. We were assessing circuitry. And there were three types of circuitry and – there's an awful lot of technology all mixed up in this, you know? All these types of circuitry – oh, I guess, I look around here; some of you were there – and you could detect this circuitry, and then if you got a terminal that fitted that circuit, of course (we know now) you had the name of the terminal, you see? So therefore, everybody who had a beingness goal (this we know now, didn't know it then), everybody who had a beingness goal and who happened to choose the terminal of that beingness, you see, goal... And we ran a 5-way bracket of Help on this thing, we got a first

dynamic Clear who might fall in again because we hadn't got any of the GPM really out of the road. We just got it keyed out.

In fact, let me see, there's somebody right now I just remembered that is here – Tony – and we had something on you that was heading for the direction of Clear. And if they haven't got his goal right this minute, I could exhume what this was, do a list like I just did on Jean. I knew that the word *doctor* was kicking around because she went Clear on this down in South Africa, so the goal must have contained the word *doctor*. Had her auditor do a whole list of these things after she was – I beat her a few times and managed to get her to do it. And got a whole list of these goals with the word *doctor* in them. They assessed out this short list and they got the goal. See? Tricky, huh? We could probably do the same with Tony. I just remembered it.

In other words, you could clear anybody with these technologies, whose terminal was also his goal. Do you see the basic limitation of this thing. Terminal was also the goal.

Well now, how I did these original assessments – because I assessed everybody on that ACC, the whole lot. I did them in two afternoons, fifteen minutes per person. And the – the trick of assessment, you see, was to find exactly what the – I don't know if we were using the word *Rock* but it was what the Rock was, anyway. I didn't remember if I applied the word *Rock* till the later part of the course or the early part of the course. But anyhow, this was the Rock, whatever it was, and naturally that would be – if that flukily coincided with the wording of a goal that would clear them; we had a Clear.

Well man, the meter was in. The meter was in. It proved itself right there. There wasn't any more monkey business about this. I couldn't find out how you could do it otherwise. That was it. Took this type of assessment. Well, before, assessment had not been this vital. But it became obvious to me at that point – about 1956, 57, during that period sometime – it was getting more and more obvious to me that you weren't going to clear anybody without a meter. And this was horrible because I'd never been able to teach an auditor to use one!

Ah, the cat is out of the bag! I'd never worked very hard; I'll give you that. I'd never worked very hard to teach auditors. But I used to watch auditors sitting around with a meter in their lap and the needle's wagging – particularly if they got one of these whizeroo Mathisons that had to be driven in on a truck. And the needles would be going back and forth in conflict and dials ringing and gongs going and... We've even got one of these old beep meters upstairs. I'll have to break that out because it proves something else entirely different than E-Metering.

But we were in. That was it. You weren't going to clear anybody without an E-Meter, because you had to be able to look into their bank and find the anatomy of that bank and find the proper button to press; and if you pressed any other button – as some of you either have learned or may, I hope not, learn from experience on a pc and I – certainly not on yourself – the bank beefs up and goes *blooey*. Everything goes wrong if you get the wrong button.

You're going to run the wrong button long enough or hard enough on a pc with a clearing process and you'll practically ruin him. The remedy of it is to find the right button and run that. But they're awful uncomfortable. And the Step 6 phenomena that we ran into in clearing, shortly after all that, was wrong button. You get the pc mocking up something that's off his goal line and the bank beefs up because of the goal. And it isn't that creativeness

mocks up the bank. See? Finally been able to understand the rest of this Step 6 phenomena – why Step 6 worked on some cases and didn't work on others. Naturally, if you had the guy's goal run out, or desensitized, he could then do all types of Creative Processes which are not in conflict with his goal. That's Step 6 phenomena. You're not terribly concerned with that one way or the other, but I just mentioned it in passing. It's actually running the wrong goal.

I mentioned to you in a recent lecture that the phenomena of alteration of creativeness was your highest pin. So therefore religion and who created this universe plays an enormously strong role in banks and that sort of thing. Well, you run – you collide with that when you get the wrong goal for the individual, and just everything starts to beef up and go solid.

Now, when a bank goes solid, that's no fun. That is no fun. I can tell you that by experience – personal experience. I've had my own bank beefed up to a point where it was just nothing but concrete and you practically had to take small hammers and chip them off of the area in front of my eyes so I could see, you know? What I've been through for you. Anyhow... [laughs] – a very good subjective reality on that. And of – one of the things – reasons I've "been through things for you" – not putting it that way – but one of the reasons I've been through these things: I very often will refuse to subject a pc to an experimental process that I halfway feel will knock his block off. So I feel I could dig myself out of it and usually have.

Now, the difficulty, though, of auditors finding the right Rock loomed enormously, because I've never known a proper assessment. I've never known of one.

So from that point till now, two things have been in action, two separate things: is technology which unwound any accidental out of this package of clearing. We must understand everything there is to know about clearing. There must not be any unknown data. And the data we do find must be interpretable by an auditor on an E-Meter. Well, this required a meter. And the first British meter was simply built, I don't mind telling you, as a mere copy of the American meter. I didn't even possibly think it would be as good. I hoped we could build as good a meter over here as the 1957 American meter. Sounds funny, doesn't it? Because I should have known from my earlier experience with British electronics people that they're pretty sharp on an individualistic basis.

America is the mass-production area of the world. See? They will build it better, they will build it so it works more automatically, they will build it so it works longer with less repair, and they will build more of it than anybody could possibly have any use for, see? But they won't, and apparently almost can't, build a little of anything on a company or manufacturing business.

And I might have realized that these boys Fowler and Allen, when I first collided with them – I'd collided with another E-Meter manufacturer uptown and a few geniuses on the line and that sort of thing, but none of these could really answer up to what we wanted. And when Fowler and Allen came along, why, I thought, "These are pretty sharp boys." And I started telling them what it was all about and that sort of thing, and they made the first of these present series of meters. And they didn't have any reality on what they were making; they were not Scientologists; and they were just hooking wires together. They took the green and gold meter that somebody was making uptown up here (which was a copy of the American meter), and they didn't like this meter. They didn't like the meter they were copying it from. So they

asked me if they couldn't do this and that, and I looked over some of the stuff they were doing, and I said, "Well, that's good. That's fine. Just so it works." And they built the first of these meters.

Well, one day, Fowler, no, it was Allen was sitting across the desk from me and I told them how these meters worked. And of course, they thought they were building something that looked like a psychogalvanometer, you see? And they were trying to add up all this theory together and they – and so forth, and they didn't have a clue what they were doing.

So I sat this fellow down across from my desk and I ran a responsibility process on whatever he was looking at, and put him on the meter and asked him a few things and located a couple... oh, a dead war companion and his feeling of overts against that one and some things, and then found out that he was just looking at blackness but – surrounding a window. But he had a window. And I thought, "This is intriguing." So I asked him what part of that scene he was looking at could he be responsible for. (I don't know if you've ever run this on a pc or not, but the results are sometimes quite fascinating.) And the next thing you know, he had more and more room. He was seeing more and more room, you see, in the picture. He was backing up from this window, and he saw more and more room. And all of a sudden the atomic bombs went off through the window, boom, boom, boom, boom, boom, and he turned around and ran away from the window, ran out of the room, jumped into his car (small space opera-type vehicle) and took off over a hill with full kinesthesia. Sitting right there in the chair across from me, you see, he got the *full* operation of jumping in the car and the car speeding off and accelerating, and then going over this hill, you know. And you know how light you feel sometimes when something goes over a hill fast. And he didn't have this picture anymore. And he didn't look the same either. And they became rather mystic about it all. They weren't quite sure what had happened, but they knew something had happened.

Well, on numerous occasions I explained to them bits and pieces of the operation of the E-Meter and odd bits of this and that, and they finally began to recognize that it was reading something, and they learned how to read it on each other a bit, you know, and that sort of thing. And they got accustomed to what we were doing, and I got them to do some work on the OT meter and – eventually. But that's ahead of the story.

On this meter, they went on and built the Mark II and they built the Mark III and I smoothed that out, and built the Mark IV, the present meter. Well, they built the Mark IV by the time they were pretty knowledgeable about things, and they changed a lot of things around. For instance, the early meter can occasionally get a big rock slam on the thing and you'd have to throw the dial – this is true of the American meters – and they have to throw the dial back and forth hard to clean the dust out of it. Well, this has got a pot in it that that can't happen with. There's several oddities here that have been built into it that are quite distinctly different. But more than that, the circuit is a bit shifted here and there and sensitized up, and the thing has its own balancing mechanisms and so forth. And they've solved quite a few interesting electronic problems, such as the drift of the meter during auditing and so on.

And they have also built two or three monstrosities as prototypes for this and that, and they have been rejected. In other words, there's been a lot of hunt and fumble here. There was one meter that – you would have laughed; it had – and you wouldn't have used it either. It had

two dials down here and you switched the meter on and then you adjusted the needle to set with one of these dials and then you waited for one minute – I can see you waiting for one minute – and then you plugged it in and adjusted the other dial to set and actually after that it would not creep either way. That was fixed in but they balanced it twice. We rejected that.

Anyway, they finally not only got the meter's design we finally wanted, but also did this so that it's a good – a pretty consistent production. And although we check these meters out, there's less and less variation from meter to meter. They smooth these things out as they go along. They find parts that wear in them and they make sure that the next time they build a series that the part doesn't. And the meter, although it's a Mark IV, is actually in constant state of refinement as far as the actual parts are concerned. For instance, they just offered me a new cord today that could be buried at the bottom of the sea for 150 years without any deterioration. But you're not going to be auditing down there, so I... [laughter, laughs] It felt just a little bit sticky to my hand and it smelled slightly medical, so I rejected the stuff. Anyway ...

I just designed a case for these things, by the way. I don't know if any of you have seen those E-Meter cases or if any of them have been shipped in. Maybe they're under manufacture at the present time. They take a clipboard the size of an auditor's report. They take the meter, and they take two soup cans, and the lady's powder puff and a few things like that, and then flap over and strap over your shoulder. And the more important part of it is, the case can be rolled up into a relatively small ball and still protect the meter when the meter is in it. Odd things like this are going along.

But the meter, as far as that's concerned, is still designed to do just one job. And that was from 1950 on forward. And that job is simply to detect what the pc has in the reactive bank. That is the job the meter is designed for. And it is actually incidental that the meter detects what the pc is thinking or doing or withholding or anything like that. Somehow or another we could probably get by those later points. But we would never get by "What does he have in the reactive bank?" You see? That is the basic mission of the E-Meter.

And you go on and start fooling around with meters or trying to design them or trying to do something with them and start stressing that it's just what the pc is thinking, what the pc is withholding from you, does he have problems and that sort of thing, as the important line, you could totally miss this other one. And that is what the meter is built to do. And the meter is not built just to keep rudiments in or something like that. Those are auxiliary uses of the E-Meter.

The meter therefore must be sensitive enough and must be built around this one point of the detection of a prime postulate in an individual. If a meter will not detect a prime postulate, that meter is useless – just pointblank – because you wouldn't ever clear anybody with it.

Now, I probably haven't talked about this for a long time. You probably knew a lot of this or maybe it set some of your data straight because some of the propaganda issued in the early days and so forth – not necessarily totally factual. And I've given you a very – a very straight story of this E-Meter.

Now, the greatest liability of the meter has not been a poorly built meter. We have always been able to refine a meter down to a point where it would read the prime postulate. It takes pretty fine doing. It has to be a very sensitive meter – far, far more sensitive than you

would dream of. Because when you really find one today after listing 850 goals or 1,000 or 1,500 goals to where there's no tone arm action left on the goals list – and by test there should be no tone arm action left on the goals list before you start nulling the first time – when you get down to that point the goal probably reads something on the order of about a fifth to a quarter of a division of the dial at sensitivity 16. And that would be the absolute minimum sensitivity that a meter could have to operate with. That'd be absolute minimum because you couldn't detect below that point. But if you have a meter that is too sensitive, it picks up all the body reactions and everything else the pc is doing – digesting, blinking his eyes and twitching and anything else – and it becomes an unreadable meter. Now, there's possibly design ways to get around that but they haven't been designed to do it.

Now, this meter – this meter has the liability of auditor reading. And it has always had that liability. And I had not realized until just last week – to show you that a terrific advance has been made here ... You think it's just done so that you would be kicked around, but that's not true. A terrific advance has been made here: E-Meter reading has been singled out as – given the existing technology – as the weakest point of auditing today and the one point which must be corrected in the auditor before he can be called a safe auditor. That is the one point. Now, that has always been the toughest point about an E-Meter: getting an auditor to read one.

Now, so much technology has gathered around this point because of so much difficulty in getting this done... See, I learned how to read one of these things in 1952, and there's never been any doubt in my mind about it as to how they read or what the read looked like or anything like that. Well, I'm way ahead of you on practice, and additionally I'm probably ahead of you on just the basic idea of obnosis. I'm perfectly willing to sit and observe what's happening without dreaming up any reason why it happened or anything else, you see? And I'm willing to sit there and look at the needle. One day you will acquire this. You won't do anything else; you will look at the needle and then you will act.

And the gist of this is that the meter has been abandoned on at least one occasion for a period of two or three years because I despaired of teaching auditors to read the meter. But at that time very little had been articulated about meter reads. A tremendous amount of information now exists on the subject of meter reads because I've been analyzing everything I've known about meters all these years and everything that's done with these meters and how they respond and behave, and limiting down exactly what auditors do wrong with meters. And I've had a great deal of attention on that.

And I find, in the final analysis, that it is simply an auditor has yet to acquire an every-timeness for a clean or a reaction on the part of the meter, and that's the only thing that an auditor is missing on. And that's what he is missing on.

Some auditors choose to have trouble with coordinating the last syllable of what they are saying with the read of the meter in order to get an instant read on the thing. Well, I don't really buy that that is any difficulty at all because I never watch a needle for any read until I have enunciated the last syllable. See, let's say *out* was the last word in the goal or something like that or the line or the rudiment, and it's basically – not even bothering to look, you see? Let's say, "How would you find out?" You see? All right. "How would you ..." It's really this

way: "How would you find out?" See? But that introduces a comm lag, so your trained response is really this: "How would you find – out?" And then your eye is on the thing during the period of the articulation of the *t* of *out* and of course you see the read. But you're going to wear your eyes out looking at it. "How would you find..." Who cares? See? "How would you find..." You introduce fantastic quantities of eyestrain and that sort of thing into meter reading. It's just like the needle must be on the dial at the moment you say the last syllable. It doesn't matter whether it is or not before that moment.

You could be looking at this. You could look at the pc. "How would you find out?" Yeah. And your coordination between the enunciation of the last syllable and the instantaneousness of the read is then done all in a split second. You lift your eyes off the meter or don't bother to look. Can you fix your eyes on something without looking at it? You can. You can. There is an additional action called looking that has nothing to do with pointing the eyes. Learn the difference sometimes. Just fix your eyes on the wall and look at it, and then don't look at it. Look at it, don't look at it, see? Look at it, and don't look at it. It's looking in that instant that is giving you the trouble on some cases.

But the technique of how you read one, the drills of how one should be – read one, should contain equally "it isn't reading" with "it is reading." "All right, point me out some no-reads," you should, as coach, tell the student. "All right, give me a no-read." And he's got to show you times when the meter is not reading.

"Not reading, not reading, not reading, not reading."

"All right. Give me some times the meter is reading."

"Read, read, read, read, read."

Just watching a needle, no instant read. Just the thing drifting around.

"Give me some not-reads."

"That's a not-read, and that's a not-read, and that's a not-read, that's a not-read."

"Give me some reads."

"That's a read. That's a read. That's a read. That's a read."

Get the idea? Just that type of drill. Then let him hook it up to his own vocal cords. Because that's a separate action.

But now I believe we *know* how to teach people to read an E-Meter and if we don't know I'll jolly well find out, because I have made up my mind not to any longer retreat on this subject. If you're going to clear people, you're going to have to be able to detect the thing in the mind that is keeping the person from not being Clear. I know of *no* other way to do it except with an E-Meter. If you're going to clear people, going to have to learn an E-Meter.

So I have finally made up my mind – which I never had before, completely – that you've got to learn how to read an E-Meter. Also, that you can and will learn how to read an E-Meter. That is all. Because there's no way around that particular impediment on the track. There isn't any other way around it. There isn't anything else can be done for you except that fact. We can give every assistance in the world in learning how to read one but we've got to

cross that hump. And that's what you've seen happen here in the last ten days or so. And I've given you a resumé of all of this oddball oddities of history just to show you that there's quite a bit of background to the E-Meter, but there's never been this background to it: You've got to learn how to read one and you will be able to read one. See?

So that's the background we have added to this, because it comes along with this other datum: that the only reason one auditor seems to be better than another auditor is because one auditor can read an E-Meter and the other auditor cannot. Presence is marvelous. You can acquire all these things. The drills are very interesting; they're very easy. Everything is very smooth. You can smooth a session out. You can do all kinds of things. You can get your auditing questions answered. You – all of these things are fine, but in the final analysis it's whether you can read a meter or not read a meter that makes you a good auditor or somebody who can't audit.

All right. I have spoke my piece on the subject of E-Meters, and I've had it on my mind, and I thought I had better tell all.

Thank you.

Audience: Thank you.

QUESTION AND ANSWER PERIOD: GOALS LISTS, FIELD AUDITORS

A lecture given on 19 July 1962

Okay. We're going to Q and A now. This is lecture two, Saint Hill Special Briefing Course, 19 July AD 12. A Q and A.

I do have an announcement to make before I do this. For those of you who have not noticed, we have a TV demonstration on Wednesday night. And this has been so successful for two consecutive weeks that next Wednesday night we're going to repeat this and the formula by which auditors are chosen for this demonstration is just by formula. It's not as some of you believe – that you have protested or are afraid or something like that. It is – there's one GAE – somebody who is off auditing because of errors. There is one person who is going along fair and there is one person who is pretty good. Now this could include of course anybody after their first week on course. So some of you needn't be too – feel too safe about it. I mean there's always a point where you shouldn't feel safe. Yes, very, very vicious.

The truth of the matter is that you have been learning so much from these things that I should feel very odd if I left them out. And perhaps I will resume my own demonstrations. But if I do, there's a possibility that it will be on a fourth night. So you just figure – just figure this; that there are some hills that have to be climbed and take this in your stride as just one of the liabilities of being on course. There's actually no sadism connected with it.

None of the instructors take any particular joy out of the smell of fear. And if I knew some way to teach you more smoothly, I would, but in this particular instance, this is a – this is a bomb. This is fine.

It has this virtue. Those that are on the demonstration sure as hell know whether their auditing is any good or not when they finished off. We tell them in no uncertain terms. And sometimes somebody's been riding along sort of blaming the pcs, you know and that sort of thing and then they turn on the wrong end of the totem pole after something like that and then they scramble like mad on their theory and practical and so forth and all of a sudden, they don't have to blame the pc anymore because the pc's getting along fine.

It's quite mysterious. You sit there on a pc, the pc's terrible, is doing awful things and have him getting ARC breaks and a very nattery pc and it's just no good. That's all – that's just – the pc's just no good, you know. And then you smooth out your E-Meter reading, you smooth out your auditing and that sort of thing and you sit there and do it right off the text-book and so forth and you come back and audit the same pc and he's just quiet as a lamb and he's good and everything's fine and goes along. And you know something? The pc didn't change any in the time the person's working out his GAE.

If you ever find yourself in the position of a D of P or anything like that, just remember that. Just remember that. It's very important. You as the D of P can make the most serious mistake possible for a Central Organization by trying to audit the pcs through the auditor. That is the most serious error that you can make because you'll inevitably come up with unusual solutions. Now that's very serious.

The only thing you can possibly do is handle the auditors who are auditing the pcs. That becomes an entirely different operation. You can almost differentiate between good Ds of P and poor Ds of P on that one basis. The good D of P is handling the auditors and he makes sure that the auditors can do their job and that the auditors are doing what they're supposed to be doing. And the poor one tries to handle the pc without any recourse to the auditor.

Now oddly enough, the fellow who's trying to handle the pcs, if he's got very bad auditors who don't know what they're doing, probably will get better results for a while than the Director of Processing who is handling auditors, see.

When you run into the fact you haven't got any trained auditors working for you, you'd better handle those pcs because nobody else is. But this lays in its own trap. In the long run, you'd get far further bringing those auditors up to the point where they can handle the pcs. And your results also will be better and improve as you go along. All this is quite important. You wouldn't think that that much – that there'd be that much difference in just those two points of view, but there is a terrific difference. I look at the auditors reports from a – from HGCs coming in from all over the world and I can tell you at a glance whether the D of P is handling auditors or pcs.

All right. Q and A. What question would you like to ask?

The oracle is open. Yes, Merrill.

Female voice: On this, you know, testing for a complete list on goals ...

Testing for complete list on goals.

Female voice: Mmm. I'm wondering if you could null, say, part of the list and there's a question, see, if you know the list is complete, you go back and give the test, you know, like reading half a dozen goals or more to see if you get any TA. If the fact that you had nulled, see, those goals – these are the ones at the beginning of the list – would this make any difference as far as that TA...

I can tell you that it would make no difference.

Female voice: Hmmm.

If the list is not complete and the rudiments are in, you will get TA action on an incomplete goals list. That is something on the order of, "If you wind up a clock, it runs. If you don't wind up a clock, it doesn't run."

Female voice: Thank you.

Yeah. That's one of those open and shut data. There were some 3D and 3D Criss Cross tests for completeness of list. Any one of those tests could be applied for the completeness of a goals list. It's about all that we ever salvaged from 3D Criss Cross which we're not using

anyplace now. With *horror* I read through from an organization the other day – after we had trained everybody on 3D Criss Cross, I sent a dispatch out *no, no, no, no, no, no, don't do that. No, no, no.* Abandon it. Go around the organization and tear them all up. But actually there was still a datum in 3D Criss Cross that was quite valid and that was there were a number of tests for complete lists and all of those are very valid for the tests of goals. You can take and read as little as a half a dozen if you're really watching your meter – half a dozen goals and tell whether you got TA action or not. Man, a complete goals list is the flattest, limpest fish you've ever handled. It's as floppy as a president's handshake. No kidding.

Okay. Thank you, Merrill.

Female voice: That leads me to a second question on that.

Well, I don't know if you can have a second one or not. Go ahead.

Female voice: Well, if you were making a second test, see, after going on listing some more, would you use those same first goals or would you go on ...

Honey, it doesn't matter what set of goals you used. You know, you could even use the ones you thought you'd nulled. I mean it's that much of an open and shut question. Because one of the things they won't do is stay null on an incomplete list. Oh, they pop in and out like jack-in-the-boxes. You've never quite noticed this.

Let's take some list where the goals have stayed in and had to be rubbed out with a – with a branding iron or something like that, you know. You could just *hear the grind* going on in the session. "*To catch catfish. To catch catfish. To catch catfish. To catch catfish. To catch catfish. Grrrrrr. Grrrrrr.* Still in." [laughter]

Get the pc's rudiments in, polish him all up. Get everything all fine. Get a Prepcheck done on listing and then go back and, to your horror, those that you think you have erased will have some life in them. It's something on the order of trying to jump up and down on a bed made out of steel, you know. It doesn't sink.

Charge on a goals list is expended only by listing of goals, not by nulling of goals. It's only by listing. And you really got to get that list flat. What was your exact question?

Female voice: Umm. On making a second test ...

On making a second test ...

Female voice: The – the, yeah – for completeness.

Yeah.

Female voice: You use those same first goals.

Yeah. Well, it doesn't matter whether you use first goals, last goals, but I actually would take, just because it's more seemly to the pc, I would take some goals I had just done. I'd just tell the pc to shut up and read them once. Just read them once. Not try to null anything. Just spend all of my time watching the meter, see, you know. "*To catch catfish. To shoot tigers. To ride waterbucks.*" And keep that thing in the center.

You know that a complete goals list stays in about three goals on a page of thirty or forty. Ohh, that's ... And I can tell every time by looking at that part of the goals list, which was added on and has been nulled. You can't tell by the number of strikes opposite the first of the goals list.

Let's say a fellow did a goals list last April. And the first five pages have got X's and slants after them and they've been nulled out four times and all of that sort of thing and they died hard, you see. And, you can't take those first few pages and tell anything about how easy the thing is nulling because obviously those are old goals that have been gone over before the list was completed, while the list was still charged. So to make a real test of the thing, you just glance at the pc's goals list the auditor has been doing on the pc and take that – a section that he has been nulling since he added the last goals. Well, that doesn't mean three or four goals. You could add three or four, I mean you went into a long business of listing, see.

Now, when you go down and null those things, that's the page to look at for the test. And you just look at that page and you'll find in, in, in, out, in, in, in, out, in, in. Oh, come off of it. Come off of it. That goals list is not complete. That is all there is to that. It's not complete. You can actually test by nulling, you can test by reading to the pc, you've – there are numbers of ways of testing given in the 3D Criss Cross info letter and they're just all – that list is charged. You want it to go out, out. This is just on three reads, see. In. Out, in. In. Out, out. That's the end of that page. And then you really know. You really know.

Now, in view of the fact that it really doesn't take much charge off the case to list goals, it's – you sort of had it, you see. Hence, your long, long lists, the long, long lists; because listing a goal doesn't take much charge off per goal, see. It's not like listing items. You list items and the charge just goes off in all directions. *Zoom, zoom, zoom, zoom, zoom*. But not listing goals. You don't get proportionate quantities of charge off. And when I first looked at this, I myself had found enough goals and had them stay in without making long and arduous lists, that I was obscured on this particular fact and after a great deal of study, of what I was doing – not just what you were doing, but I also myself was doing on goals and the trouble I had had occasionally on goals and so on – I recognized you had to list the charge off the goals list. And if you got the charge off of the goals list, why, *viola!* You'll find the goal, bang! Just like that. Stands up like Pikes Peak, you know. It's very obvious. But if you haven't got all the charge off, it's mixed up in all this other charge stuff.

Now, don't feel that you could list the list until no goal would read. The goal will still read. Now, theoretically and only theoretically, you could list goals until only the goal would read three times for three reads, see. Theoretically. But you'd probably have to list about 50 percent more goals than you would have to have, see, just to take the last bit of charge off.

Rudiments really have to be in for goals listing. Otherwise the charge doesn't blow as you list the list, see. Listing goals is auditing. Another question's going to come up in line with this.

I probably should have given you a 3GA lecture this second lecture, but I was half of a mind to do so, but I got a piece of technology that's in the middle of something here. And un-

til that's wrapped up, I didn't care to really give you a lecture on it. Now I haven't even got a withhold on you.

And, but listing goals can be done by a pc all by himself, see, perfectly happily. Perfectly valid. It is not self-auditing. Don't put it under that category. They've been doing this kind of thing all their lives, sitting around wondering what their goal is. It's just life, you know. So let them go ahead and make a goals list and even keep whanging them along with the end of the towel saying, "All right. All right. So you're all run down at 350. Well, go on. List it up to 850."

You know, just keep pushing them that way. You're not bothering to get their rudiments in or anything like that and then give the list a test as your auditing action to find out whether or not it gives TA action. But to do that, you'd better get the rudiments in. You'd better give them a little bit – you'd better give them a Prepcheck like the June 11th bulletin, see. And then give that list a test. And if you got TA action, you could go on listing, and probably will, but don't be harassed if the pc keeps going home and turning out lists of 50 or 60 and bringing them in. Feel this is fine, not otherwise. Perfectly okay.

Now, when we get into listing lines of items from that goal, we get into a slightly different proposition because I myself am piloting through and figuring out.... A lot of individual listing without an auditor can be done with the resulting gains. There is no doubt about this. It's possibly five or six to one, however. You spend five or six hours if you were listing by yourself to accomplish what you would accomplish in about one hour of listing with an auditor. It's quite interesting. Quite interesting that you can do individual listing. I'm doing a lot of listing like that myself right now because there is no way you got any auditing time for me. Everybody's studying, processing. No time to process, you know. That sort of thing.

But listing only gets out of hand – if you're doing it personally and individually – if you don't get an occasional Prepcheck to straighten out the subject of listing, you see. Now, a guy doing a Prepcheck on himself in order to continue listing, now, now, now we're in trouble, see. Now, we're going to go to hell in a balloon if we don't watch it. So if individual listing were taking place, you would have to have at least a Prepcheck going on by an auditor. That would be your minimum requirement.

You have to watch also an equality of list. You have to make sure those lists stay the same length. And people listing by themselves get careless about this. And they run on and all of a sudden they're 250 items ahead of any other list. And they get sick at their stomach and dizzy and they feel terrible. They go around in horrible shape for three or four days and then they suddenly say, "I wonder if one of these lists is longer than another."

The best way to check it is not by numbering items but just by numbering pages. You don't have to be accurate – 400, 400, 400 – because about the average number occurs on a page. If you write very small, you can take a double spread of your legal-size paper. You know. And put four lists on that double spread. You can see whether or not they're even fast enough. But just do it – "equality by pages." There are this many pages and this many pages, you know, that many pages. So don't try to do it by number of items. Do it by number of pages. You'll come out much better in the long run.

But apparently listing all by itself as an action – whether of goals or of items – apparently don't come under the heading of self-auditing. They don't – they don't have the same thing. But listing of items – you apparently get lots less charge off, or listing of goals you get lots less charge off than you would under an auditor, see. So just be prepared to list lots longer. But it's a good thing to know that.

You get swamped with pcs sometime and you got four pcs going clear left and right and they are standing around on one foot and then the other foot and you figure if you keep going this way, by the time you've delivered a thousand hours of auditing necessary to clear them by Christmas and it's to your interest to clear them fairly rapidly, why, just keep giving them a swift kick and tell them to list and bring their lists in and prepcheck them, see. And then list awhile after you finish the prepcheck and get them – lists equalized again and let them go list awhile, you know. They won't do themselves any harm at all. This is actual experience on this line.

They will do this. They'll change the lines. They'll wobble. They'll just decide the line should be worded wrong – differently. They all of a sudden reword their line, particularly if it's right there ahead of a very heavy item.

The reason I didn't give you a lecture on 3D Criss Cross tonight is definitely in the direction of listing lines, lines, wording of lines. I'll tell you something about that. I'll give you as much as I know about it.

You've got four vectors. There's the vector of inflow. There's the vector of outflow. There's a bulletin on this. And then there's the inhibition of the inflow and the inhibition of the outflow. On beingness goals, the wording want-not-want, oppose-not-oppose, is apparently adequate. At least it's cleared to date an awful lot of people. But they all had beingness goals. How interesting. Or they had goals they were interpreting in this way. Or they got by with it somehow. Now, we have just collided with doingness goals. And there's doingness goals and there's havingness goals. And the horrible thought has reached in to the midst of this happy state of affairs that maybe the lines for a doingness goal have to be worded differently than the beingness goal and maybe the lines for a havingness goal have to be worded differently than the other two.

At the moment, I'm only working on a doingness goal and now this is a – quite a problem. If you draw on your sheet there two – go ahead and draw – two arrows facing each other. Just draw two pointed arrows facing each other. Name one outflow and the other inflow. And then below that draw two little arrows facing the opposite directions. In other words, on the inflow, draw one facing the opposite direction. Little, short arrow. And on the outflow draw a little, short arrow which is facing against the outflow. Get the idea?

Now, you draw these four arrows. The inflow and the outflow are the main flows. But those little, tiny arrows are the things that oppose the main flows. You've got to list at least this many things to make the package unwind on a goal and the pc go Clear. Now, it's very fine to have that inflow one and the outflow one and so forth. To have all of these nicely coincidental and just worded "want" you see, "not-want." See, that'd be the little short arrows – "not-want." That's the opposition to "want" and then the other one to be "opposed" and the

little, short arrow under that one to be "not-opposed." That wording has been adequate so far in the goals worded.

We're all of a sudden starting to run into a strata of doingness goals where this wording is not adequate and where this situation has begun to exist: where the pc confuses – because there's – isn't any seeming difference between them to the pc, the "not-oppose" and "not-want." So he actually is wording the outflow, the inflow and a third line. The inflow and the outflow and a third line – which overlists one line, doubles the listing on one line and omits another line entirely. And on that four – four-line wording that you have there, the pc usually is listing only these: The "want" – call that the outflow line just for the fun of it – the "oppose" which is the inflow line and then "not-oppose," because "not-want" when you get into doingness, is too identified with, "not-oppose." And actually all he really does is, "not-oppose" mostly "not-opposes" all the way down the line. Or he could go in reverse and list only the "not-wants" and just skip the "not-oppose." In other words, when you ask him "not-oppose" he just lists the "not-want." In other words, it isn't articulated enough for the pc to get this thing straightened out.

It is on a beingness goal, but it isn't on doingness goals, so we run into this limitation. What we really want, is the outflow line can, of course, be designated as, "want to do this goal" whatever it is, and the inflow line would be "oppose this goal" whatever it is. You don't – you're not using the word "this goal" that I'm just giving you "this goal" instead of fabricating a goal for you.

And then on the inhibition line – you see, the inhibited outflow – you know, your four flows: outflow, inflow, inhibited outflow, inhibited inflow. Those are the four basic flows. If you haven't got that many, it won't go together. Of course, God help us if we have to list sixteen flows or something like that. See, that would give us all the flows there are, but you don't need that many to clear a pc, fortunately. But you do need an articulation of these four flows so the pc never makes a mistake. He never comes a cropper, he doesn't. And to do that, you'd have to word them something like this: "Want to goal." And then that inhibition line down there, "pullback" or some such wording "from goal."

You see, there's your outflow. Then there's the "pullback," see. This "pullback" vector has got to be just called just that on a doingness goal. Something that gives this distinct idea that it's a pullback of an outflow. In other words, taming and slowing down that outflow. And then over here, on the inflow, well, you have "oppose," well, that's dandy. It's all perfectly all right. No reason to change the word "oppose" or the wording of that line who or want – "who or what would oppose goal" – undoubtedly the i-n-g form of the goal. That's fine. But how about the opposition to the opposition? We'd have to have something that said, "pull back the opposition."

"Who or what would restrain opposition to the goal?" You see that other line? "Who or what would restrain opposition to the goal?" And we get a whole new series of packages. So you got – you got wording that goes something like this: "Who or what would – Who or what would – pull back someone or something from, 'to catch catfish?'" See, goal. "Who or what would pull back something or someone – someone or something from catching catfish?" see. "Who or what would want to catch catfish? Who or what would oppose catching cat-

fish?" And "Who or what would restrain opposition to catching catfish?" That would be the fourth line. Well, this would probably clear even a doingness goal, you see. But this is under present action. It is better to have just that wording you've got right now on any kind of a doingness goal than the earlier wording. The earlier wording's liable to get you into trouble if you have a doingness goal.

We've all of a sudden come up with several doingness goals. We hadn't been listing them before. Apparently, beingness goals are easier to find or something like that, see.

Now, you know what I'm talking about? It's got to communicate to the pc that he's got to list a bunch of items that would want to do this goal, see. Whatever it is. And a bunch of items that would pull him back from doing this goal or pull back items from doing this goal. And it would oppose doing this goal and something that would restrain opposition to the goal. And then we get the four main flows expressed properly, particularly for a doingness.

What has entered the complication on it is a thetan who has a doingness goal usually winds up in a stuck flow and then he has a hell of a time for himself. See, he's stuck flow. Let's say the goal is "to shoot buffalo." Well, man, he's not about to be able to shoot buffalo after all these trillennia. The mere thought of shooting buffalo causes him to put on the brakes with a scream, see. And you've got to list what's putting on the brakes with a scream. Now, only this little question enters into all of this. Apparently, he could also get answers on "could" and "can't" for the goal, making six lines, throwing everything to hell, throwing it all out of balance and in actual fact you're moving on up toward your sixteen. Those four lines, as far as we know at the present moment, would operate as a clearing action.

Now, I am fully prepared to have a havingness goal require a different set of words. Life is interesting, isn't it? Get something all buttoned up and then somebody falls in your lap and says, "Hey!"

Of course, all the laws of motion are active in these goal lines, you see and the poor guy who has an outflow or a reaching or a "meet up with" type of goal has gotten on a stuck flow, so he's accumulated tremendous numbers of things which are inhibiting him from performing the goal. And frankly, he is much more likely to perform the goal than not to perform the goal. The mere fact that he has that goal is giving him trouble in executing it. The fellow who has "to throw away bread" as a goal, you see. You let a piece of bread – just sit – put it on the kitchen table, the far corner of the kitchen table, you see and without any human volition of any kind whatsoever, I guarantee you that piece of bread or that whole loaf of bread is going to slither across and slap him in the face. He's going to be the damnedest collector of bread you ever ran into. And yet he might stand for hours in front of a shop window realizing he couldn't possibly even come close to that bread much less throw it away. And that nobody could ever truck bread or do anything with bread. These are the social convictions he is now saddled with. They're not being expressed in the goal form, but he wants to really do the goal form, but he is in a position where he would – really would hardest dramatize something the complete reverse. And then he will also tell you if you omit these lines that his case isn't moving, that nothing is happening, that nothing could happen, that nothing is reaching anything. And, of course, he's just telling you what the basic goal is. But that's because you're omitting

this restrained outflow line. And the restrained outflow line is the one he never notices. And that's quite interesting.

Now, how we get over this particular hump – this is an easy one. We'll get over this hump, but it is a hump that's been brought on. For instance, we've had a pc here that had a – had an outflow goal which is kind of an outflow around inflow goal, see.

And a redesign of lines – a redesign of lines lets it come up easier on the pc. But this pc's lines were misworded. She might have gone Clear on the first wording without any difficulty whatsoever if they hadn't been overlisted and if the wording hadn't been completely changed. The pronoun was changed in the goal and made a different goal and so forth. Made a mess out of it. Well, anyhow, how are you getting along with that?

Female voice: With what?

The goal.

Female voice: Her auditor's on GAE.

Huh?

Female voice: Her auditor's on GAE.

Oh, your auditor's on GAE. All right. How do you like that? Not only is it not moving, but the auditor then gets put on GAE. People don't have any luck at all.

All right. I told you all I know about that. It'd be safest to word by the wording I gave you on any goal if you want to know the truth of it. And then any little falderal on the situation wouldn't mess you up. You had to be just a little more positive. Completely in spite of the fact that we've had nine people go free needle with the original wording, see. But the interesting part of it is that the doingness and reachingness type of goal wasn't going free. So the old man suddenly pulled up his socks and said, "Here it is. And – the Marines are about to land." Landed, figured it out and triggered it up and so on. What are you going to do when I'm not around to fix that up?

Anyhow, let's have another question. Yes, Jean.

Female voice: Um – question on listing.

Yeah?

At what point can you begin to allow your lists to go uneven towards the end of listing?

At what point can you allow your lists to go uneven toward the end of listing. Now, you mean the – when needles are going free?

Female voice: Yes.

Ahhh. At what point? The point of the first free needle. At what point can you allow your lists to go uneven at the end of listing. And by that end of listing, she doesn't mean in the session. She means in series of intensives adding up to clearing. She's talking about clearing now.

All right. And that is taken care of by the law of the free needle. You never list a free needle. *Never. Never. Never. Never. Never. Don't. Don't. Don't. Don't. Don't* ever list a free... I've had guy after guy around here, Jean, who's try – been trying to list free needles. They don't recognize that a free needle is total expression of the cleanest needle you can get, see. So never, never, never, never, never list a free needle. That answers your question. You list exactly to free needle. You say that needle is free.

Now, just for Esther's benefit, you don't sit there and say, "*Wow! Look at that. A free needle. Hey! Hey! Look at that! Ha! Ho-ho! What do you know? Lying to it, I got a free needle. You won't look. Look. You know.*" [laughter] Poor Esther. That was what happened to her first free needle back in June. Gruesome, man. Huh?

Female voice: I – I'd like to know how come that you can have a free needle when the wording is wrong on the list.

No. You could – you ...

Female voice: That's what happened to me.

Yes. But you could have had one that was a reinterpretation and you were reinterpreting as you did it and so forth. And you see, clearing isn't really all that touchy, but you walk down and you must have been very close to it and then, was it one line or two lines went clear?

Female voice: One.

One line went clear. And that's pretty easy, you see. So what happened to you actually is one line went clear and you had in effect a first dynamic Clear all of a sudden created with the other three lines not free. Freak. But it could happen very easily. It's not even mysterious.

Now, your question, first free needle. After that you don't pay a doggone bit of attention to the length of lines. I'm very glad you asked the question by the way, Jean. Don't pay any attention to the length of lines after that. You just list a free needle.

Female voice: And you never go back to the one that's had a free needle. That's the point that I'm making.

Oh, yes, you do.

Female voice: Ooh.

Because it's not going to be free now.

Female voice: Yes.

Your free needle is a sporadic phenomenon.

Female voice: Yeah.

So, you list line one and all of a sudden you've got a free needle on line one. Take it in the swim. Don't fire off rockets. And say, "Well, that's it." See? Good. The needle's free. There it is drifting. You might have done two or three before you suddenly realized you had a free needle on your hands and you say, "All right. That's it. That's the end of that line ... " Go

to line two. All right. You'll find that the second you start asking for line two, you haven't got a free needle. This is the phenomena that demonstrates itself, see.

And you list, list, list, list, list, list, list and if you're listing, all of a sudden pretty long, not getting anyplace and that sort of thing and the pc is starting to grope for things, it's just as you were doing before. That you've had a free needle doesn't interrupt your behavior with line two. And then you go to line three and you list and you go to line four and you list and maybe line four goes free. Well, the second it goes free, you drop it.

Go to line one. You'll find this is very unfree now because of the four flow manifestation. See, you've moved a lot of bank in on this guy by listing the other three lines, you see. So you list that down. And supposing it doesn't go free. Well, you just list it the normal length of time that you would list a list, don't you see.

Female voice: Yes.

Now, you – maybe you'll find two going free. The second it goes free, you come off of it and go someplace else. You got the idea? So you're keeping up your equality as long as something isn't going free. But then you're going to get to this interesting stage. That's the early stage. That's your first free needle and it cuts in and out and you'll see it a couple of times in the session. And each time you saw it, you come right off of that line, you see. And you'll eventually settle the thing down to where you'll list a line to a free needle and then list the next line for a while. The needle's not now free. And it doesn't go free. And then you list line three and that goes free. And so you go immediately to line four and it doesn't go free. And then you go to line one and it goes free. And you stop right now on it. And shift to your next one, line two and it goes free. And you go to your next line three and it doesn't go free now. And you list that a reasonable length of time. And then you go to list four and it goes free. And the next thing you know, you've got line one to free needle, line two to free needle, line three to free needle, line four to free needle, line one to free needle, line two to free needle, line three to free needle. They go off. They'll shut off every time you start to list the other line. And finally, it doesn't matter what line you list. You're going to have a free needle. And at that time, you don't list another single item. You just – you're there. What you do then is let the pc go around and acclimate himself and – to the operating atmosphere and have him get up in the morning and look at himself on the E-Meter and wondering if he's still at the clear read. You know how they do. And you just assess for a new goal. And maybe his old goals list has come alive again. But probably the safest thing to do is assess for a new goal. See, you have brand-new goals now.

Goes through the whole procedure again, but it takes less long. And once more the law of the free needle is never list beyond the point of a free needle on any given line. Never do it. The reason you never do it is because you're going to list him into the next GPM.

You can overrun a free needle. It's not serious. But you can list a free needle for a half an hour and have the next GPM start coming up. Everything starts pulling the wrong way. You get a terrific rock slam. Everything starts going wild and so on. You're just pulling the next section of track up where it has no business to be at all. And then you run into a little bit of trouble. And your pc's going up and down. Your pc doesn't know what's going on and that

sort of thing. Well, actually, it's a violation of the Auditor's Code. It's running a flat process. Listing a free needle is running a flat process. That's all. Does that answer your question?

Female voice: Yes, sir.

All right. Probably even more thoroughly than you thought.

Female voice: Yes.

All right. But you appreciate it.

Female voice: Yes.

All right. That's better. All right. Yes, Esther.

Female voice: I'd like to know about the – the difference in these goals that are beingness, doingness and havingness goals.

They just say it. They say be and do and have.

Female voice: What I mean – I – I know what the difference is between do, have and be.

No. They – they say it.

Female voice: I know. That I know that, but what I need to know is something different. Can you ...

All right. She wants to know the difference between a beingness, doingness and havingness goal and ...

Female voice: Can you tell ...

Can you tell ...

Female voice: ... the um – how far back these goals would go by the difference in the goals whether it's a doingness or beingness or havingness. Whether it would be further back on the track or so? That's what I mean.

Whether a beingness or doingness or havingness goal would be the furthest back on the track and that sort of thing. I don't think you could tell a thing about it.

Female voice: You couldn't determine that?

I don't know. I have no data on that whatsoever.

Female voice: That's what I'm curious about.

No. I have no data on that whatsoever. By theory, by theory the beingness goal is earliest on the track, the doingness goal is mediumly on the track and the havingness goal is the late one on the track, but that is by theory and how these pancakes are stacked on the griddle and eaten on the plate, God help us, we don't know. Okay?

Female voice: Yes.

All right. Yes, Merrill.

Female voice: I've got something sort of wild here. I wonder, you know, if you ever do find out after you've listed on a goal and everything, sort of what cycle it was. You know?

If you ever find out?

Female voice: Yeah.

Oh, I'm sure you'll know someday.

Track opens up and you suddenly remember where it was and ... Trouble is nobody ever comments on it because the time the thing is run out it is totally unimportant. All right. David?

Male voice: Got a question that's not sequitur to this actually, Ron. It's um – what would you like to see a field auditor leaving here do?

What would I like to see a field auditor leaving here do? Now, that's a – that's an unfair question because its answer is a divisional – I mean I would like to see a field auditor leaving here, help out in a Central Org for a short time just to help himself out. But next to that, I would like to see him sit down somewhere and accumulate any and all people who have ever been trained in his immediate vicinity and start winding them back into the line, pick up any and all pcs he ever had around and straighten them up and start them back into good shape again. In other words, this process is basically an ARC-type action. If you pick up the ARC breaks in your immediate vicinity, or pick up the unfinished cycles in your immediate vicinity, anybody leaving here now at the state of training he should be in, would actually be able to accomplish some rather remarkable things, not at a great sweat. People are more likely to fall on your head if you tell them you're there, you know, than otherwise. There isn't any great action.

For instance, Dorothy Broaded went back to Seattle area and, I don't know, she had about sixty people and all kinds of things were going on and everybody getting very excited for her. She'll have a hard time staying out of the running like I used to do. I had more difficulty not auditing than I did auditing, see. People on the front doorstep all the time and that kind of action.

Now, there are certain – sometimes in a vicinity there are quite a few people who have been trained at one stage or another. Didn't really finish their certification or requirements. Some of them did. Some of them aren't doing anything. Some of them are. There's some Book Auditors around that did this and that. There are some people who are just interested who did this and that, but they're sort of hung up, see, to some degree, or not hung up at all. They may still be going forward, too.

Well, anybody who has his hands on good training and good performance and can do something like that would only have to reach in their particular direction just to some slight degree to get the show rolling. And a lot of the auditors who have left here that – I've had to come down on them with a club. They're just auditing day and night, you know. I mean that kind of thing. And very busy doing lots of things.

So what would I like to see them do? Well, there's lots of things I'd like to see people do, but I know inevitably what they will do. They'll either collect the Scientologists in their

area and see that they get some auditing and straighten the thing out and keep it going or they won't. All right. You bet. Okay.

Male voice: Oh, to carry on with that, John told me when I stopped up to see him that "Don't go out in the sun and cast a shadow because the people will trip over it and you'll be completely snowed under."

Yes. Yes. Poor... That's a good thing. He says don't go out in the sun and – Saint Hill graduate here – don't go out in the sun and cast shadows because people will trip over and you'll be snowed under ever afterwards. That's true. I've gotten some letters from people that he hasn't deigned to write to and they are very upset with him for not instantly getting them 7,640 hours of auditing and that sort of thing. He got more than he bargained for. Yes, Ian.

Male voice: Ron, E-Meter reading.

Right.

Male voice: How soon are we going to get some visual aids on this?

How soon are you going to get some visual aids. Your best visual aid – somebody was telling me a couple of weeks or something like that and I see from a head nod here that it's probably still that same estimate.

Male voice: Maybe a bit earlier.

Huh?

Male voice: Maybe a bit earlier.

Maybe a bit earlier. Your best visual aid at the present moment is not asking questions or putting some guy quasily indifferently into session. The student sits down and takes hold of the cans. Another student sits there and watches the meter. And nobody says anything except the coach and the student. The coach stands behind him. Or no coach. I just sit there and watch the meter. And just call the reads. And call 50 percent of the time no reads and the other 50 percent of the time reads. Now, that in itself is terrific training if entered in upon without messing up anybody's bank or anything like that. And I think possibly anybody doing that here oh, probably at the other end of the line, will be grooved in enough when he's really good at that to collide with the first visual aids we will have. And I think that would get us over the jump. Does that answer your question?

Male voice: Yes, thank you.

You bet. Okay. Any other questions? All right. That's fine. Thank you very much. Have a good auditing day tomorrow and a good weekend.

Good night.

ROUTINE 3GA, PART I

A lecture given on 24 July 1962

Thank you very much. This is the what of what?

Audience: 24th.

The what?

Audience: 24th of July.

It is? Imagine that. It's gotten to be the 24th and you didn't even know it.

First lecture, 24 July AD 12, Saint Hill Special Briefing Course.

All right. Now, I'm going to give you a lecture now on bits and pieces of Routine 3GA. And I do not intend this lecture to be a complete summary lecture on the subject, but it covers changes, up-to-dateness and improvements on 3GA which will make it easier for you to get along and find the pc's goal and get your job done.

Now, although you have seen over the past couple of months a new plateau in auditing formulating rather rapidly and it was quite apparent that I must be working exclusively on things like Prepchecking and that sort of thing, that isn't the case. Most of my attention is very squarely on Routine 3GA and lots of Clears. Now, that is very much to the point – very, very much to the point.

Why you aren't getting Clears goes something like this: The first Routine 3 cleared those who were lucky enough to have found on them a goal which contained their terminal name. It's as simple as that. They found a goal, offhandedly found a terminal and then it turned out that the pc could be run on the goal which included the terminal; that's – we have an example right here.

Now that was the first of the Routine 3 successes and, of course this wasn't a very high percentage because the "to be" goals are in the minority. And we had a "to be." If you had a "to be" goal and you were lucky enough to have found the "To be (blank)" that "blank" as the terminal for the goal that was found, why they went Clear and that was fine.

Now, the next thing that was necessary was a better method of handling this particular goal. And the first Clears made way back when, were found by isolation of a rock. I did the assessments. That doesn't count. I could probably clear people with fifty dozen different technologies, but the point is not whether I can clear people. That's not what we are trying to prove. We wouldn't get very far if that was all that ever happened in Scientology. It would be something on the order of two a year or – you know something like that – three a year between fishing trips and... You know how idle I am anyway.

But we used the same 5-way bracket with the addition of a – of a Prehav Scale. With 5-way bracket – was on the original twentieth Clears – and then we used this same thing, but we additionally added in the Prehav Scale to that and that isn't actually adequate to do more than key out the GPM.

Now, it is rather remarkable that you can key out the GPM, because if you found two, three, four, five wrong goals on a pc and tried to list each one in turn, you'll find this, this GPM is enough to get him down on the mat and break his flaming neck. You know, this is nothing to monkey with.

There's practically nothing disturbs the GPM; that I can guarantee. All experimental activities in an effort to take the Goals Problem Mass and dispel it by ordinary repetitive processing have failed. The best they have ever done was when the goal was very accurately found, was to key the goal out temporarily up to the time the person made his next heavy postulate.

Of course, you've improved him to a point where he can make better postulates. That's great. That's a self-defeating activity, isn't it? At any given moment he is liable to make a postulate of, "I don't have ..." And all Clears go through this stage for the first few weeks, you see – "I really don't quite know whether – what I'm walking a tightrope and dare I breathe." And this sort of a state of mind exists and they have been known to say, "Well, I miss talking to my fellows and I feel all out of sorts with everyone and if I were just aberrated again why I would be happier," see. And they've had it, see. "I'll be aberrated," they say.

Now, the GPM was there to help them out and it would key back in again. In other words, you put an individual into a temporary state and improve his ability to do something and then he goes on and does this thing and if the temporary state you put him into is a temporary state and not a permanent state, why he, of course, hits the banana peel right at that point.

Now, I want to call to your attention that everything that has come along in states has been achieved, at least temporarily, many times. The data on this is good.

Now, early Clears were freed from engrams by an accustomment to masses. You accustomed him to confronting masses by gradient scales was the first method of clearing That's clear back 1948, something like that, see.

Now, any observation that I have done as it comes along is based on the actual observation of the critter. Now, you bang somebody out of his head, you take a – take a roaring psycho and you bang him out of his head and he goes out of his head clean, not dragging a mass with him and he's out there, twenty, thirty feet away, but still talking through his body – you've just got about the sanest, wisest man you ever had anything to *do* with. This is quite remarkable. He would stay that way for minutes. You talk about achieving a temporary state, if you wanted to be excessively cruel to somebody, just do this several times to demonstrate to people how you could change things and you'll louse him up but good.

But that temporary state of Theta Clear has been achieved many times as minutes, days – but in no case longer than five or six days, that I have any record of.

A guy is beautifully Theta Clear – this is why the principle of banging him out of his head, don't you see, you know and he's exteriorized. And he takes his car and he drives downtown and he gets interested in the skyscraper tops around him, you see and he forgets the car as it is sitting there and there is his body in the car at the stop light, you know. And the next thing you know everybody starts hooting horns and there is a lot of confusion. And then he suddenly realizes he's totally capable of abandoning both body and car and he goes back in his head and the next time you can't get him out with an hydraulic jack. The same action will not work this next time, because he has learned that he can't trust himself and all the mechanisms of aberration are still there ready to snuffle him up again. See, he's got all the ridges all ready to pounce, see. All he's got to do is hit the right associative restim-stimuli and bang, there he goes.

Operating Thetan to a lesser degree, but observed, but observed. People have spoken in the middle of the room. People have lifted match sticks. People have mocked-up something that was a shimmering something sitting out there and everybody looking at it saying, "uugghhhh," you know. And of course everybody said, "uugghhhh," and the guy didn't do it anymore, you know. [laughter]

Release – oh, there probably isn't a person in this room that isn't a Release. But the state is so downgraded in relationship to other states, that very few Scientologists ever realized they've ever attained it, you know. They just know that they're on their way and they'll get better and everything will be fine, and so forth. They never think of this in terms of a Release.

And we've got a bunch of Release buttons. If you want to apply for a Release button do so. Beautiful little S and double triangle with a great big red R in the middle of it. Those pretty little stick pins is what they are and they'll be along shortly. They are coming from Ireland. I think they are probably held up in customs.

The future of the British nation is held up in customs! Anything – anything you haven't got, why if you want to know where to lay your hands on it, the *best* chance is just customs, you see.

We brought a little boat in the other day from Norway and customs is just down there worried sick. I mean the customs officers are pacing up and down the dock. They're afraid they won't get their few pounds duty for the stamps, you see; and they were on the phone to Peter. The engines had hardly cooled off, you see, before they were on the phone.

We had no complaints though. They held up – all they did was, it – I think it was only a month or two that they held up the children's toys from America recently. They were doing well. The beep meter I think was held up for a year.

So if you've lost anything or aren't receiving anything, phone customs. Probably get it there.

Well, customs on a national scale is a sort of a ridge. If you don't believe it go down to any customs in any country and you'll see the stuff trying to get out of the country banged up against the stuff trying to get into the country and it's just about the wildest ridge you ever laid your eyes on.

I remember the first time I ever mentioned this during the Philadelphia lectures. And one of the boys there in that particular unit had to go down to customs to get some books that Mary Sue was busy mimeographing over in London. And he had just heard about this, you see, in a lecture and he had thought, "Well, it's one of Ron's exaggerations, hyperbole, you see and metaphor." Or something like that. And he came back and his eyes were as round as saucers, you see. He couldn't even get into the shed because of this ridge, you know. It was the wildest ridge he'd ever looked at.

Well, a thetan advancing to higher states, if he advances through the barbed wire, ridges, barriers, impasses, trigger mechanisms, booby traps that the mind is replete with, of course moves into these states bypassing these things. Why, he's taken too short a cut and the next thing you know he winds himself up in a ridge or something. And that's what happens, that's how they – how they nose dive. You can shortcut any of these states, in other words, to some degree. And then because you haven't actually solved *why* he is in that – in the state he *was* in and then he gets pulled in like a demonstration vacuum cleaner, you see?

Now, the isolation of *why* and *what* pulls him back in marked a tremendous upsurge in clearing because we had our paws right on what happened to the bank, why the bank was that way and so forth. And we called this Goals Problem Mass because the individual has had problems. And he has had problems as identities and these problems as identities of course, found *him* as an identity part of a larger problem. And, of course, he was the mass, the identity and the mass, which was countering another identity and mass and you got these two masses counter-opposed – and you made a problem which hung up in time, very exactly balanced. And then he got to be another identity and this hung another one up and then that was opposed to another mass. And then, then he gets along and his conglomerate aberration by this time is enough to pose him – as a problem to other masses and other masses as a problem to him, don't you see.

And you get this thing and it's just adding up. And if you want to know how many of these identities there actually *are* in the bank, irrespective of the person's goal, just go by doubles. Do about five hundred doubles and you would have the first trillion years of his existence, you see. About five hundred doubles. Now, how many is five hundred doubles?

Well, is – if you – if you started the first day and saved a penny and you doubled your money every day thereafter at the end of thirty days I think you have some, oh, it's – I think it's better than a million dollars.

Doubling goes very fast. So this as an individual is opposing the world as an identity and the world is opposing him as identities and we eventually get this thing stacked up and it becomes pretty wild. And he packs this around and we call it a reactive mind.

Now, the anatomy of the reactive mind is what we are attacking when we are clearing somebody. And if we want this fellow to assume a stable case gain then we have to get out of the road what is going to unstabilize the gain we give him.

So the problem of clearing is actually not making a Clear, but making a Clear who will stay Clear. That, that is the – that is the problem. This state has been achieved temporarily, you see, many times. Some of them quite with good longevity, as far as clearing is concerned. Not speaking now of theta clearing. But the GPM had been keyed out and there it was still

waiting – and he looked at the wrong blond or something like that and – *bow!* There he went again. That was his favorite oppterm, don't you see, and snap and bang and we have the GPM all confounded and complicated once more.

In other words, we are dealing here with a conglomerate mass which goes in pairs, but the pairs oddly enough do not come apart easily unless you get the other pairs restraining the pairs. You are really basically dealing in pairs, but you have another identity opposite each one of the pairs. Don't you see? So it's a four, it's a four-item package by the time it gets up into its full, highest blown complexities.

You've got just the pair, which is the Goals Problem Mass and then just for good measure the thetan stacks in two more identities outside the pair, each one of which reinforce the collision of the pair.

These last two went undetected until some months ago, and then realized that we could smooth it out much faster by taking into account these others. You don't go above this four.

You, by the way could go to sixteen because frankly, fortunately for you, they blow. But outside, you see, these first two, well, you actually could pressure in and get rid of the collision of these two and disintegrate the mass. That's theoretically, see, but you do it much more easily by taking in the retarding pair on the outside of the identity. See, so you got four.

Now, in actuality there are two more outside those and two more outside those and two more outside those, up to the number of about sixteen. And then frankly, added into the GPM, but not particularly – you pay no attention to it in clearing. You have a whole new sixteen known as "the other," see. So now you've got sixteen versus sixteen. Do you see how that is? Well, there's thirty-two flows, you see. And of course you can get a terminal that represents any one of them. You'll find them in cluster.

Now, of course if you wanted to be idiotic about it, you could spring it on up the line, if you had to and you don't have to. You'd have thirty-two versus thirty-two and you could also have sixty-four versus sixty-four. And then, of course, you could have the hundred and twenty-eight versus the hundred and twenty-eight. You get the idea? And then you make up another few years of a thetan's travail on the track.

And by the time you've added this up by doubles on top of the – of any cycle that the fellow has lived on the track. Oh, well, let's say the last hundred million years, see. Let's call that a cycle. That's very, probably a very short cycle. Cycles ere as short as sixty thousand years, ten thousand years, and so forth. But for goals purposes, the way we are assessing now, you will find out that the cycles you're handling usually exceed a hundred million. They are greater than that. We've reached that far back and we're probably cleaning up dozens actually of – of cycle GPM. You see we have reached that far back into the bank.

Well now, look at the multiplicity of items. Now, how many items do you finally list? How many items do you finally list when you are listing out a goal? Well, a very ordinary figure is four lists of ten thousand each. I would consider that an ordinary figure.

In actual fact it isn't quite that wild. I mean, I wouldn't – I wouldn't be *upset*, you see, if it took that many. See, that's within an auditor's expectancy. Four lists of twenty-five hun-

dred each is about, I think from first glance if I remember rightly, it would be considered more or less normal at the moment. We've got data on this now, you see. We've got quite a bit of data.

But we don't care how many. All we care about is how Clear? That's the thing. We want a free needle on each one of the four lists we are going to list from the goal found. Each one listed to free needle and then you're fairly – you're fairly well off then in a stability.

Now, why are you well off in a stability? I mean, why do you think this fellow will stay Clear – any clearer than a 5-way bracket by the Prehav Scale? Well, it's because we're taking what was alter-ised and unalter-ising it, if you follow me.

The fellow made a basic postulate of some sort or another. He had this basic postulate and then he couldn't follow out this basic postulate and every time he tried to follow it out or didn't follow it out, why, he'd run into alter-ises. And these alter-ises or alterations of his basic would form mass and this mass thus formed accumulated and accumulated and accumulated.

And it's something like there's one log can be pulled out of a log jam and cause the whole log jam to go swish down the river. See there might be millions of logs in the jam, but there's just one key log. You pull that one out and nothing else can hold.

Well, the difference in the simile here is that when you pull out the key log, the goal and so on, when you pull *that* out the logs vanish, see. You – when you finally listed this thing out no logs go down the river. See, the trick is there were no logs there in the first place, that weren't alter-ised logs, see. The log existed because it was an alter-is of the prime postulate, see. So in the absence of the prime postulate you haven't got any logs. And that's why we know it doesn't key in, because we have reached the state of "ain't."

Now, it took me quite a while to find out, even after we started these later – these later Clearing Processes, it took me quite a while to find out what happens to the logs, see. Where'd they go, you know? I thought they might go backtrack. I had to be sure, you see. They might go backtrack or they sort of, you know, disappear somewhere on the track or they fit themselves on the track and there they sit, you see, so they are not bunched up now. And the fellow is safe for a long time because they won't bunch up like that again except by accident.

Well, that doesn't happen to be the case. The answer is there are no logs. See, because the logs are composed of an alter-iness of the basic purpose and that is the mass of which they are composed. That's the only way they can continue to exist and that's the only mass in them. And when you get the alter – the thing that is alter-ised out, you get no mass. So that it's a vanishment of mass. It's not an erasure of mass, it just – because all the mass is just an alter-is.

All this is quite fortuitous. You're just lucky, that's all. I didn't plan it that way. Needn't thank me when your bank as-ises. Only thank me for the fact that it *does*, not why it does, you see. Because the basics of the thing are, of course, have been hunted up.

Now, it's on the basis of the fact that what a thetan made he can unmake. And it is not based on this premise of the thetan that *anything* you make is better than making nothing, because this bank is wholly composed of things he *wishes to Pete* he had never made. And that's why it's so invisible to him. It's the things – it's the things that if he just sat down and

thought about it for a little while he just wouldn't want to have anything to do with it at all. So he puts it into an invisible crush. He makes a superinvisibility out of this bank and only after you begin to audit the right goal does it start showing up to any degree. And then all of a sudden he becomes aware, "Where did this come from?" You got it? "Oh, no wonder I squinch my eyes all the time. You see there's a black ridge been sitting across from..." as the thing dissolves, you know. Where did it go? Well, it didn't go anywhere, see. It was composed of an alter-ness, which now not alter-ised, isn't.

It's like making taffy. It's like making taffy and then uninventing sugar and water. Of course, there would be no taffy. You've uninvented them. You picked them up prior to the time you made the taffy and then of course, there is no taffy. This is the – no matter how sticky the taffy was of course, if you took a time prior to the time you made it and made the sugar and the water and the flavoring cease to exist, then, of course, the taffy's gone, too. No matter how many times you'd pulled it or anything else, it would still go.

That, by the way, is a happy thought to those who had been stirring their banks for a long time. [laughter]

Now, it doesn't happen to matter – it doesn't happen to matter what happened to you in auditing or what got keyed in, if you get the basic postulate and that section of track from then till now goes. Because, of course, any bad auditing or upsetting situations in auditing or ARC breaks or not liking this, that – those all go. They're all pieces of log, too, that are made out of alter-is. Don't you see? And you don't have to go back and erase all the bad sessions you have ever had or something like that, after you have gotten Clear. You're also lucky there, if you have ever had any.

Now, to a large degree clearing depends upon an automaticity of perfection, which isn't an automaticity, but a truth. You see, if you'd look at it, you say, "If you took off all of these other things, why, something would be left." Well, fortunately for you something is left, which is you. But you have a sort of an automaticity which isn't an automaticity. I mean it – it's just an is-ness. It's a total is-ness.

Your predilection for perfection is the only thing that causes you to find fault with the universe and this manifests itself on lower scale in nattering. And on upper scale just things straighten out.

Now, frankly, as a philosophy of existence this is much, much too simple to pay anybody who is writing at so much per word. The is-ness of the individual is perfection. It's only his alter-ness that is imperfect.

When you get an individual up to a point where the things he has alter-ised are not causing him now to think in an alter-is, he thinks in a perfection, which is an automatic sort of perfection, don't you see. I mean there it is. We use this word automatic in another way in Scientology. I just say it goes on without his paying any attention to it, which is also a very interesting point and once more you are lucky.

Let us say you had always – you always – well, it'd give you a very, very easily understood – let's say you had motes in front of your eyes. You always had these motes, little sparks and so forth and whenever you looked at things, why you normally saw these motes.

Well, now you *don't* see those notes. See, when you've got the bank cleared up, you see right. That's what I mean. There's a – let's instead of calling it automaticity of perfection, let's call it a – the is-ness of perfection. It simply exists. You see right without any further effort or action. That's where you're lucky, you see.

Now, a body can go beyond the point of no return and it does not right itself to a totality – well, particularly if it's been tampered with surgically or something like that. But within meaningful limits and these are interesting enough to be very useful to us. That is the meaningful limits of this situation, the body, to the degree that it is possible, reverts to a perfection.

Now, the individual, let us say, had always suffered from ulcers. Well, you clear him up, he ceases to suffer from ulcers, you see, which is quite, quite interesting. In other words he doesn't *do* anything else to patch up his ulcers.

This is so much so that you could say that this universe is only an accumulation of imperfections. It's, as I say, it doesn't make a very wordy philosophy and that is why the thetan protests. But by his protest and his effort to attain perfection by a *doingness*, he of course alters the existing *imperfections further* and fixes them right there – *boom!* There they are.

It's something like a fellow having dents in the fenders of his car and he goes out and with a big wrench and a hammer, you see, twists the fenders around. And he says, "Well, they look more crumpled than before. Maybe if I banged the car for a while against the fence the fenders would come straight." So he does that and he goes around and he looks at the fenders and he says that, "You know, that isn't so good. Those aren't so good," and so forth and "Maybe, maybe if we – maybe if we got out in thick traffic jams, maybe other cars butting up against the fenders might iron them out." And that doesn't work either. He tries that. He has a final solution – he had two final solutions – he finally rolls the car up in a ball, you know. He can do that in various ways. Take it down to a junk merchant. They have these pneumatic presses.

Actually it's very funny to see a car after it's been hit with one of these super-ton pneumatic presses. It's a – it's a flat sheet, but you can still see the impressions of head lamps and things. So he does that and rolls it up in some fashion or another. But look, if he couldn't actually sell it or get rid of it, you see, he'd have to have that around the yard. So he has a solution for that. He doesn't see it. Those are his last two solutions, you see. Squash it up in a ball. See, that's not so good, so he doesn't see it.

Now, when he's done all these odd actions he now has some – some bits and pieces that he can't account for. And in view of the fact that these bits and pieces are collided with other bits and pieces, with nicely balanced velocities and that sort of thing, you get a built-up GPM. And that's how it is, see.

He lives this life correcting imperfections, you see. You know, straightening out the fenders with sledge hammers and smashing the car up. Finally he rolls it up in a ball and then doesn't see it. It's a sort of a give up of the whole lot, you see. He's sorry he ever started it in the first place.

Well, nearly every thetan has free track and if you take too much free track away from him he often gets unhappy. You know, he's got a nice picture of a brunette and she's got a

picture of a muscle man, bulging muscles, superperfection of some kind or another. I dare you to try to erase one of those one time. If you can find one on the pc, try to erase it. You're not going to get anyplace trying to erase it, see. That's the old secret in Book One of why you couldn't erase pleasure moments. You couldn't do anything with pleasure moments.

So you do have free track. Well, this free track is visible and you can run the pc on it. And you can actually erase less unhappy incidents on this free track and you can actually straighten out what we once called his whole track. But it is whole – something like the idea that you have a thousand-mile-long fence composed of a stake every foot. Got that, a thousand-mile-long fence, there's a stake every foot. All right. Let's omit all but one stake per mile. Just leave one stake per mile on this thousand-mile fence and that would be a fragment of his free track. One stake per mile.

What happened to the other stakes? Well, they're over in the field back of the fence, crunch, and we don't see them anymore. Those are the ones he wants nothing to do with.

Now, these things are compounded into identities. Actually every one of these balls is an identity and it contains in it a full track all by itself. And you will sometimes see one of these things start disintegrating and it will scare you half to death because it looks like you've suddenly accumul... oh, there's various phenomena, not necessarily this one, but it will look like you have a fantastic magazine of 35-millimeter-slide pictures or something. And, "Where are these from?" you know and you start pawing away at these things and all of a sudden everything goes black.

But for a little while – for a little while it's very interesting. Everything is sort of down in size and there are all kinds of little mechanisms that thetans use, not necessarily the 35-millimeter mechanism. They have many more. Sometimes they are in motion-picture reels that just unreel. He suddenly pulls off part of it and he'll get something unreeling. How interesting, you know. *Clank!* "I'd better not go through that." [laughter, laughs] He forgets himself, you know.

Well, you've got various phenomena associated with this sort of thing, but you start running him up and down free track and one day you'll run him into an engram that has a black edge. You'll say, "I wonder what else is over there." And you just say, "Well, go up and down the free track."

"Oh I'm not so sure about that, mmmm-mmmm. What's that little black edge? What's in there?" you know. And he looks very hard in there and there is a shattering sound and a big chunk of the GPM closes in and he doesn't – "Where's the track? It's dark in here," see. That's the immediate response.

What happened? Well, the only thing that happened is all these pieces that he has carefully scrunched, all these lives he has lead that he doesn't want to lead anymore and he's carefully scrunched these things, you see and then has said he isn't going to *see* them anymore, they're not-ised totally. What's happened is, is one of these things has come back and he has seen it against his postulate of never seeing it again.

Fortunately, that's not much of a basic postulate and doesn't get in the road of clearing. But it certainly makes life rather incomprehensible. It makes it exciting to say the least. You

start somebody up and down the free track and he has beautiful, clear, three-dimensional pictures, except the train of the wedding gown in the marriage is black and that whole corner of the church is black, actually. And he says, "What's over there?" And you run him into there and, well, actually probably what's beyond this is half a dozen lives as the Master Inquisitor, see, using churches for the sole and exclusive purpose of saving souls by burning bodies, you see. And he'll have all of these lives stacked up and when he went to this wedding – first time he'd been in a church for a long time, you see – and something that he had beautifully not-ised and said he isn't going to see anymore, you see, that has appeared to a point of where it is slightly noticeable.

This is a tremendous magnification of the ordinary manifestation of somebody being uncomfortable in a locale. This fellow isn't uncomfortable. He thinks it's getting married. You trace it down, it will be all these lives as a Master Inquisitor, don't you see. And it's the church that keyed it in. He didn't even know this.

He goes along after that thinking it's marriages upset him. That won't be the case at all. He goes near a church and goes kind of *screek*. Every time he goes near one he sees a little plainer this mechanism of the blackness, don't you see. And he finally says he doesn't like noise so that's why church bells get on his nerves, you see.

And oddly enough he has some predilection for graveyards. He seems to find them very nice and soothing to walk in. As a matter of fact, there's sort of a sensation comes over him, a sort of a – a beautiful sadness comes over him. So he stays away from churches and walks in graveyards, you see.

Well by *staying* away from the church he's keying it in. By walking in the graveyard he's keying it in. By going in the church he's walking it in and staying out of graveyards he's keying it in. He hasn't got a prayer, see. That is the life he lived. That is part of his experience. That is part of the recorded experience of that individual which he has packaged up and said, "This is an individual and I am now dead and this is all put away and I won't have anything more to do with this. And now, I am all reborn again and isn't it wonderful."

It's something like the fellow who has a number of murdered bodies in the closet. And he's put just a few too many in the closet to close the door and he never can really get the door shut. Now, he'll take anything rather than open the door. He will just suffer anything – arthritis, rhombosis, medicos, he'll suffer the most fantastic things rather than let that door open another crack.

The funny part of it is he doesn't *dare* let it open. He hasn't dared in all this trillennia, because aside from Scientology there was nothing could have as-ised it.

I know whereof I speak because I've tried to do a number of things with the GPM and no ordinary repetitive process works on the GPM. Nothing works on the Goals Problem Mass, to date, except just exactly what we are doing with it.

We finally find the prime postulate. He said, "I am going to be good." That's what he said, trillennia ago. And then he ran into men who were bad. So of course, he'd better straighten these fellows out.

You find this fellow with this postulate sitting in Sing Sing, you see. And the odd part of it is he'll still tell you the computations from the basic postulate. "I'm just a good boy" and all that sort of thing. He'll give you the lot.

But of course this thing has been going on. Now, it isn't one every life. You can actually find a postulate or a goal, if you please, in front of every engram, in front of every life, in front of anything and everything you can find a goal. You don't get anyplace much running these things.

There is a process if you're interested that would be handier than others to do something with and, "Tell me something you have decided." That's a sort of a reverse angle on a postulate. Not, "What goal have you made?" but, "What decision have you made after the facts?" And it's quite interesting in helping out psychosomatic ills and that sort of thing. But it doesn't do anything really to the GPM.

No wisdom which has come up before Scientology has even scratched the GPM. People could learn to live with it, see. People could suffer themselves, they could suffer themselves to be sufficiently able to act in spite of, don't you see? Or in an effort – in an effort actually to experience and condition themselves to it; if they could do this, this is always the hope – if they can experience themselves sufficiently, why, they would no longer mind it and it would go.

These were philosophies of one kind and another. Seldom has man had the fortitude to get up to a point of experience where he no longer minded it. You see, this was not a very general track.

Now, if there was – you'll find this philosophy around. You will find some people in Scientology, I remember one of them in Brisbane. He thought after you ran an engram you had to experience for a while in order to right the engram. All right, okay, that's true. You have to be in the environment a while, see.

But let's go further than this. This philosophy has existed, *in extremis* – undoubtedly has worked. But is there any other way of attacking the situation whereby you suddenly find yourself missing this GPM. Now, that's what's interesting to us. Yes, well, there is and you have to examine the anatomy of this thing and you find out how it got there. And you got there from a man's lack of integrity to himself. And that is the basic evil.

You want to know what evil is – it's man's lack of integrity to himself. Hamlet, Act 5, Scene 3 – Act 1, Scene 3, can't quite – "And this above all to thine own self be true." He knew whereof he spake, undoubtedly there's a lot of other advice in the exact speech – same speech that isn't true. But the point – the point here is one's lack of integrity troubles him, that is to himself, it is not to others, troubles him to such a degree that he has to forget what he is being faithful about, in order to live at *all*. So the hole that a thetan can put in his own is-ness of perfection is to be false to himself. He makes the postulate that launches him off on to a career and then he cannot be true to that postulate and he accumulates masses and he goes astray and he accumulates imperfections and all sorts of wild, bad experiences exist and he has to bury that thing. He doesn't unmake it, he just buries it. And he goes on and on and on with that, dragging that buried corpse behind him of his own lack of integrity to himself.

Now, oddly enough man actually can betray families, sell West Point – do all sorts of mad things and find himself not greatly affected over any term of lives. Oh, it will make one go smash, you see – but he recovers from that sort of thing.

It's not even in the same order of magnitude to be faithless to oneself, one's own postulates. Not even of the same order of magnitude. Unfaithfulness on the first dynamic would rank as high, let us say, as the Washington Monument. And unfaithfulness on other dynamics would be about as high as a blade of grass in the park alongside of it.

That is not any invitation to sin, but if you are – if you think I am weighing heavily upon you to be awfully good these days because I want you to pick up your overts or that sort of thing – think of me looking over your shoulder and supervising your behavior because of the overt-motivator sequence. You can take that off during Prepchecking and that's just dandy. And it does a very – bunch of nice, little, interesting things and it will straighten out this and that and make a person feel happier. And you pick up his missed withholds and he will be nicer to his fellows and all that sort of thing.

Well, when you are handling Routine 3 you are up to the top of the Empire State Building in terms of magnitude, you see. This is tall. This is big as the other is small. And what you are doing is picking up the basic overt against self. And the basic overt against self that a thetan is capable of is to betray his own postulates.

You see some of this. A fellow feels real bad sometimes. He makes a bunch of New Year's resolutions. He says, "I'm going to be nice to the little woman. I'm going to give her some of the paycheck," you know. And, "I'm going to be – I'm not going to shout at the kids anymore. I'm going to stop running over dogs for fun," you know, all these sort of things.

A few weeks later – a few weeks later, why, he comes home and he's got the paycheck and the wife's had a hard day, you see and she's sort of nattering around one way or the other. And he said, "Well, why should I give her any of the paycheck?" you see, "after all." And he sticks it in his pocket. He sort of feels a little bit degraded about it. And then the kids come roaring out of the – out of the street and shout and scream, something of the sort, just as he's sitting down to read his newspaper, you know. And he looks at them and he says, "*Shut up,*" see. And somehow or another he feels just a little bit degraded, you see. And then he's going down the street and a dog starts barking at him. It's a particularly mangy, ornery-looking dog, you see, so that lessens the overt and he all of a sudden steps on the brakes fast, swerves the car and runs over the dog, you see. He goes on.

And he's talking to a friend about a week later and he said, "Well, you know, I used to when I was young have a lot of pride and that sort of thing, but these days, you know, I realize that as you go on in life that – that life is a degrading sort of thing, you see and being married is the most degrading." You see. He'll have some big rationale, don't you see. No, he just disobeyed all of his New Year's resolutions – that the overt against self is of greater magnitude than the overt on any other dynamic.

Now, of course, underlying and back of all postulates there is another overt, which is an unspoken overt. He didn't postulate anything ahead of this overt, see. I mean, he didn't postulate this one. This one *is* and he actually can have an overt on himself greater than an articulated postulate. He can simply be imperfect. That – it's quite interesting.

And if you have a heart-to-heart talk – if you want to – if you run into Socrates or something and you don't know what to talk about and – or if you run into somebody who is terrific in the field of philosophy and he's a great figure-figure merchant, why, you can tie up the whole evening or the whole debate just on the subject of man's recognition of his own imperfection. Honest, it's a subject that they just can't help but discuss with you. Not recognition of the imperfection with others. They all know about that, but this other is a more fundamental fundamental – man's desire and reach for perfection of self and so forth.

Now, most of them – most of them will go at it on an entirely reverse vector. They will say, "Man is evil, will be nothing but evil and is trying to attain nothing but evil." That's how far they have lost sight of it. And when somebody starts to preach that philosophy, you know how many overts he's got against the first dynamic. You know how many of his own postulates he has thrown aside and you know how big his GPM is. You can also estimate the number of times he's going to be sick. You can do all sorts of things, see. That's your – those are judgments that you can make along this line.

Now, people with high critical – people with other manifestations are actually – are actually not as bad off as people who are not critical at all anymore, but they get in our hair so we often detest them.

Well, remember there's a state below that, that's probably normal. It's, "Well, why should I interfere with the other fellow? Live and let live. That is none of my business. Who would want any responsibility for that? Well, I would have no business interfering with the lives of my fellows." Don't you see, all of this sort of thing.

That is all saying, "I've had it." It's also saying by this time, "I am – you want to know who I am," you see the fellow was saying to you, "Well I am a GPM, that's who I am." And you can also hang a sign on his nose and say, "No thetan lives here."

But the significances of clearing are based upon the mechanics and fundamentals I have just talked to you about. It's out of these fundamentals and mechanics that you get an understanding of clearing. And I've given you – in spite of the rapidity and colloquialosity of it – given you the basic fundamentals from which you could extrapolate or predict what it would amount to or what you could do wrong in attaining the state.

Now, it points out, for instance, that if you clear somebody you don't wind up with a criminal. See, it gives the moral aspects of clearing. And if you fail to get a prime postulate, that all you were doing is adding more logs to the logjam by running it, because you've not pulled the key log. And you've pulled the wrong log and of course it just gets more jammed up. At least more water appears to be jamming up back of the logs. And it tells you that alter-is-ness of the bank itself will increase the mass of the bank and increase its activity or reactivity.

Well, that is what you are finding in a pc, but you are not actually looking... This is why I have always told you. "Don't process what's *wrong* with the pc, see. Process against what's *right* with the pc and you'll win." You must process the thetan, you see, not the engram. And if you process directly and immediately at the target of a prime postulate, you will find that the GPM gets in your way to the degree that you are inexpert in reaching back toward the prime postulate, directly.

Now, the less expertness you have the more GPM you collide with in trying to audit the pc. So, if you were just sloppy, sloppy, sloppy in all departments and activities – terribly sloppy – you would collide with *nothing* but GPM and you would never clear the pc.

This is quite interesting. The more rapidly that you can locate a goal, the more chance you have of finding a goal. You see, it gives you all that kind of a maxim to go on, you see. The less directly you reach for the pc's goal and find it, the more GPM you are going to collide with. This is quite interesting. And, of course, then, the more alter-is you are going to introduce into the sessions and the bank and so forth.

You spend any time condemning a pc for being aberrated during an auditing session and after that you've had it. You've had it. Now, you've got lots of GPM to monkey with because you keyed it in like mad because that's what he's against, see. The pc, you will find, is almost uniformly, no matter what his manifestations are in session, will go in the direction of the decent thing, the good thing and that sort of thing. And the more you recognize that fact, the easier pcs are to audit.

So a missed concept of the nature of man can stand in the way of an auditor as it has stood in the way of all people who have tried to attack the problem of the human mind over the trillennia. A misconception of the nature of man. Therefore you should have a fairly good concept of the nature of man and his anatomy, in order to do anything about man.

Now, the states that we produce are producible on the route of Routine 3GA, all pcs, to the degree that we can find the basic postulate and audit that out.

Now, therefore, you see, my time has been spent as it has been spent for a long while, but is spent very successfully over the last two or three months getting together more rapid, faster, more positive clearing technology. That is the important sphere of auditing. Oddly enough, the contributive factors to this are – because if they are dropped, make it impossible – as important as the fact of clearing itself.

I wish it were simpler. I had one the other day, I thought, "Well, I've got it now. Everybody all has the same goal. I'm going to make a test, if everybody's got this same goal, why" – you know just taking the, taking the Axioms and Factors – "if everybody's got this same goal, if we can reach it in all pcs you never have to assess goals anymore."

I worked like mad, did some tests on the thing – worked like mad to prove it up. I – I just worked on that like mad. All I had to do was tell you what the pc's goal is. Then you suggest it to him and then run out the suggestion, [laughter] and you've got it, see and you're right on the road to listing it once and so forth. And this was a brave effort and a beautiful thought and, it doesn't work.

So I'm still chugging away at it even though you've got Routine 3GA. Meantime we have a workable technology and at the present moment I don't see much signs of it getting much simpler. I can simply tell you more ways to do it easier, but the same fundamentals are in our road and the way we are tackling them at this moment are successful.

Thank you.

ROUTINE 3GA, PART II

A lecture given on
24 July 1962

Okay. This is lecture two, Saint Hill Special Briefing Course, 24 July AD 12. Another lecture, briefer one on Routine 3GA.

The way you detect whether or not a person is running well on Routine 3GA is as follows:

They've got tone arm action, and the tone arm is routinely and regularly coming down as well as going up. The pc looks good, and the pc is not very ARC breaky, and the Want line gives the pc an occasional somatic, by which I mean pain. Pc wants to know what pain is, take a pin and shove it in him, that's pain.

Sometimes a pc will tell you, "Yes, I have somatics." And by that they mean a sensation or a dull thump or a twitch, see? Now, we want pain, actual pain, pain on the Want line, occasional pain on the Want line, and nothing else on the Want line. No sen – no sensation – you know, *wog-wog*, dizziness and that sort of thing. And on the "pull back from" the goal, occasional pains. See, that's the old not-want line.

And on the Oppose the Goal line, sen, winds of space, *wog*, *bzmm-bzmm*, twitches, thumps, see, but not pain. I would say so far as maybe occasionally, why, the pc get mixed up and name the wrong terminal, and they get a small pain on that line. But it would be *wog-wog*, *mug-mug*, and the "who or what would pull back the opposition to the goal" on that fourth line, or whatever the third – line three of listing is, also a bit of sen – sensation, dizziness, motion, that sort of thing – that occasionally turns on, or winds of space, momentarily, not to any great excessive degree.

Now, that's what happens when a pc is going right and the auditor can read the meter and it's the right goal and the lines are being listed okay and the mid ruds are being kept in, and so forth. That's what should happen.

If that isn't happening there are certain things going wrong, and I will tell you what those things are on the whole of Routine 3GA in a moment.

But let me tell you what happens if 3GA is going wrong. It doesn't matter whether it is in – at what stage of listing the goal these things happen or at what stage of nulling or something of the sort – that is nulling goals – you haven't found the goal yet, don't you see, so the only thing that can be wrong before you find the goal is actually bad sessioning and bad metering. That's all that can go wrong, see; that's the only thing that can go wrong on finding them. There is something wrong with session form – well, TR 2 is bad, TR 1 is horrible, audi-

tor can't read the meter, this sort of thing. And I can give you a lot of other materials to make sure that that goes right. But if that is really going wrong, then it is just bad sessioning or bad metering. And pc isn't ARC breaky, nothing is really going haywire if your – if your sessioning is all right and your metering is all right, you know.

But let's take after the goal is found. Let's take after the goal is found and you start listing it. And now we're going to find several symptoms if it is the wrong goal. And these things are very, very important for you to know, because by George, no pc ever went Clear on the wrong goal, because you list the wrong goal and it's just more alter-is and more alter-is and more alter-is.

There are four things out which can make a goal read. It's the wrong goal, but it'll read – boy, will it read, beautifully every time. Something has been suggested on the goal, something has been suppressed, something has been invalidated or something has been a failure to reveal – something has not been revealed.

You in actual fact only have *three* of these which are capable of making a goal read that isn't the goal – only three of them – but the fourth is supplementary to it: Suppressed. Because the wrongness, you see, won't read. If you've suppressed an invalidation you don't get the invalidation to read, don't you see?

So you've got – that's right, you suppress an invalidation, you can suppress a failed to reveal, you can suppress a suggestion and you can't get the thing to read. So you get Suppress in first. First you get in Suppress and then you get in Suggested – if you want to know the actual apple pie order here – and then you get in Invalidated and then you get in Failed to Reveal.

Now, this is quite elementary because anybody can tell a Failed to Reveal. It's the dirty needle. It's the little, tiny, minute rock slam; that little agitated rock slam multiple read. You say the goal and you get a multiple read. You say the goal and you get a multiple read. You get – say the goal and it goes *bzzt-bzzt-bzzt*. Well, that's a Failed to Reveal. You can always identify a Failed to Reveal. A Failed to Reveal never reads any other way. It can be such a tiny *bzzt* that at first glance it might look like a tick, but even that is rare. Usually it's a – it's a *bzzt* usually about at sensitivity 16 that is about an eighth of an inch wide, or something like that. If you can imagine a rock slam an eighth of an inch wide, well that's that dirty needle, and that's something hasn't been revealed.

So that leaves only two things that will make a goal tick-tick, and one is a suggestion, which is evaluation, our old two first lines of the Auditor's Code, for God's sakes, way back then, and the other is an invalidation. The two "-tions" and that's the only thing oddly enough that can make a goal go tick-tick-tick, like a goal when it isn't the goal.

Now, any goal on the list, any goal on the list can be made to read like *the* goal by a knuckleheaded auditor – any goal on the list. We've got a goal "to catch catfish," and it is no more the pc's goal, see, than "climbing clouds" is, see. But the auditor looks very hard at this goal, and he says "to catch catfish, to catch catfish, to catch catfish. Say you know, that reads every time. To climb clouds, to climb clouds, to climb clouds, that doesn't read," and so on down the list. Now, he comes back through, and so help me Pete, "to catch catfish," tick, "to catch catfish," tick, "to catch catfish," tick. It'll go right on through till the end of the session,

too. It'll go right on through to the end of the goals list, too, *huh-huh*. Why? There was a hidden invalidation along with the evaluation. The auditor seemed to give the goal an is-ness. The auditor, in any way at any stage, even at the end, misreads his meter, or he's got an invalidated goal that's already invalidated, and looks up brightly, and looks like he's found the goal, and he says, "Well, that-that-that reads; that reads every time."

Now, just prior to that, as the auditor went over the final list, let us say – usually this is a condition happening on final lists because the goal has to be a little bit sticky to get into this shape – as the auditor went over it the pc might have said to himself, "To catch catfish, that's a silly damn goal, ho-ho."

On the next pass around on the nulling the auditor says – of course now, the thing will tick every time because the pc has invalidated it – "Now, let's really hang this thing up but *good*, let's just drive it in with spikes and make this thing look just like a goal."

The auditor says, "Well, *hahhhhh*, that reads every time. To catch catfish, to catch catfish, to catch cat-."

The pc has already said, "That isn't my goal." The pc says, "Are you sure?" – see, invalidation number two, see?

The auditor says, "Oh yeah, yeah. It reads. To catch catfish, to catch catfish. It reads every time, *ha-ha-ha-ha*."

Pc says, "My God, that doesn't sound like my goal." Invalidation number three, evaluation, invalidation, evaluation, inval-. Get the idea? Bang, bang, bang, bang.

Wow, this thing will check out by any knuckleheaded checker, and you start listing it – here we go. The tone arm will start going up and stop moving. Maybe this is after ten or twelve hours of listing. Don't expect it to happen right away. Usually four and a half, five, something like that, sticks. Pc starts to look awfully bad, *bla-bla-glaa-glaa*, and so on and sort of caved in.

In session they are ARC breaky as hell when you're trying to list. Yap-yap-yap-yap-yap, chop-chop-chop-chop-chop, you just can't keep your rudiments in during listing. And the somatics are wrong. If you get any pain at all, which is highly unlikely – so unlikely that you say: An absence of pain equals wrong goal. No pain: wrong goal.

The pc gets sensation, dizziness and so forth, on the Want line. Who or what would want goal? And now the pc after a while, after ten or twelve hours, starts going *wog-wog-wog-wog*, gets sensation, winds of space. If there is any pain at all occurs, it will occur, perhaps, on the oppose – which is highly unlikely that any will occur – but oppose is more comfortable to run than want – Want line. The other two just compound the felony.

Oddly enough a pc very often, if it's anywhere close to his goal at all, will run it with great, apparent satisfaction; will go around and tell people this is his goal; will figure out his life by it, although there are some blank sections that don't quite add up. But he won't be unhappy with it. He won't be going around telling you it's a wrong goal. Matter of fact, may even get mad at you when you try to tell him it isn't his goal, because he's so anxious to have a goal, don't you see. Any goal is better than no goal. It gets him off the horror of search,

search, search for the goal, don't you see? He's more likely to hold on to it than he is to give it up.

And those are the only symptoms: high TA that sticks, pc looks bad, pc ARC breaky and the somatics are wrong. They are reversed if they exist at all. They're all opposition somatics, actually. Opposition somatics are sensation, dizziness, winds of space, that sort of thing, and anything he lists gives him those.

Now, if you keep going in this direction you're adding more and more alter-is to the bank, and the bank gets heavier and heavier, and thicker and thicker, and the pc feels all bowed down and crushed.

Now, in actual listing of the right goal there is a certain amount of bank gets thicker, there is a certain amount of wog, there is a certain amount of these other things, so very often a pc will persist hoping that they will go by and they will run out. But they do not; they get worse and they get worse and they get worse and they get worse and they never get any better. And that is the difficulties of running a wrong goal.

Now, a wrong goal is found by bad sessioning and bad metering, and by not hitting the thing right or checking the goal out right at the end. It's pretty easy to find a right goal.

Now, I've told you what is the symptoms of bad 3GA are. Somebody doing 3GA wrong after the goal has been (quote) found (unquote), you get those manifestations that I have just given you. Those things occur in the pc.

And the remedies of 3GA are these: In listing on goals, the goal is unrevealed – it's unrevealed yet – so get list complete or find out why pc won't give it. That's a highly generalized statement. These are the things that you as – if you were a D of P or something like that and somebody said, "Well I just can't find the goal," and so forth, you know. That's number one that you would tell him, see. "Well, your list is incomplete so go on listing and get the goal," you see? That's that. That's what you'd tell him, just automatically.

There aren't any other reasons except this one: bad metering. We assume the fellow is running 3GA, don't you see. Let's not get picky as to whether or not when he reads the E-Meter he is holding his pinkie at exactly fifty-three degrees from the horizontal while he shifts the tone arm. You understand? That is not what's wrong. See, that's not what's wrong. It's the goal isn't on the list or the metering is bad. See that? It's elementary my dear Watson. That's the only two things that really go wrong, assuming that the guy sits in the chair and goes through Model Session and gets the goals listed and nulled. You are not even assuming that's good, and you are not going to find fault with it particularly. That's not what you are going to pick on.

You are D of Ping some auditor, and he just can't seem to get to first base, and he can't ever find the goal; then you are going to tell him two things. "Well, the goal isn't on the list so get it complete," or "Your metering stinks." It's one or the other, and of course bad metering would have missed the goal. Precheck would have revealed a wrong goal. You see? All that would have been – been remedied actually in the – in just the standard rundown of 3GA. So only these two things stand out as being things that could be wrong with trying to find some-

body's goal, and those are the things that are wrong – goal hasn't been revealed or the metering is bad, one or the other. Could be both, you know, too.

And the next one is when the goal has been found and the pc is turning up with these upper symptoms, which I've just given you, and the goal has been found, then this is what you do: There are only three things that can be wrong. In listing from a goal, the only thing that can be wrong is the goal or the lines or the metering. Now, that's all that can be wrong.

And if you were D of Ping somebody and he was listing on lines, and the pc was starting to get a high tone arm and it was sticky and the pc looked bad, let's just say, "that's enough." Nothing else going on, the pc isn't particularly screaming, and – and the somatics – well, he's not getting anything. He really can't tell about the somatics. No, he isn't getting any sensation, or something like that, and yet you're listing, and this is what you'd pick on. Or if the pc was *screaming* ARC break session after session after session, he just couldn't hold any rudiments in at all, these three things are what you do: You recheck the goal and recheck the lines and remedy the bad metering, see?

And if the somatics didn't exist, there was no pain of any kind whatsoever, and there was plenty of sen, sen, sen, and the bank getting thicker and thicker, and bearing the pc down harder and harder, and more and more, and all that sort of thing, then it's these three lines that you would check, see? These three things, is recheck the goal, recheck the lines and remedy the bad metering. That's all you'd tell this auditor. Don't tell him anything else. Don't say, "Well, we've got to reform the lines, and I think the best thing that we can do in the reformation of the lines – I – I – think you're better – perhaps it's your TR 4, or maybe the pc has a missed withhold."

I'll tell you a missed withhold a pc had who was very ARC breaky in session. One of the lines was wrong, and no auditor would listen to him. It was a missed withhold. It was totally missed on and on and on, and the pc only required a few more hours of listing to go Clear after the line was corrected, which is quite interesting. See, missed withhold.

So we just don't go into those things. Don't go into the mechanics of anything. There's only three things wrong if 3GA starts wrong, and that's you recheck the goal and you recheck the lines and you check the metering. That's it.

Now, it's very fortunate for you that nothing else can be wrong with 3GA. That's all that can be wrong because we assume the fellow – the auditor can sit in the chair, we assume that he can go through his Model Session. We can assume that his TR 1 is understandable. See, we can under – we can assume all of these things because they vary in degree from auditor to auditor, and it isn't their varying in degree which causes the pc to have a high TA, to look bad, to be ARC breaky and have sensation instead of pain, see? It isn't those things doing it, so don't ever look for anything small.

Now, you think you're jumping off for something adventurous when you try to find out a pc's goal. That's nothing compared to jumping off for listing his lines, because you have now hit the silk, and it is in the lap of the gods whether the chute opens or not, see. It's just that. You've jumped off into nowhere. You're committed because if you are wrong, the next time you try to find the pc's goal it's going to be much more difficult than it was.

And supposing you found two wrong goals on the pc, one after the other, and listed both of them. Well, the thing you'd do would be to find – try to find the right goal again and you take a third one. And supposing that was the wrong goal, how harder – much harder do you think the goal will be found next time?

Well, I know whereof I speak because I've had five wrong goals found on me in the name of research. I could go on the – the mother plea, you know, "What I have suffered for you children," you know?

But actually I know what I am talking about here. Very much on the groove, both from watching you, subjective reality, experimentation on it. It has not been easy to pioneer this particular track into 3GA because the GPM is nothing to stand up and box with, man. And I would say this, I have been standing up and boxing with it without any information about it at all, originally, and it's got teeth, man. The thing's got teeth. Boy, you never felt some of the somatics like can turn on when you do it *completely* wrong. Let's *really* be wrong with it. Man, that's a matter of waking up screaming.

I'm not trying to exaggerate this. 3GA is pretty good, but you mishandle the GPM, you mishandle auditing, you let auditors start auditing goals and finding goals on pcs that don't know – even know how to sit in a chair, you'll regret it. I can hear it now, two o'clock in the morning your telephone will be ringing. "My God, what do I do?"

Well, the pc, after they've been wrong listed for a while, are not in a state of mind to have another goal found on them, because any auditing at this point starts to beef up the bank. Now, that the bank has started to beef up, anything goes on from there and beefs up the bank further. And they don't want to be audited, and that is another little manifestation that you can put down. A goal that has been wrong and it has been listed – that person will then pretty well routinely tell you they don't want any auditing. And the only hope in hell for them is some good auditing.

So you see, I'm not trying to make you scared of the GPM. I'm not, I'm not, because I go on the basis that if I could stand up and box with some critter, you can. And it won't kill you dead; you'll just *wish* you were, but you'll come out all right.

Now, how do you go about these various operations? Well, I'm not trying to give you a summary lecture of all of 3GA. You've already got the parts of 3GA. I want to give you a few little modifications and changes and some stuff that I've dug up here in the last few weeks on 3GA that will be of great value to you.

You must complete the list. I've already told you that it takes about 850 goals plus to get a complete goals list. A pc can do this on his own. And actually I'd keep – if I had a pc, I'd just keep kicking him in the head till he gave me a goals list 850 long. Why? Because it's un-embarrassing for him to sit in the quiet of the evening with nobody around and write down these appalling goals, you see? In fact, you are more likely to get the goal on the list, see. He isn't embarrassed by your presence, or she isn't embarrassed by your presence, you know? They write down the goals that occur to them. So you want about 850 plus. That's absolute minimum, 850.

But what makes a minimum goals list? It is not for your benefit, because you've been having a hard time establishing this, an absence of TA action. Take that as a matter of course. It's actually an absence of needle action.

You want a goals list so complete that when you read a series of goals on that list to the pc, five or six goals, half of them will give you no twitch at all; another one will twitch maybe once in three reads; another one will possibly twitch once, and one will twitch twice to stay in. And that would be about it. It's about – actually six is an unhappy number – it's more like – more like ten. You want about one in, in ten.

Now, this violates a datum you've had for a long time, that if the needle stopped twitching on goals – you're going to get a twitch anyway someplace or another. I find, recently, on very careful experimentation, that you can list the goals list down so completely that goal after goal, read after read, three reads per goal, and you get no single twitch for three and four goals in a row. And about the time you decide the middle rudiments must be out, out, out, why, all of a sudden one ticks. You say, "Well that's nice." You get a tick, so you know the pc is still reading on the meter. But that's about all it would tell you.

On first nulling you get three in per page – per sheet. And on second nulling, why, you get almost a scrub. It goes down to about thirty goals. Now, that's how complete a list can be. These ticks that you get are specific ticks. If you get a little, tiny rock slam when you read a goal as an instant read – of course they're classic instant reads. None of this slightly early, or anything like that. Man, you really got to watch that with goals, you see? You could leave something in if you weren't sure. Don't go beating your brains out because it isn't important whether or not you leave it on the list the first time. But don't go to the point of leaving them all on the list the first time because the pc has a constant dirty needle. That'd be nonsense.

But you've got all of these goals, and they're falling off left and right, and they're nulling down, *bangety-bangety-bangety-bangety-bang*, an occasional tick is all you require to tell you that the pc is still reading on the meter. Goals lists can be complete enough to leave a completely limp goals list.

Now, if that goals list doesn't add up to a complete limpness, make absolutely sure that it isn't your rudiments that are giving you action. Rudiments might be wildly out, you see? Make sure your rudiments are in well.

When you're reading that list don't be alarmed if two or three times a page, particularly early in sessioning – if your meter reading is good this can happen to you – I mean even if your meter reading is good this can happen to you – that early on, on nulling of a goals list your pc goes *bzzt* all – every once in a while, and tick, tick, tick, tick, and slash, slash, and then constant dirty needle and *oh, dah* and random, and don't be upset if the pc's needle goes to hell. You just get competent in straightening out pcs' needles. That's all.

Now, I've seen a pc's needle straightened out in many different ways. The easiest way to straighten them out is get a fast check on the middle ruds. That is the most predictable and easy way. Now, you can introduce a lot of corny rudiments and dream ups of one kind or another. You can introduce a lot of extraordinary activities here to clean this thing up, but fish and fumble, of just sitting back, is something that you are eventually sometimes driven to. You can't get it in with the middle ruds, and you don't know what the hell it is. You're just in a

drift. Well, sit back and say, "Well I'm going to see what this is doing," and just do it by steering, fish and fumble. You see the needle go *bzzzt* and *bzzzt*, and over again. You say, "What did you think of then? Whatcha looking at? There. There. There."

"Oh, nothing, I – I just – just the pattern of the table here in front of me, that's all I keep looking at. It's just like my mother's boudoir table, you know!" *Bzzzt, bzzzt, bzzzt*, you know?

And you say, "Well, anybody miss a withhold about that?" or something like this, see?

"Oh yeah, I broke all of her perfume one day, ha-ha. I nearly forgot about that." And so on.

The needle is fine, goes. That's kind of an extraordinary solution, but I have been driven to it.

Pc's needle becomes utterly unreadable. It doesn't matter whether you are reading a goal to them or not reading a goal to them, it just keeps going *bzzt-bzzt-bzzt-bzzt*. You don't know whether it's falling on this or falling on that, and it's just gone dirty in the process of reading the goals no matter how limp the list was. Doesn't mean the list was charged. The pc gets kind of anxious, the pc goes out of session, and remember those goals are awful, doggone restimulative, and they kick in Prepcheck chains, and they do all kinds of weird things.

But don't go on struggling against reading goals with a pc's needle dirty enough to be washed by the Empire Laundry, see? Don't do that. Don't keep trying to read through a dirty needle. What the hell are you doing that for? The pc's out of session. You don't know what the goal is reading on. Even though the pc's rudiments are in, the pc is out of session as long as that needle is ticking on other things that you've got nothing to do with, because you are not talking to the pc. The pc isn't re – the pc isn't reacting to the things you want him to react to, so therefore the pc's out of session.

So you keep going, and you keep going, "Oh God, there's that dirty needle again. Let's see, 'To catch catfish,' all right, it's equivocal, ah, 'to catch ...' That's it. It's still doing it, I'm not saying anything. 'In this session,'" – you are shortly going to see a change for goals processing in the middle rudiments, by the way – "is there anything you have suppressed, suggested, invalidated, failed to reveal or been careful of? That read, Careful of. What's that? What's that? "

"Oh, I'm just careful not to think. I've been sitting here concentrating, care... concentrating on not thinking."

And you say, "Good. Thank you. I'll check that on the meter. All right. In this session is there anything you have been careful of?"

"Yeah, just not to think, ha-ha."

"Good. Thank you. I'll check that out. In this session is there anything you have been careful of? That's clean. Do you agree that's clean? Do you agree that's clean? All right, thank you very much. To catch catfish, to catch catfish, to catch catfish, see. To hit polar bears, to hit polar bears, to hit po-. Okay. If it's all right with you there, we'll ... " Because the second you started to say "to hit polar bears," it started going all the way across.

After you've done this for fifteen or twenty minutes with a pc, then all of a sudden – you've cleaned it up two or three times – this starts happening: The auditor will say "To catch catfish," tick, tick, "to catch catfish," tick, "to catch catfish. Yeah, well, that's out."

Once in a while be bright enough to stay in two-way comm with your pc because very often the omission of two-way comm means the intermission and intervention of a tremendous amount of middle rudiments.

This is the way to handle something like that. This is the kind of answer you get. You say, "What's going on? What's happening?"

"Ha-ha, knew when you read that slow that my needle had gotten dirty, and I was worrying about what I might be stuck in now."

You say, "Thank you," and the needle clears right up. See, two-way comm is always marvelous. Two-way comm has this limitation: If you can't find out by asking once, you shut up and do something else. That is the rule back of two-way comm. You can always ask any question of the pc. It's not a metered question, don't you see, in the line of two-way comm.

Cut comments to a minimum. The more you comment the worse off the pc will get. Don't comment. That's an evaluation of sorts. But you can ask the pc any kind of a question you want to. You can ask, "How are you getting along?" You see a dirty needle start up, you can't read through it, "How are you getting along?"

"Oh, I've been very nervous the last few minutes ever since you read that goal 'to hit lions.' I've had a feeling here like I haven't got any top to my body."

"All right," you say, "thank you." Dirty needle continues. Get in your middle ruds, see?

Don't go on and on and on, "Well, what about this lion? When did you first think about this lion? Have you always been troubled with lions?" No, you are not running a session having to do with running engrams connected with lions. And you go on and violate this rule of "It's all right to ask him anything once," you violate that rule – that's a good rule, you can ask a pc anything once – you violate that rule and you'll find yourself running engrams and whole track and God knows what and all messed up and then running an engram so that you can clean up his needle.

Oh man, it's just getting dirtier and dirtier, and stickier and stickier, and messier and messier, and of course the less auditing you do the less auditing he gets, the more anxious the pc gets, the dirtier the needle gets. You see how it defeats itself? Because you're doing an alter-is, you are jamming him up in the bank, you see? Just go on the basic principles of what the GPM is. So the more you alter-is what your intention is here – your intention is to find the guy's goal – and the more you depart from that, why, the unhappier the pc gets.

Now, it's when the pc begins to realize that you can read a meter, you're not leaving him hanging, or her hanging in midair, you know. "Do you have a present time problem?" The pc is about to say, "Yes, as a matter of fact I was sued for a thousand dollars today, and as a matter of fact the court is going to hold me in contempt, and let..." He's about to say something like this, you see? The pc says, "Ahhh," and the auditor says, "Do you agree that's

clean?" Pc goes into a little bit of a state of shock, see? He's been not-ised, see? TR – meter TR 4 is very poor at this point. You only have to make a few of those mistakes and the pc doesn't have any confidence in you anymore.

Now, you make him straightway. You make him, you know, calling it every time, calling it every time, right on the button, never miss a read, you know, bang-bang. Pc eventually forgets about the meter and his problems. He knows you'll take care and he'll sit back further and further and relax more and more and life is wonderful and he sure doesn't get in your road in a – in a Goals Assessment, see?

And after you've been assessing him for a day or two, and he's learned that you are to be trusted, and that sort of thing, the needle doesn't dirty up. But the more extraordinary solutions, the more meter goofs, why, the dirtier the pc's needle is going to get. That's for sure.

And after you've been doing goals on a pc for a couple of days, a couple of days, and you find out his needle is getting *worse* than it was, then that means that every time you put in the mid ruds you must have driven half of them out, see? That's it, that's it. You just miss, miss, miss, miss, miss. I mean, there isn't any argument with this. It isn't because your tone of voice is this or you're that. It's just bad metering. That's the end of it. Bad metering is what makes the needle go *bzzt-bzzt*.

All right. Enough of that berating. The point I'm trying to make here is you want to audit the right goal. That is desirable. That is productive of live thetans. That doesn't leave you in the embarrassing position of the pc all of a sudden can't use his legs and can't hear by reason of the auditing session. That doesn't leave you in the interesting position of having a pc with a siren going off hour after hour that you can't hear but he sure can.

There's no substitute for the right goal. It is thoroughly recommended.

Now, how do you find out if you've got a right goal? And I'll tell you exactly how to do a fast check on a right goal. This is an Instructor-type check, but you can pull this thing off in ten or fifteen minutes rather than make yourself look silly. There is no real reason to give a Prepcheck every five sessions, mathematically. There's no reason at all to do so. There is every reason to give a Prepcheck every time you're having trouble with the pc. That might be oftener than five sessions, and if you're that smooth it might go up to ten or twelve. You understand? Five sessions was given as an arbitrary figure, entirely and completely arbitrary, just to make sure that you did prepcheck the pc. But there's no real reason to do it oftener than is necessary, because it can amount to no auditing for the pc, and can give you a roughed-up needle because of the anxiety of the pc. And you come out the other side of the Prepcheck with a rougher needle than you start into it. See? All right.

Now, the way you do a fast check is based on the data I gave you earlier. A goal reads on itself, as itself, on it's own charge in the bank, or it doesn't read because of invalidations or evaluations. That is a true goal.

Or a goal reads because it has been invalidated, and after you have cleaned it up, it for a moment doesn't read, and then starts to read again on it's own. But the only thing that make a – can make a goal read wrong are Suppress, Suggest – Suppress because of course you don't get the – the needle action – Suppress, Suggest, Invalidate, Failed to Reveal, see? Those are

the four things. There are no others. There isn't concentrate upon a shift of attention, you see, and there aren't a whole bunch of other buttons.

Of these, only two can introduce a goal-like read. Failed to Reveal introduces a minute rock slam which is quite recognizable. But Suggest – which is Evaluate – and Invalidate can, either of them, introduce a goal-like read which is indistinguishable in size, frequency and magnitude from a true goal. Indistinguishable.

You can take a wrong goal, evaluate for the pc on it and make it go tick, tick, tick. Which after that, if you did not, if you did not check it, if it wasn't checked out well, would look like the pc's goal, and thereafter would be as wrong as a Confederate seven-dollar bill. And that's how people get on to wrong goals.

So here's a fast check that tells you whether the goal is the goal or not. You read the goal to the pc, "Bark, bark, bark," you know, and you say, "That reads." Now, a read of a goal at sensitivity 16 is never more than about a half a division. It can be cleaned up to a point where it might register a little bit more half of a division, but you are really priming, you are really pouring the petrol and alcohol into the cylinders, you know. You're not adding to its power, but it is so clean that it – nothing can stay that clean, and five minutes later it'll slump. But that is the most it reads, and it always reads with a fall. It never reads with a rise.

Now, if announced, however, against a rising needle it will cause a stick, and against a very fast rising needle will cause a slow. But in actual essence its action is a fall, a tick. And that tick is – well, you just won't see one more than – more than one and one-quarter dial divisions here, meaning about, I don't know, three-eighths of an inch. That's big, see. And the one that you will normally see, when you first see it, is about a sixteenth of an inch fall, instant fall. You say the goal, and right on the last letter of the goal, the last letter in the whole line, it'll go tick – sixteenth of an inch. That can be as small as a thirty-secondth of an inch. It can be as small as a stick, depending on how much invalidation-evaluation is on it. And if there is tremendous invalidation and evaluation on it, it cannot read at all. In other words, the true goal can be squashed right out of existence and not read.

So a false goal can be made to read with an invalidation – evaluation, and a true goal can be made not to read. Oddly enough if you invalidate a false goal enough it will cease to read again in its turn, and a real goal invalidated enough will cease – will star – start reading in its turn once more on the false reads for which you can make it go through the cycle. You can make a bad one go through the cycle of read, not read, read, not read, read, not read, just with repetitive evaluations and invalidations, don't you see? And you can – whether the goal is right or wrong it will go through those cycles.

Now, they – keep that in mind that those are the only four things that have to be remedied to make sure that a goal does read properly. You can recognize the Failed to Reveal, but you're going to use it in the check anyhow. The Suppress does not give a tick, but can make the Evaluate or the Invalidate squash out of sight so that you can't find them. So you have to use a Suppress.

So, you compose a repetitive Prepcheck which simply contains these four things and the name of the goal.

Now, I'll go through this thing fairly rapidly for you just on demonstration. You say to the pc, "All right, I'm – I'm going to give this goal a fast check, and I want to read to – the goal to you a few times and then I'm going to carefully get in the four goals middle rudiments, and then I'm going to see if the goal reads, and then I'm going to give it a fast check and then read the goal again and then we'll know for sure what that is. What do you say to that?"

And the pc says, "No, I don't want that." And you go ahead and do it.

The pc very often says he doesn't want this. You have to persuade him, say, "Wouldn't it be much better to have your mind completely at rest?" The goal is at rest, you know. The goal is "to be active," and the pc says, "No, under no circumstances do I want my mind at rest." You know.

So, you say to the pc, "To catch catfish, to catch catfish, to catch catfish. That read. Thank you very much. We are now going into the repetitive rudiments," – sensitivity 16, you see, of course – and you say, "On the goal 'to catch catfish' has anything been suppressed?" That's run repetitive, you see. And same question, same question, same question. The pc finally says, "No." And you say, "All right. I will check that on the meter." And you look at the meter and you do, and you find another read and you look back at the pc and you give him the more repetitive. And you finally get all the suppress, suppress that you can possibly get off this goal, and then you go tearing in and that suppress is good and clean. That's polished up like Dutch cleanser, see? That's bright.

So we move over then into our next one which, of course, is Suggested, and we run Suggested. "On the goal 'to catch catfish' has anything been suggested?" over and over and over until the pc says, "No." And let's check it on the meter, and you find one. You look back at the pc and you ask him again, over and over and over, until he finally says "No" again. You Check it on the meter, something like that. Anyway, this thing is eventually clean.

Similarly, you handle the word Invalidated. "Has anything been invalidated?" And you handle that till that is clean and polished. By the way, it is a very good policy at this time to be in a state of operating a meter where you miss no reads, ever, and you miss no cleans ever, see? That's optimum. In fact, it's the only way this check will work.

So you go through that; and then Failed to Reveal. And – see how that would be worded? "Is there anything you have failed to reveal?" is the best wording there. "On the goal 'to catch catfish' is there anything you have failed to reveal?" All right, let's get that all clean by repetitive, and so forth. All right. That's that. Don't bother with Careful of.

Now, let's go through this thing, and we say, "All right, I'm going to read the goal to you now, 'to catch catfish, to catch catfish, to catch catfish'." And tell the pc what's happening, see. Tell him, "Well, that reads." It possibly will if it's the real goal. "To catch catfish," three times, see, bang, that's it. You say, "All right, that's reading. Thank you. Now, I'm going to have to do a fast check of these same rudiments, and check the goal." And this is what condition you've got to get those first four repetitive questions in so that you get a no read, *pshaaaw*, right across them, you see?

All right, you do it just like this: "On the goal 'to catch catfish' has anything been suppressed, suggested, invalidated or non-revealed?" Wrong wording. "To catch catfish, to catch

catfish, to catch catfish," see? If it's not the goal, if there's no read anywhere on that line, that's it, man. But you get the trick here? Don't go puttering around picking geraniums. Don't give him any opportunity to invalidate or evaluate or breathe while you are saying that sentence. Just rip that thing right off *brrrrrrrrrrr*, see. Even omit the acknowledgment, who cares?

Ordinarily you would say, "Thank you. To catch catfish, to catch catfish, to catch catfish," see? Bang-bang-bang-bang, that's the goal. If none of those read, if none of those mid-type ruds read, and the goal read, the chances are a thousand to one that that's the goal. And if none of those read, and you, by repetitive check, had found answers, you know, your meter is active on the pc, and none of them read, and the goal didn't read, it isn't even a cousin to the right goal. And that's how you do a fast check on a goal. And you tell the pc, "Very much – thank you very much."

Actually that's about a – that's really in actual practice, that's about a fifteen, twenty, twenty-five minute fast verification of a goal. And that's the way a goal has to be verified. If a goal won't beform – perform this way, it's not the goal.

Now, you understand that if you've got a read on Invalidated, and ignore it, and read the goal, you are going to read the read for Invalidated, and it will be just exactly like the goal tick. If there's an Evaluate, there's a read on Suggest or Suggested, see, and there's a read on the goal, that's Suggested reading on the goal. And if the goal reads with a dirty needle, it's simply a – it's a missed withhold on the goal. The goal is – withheld it from somebody – has been withheld, that's all.

Now, that's the way the pendulum swings. And that's how you verify one of these things, and this is how you tell if it is the goal, and if it isn't the goal.

Actually, there's no arguments about this. I mean that is the way it is, you see? And you could do it that easily and that well. But remember you have to read your meter perfectly. You have to read your meter every time, and when you read off that last sentence, *brrrrr*, you have to read that without a lot of halts, or gulps.

If you read it something on this fashion, "On the goal 'to catch ... catfish,' is, ah, there – anything ... ah, that, ah, you – no, I mean, ah, that you have suggested," why, it then reads, see. You say, "No-no, no-no. I mean suppressed, excuse me." See. Well, don't be so confounded upset if you've done your TR 1 that poorly, that to be surprised if you get reads on these things when you just cleaned them because the reads just happened. The pc invalidated your reading of it or something like that, that'll now read. So now you have to go into it and you have to clean up those rudiments, see.

Now, this is what happens if you read that across the line, you got a read on some. You clean it up on a fast-check basis, see. And you clean it all up on a fast-check basis until you've got all of them, and then you don't read the goal after this until you've got them all clean on a fast-check basis, see? Then when you've got them all clean on a fast-check basis you read that goal "to catch catfish, to catch catfish, to catch catfish. Thank you." That's his goal. You see what happens there?

Now, on the actual goal, oddly enough, the read will disappear off of the goal, and appear over on the Invalidate and the Suggest. And when you take them off the Eva – Invalidate and Suggest, it will reappear on the goal.

And when you've got this thing over here – you've got a *wrong* goal reading with a read, you'll find Invalidate reads, or Suggest reads. And you take the reads off Invalidate and Suggest, clean that all up, see. What happened to the goal? Where did he go, Charley? Which way did they go? Where? Where?

That's dead easy to get a wrong goal. Don't be upset about that. You come tearing down the last summation sheet, and you've just gone across "to bully potatoes." And the pc says, "What the hell was that?" you know?

You go tearing down the line, and then you come back to it after you've nulled everything else, and you say, "Well, I've got two left in, 'to bully potatoes' and 'to soar gracefully.'" And, "To bully potatoes, to bully potatoes, to bully potatoes. That reads every time. To soar gracefully. To soar gracefully. Doesn't read, that doesn't read, now. Well, I guess we got it, ha-ha-ha, guess we got it, reads every time, 'to bully potatoes.'"

Brother, it's going to take an artist to pull that thing apart, see. Boy, that's in there because hidden is the invalidation of the pc, and what's apparent, you see, is the evaluation of the auditor. And those two things will lock against each other and you try to clean this up. First you'll get Invalidate read and then you'll get Evaluate read, and it may be lost clear back there during the assessment sometime, and pretty occluded and suppressed.

The pc said, "Well, I really want a goal at this time, and he said so, and he's a good auditor, and who am I to argue," you see, and suppressed it. And then casual inspection of this doesn't – doesn't locate it.

Then you find yourself listing a wrong goal. And then the tone arm rises and goes up to 4.5 or 5, and the needle gets very sticky, pc starts looking terribly bad, gets very ARC breaky in the sessions and the somatics are all wrong and backwards. And obviously your lines are right and your metering seems to be okay. What is it? Can't be a wrong goal because we get a read every time we say, "Has it been suggested?" Must be the right goal, you see.

"I keep asking him 'Has it been – would you suggest this as a goal,' you know, and I get a read every time, you know. And I keep telling him it's his goal, and he just – he finally has accepted it." And it does, it reads every time.

Now, the funny part of it is that a heavily invalidated goal will read better than a real one, because it doesn't blur out. It doesn't have nasty tricks. It doesn't fade and dull things like that. It just keeps on going bang-bang-bang every time, a thirty-second of an inch. Never varies, nothing does anything to it except the second you pull the invalidation – no goal.

All right, there's one more thing I could say about it, is that a goal, routinely and normally, fades out when the rudiments go out, and comes back in when you get the rudiments in.

Now, when during listing a goal starts to disappear is very hard to say, but it probably isn't until the last three-quarters that it's totally gone and then the read is still detectable at the

end of the lines. But an awful lot of listing has to be done before that goal goes so that you can't check it anymore. And it never starts reading early and latent and other screwball things. If the goal starts to read screwball, it isn't the goal.

The real goal, when the rudiments – the four I just gave you – are cleaner than a wolf's tooth, fires every time, fires every time except at a very fast rise, because the impulse of the fire, you see, merely gives it a tiny slow and you might not see that tiny slow. If you've got a fast rising needle you won't see this every time. But every time the needle can be influenced by the goal, and not a fast rise, you'll get that *snap, snap, snap*. It's just marvelous to watch one of the things fire.

If you want to know what a goal looks like, and if you want to get very, very critical and investigate it very thoroughly, get ahold of somebody and pick up the goals list, take a goal at random and say, "Which one do you favor on this sheet?"

And the fellow looks at it and finally says, "Well actually, to kiss blonds, you know."

"Well, that isn't actually your type of goal. I know by experience. Actually, here is a goal here 'to whistle at men.' Now, that's really – I think that's a better goal. Let's put you on the meter here for a moment, 'to whistle at men,' 'to whistle at men,' to – it reads every time – 'to whistle at men' – reads, reads, reads, every time, you know – 'to whistle at men.'"

Then you can sit back and just by the hour say "To whistle at men, to whistle at men, to whistle at men." You will get exactly what a goal looks like. And until you suddenly turn around to the pc and say, "Has anything been suggested on this goal?"

And he'll say, "Yes, damn it, so and so, and so, and so."

"Anything been invalidated?"

"Yes, I said to myself every time, It cant be." You see, and yap, yap, yap, yap, yap, yap, yap, you get it all cleaned up, and so forth.

And you say, "To whistle at men, whistle at men, whistle at men." There's nothing. You can make any goal read.

If you want to know what a goal looks like reading every time just invalidate the hell out of somebody's offbeat goal, and you'll see a goal read. Interesting, isn't it.

All right, well, that's 3GA. You want to continue your list until the ticks you're getting are about the size – and if you do continue a list that long hit it at sensitivity 16 for the whole list. If you can get a list that long first crack out of the box, or if you've been adding to a list that's been well nulled, and that sort of thing, do all the rest of it at sensitivity 16 because you won't get any other reads if the list is that limp.

And I'd say a list done as I've been telling you, and so forth, listed completely should be thoroughly, completely and all of it done at sensitivity 16 now. I know of no other immediate changes.

Okay? Thank you.

Good night.

ROUTINE 3GA DATA

A lecture given on
26 July 1962

Thank you.

What's the date?

Audience: 26th.

Male voice: June 9th. [laughter]

Thank you! All right. July 26, AD 12, Saint Hill Special Briefing Course, lecture number one.

I'm going to talk to you about 3GA. Now, don't consider this a summary lecture about 3GA, it's a data lecture. The last two I gave you were data lectures. The basic summary lecture on 3GA was given some little time ago, and most of the data in it still applies, there have been a few changes based upon the usual reason. [laughter] Yeah, it's tough!

I don't give you unusual solutions, I keep taking solutions out. *Dianetics: Modern Science* – oh, no, it was *Dianetics: Evolution of a Science*, talks about the introduction of an arbitrary. Every time you introduce an arbitrary into an action, you inevitably will develop a little confusion around that arbitrary. This is a law.

Governments basically and originally started getting in trouble with me by the number of arbitraries they can introduce. The number of government employees and that sort of thing, the tremendous expansion of units and agencies and finally, the final asininity, "the man in Whitehall knows best," all of these things come out of just one thing: People have introduced arbitrary after arbitrary after arbitrary. And it is very difficult to avoid the introduction of arbitraries, because people demand them of you, constantly and continuously.

HCA/HPA – a practice, not your type of practice but the handling of Academy courses, has just been changed. Too many arbitraries have been introduced into it, and a person couldn't get his HPA/HCA Certificate until he had done an extension course, and – took him a year – and until this and until that, until the other thing, and it was sixteen weeks, and after that they retreaded, and on and on. There were all kinds of reasons why you couldn't make an auditor. That's all they added up to.

They were an effort, however, to get people to complete their courses and know their business. But why, then, did we have to start introducing regulations? It must have been that the instruction of Academy courses was deficient. So we introduced regulations, you see, to

make the Academy course more efficient. And then, having introduced these, we introduce a few more. And then we have some demands from somebody for a clarification and a ruling. So we introduce a few more regulations. And then somebody else has a problem, and we solve that for them in the line of training, or the Academy, you see. And we have a few more arbitraries introduced, until all of a sudden we can't make auditors. I mean, that's the final culmination of the introduction of that many arbitraries.

Now, let me show you exactly how this occurs as a cycle: I swept these away a few days ago by the issuance of a policy letter that said there would be no limit on the number of weeks that a person would be in an Academy course. In other words, I wanted to make auditors – that was the main thing. Let's make auditors – that was the main point. And that it wouldn't be this many weeks or that many weeks; and that there would be no extension course, you see, not make it necessary, before they get any upper-grade training, that they have to have completed their extension course or – and if they complete that, validation seal, something like that.

But let's not make that a condition for a professional certificate and then stop people from being certified, you see? Let's fix it up so that a person goes through – this was made possible, by the way, by the simplification of what we are doing these days with auditing – and a person should be able to go through and at the end of the time he knows his business, he can pass his examinations and so forth, and he is at that moment given his certificate. Yeah, that's the way it ought to be.

Well, I streamlined it all down to that, by simply saying there would be no limit on the number of weeks and no arbitraries about their certificate. The person would be examined and be issued his certificate.

Well, I said, "That's a job well done. We've got our material now, our technical material is sufficiently simple that – so forth. A person can push in some sort of a job on this, and without getting people into too much trouble; and a lot of complexities dropped out of it. That's fine."

I dusted my hands off, feeling very, very complacent about the whole thing, and I was walking around happy as a clam this afternoon. And I walked into the telex office and here sat Peter, sitting there, hair streaming down in his eyes, pounding madly away on the telex machine answering a despatch from London. Well, actually, Peter knew better than to show me this despatch, and I probably never would have known about it if I hadn't gone in and actually started looking over his shoulder wanting to see him about something else. Such as "Who has just dug up the grounds without permission?" You know, some minor thing, see. [laughter, laughs] And I read this, and my teeth sort of fell apart and my jaw muscles became rather slack, and I quickly buttoned this up and discussed this in an intelligent fashion with Peter, but actually I was a bit stunned!

Because what was demanded was a clarification of this order and some ruling so that the order could be implemented. Went like this: I said, "that anybody would go on being consecutively trained unless they left the course, and leaving the course would be defined as two weeks." See, gone off the course for a couple of weeks, why then if they came back on the course then they could retread the course. And this applied to all old auditors who wanted to

get new material, they could retread the course for 30 percent of the cost of a professional course without discount, you see. Just 30 percent of that, and that's a retread fee, and that's all fine and that's all very simple. *I* thought it was simple, anyway.

Nope! Apparently this is not a simple problem. "What if a student leaves course with the D of T's permission? Now, is that included in the order? Now, what if he's ordered to the HGC for auditing for more than two weeks? And that would cause him, if he came back, to retread, wouldn't it? And what if he blew the course and was gone for more than two weeks, you see? Does this include blows? HGC retreads? Or people given permission to leave the course for a short while?" you see. And Peter was saying, "Well, the wording may be ambiguous, however..." And he threw the whole thing off, you know; and you know, sort of – on the basis – you know Peter, he'd say it very mildly – well sort of "To hell with it." But that was exactly what should have been said. He said this very politely.

But here you had an introduction of arbitrariness into a simple order which was an effort to take out the arbitrariness. Now we're going in and put more arbitrariness in this thing, don't you see?

Now, the reason for arbitrariness is the lack of judgment and the unwillingness to assume an initiative. Wherever we have a zone or action where we have an unwillingness to assume initiative or responsibility or take terrific judgment on the thing or to use one's judgment or judgment is poor, then we get this phenomenon of the introduction of arbitrariness.

Now, games consist of freedom and barriers. And remember that a game does consist of freedom and barriers. A lot of the chaps running around saying, "Three cheers, we're going to have a revolution!" see. This revolution which is going to come up at any moment, is going to give everybody freedom – everybody freedom. They're all going to have freedom. Yes, sir! Of course most revolutions have the kind of freedom like the fellow says, "When it comes to revolution, we have strawberries, everybody eats strawberries."

And the guy in the audience says – the guy in the audience says, "But I don't like strawberries."

And the speaker on the stand says, "When it comes to revolution, you'll like strawberries!" See, in spite of the fact that the revolution is all in favor of freedom, we still seem to have a barrier sitting there.

Actually, a game cannot exist without freedom and barriers. It must be *and barriers*. You know this old principle, we've had it around for quite a while.

Now, a game ceases to exist when you have too much freedom or too many barriers. And the trick is to keep something like a practical percentage of freedom and barriers. There must be an interrelationship of these which is compatible with a game. Otherwise we never get any action at all.

You talk about M1 and fast highways and the hundred and eighty-four-pass cloverleafs that came over Telstar's broadcast the other night. They showed a cloverleaf outside of Detroit. I don't know why they picked that particular one because there are a lot of them bigger than that and they only had one car on it. I thought it was a rather poor choice of shots but

then I guess it was just the time of day, or something like that, and the placement of the TV camera.

But if you look at those very carefully, that is a freedom of travel. And then they start putting stuff up at both sides of the road, see. And then they start putting "go slow" signs up. And then they put radar traps, see, and signs about radar traps. And then they neglect the highway and let it pit nicely, and sometimes they go so far as they did down in Texas, of putting deep dips in the road; so if anybody hit one of these dips at fifty miles an hour, or above the speed limit, you see, why all the car springs broke, and so forth. And after that the road's impassable. And then you get the total freedom of no road at all!

All you've got to do is imbalance the ratio of barriers and freedom and you get a complete hotchpotch and it's no longer a game. A country does not exist well without some laws. They form basic agreements on what they're doing, you see? And a country exists very poorly without too many – with too many laws. And of course, although perhaps just by the nature of technology, we tend to go in the political direction of anarchy – yes, that happens to be true – but of course anarchy is always something that arrives when there is no political philosophy extant in that particular time and place which is applicable or acceptable to the problems which a – the race is meeting at that particular time.

You finally get a political setup where the political solutions, called political philosophies in light moments, these political philosophies become so overwhelming as far as the individual freedom is concerned, that eventually all one can think about in the zone and area of politics is just "Let's be free of it. See, let's not have any more to do with it."

Well of course, if that took place, you would have no government at all, and by definition that's anarchy. But that's not saying all Scientologists are anarchists. But it says that's the only political philosophy that you tend to approach. But there's quite another reason why, if you thought it out very, very carefully, you would see that anarchy was a very proper and fitting target. You see anarchy has never been possible, and if every individual had judgment and good sense, there wouldn't be much reason to have any government. So a government, you see, is a substitute for judgment and responsibility. The more government you have, why, the heavier criticism it is of a people's initiative, judgment and responsibility.

You're operating in a political area which says, "The man in Whitehall knows best, " you see, that type of philosophy. Or you should have the commissar within call at any moment to know whether or not you dare talk to your neighbor across the back fence, you see, as they have in Russia. This type of philosophy rather dims out initiative and rather dims out judgment and rather ruins one's sense of responsibility. And that's a poor thing – extremely poor thing.

So when we – when we have an absence of this, you see, when you have an absence of restrictions, in a business or social or scientific group, and yet the people involved with that group are individually politically involved with a system which denies them responsibility and judgment, don't you see, they start taking it out on you to some degree. So you get a telex saying "What is the meaning – what is the meaning of this policy letter which says students should be trained to become auditors and left on course until they are auditors, but what is 'off course'?" I knew that would be asked, you see. And well, "off course" is anybody who's gone

for two weeks, you see. And that just served then as a wide-open invitation to introduce all manner of arbitrariness. We promptly got an invitation for more arbitrariness. "Please give us more arbitrariness."

Well, I sometimes almost explode under situations like this and I say, "All right, what have we got a D of T for?" See, "What's he doing?"

First place, I certainly should never be expected to lay down a regulation on students who blow. What? Lay a regulation down on... Because – why? Why? God's sakes! Somebody has just goofed, man! Somebody has just missed all the withholds in the book, don't you see? And then some D of T didn't get that shepherd's crook of old, and reach, snare and yank. Well, all of this is to me quite self – evident. And I – wow! See? Wow! And – you've – I'm sure have heard me protest, somebody – I say, "Well all you do is, you just ask the guy – you just ask the guy how he's doing; how he's getting on, you know? Just ask the guy, and so forth, and that's sufficient."

And somebody always comes up, and says, "What words do you use?" You know? It leaves me speechless! See. "What words do you use?"

I don't know. And I'm sucker enough occasionally to say, "Well, say 'How are you doing?'" [laughter] And, see, and after that, wow! You've had it.

You go by and somebody's running the session, and he says – and it's running like this: And he's saying, "Do birds fly?" or whatever it is, "Do birds fly? How are you doing? Do birds fly? How are you doing? Do birds fly? How are you doing?" And then some people have been known to come around to me afterwards and say, "Look at this horrible thing you have just put out!" See? "Look at this horrible thing you are doing there. Look at that auditor, and look at what that auditor's doing! "

"What's he doing?"

"Well, he's saying, 'Do birds fly? How are you doing? Do birds fly? How are you doing? Do bird.. .'and it doesn't make any sense!"

Well, I have been in the process of stripping off arbitrariness ever since we've been going forward. And to a lot of people anchored down and conditioned to a changing and a senselessly changing world, and so forth, see it as changes. It's strictly not changes; it's a continuous series of omissions. Not omissions on the standpoint of omissions, but things are dropping out all the way along the line. The track of Scientology looks like some old Model T Ford has passed by. The nuts and bolts are strewn all over the highway.

You – to show you what sort of a job I'm doing in this direction – you just pick up a list of bulletins that are for four years ago. And just count the number of nuts and bolts that have been taken off the machine. And look at it that way, not "How many things have been changed?" How many nuts and bolts have been found unnecessary for the explanation and running of this machine? Because we get down to more fundamental actions. We're always working with a more fundamental action. And the more fundamental it is, the less nuts and bolts you need to hold it together. That's for sure.

Now, we've just stripped one out of the rudiments – the beginning rudiments. Get along without it fine. There it is, see. And frankly, if an auditor is having a hard time reading an E-Meter and is throwing the pc out of session, he's frankly better off to say to the pc who can't be put in-session, he's better off to say, "Start of session," you see, and start doing some action that he is doing, but only those actions which require no metering can be done this way. That's an unfortunate fact. In other words, you could say to somebody, "Start of session," you see, and just start doing what you're doing. But unfortunately no metering action can be performed in that type of session.

So you could possibly – you could list goals in that type of session, or you could list items. You couldn't do much of anything else in that type of session. Well, of course it's quite adventurous running a session without any rudiments in, but let's look at the practicalities of the thing. Instead of the rudiments going in, if we're introducing a lot of new arbitraries into the session under the guise of rudiments – you see, a misread here and cleaning a clean there and that sort of thing – if that many arbitraries are being introduced into the session left and right, of course the pc's going to go further and further out of session.

Now, actually, the more actions and the more arbitraries are introduced by the auditor into whatever he is doing, the less he gets done.

Let's take some auditor, he runs along for a very short time and then he decides the pc looks bored and so he runs some O/W, you see. And he runs a few commands of O/W, the pc looks less bored, looks kind of resentful now, and he says, "Well let's go on and list a little while longer now," and looks at the pc and then the pc's sitting there and just about getting interested in listing again, or something like that, and the auditor looks up, and he says, "I think I'd better run some Change of Space on you." And he does. And he thought the pc was getting too introverted. And then he got down toward the end of session, you see – down toward the end of session, and he says, "Well now, you've been outflowing the whole session, and I just had a good idea here, and let's inflow a little while. So I'm going to tell you everything I've been thinking about during the session." See, that's before he ends the session. So he tells him all the criticisms he thought of the pc during the session, see, and then he ends the session.

Now, the odd part of this is that you go over all of these introduced arbitraries and that's all you're going to find hanging up in the session. Isn't that interesting? That is on a raw – meat pc, too. That's not a trained pc, or somebody who's used to being audited or anything. You take your meter and you find all the places where he tends to be stuck in the session he just had, and each one of them will coincide with the introduction of an arbitrary.

Now, Model Session is designed to repetitively introduce an arbitrary so that even the arbitrary runs itself out. We always ask, "Do you have a present time problem?" exactly that same place in the session, don't you see? Well, actually just asking it every session tends to run it out. But how about sessions which have wild variations in them all over the place? Well, they don't run out, that's all. You'll find the only place pcs hang up is on the introduction of an unnecessary arbitrary – unnecessary arbitrary.

Remember, games consist of freedom and barriers. There're a certain number of barriers have to be introduced, or you're not even going to get the pc to sit in the chair long enough to be audited.

For instance, some of you – not after you've been here for a little while – but some of you when you first come here and get audited in the goldfish bowl on rudiments and that sort of thing, would just love the arbitrary of a wall to keep out the sessions to the left and right. See, that would be lovely. Well, barriers have advantages, you see, as well as – frankly, you give people too many barriers and they will do nothing but fight barriers. But remember they can fight barriers to a point where they have no game of any kind – no action of any kind. There are no activities.

Now, your barriers, if kept to a minimum, and if they are stripped down to the point where they are necessary barriers, vital barriers, without which we're not going to have anything at all – if we can strip down toward that minimum, and then not expand it out toward vast numbers of unneeded arbitraries, why we will have a rather effective and efficient session. You see, that session has got to have some arbitraries, see, there's the arbitrary of knowing the English language if you're being audited in English. There's various little arbitraries set up around a session. But we start deleting too many of those arbitraries, we don't have a session, you see. Well similarly, if we add too many arbitraries we don't have a session. Same thing happens. What we're seeking in the form of a session is a rather optimum balance between the freedom of the pc and the arbitraries entered into the session. And if we can get that into a nice, balanced ratio, we're fine.

Now, I told you the other day – the other evening, that a pc got along all right, but that in – unless he was faced with an auditor who was too slavishly following rote or was neglecting it utterly, there would be three conditions. Either the auditor would so slavishly follow rote that nothing would happen, or the auditor had so much freedom that nothing got followed. Now, there's a third Condition where the auditor introduced so many arbitraries that Lord knows what the pc was now in. Any of those three conditions could obtain. We're seeking a happy balance of these conditions.

But the auditor could be far too fixed, too slavish in going ahead and doing what he's doing. Let's look at the type of impasse that an auditor could get into by being absolutely knuckleheaded. This is very important to 3GA. It's not so much a lecture on auditing as it is 3GA, because when you get into anything like 3GA, man, any weakness along the line peaks. It looks like a signboard. Before it looked like about the size of a blade of grass, but now it's one of these big gaudy signboards with a naked girl bathing on it, you know?

And here's your situation. Auditor starts his session, glances at the needle, and it's going *bzzzzzzzzzz!* Well, he says, "Well, I have to get in rudiments one, two and three." So, he asks rudiment one. And the immediate response is, on the needle, throughout the whole enunciation of "Are you willing to talk to me about your difficulties?" – rudiment one is goals, the effective rudiment – is *bzzzzzzzz!* [laughter]

So the auditor says, "That read was equivocal." [laughter]

And by God, I think he'd come around after the session and ask me – if he would go this fixedly – ask me to introduce a new arbitrary as to how many times should you ask a

question when you're getting an equivocal read before abandoning it? And expect me to say "five and a half."

You see, he shouldn't have been asking it at all anyhow. That's the whole thing. He should have enough judgment to know damn well that he isn't going to be able to sort anything out on this meter. See, he – you could run into this. This would be very rare, but wow! Well, the best thing to do at a time like that, you see, best thing to do at a time like that would be to lay the meter aside – this is an unusable instrument at this moment – and let's just run some O/W. You see, you do have a solution. Let's treat the thing as the pc must be sick, see, or something like that.

And we run some O/W, and the pc says he feels better now, and – or feels disgusted, or something, we don't care what the pc said, but the pc feels different. That's what we're looking for. Let's put him back on the meter, and if this thing is still going *bzzzzzz*, which it won't be, it'll be doing something else, now. Maybe be totally stuck, or something. We can at least ask him the random rudiment because all dirty needles are basically missed withholds. But let's not be so knuckleheaded as to ask him the random rudiment if it is a random rudiment that he has never been able to answer. You get the idea? He's never been able to answer this particular random rudiment, he always has trouble with it, see. He gets into arguments with this thing, or he gives motivators all the time, well let's be smart enough to run a rudiment which still gets off the missed withhold.

I was into this situation the other night in an auditing session, and I had to phrase, before I was finally finished up – I had to phrase the missed withhold question about five different ways, treated as a rudiment in the middle of the 3GA run, until finally the penny dropped and that was it. And that needle quieted down. But the pc had a missed withhold but I just couldn't get the missed withhold question answered so that the missed withhold came off. You understand? So it was a matter of bad luck. The first four times I asked the missed withhold question – the first four times – obviously were wrong! I got them all answered. What – I got what I asked answered, but they obviously were the wrong missed withhold questions. There was a wrong wording or the wrong phrasing or the wrong something. But let's get the slight difference here.

The old man was in here puppy to the root. He knew if he – in order to go on nailing a goals list, and go on nulling goals, he jolly well had to have a clean needle. So he wasn't saying, "All right, we'll cancel out – we'll GAE the pc." See, we won't do that. Well just sit here, all night if necessary, and slug this needle out of the road till we get it, see. Now, I carefully settled such things as, "Is there anything you have done that people have failed to find out about?" – you couldn't read the needle anyhow – until I got a response from the pc and was able finally to check this out somehow in some haphazard fashion, and – but I wasn't letting go of any missed withholds, you see. Who had missed this withhold? That was the thing. Who had missed the withhold?

And I was cheered up by a little success, as I went along on this, by this interesting phenomenon of a half-a-dial-wide rock slam turning on occasionally, just for a moment. Brr! "No, I don't have any missed withhold," no read on the meter, either, except *bzzzzzz!* So finally, finally I found out it was other people and that they didn't know. It wasn't that they

missed a withhold, see, that was different, yeah. That was different, see. God knows why it was different, but it was! And just other people didn't know. So that was that.

And at that moment, the needle started to sweep, up and down and around. Beautifully readable, and I went on about my business and got us some nulling done, see. But that, you might have said, was a slugfest. I was unwilling to settle for nothing, see. My job was to null a list. First to make the pc feel better, which I had to do – cured a half a dozen chronic somatics and that sort of thing, some mild job, see. Get in there, null a list. How the hell could you null a list with a dirty needle? You couldn't. I tried, thinking it would – you know, it sometimes is just lack of auditing. All right, I got in there, thinking, "Well, we're going to get some auditing here, and the dirty needle will clean up, you know, ha-ha." No. No.

Then all of a sudden I said, "Well, we can't go on with this any further." I went through this kind of a system, and this is – be an interesting system for you and it's quite useful. First ask the pc – now 3GA, you see, has its problems. I should have told you, the problems of 3GA is reading a meter – and ask the pc, "What's going on?" That's number one – first action. This needle is going *bzzz-bzzz-bzzz*. "What's going on?" you say to the pc. *Something like that.* [laughter]

And then you get your middle rudiments in. You didn't do anything with that, see, that's a flop, see, he said, "Oh life is terrible and you're doing awful things to me."

Well, pursuing that particular course is not necessarily conducive to settling a free needle, see. First place, two-way comm may say two-way comm, but it's a one-question proposition, see. You go more than one question and you've had it.

For instance, somebody today should be ashamed. They were in there running the CCHs, and they were saying to the pc, apparently, I hear, "Is there any more that you wish to tell me about that? Is there any more to that? Is there any more about that?" After the pc had originated, you see. That was TR 4. TR 4 took the shape of "Is there anything more to that?" "Would you like to tell me any more about that?" see. "Good TR 4" you know, no Q-and-A, oh, nothing like that, see. In other words, the auditor never gave the character a cheery, "Aye, aye," and we were all set, see. But "Is there any more? Is there any more? Is there any more?" till the poor pc, you see, is bled white and trembling and then goes up in a small bundle of smoke.

Now, this action of two-way comm doesn't work, still got a messy needle. Your next action is get in your middle rudiments; just standard middle rudiments. And you still got a messy needle. It's hard to read through, see. Well now, you'd better roll up your sleeves and put on your judgment boots, because you can't go on, man. Now, you've just cleared "Failed to Reveal," haven't you? Just in that many words, in the middle rudiments, as well as you could clean it. You cleared it off and it didn't affect the dirty needle. Well, that doesn't vary the fact that that dirty needle now must be coming from a missed withhold of some kind or another and you better find out what it is.

Now, there's sixteen versions of a missed withhold question. And there're probably several more that you could ask cats. I'm not going to give you the categories.

What you want to know from the pc is what did he do that was criminal and sinful, that people slipped up on getting wise to, see? Is it you in the session, was it during the day, was it in the last week or so, was it now? What the hell is this thing that the pc is holding on to with all of these ski ropes and so forth that's towing him all over the bay? See? What's he got hold of? That's what you want to know. Because it's a missed withhold of some kind or another. You can count your stars on that.

Now, some pcs will answer up and all of a sudden, terrific cognition, falls off the meter, everything else, the question's hot as a pistol, and so on, "What didn't they know?" see? "Is there anything people didn't know about you today?" See, or something like that, see? Oh, that's hot as a pistol. But for some reason or other, for some reason or other, you ask him, "Is there anything you didn't tell people today that you should have?" Well, there's nothing to that. That's not the question. You got the idea? I mean, peculiar reason the piano only resonates to a very, very tiny shading of meaning.

I ran somebody one time, had she ever done anything to X? Had she ever done anything to X? Had she ever done anything to X? Nothing. Nothing. Nothing. You know, "Didn't wipe the dinner dishes completely dry before putting them on the table." You know, big overts. Big overts. Man, this is colossal, see?

So I got tired of this pat-a-cake, you know, and I said, "Well, have you ever done anything that X didn't find out about?"

"Oh, well, yes. Put down things on the expense account slightly, you know, altered the household budget two cents here and there," and that's about the limpest nowhere I ever saw. I could get no needle reaction, you understand.

And finally I said, "All right. Is there anything you have done that X never knew about at the time?"

And it went *bang!* See?

"Oh, well yes," see, and equivalent of affairs, and you know, bank robbery, and sinking steamers on the high seas, and all of this sort of thing, and it was just that shade of question; that rang the bell. And it came under the heading of "didn't know." See. He didn't know. Well, "found out," that was different. Don't ask me why "found out" is different from "not-know," but to this pc it was that wildly different. And it was that sort of thing that finally settled up this case and got this case firing, got some tone arm action going, and that sort of thing. Case just did not respond to the exact question that one would normally would have thrown.

You'd said, "Since you have been living with X, is there anything that you have failed to reveal?" No reaction. But, "Since you have been living with X, is there anything X didn't know about?" Oh, man! Volcanic action. See, but on the same question, "Is there..." – "Since you've been living with X, is there anything that X didn't find out?" No action at all. You tell me, you see. What you're into there is a very thin shading of semantics. And the pc in an almost childlike daze reactively hides behind some of the thinnest little excuses.

But remember, my job as the auditor was to get the needle cleaned up. That was my job as the auditor. And if everything I was supposed to do, usual, natural and normal that

we're doing today, just as you are doing, didn't finally accomplish this action, then I had to assume that there was some shading of meaning, there was something we just weren't getting at here, man, and start drilling away on it.

There's something I certainly didn't know. Certainly there was something going on here I didn't know about. Now, what's going on can take in the wildest and widest of horizons. Of course, the goal you're trying to prove out may be the very, very wrongest goal you ever heard of on the pc, at which time he'll get very withholdy and his needle will go very dirty, and then you find yourself in the silly, silly position of trying to pull missed withholds from the guy – the missed withhold is something he knows reactively but does not know. It is not his goal.

And he sits right there and he says, "It's my goal," and so forth, and "Yes," they're very happy to have the thing checked out and so on. And, "But what are you doing? yak-yak." And all of a sudden natter-natter and scream-scream, and "I think I'm going to blow course tomorrow because I'm just not ever going to be audited again. Auditing is – I'm finished. There's going to be – no more. I just don't want any more of any kind," you see? And yap-yap-yap, and it doesn't matter what the auditor does, the needle's unreadable, everything's going to hell, yeah, there's a missed withhold there, but the pc doesn't know it, and you couldn't dig it up except by actually checking out a hundred percent the whole problem of goals with this pc, see. That's your answer to the situation.

But it might be – you see, this is where you're hung as an auditor and where you've got to use some judgment – it might be that during the noon hour they were mad at you at the thought that you – they were – see, you already got missed withholds, see. It's the little missed withholds – and they took your lunch kit, see, and threw it on the floor. See, it might be that one, too, see? You get the idea? You see what you're into here?

You're sorting through the human jungle called the reactive mind. And in sorting through that jungle you are fortunate in having the keys, the maps, you know the blazes on the trees, but remember there are conditions here where the same white blaze occurs simultaneously on twenty different types of trees. You've got a missed withhold which is the guy's goal is wrong, but he doesn't know it, and you don't know it, and the thing is reading on an invalidation only, that the lines are wrong or that his goal has already been nulled out early on the list! He knows that reactively, see. It was his goal. There it went. [laughter, laughs]

He doesn't know it! There isn't anything under the sun would tell you that was his goal! You just did a little sloppy piece of metering or something, or maybe your rudiments weren't in at the beginning of session, and the goal just before it, something like this happened: you looked up and sounded rather interested or amused on the goal just before his goal. You get the idea? It was, "to lick pots and pans of old fudge" or something like that, you know, and you looked at this and you sort of – you know, and he says, "What the hell is he doing that for?" you know? [laughter] And the meter's inoperative for the next couple of goals. And the time he wakes up on down the line someplace, he says, "I wonder what page we're on. What page are we on?" you know, reactively sort of, "What page are we on? What..." He's sort of reactively listening for "to catch catfish" and it doesn't come up, see?

Sometimes he'll want to look through the goals list, you know? "X!" See, he'll just see that, down deep someplace. And after that it's chop-chop-chop, *nyat-nyat-nyat*, yap-yap-yap.

Now, he doesn't know what happened, you don't know what happened, you've got a dirty needle, and you go ahead slavishly trying to clear, "Have I missed a withhold on you?" see. "What have you done?" you are saying, see? "What have you done that I haven't found out about?" He hasn't done a thing! [laughter] And it can't of course be cleared. You missed his goal. Of course you don't find that out till next month, or something like that, see, when the data does you no good whatsoever.

Well, there are several trees have the same white blaze. There is no substitute for good metering, there's no substitute for being alert all the way along the line, and there's also no substitute for using your ruddy 'ead once in a while. See, I can give you – I can – I can fill your arms full of charts and stuff your pockets full of good compasses, and things like this, and give you little playing records of witty sayings for the session and ways to open the pet-cock and drain the oil out of the pc. Give you all sorts – give you lube charts of his mental machinery. But please, I think you're asking too much, too much, you see, to absolve you of any sense of any kind whatsoever. And that I've always steadfastly refused to do. Even if my goal were – and it isn't – to overwhump you, I wouldn't.

Here's the point. We're already along a line, you see, of your doing what Ron says, you see. We're already along that line fine, very heavily. And that became necessary through such randomness that nobody in the world was getting audited, don't you see? But that came into being there, all right. Now, let's not push that forward through to the final hilt of saying, "Thou must never have any initiative." Let's be worse than that. Let's say, that – let's not cook up things of "This is a sin and blasphemy since one is having an idea," see. Let's not get that corny, see. We're not – these aren't the days of Buddha.

Here's the final word on the thing. Yes, there is a way. And frankly, if you put your very best efforts to it, and work like mad, with the sweat held – you have to have rain gutters across above your eyebrows to channel the sweat off – for years and years and years, you would eventually, possibly, have come up with just about what we've got. Because it's been continuously monitored, not by my inventions, but by my observations, both of human behavior, the human mind, and the activities of people doing things with these items.

Now, I'll probably have to run some of that out as invalidation later. But anyhow – of me! But the point, the point I'm making here, is you get too slavish an adherence and you will commit as grave a sin as introducing too many arbitraries and too many barriers. Or introducing none in some wild burst of imagined freedom, and your pc practically spins in.

Now, I'm not trying to give you a distrust of what you're doing. I'm merely saying that in 3GA, you're confronting a pc. You've got a pc in front of you, you're auditing the pc who is in front of you. Now, there are various exact, textbook reasons why this pc misacts the way he does. These have been ferreted out, and someday you'll come to the knowledge that these are.

You'll know that definitely. And now let's come to a further action, and we don't use our good sense in handling of this situation, believe me, you'll get no auditing done. You see, there are various directions you can go, and one of them is too fixed a fixedness, and you can become a complete idiot this way. Just completely idiotic.

We say to the pc, "Start of session." See, well that's fine, we're getting him all ready, and he's going into session and so forth. He keeps vomiting, you see, but we're not paying attention to that. And we say, "Are you willing to talk to me about your difficulties?" you know, and he vomits a bit more, and so forth. [laughter]

And we get very upset and cross with the pc because he won't hold still long enough to see if he's willing to talk to us about our difficulties. You get what I mean? You see it's just stupid.

All right, similarly, pc sits down, looks at us very gloweringly, and we say, "Well I shouldn't inquire too deeply into this pc's past because he looks dangerous." Now, the best thing to do with this pc is to just open up the session, not do any rudiments because they do contain this withhold question, and let's keep out of all the trouble we can keep into, and now let's go into an auditing session, and let's omit Prepchecking on this pc, because we really want to get 3GA done, you see? Well, that's way too wide. At that moment you would have had it.

In the first place, the pc isn't in-session, isn't going to give us any data, isn't going to as-is anything; it's all going up in a balloon, and you're operating across continuous piling up missed withholds, and you're lucky if you can get out of it with your life, man! You get the idea?

All right, but then, let's have this other situation – have this other situation, see. That's total freedom, the one I just gave you. And let's get the other situation of where just to make sure he's in-session, let's put in fifteen or twenty extra beginning rudiments. Let's – we know that his mother has violently opposed to his having processing. So every session before we get into the body of the session, let's ask him a rudiment about how his mother is.

Even the rawest-meat pc would begin to realize that a bunch of arbitraries were going here. Who wouldn't? But the pc wouldn't look good. Just the pc would look worse and worse, and get worse and worse, because man, he's being run into practically every present time problem he ever heard of, don't you see, before he is brought to the body of the session. He just can't quite concentrate by the time he gets to the body of the session. So you wouldn't get anything done either.

You can also startle pcs. You can decide that we should run several extra middle rudiments. See, middle rudiments are working all right, they're cleaning up things when they're used. Let's run in several extra middle rudiments. We found out that the pc has a tendency to repress a cough. So, irrespective of the pc's coughing, well, let's introduce a middle rudiment, asking specifically, after we say "careful of," that "Have you suppressed a cough in this session?" See, let's get that going, and let's get several others going, and let's have some fancy curves in here of some kind or another. And finally the whole body of the session is taken up with middle rudiments, you know? Because you never seem to be able to clear, "Have you suppressed – in this session have you suppressed a cough?" That's the one that's giving us trouble, you see? Because the guy says, "*K-Humm...*," you see, and you say, "That read." [laughter]

Just doesn't ever seem to clean up. And we find out when we're auditing him on the full – the whole track that he has a button called "cough," and you fin – you'd find out it's

funny, every time you say "cough" to him he'll cough, you know. Cough-cough, cough-cough. It's very interesting. Very amusing. We find out he's also coughing as a thetan, which is very interesting. We never seem to get that one in, but we tried. Too many wild variables.

Now, it's amongst this tangled brier patch that we walk in order to get somebody's list of goals and get somebody's list done on the goal that is found, and so on, it's our job to get the auditing done. Now, the best way to get it done is the Model Session you've got right here, according to various findings. And your middle ruds are pretty good. But I can, and am going to, slightly change their sequence to give you just a little more of the stuff you're asking for, don't you see? Just slightly change that. I have no reason to publish it at the moment. But it's just all in the interest of let's make it nicely – let's get it good and patterned, and then we're not upsetting the pc by giving him something unexpected every two minutes, and let's get it nice and patterned, and let's adhere to that pattern, and let's do a minimum of rudiments and a maximum of auditing in any session. But let's not do such a minimum of rudiments that we have the pc out of session while we're doing the auditing. Do you see the nice balance there? Well, that is only furnished by an auditor's judgment.

There is no substitute for an auditor taking responsibility for his pc. There is no substitute whatsoever for an auditor using his initiative. And there's also no substitute of any kind for an auditor, basically, getting results – there's no substitute for that. And if I could invent something that you would say to a pc, and wouldn't require any barriers of any kind whatsoever, and you just said "Boojum boojum boojum" three times to the pc like that, and the pc was instantly cleared, and you didn't even have to say it in a sudden tone of voice or anything else, you could say one word "Boojum" and the next word "Boojum," it wouldn't matter, and so forth, why you'd be all set. But unfortunately this small fact stands in your road of that: is pcs don't go Clear when you say "Boojum boojum boojum" to them. It takes a Model Session, it takes very accurate reading of the meter, and it takes a very set pattern that has been piloted through with vast ardour, and is a rather narrow road, actually. At the same time I think a narrow road can be followed so as to pitch over the edge of the nearest cliff, you see. And it can also be followed rather easily and comfortably. But even a mule has to have some judgment to go up one.

It's bad judgment to introduce too many arbitraries, it's bad judgment to put in too much freedom, and it's also very bad judgment to be so damn fixed to what you're doing that you never look up and find what has to be done in the session, see? Your auditing actually becomes a happy mean amongst those things. And if you do that well, why you'll really get there. You'll really make Clears.

We've got several people coming up to Clear this minute. And isn't it interesting that the people who are coming up toward Clear and so forth are being audited by the auditors who do the best Model Session and best reading of the meters. I don't think it's any coincidence at all. It'll inevitably be that way.

But I'm also saying that in those sessions where people are going in that direction and coming up to Clear, there must have been a little judgment sitting there in the auditor's chair. Do you follow that?

All right. So there is the razor edge we walk. And that razor edge of course spells success.

Thank you.

PREPCHECKING WITH MID RUD BUTTONS

A lecture given on
26 July 1962

Well, now, we still I think – what date do we still have?

Audience: Twenty-sixth.

Oh, you're still here on the 26th! Hey! Twenty-sixth July AD 12, second lecture. Saint Hill Briefing Course. The subject of this lecture is *prrrrrrrrepchecking. Prrrepchecking.*

It goes without saying that everything that you are working on – I refuse to leave any errors in it just to appear right.

In other words that's a peculiarity I have and you'll just have to put up with it. Most scientists get enamored with an idea and they have so few – [laughter, laughs] they spend the rest of their lives trying to prove it. And were they to change their minds concerning this, they would of course lose in repute. I don't consider that repute is more important than getting the job done.

I don't care what you think of my repute, I'm going to go on being honest. When I find something wrong, why, I jolly well reserve the right to say so. And when I have been wrong I have uniformly been the first to tell you. When something can be improved and make the job easier for you I don't care what it invalidates, I'm going to tell you.

Now, there's a certain amount of effort spent in the direction of trying to force me over into the other position. Every once in a while I get blamed for not having invented Scientology in the last lifetime. Somebody comes along and says, "Well, why on earth didn't you tell us about missed withholds back in 1952?" You see?

All right, if I had known about missed withholds in 1952 I would have told you. It's as simple as that.

You see, don't ever assume that I am dealing you data off a stacked deck which has been in existence for Lord knows when. Although this data existed at one time or another on the track – and I don't mean the whole body of the data – the various data and postulates were made up to remedy and solve things as people went along the track, packaging it up in one piece and so forth, just – well, let me put it this way – hasn't been customary.

And a thetan got the way he is because of the introductions of arbitraries and when you find out you are dealing with a few more arbitraries than you have to, well, the thing to do is to throw them away. That's the proper thing to do. You say, "There's more arbitraries than we need so let's dispense with them." And any time I can get two procedures to do a job that was formerly being done by fifty, well I for sure will give you the two procedures.

And if I can find two jobs that could be done with one procedure, I'll sure throw one of those procedures away. That's the only sensible way to look at it. And I've just found a way to use middle rudiments and make them double in brass and get the job done much better in Prepchecking which is quite remarkable. And this is very embarrassing because I have just gotten out two policy letters giving you canned Prepchecks! All right, if I had wanted to appear the big man and "I'm always right," you know, *right*, right, exclamation point, right, and so forth, I would of course have to suppress this data because data which is slightly more complicated was just released at the beginning of the week. That would be good for my reputation but it's sure hard as hell on you as an auditor and a pc, you see. So I don't subscribe to that policy.

Now, the middle rudiments were carefully sorted out of a tremendous number of buttons which could have been used. Now oddly enough you could add another fifteen or twenty buttons with the greatest of ease and have your middle rudiments maybe twenty-three or twenty-four items long. And what you'd do – this is probably the way the session would go – in any two-hour session, you'd get in your beginning rudiments; you would ask one Prepcheck question and then, to check the thing, you'd spend the remainder of the body of the session and then, if the original Prepcheck question that you asked in the session were found to be alive, you wouldn't have any time left, of course, to clean it, so you'd have to leave it that way, so that you can get into your end rudiments.

This doesn't appear to me to be very efficient. So I've carefully taken out all the stuff we knew and so forth, and believe me a tremendous amounts of stuff have accumulated as far as data is concerned. You know this research line is only something on the order of about, I think it's about thirty-two years old right now and the most concentrated part of the area is about fifteen years; and to rack up this much data and cover this much territory in a measly fifteen years, particularly regarded from a whole track viewpoint, is not only incredible, it's impossible.

There's been a certain amount of rush on it and so forth, but basically it's just working on it that has been important and working on it without any pitch. You see there's no pitch. I am not working for the Intergalactic Survey, you see, or something like that: "Come to Earth to civilize the natives," you know or something like that. That arbitrary we can delete.

That doesn't mean that I am not connected with the Intergalactic government, you see. But they don't know about it either yet! [laughs, laughter]

I have my name, rank and serial number just like other people. But that's very funny: hardly anybody can ever clear – "Have you ever worked under an assumed name?" Clang! "Yeah, what?" And I have to answer, you see, and I keep giving this thing – I keep giving this thing – I keep giving this thing – and it always gets cleared any time I get that Prepcheck

question. Very, very funny. People wonder why it doesn't clear. Well, it doesn't clear because it is true! It goes on and on and on and on and on, you see? It's present time.

Now, we look over this situation and we had all this bushel basket load of buttons in the human mind. You've seen them, a lot of principal ones in the Chart of Attitudes, a lot of other areas of data and so forth. There's various buttons that you can push and frankly although they were announced and given to you very softly and very quietly, the middle rudiments are an assembly and a stripdown of buttons based on this fact: They consist of – when you add the word *suggest*, which is used in your Prepchecks – they consist of just those things which can keep one of the others from reading and which, if present, can keep a goal or item from reading. That is the whole assembly.

Well, this makes them pretty powerful buttons.

Let's take a look at them. There's *Suppress*. Now if you got all the suppress off the case, nearly everything would blow, don't you see? If Suppress is alive, of course you don't get a read on the remainder. So just as a rule and law you've got to run Suppress before you add in another series of anything. That's the law, that's the rule. You've got to put in Suppress. By getting off suppress then you will get a read on the remainder.

Now Suggest could be translated – and sometimes, by the way, has to be – as is-ness. That's evaluation out of your Auditor's Code. That's evaluation. That says something is – that's the is-ness of things.

Now it is a very powerful button because you say something is and although it wasn't reading before, it will now read. The auditor says, "That is still alive," and oddly enough he can possibly make a pc wonder about it, you see, and the pc jams on it and says, "That couldn't be still alive," to himself, don't you see, and it would create a little ridge there and it'll just read on the meter and read on the meter and read on the meter. See? So evaluation can make something read. And that is contained in the most – its nearest cousin in the English language that anybody can understand in the form of Suggest.

Now the next point would be Invalidate. And invalidation, if present, if a goal is invalidated, it will now read as *the* goal. It'll make an item read which wouldn't otherwise read. When you take the invalidation off, the item no longer reads which is very peculiar.

Now you've got suppress, of course, on top of an invalidate, keeps the invalidation from showing up.

Now "Failed to reveal" is off the line because it gives you the dirty needle. That is – that is that little minute rock slam that is always a "Failed to reveal" so that gives you a particular and peculiar needle read.

The item "Careful of" is to a marked degree another Suppress. But it has this characteristic: After the person has been having something done for a little while that is a little bit offbeat, they can hang up in the thing if they have become too careful of something or other. And they could also make something read in quite the reverse by not suppressing. "Careful of," that gives you an opposite flow.

So you get your – you get your middle rudiments, in short, as being something which are capable of making a goal or item read if present.

Now that Suggest, moving that Suggest in there, which you will find in your Prepcheck, is actually not as current or as constant as you might think. It – you wouldn't use it in every middle rudiment that came by because you can pick it up at all one fell swoop. Mostly based on this fact: that auditors seldom suggest anything, but they might seem to some place or another, so you pick it up on a Prepcheck basis rather than a middle rud basis, every time you go by.

You actually then have in essence five middle rudiment buttons that could be used.

Now, the way you would arrange these buttons, if you wanted the optimum service out of these buttons on – for a Prepcheck purpose, which I am about to give you because I am going to show you how to use just the middle rudiments to perform a whole Prepcheck, which is a very interesting little advance here.

You would say, "Suppress," and then you would say, "Suggest," you see, and then you would say, "Careful of," and then "Invalidate" and "Failed to reveal."

Do you follow how those things are played together?

Of course, the one which is most important and can blow the session up in bits and pieces we put at the end to occur when everything else has been beautifully swamped up. And we actually put Suppress in twice by putting its opposite in, you see, careful of.

So you'd have – you'd have these arranged in that particular fashion as being very powerful. You'd have Suppress, Suggest, you would then have Careful of and Invalidate and then Failed to reveal. All right, in that order you would have two cracks at suppression.

Now that would be very interesting if these buttons could be used for the bulk of Prepchecking. Wouldn't it?

Well, if they are that strong a series of buttons, why, they must have some value. Last night I sat down and looked at a pc – it was very late and I'd had a lot of auditing that hadn't recommended itself to me one way or the other. I was already violating the Auditor's Code, one of the only times I get a chance to audit, way after ten, man. You have to be good to audit after ten. Had the pc sort of gummed up and said, "What am I going to do here?" And said, "Well, the best thing I can do with something like this is form some Zeros here before I get on about my business, form up some Zeros." I was thinking – Zeros? Why the hell should I form any Zeros? I know the pc has not been feeling very well for an exact period of time. Let's just throw the middle ruds in as Zero questions.

Man! Man, I've seen assists in my time but that was about the wildest I've seen in some while. That was just about the best Zeros I ever saw. So after the session I said, "What the ruddy bleeding hell happened here? Almost blew the roof off," you know. And I said, "Well, of course, you idiot!" – I seldom call myself an idiot, except – but sometimes do. You've carefully got together the most powerful buttons that you can possibly give, because they're the only things that can make a goal read or not read or an item read or not read, and you summed these things together in the middle rudiments, then you don't move them over

into Prepchecking, well what can you expect will happen if you move them over into Prepchecking? Well, of course they are the main buttons that are sitting there. *Crash!* All hell's going to break loose if you prepcheck these things against a period of time. Quite interesting.

So I sat down and wrote this down for you. This would just be a sample action. This would be a sample action. This would be a Prepcheck, guaranteed to do something very interesting with a pc. This is more complicated than it need to be. I'm just giving you an idea of what you could do with this, see. This is fun. Just for you. "When did you decide to come to Saint Hill?" You ask this guy, see. You ask this student, "When did you decide to..." Well, he finally picks it out of the ether and you get the thing confirmed on the meter and so forth and you get the date! You write the date down in your auditor's report. Then you ask him, "Just before – whatever the date was, see – what happened?"

In other words you discover an area of overts which is the prior confusion to the date. Got the idea? An area of overts.

And then date the beginning of that prior Confusion. We're moving it back a little earlier. Date the beginning of the prior Confusion. And now, just for the hell of it, in case he's skidded and missed, why let's select an arbitrary date a month earlier and let that be our date by which we head these questions. You know, your Prepcheck question has got to have a time limiter. This all starts to get very, very amusing and very interesting indeed, because you've moved back to a specific date now. You've got the beginning of the prior confusion before he made this decision, now we're going to move back a month earlier just in case he slipped and didn't forget the original overt, you know – didn't remember the original overt, so we're going to take that as the arbitrary date and then we're going to do this with it: All we're going to do is frame an expanded mid rud series of questions. We're going to flatten each one repetitively and then we are going to go over this two or three times. Going to frame the questions like this: Let us say – it wouldn't be, but let us say it was June 1st, 1955. Wouldn't be, but let's just say that was the date. Your Prepcheck question would be, "Since June 1st, 1955 is there anything you have suppressed?"

Well now, if you don't think that isn't going to keep your pc running for a while you're mistaken. And we're just going to run this repetitive, see, just totally repetitive. "Since June 1st, 1955 is there anything you have suppressed? Thank you." "Since June 1st, 1955 is there anything you have suppressed? Thank you." "Since June 1st, 1955..." – you don't have to answer these just so I am not missing any withholds on you. [laughs] "Since June 1st 1955, is there anything you have suppressed?" See? And finally the pc says, "Huh! No, that's – that's all. That's it, that's the lot!" And you say, "Thank you. I'll check that on the meter."

Understand this is done terribly formally, you see. Very formal auditing. You are not interjecting comments or running Two-way Comm. Nothing. Because it's very easy. It's almost automatic.

You get it over here and say, "All right. Going to check that on the meter. Since June 1st, 1955 is there anything you have suppressed? That reads. That. That. That. That."

"Oh, yes, well that's – that's my mother..." so forth, and so forth. You just lay the meter aside, "Since June 1st, 1955 is there anything you have suppressed? Since June 1st, 1955

is there anything you have suppressed?" And you go on and on and on. Oh, honest, you're going – you're gonna – you're gonna get yourself some – a bucket of answers, man!

In the first place the pc is perfectly willing to tell you things they have suppressed. In fact they practically springboard off as he remembers them. See? This is auditing with bed-springs under it. *Boong, bing, boong!* That's dandy. Oddly enough a lot of somatics come off at this time. Now, what I thought would happen when I was doing this, is that everything might restimulate. But it didn't. The somatics came off with the suppressions. A lot of them.

All right. Well, let's say the pc has come to a point of saying, "No," and let's say that we have asked the pc, "I will check this on the meter. Since June 1st, 1955 is there anything you have suppressed?" And let's say that we have read the meter correctly and that it was clean. Now, clean is awfully relative in this case. Man, this is relative. But it didn't show on the meter and the pc isn't thinking of any answers, and as far as he is concerned, as far as you're concerned, that's clean. All right, fine, fine, fine, fine. That sounds great.

All right. Without doing anything else extraordinary or doing anything we simply swing into the second question, "Since June 1st, 1955 is there anything you have suggested?"

Now the funny part of it is that you will quiver on this, if you will redecide perhaps, to run this as decided, or something like that, but that is not the meaning of it, the meaning of the thing is evaluated, don't you see? But suggested is very mild, isn't it?

"Yes, I've suggested to my father that he go to hell and I've suggested to Mamie that she buy a new hat, and I've suggested that we separate." You get the idea? "I've suggested that it's better that they blow the world up," you know, these first little things. It's very mild. It's not any overts to amount to anything at all.

Well, we follow the same repetitive on and on this, and we don't care if it runs shortly or longly, we are going to run it to a point where both the pc and the meter agree utterly that that's it. That's clean. That's good. All right. That's fine. We drop that. Everything's running along fine. It'll probably be the second or the third Prep-check session when it is done, but – this is actually a twenty-five-hour intensive probabilities, quite possibly, because my question last night was, "In the past two weeks..." And it ran and ran and ran.

All right. So we go on and on, and now we get into this sort of a situation. We want to know now, of course, some more suppressions. So we say, since June 1st, 1955 is there anything you have been careful of? Isn't that mild and innocent, man? That's mild and innocent. Of course all this time why, given that you are reading the meter and getting your rudiments in every session, and that sort of thing, and not goofing anywhere along the line, your pc's ARC is building up, building up, building up, building up with the auditor. He'll be able to blow things better and all that sort of thing.

So we flatten that one. Since June 1st, 1955 is there anything that you've been careful of? And of course we get the remaining suppressions off of this thing. And then we let the pc have it right in the eyes, see?

Got that all beautifully flat and so we say – got it on the meter and everything – everything's clean, "Since June 1st, 1955 is there anything you have invalidated?"

Well, that's a nice quiet sort of word, isn't it? Invalidated. Anybody'd answer that. *Pow!* You know, now you are going to get some somatics he didn't dream of, you know, here and there, and this and that, various things, cognitions, that sort of thing going to come up. We run that thing on down, pc says it's flat and the meter says it's flat, and because we know by this time how to read our meter we know it's flat. And we got that one all set, and all squared away and pc is feeling fine.

And now we say, "Since June 1st, 1955 is there anything you have failed to reveal?"

Well, what's very interesting about this is you of course during the sessions as you went along will probably have had to use your random rudiment now and then, or something like that, you might have had this to boost along, but this will come as a totally natural action to your pc by this time. Failed to reveal, that's very innocent, that's very calm, that's very nice and he'll just walk on through and unload withholds left and right. Hardly noticing that he does so because it seems so easy and natural and everything will go fine.

Now, the possibility is, certainly if that becomes flat at that time we could actually skip the whole thing and not do anything further about it – don't overlook that possibility – providing we don't do this idiocy, of check the mid ruds on the period. Do a fast check of the mid ruds on the period. Let's just cut our throats right there. See?

"Since June 1st, 1955 is there anything you have suppressed, suggested, been careful of, failed to reveal?" You know? Ugh. Let's just miss all the rest of the withholds. See. If you just left it at that, went through each one of these things once, you'd have practically a different pc sitting in front of you, providing it was done in Model Session and you were reading the meter and you had your rudiments in, see.

This would be quite interesting, this would be highly informative. You say well, you couldn't possibly have gotten the bottom of every chain. Well, here's what I found out, and the only reason I'm releasing the data, is because you are taking them up in this particular sequence and because these are very odd little buttons to be taking up and they appear to be very innocent, and that sort of thing, they clear away an awful lot of track without worrying about fundamentals and basics. And that, by omitting the withhold system, we left ourselves wide open. Don't you see? Some guy just wouldn't clear up on this subject, because we never had any method by which to get the earliest on the chain, don't you see?

But this doesn't matter, whether you get the earliest on the chain or not. Because these buttons are hot enough, apparently, to wash out whatever is going on without you finding a big missed withhold sitting in your lap and that sort of thing. But you could – this is for the purposes of the establishment of a system here – you could now start in all over again. If you were running an intensive and you had lots of time or if the pc had given it a very shallow pass, you start in all over again and you could get it from the beginning to the end.

In other words, you do the whole cycle of those middle rudiments. Probably take you another session or two or three to get that all the way through again, but you'd pick up some deeper fundamentals along the line.

However, I wish to caution you to this effect: that is cleaning a clean. You've already said that that's all that he has suppressed and that sort of thing. You'd only get into trouble with this if you weren't able to read a meter or you left one of them muddied up.

Now, a couple of times on TV demonstrations here I've seen a Prepcheck question left unflat as though it were not very important or something of the sort. Well, let me tell you, man, that – exclamation point – important. Don't ever leave a Prepcheck question unflat whatever else you do! That's – the Catholic church has sins of blasphemy and other types of sins for which they burn people and armies shoot men for cowardice in battle. I think they shoot them now for being brave in battle – but anyhow, armies shoot people for desertion – when they are headed by Eisenhower.

Every group has its sins, see, but we don't have many sins, we don't pay attention to many sins, but there is a sin, really, is leaving a Prepcheck question unflat, because it amounts to a sinful situation. You've got somebody all upset and without knowing what is wrong he gets blowy and he is liable to leave Scientology and deny himself auditing. See? It's important. It's important.

All sorts of wild things can happen by just leaving one Sec Check question unflat. The darnedest thing you ever heard of. I've never seen so much commotion!

God, I've had telex machines going wildly in all directions and everything else, just on that one basis. So, we'll put that down as a sin.

And you're teaching an Academy student sometime – his is not to reason why – he can't seem to pass the missed withhold bulletin or something like that, just tell him it is a sin.

Now, that's quite interesting as a clean-up little intensive for a Prepcheck area. Quite interesting. If that were run on you you would be quite amazed at some of the results and things that would come off.

Now, I have just given you a method of discovering a date, by taking a decision which somebody has obviously made. I'll give you an obvious decision – the fellow has gotten married a couple of years ago. We don't do a Problems Intensive to find the key problem on the track before we audit him, if we haven't done that we are not going to spend any time doing that, something like that. You can arbitrarily pick up some obvious decision the person has made. What's the most obvious decision with this guy? Well, he must have decided to get married. Of course the girl is probably of two opinions about that, but he must have decided this. Therefore just pick on it. And decide that if he made a decision of this character, why, there must have been a prior Confusion ahead of it. And you will always be right. Oddly enough you will always be right.

Now, if you just back up the time a month arbitrarily before the prior Confusion that you've spotted, of course you've included any little additional activities that might have occurred that he has kind of forgotten about. So you sort of have a basis to the prior Confusion. Just a method of doing it.

Now, you can also run this, wildly enough, on a – this basis – I'll tell you the basis you can't run it on in a minute, but you run on this basis, "In this lifetime – ." Now let's really shoot the moon – let's settle in for a fifty-hour intensive, just like that. See? "In this lifetime,

is there anything you have suppressed?" Yeah, we're settling in for the long haul here! See? Gosh you'll get to the end of the first question, you see, about three or four sessions later. See?

Well, that's fine. That's fine. And you just follow exactly the same action, except you don't have to establish any arbitrary prior Confusion, don't you see.

There is one but don't try to establish it. [laughter, laughs]

And you just carry on exactly in that fashion. You first clear up, of course – always the same sequence: Suppress and then Suggest and then Careful of and then Invalidate and then Failed to reveal. The magic five. And you're going to get all kinds of wild things coming up. Oddly enough, if you attacked it in that particular way, you would get withholds off pcs more or less easily and voluntarily. You wouldn't have to be slugging for it very hard, don't you see?

Now, there's only one caution on this, I talked to you a little earlier this evening. Follow the rules. Follow them right straight down the middle of the path, so forth, but don't be an idiot.

Failed to reveal communicates nothing to this pc, let us say. Just kind of fish around on a question before we go overboard on the thing. See? Failed to reveal means nothing to them, it doesn't mean an overt, it doesn't mean anything else. Failed to reveal, well, reveal, he's never undressed in public, and this is what reveal means to him, see. So his answer is "Nothing. I've never failed to reveal anything," see? Nothing. He's got it all backwards and somehow or another can't realize that when he answers that way means he's always undressed in public. [laughter] He just doesn't seem to untangle this thing.

So you'd have to, at this point, why, any of those points you'd have to be smart enough to stay on the exact meaning, but within the intelligence of the pc.

Give you an example, you're auditing a little kid, you know. You've got to translate the word around, and sometimes you can make a wild mistake. It doesn't mean the same thing at all. But you've got to use the words in the meaning that will communicate to the pc.

So you might run that one, "Since early in this lifetime is there anything you've done that people didn't find out about at the time?" See? It's what you are trying to get. See, he says, "Well, I was audited last year at the HASI, see, I was audited last year and I gave them all of my overts. So therefore there is nothing I have failed to reveal." If you don't think you don't sometimes get this answer, you ought to read some auditor's reports sometimes. That's pretty wild. And sure enough, the auditor pulled a lot of them, so it's now unanswerable you see, as a question. "But people didn't find out at the time." Oh, at the time, they didn't find out about it. "Well, they didn't find out about it at the time. Yes, they didn't, you know. It's true. Oh, there were quite a few of those! Oh, that's what you mean!" Big cognition.

Well, you can run that thing but the only error you are going to get into in handling this little system I'm giving you here of using the middle rudiments doubling them in brass, the only error you'll make is failing to get a communication established here. And... "Invalidated." Boy, he does not understand that, man.

Of course an invalidation, you should know, is not-is and is the not-is axiom. And so you realize that translates into maybe, "tried to make nothing of". So it's "In this lifetime is there anything you've tried to make nothing of?" See. It's almost a direct translation. In fact, it's possibly a little directer than "Invalidate." That communicates.

So it goes by this rule, that if you find the pc is unable to answer or give you many, don't blame it on the pc's unwillingness to give up withholds or something, or the caginess of the pc; blame it on the communication. The communication is not occurring. See? You've got to make the communication so it does bite. It'll be the offbeat of that communication which stomps this thing. Naturally you go to all trouble of finding out what each one of these words means and translates well to the pc. You've got a new-worded set of middle rudiments, haven't you, to use on the pc. They might sound very strange but they are communicating to the pc. Don't you see? See, that's what it is. So anyway, if you were to do that and do just that, the bank unstacks in its natural sequence, which is always desirable in Sec Checking and Prepchecking. And you have just about the easiest job in the world which is doing a Repetitive Prepcheck. It becomes just as easy as can be.

Now, I'm not recommending that your Prepcheck assignment be immediately transferred over to this. See? That what you are doing in Prepchecking immediately be transferred over into this activity and so on. You've got the last two pages of the Joburg 6A. These are specialist actions which of course have to be checkable and so forth. It's mainly done as class work and to sweeten up the tempers of your fellow students, that's why it is, and don't let them accumulate a lot of auditing overts and that sort of thing.

But if you get assigned to a long stretch of Prepchecking and so on and you've completed your assignment, there is some more auditing that you can do in this particular line, or if you are assigned to Prepchecking and you have already completed your requirements on the thing, that's what I would do. I wouldn't go into any arbitrary form. Arbitrary forms have their value. They particularly have value in instruction because you can check and find out what the person did. I'd use more this type of approach.

Now I'll show you another way this could be used and combined and made up.

Let's take the old style Problems Intensive the way it was finally canned up and released with its 0 and P sections and sort out, by assessment, the chief problem, by assessment, that's a self-determined decision the person has made. Of course, that's immediately preceded by a problem and that's immediately preceded by a prior Confusion. And by assessment of the decisions, self-determined decisions the person has made, by assessment, discover the most charged decision in this lifetime.

Now this would appear absolutely magical to a raw-meat pc and would stand a psycho-anal-yst on his ear.

What you do is just take an assessment of these self-determined decisions, date the problem, date the prior Confusion, and remember now, there's one thing everybody has missed consistently and continually in the Problems Intensive, that just drives them completely astray and makes Problems Intensive unworkable. We mean the prior Confusion to that decision. And we are talking about a period of time as little as five minutes and as great as a week or two. And we are not talking about three years before.

Auditor after auditor, I have watched them, I have read their reports and I absolutely groan. They come in from Central Orgs and that sort of thing, and I groan on this thing. They take periods of three to five years before the self-determined decision. No, that is not a prior Confusion, that's not the prior Confusion that is meant.

The prior Confusion that is meant takes place from five minutes to a couple of weeks. It's right there! And if you ask the pc, you've got this terrifically charged self-determined decision and you ask the pc for the prior Confusion. You see, it happened when he was twenty-seven and it was a decision – it was a decision to go to work for the Bide-a-Wee Soap Company. This thing is absolutely dynamite! I mean you'd get it on the meter and you've been going down this list, and it goes *pow!* See? To go to work for the Bide-a-Wee Soap Company.

We ask the prior Confusion and the pc says, "Well, it was my mother washing my ears when I was a little boy." And the auditor says, "Well, all right." [laughter] "What were – who were the people who were present during that period?"

"Well, there was myself and my mother." And the auditor then runs overts against self, you see, to solve the whole thing. No, that is not the way you do it. I thought I had written it down plainly but apparently I missed there. Because a prior Confusion means the just prior Confusion. It could be within five minutes of the decision. But the pc will slide off of this and go anyplace else rather than face the thing. You've got to scramble him right in there.

You'd be surprised what's left on a Problems Intensive! What gets left, you know? What never gets touched! The whole prior Confusion never gets touched, you know. There's a murder and a bank robbery, see, that just happened the last Saturday before the fact. All there. That's all clean. You say, "Well is there any prior Confusion to that?" Oh, it falls off the pin. "Well, what was the prior Confusion to that?"

"Well, when my mother was washing my ears when I was a little boy. An auditor and I took that all up."

No! No, no, no, no! See? It's *just* prior! So if you think of a *just* prior Confusion, all will be beautifully resolved.

Your actions on putting one of these things together are elementary actions. You want the self-determined decision, you don't want an other-determined decision. Like sometimes marriage and so forth is not a self-determined decision. You want something he decided. Decisions he made. And you ask most pcs this and they sometimes start off very sloppily and give you other-determined answers. See?

You want self-determined changes in your life, is what you need, that you decided, you see, and if you say, "Self-determined changes in your life that you yourself decided to change on," you can kind of get it across, you know, across.

And the pc says to you, "Well, I was ill and they changed me to the hospital." And you just leave your pencil in the air and you say to the pc, "All right, that's fine. Now, thank you very much. Now, I'll repeat the auditing question, now. I want you to answer this question. This is the question." You know. Until you finally get, all of a sudden, "Oh, you mean things I decided? Oh well, that's different."

Changes in his life. Changes in his life, and so on, because sometimes it has to take a little while to dawn on the pc that he himself has effected any change in his life. When you first address him on this subject, he thinks of himself as a pawn, who was moved from one end of the board to the other. [laughter] He never thinks that he himself pushed himself around. So you sometimes have to dig a little bit before you get these things.

And you get those written down, and you make a nice list, each one, and that self-determined change, see, it's got to be very short. Very, very short. You shorthand it.

"Well, my wife and I, why, we owned a motel and we had been around the desert for quite a while and we-we-we-we've had – we had this service station first in Waco, see, and then – then we owned this motel. We owned this motel. And I went up to Montana for a little while and saw a friend of mine up there. He's a goat hunter and I saw him for a long time and actually I brought him back down and he made a couple of insulting remarks about this motel, and that sort of thing, but that was after I went to Los Angeles. And I finally found a buyer for the motel and we – we decided to go to San Francisco."

And honest to God you will find this sometimes on the auditing report. The whole story. Honest, you'll find the whole thing. I've seen some of them and – I haven't written that hard enough, see. It's various – you know...

"Decided to go to San Francisco," you see. June 1928. Decided to go to San Francisco, June 1928. That's all you want.

You're going to have to read those things back and you've got no time. "And that was the place where we – Waco, you know. And we had the petrol station in Waco and then I went up to Montana and there's a fellow up there shooting goats..." You know, you haven't got time to read all that!

It's – totally practical consideration – I'm not making fun of you. Actually, I thought I had originally stressed this madly. And you should see some of the old records that we have around here on that; they are quite ludicrous. We've corrected it and after that they get so they can really do it. But some of the first efforts have to be carefully explained to them that it had to be in two or three words with a date following it, you see, and you still get this short story, and they keep running out of forms, you know. [laughs]

Let me tell you the liability of putting down an other-determined change. All you do is assess the list of engrams.

They must be self-determined changes. You must not have on that list any other-determined change or you are liable to find yourself assessing an engram.

"Well, the doctor decided I had to go to the mountains for my health," and the auditor writes down "Gone to the mountains for health, October 1956." He comes along and he's assessing wildly here and God! "This October – mountains for health, October 1956." Boy, he just falls off the pin you know. You can – you can hear the air being split as the needle falls. Boy, that's it, you know, that's it. Now let's look for the prior Confusion to this area. We've got that straight. It has to be within the last week or so before that.

All right, that's fine. "All right. What's the personnel in this confusion?"

"Well, there was the lorry driver, and the three children that were riding in back..." Back of what? You know? We got a car smash, you see, and he spent the next several days in the hospital between life and death and we are running the beginning of a beautiful engram and this system, I assure you, does not handle engrams. So watch it!

There can be moments of pain and that sort of upset in there and this system will get you out of them more easily than other systems, and you mustn't avoid an area just because there was an accident in it or something like that. As long as you are assessing *self-determined* decisions to change you don't run into this difficulty and you get a proper assessment. You go on the line. But the pc has to sort this out for a while. Sometimes he really goes around in circles.

Yeah, he'll tell you about the doctor ordering him to the mountains, and you just hold your pencil up, give him TR 4 on it.

Say, "Oh, doctor ordered you to the mountains? Thank you. Good. Yeah. Fine. Good. All right. Now let's have a self-determined change that I just asked for. Let's have this self-determined change. Self-determined change that you made yourself!" [laughter]

"Oh, Oh. Oh! Oh! My mother took me out of prep school."

You say, "Good. Thank you, thank you, that's fine." Like that and so forth. "Now, I'll repeat the question here. I'll repeat the question, what I want is a self-determined change that you did yourself, on your own initiative." [laughter]

"Oh! Oh! Oh! Oh! I've got that, I've got that. Well, my father and mother moved to another town when I was young."

Don't commit suicide. Just keep at it until you've got this thing grooved in. Lay down the pencil and say, "Now look, what I want from you is times when you yourself, you, you, you yourself, decided on a change in life. Now, for instance churches, or you decided to, you know, shift something in your religion or something like that. That's what I want! That's what I want. You got that?" He's got that now. You pick up your pencil again and you sit there and look at him alertly. All right. And you'll probably get them!

And then you get a list of that and then you make sure that every one is a self-determined change. Don't keep challenging the pc each time he gives you one. He says, "I decided..." That's good enough.

You go down that list, you assess that thing out, you take the one with the greatest fall. Or assess it by elimination. Oddly enough they will assess by elimination. Just like the Prehav Scale. But you want to watch it because they will assess all the way out if you don't grab the last one just as it disappears! Don't sit there like an idiot saying, "Which one was the one that went out last?"

You've got two, you see, and you are going between these two and you go from one to the other and keep making marks and you go back and read that one and you say, "Well, it must have been the other one, but that's gone, too, so which one did you have?"

And do your assessment, take that thing, now move back, find out if there was anything happened just before that and then move it back about a month to be safe and take that

as your arbitrary date. It's an arbitrary date that is made to include a distance as close to that as a month. And that'll include anything that happened in that period. And everything will be dandy. But if you permit that date to go back several years for the prior confusion you will miss it wildly, and you'll get the pc all wound up in a circle.

You want that area that just happened, because let me tell you, his decision was just preceded by the recognition that he had an awful problem to which the decision is a solution. The decision is always a solution to a problem. And just before he had this awful problem, well, he was in there committing overts and people were missing withholds with both fists! He had both feet into life up to the neck, if that's the hottest one that comes up.

But you mustn't go back any great time period from that. Don't go back years. Take that as your date and give it the works here just as I have been giving you here. Do those middle rud-Prepcheck type of thing. Let's say it turned up to September the 2nd, 1951. So you'd say, "Since September 2nd, 51 is there anything you have suppressed?" On and on and on and on and on!

Now, you get sometimes thrown by this type of action. I might tell you at this time, that I'm interested in this and interested in Prepchecking in an effort to upgrade the therapeutic value of Prepchecking. I'm quite interested in doing that. To make Prepchecking more meaningful, to make it do more for a case and what I'm giving you, I should have probably given you a better preliminary on the thing, but what I'm giving you actually makes Prepchecking pretty beefy. If it is well done the things that you can do with this will, I think, astonish even you. When you have already had results on this, I think, you will be quite astonished.

You get somebody, you only got a twenty-five-hour intensive on this person and that sort of thing, you'd be unhappy to prepcheck this person perhaps and try something desperate if it was all the money the poor bloke had and you didn't think you'd get very far with your Prepchecking and so forth. No, if you had a little experience with this particular type of mid ruds type Prepchecking, why you'd feel comfortable about sitting there and giving it to him, because man, some things are going to fly off he never heard the likes of. And also, because you've achieved sufficiently high result, the possibility of your getting a dirty needle after this is quite slight. Your auditor altitude, you see, has taken a rocket ride to Venus. See? You're amongst the stars as far as this guy's concerned.

Well, it's all real to him, that's the main thing that happens. It's all quite real. Because of course, he isn't going to tell you anything that he doesn't think he has. And you don't fish for any data, you don't push him around, you don't try to get any overts off particularly. You wind up – make sure when you finish all this that you get your middle rudiment in, that you haven't missed any withholds on him because that could be catastrophic, but that's a middle rudiment type action. Fast check, see?

And your guys are going to wind up at the end of this line, or the lady involved, and I think you will find you'll be quite happy with what you have done and actually you've done something rather relaxed about the whole thing.

Now, in handling – in handling Prepchecking in general, you would perhaps feel shy of doing it if you weren't going to get a result which was a desirable result to the pc. Well, I

think you'd find this – let us take an example here: Mrs. Jones has just been delivered of a nineteen-pound bouncing boy and has a slight postpartum psychosis and you think the best thing to do is to run out the birth engram. No, I can tell you that the best thing to do would be this middle ruds Prepcheck, predated on some prior Confusion Prior to that, not taking the birth as a date, but letting your date fall so that the birth is included in the period.

You are not targeting at it. You are auditing her a month and a half after the date of the delivery. Well, you fish back and find out a little bit more and talk to her about her life in that period and just take it at two months. That includes that period. And I think you'd be astonished to find the somatics fly off, without winding the pc stuck in the incident! You see? It has value, man!

This amounts to a PT problem, don't you see? It's just happened! You don't get it out of the way, why, you're going to have a mess on your hands. That gives the auditor another weapon too. And how successful it is is totally dependent upon the quality of your meter reading, and the degree the pc is in-session and the excellence with which you clean off those questions one after the other as you – I mean clean them off when you test them. I think you'd wind up at the other end of the line with a very happy pc.

Because a pc, asked permissively in this fashion, won't pull themselves deeper into the pit than they think they can go at any given moment, and you've got that interesting rule that is given, I think in Book Three of *Dianetics: The Modern Science of Mental Health*, that the mind has a self-protective mechanism. You don't tend to overthrow that.

Now, this was necessary at this time since we have so many techniques that will overthrow the balance of the mind. We could run into somebody today like a – that's one of the reasons you want to – "Well, my God! When auditing in the old days I never had this many ARC breaks from the pc just putting in rudiments and that sort of thing. Ah, must be my auditing is deteriorated." No. You've got a stepped-up Model Session, don't you see? The potential of ARC is fantastic! If you don't learn how to drive this car right – it's like a Ferrari or a Cooper Special! Man, that thing is going to go off the curves! See? You are driving a racing car. You might as well make up your mind to it. See? This thing has got power and it has got speed. If you want to go back and drive a Mercedes-Benz 1898 model, why you won't get anywhere near the amount of ARC breaks and upsets from a pc. You won't get the results either! You get the difference of what you're learning right now?

Well, similarly this is gunned-up Prepchecking. But there was a – necessary at this time to have a relatively permissive system, which didn't overthrow the balance of the mind.

All right, let's take an extreme example of this. This girl, never under God's green earth ever dared go near the time she was thrown into the institution and electric shocked within an inch of her life. She begs you not to go anywhere near this! Well, that's one thing she won't talk about. If you guarantee not to talk about this in any way, shape or form, she'll be perfectly happy to be audited. Select a period two months ahead of it, run it!

I think, if you audit well, you'll be on the safe side. But if you don't audit it well and find yourself with the feeling that you have just shot off the edge of the Grand Canyon within a racing car and it is turning over and over and over in empty space, don't say I didn't warn you!

The thing to do is, of course, go back to giving a Touch Assist. [laughs] Can't miss a meter read with a Touch Assist, it has that advantage.

You know, there's some guy in practice someplace in the Middle West of the United States right now who does nothing but Touch Assists, has never been trained as an auditor and has a roaringly successful practice! So we mustn't, we mustn't sneer at these little things. But I just give you the word of warning. See? You put a 500-horsepower supercharged engine in an aluminum tubular-framed hull and it takes some neat driving! That's all. The driving is neat. And if you notice on such a car, there are a number of curves in the road. I'll just point out one little thing to you, that there are a number of curves in the road, and therefore you cannot go on the average of not missing many! You are allowed just one curve. And then they bury you. That's pretty near the way it is.

Okay. You think that might do you some good?

Audience: Yes!

All right. Thank you.

Audience: Thank you.

Good night.

ROUTINE 3GA DATA ON GOALS, PART I

A lecture given on
7 August 1962

Well, I should be much better off now after a week's layoff here, should be much better off indeed. And just worse than ever. That's what I get for taking vacations.

All right, this is what, 7 Aug., AD 12, Saint Hill Special Briefing Course.

You are very lucky to hear this lecture, extremely fortunate. In fact, if I didn't give you this lecture you'd all be in the *zoup*. It's one of them kind of lectures.

And this has to do with goals, 3GA, data and Materials concerning. Now, this is not a lecture of a complete embrasive rundown on everything there is to know about clearing, but I'm going to give you some fast ones on the subject of HCOB Aug. 1, and HCOB Aug. 1, Issue II – the drills. And it's ROUTINE 3GA, GOALS, NULLING BY MID RUDS, and the nulling drills that go along with it.

Now, this material is taken care of pretty well in the bulletin. There is nothing particularly that one would alter in these bulletins – gives you quite a bit of data. I'm going to duplicate some of that data and I'm also going to give you a lot more tips and an amplification of the material. A lot to be known about this.

First thing you will want to know is, what if you find a wrong goal on somebody, and their head swells up five times the size and they get palpitations of the platina. What happens? What do you do? That's the first thing you want to know, because you'll do it. Sooner or later this will happen, even to you.

Most of the data on this, by the way, is subjective. Got a good subjective reality on this, and a good objective reality on this.

For instance, somebody came to see me today from far off on which a goal had been found wrong, and had been listed vociferously with considerable enthusiasm by one who is now amongst you, but who was not then a Saint Hill student – so he can be forgiven, possibly. He's not amongst you at the present moment. I won't identify him any further. [laughter] And I said, "Well, that's the way it is, wrong goal," and sent her down to ask Reg, out of the magnanimity of his heart, if he would not check out these goals.

Now, of course, he thought he was checking a goal out, and she thought so, too, but in actual fact I sent her down to get patched up because the way you correct ... There are two ways of correcting a wrong goal. One is to check out the wrong goal that was found – or any wrong goal that was found – within an inch of your life. In other words really check that thing out. Now, of course, it ceases to fire, it ceases to read, it ceases. But it must cease with all somatics and sensations and with all misemotion. When you have got everything off of it there is nothing left on it. Got it?

In other words by prepchecking – this is very valuable data – by prepchecking out the goal that was found wrong, you shuck off the consequences of having listed it. Interesting isn't it? Marvelous. You should have such luck. But that's the way that one is.

Find a wrong goal on somebody, and with vast enthusiasm list it for five or six or eighteen-thousand items, you see. And the person puts on two hundred and fifty pounds of weight, and a few other minor things like this occurring. Their eyeballs keep leaking blood and palpitations have begun in the heart, and gastronomic upsets are occurring as the order of the day, and medicos have been called in, morticians, and so forth, and have made a diagnosis of plumbosis of the platina, and they must operate inconsequentially. Why, that's what you do – you just prepcheck the living daylights out of the goal that was wrong and found, no matter how much it was listed.

At first it won't read. You can't – won't get much out of it. You get all the suppression off of it, and you get the reads on it and the suppressions off of it, and the reads back on it and the reads off of it, and so forth, and you go on and on and on – and you finally get rid of this thing. But you may need a few more little buttons to go along with your mid ruds. And I will give you a list of those buttons. To make a very thoroughgoing checkout of anything, you may find these buttons of some use. On the goals check HCOB, "Mistake been made" is added to the little list. That's the short Instructor's check. Well, please add, "Has a mistake been made?" on to the question that must be cleared there. Now, that's for the short form.

Now, add that – this is for a longer form – "Mistake been made? Protested? Asserted?" You've now got the bulk of it. "Confusion about?" and "Ignored – Been ignored?" You've just about got everything that is significant that will even produce a shadow of a side read on the other things, you see.

The basic things which make a wrong goal read are, of course, Suppress – that doesn't make it read, that prevents the invalidations from reading – Invalidate, Suggest – of course that's Evaluate, that's also Assert and Mistake. Now, those are the things which give you a clean tick. The Suppress, of course, pulls off the suppression and the errors now read. The errors on the goal don't read till you get all the suppress off. Now let's look at it and we realize invalidation can give it a tick just like a goals tick, except it doesn't look like a goals tick if you get to be an old veteran and seen a lot of them.

Now, a goals tick is a rapidly inspired input with a fast decay. It goes *phew*. It fires fast off the beginning and slows down rapidly. Whereas these ticks are just ticks. They go *thud, thud, thud*, and they're of equal speed more or less, but they can be mistaken very easily.

And of course if a goal has charge on it, then it can be invalidated, you see, and the invalidated picks up the charge, you see. But it still looks like an invalidation. But that invalida-

tion has charge – not because of the invalidation but because there was charge on the goal, you understand? You've got a question of transferred charge. You've got charge on the goal, but the goal doesn't read, but the charge transfers over if the goal is invalidated. Now, Invalidated reads. The charge transfers over to Suggest, Evaluate, Assert.

Suggest is the best of those phrases, but you can also say Evaluated, you can say Assert, make it meaningful. The Mistake, a mistake calls for sort of a ridge because it's a special kind of an invalidation.

It comes down to the fact that a goal reads on the two oldest lines of the Auditor's Code – evaluation and invalidation. But you see, either one of these have different ways you could describe it. Now, you'll get a tick out of those things. It looks like a goal, it goes *tick, tick, tick*. Of course if your needle is rising rapidly the tick is – just slows the rise – or it'll just stop the rise so it looks like a halt. But actually they're a throw-down. They fire over here from left to right, and the usual tick – something like that – if the needle were quite still, well, it'd be about anything from a sixteenth of an inch to a half an inch, from left to right in the direction marked "fall" on a Mark IV E-Meter. It's – be a sixteenth of an inch to a half an inch.

And a goal read that is clean and clear is very remarkable. It looks like a small rocket taking off that slows down rapidly. It doesn't look like these other things, but you'll get used to that by and by.

Every once in a while on nulling a goals list, by the way, you'll see this phenomenon. It isn't the goal, but you'll see a goal tick – a real goal tick. You get it clean, everything is fine and you've been saying it – you've said it a couple of times before and taken invalidations off of it and so forth and you get it all clean and you get down there and you say, "To be a tiger," and *pow*. And you say, "Boy, we've really got something here," you know. You know, make it like that... At that point make enough excitement to throw the pc out of session, you see. And you say, you say, "To be a tiger." It doesn't read anymore, you see. Check it all over again. If you ever get one to fire, for God's sakes check it over again. Check it all over again. "To be a tiger." It's dead, it'll never fire again. R.I.P. You've taken it off the goals chain, see. It read like the goal once.

Now, that's – the goal charge transfers over to a secondary goal which merely fires once, as it frees itself from the main goal chain. But that charge, while it remains on a secondary – not the goal but a close cousin – can transfer over to an invalidation or an evaluation, you see. You get substitutes, got a series of substitutes here, see. So you pick off the invalidations and evaluations, and then you pick off the charge off the secondary goals on the list, and then you hit the goal and the goal goes *pow!* – and it goes like that every time – *pow, pow, pow*.

Now, of course if somebody invalidates it, it ceases to go *pow* until the eval – invalidation is picked up. Somebody evaluates for the pc. It ceases to fire until, of course, that evaluation is picked up. You can always get this thing to fire again however – which is quite remarkable – until it has been listed completely out. And when it's listed completely out, you've got a free needle.

All right. It's a series of substitutions. In other words, the charge goes from here to there. It isn't that evaluation is going to ruin the pc – it's merely going to ruin the goal read. And you'd think it would ruin the pc if you saw some of the somatics that can occur because of it. But the whole force of it is derived from the goal itself, see. The whole force and charge of a goals list is derived from *the* goal.

For instance, if you haven't got *the* goal on the list, the list will be hotter than a pistol even if it's five thousand goals long. You can't cool it off, that's all. It just won't cool off until you've got the goal on it. And when it goes complete, fish-flabby cold as a list, you've got the goal on it someplace.

It isn't the number of items quantitatively that is entirely responsible for discharging the goals list. It's monitored by whether or not the goal is on the list yet, and it will stay charged up till you get it on. There's a couple of ways of making sure of this, but I'm getting ahead of my story.

Now, that charge there transfers over to the secondary goals and then that transfers over to evaluations and invalidations and charges this thing up.

When you've gotten a wrong goal then, you have simply added to the charge residual every time you listed one more item – because you're not only evaluating for the pc, you are saying, "This is your goal – to have a pie face," or something like this – and it's not, you see. And at the same time you are invalidating the actual goal – whatever it was. So these two things are happening simultaneously, and the more you list the more this thing charges up! And this can get gruesome!

If you ever were adventurous enough to list two or three thousand wrong items on each one of the four lines – well, it's almost a case for the mortician. It's horrible! I couldn't overemphasize the thing. The pc would just be walking around in circles. Usually there is abundant sensation, the pc's getting dizzier and dizzier. The pc will start passing out if you go too far. Pc just goes blah, you know – be walking down the hall and go bang, see. I mean actually pass out. A fainting sensation and that sort of thing goes along with it, and there's all kinds of these wild things, see.

Nothing to worry about because long before the pc got into this state, an auditor would start saying, "What's going on here?" you know. But they will think they are in bad enough state if they've only had a few items listed on a wrong goal. You can list four on a wrong goal and start picking up sen.

If you find a goal on the pc, you haven't checked it out yet, and the pc says, "Oh, gee – whiz, I've got my goal," you know – adding another assert to it, you see. "I've got my goal." Nice suggest, you know. "Yeah, that's fine."

He leaves the session and he goes home and he sits down and he says, "Let's see, who would want to be a pie face?" you know. "Who would want to be a pie face? Oh, well, yeah, pie man, yeah that's good, and who would oppose being a pie face? People who didn't have one, and who would not retard pie facing? I don't know if I've got that right or not."

They'll do it! You'll see somebody do it. Somebody go out of session right after you found their goal. You haven't had a chance to check the thing out – found it right at the end of

the session. They'll come back in. They've done some experimenting on the thing and they'll be going, *wog – wog – wog*, you know – if it's the wrong goal. See if it's not the right one, they'll really catch it.

So this is something you must know a great deal about. Don't think of it on the basis that, "Oh well, this all applies, you see, providing I ... None of this applies, I'll just check every goal out that comes along, you see, and I'll check them all out and I'll be very careful, and then none of these things will happen to any pc I audit."

Who are you kiddin'? Just who are you kiddin'? First place you don't know if it's the right goal. You don't know if it's the right goal until you've listed two or three hundred items on it. Then is the first time you'd lay your paw on a stack of Bibles, put *Dianetics: The Modern Science Of Mental Health* on top of it to make it a fact, and swear it was the right goal, see. See, that's the only time you'd really know, because one of the tests is: Does the goal, when listed, turn on somatics on lines 1, you see, and 3. And does the goal turn on dizziness and sensation and emotion and what we generally call and refer to as "sen" on lines 2 and 4.

Now, if the goal, while you are busily listing it – on line 1 turns on dizziness and on line 2 turns on somatics – man, you've got it backwards! That's all – it's just backwards. You have been misfortunate enough, you should have gotten up and given a session that day. Why did you have to get up and give a session that day? Why didn't you have an appointment elsewhere? Because you found the oppgoal.

Now, frankly there are four goals that you can find. I'll make you secure, make you confident, make you happy and going about your business without ever a care. There are four goals: There's the goal for line 1, the goal for line 2, the goal for line 3, and the goal for line 4. *The* goal is the goal for line 1. That's the pc's goal. But the opposition goal of course is really another goal – and although it phrases out beautifully if you just say, "Who or what would oppose catching catfish?" you see. That will work out and it's all fine. There is – actually, you are listing another goal there. There's really another goal sitting right there. See? It'll be something or other, "To preserve our piscatorial friends," or something like this, you see. Opposition to catching catfish! It's because there's another goal sitting there. And as far as retarding goals are concerned, on lines 3 and 4, there are two other goals there, too – and you know they will all fire. They'll all fire. Witness 3D, old Routine 3D. You can find 4 goals in a row that will all fire.

Now, the pc's goal is the one you want, and that is the one which fits on line 1, and that is the one that gives somatics, and that ordinarily is the one you check out. But beware one of these terribly long goals lists. If they are terribly long then the pc is listing all four goals on the same list. He's listing his's and theirs's, and his allies and his covert enemies – and he's listing them all on the same list.

He's saying, "To catch catfish. To protect and preserve our piscatorial friends," will occur consecutive. He will list 1, 2, 3, 4, 1, 2, 3, 4, sometimes as nice as you please, you understand? He doesn't know whether he's himself, or his worst enemy, or what, you see. The GPM is so snarled up that just picking out anything out of it, he doesn't know whether it's friend or foe. And as you are running down a goals list he'll say, "That one made me feel dizzy." You've picked up an opposition goal. That goal is either a line 2 or a line 4 goal. "Got

hmmm," he said – or, "I feel so despairing whenever you say that goal." A line 2 and a line 4. Sensation is emotion. "Goodness, I am so frightened whenever you say that." Line 2, line 4 you see – sensation, emotion. There's only one thing you want on line 1 – 1 and 3 – of course, is good, solid, honest pain.

Now, somebody's going to come along and tell you sometime that it is a somatic. Of course a somatic covers pain and sensation, and that a somatic is a somatic, and they'll say they have pains – when as a matter of fact they mean they have pressures.

You don't get confused about this. You have to make this very definitive. You say they have a pressure on the side, so they tell you they have a somatic, and then you think they said a pain. You ask them, "Well, was it a pain?"

And they will say, "Yes it's a heavy pressure." But they maybe not say, "It's a heavy pressure." See, they – "Oh yes, I have a pain in my side." They mean it's some kind of a pressure, don't you see. So you have to describe what you mean by pain.

"Well, does it feel the same way if you took a knife and pushed it into your side and twisted it around a bit? It would be painful." "Oh no, nothing like that," you'll hear a pc every once in a while, you know. "If you stuck a pin through your finger is that the way it would feel?"

"Oh well, no, nothing like that. There's just a little solid pressure there," something like that, you know. Because pain is pain. There is no substitute. Pain – it hurts. It isn't uncomfortable – it hurts! And that's what we mean by "pain".

Now, the real goal gives pain on line 1, and a little pain on line 3. Line 3 sometimes mixes it up with pain and sensation, see, because it's a harder closure, see. Because line 3 of course, is opposing the opposition, so it gets the sensation of the opposition, and so forth. It can get more mixed up, see. So it's not a reliable test.

And line 4 – since line 4 is simply a covert opposition of some kind or another – sometimes has some pain mixed up in it as well as sensation. Whereas it's basically and ordinarily sensation on line 4, it sometimes can get a little pain mixed up into it. The guy gets a feeling of heavy pressure with a little *zzst* that goes down the front of it that hurts, see. Well, it's a mix-up, don't you see.

So therefore, lines 3 and 4 on listing are not reliable as indicators at all and shouldn't be taken to heart – unless down toward the end of the line the guy insists on getting sensation all the time and forever, don't you see – sensation is continuous, and that sort of thing – on line 3 for instance. Well, that would be very unusual. It should become more and more predominately painful when anything occurs there. So it comes back to the sole indicators, which are lines 1 and 2. And line 1 has got to have pain in it – period. Must not have sen in it.

But when you first start to patch up a goal that has been misrun, you're liable to get some sen coming off of it or something like that because it's been too invalidated and then it will come into pain, don't you see? You might get a little sen off of line 1 before you got any pain off of line 1, but don't count on it.

And line 2 shouldn't have any pain in it at all, but occasionally on running items down the line the pc gets his items mixed up. The items that should be on list 2 are occurring on list 1 and vice versa.

You say, "Who or what would try to catch catfish?" Or "Who or what would want to catch catfish?" Let's get the proper goals here. And you say, "Who or what would want to catch catfish?"

And he says, "A fish and game warden." You say, "Well good, thank you. Who or what –" you know, don't challenge the pc's answer – and you'd say, "Who or what would oppose catching catfish?" And he says, "A catfish fisherman." It all seems sensible to him.

Well, you recognize what is happening there. The closure is so tight, the pc is all mixed up and he's liable to get some sensation and some pain misplaced on these lines once in a while. But your standard, run of the mill action is pain, and that is the test by which you guide by. That is one of the basic tests. As you go running down the line you say, "Who or what would want to catch catfish?"

"Ouch."

"Who or what would not – would oppose catching catfish?"

"Mmmmmm, ohohohoh," see. Why are you swimming, auditor? "Who or what would retard the opposition to catching catfish?" And it's... "Mmmm, ouch!" see.

And "Who or what would pull you back from catching catfish?" would be "Mmmm, ick." That's the way these things fit. You get it? (However the wording of the lines goes.)

Now, finding the goal originally – if you are doing a very good job, an excellent job, if you are right there, right in there pitching – in other words if your Model Session and your auditor presence is good, and if by some accident you can read the E – Meter, what's going to happen? Every goal you find on the pc's goals list that has any sensation or pain in it by reason of being touched and read on the list will be clean as a whistle by the time you leave it.

We're going down the list, we're going down the list, *pocketa – pocketa – pocketa – pocketa*, see, and we've got this goal "To be a waterbuck," see. And we've got this goal "To be a waterbuck," and the guy goes "*whaag*," and so forth.

And one of the things you're not doing right now that you certainly had better do – two things:

A goal that actually bangs all by itself, you put a circle around the X. See? Cross it out, but put a circle around it – because you could use that data various ways. In other words, that means it fired all by itself when I got it all cleaned up. When I got it all cleaned up it fired all by itself – and then went null, of course – but it did fire all by itself. Put a circle around the X. That's just for future reference, and you can very often use that.

And get the pc to tell you when he has pn and when he has sen, and put it down.

Now, those two things you really ought to do.

I used the fact of what goals were rock slamming the other day to plot out what the pc had overts on to run O/W on to turn off a dirty needle, and it's now off. That's pretty slippery,

isn't it? I expect you to do that as a matter of routine action, but I just – I found there were about four or five goals that rock slammed. I went down through the line and I figured out, by asking a few little test questions of the pc, what the pc had overts on that was giving him a dirty needle all the time, and just ran O/W on that. And bang – that was the end of the rock slamming needle. Quite interesting. Pc had to be pretty well in-session before that could have occurred.

But there was the use, see, of notations on a goals list. Let us say a rather unusual expedient, but this was also rather unusual to have a half-a-dial rock slam, see. I had to get it off in order to get anyplace. So I just decided to take it all off in a batch, and I made this test. Took the – took about five goals that had rock slammed and I had noted down on the borders. After they went out I'd noted that when I hit these goals they rock slammed, added them up and said it must be to this thing, asked a couple of questions, checked it out, ran O/W on that and that was the end of the dirty needle. It was just an experimental action, but it worked beautifully.

And this other one, of course, you can figure out which way the pc is going – and you can figure out whether you've got a goal or not by going back and looking at those circled X's. Just look at them, and they had pn, circled X – "pn" and then X with a circle on it. It banged all by itself – goals line, see. After we cleaned it all up, it had one bang in it, and it had pain on it.

Now, we see what kind of a goal that was. It's a hunting-type goal – "I want to get at men, men, men," you know, something like that – goal something like that see – hunting-type goal. Outflowing, hunting-type goal, see.

The next one that stayed in madly, "I want to shove it down their throats and make it stick!" – pn, circle. And the goal we had found is "To kill them all, damn them – to kill them all," you see.

And there's one in here, "To be a sweet and peaceful child." It fired once, but it had "sen" after it. Ah, we see where this pc is built, don't we? We can do an analysis of it and it safeguards us from listing an opposition goal as the pc's goal.

Obviously "To kill them all, damn them, to kill them all," – right in keeping with the rest of the goals that produced pain and stayed in – pc's goal, see. Of course we don't know that for sure after we've listed it for a while, but we can pretty well guarantee it on that spot check. See the use of that?

Audience: Mm – hm.

Yeah, you've got to be slippery. You've got to outguess the pc. If left to his own devices, you understand, the pc would give you the wrong goal, the opposition goal – would insist that you check it out. I never saw the like of it. PCs will sit there and they'll pick some favorite goal, you know – "To wear tall hats in court," you know. They think, "My, that's a nice goal!" you know. For some reason or other, they're enamored of this goal. Do you know that twenty-five percent of the pcs will try to do this, but your Model Session is so rigged today that they can't. If you didn't have Model Session the way it was today, twenty-five percent of your pcs would. They'd lift their finger every time you saw that. "To wear tall hats in

court." They can get it pretty well timed, too. They know at what point to lift their finger off to give you an instant read, you see. [laughter]

Another one is to go into a convulsion. They sell you the goal by going into a convulsion. You know I just never will take a goal that will throw a pc into a convulsion anymore. I just won't.

Mary Sue has a system. She says, "Sit back there and don't you move. Now, I'm going to read the goal." It's a very effective system, too, and she can check the thing out.

But you get pcs going into a writhing convulsion or something every time you read the goal "To put out the devil's eyes," you see. And they love that goal – and they'll actually knowingly go into a convulsion, knowing you can't check out the goal. They are selling that goal, man. They'll just sell that goal and sell that goal. *Wow!*

Well, people commit suicide. We just had a notable example tonight.* Any one of you girls could have done very well with that mock-up that knocked itself off in Hollywood in the last day or so. I'm sure that she would have thought that was quite nice. Here she is going and knocking herself off, you know. The body, herself, see. She didn't have any use for it, why didn't she put an ad in the paper? [laughter]

Well, she's probably crying in some maternity ward right now – and somebody will be saying, "Well give her a sedative." [laughter] Yeah. But they will, they'll just commit suicide, just like that. Got everything to live for – there's the auditor, good auditor, ready to audit him, everything else and then they have got to sell you this corny goal.

They get very anxious, you know – they've got to have a goal, they've got to have the goal, they've got to have the goal! *Hehh!* They've just got to have one regardless – any old goal. So, ping! – off goes the finger! Ping! – off goes the finger. Ping! – off goes the finger. Convulsions and so forth. You'd be amazed what we've seen around here on that. It's absolutely fantastic. It's twenty-five percent of the pcs. That's no small percentage, and they'll do it! And an auditor who will buy a pc's goal is not only a fool, he's practically a murderer.

And yet, man, the sales talk you will get. Why down at the car agency they don't know 'arf. "Well, it's always been my goal, to catch catfish. It always has been my goal. I, you know, studied fishing when I was in college," and so forth, "but I couldn't pass any of the courses." See they've learned all of the rules on which goals are goals. "I was never any good at it. It's always been some – it's always given me a terrible headache every time I go down by the river banks," you know.

And look at all the other similar goals in there! Look at the other similar goals to this, and so forth. "To be a bank teller" – you see, similar goal. Sales talk, sales talk, sales talk, sales talk. It's when it gets that hot you have to pull this Suggest as Assert – when you are checking them out. And you get a marvelous parade of these goals going by.

Well, anyway – you've got to get the pc's right goal, and you can't be overwhelmed by a bunch of wrong goals. And one of the little incidental tests is: You tell the pc, "Every time you feel dizzy or faint, or something like that, you tell me."

* Editor's note: LRH alludes to Marilyn Monroe who committed suicide on August 5th, 1962.

And you've got to tell him that every few goals. He'll forget it, you know.

You've got to ask him, and you ask him if he's had any pains or sensations, you see, and then tell him, "Well, when you get any, you want to speak right up and tell me," you see. He'll keep forgetting it. They eventually will groove in so they will tell you. But you can mark those down, and then by comparing that to the very few goals that stay in – on nulling by mid ruds – you can sort the pc's goal out and know whether you are running the right goal or not before you start listing it. All right, that's a sorting technique.

Now, this is what I wanted to tell you – that you mustn't go *by* one of those goals and leave a somatic on it, whether it's pain or sensation. You mustn't, mustn't do that! In other words you say to this person, "To catch catfish," and he has a horrible pain in his mouth. And he says, "dit." Doesn't say anything to you about it, and you clean off the suppressions and the invalidations, the suggestions, the fails to reveal and the mistakes, and hit it, ask the suppression. You don't see anything on there.

Now, listen there's another test. If you are very alert, the pc has been telling you when he had pains and if there is anything remaining of that pain, you've got a goal behind you which is hung up. And after a while the goals list gets jammy.

Now, what I am telling you is this – that goals nulling by mid ruds turns out to be a *fantastically* therapeutic action. It isn't just sitting there grinding away. Now, if you know this other fact, the pc just comes up shining – if you know this other fact – that you mustn't leave sensation or pain of any kind on the pc when you leave the goal. If that goal turned it on, you've got to get all the invalidations and everything else off of it.

It isn't really as vigorous as it sounds. It only takes you a few minutes to do this. I mean, you just do it, just in the normal course of human events, or inhuman events. Just straight drill. But one of the things that you should make sure of is if a pain came on when you read that goal, *that all of those somatics are gone at the time you leave it*. The somatic, you might say, goes slightly deeper than the meter, so you've got to check. Now, you get to listening to this pc – he says, "To catch catfish," he gets a pain in his mouth.

And you get the invalidations, and you get the suggestions, the failures to reveal and mistakes – just normal, just like you are doing it – you don't have to push for anything else off of this thing. You read it and get the suppressions, and it doesn't read. He's still got a pain down here in his stomach somewhere.

So if a pain came on, you go back and you find out there's a little piece, little, tiny, old piece of an invalidation stuck in there that you didn't get off.

See you didn't ask the invalidation question again. See, you thought you got invalidations cleaned up, but remember you took some other things off. Then when you – invalidation was still a tiny little bit hot. In the normal course of finding a goal it wouldn't be enough to destroy a goal perhaps or keep a goal from reading – but it's enough to keep the somatic in.

So don't go so careful you drive your pc berserk and only get six done in three hours of auditing, but just be careful that when sensations and somatics come on, that you keep taking off your suppressions, invalidations, suggestions, failures to reveal and mistakes. And if they don't all come off, get curious about this, you know. Use another word like asserted,

evaluate, you know, it's almost like a final checkout, only you don't go into a big Prepcheck. You'd be surprised what facility you can develop just to knock off that last little sticking piece, you see.

Well, you can go by one of these things like this, and you say, "To catch catfish," and the pc goes "mmmp." That's it, that's it. You say, "Has this goal been suppressed?" And you don't get much of a response on it. And you go on, and pc had a somatic at the beginning of this goal. Well, if you're having trouble cleaning this, ask him the kingpin question: "Any somatics been suppressed on this goal?"

Because what happened is you said, "To catch catfish" and the pc put on every brake in the bank on the somatics. And somehow or another it doesn't cross in his mind. And if you didn't know this, you would go right on down the line, *pocketa-pocketa-pocketa*, and you'd leave that goal hung, and the accumulated hanging up of four or five such goals then leaves the pc rather uncomfortable by session end. And he shouldn't be uncomfortable by session end!

If you do goals nulling by mid ruds properly, your pc is just as smooth as silk – much better at the end of a session than at the beginning.

Now, if you don't do this – and one other factor added, which is the reassurance factor – if you don't do this, your pc is going to get nervy, anxious, upset. Only one other thing can make him that upset, and that's to go by his goal and not find it. *Ooohh* God! You remember Henny Penny and the sky was falling, you know? That was *thyeh!* That's purely a fairy tale compared to a pc whose goal has been passed on the list! His goal was "To catch catfish," and it's back there now about three goals, and he suddenly starts waking up. "Are you sure you can read the E-Meter? Yes, well, I have quite a pain in my side here. Why don't you hear what I am telling you? The room is much too hot."

Here we go, you know, you can't keep the session together, you can't keep anything, it'd just go to pieces. You pull missed withholds, you pull more missed withholds. It doesn't do any good – the missed withhold is the goal. It gives all the responses with exclamation point of missed withholds. All of them occur right at that point, except he might not wake up for a half a page, see. If he'd just wake up that instant that you tried to leave it, or something like that, but they don't. It goes by, and when it's well by, the pc says, "Hey, where are we going? Where are we going?" He gets a set of Dunlop tires, you know, puts skid marks on the auditing track about a hundred and fifty yards long. He isn't going anyplace.

Poor auditor. And by the way, this is complicated by the fact that pcs can also act that way *without* their goal, but not quite so much. It's a matter of degree if you are leaving somatics on the goals as you go by. Then the pc starts getting nervy.

You went by one, "To be a tiger," and he went "*Ooohh*." Then you went on to the next one, "To eat waterbuck." He's still going "*Ooohh*." He never got out of the tiger deal, see. He's still there; he's still got sensation on this thing.

If you picked up – now hear this real well – if you picked up all the invalidation that you would normally get in a session – not backtrack or anything – all the invalidation, all of the suggestion, all of the "failed to reveal," and all the "mistake been made," and all the sup-

press – if those things were all picked up – no somatic or sensation would be left on any goal contacted.

Now, add that in to the other side of this which is, if a goal has been found that is a wrong goal, even though it has been listed, and upset the pc, God help us, if you take all of the suppressions, invalidations, fails to reveal, you see, and mistakes off of that wrong goal, your pc will come back to battery. Get them all off. Man, you really have to get in there and sweat. It isn't that it takes a long time to do, it's just that it takes an accurate look over. You have to get them all off; why, the pc will come right back to battery.

There he was with two feet in the grave and both of his hands on banana peels, and he'll come right back out – and he'll come right back out. It's quite remarkable.

Now, if a pc has had several wrong goals found on him, one after the other, take them in sequence. Take every goal that has been found on you. Not found and proved out, see? Every goal that has been found on you, like goals that have been suspected and goals that you had to have checked out the next day but they didn't check out. You get what I mean now by every goal found on the pc? Whether found and proved, or just, you know, just found. And you can even add those he was "absolutely sure were his goal," see. And just make a list of those things – just write them all down in order of sequence as they happened, see. Clean up each one with nulling by mid ruds. Pc will feel wonderful. There will be no liability to having found wrong goals. That's very well worth knowing, isn't it? That's patch-up.

Now, that doesn't mean that you can do a careless job of goals finding or a careless job of listing just because you can patch it up, because the patch-up is never quite as good as the original article. It's something like a rebuilt – a rebuilt typewriter, don't you see, or a rehabilitated girl. They are never quite the same, sleek condition as the original article, but it permits you to go on and find the right one without any consequences. Got the idea?

You – well you see it yourself. You list five thousand items on a wrong goal, and wow! Well, there actually would be no reason whatsoever to take the time necessary, you see, to erase every single, slightest thing they had ever done or said in listing.

You'd clean the goal up is what you'd do, clean it up so it's slick as a whistle and you can't get it to fire, you can't get any of the other things to fire and you can't get a couple of others to fire as I just gave them to you. Can't get anything to move now and it all appears fairly clean. That's good enough – now you can go on and find yourself a new goal.

Don't say the pc won't – he won't feel bad about it, but he'll look a little seedy around the edges if you've gone that far. You understand? Don't expect him to come out clear and shining. If I left you the idea that they would come out into a cleared state, then we would have a new method of clearing. You just find a wrong goal on the pc, list it and then clean it up. [laughter] No, there is no substitute for doing it right in the first place.

Your actions here in doing that – I want you to know this real well – in doing these drills on this bulletin of August 1st, you've got two things that if you want to keep a pc really shining you must do: is polish up any goal that has been found, or is being found, or anything else. In other words get the sensation, somatics off any goal as you go down the list, see. Or if you are picking up a pc who has had the wrong goal found on him, then get every wrong goal

that was found on the pc and clean all those things up, see. Cleaning up the goals – that all comes under the heading of it. And if you go down the nulling list, and you go on down the nulling list, *pocketa-pocketa-pocketa*, on through – clean up every one you go by.

Don't say, "Oh well, to wrap peppermint candy around lampposts in Chicago, there's no sense in cleaning that up. Obviously isn't the pc's goal, *ha-ha-ha-ha-ha*," you know. "To wrap peppermint candy around the lamppost in Chicago. Thank you. Has that goal been suppressed? Thank you, thank you very much." Next goal, you know.

You'll find yourself doing that sometime late at night. No, be alert. Even though it's a PT thing, there might have been a nice somatic on it, or there might have been some sensation on it that might be in. What the hell is he doing putting down a present time goal like that if it isn't on the goals chain. Don't you see?

Clean it up just as carefully as you would clean up – as though it were the right goal. Now, you treat every one of these goals of course then – just in summation of that – treat every single one of these goals as though it is *the* goal. They are all *the* goal. The moment you get onto them, it is *the* goal until proven otherwise.

And the other one is the reassurance factor. And that is the other thing. That isn't necessarily the two main things in auditing these things but these are the two things that will get you in most trouble. By omitting the reassurance factor. You've never heard of it before; it's time you did. A pc needs some pats on the back when he's going over the jumps on this. "Heeeyyy, wh – wh – where – where – where's his goal, you know, where is it, you know?" And he thinks of terrible situations and the horrible things that are going to happen, you know, and the terrible awfulnesses of it all if he doesn't find his goal, or supposing it's behind him. Worry, worry, worry, worry, worry, worry, worry – see.

Well, you best counter this with reassurance. Do a perfect job of auditing, but don't sit there like a wooden image with never a pat on the back for the pc. Tell him once in a while, "Well take it easy. I'm cleaning each one up. Now, as a matter of fact, I overclean and that is the reason why you are a little bit upset. I sometimes clean a clean on you just to make sure. That – that's all right, I'm just – everything is going along fine, and you are doing fine. We've got a long way to go now. You just keep telling me when you have somatics, and you sit there comfortably, and when you get dizziness or sensation you tell me, too. Everything's going to be fine." Got the idea?

You make that pervade your goals-finding sessions and by keeping them all clean as you go by them and reassuring the pc – not falsely, it's perfectly factual – he'll be all right. Why, you'll have much easier, much happier sessions. Those are the two primary things.

Now, there are several secondary things to all these things, and there are other things of importance on this, and I actually haven't really begun to fire on the subject of goals listing so we'll have to continue into the second lecture.

Thank you.

Thank you. Take a break.

Routine 3GA Data On Goals

Part II

A lecture given on
7 August 1962

Thank you.

Well this is lecture two, 7 Aug., AD 12, Saint Hill Special Briefing Course and we're going on with goals, Routine 3GA, how you do it. Let's start more cohesively and coherently and more abundantly at the beginning of the concisity.

You get the pc to do a goals list.

Now, I told you there was another remedy for a lost goal. You know, you found the wrong goal and everything has gone to hell. To make the pc feel better, just get him to list some goals. Now you can keep that as a stable datum. The pc feels bad because of any 3GA, get him to list some goals, see.

Now, that's a stable datum. No matter what else you do, also get him to list some goals. In other words if you clean up the wrong goal that was found, get the pc to list some goals. How many? Well, until he looks better. Well, in session? Not necessarily.

Now, you'll find out that you'll be tossing this off as an auditor back in your own bailiwick or organization quite often and you will learn rather rapidly that this is a way of pulling somebody out of the soup while you are sitting there with a telephone in each hand, you see, and a preclear on the couch and one in the chair, see. And at that moment a fourth party walks in the door, you see and says, "Oh, I'm in terrible trouble. Last night my wife threw me out and everything is going to hell in a balloon and when can you give me some auditing?" You see?

And you say, "Well..." The best thing to say, "Well, just as soon as you've got another 250 goals listed." And they say, "Oh, I couldn't think of that." Well, you just say, "*Do it. Do it. Do it.*" You know, "*Do it.*" You know, "Two hundred and fifty goals. *Do it, do it.*" You know, "Get them listed, get them listed. Thank you. Thank you. Don't talk to me again until you have them listed," and so forth. And they'll come back, they'll feel fine.

It's the darnedest therapeutic measure you ever, you ever had to – that. And you'll find out that that is dead right. You'll use this. You might not think now that you would, but you will. You'll find yourself using this. The guy's caving in. You know what you've got to pick up. You've got to pick up his missed withholds. You know this and you know that. And

you've got to get a ten-hour Prepcheck going on his past auditing. And you've got this and you've got that and you've got these other things. But you haven't got time to do it. So just tell him to list some goals. Got it?

It's a panacea. If somebody is dying or something like that, it might not work. They might not be able to write or something like that. But short of that – short of that, it'll handle almost anything.

Now let's expand this just a little bit further.

Listing of goals doesn't depend so much on how many goals as upon how much charge is remaining on the needle. It's not charge on the tone arm. Let's forget everything said in Routine 3 on the subject of moving tone arms. It's moving needle. How much is that needle moving?

The devil with the tone arm because you can make mistakes, the auditor, the environment, other things and when you really start running the mid ruds on every goal, you're going to get tone arm motion which wasn't there when you simply read the goals off. So that test becomes invalidated the moment you move in with nulling by mid ruds. Because nulling by mid ruds is, basically, running rudiments and rudiments is moving the tone arm and it's not the goals moving the tone arm, but how can you tell the difference? You're doing them both at the same time.

Well, so therefore moving tone arm is no longer a test for whether a goals list is complete. But a moving needle is.

Now you're going to want to know when is a goals list complete. And you say to the pc six goals in a row and each one fires a quarter of a dial. That is an incomplete list. You needn't do any more than that. See? Just, "To catch catfish, to run down waterbuck, to shoot game wardens, to have a high hat in court, to be a student and never to have anything to do with Instructors." And just read them off, one right after the other and you'll find out how much do they kick? How much does each one kick? And if they kick more, on an average, than a division – that's one of those little black line to black line, see. It's about – I don't know what that division is. I should measure it some time on a ruler. It's probably three-eighths of an inch, something like that. I don't know what it is. And if they're kicking more than that your goals list is not complete. Any kick that you get on them, if it's more than that, your goals list is not complete.

Now there's something more. If one kicks out of five or something wild like that – you understand this is just a guesstimate, approximation, because it will vary so much, various parts of the list – if one kicks out of the five, why that's enough and that one kick was just that. That's not cleaned up or anything, you see. That's just one three-eighths of an inch kick. That goals list is very nice or the pc is mad as hell at you and the E-Meter is totally inoperative. I think you could tell the latter.

If the pc's even vaguely in-session, why, that read – you read six goals to him and one, two, something like that, kick, just that much, you say, "*Voilà.*"

Now it's "or less" it's not "or more," it is "or less." As long as that needle is kicking a third of a dial, quarter of a dial and is kicking on four or five goals out of six, that list is not complete.

Furthermore, the goal probably isn't on it. Ah-ha-ha. And that would be very important to you. I can see you now, going on and on and on and on and on, nulling down 1500 goals very laboriously and then find out the goal wasn't on it. Well, there's a way to tell whether or not the goal was on it and that's how much charge is on the list. All right.

Now, rock slams don't count.

The rock slam has been the subject of considerable study by me lately. And I learnt a great deal about rock slams and they're all "failed to reveals," but actually "failed to reveal" is insufficiently powerful as an auditing command to pull off one of these big, heavy rock slams. It'll take off one of these little – these little quarter-of-an-inch-wide rock slams that you get, what you call a dirty needle, but when it's slamming half a dial, it's overts and it only comes off with overts. And it's usually overts on the auditor.

When you get a pc sitting down there and then this thing – about every third goal you get a quarter-of-a-dial rock slam, half-a-dial rock slam, something like that, watch it, bud, watch it, because that's overts on the auditor and it's O/W on the auditor that you'll probably find is the most efficacious.

If not on the auditor, then on whom? Well, you better find any goal that rock slams, add them all up and find out on what it is. You can make little hunt and punch tests. You can eventually turn on the dirty needle and the rock slam.

But of course "failed to reveal" makes the thing go. That's quite valid. In mid ruds, just "failed to reveal." This other is an O/W situation. This is readying up the needle and that sort of thing. But if you're reading off a goals list and you're getting this nice little tick and it's going tick and tick and everything is fine. You get one ticking out of ten or something like that – that's dandy. Everything is fine and all of a sudden a half-a-dial-wide rock slam turns on. Had nothing to do with the goals list. Nothing to do with the goals list. It has to do with *overts*. And of course that will compare to the goals list some place or another, but you couldn't care what it compares to. *It is overts*. Of course, the goals list charges up the overt but that's beside the point. And if you don't expect to go the whole session spending 50 percent of your time cleaning up a dirty needle, cleaning up a dirty needle, cleaning up a dirty needle, you had better find out what the hell all these overts are on.

Normally it's you. You see?

You clean them up as overts. You understand that a withhold is in place because it is the – you know, makes the problem with the prior confusion. You see? The overt is the prior confusion and it's the overt which makes this hang up. Now, when you're getting a rock slam, why, it won't come off by pulling the withholds, you understand. There's too much charge on the prior confusion, you see.

So you just keep pulling the roof off of the Niagara Falls, you see. You keep going out there with a dipper, you know, as it goes over the falls and you get some water, a little dipper

full of water and you pull it over on the side and you say, "Well, I'll get this river bailed out eventually. One dipper at a time." See.

No, no. You've got to ask for Niagara Falls before it disappears and then it as-ises nicely. In other words if you can't get rid of a dirty needle on some pc, you'd better right straight back into the prior confusion proposition. In other words, it's just overts and no more nonsense about prior confusion.

The reason why you get a dirty needle, little shivery needle like that, it's a "failed to reveal," you see. One little tiny thing, it's about, oh, an eighth-of-an-inch wide, quarter-of-an-inch wide, something like that. Yes, it – that's all it is. That's just a "failed to reveal." But if you went shopping you would find an overt you see.

There's no reason to go finding overts, however, little buggy stuff like that. It turns on once in a while and turns off again. But, when one is coming on persistently it'll very often be accompanied by a half-a-dial-wide rock slam, which is completely unexplainable. And that half-a-dial-wide rock slam is simply overts in magnitude and it doesn't pull by pulling withholds. You have to get the overt.

A withhold stays in place because it has a prior confusion called the overt, you see? A fellow walks up and shoots the cop and after that he won't talk to people about police.

Well, you can pull all the times when he wouldn't talk to people about police and just find more times when he wouldn't talk to people about police. You get the idea? You eventually have to shop around and find out what's causing this constant and continual hang-up.

Well, you finally get it out of him, he shot a cop. And after that you haven't any trouble with the withhold. You see?

A withhold is always the manifestation which comes after an overt. Any withhold comes after an overt.

So, for that purpose, somebody suggested the other day we ought to call it the overt slam, and it would make more sense to one and all.

But that doesn't count as to whether the goals list is charged or not. That doesn't have anything to do with it. That is simply overts the pc's got which are expressing themselves.

In other words you could have a complete goals list which every once in a while turned into a dial-wide rock slam. It hasn't anything to do with the goals list. It merely has to do with overts. You follow that?

That's very important to you, because otherwise you see, you could get all messed up. You'd say, "Look how charged this list is! Look, I read six goals and I get three down the line and it's just fine and then here is this enormous rock slam that turns on and so forth, and so therefore we'll have to go on listing goals." No, no. Therefore we'll have to go shopping and find out who he's got overts on. You get the difference?

The person by the way would be very, very hard to do a goals assessment on who had that situation. Very hard to do. You'd have to be very slippery. And so you'd better – you'd better do a little more Prepchecking and get those overts off. Find out where they are and they

usually are on the auditor. After all, it's when the auditor's auditing them that they turn on, isn't it? Well, it proves itself, doesn't it?

When he's not on an E-Meter he doesn't rock slam.

You can prove things to a pc like that. Get them to own up.

All right. Now, supposing you had somebody list 850 goals. You just walked up to them and you said, "Oh, you're going to have some 3GA. That's fine. Swell. I'm going to audit you. That – that's good. That's good. Well, you'd better be getting your goals list in order." And they say, "Urp" or "Ulp" or "Yes" or something. You just keep on giving them the auditing command, you see? Out of session. You just want them to get to 850 *goals*.

Your first auditing action is to test it. Just keep kicking them in the head until you've got 850 goals. There's no reason to look at it or do anything about it until you've got 850 goals. And there's no real reason to spend any auditing time on the pc until you've got 850 goals.

This is just in the interests of saving auditing time. And you'll find out they will fool around and they will go a week or two without adding anything to it and *oooh*, then they can't think of any more and that sort of thing. Well, naturally you could pull the – you could pull the mid ruds on the subject of listing. Clean up the mid ruds on the subject of listing and it'd help them out and they would go on like a bomb. Well, why do that? It's their life and their future. Why be so helpful? Say, "Well, the only thing at stake is your next 200 trillion years. Suit yourself." Usually it's just as good as a Prepcheck in the bag. [laughter] And get your 850 goals on a list.

Specify that it must be on legal paper, that is thirteen by eight as paper normally is. It can be fourfold paper, that is two pages connected at the back. It can be lined or not lined. It is usually best if it is lined, legal. And one column of goals on it only.

And let it be *legible*. But have them do it *legibly* in the first place or have it typed by somebody.

For *God's sakes* don't have the pc *copy it!*

Don't let the pc *copy his list!*

Don't let the pc *read his list!*

Don't let the pc get in front of an *E-Meter* and see *what's live on the list!*

You just tell him to list and if he does anything else you'll have his thetan. You understand? That's quite important. The pc can turn on the wildest mess of somatics and get sicker than a *pup* and be completely unauditible. And you'll say, "Good God, what's happened here?" Oh, nothing. He's just read his list over to see what's on it.

You see? That can happen to a pc. Don't discount it. He's holding in his hand a double-barreled shotgun with both barrels pointing straight at his head. You see?

Pc should not read list over to self. Pc should not copy list. Pc should not go by self to an E-Meter to see if he can find own goal. Confucius say, he better dead. He better dead, man. I've seen a pc just 'op out, around the bend on this, you know. Pretty goofy.

In other words, he's at perfect liberty to write down his goals legibly on a legal sheet of paper so that you can read them. And that's what he is at liberty to do and that's all he's at liberty to do. And that works for any goals list he does. All right, now what do you do?

We've talked a lot about Prepchecking and doing this and that. Yes, it's a very good thing to have a pc very well Prepchecked by the Routine 3GA auditor. Very good. And have listing and goals and things like that cleaned up, as the first action. And as a matter of fact you could do just that, you see, with some pc who wasn't coming to you constantly. You could do a Prepcheck on goals, you see, and then you send him off to do his 850 list. You see? That's a good plan of operation.

All right. He comes back to you and you read the first six goals and it goes *bang!* *Wham!* *Bang!* Eight hundred and fifty goals he's listed and it falls off the pin. As a matter of fact you're in fear of the Mark IV's life, that the pin will do a corkscrew. This list is charged. What do we do now? Well, naturally you could list the pc up to 3,962 goals, couldn't you? But that is rather lengthy. Now, why? One, the goal isn't on the list. That doesn't mean you never null it. But the goal isn't on the list. That's the first thing you know. He's listing all four lines on one list. You see? He's the – he's the mixed-up kid. You see, he's putting them all down consecutive.

So, your first action on doing something like this – it doesn't matter really which – which one of these two actions is first: There's two actions here. But the first action which I would do on this is I'd get him untangled on the subject of which goal belongs where. And I would run the four lists with "your goal" on each list, with, "What goal might you have?" "What goal would oppose your goal?" "What goal would retard opposition to your goal?" and "What goal would pull back your goal?"

Now for sure somebody's going to think that we mean to put his goal in there. No, no. We mean just those wordings. Just that wording. We don't know his goal yet, see?

"My goal? *Ho-ho!* *What? What? Who? What is it?* I don't know what my goal is."

"Well, all right. Answer the question that's ... Yours is not to wonder why I am asking the question, yours is but to furnish me an answer thereunto so I can write it down on this sheet of paper."

He gives you four-listed goals, suddenly. When he's given you about sixty on each list, you throw away three lists and keep one. Keep the first list and put it on his list that he's done. Throw the others away. You care nothing about them. They're probably not even accurately... See?

But the probabilities are in favor of "What goal might you have?" as a list adds sixty goals to his list. Okay? Got that? That straightens his skull out on the subject of what he's listing. You all of a sudden will have some fantastic automaticity roaring off, if you've – if it's gone like this, see.

And listen now, this is a good thing to do in any event. You see? This is nice to do in any event. Don't necessarily keep it to a specialized case. It's very nice because it straightens things kind of out for the pc. He's liable to have some fabulous automaticity roar off.

You say, "What goal would oppose your goal?" and all of a sudden all the bad nasty mean goals that he didn't want, that he was putting down on his list go tearing off. He identifies them that fast as opposition goals and after that you don't have them occur on the list.

Now, don't think this is going to clear him. Don't anybody get the sudden idea, the sudden brilliant – now wait a minute, maybe Ron didn't notice this, but you know, if you continued that on to 4 or 5,000 goals on each list he'd go Clear! Or suddenly his goal would spring out and he would know it himself without any nulling – because it's already been tested. It didn't work. You could list four lines of items, just "Who or what would have your goal?" and that sort of thing, but before you've listed fifteen you'll wish you hadn't – fifteen on each list.

I mean that's – that's a *thaaaagh, bluhhhh*. In other words items listing, thinking that will go to Clear. It won't. That's been tested.

There's another system of taking a whole bunch of terminals "Who or what would have your goal?" See? Get a bunch of terminals and then assess those and find one that sticks in and then find goals for that terminal, see? That's awfully interesting but that hasn't worked either. I'm just telling you what hasn't worked, too. There's been a lot of work in this direction.

Now, what's that do. That discharges the living daylights out of it. That gives him some idea of opposition goals and that sort of thing and it takes a lot of charge off the list in a hurry, see.

All right. Now let's get rid of all of the goals he thinks are goals but which are solutions.

Now, all goals that a pc thinks are goals, except one, are solutions to problems. All goals are solutions to problems except one. And that's postulated and it's not a solution to nothing. And everybody can sit around and regard their navel in contemplation here, trying to figure out how come a pc would have one sitting out in thin air that wasn't a solution to a problem, but I'm sorry but that's just the way the thetans that are here on this track at this time are built! See? That's what they done. See? And until I find some other explanation for it, that's all. They just postulate. That's prime postulate for the universe of self. And it doesn't depend on a solution to any problem. It solves nothing. He just did it. Just out of the goodness of his stupid little cotton-picking heart.

The rest of them, in any GPM – any given cycle or GPM area, are solutions to problems. See?

He gets beaten up by all the boys in the neighborhood, so he has a goal to beat up everybody. You see? That's a solution to a problem. To be able to punish at will. See?

He's been in jail now and then, up and down the track, so he's finally developed a goal "to escape." You see? And then he – this will go off into all kinds of odd panels, like "to escape the consequences of life," you see? "To get other people to escape the consequences of life." "To hate blue uniforms." You see? And they'll all be mixed up with this problem of getting put in jail. They're all solutions.

So the pc, well, he can figure himself crazy as to what is a solution and what isn't a solution, but you'll find that most pcs as they sit there, only accept as a valid goal that thing which they know will solve the problem they have: The chronic present time problem.

Now, we had these last year and they were getting in the road of our goals finding and they do get in the road of goals finding like mad. The guy's got a chronic present time problem. It actually hasn't anything to do with his goals line. It just happens to be a present time problem. Of course it wouldn't be a problem if it was on his goals line. Think that over for a moment. See?

It wouldn't really be a problem, see, so it must be something else, there must be some other thing. Well, he'll sit there and give you a long and involved list of solutions to that problem and call it a goals list and it drives him almost around the bend, see. He keeps – because man, you try and run this something. Try to run this process on somebody, "Solve a..." – "Think up a solution to your problems. Thank you." "Think up a solution to your problems. Thank you." "Think up a solution to your problems. Thank you."

Next thing you know the mass is getting massier and massier. He's wondering what's going on, you know. It brings the masses right in on him. "Think up a solution to your problem." Bum show.

Now a goals list, oddly enough, would be composed of past solutions so that would run them out. So that would be very therapeutic. But the guy who is sitting there with a chronic present time problem... Let us – let us say this fellow has a – has a farm. He has a big farm, see. And the government's gone bankrupt and can't run it for him any more and he's sitting there with cows and horses and sheep and wages to pay and everything and no subsidies.

And he's got this. And he's had this for quite a while. Morning, noon and night he's done nothing but think about this. Do you know what kind of goals he's going to get? "To dispose of sheep at a large profit," "to do lots of work," "to pull off miracles," "to be an economic wizard," "to make things grow better," "to make more production." See? They'll all have to do with his PTP. And you'll just get reams of stuff on PTPs. And this is why you develop these long lists because the person starts thinking up new solutions to PTPs.

So this is the gag: After you've done this four goals, that separates out the sheep from the goats and tells him which is him, to some degree, that smooths that out, takes some charge off the list, pull this other one: "What problem would your goal or might your goal be a solution to?" That is very charming. You make a laboriously written list of these things so you can throw it away. [laughter]

But what problem would your – might your goal be a solution to? Whatever the wording you use. I couldn't care less. But it's what problem would your goal be a solution to? That's what you're trying to find out. You're trying to find out a list of problems.

And the guy says, "*Oooh*, this bird with the farm," he says, "*Oooh*." "To run a farm profitably," "To get my hands paid," "To make things better on the farm," "To produce agricultural machinery without paying for it," "To sell hay at high prices – how to sell hay at high prices in summer," "How to get cows milked for nothing."

And the next thing you know, why, he says, "What problem?"

You can actually sort of run this thing on down. And he'll sort of realize, "*Ha-ha-ha*, this has nothing to do with my goal. I mean that's all different."

So "might" doesn't hang him with having misanswered the auditing question you see, as "would" would.

Get yourself a nice list of problems. How many problems? I don't know. How many has he got? How many thousand? Oh, no. Nothing like that. Dozens is the order of magnitude of this problems list. It's just dozens.

And all of a sudden he'll – he'll suddenly realize that he's been sitting there waiting for a goal to... Now this is what's – this is what's the killer. This is not for getting the goal on the list. This is for getting nulling done. Because your pc is not going to pay any attention to his own goal as it goes by if it doesn't solve his chronic present time problem. He's waiting for a goal to come up that makes farming economically feasible. See what he's doing. He doesn't give each goal as it goes by its proper weight and interest just as a goal. He's waiting for a specialized goal to come up. See? And he turns each one over as regard to his chronic present time problem. "Let's see, would this goal help me run the farm? All right. Well, this couldn't possibly be the goal." And right away goes sort of out of session, you see? He fades out on you. And he's all ...

"To catch catfish," you say. "Ah, no, that wouldn't help run the farm. No. To catch catfish, that isn't it." See? See it's a problem in attention. The guy's attention is so stuck on current track that he just can't hear anything. It's not that you will miss the goal. It just makes it harder to get. Because the pc's sitting there all the time he's waiting for how to make a farm, see? His whole problem, see, is how to make a farm solvent. You read off a list of goals, he hears a list of solutions to his chronic present time problem. He doesn't hear his own goal when it goes by because that's something that's long ago and far, far away and he ain't 'ad nothing to do with it for a long time, you see.

So it has nothing to do with his problems today and it's all invalidated anyway. And there's nothing you can do about it. See?

So this trick is to get his attention centered around for nulling. And that's why you make a list of these problems, you see. What problem might your goal be a solution to? And he'll give you all these wild problems.

Now, you can go on with this too long. You do – start doing three, four-hundred of these problems in a list and your pc's bank is going to start to get kind of gooey, because remember you're going up against the problem and to list problems is therapeutic but to repeat wrong goals and so forth, is not.

See? Because he's more or less inventing these goals. He's guessing at them and so forth. You'll find out that it will run itself out of the zone and area of therapy. Actually your tone arm starts going up kind of stickily. You can kind of follow it on the TA, you see, it starts getting a bit sticky and gummed up. You better come off it. But you've gotten that out of the road. Now you can ask him another question and add to his goals list.

"Now with all of those problems out of the way, supposing those problems were all cared for, what might your goal be?" And list some goals. Get the trick? "Well, just supposing you had all those problems handled that you've given me now, we've got the list here." We're not going to tear it up in front of his face, but, we're going to lay it over here to the side: "Supposing you've had all those cared for now, what would your goal be?"

"Oh, well that's entirely different. Oh, yeah, what would my goal be if all those things were handled? Oh gee, oh God, that would be a ball. You know. It would be marvelous. To dance amongst the daisies, to whistle at blondes," you know. You get some interesting goals that he's had as goals.

In other words, that's just a method of taking a bulldozer, you see, and just shoving first with this four list all the oppgoals off of his list so you haven't got that automaticity to contend with and then shoving his problem solutions that are chronic and current, that are really worrying him, off of the list and now you can continue the list until it's in this kind of shape so it will only give one tick every now and then. And you're not going to go up to 3, 4, 5,000 goals, see?

And all of a sudden the goals you start putting down after you've done these two tricks, see, these goals you get are going to be much more sensible. They'll look more like goals. You know they – "To communicate well," "To have a ball," "To get my own way," anything you could think of.

It will be any usual goal but it won't be, "To turn all the firemen in Chicago into ibexes." That type of goal is never found on a pc as *the* goal, don't you see.

"To run and run and run and turn around sometimes and come back so I can see where I was going when I wasn't there." [laughter] You seldom find that type of goal on a pc. You see?

Whereas you actually, in listing out things, when you start to run to your 2, 3, 4,000 list of goals, you'll get a lot of those things on there and they're just a waste of time.

So that's a way to cut your goals list down. So that sort of handles going on and on and on and on and on.

Now your next action – that's important because some goals lists tend to run awfully long before they are finally discharged and that helps them this way.

Your next action in handling your goals list of course, is to null by mid ruds. Now there's a very good idea to prepcheck before you do a nulling, any old goal that has been found rightly or wrongly or been hinted at or evaluated on the pc. Put those down ahead of the list. Any goal the pc has had. I don't care if it's been prepchecked before, see. You know, he had this goal – he was in a course – he was in a course some place a couple of years ago and he used to set goals for the session all the time and finally he put this down on his list and somebody found it on his list and it was in, you know, that kind of thing and they didn't ever really get it to pan out, but he thought for a long time that was probably his goal. Or something he was terribly fond of as a goal, that didn't pan out and he's been mad at it ever since. Or a goal that was found wrong and listed on him or a goal that was found and not listed or

3D Criss Cross was run on it. You see, any type of goal like that. Get a nice neat little list of them and put them down ahead of the goals list.

I don't care if it's been done before, don't you see, because in the meantime he's still going to have a fondness for those until his actual goal is found. And he's going to think of those once in a while. He's going to invalidate them once in a while and he's going to muck them up once in a while, see. And maybe his goal is "to get myself in a hell of a fine, ruddy mess," you know. You never know.

And he can sure do it with some old half... half-gone goal, see. You put that – just put that in front of the list.

All right. Now, you've got those things. Now clean those up and then start in. There's several ways this could go about, but kind of the way I would favor would be to run a whole prep – get those gone, see, and then just run all the mid ruds or any variation of the mid ruds on your goal, (quote) "Your goal," – (quote) "Your goal." That's a completely different Prep-check. See? It's not "On goals" or anything like that. "Has your goal been suppressed?" You see? You get these things out of the way, these old ones and then let's do a, "Your goal," just to make sure. And it sort of gets the wheels straightened out. They've been going round and round maybe for – oh, for some people they've been going around for months or even years, "What's my goal? What's my goal? What's – what's – I wonder what my goal was?" And they finally go to fortune tellers, take up Ouija boards, anything.

And you just – you not only then get the known ones out of the way, but with this basket, you know, why, you just get all the unknown ones that he hasn't mentioned out of the way, too. Just prepcheck it. Just as though you had it on the list. See?

So you'd have "To catch catfish," "To be a waterbuck," "To run and run and run and knock all the firemen in Chicago into cocked hats," and "your goal."

Get the idea? So that merely becomes part of the goals list, any old found or suspected or hoped-for goal you see, that's been worked over. Then this item, this goal, "Your goal," see, you're handling that in turn with a very careful nulling by mid ruds. See? You make sure that you get it all polished up, see, so that it doesn't bang on anything. And then sail on into his list.

Now, because they've come off against a plot of time from early to late, in other words he's listed these things consecutively, there is an argument, a heavy argument in favor of nulling them that consecutively because you can keep them cleaned up more – earlier. See? The earlier to late. And you null by mid ruds from early to late. See. You've got your list now, now null again from early to late to approximate the cycle of getting these things off.

You could also make a case out of from getting late to early because it possibly would be in the greater number of cases that his goal would be late on the list rather than early on the list; but then we take somebody here the other day, I think, I don't know how early the goal was on the list but it was practically first page.

So that argument against it really isn't valid, and starting from the beginning and going through to the end is the recommended way to do it.

All right. We tear on through that way and we clean each one of them up, as I was telling you about in the first lecture, and your pc should be looking as fine as silk.

Now when do we prepcheck this? Well frankly, if you do this trick, if you do this trick, you don't need to do too much prepchecking. When you've done your beginning rudiments if you will then run ordinary mid ruds before you go into the body of the session, with "Since your last session," see, not "In this session," you see, but "Since your last session." ... "Now, when was your last session?" The fellow says, "Well, it was yesterday afternoon, we finished up at 4:30." You say, "All right. Good. Since your last session is there anything you have suppressed?" See? And do those repetitive, like you do the beginning ruds, you see. Don't do them a fast check, do them repetitive. Because the pc when he's doing goals nulling does mighty silly things. And we've already caught two or three fellows off-base who come in and they went out with the tone arm, you know, the tone arm was sitting there at 2.75 and they come back in with the tone arm at 6.4 and the needle is going *bzzzzz* and they say, "Now, since the last time I audited you have you done anything you are withholding? That is clean, thank you."

They didn't do anything. They read their whole goals list and tried to find it on the meter. No, they haven't done anything, see? *Ha-hah*. Well they're not withholding it. They would have told you if you asked. They've just about thrown their case into a cocked hat, see. And people do silly things while their things are being nulled. And they get anxious and they get upset and they experiment around and they wonder if there isn't some easier way to find a goal. You can expect pcs to do all kinds of things like this. So in nulling sessions if you say, "Since your last session is there anything you have suppressed?" done repetitively. And then do a fast check afterwards. Fast check the mid ruds, see, on the same thing. Now you're sailing because you're not now going to have the interim time between sessions gumming up into suppress and failed to reveal and dirty needles and all of this other kind of thing. In other words you're sailing now and it's well worth doing it. And after you've done it a few times, why it is very easy to do. It's not a very lengthy action. I did one the other evening, I think, in about, I don't know, about seven minutes, it was *whiz, whiz, whiz, whiz, whiz* and it was all clean and everything went along beautifully.

All right, now. That is a very good thing to do for a goals types nulling session, in other words, "Since your last session." Not "In this session," but "Since the last time you were audited," whatever you want to say. That thing is all clean. Now you've got that interim check, you see.

Now, if you only want to go through that once and so forth, you could do your fast check on the session. See. "In this session," *brrrrrrrrr*, see? And that caught anything he mucked up in – while doing the repetitive check, see. And that might clear that up. But that – this is now getting very nice indeed because the pc by this time will practically be crawling through the meter to get onto his nulling. So you can be just so cautious without knocking the pc out of session on the basis of no auditing. See?

The worst auditing there is is no auditing. You know that. That is the worst there is. The worst auditing there is is not an auditor who can't read a meter, who will not do TR 4, who this, who that, who the other thing. The pc's opinion, I don't care if this ruins him, gives

him somatics, puts him sick in bed, I don't care what this does to him – to him, no auditing is worse than any auditing.

That is something for you to remember. Because no auditing sometimes is what lies back of your pc's lack of progress. You're just being *too confoundedly picky*. You're just being *too confoundedly careful*. You're saying, "Well, I know we did a Prepcheck during the last three sessions, that we've been prepchecking 'listing' as a subject. I know we've been doing that, but in actual fact, in actual fact, prepchecking demonstrated there that there was an awful lot of preparatory work to be done. So instead of nulling today, instead of nulling today, why we're going to go back over all of the Prepchecking we did and straighten that out."

Then you wonder why you can't get any rudiments in. No rudiments will go in now. You see? A pc will stand for so much, but sometimes a no-auditing occurs in actual auditing and it's one of your chronic difficulties in auditing, is the pc is getting no auditing.

Now, when you start sailing on a goals list and start nulling on down the line, your own heart is going to be in your throat many times. You will go to goal number 789 and honest to Pete, this thing never ticks. There's hardly any valid... You pick up the suppressions with a tiny slow and – and *ha-ha-ha-hu-huh*. Is the pc in session? Is the pc responding on the meter? What the hell is going on here? See?

Well, possibly a lot of things could be going on there, but I think it's just routine. After you've cleaned up just so many goals the pc stops invalidating them and stops suppressing them and stops doing this and that to them and you don't find much on them. But also a flying needle – it isn't the stuck needle that is the most vicious thing to encounter. It is the flying needle. That is your worst enemy in nulling.

A flying needle. One which is spinning from – let's say your tone arm is gently and gradually rising so that in the space of five minutes will go from 4.5 up to 5. Let's say it takes five minutes to get there. Do you see the relative speed of rise of your needle? Now that constantly rising needle, if rising above a certain speed, is a flying needle and a flying needle is one which is enough to cancel out the invalidations, the suppressions and the goals reads.

In other words, the mechanical inertia of the needle, the actual weight of the needle and the fact that it is flying there, from the right to the left, oh man, to detect a slow out of that thing is heroic. It's almost worth ARC breaking the pc so he'll stick, you know. Just drives you batty.

I mean it's a flying needle. It's just a constant rise. Constant, rapid rise. And it is enough so that if your tick just degenerates into just the slightest slow and if anything is guaranteed to give you myopia as well as nervous prostration, it's one of these fast rising needles.

You're looking for that little slow. And then every once in a while to complicate the thing, pcs that have this sort of thing get a jerky rising needle. And it's going up by fits and starts and you can't tell what is a slowed rise, you see. And what is just needle pattern and so forth.

It's almost worth kicking the pc in the shins to change the needle pattern. See?

You can do various things about this but to attempt to cope with this situation very hard is, of course, no auditing. It's something that you should go through. The one thing you can't go through with is the dirty needle.

The dirty needle – very often the thing is latent which is a read and so forth. When a pc has just so many overts on an auditor, a dirty needle becomes rather chronic. And it slips and it slides with sudden jerks to the left and right and then starts buzzing, don't you see.

And those sudden jerks can have been going on, sort of, before you saw them. Do you get the idea? I mean they're not good and instant. They're not this, they're not that. Now if you take a magnifying glass on this and if you watch it very, very carefully with a magnifying glass, you'll probably be able to detect an instant invalidation or something like that inside a dirty needle.

Now I can do this and go round blinking for a week afterwards from the eyestrain. Actually read a dirty needle and read the vibrations inside a dirty needle in order to clean the thing up. It can be done, but there isn't any reason for you to do it at all, because it's O/W.

It's – now it's more O than W. Now when your pc is *all* the time, *all* the time, *all* the time withholding and they've always got a "failed to reveal" and they've always got a "failed to reveal," it's you that's auditing them, so they must have the overt on you. So let's put it in terms of overts now. Let's make a random rudiment out of overts. "In this session have you committed an overt against me?" or "In this session have you committed an overt?" or something like that.

And you all of a sudden see that dirty needle broaden out into a wider rock slam. And then murder will out. They actually repeat the goal to themselves several times after you do, while you're asking them suppress, in order to make sure or you know they're helpful. They've been doing something, you see. Or they've been talking about how lousy you are out of session or something like this, see. Something – something is going on here. That you can pretty well plan on. Your constant dirty needle if not traceable to the auditor is traceable to somebody else, but basically it would go like this: To the *auditor*, most likely, to *auditors*, you see, to *Scientists*, to *Science*, to something else on a broader perimeter. Sort of about your scale of application of overts.

For instance, somebody could do this. They could be running beautifully, go by a reception desk in a Central Organization, steal a book and after that you wouldn't be able to straighten their needle out. Do you see that? Some auditor that you're auditing could get furiously angry at a pc and refuse to audit the pc and put the pc off and raise hell with the pc, don't you see? (Come under the heading of Scientists. You might as well say, Scientists and pcs there on the list you just jot it down.) And come back into session again: He's got a dirty needle. He's got a rock slam. You can't read this thing, you see.

So just put it down to this: It *is* overts.

Now there's a thing called a missed withhold, isn't there? Well now, just translate the whole lot into missed overts. Dones that they didn't find out about, see. And you've got basically the same situation only we've got the overt side of the situation, you see.

So the missed overt, done, that people didn't find out about and that sort of thing. You've got a lot of phraseology that can go this way.

Now, of course that necessitates running some O/W to clean that up, doesn't it? Now, let me tell you the difficulties with O/W. And one of the reasons why you have so much trouble sec checking and prepchecking people is they don't answer the auditing question.

They answer the auditing question because of... See? They answer the auditing question with something else. You say, "What have you done to your pc?" You finally isolated that pcs are chopping their pcs to ribbons you see. "What have you done to pcs?" This is a field auditor in practice some place or another they come in and you are clearing them. And they answer it this way, "I wonder why the pc acted up so." It's, "What did I do to pcs to make pcs act up?"

You see? That's not the auditing question. It's, "What have you done to pcs?" Not, "What have you done to pcs to make them act up?" And as long – now listen – as long as they answer the question with any additive, it will not clear. Now, that's well worth knowing.

And you'd better write that down very strong, because where O/W doesn't work, the pc is not answering the auditing question. And if you don't have a reality on this already, some day you're going to get a flaming reality on it. You're going to be utterly shocked at that fantastic, offbeat – you'll have run O/W for fifteen or twenty minutes and the pc is just getting more and more ARC breaky and you can't quite figure what the hell's going on here, you know. You haven't got any tone arm action or something like that. And then lightning will strike. And you will suddenly remember Ron telling you at some time or another that it was because the pc wasn't answering the auditing question.

And you all of a sudden decide to investigate even at the risk of causing further ARC breaks and find out what the pc is answering. And just explore this, just discuss this for a while. All of a sudden – it sometimes takes a pc quite a while to get disentangled from this thing, you know – you'll find out the pc was answering the auditing question with some via or additive, in some fashion that had nothing to do with the auditing question. Like, you're saying, "Now, what have you done to women?" See? The pc gets a dirty needle or a rock slam or so forth every time – every time he has anything to do with women, see, and he comes into session and you – it's all a mess, see.

Of course it's all on his goals line but you haven't got his goal. How the hell are you going to straighten it up? See? Your – your problem is to find his – is find his goal without having found his goal. See? And then you've got a rock slam and a dirty needle and so forth, so you're going to say to him, "All right, what have you done to a woman?" See?

And he's going to say – if you listen carefully there's always something a little bit wrong with the answer. "Well, I've – I've scolded them." That sounds all right to you. See? "What have you done to them?" "I have scolded them."

And you say, "All right. What have you done to a woman?" "What have you withheld from a woman?" Now, what have you done to a woman?" And very shortly they run out of answers. That's one of the phenomena. They run out of answers. They're back to scolded

again. You see? And they just aren't getting any better. Now the index is and the only test you have is it isn't clearing up.

See? You're getting no tone arm action to amount to anything and it isn't clearing up. They aren't getting sweeter-tempered. They're getting worse. So what you can count on is they're asking – they're answering a question that sounds to them like this: You say, "What have you done to a woman?" See? And they answer it, "Why have I been a victim of women for so long? Is it because I have scolded them? Is that why women do me in?" And they're actually running solutions and they get no better. They run solutions to the problem of why they can't get along with women. You got the idea?

It's kind of like they do a little Goals Assessment on themselves. God help them. You see? "Why – why have I...?" "Why have I been the victim of women?" "Why have women chewed me up all the time?" "Why are women always stealing my car?" This is what they're trying to solve, see? They're trying to solve a whole bunch of problems with relationship to women. Not what have they done to women.

And the solution to it is to say, "Now, look, look, the question is done, done, done, done, done, just plain done, done, you see, done, have you got that? Done."

And they say, "Yes. I've been a victim of..."

"No, done, done, see, done to women. Now get the idea of a woman there and you there and you've done something to a woman. Done. Just – just that."

And all of a sudden – you don't harass them this way unless they're getting worse on O/W, you see and you'd better harass them, see. And, "Done to women? I really have never done anything to women. Not really. Oh, hit them once in a while. Well, I guess you could call that an answer. Hit them. If that's doing anything to a woman. But, I guess it is. Hit them. Yes. Hit them. All right. That's an answer. All right, call it an answer. Yeah, that's right. I hit them."

And they sometimes will say to you, "But of course that doesn't have anything to do with my problem." And you have to go over it and you say, "Now look, we're not asking anything about your problem or anything, all we want to know is what you've done to women. Just done."

Oh, this guy will say, "Oh, yes. Oh well, if it comes to that, very often picked them up and dropped them outside of civilization and make them walk, you know. I guess that's doing something to them. Yeah, that is. That's doing something to them. And ignoring them. Mainly ignoring them. Yeah."

You've got a whole bunch of new answers. Now these answers go along. The pc gets cheerful and you get tone arm action.

Whenever you're not getting tone arm action on Security Checking, the pc is trying to solve a problem. Not trying to answer the auditing question. Got it? Either that or there is no answer on it. You know, you're just – you're checking a – you're checking a check list, a Sec Check list of Zero Questions for burglars. You see? And the pc is an editor. You know. It just doesn't match. His burglary is done in other ways.

So the whole situation you see is entirely shifted. You're not getting an answer to the auditing question or it doesn't apply. And you don't get tone arm action. The pc feels no better. The pc feels worse.

All right. That is actually your dirty needle. Now you can pick up some time when he had a dirtier needle; he had a dirty needle in an early session. You can, you know, you can flick, what was the withhold missed on him in that session? Bang! It goes out. And you're not troubled with it, you see. You can do other stunts to get rid of this thing. I'm just telling you what lies underneath these wide rock slams and chronic dirty needles and that sort of thing. And why O/W suddenly raised its head here a few weeks ago after being dormant for so long.

But O/W has that liability – is the auditing question must be answered or the pc will get more nattery and get worse.

All right. And if all those things are done, nulling and looking for a goal and so forth can be done rather easily, very successfully and without too much trouble. The pc's goal is on the list if the list is in the condition I've given you. You see, if it's limp and so forth, why, his goal will be on the list and you will find his goal in spite of, "huhh huhhh," in spite of this, but sometimes you will run into this freak condition, there's a piece of the goals list missing or something wild like this has gone on and you will say, "Oh, no wonder!" or something. But I'd just do the whole list before I started worrying too much about special solutions to the thing. But sometimes you will, you'll have a piece of the goals list gone or something like that.

The pc brought in all the goals list except pages 2, 3 and 4. Ha-ha. After you're nulling at list number 759, why, he says, "You know I found these on the dining room table the other day. They were mixed up in some sandwiches. I wonder if they're important," you see. And his goal is number 4 on page 2. But sometimes you're unlucky and sometimes you're lucky.

Well, all right. Now, I've given you a lot of extra data here on nulling and finding goals and checking goals out and that sort of thing. I hope the data will be of value to you. This has – I've given you very little about listing. I will have to cover that another time.

Thank you very much.

Good night.

TV DEMO: ROUTINE 3GA, NULLING GOALS

An auditing demonstration given on
8 August 1962

LRH: Okay, we're – all we're going to do here – all we're going to do here is do the rudiments, null some goals, straighten out anything that occurs with relationship to the needle and carry on through. Just going to do some 3GA nulling.

PC: *Right.*

LRH: Okay?

PC: *Mm-hm.*

LRH: All right. Is it all right with you if I begin this session now?

PC: *Mm-hm.*

LRH: All right, here it is. Start of session. Has the session started for you?

PC: *Mm-hm.*

LRH: All right. All right, what goals would you like to set for this session?

PC: *Get some nulling done.*

LRH: Okay. What other goal would you like to set?

PC: *Find a goal?*

LRH: Hm?

PC: *Perhaps find a goal, maybe.*

LRH: Perhaps find a goal, maybe. Okay. Okay?

PC: *That's all.*

LRH: And that's all. All right. Are there any goals you'd like to set for life or livingness?

PC: *Usual.*

LRH: Usual. All right. Okay. Squeeze the cans. Thank you. All right. Tone arm is sitting here at about 4. Okay. Are you willing to talk to me about your difficulties?

PC: *Mm-hm.*

LRH: Thank you. I'll check that on the meter. Are you willing to talk to me about your difficulties? Do you agree that is clean?

PC: *Mm-hm.*

LRH: Very good. Since the last time I audited you, have you done anything you are withholding?

PC: *No.*

LRH: Okay, I'll check that on the meter.

PC: *Mm-hm.*

LRH: Since the last time I audited you, have you done anything you are with-

holding? Okay. I'll check that. Since the last time I audited you, have you done anything you are withholding? Do you agree that is clean?

PC: *Mm-hm.*

LRH: Okay. Do you have a present time problem?

PC: *No.*

LRH: Okay, I'll check that on the meter. Do you have a present time problem? Okay, do you agree that is clean?

PC: *Mm-hm.*

LRH: Very good. All right. Now, your needle's quite free and clean here. Everything seems to be all right. Now, it was quite a surprise to you, I understand, that you were going to get some goals nulling.

PC: *Yes, uh-huh.*

LRH: You didn't know this.

PC: *No.*

LRH: All right, I'm sorry, I thought I had asked you.

PC: *Mmm.*

LRH: Okay?

PC: *Mm-hm.*

LRH: Now, did anything upset you about that particularly?

PC: *Well, a little bit of a rush, you know.*

LRH: Just a bit of a rush, eh?

PC: *That's right. And then, they had that camera turned on there.*

LRH: All right.

PC: *I thought that was an overt.*

LRH: It's not on. It's the other camera that's on.

PC: *I know it's not on now.*

LRH: Okay.

PC: *But it was on when I sat down.*

LRH: Right.

PC: *And-um- I consider that camera an overt against anyone.*

LRH: All right. Okay.

PC: *And-um-hm-that's all.*

LRH: That about it?

PC: *Yeah, that's it.*

LRH: All right. Were you worried about any goals on your list here?

PC: *Well, there's some goals on my list that are my goals that I prefer to remain my goals...*

LRH: I see.

PC: *... but-um-that I certainly want to keep them my goals.*

LRH: Okay, all right.

PC: *Mmmm, I don't consider my life is – uh – public property.*

LRH: All right. Very good. Well, is that going to interfere with that?

PC: *Um, to a degree, perhaps, but ah... Just skip the ones – um – that are my own personal goals.*

LRH: All right. Okay, all right. Now, do you feel better about that?

PC: *Mm-km.*

LRH: Okay?

PC: *Mm-hm.*

LRH: All right. Well, I saw this as a good opportunity to get a few goals nulled on you, hm?

PC: *Mmm .*

LRH: Is that all right?

PC: *Yeah, that's fine.*

LRH: All right, very good.

Well, your tone arm's come down to 3.75. All right, now let's see what we can get here in the way of goals, all right?

PC: *Mm.*

LRH: Now we just – we have just hit a goal here, number 816...

PC: *Mm-hm.*

LRH: ...and it was – had some pain on it and gave a good solid bang.

PC: *Mm.*

LRH: All right, let's see if there aren't some more on this list like that, okay?

PC: *Right, uh-huh, mm.*

LRH: All right?

PC: *Mm-hm.*

LRH: Okay. Here's the next one: To not have things sadden me. Has anything on that goal been invalidated? Has anything on that goal been suggested? Is there anything on that – all right, what was that? I got a read, a suggested.

PC: *Well, that's more or less in my family as a suggested goal. Everyone considers that very vitally important, to always be happy and never be saddened by anything*

LRH: All right, very good. Thank you. On the goal to not have things sadden me, has anything been suggested? Okay,

there's a tiny slow, is there something more you'd care to say on that?

PC: *Well, let me put it this way, it – actually that wasn't quite true, it's my father's side of the family...*

LRH: Oh, all right.

PC: *... that this was always suggested.*

LRH: All right, thank you. All right?

PC: *Mm-hm.*

LRH: All right. Has anything on that goal been suggested? Okay, there's still a little bit of a tick, something more there?

PC: *Well, I suggested it, I brought it down, to that degree.*

LRH: Attagirl. All right. On the goal to not have things sadden me, has anything been suggested? Okay. On the goal to not have things sadden me, has anything been suppressed? Okay, have you got a little suppression there? There.

PC: *Um, the only thing I can think of is I'm fond of Russian novels. I like Russian literature but it always saddens me, so it goes against that goal, do you see what I mean?*

LRH: All right, all right. All right, on that goal, has anything been suppressed? Okay, all right, we got a needle kicking up here. Have you done something in this session, are you withholding something? ... Something right there. What is that? There it is.

PC: *Um...*

LRH: There it is, bang, that. There it is.

PC: *I thought of it – actually what it is, I'm not so much sad as sort of a – it's a bit of an – of unkind consideration with regard to the students downstairs, you see.*

LRH: All right, what is it?

PC: *And it's merely that some of them – uh, you know, are – I do not mind them knowing me, you know, really knowing me. Others I do not care to have them know me. I'm sort of selective in whom I wish to – to have my case acquainted to.*

LRH: All right, very good. All right, is there anything else you've done there? No, that's...

PC: *As an overt? Hm.*

LRH: ... appears clean now, all right. Thank you. We'll carry on with this now. All right, on the goal, to not have things sadden me, has anything been suppressed?

PC: *Don't think so.*

LRH: Hmm?

PC: *Don't think so.*

LRH: Don't think so?

PC: *Hm-mm.*

LRH: All right, you're getting a scattery, scattery needle here, you're busy thinking and...

PC: *Hm-mm.*

LRH: Really?

PC: *Mmm.*

LRH: I wonder if it could be those cans. You know, they did have a short in them.

PC: *Possibly, I don't notice it.*

LRH: You're throwing them around pretty hard.

PC: *Yeah.*

LRH: All right. I know that chair's uncomfortable but there's nothing you can do with that chair.

PC: *No.*

LRH: All right, would you like me to get you another chair?

PC: *No, no, that's fine. See that...*

LRH: I could get you that captain's chair in there.

PC: *No, I am perfectly comfortable in this chair.*

LRH: You are?

PC: *Yeah.*

LRH: All right, very good. All right, let me see if we can't carry on here with this, okay?

PC: *Mm-hmm.*

LRH: On the goal to not have things sadden me, has anything been suppressed? Okay, do you agree that is clean?

PC: *Mm-hm.*

LRH: Very good. To not have things sadden me. Okay, that is out.

PC: *Mm-hm.*

LRH: Okay? The next is, "To recover from" – all right, you got a little bit of an overt there?

PC: *I just wondered what is the next one.*

LRH: Is this upsetting – very upsetting to you that somebody else might hear these goals? They're not bad goals, I see nothing wrong with them.

PC: *I know, I know, but-uf-um...*

LRH: What are you doing, suppressing them, or what?

PC: *Well, I feel – no the only thing I can say on this, I feel that they – are – have little extent to do with me, that they're like me, you see.*

LRH: Right.

PC: *And to that degree I have myself identified with them. And just as I wouldn't loan out my clothing, or something like that, to someone else, so I don't like to – to give my – me, parts of me, out indiscriminately, you see what I mean?*

LRH: All right.

PC: *But I do – I'm not worried about that really.*

LRH: You're not worried about that.

PC: *It seems to me, yeah, since I told you about that, it doesn't seem to be any concern.*

LRH: All right.

PC: *It's just that I was wondering, what is this? I couldn't remember it – to recover.*

LRH: All right, they're perfectly good goals, there's nothing wrong. All right?

PC: *Mmm.*

LRH: Here's the next one. To recover from depression. Has anything on that goal been suppressed? Thank you. That is out. To recover. Has that goal been suppressed? Thank you. Any stray thought there?

PC: *I just wondered what I thought I was – what I put the goal down in reference to, to recover. From what?*

LRH: All right. Okay. Has anything on that goal been suppressed? All right, there's a little more suppression. There's a tick.

PC: *Mm-hm.*

LRH: What is that?

PC: *Um – well it's sort of – um – what I thought there is, is that – um – Mother and family, you know, suppressing recovery as a child merely to the degree that – um – in believing that after an illness or something like that, precautions were always necessary, you see what I mean, so they sort of repress one's recovery and repress the goal to that extent.*

LRH: All right. I see. All right, okay. Thank you. We'll see if that's clean now. Has anything on that goal been suppressed? Okay. To recover. Okay. That is out.

PC: *Mmm.*

LRH: Okay. To be unaffected. Has that – has that goal been suppressed? Okay. That is out. Okay. You had another slam there for a moment. Any overt?

PC: *Mm-mm.*

LRH: Nothing.

PC: *Well, I wondered who it was who went upstairs there, someone walking in the upstairs hall.*

LRH: Oh, you wondered who it was upstairs?

PC: *Mm-hm.*

LRH: Yeah, bang, bang. Okay. Probably Sang, huh?

PC: *Sang, yeah.*

LRH: All right, okay. To not be tied down. Has that goal been invalidated?

Has anything on that goal been suggested?
There's a slight suggestion.

PC: *Uh – the words in that – um – that's more or less – uh – sort of a – a colloquial type of expression.*

LRH: All right.

PC: *You know.*

LRH: Thank you.

PC: *Suggested by the locale and the people and what have you.*

LRH: All right. Has anything on that goal been suggested? Okay. Equivocal. Has anything on that goal been suggested? There's still a – one – there's still some suggestion on that.

PC: *Possibly my mother – um...*

LRH: Okay. All right. Does that answer the question?

PC: *Mm-hm.*

LRH: All right, very good. On the goal, to not be tied down, has anything been suggested? Okay. That's a bit equivocal. On the goal, to not be tied down, has anything been suggested? Okay, thank you.

PC: *Mm-hm.*

LRH: On this goal, is there anything you've failed to reveal?

PC: *Don't think so.*

LRH: All right, thank you. In this session, is there anything you have done? There it is. What are you sitting on there? Are you worried about something?

PC: *Moved my hands, I suppose, you know. I mean...*

LRH: All right.

PC: *I've not kept still.*

LRH: All right.

PC: *Um – nothing else I can think of.*

LRH: You don't think anything else there, eh?

PC: *Mmm.*

LRH: But you had moved your hands.

PC: *Yes. I had.*

LRH: All right, thank you.

PC: *Mm-hm.*

LRH: All right. Now, in this session, have you committed an overt?

PC: *Being – possibly from being – by being late for it, but that's not in the session. But I thought in this session that I was late for the session and I didn't quite know I was going to get – but...*

LRH: All right.

PC: *... I thought, well, I was late for it.*

LRH: All right, thank you.

PC: *Mm-hm.*

LRH: All right. In this session have you committed an overt?

PC: *Well, having a rock slam turn on, that's an overt.*

LRH: All right, thank you. Okay, we'll get along here and see how we can make this, okay?

PC: *Mm-hm.*

LRH: All right. To not be tied down. All right. On this goal's anything you have failed to reveal? Yes. What have you failed to reveal?

PC: *Well, I suppose that – uh – to not be tied down means not to have –*

um – unwanted responsibilities that I don't want.

LRH: Oh I see. All right, thank you. On this goal is there anything you have failed to reveal? Okay, that's good enough. On this goal has a mistake been made? Okay. Equivocal. On this goal has a mistake been made? Okay. There's a mistake here somewhere.

PC: *Merely to the degree that I don't think it adequately expresses exactly what I was trying to state.*

LRH: All right, thank you. On this goal, has a mistake been made? All right. On this goal, has a mistake been made? Okay. To not be tied down. Has anything on that goal been suppressed? Okay, do you agree with that? Got any stray thoughts on this?

PC: *No stray thoughts, really.*

LRH: All right, thank you. That is out. So the next is: To be anything at will. Has anything on that goal been invalidated?

PC: *Yes, I invalidated that "at will," that's that funny thing, sounds – at will.*

LRH: All right. Okay, thank you. Open your eyes. I believe there is a short in those cans.

PC: *Mm-hm.*

LRH: It keeps knocking around. I have another set right here.

PC: *Mm-hm.*

LRH: The fact that you do not like the larger can... There you are.

PC: *Mm-hm.*

LRH: All right. Okay. On the goal to be anything at will, has anything been

invalidated? Okay. On the goal to be anything at will, has anything been suppressed? Okay. To be anything at will. Thank you, that is out.

PC: *Mm-hm.*

LRH: To get a new body. On this goal has anything been suppressed? Thank you, that is out. What are you thinking so hard?

PC: *Well, I wondered when I had thought I want – when I have had that goal this lifetime or whether it was an in-between lifetime goal, you know, sort of when?*

LRH: All right.

PC: *When is the when?*

LRH: Okay, all right, thank you.

PC: *Mm-hm.*

LRH: All right. To know what to do with my next life. On this goal has anything been invalidated? On this goal has anything been suggested? On this goal is there anything you have failed to reveal? On this goal has a mistake been made? To know what to do with my next life. On this goal has anything been suppressed? Okay. To know what to do with my next life. All right. On this goal has anything been invalidated? Anything, any new thought?

PC: *Well, I don't know what to do with my next life, I mean it's still – uh – a bit unsolved in that I still – h ...*

LRH: All right. Okay. On this goal, has anything been invalidated. That's a little halt there. Anything else?

PC: *Well, it's sort of – I thought to myself then, "Why, it's jumping the gun a bit isn't it?" you know? I haven't – I haven't gotten my goals run out this – you know, for the past so many trillion years,*

and here I am already thinking – uh – plotting for my next actions.

LRH: Okay.

PC: ... *you know what I mean? It's sort of like the cart before the horse.*

LRH: All right. On this goal has anything been invalidated? Equivocal read. Are you thinking of something else very hard?

PC: *Hm-mm.*

LRH: On this goal has anything been invalidated? Okay. On this goal has anything been suggested? On this goal has anything been suggested? All right, a little bit of a rise there, a speeded rise. Anything else?

PC: *Hmmm, I thought that I would – uh – I've suggested to myself that I would like to go to a different planet next life and – uh – I've suggested that I would like to stay away from cold countries and then I've suggested that I would – don't think I would like to have a biological body next life.*

LRH: Okay.

PC: *And – uh – those, I made those suggestions.*

LRH: All right, thank you. On this goal has anything been suggested? Okay, any other stray thought on that?

PC: *No, just – uh – I – um – very definitely, in looking at my thought flows, I don't think I want to be on Earth again, I'd like to be someplace else.*

LRH: All right, very good. All right, on this goal is there anything you've failed to reveal? I got something there, possibly it isn't failed to reveal, but.

PC: *Well, the only thing is I haven't revealed to myself where the elsewherenesses are, you know...*

LRH: Oh, all right.

PC: ... *or where I'd like to go.*

LRH: Okay. On this goal is there anything you have failed to reveal? Okay, any other thought?

PC: *Well, I thought that – um – I would like to um – avoid the – um – more or less the Anglo-Saxon civilization, you know – in my next life.*

LRH: Yeah, all right.

PC: *But I don't see how one can sort of avoid it if one's on Earth, you see, and I'll always have the idea of Coca-Cola following me, being posted everywhere, in every mud hut throughout the world. That sort of thing.*

LRH: All right, all right. On this goal – on this goal is there anything you have failed to reveal? Okay. On this goal has a mistake been made? All right. To know what to do in my next life. On this goal has anything been suppressed? Okay, that is out.

PC: *All right.*

LRH: Now, have you had any pain or sensation or anything like that while doing these goals?

PC: *Um, that last one, a bit of sensation.*

LRH: Had sen on it, huh? All right, very good. And it fired once all by itself. Hence the time I spent on it – it had a rocket read...

PC: *Oh, it did.*

LRH: ...for a moment, but it was a little bit of a ragged rocket read but it's all

right. And your TA came down to 3.2 there for a moment. It's gone a little bit up now, all right?

PC: *That's very good.*

LRH: Okay?

PC: *Mm-hm.*

LRH: All right, you're doing quite well. That was less withholds than can short.

PC: *Oh, good.*

LRH: So, you can stop worrying about that.

PC: *All right.*

LRH: All right, we're doing all right here. Not the record-breaking speed that we might ordinarily expect but, under the circumstances.

PC: *Under stress...*

LRH: I think it's all right.

PC: *... symptoms of stress.*

LRH: Okay?

PC: *All right. That's all right.*

LRH: All right.

PC: *I'm getting some nulled and that's all right and I'm happy.*

LRH: No matter how!

PC: *No matter how slow or how fast or...*

LRH: Okay, honey. Okay, here we go. To recover a zest for life. Has that goal been invalidated? Has anything on that goal been suggested? Equivocal. On that goal has anything been suggested? On that goal is there anything you failed to reveal? On that goal has a mistake been made? Okay.

To recover a zest for life. All right, on that goal – on that goal has anything been suppressed? Okay. To recover a zest for life. All right. Any stray thoughts while we've been doing this?

PC: *Yes, I thought – uh – that it sounds sort of funny, semantically, to recover a – a zest for life. You could take it two ways, you see. A zest for life – that means a zest for all of life.*

LRH: I see.

PC: *You see and then recover a zest meaning recover a – um – an enthusiasm for life. You see what I mean – there's two different things.*

LRH: Yeah, all right, okay. Double-entendre.

PC: *Yes. Hmmm.*

LRH: All right, I'm going to read it again because it fired. It's odd to see two together that fire. All right. To recover a zest for life. Okay, that is out. Any pain or sensation?

PC: *No.*

LRH: All right. To recover a joy in living. Has that goal been suppressed?

PC: *Suppressed laughing, you know.*

LRH: Hmm?

PC: *Suppressed laughing, you know. It was so funny.*

LRH: All right. Okay. I asked you the wrong question. Has that goal been invalidated?

PC: *Well, yes, laughingly.*

LRH: All right, thank you. Has that goal been invalidated? Is there anything on that goal – is there anything on that goal that's been suggested? Okay. Is

there anything on that goal you've failed to reveal? All right. On that goal has a mistake been made? Okay, any mistake?

PC: *Hm-mm. I don't think so.*

LRH: All right, very good. On that goal has a mistake been made? Okay, I'm just cleaning a clean on you there.

To recover a joy in living. Has that goal been suppressed? Okay, that is out and it fired once. Was there any pain on it or sensation?

PC: *No.*

LRH: There wasn't?

PC: *No.*

LRH: All right, thank you.

PC: *You asked that aft – and after the fact I get a pain in my shoulder. After the fact of answering the question, the pain came in my shoulder.*

LRH: It did, huh?

PC: *Yeah. I said no and wham!*

LRH: All right. And here we are, well, you've gotten ten of them...

PC: *Good.*

LRH: ... going, all right. All right, here's the next one: To influence matter with thought. Has that goal been suppressed? To influence matter with thought. Any stray thoughts on that goal?

PC: *Yes, I would rather sort of – um – liking to – um – to even produce matter with thought, too, to create matter with thought, you know.*

LRH: Oh, yeah.

PC: *Yeah.*

LRH: All right. Okay. To influence matter with thought. Has that goal

been suppressed? Okay, that is out. To influence the body with thought. Has that goal been suppressed? Thank you, that is out.

What did you think of there in the middle of the run?

PC: *I thought, well, I-I've been able to do that to a degree, you know.*

LRH: Oh, you thought you had done that?

PC: *Mm-hm.*

LRH: All right, very good. Thank you. To accomplish all through the mind. Has that goal been suppressed? All right, any thought of suppression there?

PC: *Well, it – um – to suppress thinking – um – all through the mind – sounded funny, I was wondering what, what, what it meant.*

LRH: To accomplish all through the mind.

PC: *Mm-hm.*

LRH: All right, sounded funny so you...

PC: *Yeah, sort of suppressed – wondering what's that...*

LRH: All right, thank you.

PC: *What, what, what?*

LRH: All right. Has anything on that goal been suppressed? All right. To accomplish all through the mind. Okay, that is out. What was your afterthought there?

PC: *I don't know. Didn't – didn't pick anything up. I thought well, it was out, that's all.*

LRH: Oh, you did think that it was out.

PC: *Yeah, yeah, it was out.*

LRH: It registered up on the meter. All right, thank you. Okay. To get out of the realm of thought into the realm of action. All right. Equivocal. To get out of the realm of thought into the realm of action. Has anything on that goal been suppressed? All right. In this session is there anything you have failed to reveal?

PC: *Yes, I thought that was the goal before this life.*

LRH: Oh, all right, thank you. In this session is there anything you have failed to reveal? Okay. There might be another...

PC: *It's not that – that is*

LRH: There might be another something there. It didn't read but this is a wiggly needle all of a sudden.

PC: *Well, the only thing I can think is that on that last – uh – the goal I thought to create – to create matter with thought. And perhaps that should – I wanted to add that to my goals list.*

LRH: Oh, you forgot to add that – tell me.

PC: *And I refrained from telling you.*

LRH: Oh, all right. And what is it?

PC: *To create matter through thought.*

LRH: To create matter with...

PC: *With thought is what I mean.*

LRH: ... with thought. Very good. Perfect.

PC: *Yea.*

LRH: All right?

PC: *Mm-hm.*

LRH: To get out of the realm of thought into the realm of action. All right. Has anything on that goal been invalidated?

PC: *Well, I didn't make it.*

LRH: All right, thank you.

PC: *And I don't, particularly, at the present moment want to accomplish that goal. That's – uh – that's an in between – this is a before this life goal, do you see that?*

LRH: Oh, thank you.

PC: *I'm not interested in accomplishing it now. I've only put it on my list because it is one I have had.*

LRH: All right. Has anything on that goal been invalidated? Okay. On that goal has anything been suppressed? All right. To get out of the realm of thought into the realm of action. All right. On that goal has anything been suggested? On that goal is there anything you failed to reveal? Something?

PC: *Umm...*

LRH: There it is.

PC: *Well, that goes with the – uh – that goal goes with the – the ranch and the – and the cattle and – uh – and – um – and the cowboys and that type of thing. See – uh – I failed to reveal all the paraphernalia that was supposed to – to have accomplished the goal in order for the goal to be attained.*

LRH: Okay. All right. On that goal is there anything you have failed to reveal? Okay, any stray thought there?

PC: *Yes and I thought – uh – and the oil wells – there should have been*

some oil wells thrown in with the cattle and the ranch and the cowboys.

LRH: All right. Okay. On that goal is there anything you have failed to reveal? Okay. How's that seem to you?

PC: *I don't think there is anything else.*

LRH: All right, thank you. On that goal has a mistake been made? Okay. Very good. To get out of the realm of thought into the realm of action. Equivocal. To get out of the realm of thought into the realm of action. All right. Has anything on that goal been suppressed? Okay, that is out.

Okay. To have a body that could stand up to the sun. Has that goal been suppressed? Okay, that is out.

To have an outdoor-type body. That is equivocal. To have an outdoor-type body. Has that goal been suppressed? Thank you. Any stray thoughts on that?

PC: *No, I just thought that – um – well, I was thinking that there was a better one – type of body – you know, that can – that they – can withstand all the – um – cold and heat and – and sandstorms and an awful lot of... They – they're a pretty strong biological body type.*

LRH: All right.

PC: *I didn't want to look like a better one, mind you, but I wanted a body that would stand up to those factors.*

LRH: All right. To do dashing things. Has that goal been invalidated? Has anything on that goal been suggested? Is there anything on that goal you've failed to reveal? On that goal has a mistake been made? Okay. To do dashing things. Equivocal. To do dashing things. Okay. On that goal has anything been suppressed?

All right. On that goal has anything been invalidated? There's an invalidation.

PC: *Oh, yes. I have a sort of dashing things associated with – um – sort of a time of um – carriages and horses and this sort of thing and one doesn't do dashing things in a mechanical age, you see what I mean.*

LRH: Oh, all right.

PC: *Everything is sort of scientific and dry. It's the wrong – I think it's the wrong time for such a goal.*

LRH: All right, thank you. All right. Has that goal – has that goal been invalidated? Okay. Thank you.

Is anything on that goal that you have failed to reveal? Anything you failed to reveal? ...I don't have a reading here, I just have a slam.

PC: *Hmm.*

LRH: I just had one.

PC: *No, I always get a picture of a horse rearing when I think of that, you know.*

LRH: Of a horse running.

PC: *Of a horse rearing.*

LRH: Rearing!

PC: *You see, and sort of riding sidesaddle on a horse with long skirts and – well, I can see the horse is – is this – you know, he's sort of black and there's foam in his mouth and his eyes are wild and rearing and ...*

LRH: Okay. Is that what you failed to reveal?

PC: *Yeah, I ha – always with you – every time you read that, I had this picture about that.*

LRH: Oh, all right.

PC: *Mm-hm.*

LRH: Okay. On the goal to do dashing things is there anything you have failed to reveal? Something else.

PC: *Mmm. I suppose that I feel, too, there's a lot of the dash is taken out of one in our present civilization. There isn't much – there isn't much dash left available to one after one has survived – uh – sort of childhood and – uh – and modern educational system and that sort of thing. It sort of leaves everyone sort of pallid and – and very undashing. Hmmm.*

LRH: Well, all right. Very good.

PC: *Hmmm.*

LRH: Is there anything on that goal you have failed to reveal? Okay, thank you.

PC: *Mm-hm.*

LRH: On that goal has a mistake been made? Can you think of any mistake? Stray thought.

PC: *Yes, I think that the goal would have better been "To be dashing" rather than "To do dashing things."*

LRH: You want that goal on your list?

PC: *No, I don't. Hm-mm.*

LRH: All right. Thank you.

On that goal has a mistake been made? Okay, there's still a little something on that.

PC: *Hmmm. Well, one other mistake is what sort of things – what do I mean by, you know, "dashing things"?*

LRH: All right.

PC: *Mm-hm.*

LRH: Thank you. On that goal has a mistake been made? Okay. To do dashing things. On that goal has anything been suppressed? Okay. Some suppression. What is it?

PC: *Dashing, you see, is that – um – I'm with these high heel shoes, stiletto heel shoes – one can't very well be dashing, you see what I mean. Otherwise you leave heels stuck in – in grates or floors or...*

LRH: All right.

PC: *... or you lose your shoes or something. They're dangerous – um – dangerous instruments to go dashing about in.*

LRH: Okay. All right. On that goal has a mistake been made? All right. A little slow there.

PC: *Hmmmm. What I thought there is, I thought we were – um – we were – we were on suppressed, I think. But I thought I answered suppressed.*

LRH: Well, you probably did, honey. I'm very sorry.

PC: *All right. Hmmm.*

LRH: All right. Let me check this anyway.

PC: *All right, fine.*

LRH: On this goal has a mistake been made? Okay. That's all right. On this goal has anything been suppressed? All right. That's clean anyhow.

PC: *Yeah.*

LRH: All right. I beg your pardon.

PC: *That's all right, no.*

LRH: I think – I'm afraid I got interested in your goal.

PC: *All right, that's okay. It is all yours.*

LRH: All right. Okay.

To do dashing things. All right. Ha! A rocket read!

PC: *Really? What do you know!*

LRH: On that goal has anything been invalidated? A little something there.

PC: *I thought – um – well, I invalidated a little bit to the – to the degree in thinking – um – that would be a nice goal to have. But then I thought, but what a poor time and place in the physical universe to have it. Or try to accomplish it, you see?*

LRH: All right, okay. On that goal has anything been invalidated? Okay. On that goal has anything been suggested? All right. You got a stray thought there? I don't say there is one, but... All right. On that goal is there anything you have failed to reveal? Okay. On that goal has a mistake been made? All right. On that goal has anything been suppressed? All right.

To do dashing things. To do dashing things. To do dashing things. Mmmm – very intriguing. This goal's firing. All right, let's see what we got here.

PC: *All right. It'd be funny if we did get my goal.*

LRH: All right. Let me clear up a couple of random rudiments here, okay? Different rudiments.

PC: *Mm-hm.*

LRH: On this goal has anything been asserted? Okay. On this goal has there been a confusion? On this goal has there been a confusion? Okay. On this goal has anything been protested? Equivocal. On this goal has anything been protested?

Okay. Have you got any stray answers to any of these things?

PC: *Uh-uh.*

LRH: All right. On this goal – on this goal has anything been suppressed? Okay. Check that again. On this goal has anything been suppressed? Okay. On this goal has anything been invalidated? On this goal has anything been suggested? Now, what was that fire?

PC: *I sort of heaved an inward sigh. I've sort of been a little bit holding my breath on these questions and I sort of noticed – I'm not actually aware of holding my breath but suddenly I noticed, well, I'm not breathing, so I...*

LRH: Okay. On this goal has anything been suggested? Okay. On this goal is there anything you have failed to reveal? All right. On this goal has a mistake been made? All right. Any mistake on this?

PC: *Hm-mm.*

LRH: I just got a tiny thing that might have been a speeded rise.

PC: *Um – yes, I thought I'm being very careful to hold my cans, see, now, I don't want any mistake to be made.*

LRH: Uh-huh.

PC: *And – uh – to that degree I'm sort of making a mistake in being so careful.*

LRH: All right, thank you. All right, any stray thoughts here?

PC: *No, the only thing I did think is, is that – my, how interesting it is that I never would have – have thought that goal – you see, it isn't one of my favorite suspected – pc suspected goals, you see. One that – that every – you know pcs have that are their favorite little things. And this*

is totally un – unsuspecting, that it would be firing.

LRH: All right. Okay. Well, let's see how it's doing now. I'm going to read it three times.

All right. To do dashing things. To do dashing things. To do dashing things. All right. On this goal has anything been suppressed? All right. On this goal has anything been invalidated? Suggested? What have you suggested on this goal?

PC: *Well, I suggested to myself then, well, I wonder whether it reacted or didn't react the last time. That's all.*

LRH: All right. Thank you. On this goal has anything been suggested? Okay. On this goal has a mistake been made? Equivocal. On this goal has a mistake been made? There's a little mistake here.

PC: *Hmm.*

LRH: It's there. There. Something's kicking there.

PC: *Well, the only mistake I can think of is I certainly have had – uh – is it – uh – it's the wrong time to be born to have that type of goal. Do you see what I mean? And so the only mistake is me, in this body now. Hmmm.*

LRH: All right. On this goal has a mistake been made? All right, very good. On this goal has any – has anything been suppressed? All right.

To do dashing things. To do dashing things. To do dashing things. To do dashing things. All right. It is clean.

PC: *Oh? Pity.*

LRH: All right. Did you have any pain or sensation on that goal?

PC: *Um – a bit of sensation, I suppose, yes.*

LRH: Was it sensation?

PC: *Mm-hm, sort of – um – a little bit of um – sadness.*

LRH: All right. Sen and a picture?

PC: *Mm-hm.*

LRH: All right.

PC: *Sen and a picture.*

LRH: All right, thank you. Well, that's getting interesting, wasn't it?

PC: *Yeah. Oh, shucks. All right.*

LRH: Okay, honey. Here we go. Here's your next goal: To be a bandit leader in Mexico. Has anything on that goal been suppressed? Equivocal. Has anything on that goal been suppressed? Okay. Any stray thoughts?

PC: *Umm. The only thing I thought of then is that I'm not Mexican, so that makes it difficult to be a leader of bandits in Mexico.*

LRH: All right, okay. Thank you.

Here's the next goal: To never be a circus performer. Has anything on that goal been suppressed? Okay, thank you. That is out. Any stray thoughts?

PC: *Oh, I can't stand – I couldn't stand it – I think – um – the circus is a most unglamorous thing. Who would want to be out there and strain one's muscles endlessly the way those poor people do.*

LRH: All right. Okay.

PC: *They practice and practice and practice and practice. It takes them five years or something to perfect the – the little old thing of standing on their hands*

and walking on a – on a platform 200 feet off the ground. You see, no – hm-mm.

LRH: Ohhh. All right. Good enough. All right. You'd be interested, by the way, that your TA just came down to 2.7, lowest I've ever seen it.

PC: *Oh, good, very good.*

LRH: All right? Here's the next one, baby: To be a Southern belle. Has anything on that goal been invalidated? Equivocal. Has anything on that goal been invalidated? All right. On that goal has anything been suggested? Yeah, what's the suggestion, if any?

PC: *Um – really that – um – I'm – I'm from the Southwest, you see, so that, I'm not quite – cannot quite classify as a Southern belle. I'm a Southwestern belle. I should have been born in Kentucky or someplace like that.*

LRH: All right. On that goal has anything been suggested? All right. Do you have a thought then?

PC: *Yeah, I thought that the thing that suggested it is – um – winding rivers and – and ah – plantations and weeping willow trees.*

LRH: All right. Okay. On that goal has anything been suggested? Okay. On that goal was there anything you've failed to reveal? On that goal has a mistake been made? On that goal has anything been suppressed? To be a Southern belle. All right. To be a Southern belle. Hmmm. All right. I've marked it out.

All right. Here's your next one: To own a plantation. Has that goal been invalidated? All right, any invalidation there?

PC: *Um, that is invalidated in that I did have a plantation on the track.*

LRH: All right, thank you.

PC: *... but I didn't – but I didn't get a chance to own it too long due to unfortunate circumstances.*

LRH: All right. Okay. On that goal has anything been invalidated? Okay. On that goal has anything been suggested? Okay. On that goal is there anything you have failed to reveal? On that goal has a mistake been made? There's a mistake, what is it?

PC: *That they've cut out a lot of the – they used to do a lot of farming of cotton on the plantations and they used to do a lot of sugar cane growing but that's been cut out now and who would imagine having a plantation – most of – a lot of in the South – a lot of the plantations have been turned mostly into rice paddies and one can't imagine one having rice – a plantation of rice paddies, you see what I mean. That – that should be associated totally with the Chinese and not with the – not with the southern part of the United States.*

LRH: Okay. All right. On the goal to own a plantation has a mistake been made? Another one? Something there?

PC: *I don't see anything other than what I was already referring to – there is a plantation in the old sense of the word and that's impossible in this day and age.*

LRH: All right. All right. Okay. On that goal has a mistake been made? Okay. I'm going to check that again. On that goal has a mistake been made? All right. To own a plantation. Has anything on that goal been suppressed? Okay. To own a plantation. We're getting random reads around the end of this thing. Is there

anything on this goal you've failed to reveal? I don't say there is.

PC: *Hm-mm.*

LRH: All right. To own – to own a plantation. Now, in this session is there anything you have failed to reveal?

PC: *I don't have that goal now.*

LRH: Oh!

PC: *Hmm.*

LRH: Small thing like that.

PC: *Yes.*

LRH: All right. Okay. In this session is there anything you have failed to reveal? Okay, thank you. Let's check this again. To own a plantation. To own a plantation. Okay. On that goal has anything been suppressed? Okay, thank you. That is out.

To own a ranch in Spain. All right, in this session is there anything you have failed to reveal?

PC: *Yeah, I failed to reveal that was the next goal coming up, that certainly shocked me.*

LRH: Oh, really?

PC: *I thought, "What!"*

LRH: All right. I'll read it again. To own a ranch in Spain. Okay. To own a ranch in Spain. Has anything on that goal been suppressed? Okay. Any stray thoughts here?

PC: *Hmm. How about that – um – I'd like to - um - to own a ranch in Spain doesn't quite communicate exactly what it was I was trying to communicate. I was trying to communicate to own a ranch and to raise bulls, see, for bullrings around the world and that sort of thing.*

LRH: All right.

PC: *Yes.*

LRH: You want to put that...

PC: *No, no, no I just uh...*

LRH: Well, uh...

PC: *I can't quite express it – to be – I don't know how to say to, you know, to be one of the old families that – of Spain that raised – that raised bulls for a means for generation after generation, you know.*

LRH: Oh, all right. Okay, let's check the thing over now.

PC: *Mm-hm.*

LRH: To own a ranch in Spain. Has anything on that goal been suppressed? Did you hit suppression or something else?

PC: *No, my only thought there is that – um – um – present day conditions in Spain are not very conducive to humans, sort of, you know?*

LRH: Oh, all right. All right, here we go. Has anything on that goal been suppressed? Okay, a trifle bit slow, there might be something else there.

PC: *And I thought the goal was suppressed when I was in Spain and got so sick on my drinking their water.*

LRH: Ohh!

PC: *You see, if I can't drink their water then I certainly shouldn't be there sort of owning a ranch in Spain type of thing.*

LRH: All right, all right. On that goal has anything been suppressed? Okay. Any stray thoughts there at all? All right. To own a ranch in Spain. To own a ranch in Spain. Okay, that is out.

PC: *Mm-hm.*

LRH: To ride a donkey sideways. Has anything – has anything on that goal been suppressed? To ride a donkey sideways. All right. Has anything on that goal been invalidated? Is there anything on that goal been suggested? What's the suggestion?

PC: *Well, I suggested it. The only thing is, it's really to ride a donkey sideways under a great big straw hat. And that's it.*

LRH: All right. On that goal has anything been suggested? Okay, anything else?

PC: *Well, I thought it isn't exactly a whole track goal...*

LRH: All right.

PC: *...I suggested to myself.*

LRH: Thank you. On that goal has anything been suggested? Okay. To ride a donkey sideways. All right. Has anything on that goal been invalidated? Equivocal. Anything on that goal been invalidated? All right, anything else there? Invalidation? Perhaps a read, perhaps not.

PC: *No, I don't think so, I can't think of any invalidation.*

LRH: All right, very good.

PC: *I haven't done it, that's invalidating, I mean that makes sense.*

LRH: Okay, I was probably cleaning a clean there, I'm very sorry.

PC: *That's all right, but I haven't accomplished it yet.*

LRH: All right. On that goal has anything been suggested? Okay. On that goal is there anything you've failed to reveal? There's something there.

PC: *Yes, I failed to reveal that this is what I – this is what I wanted to do. I – is – the rest of the story on the donkey is that – that I want to go through all islands in the Mediterranean, you know, going from one island to the next island by, of course, boat, but when I'm on the island is that I want to ride a donkey sideways sitting under a straw hat all over the island and see all along the islands. So, it's more complicated to.*

LRH: All right. All right, I get you now. All right. Okay. On that goal has anything been suggested? There might be another something there.

PC: *Well, I suggested that I don't want to – I didn't want to use modern transportation on these old islands and on some of them that you cannot anyway, there are no sort of roads or hm mm.*

LRH: All right. Very good. On that goal is there something you've failed to reveal? I don't know what that was. On that goal is there anything you have failed to reveal? Okay. On that goal has a mistake been made? Yes?

PC: *Well, yes, it doesn't communicate the – the totality, but that would mean rewording it so long that it wouldn't be a goal anyway.*

LRH: All right. On that goal has a mistake been made? On that goal has anything been invalidated? What's the invalidation?

PC: *That's simply that I haven't done it.*

LRH: All right. Thank you very much. On that goal has anything been invalidated? All right. To ride a donkey sideways. Has that goal been suppressed? Thank you. That is out.

To own vast acres of land. Has that goal been suppressed? Thank you, that is out.

To ride over my land. Has that goal been invalidated? On that goal has anything been suggested? On that goal is there anything you failed to reveal? All right, there might be something there.

PC: *Well, that – um – I have to have the land to ride over, too, you see.*

LRH: All right, all right. On that goal is there anything that you failed to reveal? Okay. On that goal has a mistake been made? All right. Any stray thoughts?

PC: *The only thing I thought there is a strange thing, is that anytime I see lots and lots and lots of land stretching out I always, you know, I always do have some sort of feeling of ownership for it, whether I own it or not, I do own it. I have a feeling of ownership for it.*

LRH: All right, thank you.

To ride over my land. On that goal has anything been suppressed? Thank you. That is out.

To keep all orderly. On that goal has anything been suppressed? Thank you. That is out.

PC: *Mm-hm.*

LRH: Okay? Here's the next goal: To have someone to talk to. Has anything on that goal been suppressed? Check it again. To have someone to talk to. All right. On that goal is there anything you've failed to reveal?

PC: *Hmm – I just wondered what I mean by it. I have – I have failed to reveal it to myself. What do I mean by it.*

LRH: All right, thank you. All right. On that goal is there anything you

have failed to reveal? All right, thank you. To have someone to talk to. Okay. On that goal has anything been suppressed? Okay, that is out.

To find a true friend. Has anything on that goal been invalidated? All right. On that goal has anything been suggested? On that goal is there anything you have failed to reveal? All right, anything you've failed to reveal there?

PC: *No, but knowing how – uh – knowing how people's minds work – their busy little, mean little, nasty little minds .*

LRH: What's that?

PC: *I don't think that – um – I don't think it's possible to – to find a real, true friend.*

LRH: Oh, all right.

PC: *You know?*

LRH: Okay. All right. On that goal is there anything you have failed to reveal? Okay. To find a true friend. Has that goal been suppressed? Okay, that is out.

To not have to keep up appearances. Has that goal been suppressed? Check that. Has that goal been suppressed? Okay. To not have to keep up appearances. All right. Any stray thoughts there?

PC: *No, but what I thought is that – um – um – what I thought when I had the goal and that was – uh – wearing blue jeans and sloppy sweaters and that sort of thing and – uh – as a kid and my mother always objected to that.*

LRH: Well, all right.

PC: *And – uh – that's all.*

LRH: Okay. All right. I'm going to check it again. To not have to keep up ap-

pearances. Has anything on that goal been suppressed? Okay, that is out.

I am going to null on down to the bottom of this page...

PC: *Mm-hm.*

LRH: ... and then we will end – on through the session, I've got a half a dozen goals here or more. Okay?

PC: *Mm-hm.*

LRH: All right.

To not have to withhold. Has anything on that goal been suppressed? All right. To not have to withhold. Okay, that is out.

To feel and express how I feel. Has anything on that goal been invalidated? Has anything on that goal been suggested? All right, suggestion?

PC: *Well, it sort of sounds suggested that I – that I can't, but I can.*

LRH: All right, very good.

PC: *Yeah.*

LRH: Has anything on that goal been suggested? All right, there's something a little more, just a hair maybe.

PC: *I've sort of forgotten what it is.*

LRH: All right, to feel and express how I feel.

PC: *To feel and to express how I feel. Oh. Doesn't make much sense and I just suggested that.*

LRH: All right, thank you. Has anything on that goal been suggested? All right. To feel and express how I feel. Equivocal. To feel and express how I feel. Okay. That goal is out.

To not have to protect identities. Has anything on that goal been suppressed? Okay, a little suppression.

PC: *Yeah, sort of just trying not to be so protective of identities. That would be suppressing the goal to – um – what is it on?*

LRH: To not have to protect identities.

PC: *Well, protecting them. The children and – um...*

LRH: Oh, I see. All right. Thank you.

PC: *... the staff.*

LRH: To not have to protect identities. Has anything on that goal been suppressed? All right. Has anything on that goal been invalidated? Is there anything on that goal you've suggested? On that goal is there anything you've failed to reveal? On that goal has a mistake been made? To not have to protect identities. On that goal has anything been suppressed? All right, what's the suppression? There.

PC: *Hmm. Well, doing so, that suppresses the goal, doesn't it? Doing so that suppresses the goal.*

LRH: All right, thank you. I'll read the goal again. To not have to protect identities. Equivocal. To not have to protect identities. All right. Has anything in this goal been invalidated? Has anything in this goal been suggested? Is there anything in this goal you've failed to reveal? On – what's that? Failed to reveal. Something.

PC: *Well, I suddenly do realize is – that I don't go around protecting my own identity but I certainly do protect other people's identities, you see what I mean?*

LRH: All right.

PC: *Mm-hm, protecting their bodies and other people's identities and that sort of thing.*

LRH: All right. All right. Is there anything in this goal you've failed – anything in this goal you've failed to reveal? Okay. Thank you. On this goal has a mistake been made? Equivocal. On this goal has a mistake been made? Okay, thank you. On this goal has anything been suppressed? Little more suppression.

PC: *Mmm. Well, sort of I wish we'd get over it.*

LRH: Hmm?

PC: *I wish we'd get – um – off this one. I'm – I'm not too fond of this one.*

LRH: All right. Thank you.

PC: *That's all.*

LRH: On this goal has anything been suppressed? There's still a suppression on here.

PC: *Can't think of anything now.*

LRH: There it is.

PC: *I suppose the identity known as a mother always suppresses that with, you know – assuming that identity one would have to suppress that goal.*

LRH: All right, okay. On that goal has anything been suppressed? Ah, thank you. To not have to protect identities. Okay. That is out. Any thoughts you had on that?

PC: *Hmm-mm.*

LRH: All right, thank you. Now, actually I'm going to do just one more goal and that is the end of the line.

PC: *Mm-hm.*

LRH: All right. Here it is: To have people love me. Has anything on that goal been suppressed? I will check it again. To have people love me. Has anything on that goal been invalidated? Has anything on that goal been suggested? What's that? Suggested.

PC: *Hmmm. Sort of that people love thy neighbors and – and have thy neighbors love thee – type of thing.*

LRH: All right.

PC: *That's all.*

LRH: Okay. Has anything on that goal been suggested? Okay. To have people love me. All right. Has anything on that goal been suppressed? Okay, that is out.

All right. Now, is there anything you care to say before we end this nulling session?

PC: *Yes, I thoroughly enjoyed it.*
Hmm.

LRH: Hmmm?

PC: *I enjoyed it.*

LRH: All right. It wasn't quite as bad as it might have been.

PC: *No.*

LRH: All right, let's see where we wound up. We, by the way, had a very interesting tone arm area here. I think we were quite low for a while. It's down at 2.7 again.

PC: *Ohh... Hmmmph.*

LRH: Okay? You have any somatics? Feel all right?

PC: *I feel fine.*

LRH: You do?

PC: *Mm-hm.*

LRH: All right. Here we go, into the end rudiments. In this session – in this session have you told me any half-truth, untruth or said something only to impress me or tried to damage anyone? All right. In this session is there something you have done? Yes, what is it?

PC: *Um – I have a hard time with these cans. I always feel that – uh – you know...*

LRH: Yeah, they're too big for you.

PC: *... they're too big. And then I always feel that's – that – um – that I'm doing something by holding these cans. I feel it's an overt on the auditor because I – I'm not ever sure that I'm ever keeping my hands still on it, do you see what I mean?*

LRH: All right, okay. Thank you. I'll recheck this question. In this session have you tried to damage anyone? Well, we're still pumping on something. I'll clean this other failed to reveal. All right. In this session is there anything you have failed to reveal? Okay, in this session have you tried to damage anyone? Okay?

PC: *Blacks?*

LRH: All right.

PC: *Did I ever try to damage any? Um...*

LRH: Something there, bang, we just hit on something.

PC: *I thought of me, you know.*

LRH: Well, all right. Is that right?

PC: *Particularly sitting on sombrero – on a – on donkeys under the sun.*

LRH: All right. Okay. Here we go. In this session have you tried to damage anyone? Okay. Any other thoughts on that?

PC: *Hmmm.*

LRH: Something there.

PC: *Well, people. Just people in general and the true friend one. You know I was thinking about people with their mean little minds.*

LRH: That's right.

PC: *Well, I think some people might not have mean little minds, sometimes, possibly.*

LRH: All right, okay.

PC: *There might be someone with some magnificence of mind.*

LRH: All right. In this session have you tried to damage anyone? Okay, do you agree that that is clean?

PC: *Yeah.*

LRH: Very good. In this session have you deliberately tried to influence the E-Meter? Do you agree that that is clean?

PC: *Mm-hm.*

LRH: In this session have you failed to answer any question or command I have given you? Equivocal. In this session have you failed to answer any question or command I have given you? Do you agree that that is clean?

PC: *Mm-hm.*

LRH: Thank you. In this session have you decided anything? Okay. Do you agree that that is clean?

PC: *Mm-hm.*

LRH: Thank you. In this session have you thought, said or done anything I have failed to find out? Something I have failed to find out?

PC: *Uhmmm.*

LRH: There.

PC: *Yeah, that sometimes this chair was a bit uncomfortable.*

LRH: All right. Thank you.

PC: *Hmm.*

LRH: In this session is there anything I have failed to find out? All right. Do you agree that that is clean?

PC: *Mm-hm.*

LRH: Thank you. In this session is there anything you feel was misunderstood? Something there – a little bit slowed – or is it the surprise of the question?

PC: *No, I think everything's understood.*

LRH: All right, I'll check it again. In this session is there anything you feel was misunderstood? Equivocal.

PC: *Mmmmm, no, I got it. I feel you understood.*

LRH: Oh, all right. Okay, thank you.

PC: *What misunderstandings have occurred downstairs, heaven knows. But you understood.*

LRH: Okay, I'll check that again here and make sure. In this session is there anything you feel was misunderstood?

All right, do you agree that that is clean?

PC: Yes.

LRH: All right. In this session was the room all right? All right, do you agree that that is clean?

PC: *Mm-hm.*

LRH: All right. Here we go. Squeeze the cans. Well, put them back a little bit more there.

PC: *Oh, sorry.*

LRH: All right. Squeeze the cans. Well, what do you know. All right. Put the cans down. All right, touch – we're going to run a little – just a little bit of Havingness here, just a few commands.

PC: *Mm-hm.*

LRH: All right. Touch the table.

PC: *Mm-hm.*

LRH: Thank you. Touch your right sleeve with your left hand. Thank you. Touch your left sleeve with your right hand. Thank you. Touch that telephone. Thank you. Touch the other telephone. Thank you. Touch the tablecloth. Thank you. Touch that curtain. Thank you. Touch the top of your head. Thank you. Touch my hand. Thank you. All right. Pick up the cans. All right. Give them a squeeze. Thank you. That was the last command.

PC: *Mm-hm.*

LRH: All right. Now – you can set them down – have you made any part of your goals for this session?

PC: *Ah, yes. I've got quite a bit of nulling done. I got two pages done.*

LRH: Yes.

PC: *Good, very good.*

LRH: All right, okay. Perhaps find a goal, maybe?

PC: *Ohhhh, almost, but not quite.*

LRH: Well, all right.

PC: *I'm not upset about it. Got near finding a goal.*

LRH: All right. All right, have you made any other gains in this session you would care to mention?

PC: *I feel sort of less gruffy.*

LRH: Feel less gruffy?

PC: *Yes.*

LRH: All right, very good. Any other?

PC: *Um – tone arm coming down. Tone arm coming down on the...*

LRH: Yeah! Tone arm down, yeah, I realize that.

PC: *... after – after rising up and up on these.*

LRH: Mm-hm.

PC: *Mmmmm. That's good. And – um – I feel – uh – relaxed, more relaxed.*

LRH: All right. Good. How's that?

PC: *That's fine.*

LRH: Very good. Now, is there anything you care to ask or say before I end this session?

PC: *Yes, thank you. I really got into – it's just like our sessions – I really got into session.*

LRH: You really got into session.

PC: *I really got into session.*

LRH: All right, very good. All right.

PC: *Magic.*

LRH: You're welcome.

PC: *Mmm.*

LRH: All right. Is it all right with you if I end this session now?

PC: *Mmm.*

LRH: All right. Here it is: End of session.

PC: *Thank you.*

LRH: All right.

PC: *It's been lovely auditing.*

LRH: All right, thank you.

CLEARING

A lecture given on

9 August 1962

Thank you. Thank you very much.

What's the date?

Audience: 9th of August.

Ninth of August? What planet? Nine August, AD 12, Saint Hill Special Briefing Course, lecture number one.

Subject of lecture: Clearing. Series of two lectures here, one of which is clearing in general and the second lecture will be on the specific technology of listing in which you will be very, very interested.

All right. What are you trying to do? Well, you're trying to clear people. Now, that may not be what you're trying to do according to your goal [laughs] but unreactively, you are, of course, quite happy to do just that. Therefore, you should recognize that all processes are subordinate to this final end. There are no processes that compare with those that clear. That is very much the case.

Now, you have to consider that an individual, in order to be clearable, has to be auditable. So that therefore becomes part of clearing to the degree that it is – assists clearing. And if at any time an individual cannot be audited, he of course cannot be cleared. That's awfully plain, isn't it? That's one of these idiotic things: The way to get up the – across the river is to get across the river. You know? But you're going to face this. You're going to face this many times. You're going to have somebody who is unauditably and you're trying to clear them.

Well, what do I mean by unauditably? There's nothing very esoteric about the definition. If the fellow can't talk and can't listen and can't respond, he, of course, is unauditably.

So when we're speaking of unauditably for the subject matter of clearing, we have nothing to do with the old, I think it's Kraepelin, I think the fellow's name was, over in Germany. I think – it really was! [laughter, laughs] I mean – he made up this scale of insanities and I don't know – very Germanic subdivisions of the subdivisions into the subdivisions and all of this sort of thing and this terrific chart. I mean, it's marvelous. They took it over to the United States and they sort of amputated it down and cut out a lot of the steps and then changed the definitions of those, but aside from that alter-is, they're using the same chart.

Now, that's states of sanity. And you frankly don't have anything to do with a state of sanity. Just make up your mind on that, right there. You got nothing to do with it. I know it is an intriguing subject, but consider it one of the lesser para-Scientology subjects that somebody should study sometime for a master's thesis in a University of Scientology somewhere up the track when you can't teach him anything else. You got the idea? See? It's a subordinate subject to Scientology. Yet the whole world tries to force any activity in the field of the mind either into the field of insanity or the field of advertising. [laughter]

Now, our difficulties are multiplied by the fact that the public at large believes that we have a lot to do with sanity whereas – now I'm giving you a technical truth; what we had to say about insanity had to do with difficulties in auditing and other things in the past, you see.

Well, just kind of lay all that aside and just skip it. Assign it to propaganda, necessary statements, efforts to keep organizations and auditors from getting themselves in trouble and, you know.

So we've used this word "insanity" from time to time. We've used this word "sanity" from time to time. But actually we have no business having anything to do with either because there isn't a human being on Earth today who is sane. They're all batty or they wouldn't be here.

It's just – it's one of these definitions that proves itself, you know. You say, "Is this fellow insane?" Well, you can't say he's insane because we don't know what the definition of that is. But is he sane? And we find him in a small factory working someplace at a drill press, you see, and he comes down to the drill press in the morning, at 8:00 in the morning and he goes this way – see? And he does this until 5:30, see. And he does this five days a week. That guy must be crazy! His total horizon is being retired someday by a socialist government which, of course, having drained the population of taxes in the interim, probably won't exist at the time of his retirement. His complications are many, but you couldn't say that he is taking the optimum solution out along the line.

And I'm afraid you could only define sanity. You cannot define insanity. And somebody who is sane could be defined as: a person who resolves problems for the greatest good of the greatest number of dynamics. That's a sane action. We can define that; I think you would agree with that. I'm not shoving it down your throats as the definition of sanity. We don't even have to have it as a technical fact, but I think you'd rather agree with that as sane.

Well, when you look at the actions of human beings and their various tangles and so forth, very few of their problems are solved with that equation. So, which of course, rather debars them from the subject.

So we haven't anything to do with sanity or insanity – nothing. The guy's in a spinbin; that doesn't prove he's sane or insane or anything else. See, it proves nothing. The only thing you're interested in is the auditability of a person. See? The second you've got clearing as an absolute fact – there it is – you're only then interested in the auditability of a person.

So people fall into a gradient scale of auditability which passes out down into a scale of inauditability. And that's what you should really study if you're going to study states of

man and that sort of thing: is are they auditable. Now, that is a very narrow look. That is a very narrow look because it's a technical look.

A person who is not Clear will not resolve things for the greatest good for the greatest number of dynamics. Even a first goal Clear won't, ordinarily – and I think you will find it borne out that you get a second goal, third goal and all of a sudden they're starting to really look around and observe things in that their equating and resolving problems and so forth will step up to that degree – will begin to match up to that particular definition, of a proper definition of a solution to a problem for the greatest good for the greatest number of dynamics.

But look, I'm talking to you now – not on a basis of propaganda or what I'd like the world to believe or anything else – I'm just talking to you straight from the shoulder what I know. And what I know is this: There is no processing short of clearing that is worth long and arduous hours. See, there is none. Now, that we've got 3GA, we can take a look back along the line and we can see easily how hard we have worked for what tiny gains. Now, that's – those gains were *well worth making*. My God, let's not downgrade this fact. They were well worth making, but the gain we can make in comparison to these things by clearing is something like a matchstick up against the Empire State Building. You see? The comparative values of these things are fantastic in compa... they're hardly – they're not of the same order of magnitude hardly, you see?

You got somebody over his headaches, and he got along better with his family. Fine. Good. Wonderful. Nobody could do it before on this planet. And, therefore our existence has been justified. But look, we all of a sudden have got our hands on a fact here. And this fact is 3GA and I've watched it now. I've kept my eye on this and I just give it to you straight from the shoulder. I mean what we're doing has absolutely – hardly any comparative value with what we've done at all. And the value of actual clearing is so great. And it does so much for the person that to strike for a lesser goal when that other goal of clearing is in your power, of course is an awful waste of time. So we become interested in auditability.

Now, every now and then, there's one or another amongst you I start worrying about, see? That isn't anything that you disturb my dreams or something, but I see how you are doing and how you are not doing, and so forth, and I start worrying. I see your case going awry or something like that. Your Instructors can tell you – all I do is start "push, push" along this line, you know. Well, how can we get him up into 3GA group, you see? And how can we somehow or other cut the corners on this, and how can we press this one forward, and how can we get this person to audit well enough so that he can receive some auditing and, you see, and it's all – it's this kind of action that is taking place, see.

And the difficulty that we face is actually not a technical difficulty that an auditor faces to a pc, see. Here is a little bit of a different difficulty. You are technicians. You are Scientologists. You are scientists. You are people who can do things with the human mind. You practically – this small confine here – practically all the people on Earth who are experts on the subject are confined at this moment in this very small area. See?

All right. The trick is from my viewpoint, to get somebody who can clear somebody else while being cleared, see, that's the stunt. Otherwise nothing else works – not on this planet, you see.

All right. So we're faced with this additional problem, and your judgment on this course is liable to be warped a little bit as to the auditability of somebody because he's not up in the 3GA group, see. There isn't anybody on this course who couldn't be that [snaps fingers] fast in the 3GA group, you see. You walk right straight in the front door and just go straight onto a 3GA group providing there was no requisite they pay for any of the auditing they get by auditing. You see? That there was no requisite. We maybe could have a staff of a half a dozen people and these people are all groomed up, and a student comes in and we audit that student to Clear and then he walks on out the front door and gets lost in the vast multitude, or something like this. You see?

Now, that is not an optimum condition. You may have disagreement with this and you're perfectly welcome to disagree with this because I point it out clearly as simply a point of view. My struggle has not been to clear people. My struggle has been to get people to clear people. You see?

Now, if we can do that, we've got this – we got it licked. We've got this planet licked. We've got the biggest breakthrough that has happened on this planet – ever! There has never been a comparable breakthrough – all right – such as we have in our hands right this minute, because we are doing that very thing and therefore it's a tremendous breakthrough. So don't adjudicate your judgment as to who is clearable on the basis of somebody is in rudiments and havingness section, see? See? Don't go off to that degree. He's in rudiments and havingnesses because he can't audit anybody well enough to receive auditing yet. Got the idea? Or he's working up till he can. We don't have any unauditables here from a standpoint of clearing. Now, does that open your minds up a little bit on this?

Audience: Mm-hm.

There isn't one in the place. Not one.

There's some dirty needles. There are some people that have a little difficulty to stay in-session. And all those things are curable by the very things which you're being taught. That is to say you can give them some rudiments and Havingness sessions and you can give them some Prepchecking sessions and you can pull their overts and there goes their dirty needle; and you can straighten them out and then you can take them right on through and find their goal. Now, that's – that's the truth of the case. Don't you see?

You actually are not being subjected to inauditables cases, and you aren't. Now, getting your point of view, then, straightened out, just on this: How bad off does a person have to be to be unauditables? How bad off is he? Well, it's pretty bad; it's pretty bad. Now, I'll tell you what makes them unauditables: it's how many overts they are secretly committing during the period of auditing. That's a factor.

Now, if you have got somebody so poorly under your thumb as an auditor, see, his control factor in the session is poor, and goes out and goes this ... You don't have them show up for sessions by reason of the fact that they're dead drunk or in court or something like this. Don't you see? There are a lot of things getting in the road of your auditing all the time. You see? Well, that's what makes them unauditables more than anything else. Or he keeps coming into session with a dirty needle. You clean it up today and he comes in tomorrow, and so forth, you see. You just can't...

Now, the person who can be cleaned up and who can somehow be bludgeoned into keeping his snoot clean long enough for you to read his needle, see, all right – that is the lowest level of auditability.

Now, below that level you have the fellow who won't tell you, who will never give any of his overts up, who will not cooperate with you or be frank with you, and from that point on there it all is. I mean, right on down to the fact that he can't talk at all. See? From – for our purposes, the communication level at which auditability ceases is where the person will not talk to the auditor frankly. See?

Now understand, an auditor's got lots of tricks and he can force a lot of people to talk to him. And he can force them under control and dire warnings: "You come in here just one more morning with that many overts the night before and I'll pick up this E-Meter – I won't audit you tomorrow – I'll just pick up this E-Meter and break it over your head. Do you understand? Then you'll owe me for an E-Meter." [laughter] See? "Got the idea? When you go home tonight, walk only on the left side of the street. Don't say a word to your wife. Go to bed quietly. Don't have any fight this morning at breakfast because I'm not going to spend another two hours cleaning up your breakfast quarrel. Now, keep it easy now and we'll have you through the knothole," see.

You know, I mean you could be that tough. But that person that you could do that with that that would work on, you see, he's still in this band of auditability – the person that can be almost bludgeoned into giving up his withholds. Oh, you – auditor has lots of tricks this way: "Well, I'm willing to sit here the rest of the night. There's the read. Where's the overt? I'm willing to sit here the rest of the night until you tell me, but are you?"

Just fold up the E-Meter and sit back in your chair. Yeah, you've got all kinds of forcing tricks, but you see there's a band of people on which this doesn't work. Below that, is only the people that you can't force to give up any overts. You can't force them to be frank with you. You know, just can't make it any way you can possibly think of. Comes in here, needle going: *bang-bang-bang-bang-bang*, *bang-bang-bang-bang-bang-bang*, *bang-bang-bang-bang-bang-bang-bang* – and you say, "What have you done?"

"Nothing."

"What crimes have you committed in the last 24 hours?"

"Nothing." Try any trick in the trade. "I haven't done a thing. Oh, I'm telling you the truth. I've *always told you the truth!*" See, now we're getting down.

Now, whether that personality is psychotic or neurotic or badly bent or anything else, we couldn't care less. See, the personality is a fact. See? We don't care what classifications or labels gets assigned to the personality. We can't break through to smooth this case out enough.

Now, it isn't that our meter won't read. You see? That's not actually – that would be on the apparent surface of it, the debarring factor. Of course that makes it impossible, too, but it's actually that this guy's not going to sit still long enough and he's got so many curves on the line that you're never even going to clean up one goal. Look, if you can't get him to talk to you, how are you ever going to get any rudiments in or anything else? You see? Regardless of

whether you were auditing him on a meter or not. If you were to just lay a meter aside and try to audit him up the line on the something or other, you'd just get a pack of lies, and of course, the meter – at the end of the session you'd have to clean everything up at the end of session, you see. It'd be a mess!

So it – that person, you see, goes down into this other category and you're now down into the CCH band. Now, we call him "unauditable" for purposes of clearing, but he is preparable. Almost anybody, if they're not dead and can talk, is preparable – almost anybody. That will be one of the great studies of tomorrow, see – that isn't necessarily you study it today at all. I was doing some work on it a year or two ago. I was thinking, "Well, how do you get a whole institution of people – pull the psychiatrist off their neck – how do you get a whole institution of people to – some of them come through it. You know, I was thinking about, well, it's rest and some food and give them some large objects that they can sit around in courtyards and just look at, you see – good stable data. Other trickery of this particular character, but you see, they can't be audited, but they might be prepared for auditing.

Now, let's take another level of extremity of prepared for auditing. This fellow has a cut artery and is pumping what gallonage he has in gore over the local pavement. Now, he is not at that moment auditable. You see, by the time you had cleared the auditing command, you see, he has no more fluid to pump through the blood system. Now, now there is a comparison between that as an immediate emergency action and preparing somebody so he can be audited, see.

Well, naturally, the thing to do is to put a tourniquet on it and bandage him up somehow or another and square him around and get the emergency off of the situation, and then you can probably audit him – and undoubtedly should, to get a nice clean healing of such a wound. But you're going to find that on a broader sense a lot of human beings come into this category – a lot of them. They're quite a few. There's Betsy Ann who has migraine headaches and who won't talk to the auditor and who doesn't want to listen to anything about Scientology, doesn't want to hear about it, and yap, yap, yap, yap, yap, yap and is very angry with her husband all the time because – because he goes off with those Scientologists and so forth. And he is interested in that, and he don't – and so forth, and – isn't it terrible, and so forth, and they're a bunch of *raaaaa* and *raauw-raauw*, *raaaruw* and *raauw* and so on – and my migraine headache is killing me! And yap, yap, yap, yap, yap, yap, you see. And finally, the husband comes around to you and says, "Well, look, why can't you audit her?" Well, he's asking you to look down the long road, you know. CCHs or maybe even just rest, you see – something of this sort.

Now, there's some fellow who has had the latest psychiatric operation. They take an ice-cream scoop and go in through a hole in the top of the skull, you see, and empty the gray matter out, and so forth. And he's lost all of his coordination. He can't do anything, and he can't talk, and he can't do this. Well, he's not necessarily a throwaway – not necessarily. You might be able to by CCHs and other drills and – but, even more fundamentally, just by letting him recuperate a bit and so forth, he might get up to a point where he could communicate to you somewhat.

There's a fellow lying in a coma. He's a CCH case. You can generally pull them through that. You see, you got all kinds of these cases down there. They're – you might say, they're not immediately auditable. They are preparable for auditing. Now, don't forget this: that that fellow's going to kick the bucket – the unauditible case – sooner or later and he's going to pick up another body sooner or later, you see, and you catch him up the track somewhere so he's still not all the way gone – providing the technology is still there. See. That's the little question mark on that fact.

Now, I wouldn't spend any more time on any of the unauditible cases – now let's get back to some very factual facts here – spend any more time on an unauditible case than is necessary to put them into a state of finding their goal and listing it out. Now with some case, that's five years – that's five years of rehabilitation, see. A manual operating with weaving or something, you know.

And with somebody else, that's five hours of Prepchecking. See, it's that variable. There is no case that can't be reached except the case that isn't there and will never hear of it. Now, if the case is never there and will never hear of Scientology, yes, he comes into the absolute. That is a theoretical absolute, don't you see? He's way out of sight. See, you're never going to lay your hands on him, but to some degree, others are preparable and some are just auditable. You just sit down and – well, you got a banging needle and you say – use some of your trickery. You say, "Now, let's see, Gracie Ann. What question would be the most nerve-racking question that I could think of, Betsy Ann?"

"Well, am I a virgin?"

"Well, are you a virgin?"

"Oh, of course, yes. *Ha-ha-ha-ha*. Oh, yes, yeah. I sure am."

Now, you really get a rock slam, see. And you say, "All right, Betsy Ann. Now, let's level with it."

"Well, I can't – can't talk to you about it, you know."

Well, you've ended the session. You say, "Well, when you come back to see me tomorrow, I want you to have made up your mind whether or not the withhold which you have there is worth going the next 200 trillion years in misery for."

And she comes back in and you say, "All right now, Betsy Ann. How about this question you didn't want me to ask you?"

"Well," she said, "there's Bill and Joe and Pete and Tom and Dick, so on and so on, and the priest in the village and so forth." [laughter] And the needle quiets down; the needle quiets down. You run a little bit of O/W and the bank stops shifting around, and you say, "All right. Give me a list of your goals." Get the idea? Whatever trickery; whatever duress that is put on her is justified by those means. That's safe. That's it, that's up to you to get the fellow or the girl to talk to you. That's the case. That's the lowest rung of case you probably will be having too much to do with.

Now, if you take somebody who is a habitual drunk, and he goes out and robs service stations every night to pay for his liquor every morning, and he's doing this and he's doing

that, and he's doing something or other and he runs up five overts for every one you pull off, don't you see. His level of responsibility is just horrible. And he can't seem to stay with it, as far as you're concerned – he keeps giving you all kinds of trouble and so forth. Well, please recognize you're dealing with an un-auditable case. Like the case needs a – needs a tremendous amount of therapy of some kind. You probably need a stockade, man, you know, and turn the key on him and let him sit over in the corner under the sorrel brush and think it over for a few days on water. About the time when the DTs are ready to kill him off, say, "Well, it's horrible what a reactive bank can do, you know." Slip it to him. But it doesn't come under the heading so much of auditing.

You can spend fantastic quantities of time preparing a case that is almost un-preparable and your heart will only get broken by that case. See, he's apparently auditable. He actually isn't auditable. You have to make up your mind about this, see. You can't force him into a groove. Oh, the case that can be forced into a groove any way you can do it, is of course auditable, but this fellow can't really be forced into a groove. He can't really be made to go into session as far as you're concerned, and so forth. Recognize that at this particular moment we don't have the tools of therapy necessary to handle such a case which is possibly a stockade and a bottle of water, you know? And if we were to put him in the backyard and chain him to a tree for a few days, even if he's a chronic alcoholic, do you know that neighbors – neighbors being what they are – they'd probably complain. [laughter] Therefore, the littlest good to the fewest number of dynamics.

Frankly, the auditability of people depends in a large measure on the sphere of influence of the Scientologist, see. And when his sphere of influence is big enough that – all of them become auditable. See, here's Grandma and she's going *nyah, nyah, nyah, nyah, nyah, nyah, nyah* at the family and that sort of thing and she's raising hell with them. She holds all the purse strings, tells them they can't do this and all that sort of thing, and so forth. And, well, right now there wouldn't be a thing you could do about it, but in another age you possibly could say, "Grandma, why the hell don't you get off your overts?" you know? And she'd say, "This is a Scientologist talking to me. I had better start singing." You get the idea? That's what reputation will do for you.

Now, not advocating rough stuff or anything like that with regard to such people, I'm just trying to make it clear to you that you've got a wonderful gift in your hands.

And you start spending five years trying to set up an alcoholic simply because his brother has a million gabutnicks, all of the people you could have cleared in five years remain unclear. That's interesting, isn't it? And probably at the end of the game, because your sphere of influence isn't as great as it should have been because you weren't in there creating it, you won't have even cleared this guy's brother, see – not him either. I can see it now.

So you've got your sphere of action that would do the world the most good, is the auditable case – the sphere of the auditable case – who can be audited. Gosh, that goes down pretty far. I could pull some people in off the street that would make you blink on the subject of whether they were auditable or not. And I'd say a person is perfectly auditable; go on and audit.

One day a girl comes in – a girl comes in, walks up to Suzie and she was sitting at the Registrar's desk in Phoenix, Arizona – many, many, many years ago – and says to Suzie something on the order of. "I want Ron to audit me." And Suzie says something or other, something or other and take it in a matter of course, and starts to write the girl's name down, and says, "All right. What's your name?" You know, "I'll at least put her through the formalities here." And the girl said, "Well, what is my name?" I think she even sat there trying to invent some names for herself or trying to guess at it. She didn't have a clue, man – she didn't have a clue. And I think I gave her two sessions – an hour – oh, something like an hour and a half and something like an hour and three-quarters. Life straightened out; she went out and got married. She's still around. Memory came back. Everything's fine. Obviously unauditably: Couldn't think of her name, couldn't talk, couldn't sit still, on the run, didn't know who she was – strictly spinbin stuff, don't you see? But the difference was that she was perfectly willing to answer the auditor's questions. She was still in communication. And although for a while, that needle might have been slamming around on the meter, it calmed down pretty fast, don't you see? So do you get the difference here? She was auditable. Strictly spinbin stuff – you know?

Now, a psychiatrist would have said, "This is a very sick, neurotic girl." Yes, she was. She had a compulsion to turn into a prostitute in order to get even with her parents who were Presbyterians. She had a compulsion to. She was making a good job of it, too. But see, by all the textbooks, this is a spinbin case and by our textbooks she was quite auditable.

Another girl, because she had been in an institution, came in and saw another Registrar one time. She's – had an institutional history long as your arm. The Registrar says, "Well, the person isn't processable – couldn't be. Look at the history, you know: out of this institution, into that institution, and here and there and the other place, and wow!" See? She was even a rather gruesome-looking character. And I said, "Well, I'd – I better see about this." And I didn't audit her, by the way. But I wanted to see whether or not she was auditable. So I had her come in and put mock-ups in various corners of the room, hold them there – various kinds of mock-ups and hold them there stably. And she could mock up anything and put it there, and it would stay there just as it was and move it around. Perfectly in control of her mental pictures. Interesting, huh? Quite auditable. She got audited and away we go.

Another girl comes in: nice family, everything is fine, background beautiful, all polished up, so forth – beautiful parents, very pretty, she's well dressed – she's this, she's that, she's the other thing. *Augggggggggh*. Shouldn't happen to an auditor. She's got one of these automatically shifting banks. She can't sit still one moment or the other, one minute to the next. She can't answer questions. You say, "Did you eat soup for lunch?" And she says, "Hitler's no good, you know." Unauditably without a terrific amount of rest and preparation and everything else and so proved to be.

You see, it isn't what life has labeled them. See. Now, furthermore, it really doesn't much matter how buggy they sound. They could sound awful, awful, awful spinny and still be quite auditable.

The difference, I suppose, is this: The fellow knows he can get better or that there's some hope or he should take a crack at it and the other fellow who was unauditably knows

there isn't any hope and there isn't any reason to take a crack at it and you couldn't get better anyhow, see. I suppose that would be the handiest little rule of thumb by which to judge these two things – just fast like that.

Fellow knows you can't get any better, knows he isn't any better, knows he's absolutely right in life and it's everything that has been done to him. You add all these things in, don't you see. He knows it's everybody else's fault but you can't do anything to him that would ever make anything of it better and so forth. Thinks he's being totally sincere about it – knows that any efforts to help anybody are based on trickery, quackery. I could run you off a whole lot of this stuff, but you've heard this in part or in full many times. Well, you try to get that guy on the E-Meter and try to get him to talk and you can't read the needle and you can't do this, and you can't do that. But on the other hand, you still might be able to straighten him out and change his mind, don't you see. Such a case you'd have to find out. Now, it's you who are the judge of this.

Now, it doesn't matter how buggy they sound to you on some of their ideas. They can come around to you and say, "Throgmagog is going to tip over the Empire State Building at any minute and I worry all the time because I own some stock in American Tel & Tel," and you wonder what the devil this has got to do with anything. Well, some people can have a nutty idea and know it's nutty, and other people have a nutty idea and they don't know it's nutty. [laughter]

Do you understand that, how a person's goal could make them sound utterly batty, whereas they're quite auditable. It's just a goal, see. "To keep buildings from falling down," you see. Let's say that's the person's goal and the person is always found with their hand up against the side of the building keeping buildings from falling down, you know. Police would lock them up. You put them on an E-Meter; they're quite auditable.

So we get down to just this one criterion: Are people auditable? Well, how much preparatory auditing should you do? Well, to make them auditable on goals processes, and that's the full answer. Now, you can sit on somebody's chest that is doing some of the wildest things and still find their goal, but I wouldn't make it any tougher on myself than I had to, because look-a-here, finding a goal is a terrific stress and strain on the pc. Now, nulling by mid ruds makes them much better, makes them feel better, is a much calmer procedure and that sort of thing, but they've got to answer your questions.

And if you had a pc who had sporadically dirty needles and wouldn't communicate with you and that sort of thing and you've tried to do something with, and you get four goals nulled in a three-hour session, you know – *ha-ha-ha-ha-oh*. Next day you get two. You're missing withholds all over the place and so forth. I guarantee you about the third day you'll get none. See, that's – that is hitting it too early. A person is not really sufficiently in-session to have a goals process run on them. See?

These are things which you have to develop a judgment about. I could lay you down a lot of rules of thumb and so forth, but the best way that you'll learn is to do just exactly what you will do, regardless of what I tell you. Here one of these fine days, why, you'll be sitting there and somebody says, "Oh, a Saint Hill graduate. Gee-whiz! Ha-ha. Well, I'll pay you an

awful lot in order to find my goal and I've always wanted to have my goal found," and so forth.

And you say, "Well, I – I guess so. Yes. All right. Fine," and so forth. And you say, "Well, I have to really do a little bit of preparatory..."

"Well, no. I – no. No, the only condition under which I'll be audited is if you find my goal right away without wasting any time on this other stuff, you see, because I'm a really very high-toned person."

And you'll be pulled in. You say you won't, but this will happen to you, all of you, sooner or later. You've got your list of goals and you start down at the top. "To catch..." [very hastily:] "to catch catfish. Ahh, it's null, I – I guess." [laughter] You're in for it, man, because this will get worse, not better, because the pc is never as calm as he is at the beginning. He gets less calm as he goes on. Now, if there's anything wrong with the case at the beginning, it's going to be multiplied before you get to the end. Oh, well. That will be up to you.

But I want to tell you this about clearing: There isn't anything wrong with anybody except he's upped himself a basic purpose of some kind or other for reasons he has not. No – no reason to it. And there it sits and then when this is disobeyed and so on, then it's all blocked off, and then you get a bank developed and then a bunch of other purposes that he doesn't want, get hooked up onto this so he does those; and then pretty soon he doesn't know who he is, and he picks up a body, and here we go, you see. And then he gets all kinds of this-a's and that-a's and the other things and he is indecisional and he is upset about this and he's upset about that. Well now, look. How you going to audit it? Well, how you going to audit it with a lick and a promise little, old, light process?

I'm appalled at our impudence. I am, you know. When I look at the tightrope walk that it takes to get somebody through to Clear, see. When I look at it from a research viewpoint, it's absolutely impossible to have ever found a tightrope. See, you couldn't find that tightrope in all those Grand Canyons for you didn't even know what canyon you were trying to cross, man. And yet it works out very simple and there's really nothing to it. [laughter]

You've got yourself a – you got yourself an action here, like trying to chip away at Mount Rushmore with a small Boy Scout hatchet. And after you've been slugging at it for a few hundred years, you see, why you've made a slight dent – inches deep. Now, there's no doubt but that we could do things nobody else could do. We could bring about a cessation of aches and pains and straighten people out and run grief charges and do all kinds of things. This is all quite remarkable, but when you look at it in comparison, it doesn't compare.

In the first place, almost anything you did to somebody was sooner or later going to cave in again. He either had by some confidence engendered in himself – could get a gradient scale of peeling it off if he wasn't too solidly in the GPM and he could blow clear of that and park that over there someplace and he could live quite happily with it. That was a Clear. At any time this guy had the threat of this thing coming in on him again, see. So he lived just a little bit of a nervy life because he must have known this – instinctively, he must have known something of this. He knew it wasn't all quite gone.

Now, when you start at it – peeling it down from the top, like, "From where could you communicate to a head? Thank you. From where could you communicate to a head?" His goal, by the way, is "never to communicate to anyone," – you have this chance factor floating through all of your processing. This chance factor is there all the time. Lord only knows what it will be. Only you and a complete assessment will be able to tell and it'll be some chance factor. And that factor could be for you or that factor could be agin ya. But in any event, that factor is the monitoring factor of any results that you get.

All right. We get this girl and we say, "How could you help your father? And how could your father help you? And how could you help your father? And how could your father help you?" And we eventually find to our horror that her goal is "to destroy all families." Now, how the devil could we ever have opened that up at all or got anyplace with a lesser process? Weird part of it is that we did. But per hour of processing, there's no comparison like goals processing.

You sit down and you get this person's basic purpose and then you – the bank starts falling apart and all these other things take place and they clear, and you haven't got any bank there to go back on the track or to go up into the future or to be connected with or not connected with and it's gone. Well, that is infinitely desirable, but the change that it makes in an individual is best viewed by you by the amount of havoc a wrong goal, found but not run, can make on a case.

Now, here is your index: Take anybody who has had a wrong goal found. Now understand, not run, see. This person – they had a wrong goal found. And just sit down with a meter, and – don't do an Instructor's check – just handle that goal as you would handle the "to be a tiger" drill, see. See, whatever the goal was – and just clean it that way. And check with your pc and make sure that you clean it until all sensation and pain has gone off of it, see. That, as an additional little action – just make sure there's no more pain left on that thing. Clean it very carefully, just with a drill, with also attention to pain, and you will strangely enough see more case gain than you have seen for some time.

Well, you say, "Look, to the degree it must have caved him in to have found the wrong goal..." No, you're looking in the wrong barrel. That's what I thought the first time and then I finally got my wits wrapped around it and found out what was happening, because it was fantastic. Just that you had found a wrong goal on this person – that must have caved him in. It must have ruined him, because look at all the good it did to clean it up.

No, it's not the finding of the goal. The finding of the goal did a key-in of what was there anyhow. And it could have keyed in at any time and possibly has. But you just pick it up as a found goal, and of course, you clean up the whole goal. In other words, you call his attention to this goal. He's become familiarized with this goal now by its suppressions, invalidations and that sort of thing. He's looked at it and he's confronted it, and to a large degree it's blown and it has no further effect on him, which leads you to one of the wildest Problems Intensives you ever wanted to run. And I don't know that anybody will ever run this Problems Intensive, but they might and it's one of the steps of finding a goal.

You say to a person, "All right. Write me out all the problems that you've had in this lifetime that you want to do something about. Just write me out a list of these, see." He gives

you a list of 60, 70, something like that. And you say, "All right. Now, what decision" (you can call it anything you want to) "would have solved " and you take problem 1, see. What decision would have solved problem 2, see. What decision? What decision? You keep writing down this list of decisions.

Now, you don't date them. They're really goals, you see. You don't date them. And you just go back to the beginning of them and you dust it off lightly with the "to be a tiger" drill, see. "To never drink again," you see, that was one of the things – that the decision would have solved that problem, see. To never drink again. All right.

You say, "To never drink again." You get a read. "Has that decision been invalidated?" You know? Go right on down through your "to be a tiger" drill, don't you see. And clean up that whole lot and, man, that guy will have thought he will have had more processing than a hundred and ninety-nine hours of anything else you could have run on him except goals processing itself. Makes an interesting Problems Intensive, doesn't it?

See, it's just a little chunk of doing a goals list and yet it works out into a complete Problems Intensive. And you'll be utterly flabbergasted at the amount of relief the character will get off this. It'll look completely phenomenal to the person. The reason you possibly won't do this – although this may turn out sooner or later, I shouldn't condemn it in advance – I should announce it to you of what it is. It's just a discovery of how to run a Problems Intensive and I shouldn't further evaluate it because you might be able to do this on somebody and find out mysteriously that they will go into session now and that they become auditable whereas they were only partially auditable before so it might have more value than I have experimented with at this moment.

But I'm just giving you the value of a decision – the value of a goal. Just the value of a goal with the mid ruds cleared on it on the nulling by mid ruds technique gives you more cessation of somatic, more release and advance of case... Look, these aren't even the guy's goals, see – they're nothing. He's given you a list of 60 "What decision was...?" Oh, he's made all these decisions at sometime or another – you just clear them up. Just as-is; nothing fancy about it – pocketa-pocketa-pocketa. Well, how long might it take you? Three-hour session, something like that. The guy's liable to come out at the other end of this session saying, "Wow!" you know and just flying, you know. God! He's no longer an alcoholic and he doesn't beat his wife and, you know, things are marvelous. Gosh!

How did this ever happen to him? Well, that's simply the value of a decision, because what is the reactive bank then, but the basic decision or the basic postulate or the basic purpose which has on top of it then, a concatenation of purposes – all of which are locks on the basic purpose. Every time – this is horrible – but every time he makes a decision, he puts a new lock on the case. Wonderful way to do oneself in, isn't it? And he did it gratuitously to himself, too. Nobody twisted his beams to make him do it. Yeah, he will postulate.

Anyhow, this action might serve very well as a tremendous training drill before somebody did 3GA, but actually it's simpler, unless you had some remarkable difficulty with the pc that made him unauditable. Basically, it is simpler just to get somebody to list 850 goals, straighten out the list at the other end and start nulling. Do you see? That fact has such value

that it makes this other very important discovery kind of null and void. That's an unhappy fact, isn't it, when you get down and look at it.

Make this tremendous thing, you know, you can – we've just made a discovery whereby we snap our fingers to the right and left and say abracadabra and a spaceship appears, you see. Well, that's nothing because it's standing in the shadow of a discovery whereby all we had to do was go *whhhh*, and a planet appeared. It's sort of dwarfed. But there's – there is something that if you wanted to get a reality on the somatic value and other values of cleaning up somebody's goals or decisions – you want to get a reality on just what that will do for a case – you could do that little drill and you've – and *waaaah!* Wow! This is nothing compared to what clearing is going to do, but wow! What would it do? It'll do a lot; do a lot for a case.

Now, possibly it will turn out suddenly to have some interesting value of its own or be – you can expect sooner or later that we may suddenly have alcoholics you do this with or something like that, you know. Something might come up.

But there's clearing, and there isn't any substitute for clearing. And if you can clear people, there's no reason to do anything but clear people, because it makes all that difference.

And it's all right to say well, so-and-so and such-and-such, and we ought to really prepcheck them a lot and we ought to do this and ought to do that, but frankly, if they're auditable, if they've been prepchecked up into auditability, there's certainly no reason to go on prepchecking them.

The person's sitting there and they're being good as a pc and the needle stays clean and well, what more do you want, man? Well, I always say the fellow – that this fellow isn't auditable. I can hear this argument going on someplace, you know. This fellow isn't auditable. Why, he just talks all the time about committing suicide. So he talks about committing suicide. What's that got to do with clearing him? Nothing. He just made the decision too many times and he can't stop deciding it, that's all. He never is going to commit suicide while you're trying to find his goal. He'll be too curious to find out what it is. [laughter]

You see, actually, the out of session behavior of the individual has nothing to do with it. It's only the in-session behavior of the pc in which you're interested. And if that in-session behavior is adequate to clearing – which is running down a goals list and getting his goal and getting him to list the four lines on it and blow it clear – well, there isn't any reason whatsoever why you should do it. There's no reason under the sun because if there's anything wrong with his morality or his ethical level or something like that, it isn't going to straighten out by putting him in jail, but it is going to straighten out by clearing him. So here's the answer to this situation.

I hope to some slight degree I've solved for you perhaps some ethical problems with regard to this matter and cleared your mind up on: Who do you clear?

Audience: Mm-hm. Yes.

Female voice: Yes, very much so.

And when should you start clearing.

Audience: Mm-hm.

What we have in actuality is a technique which is sufficiently powerful and sufficiently big and overwhelming that it actually a bit defies grasp – a bit defies description. It's a little bit hard to realize you're there, you know. It's a little bit hard to realize it's there or it can be done. And you really don't start realizing it until you clear somebody or until you yourself find your goal and suddenly say, "Wo-wo-wa-wa-what's this? What's this? What happened? Ah! Look what we got our paws on now."

But frankly, ever since this has – has been squared away so that the – now that you're finding some goals in nulling by mid ruds, I was waiting until that proved itself out that way – and these other things, there's – the lid's off. There is no limit on the forward road, believe me. There is nothing.

We are at that point of the crossroads for which we have been heading for a long time. And we were right there and we have arrived. It's going to take you a long time to realize it perhaps. It's going to take other people in Scientology a long time to realize it, but to grasp exactly what this means for this planet, takes quite a little bit of looking at – quite a little bit of looking at. Three-quarters of Asia became civilized just because a few guys hoped that somebody might sooner or later be able to do it. Hey! Three-quarters of Asia, just because somebody hoped they could do it. You know they never did it? Well, what are you sitting with now? And what do you suppose is going to happen from here?

That's why I say, it's just a little bit hard to confront this thing. And of course, you're in there. It looks simple to you and so forth. It is. You're learning to audit this and that. It was only last night in a TV demonstration – you saw how easy it was. And looking at all that, well, I invite you just to lift your head just a little bit from the technical fact and look at the broad implication of what has happened here this summer of 1962. It's quite interesting. May you never be the same again.

Okay. Well, I didn't mean to get too serious about the thing, but it – I've been just kind of sitting looking at it lately and saying: well, Ronnie, I – one guy suddenly got the idea it could be done and started operation bootstrap and some other guys came along and they started working on it and so forth. And always in the past we have had the beautiful dream that the Messiah comes down with sandals of gold with a neon sign around his skull [laughter] – and he blows on this silver trumpet, see, and everybody's Clear and that wasn't what happened at all.

There was some guy, who was just a guy, and he started figuring and some other guys started to work on it, and everybody was working on it, and so forth – and it happened. Perhaps it's all out of scheduled from the archangels and perhaps it isn't on the blotter in the Galactic Council but it *is happening*.

And it didn't have to wait for the second coming of who was it – Baal? Or whoever it was. Okay?

Thank you.
